World Journal of Surgical Oncology

Dear Dr Mahalul,

I would like to invite you to review the manuscript above which has been submitted to World Journal of Surgical Oncology. Further details including the full abstract can be found at the end of this email.

If you are able to review this submission please click on this link:

<https://www.editorialmanager.com/wjsol.asp?i=738515&i=S56F1WRQ>

If you are not able to review this submission please click on this link:

<https://www.editorialmanager.com/wjsol.asp?i=738516&i=B3WZSOFR>

We ask reviewers to return their report within 14 days of agreeing to review, however if you need more time please do let us know as we may be able to arrange an alternative deadline.

You are requested to submit your review online by using the Editorial Manager system which can be found at:
<https://www.editorialmanager.com/wjsol/>

Your username is: AzamMahalul

If you forgot your password, you can click the 'Send Login Details' link on the EM Login page at
<https://www.editorialmanager.com/wjsol/>.

In order to keep delays to a minimum, please accept or decline this invitation online within the next three days. If you are unable to review the manuscript, we would be most grateful if you could suggest alternative reviewers.

Thank you for your time, and I look forward to hearing from you.

Best wishes,
Rajesh Kumar

WJSO-D-20-01985
Case report
Primary Fibroblastic Osteosarcoma of Sternum: a case report
World Journal of Surgical Oncology

Abstract: Background

Osteosarcoma, a kind of malignant bone tumors, occurs rarely in the sternum, especially the fibroblastic type. The survival of these patients is poor.

Case presentation

This case report describes a 60-year-old Chinese male with a neoplasm of sternum, who experienced three times of tumor resection and two times of reconstruction due to the high risk of recurrence. The reconstruction locking plates were used in the chest wall reconstruction, which demonstrated a very good structural stability and economic applicability. The mass was confirmed to be a low-grade, malignant, primary fibroblastic osteosarcoma by

pathological examination. As to the poor effects of current treatments, a whole-exome sequencing was performed and no targets match the existing agents.

Conclusions

Surgery is the first choice for the patients with a primary fibroblastic osteosarcoma of sternum. Whole-exome sequencing may provide novel insights and potential targets for this uncommon disease.

****Our flexible approach during the COVID-19 pandemic****

If you need more time at any stage of the peer-review process, please do let us know. While our systems will continue to remind you of the original timelines, we aim to be as flexible as possible during the current pandemic.
