#### INTERNATIONAL CONFERENCE ON MATHEMATICS, SCIENCE, AND EDUCATION "Applied Research of Mathematics and Natural Sciences to Improve Its Usefulness for Knowledge and Society"

# PREFACE

Thanks to God Almighty this International Conference Proceeding could be completed. All articles in this proceeding are presented in International Conference On Mathematics, Science, and Education – Applied Research of Mathematics and Natural Sciences to Improve Its Usefulness for Knowledge and Society on September 5-6, 2015 at Aston Hotel Semarang. This Conference is organized by Faculty of Mathematics and Natural Science. This proceeding has been reviewed of Mathematics and Science experts before it is published.

This conference is designed to improve the discussion and research scope in mathematics, science, and education area in the international level. Sub topics in this proceeding cover mathematics, applied mathematics, and mathematics education in accelerating character building. Enhancing biology and biology education research for a better life. Green chemistry in research and education. Physics and physics education for trending research.

iii

Hopefully this publication of proceeding will be profitable for all of us.

Semarang, 3 December 2015

INTERNATIONAL CONFERENCE ON MATHEMATICS, SCIENCE, AND EDUCATION "Applied Research of Mathematics and Natural Sciences to Improve Its Usefulness for Knowledge and Society"

## MESSAGE FROM THE DEAN OF FMIPA UNNES

Dear Participants of ICMSE 2015,

It is a pleasure to welcome all of you in the first International Conference on Mathematics and Science Educations (ICMSE 2015) held by Faculty of Mathematics and Natural Sciences, Semarang State University.

Faculty of Mathematics and Natural Science Semarang State University or more popularly known as FMIPA Unnes has 6 departments and 11 study programs of Mathematics and Natural Sciences education backgrounds and non education backgrounds. FMIPA Unnes has the mission of being an excellent and meaningful faculty by improving human resources through scientific activity.

One of efforts to result excellent and meaningful human resources through scientific activity is by performing discussion and knowledge sharing. To widen discussion of science and research development in mathematics and science educations scopes in national and international level, ICMSE 2015 was initiated as the medium of that discussion. I believe that ICMSE 2015 as the first international conference held by FMIPA Unnes can facilitate the knowledge sharing in mathematics and science educations area in order to establish a global cooperation among experts and researchers.

With the hope that this conference will be the medium to optimize the role of Mathematics, Science and Education in global cooperation, I am proud to welcome all of you and I wish you a pleasant sharing and discussion in this conference and enjoyable stay in Semarang, Indonesia.

#### Prof. Dr. Wiyanto, M.Si.

Dean of Faculty of Mathematics and Natural Sciences Semarang State University

#### INTERNATIONAL CONFERENCE ON MATHEMATICS, SCIENCE, AND EDUCATION "Applied Research of Mathematics and Natural Sciences to Improve Its Usefulness for Knowledge and Society"

# MESSAGE FROM CONFERENCE CHAIRMAN

My pleasure, welcome to you today on the occasion of this International Conference on Mathematics, Science, and Education (ICMSE 2015). I would like to extend my warmest welcome to all of the distinguished participants, especially those who have travelled long distances to be present here. This conference has already established itself as a key event to offer various thoughts and knowledge in enhancing our understanding in fundamental sciences and education.

This conference focus on "Applied Research of Mathematics and Natural Sciences to Improve Its Usefulness for Knowledge and Society", offers all of us the opportunity to explore exciting information. The aim of the conference is to provide an interdisciplinary forum for scientist engaged in the full spectrum of research and development activities. The meeting intends to bring together researchers, scientists, and scholars to exchange and share their experiences, new ideas, and research result in related fields and discuss the practical challenges encountered and the solutions adopted. I invite all of you to approach this year's events to take advantage of the many ways in which you too might explore the unfamiliar - and discover a great deal in the process.

First, the various sessions that have been organized for the next day promise exciting revelation for all who attend them. Each speakers who are experts in their respective fields, will address a major topic or issue related to Fundamental Sciences,. You might learn more about a topic with which you were already familiar; or you might also find yourself discovering a whole new world of ideas and information you didn't know existed. Either way, you'll have many opportunities to explore fascinating new terrain with these reputable speakers.

Second, the key note speakers will provide, for all of us, an important window into the world of the future. We are privileged to have them as our key note speakers Prof. Barke, Munster University Germany, Prof. Martin Stein, Munster University Germany, Prof. Simone Krees, Munster University Germany, Prof. Matthias Ludwig, University Frankfurt Germany, Prof. Van Horssen, Delf University Netherland, Prof. Rahim Sahar, UTM Malaysia and Dr. Margareta Rahayuningsih, M.Si experience has taken them through the whole cycle of Life and General science.

Finally, as you attend these various events, keep in mind that other people can also serve as doorways to new worlds. Hearing of someone else's background and experiences can often make for fascinating discoveries that can educate and profoundly affect us. So take advantage of this rare gathering of hundreds of people working in various fields to meet one another, talk with one another, and learn from one another.

In conclusion, I hope that you will find your time with us exciting. We have a great agenda for you with esteemed speakers and presenters from our profession. I do hope you will enjoy the next couple of days. I would like to once again extend my gratitude to all the participants, generous sponsor and I look forward to a most successful and fruitful conference.

Professor Dr. Supriyadi, M.Si Chairman of ICMSE 2015

#### LARVAE MORTALITY OF ORYCTES RHINOCEROS (COLEOPTERA: SCARABAEIDAE) CAUSED BY METARHIZIUM ANISOPLIAE ON THE RAINY SEASON

Dyah Rini Indriyanti<sup>1</sup>, Priyantini Widiyaningrum & Haryuni<sup>2</sup> logy Department , Faculty of Mathematics and Sciences, Semarang State University <sup>2</sup> Faculty Of Agriculture, Tunas Pembangunan University Email : dy ahrini36@gmail.com

#### ABSTRACT

Oryctes rhinoceros (Coleoptera: Scarabaeidae) is one of the major pests in several provinces of Indonesia. Biological control by using natural enemies such as entomopathogens Metarhizium anisopliae has been proved as a promising method to control plant pests. Pathogenicity of M. anisopliae were examined under rainy season in field conditions. The doses of Metarhizium respectively 0,1,2, and 4 grams for each 5 kilogram organik soil, put in a plastic container, diameter 34 cm and 22 cm height. Ten larvaes were put it into the plastic container for each treatment, six replications, total 240 larvaes. The third instar larvaes were obtained from Jeruk Wangi village, Jepara. Metarhizium formulation was flour kaolin media. Observations were carried out each week for eight weeks. The results showed that the fungi can infect larvae O.rhinoceros. Larvae mortality of O.rhinoceros caused by M. anisopliae began at second week (2-3% mortality) then increased up to seventh weeks (88-100%), whereas in the control treatment larvae were still alive until the end of research (80%). Data showed that application M. anisopliae in the field on the rainy season need a long time to kill the larvae O.rhinoceros (2-7 weeks)

Keyword : Biological control, Oryctes rhinoceros, Metarhizium anisopliae, the rainy season.

#### INTRODUCTION

Coconut trees are found to grow in many tropical countries like in Indonesia. There are a lot of benefits from parts of coconut trees such as from the roots, stems, fruits and leaves. They are also widely cultivated as raw material for oil palm. Some constraints to cultivate them are pests and plant diseases attack. One of potential pest causing stem damage and leaf is coconut rhinoceros beetle (Oryctes rhinoceros) or kwangwung in Javanese. O. rhinoceros attack inhibits the growth of trees and damage the growing point of plants (Widyaningrum 2014).

Based on interview with the staff of Department of Plantation District of Jepara, in Jeruk Wangi of Bangsri Jepara, there are many coconut trees that belong to people of that district (over 75%) were attacked by O. rhinoceros. Farmers could not control O. rhinoceros pest, so its population kept growing uncontrollably (personal communication, 2015).

The control of O.rhinoceros can be performed on the stage of imago and larva. Controlling O.rhinoceros imago with pesticides is less effective because the use of systemic pesticide is causing the pesticide contamination of coconut tree. Lately the control O. rhinoceros imago with pheromone attractant compound is performed because it is predicted to be more effective.

J

Controlling O.rhinoceros larvae stage is generally done by using parasitic fungi as biological control agents, such as Metarhizium anisopliae. It is done by sprinkling the fungi on larvae habitat. O. rhinoceros larvae can be found in the soil around the area of dead coconut trees, haystacks around the fields, heap husk of rice mills, animal waste and decaying rubbish bins that contain a lot of organic compound. Controlling O. rhinoceros larvae by using M. anisopliae can be done easily and cheaply. The fungi can easily be bred through corn or rice media. According to Prayogo (2004) and Trizelia et al (2011) one of the advantages of using Metarhizium is being able

be used to control various stages of insect evelopment from egg, larva, pupa and imago. fetarhizium fungi is found to be used to control locust opulation in Africa (Seyoum & Negash 2007).

Indonesia has two season of wet and dry. The peak f the rainy season is shown by intense high rainfall very day with low temperature and high humidity, while ie dry season usually has high temperature, low umidity and no rain. Meanwhile metarhizium oplication can be done in the dry and rainy seasons. eliminary test results in the laboratory showed that letarhizium may infect and cause death O. rhinoceros rvae in one week (unpublished research report, 2015). evaluation of O.rhinoceros control with 1e etarhizium in the peak of rainy season has not been udied. Therefore, this study aims to evaluate the ortality of O. rhinoceros larvae due to M. anisopliae at e peak of rainy season in Jeruk Wangi Bangsri District Jepara.

#### ETHODS

The study was conducted in coconut plantations long to the people of Jeruk Wangi Bangsri District of para, in February-March 2015. The *Metarhizium isopliae* fungi were obtained from the Balai Proteksi naman Perkebunan (BPT-BUN) Salatiga Central Jawa. e formulation of Metarhizium was powder (Conidia of etarhizium mixed with kaolin powder). While O.rhinoceros larvae was obtained from around the coconut plantations.

Black plastic pot with diameter of 34 cm and height of 22 cm was used as test containers. It contained 5 Kg organic soil media and Metarhizium fungi. Organic soil media consisted of mixture of soil, manure and powdered coconut trunk. Metarhizium dose treatment consisted of: 1 gram, 2 grams, 4 grams and 0 grams (control) for each pot. In the bottom of container it needed a hole for discharge of water. The larvae put into the pot. Each treatment used 10 larvae, 3<sup>th</sup> instar (size 7-10 cm and weigt 9-11 grams). Each treatment was repeated six times, the total larvae were 240. The plastic pot container surface was covered with netting plastic to keep it safe from animals. Then it was placed around the coconut plantations for eight weeks. Observations were made every week to see O.rhinoceros larvae mortality.

#### RESULT AND DISCUSSION

The research location, Jeruk Wangi Bangsri District of Jepara, was located at the coast of Java sea. According to the data from the Central Bureau of Statistics of Jepara (2013), Jeruk Wangi Bangsri area has high rainfall rate of 3295 mm / year, with rainy days of 131 days / year.

O.rhinoceros larvae mortality as the result of *M.* anisopliae application for eight weeks is presented in Figure 1.

					/				
	0	1	2	3	4	5	6	7	8
к –	0	0	3	5	5	13	13	20	20
••••• M-1	0	0	2	17	32	68	70	88	100
<b></b> M-2	0	0	0	10	65	90	93	100	100
M-4	0	0	3	17	65	83	95	98	100

Figure 1. The percentage of O.rhinoceros larvae mortality as the result of *Metharizium anisopliae* application at doses of 0 gram (K), 1 gram (M-1), 2 gram (M-2) dan 4 gram (M-4) for 8 weeks

In Figure 1 we can see the larval mortality of *inoceros* began to appear in second week in the trol and treatment group. This shows that there were ig microbes in the soil before it was added by Metarhizium. This was evident is showed in the control mortality of 3%.

Microbes were probably derived from mix of manure in soil media. The addition of *M. anisopliae* 

#### International Conference on Mathematics, Science, and Education 2015 (ICMSE 2015)

fungi causes high the increasing of larval mortality, so that in the seventh week, larval mortality (88-100%) was higher than control group (20%). Therefore the addition of Metarhizium causes the increasing of microbial parasites on insect larvae that live in the soil and quicken the larval mortality (68-80%). The weather condition during the research was raining with high intensity every day, with temperature of 23-31 °C and humidity (RH) of 76-95%.

This result was in contrast to a similar study using larvae O.rhinoceros and M. anisopliae, conducted in early September 2014 in Telogoweru, District of Demak. Larval mortality, at a dose of 1 gram Metarhizium, started to appear in the first week (29%) control mortality of 0% and in the third week all of larval mortality were infected with the fungi. The weather condition during the research intensity was raining with low intensity, drizzle, with temperature of 34.5 - 39,5 °C and humidity of 57-75% (research report, 2014, unpublished). This shows that there was influence of temperature, humidity and humidity on the rate of mortality of O.rhinoceros larvae. This is in accordance with the opinion of Hussein et al (2010) -that stated temperature and RH have very important role in the occurrence of Metarhizium infection to insects. Goettel et al., (2000) and McCoy et al., (2003) said that temperature and humidity are the main factors that affect the ability of the fungi to survive, spread, infect and kill the host.

Optimal low temperature and high humidity for the fungi with rain and low intensity gave the opportunity conidia of M. anisopliae in the soil to germinate. When conidia attached to the surface of the larvae integument it will grow and parasitize its host. As a result, the larvae was infected quickly, in one week there have been a lot of mortal larvae. However, when conidia germinated, then heavy rain was falling for long time, then a lot of hyphae of Metarhizium were damaged and die. Another possibility of conidia did not attach in insect cuticle surface because was because it was dissolved through water. Consequently M. anisopliae growth was slow and not as fast at the beginning of the rainy season, so the mortality of the larvae required a longer time. Therefore, controlling O.rhinoceros larvae with M. anisopliae at the peak of rainy season is not effective because it takes up to seven weeks.

It is suggested when applying M. anisopliae we need to consider the right season. When it is applied during the dry season, the soil media where the larvae lives need to be watered every day in a week. It is intended to M anisopliae conidia can germinate, multiply well and infect the larvae.

In Figure 1 we can see the treatments dose of M-2 and M-4 causes the highest mortality compared to treatment of M-1. *Orhinoceros* larval mortality charts of M-2 and M-4 treatments were not significantly different. Therefore it is recommended to use a dose of M-2 of 2 grams of Metarhizium in 5 Kg of organic soil media. Conidia density test showed that the amount of conidia of *M. anisopliae* that were stored on the kaolin media was  $0.5x \ 10^7$  gram/ml. According to Hosang et al (2004), conidia density of  $5 \times 10^5$  conidia / ml was able to infect the larvae of *B. longissima*.

#### CONCLUSION

Larval mortality of *O.rhinoceros* as the result of M. anisopliae fungi application needs 2-7 weeks. Application of fungi at the peak of rainy season is less effective because it takes a long time to kill the host.
