Comments to the Author
This manuscript describes the pathogenicity testing of H5N1 isolates in chickens and mice. Highly pathogenic avian influenza viruses are of extreme importance to the poultry industry and human health, as such this topic is of great relevance to the readers of this journal. The authors claim to have infected mice with 10e6 EID50 units of the novel H5N1 virus and the mice demonstrated signs of disease without prior adaptation. This in and of itself is not novel for H5N1 viruses; however, the authors claim that this infection was the result of oral inoculation and that the infected mice spread the virus to uninfected cage mates.
The author needs to edit the materials and methods part, where there are no details of materials used in the study.
