other hand, part of the responsibility be on the adults, whereas they don't spend time with these children, and if they spend part of their time and any of them makes a behavior of turbulent, they punished him! So it isn't shocking that these children become confused, trying to spoil everything that surrounds them with anyone close to them. Thus, the problem be not only in the behavior of the child or in the surrounding environment, but branches from its importance in terms of lack of an appropriate interactive relationship between the child and his/her environment⁶. Aggression is one of the most serious social problems in the modern time, as it's a huge problem because it combines between the psychological, social and economic impact on the person and society. It's not easy, not only because of the pain caused by violence, wherever there is any action of violence can produce more of violence actions, so violence creates violence.³ As a result of the increasing interest of those who are interested in the category of children with learning difficulties and don't suffer from any other disabilities of hearing, eyesight, emotion or physical, environmental deprivation, cultural deprivation or unusual circumstances, and those normal persons with learning difficulties or abnormal in of their intelligence and level of adaptation Have intermediate or above average IQs and adaptive behavior standards. However, they have difficulties in learning academic skills such as reading, algebraic and writing, and they fail in attention skills, reinforcement and awareness⁴. There is no doubt that the teacher play an important role in the educational process of learning and his role in influencing the behavior of students is known, for example, it's need to find ways to lead the attention of pupils and their energy towards the achievement of school, so it work to control class, reduce aggressive behavior, and respect the class system⁷. The Token reinforcement is considered a type of positive reinforcement that has verified to be effective in the behavior modification process. It's called the Token reinforcement with the replaceable reinforcement, which is the physical things that the individual gets when performing the acceptable behavior, which is to be strengthened and replaced it later by many different reinforcements¹³. Token reinforcement programs are considered one of the most behavior modification methods used, which is an exchange system where individuals whose behavior is modified are fed instant feedback, in how appropriate their behavior¹². It must be emphasized that it's necessary that children be given token reinforcements every day and have full freedom

to delay or replace the reward immediately⁸. The use of methods that include physical reinforcement in the classroom has been developed by token reinforcement, depending on the degree of coupling of the material reinforcement by providing a desirable event, reduces the time between aggressive behavior and reinforcement whereas it can be presented immediately after aggressive behavior occurs. In additional to that the token reinforcement is an indication of providing variable reinforcement thus it guarantees the effectiveness of reinforcement with different people at different times, token reinforcement doesn't work on disrupt the series of behavioral responses that undertaken by the pupils⁹

METHODOLOGY

Include a presentation of the procedures that have been done to achieve the research aims, starting with the research methodology and the experimental design and identify the community and the sample of the research, preparing the requirements and instruments of the research, and presentation of statistical methods used, the nature of the research require an experimental approach, which means the method that the researcher stitches all variables that impact in any phenomenon, except the variable independent experimental in order to measure its effect on the phenomenon (dependent variable).

The Experimental Design for The Research

It includes one independent variable which is (token reinforcement), and dependent variable (The Aggressive Behaviour), so the researcher used the experimental design with one group with the pre- and post-test.

The community and Sample of the Research

The community of the research represents pupils with learning difficulties in the fourth class of primary, all of them belong to the primary school which belongs to Directorate General of Education in Babylon (city center), for the academic year (2017-2018), while the researcher selected the research sample of (Al-Jazraah Primary School) in Babylon , intentionally to make her research, after choosing (Al-Jazraah School) the researcher found out that the school consists of (131) pupils, aged between (9-11) years, the researcher applied the aggressive behaviour scale to determine the children who have aggressive behaviors, after applied it , the researcher found that (8) pupils got the highest scores on the measure of aggressive behaviour, so the research

sample consisted of (8) pupils, who will apply (The token reinforcement) on them.

The Instrument of the Research

An instrument was prepared to measure the aggressive behaviour among the pupils (the research sample), preparing the instrument requires the following steps:

Prepare the measure items

Through the knowledge of the researcher on literatures that related to research variables and scales of the aggressive behaviour, the researcher used items of measure aggressive behaviour that are (16) items represent the aggressive behaviour, multiple choice questions are given (Always , often , sometimes , rarely and no applicable), the scores are given respectively (1,2,3,4,5), thus the highest score of measurement is (80), the minimum for measurement is (16) and the mean hypothesis is (48) scores.

Prepare the measure instructions

The aim of the instructions is to explain the idea of the scale in its simplest form to facilitate the application of the scale because the clear and understandable instructions contribute to raising the coefficients of the validity, stability and objectivity of the scale, In order to rely on the scale, it's necessary to extract its cyko-metric properties:

The measurement validity

The results showed that the apparent validity achieved 80% of the agreement by the arbitrators and specialists. As for the validity of the construction, the results showed that all the items of the scale are statistically significant, so the measure is true in measuring aggressive behavior.

The Pilot Application for Measurement, includes

The First Pilot Application

The level of aggressive behavior in the first pilot phase was applied to a group of fourth-class pupils of primary with learning disabilities without a research sample. The number of children was (30) pupils. The aim was to know the clarity of the test instructions, the understanding and clarity of the test items for pupils and according to the time required for the test.

The Second Pilot Application

The test was applied to a sample of (100) pupils in the fourth class of primary without a research sample, and its purpose is to analyze the items of the measurement statistically.

Discrimination of the Item

One of the most important characteristics that must be provided in the items of the scale is the distinguishing feature and the possibility of items or items in the detection of pupils who have the measured and the pupils who don't own them. The value of the coefficient of discrimination between the scales ranged from (2,010-4,587), thus considered all the measurement items with discrimination and suitable factor.

The Measurement Stability

Estimation of the stability is considered one of the characteristics of the good measure, although validity is more important than it, because the validity measure is stable and may not be a stable measure is validity because it may be homogeneous in items, but may measure a property other than that prepared for measuring, and to achieve the stability of the scale was found Stability in a retest method. The Retest Method : The retest method is a direct method to determine the stability of the test, that is depended on the applying of the test two consecutive times on the same homogeneous group representing the original community of persons. If the test is completely stable, the score of each individual in the first application will be fully predicted by its score in the second applying of the test, the researcher re-applied the scale on the first pilot sample, and the researcher calculated the Pearson correlation coefficient between the first and second applications of the scale, which is (0,79), that is a good stability coefficient.

Statistical Methods Used

The researcher used Wilcoxon Test to compare between the marks of pre- and post-test in order to measure the aggressive behaviour.

RESULTS AND DISCUSSION

When the researcher selected the research sample and applied the measure of aggressive behavior, the program was then applied to the selected sample. The aggressive behavior measure was applied to the sample

before applying the token reinforcement. After the token reinforcement applying, the researcher used the Wilcoxon Test to identify the differences between the pre-test and post-test as in the table 1. According to the table above, the results showed that the calculated value is (-W=zero, the least repetitive value), which is less than the ruler value of (4) at the level of significance (0.05), which refers to the differences between the marks of pupils with learning difficulties, before and after apply the program, for the favour of the post-test, so thus decline the null-hypothesis and accept the alternative hypothesis, figure (1). Moreover, the researcher used (Mac-Jojian) equalization to derive the effect size of the program's effectiveness between the pre- and post-test for violent behavior, table 2. The table above explain the value of the effect size of the program effectiveness, which was (0,768), which is a suitable value to interpret the effect size, Roebuck (1973) refers to that the effectiveness of effect size must increasing

more than (0,60) in order to the program being active.⁽¹¹⁾ The current results refer to the effectiveness of the program that is used in reduce the aggressive behaviour among pupils with learning difficulties in the fourth class of primary, so the results showed that the pupils who have been subjected to the program have been reduce the aggressive behaviour among them in comparison with what were they before apply the program. The researcher attributes that reason to (the effectiveness of the token reinforcement) which is used in the research, that was able to reduce the aggressive behaviour among the pupils with learning difficulties (the research sample), so this refers to that the program has a positive effect in reducing the aggressive behaviour which is represented in increasing the suitable responses in the classroom, and appearance of the attention situations, don't disturb the teacher, don't transfer from one place to another in the classroom, don't quarrel with pupils and joining in the class activities significantly.

Table 1. The comparison between the marks of pre-test and post-test on the measure of aggressive behavior

No.	The Pre-Test	The Post-Test	Distinctions	Absolute Distinctions	Grades of Distinctions	Sign of Distinctions Grades
1	64	30	+34	34	3	+3
2	64	20	+44	44	8	+8
3	60	30	+30	30	2	+2
4	63	20	+43	43	6,5	+6,5
5	54	28	+26	26	1	+1
6	63	21	+42	42	5	+5
7	62	23	+39	39	4	+4
8	62	19	+43	43	6,5	+6,5
						+W = 36 -W = Zero

Table 2. The effect size of the program effectiveness

Situation	The Sample N	The mean marks of pre-test	The mean marks of post-test	The highest mark on the criterion	the effect size of the program effectiveness
The Aggressive Behaviour	8	61,5	8	80	0,768

Figure 1. The Differences Between The Pre-test and Post-Test Marks (The Aggressive Behaviour)

CONCLUSION

researcher applied the measure of the aggressive behaviour phenomenon on the research sample in order to identify the variables that happened before and after applying the program, then the data have been statistically processed by Wilcoxon Test, the results have presented the effectiveness of the token reinforcement that led to reducing the level of the aggressive behaviour among pupils in the research sample.

ABSTRACT

Today technology using nanoparticle when treatment pathogenic microorganism and we focused on this here. It was found that the species of streptococcus used in present study were sensitive to erythromycin. In present study focusing biofilm formation by *Streptococcus* spp was evaluated. Species *S. mutans* was found that highest amount of biofilm compare with the other species. The aim of report effect (SNPs) on ability of biofilm form different species of streptococcus. The anti-biofilm effect of SNPs was in concentration dependent manner. The highest effect of SNP against biofilm formation was found the concentration 160 µg/ml, while the lowest effect was found the lowest used concentration (80 µg/ml) of SNPs. In vivo study revealed that silver nanoparticles treatment of *Streptococcus pyogenes* contaminated injured skin showed good prognosis and good healing process include complete regeneration of the epithelial cells of the epidermis and increase of cellularity of the dermal content compared with untreated group. In conclusion, treatment of skin infected with *S. pyogenes* using silver nanoparticles concentration (160 µg/ml) may limited the skin damage, localized the lesion to the incision site and enhance the healing process.

Key words: Biofilm, Silver nanoparticle, *Streptococcus*.

INTRODUCTION

Streptococcus mutans has dental caries with helping some host factors gave evidence that this species related with teeth infection. There is an accumulation of dental plaque on the surfaces of teeth. Secondary caries occurs under the restorations is increasing the risk of dental plaque. Increase of plaques on resin is related to the surface (such as roughness of surface), which is depended to filler size, resin type and the percentage of filler composite) *in vitro* resins to increase number of bacteria or plaques¹. *Streptococcus pneumoniae* (pneumococcus) shown that colonize the as biofilms (nasopharynx) and we have this biofilm phenotype *in vitro* using nasopharyngeal environment². In Gram positive bacteria (Quorum sensing) has been found to regulate a number of physiological activities, including

in *Streptococcus gordonii*, *S. pneumoniae*, and *S. mutans*³. Periodontal diseases forming in Dental plaque is causes a biofilm in the human body such as (periodontitis, gingivitis and dental caries). Many researches inhibit the formation of dental biofilms and to remove mature biofilms. The major (inhibit or remove dental plaque) is susceptibility to irritation in oral mucosa⁴ Most serotype 2 (SS2) of *Streptococcus suis* clinical isolates can form biofilm, which contribute to persistent infection, transmission and difficulties to eradicate infection⁵. *In vitro* Particularly the biofilm phenotype was evaluated with isolate collections and for many of the clinically relevant under static and flow conditions⁶

MATERIALS AND METHOD

Indicator isolates

The major identified tests (morphological and biochemical) these isolates were by according to⁷ were obtained from College of Science for Women/ Department of Biology /University of Baghdad.

Confirmation of *Streptococcus spp*s and Antibiotic

Resistance testing:

All isolates *Streptococcus spp* the cultures were grown on (MHA) plates at 37 °C for 18 hrs. The zone of inhibitor (mm) disk around compared with a documented standard the zone of inhibition in (mm) around each disk Clinical and Laboratory Standards Institute. The antibiotic susceptibility against using Ampicillin, Ciprofloxacin, Erythromycin, Azithromycin and Chloramphenicol⁸.

Preparation of nanosilver suspension: Silver nitrate in the beginning put under low effects of polyaldehyde. Effect of surface activator decreased silver particles affinity to attach a solution with silver particles in nanometer size. To ensure the particle size, intensity test was made in the solution. Average size of silver particles was from 2 to 6 nanometers that measured by dynamic light scattering method. In microbiology laboratory a pilot experiment was done to find out the antimicrobial effects of silver nanoparticles against *Streptococcus spp*, the standard method of Clinical and Laboratory Standard Institute was followed⁹.

Determining the MIC of Silver nanoparticle

Two grades of silver nanoparticles; first, suspended in normal saline exposed to ultrasonication for 20 min. Two-fold dilutions were gained (80 and 160 µg/ml) used in present study. Two hundred of the bacterial suspensions of stock solution were inoculated into the corresponding test tubes containing different concentrations of Muller Hinton broth (MH)¹⁰.

Biofilm assay

Method described by¹¹ was followed to achieve biofilm formation: To study the ability of adherence *Streptococcus* isolates, were grown in Trypticase soya broth containing 1% glucose in 96-well polystyrene tissue culture plates and incubated at 37°C for 24 h under aerobic conditions. The planktonic cells after incubation were washed 3 times with deionized water, and fixed with 200 µl of absolute methanol for 20 min the adhering cells in well and left to dry overnight. Were stained the adhering cells with crystal violet for 15min. The plates were washed with D.W and air-dried overnight. The crystal violet dye bound to the adherent cells was dissolved with 200 µl of 96% ethanol per well, and the plates were read at 490 nm using a spectrophotometer. The experiment was performed in triplicates, and the

absorbance of wells containing sterile TSB was used as the negative control the result calculated as in table 1.

Detection Antibiofilm Activity of silver nanoparticles on pre-formed biofilm of *Streptococcus spp*

According to¹² Method followed for the inhibition of biofilm the isolates of *Streptococcus spp.*, were selected to be assayed according to inhibition activity of nanoparticles against planktonic cells of it on plate agar. Same protocol was added to each well produce a biofilm but (100 µl of Ag NPs). The plate was incubated for 24hr at 37 °C. Wells were washed and stained after incubation period all, then absorbance was determined at (490) nm in an ELISA reader. With crystal violet binding to the wells exposed only to the culture medium with bacteria controls were performed. The following equation was used to calculate biofilm inhibition percentage¹³.

$$\text{Biofilm inhibition (\%)} = \left(\frac{\text{Control OD} - \text{Test OD}}{\text{Control OD}} \right) \times 100$$

Experimental design

Twenty mice were divided into 4 groups, the mice in the first three groups (n=15 for each group) were anesthetized with an intraperitoneal injection of a mixture of xylazine (5 mg/kg) and ketamine (75 mg/kg), then the hair of the right flank was shaved (3×2 cm) using electrical shaver and the remaining hair was shaved using disposable hand shaver. The shaved area was cleaned by soap and sterile D.W., after drying wound in the skin was induced using sterile lancet in which 3 parallel line of superficial skin wound was made. The 4th group (n=5) considered as control negative group. The mice in the 1st group were considered as control positive group and the injured skin did not receive any treatment, while the injured skin of mice in the 2nd and 3rd group was contaminated by *Streptococcus pyogenes* using one drop from the bacterial suspension 1×10⁶ cfu/ml (14). The injured skin of mice in the 3rd group was treated locally with silver nanoparticles concentration (160 µg/ml) by swab after 2 hr post infection and treatment repeated every 12 hr.

Histopathological Study

All mice were euthanized after 72 hr post infection and samples (1×2 cm) of injured skin were taken and fixed immediately in 10% formalin solution for 48 hrs,

then the samples were processed routinely and sectioned by microtome (thickness 4-6 micron) and the slides stained by Hematoxyline and Eosin stain ¹⁵.

RESULTS AND DISCUSSION

Isolation and identification of *Streptococcus* spp: a species of Gram-positive bacteria. These bacteria are aero tolerant and an extracellular bacterium, made up of non-motile and non-sporing cocci. It is clinically important in human illness as expected with a streptococci, but usually pathogenic, part of the skin microbiota. Figure (1) shown group A streptococci when grown on blood agar produces zones of beta-hemolysis, a complete destruction of red blood cells. It is thus also called group A (beta-hemolytic) streptococcus ¹⁶. Antibioqram profile results for *Streptococcus* spp isolated from clinical samples the isolates showed multi-resistant to Ampicillin, Erythromycin, Chloamphinicol. These results agreed with All the isolates were sensitive to Ciprofloxacin and least resistance was observed towards Azithromycin. The result agree with (17) shows a high frequency of resistance to erythromycin particularly in countries where antibiotics are overused. Of all throat isolates, 95.0% were predominantly resistant to erythromycin, 70.0% to clindamycin and 24.0% to clarithroycin. To evaluate the in vitro antibacterial effects of SNPs against *S. viridans*, *S. pneumoniae*, *S. mutans* and *S. pyogenes* at (40,80 and 160) µg/ml concentrations of SNPs were added to Petri dishes before pouring plates with (MHA). Uniform agar plugs with a diameter between (9-13) mm Table (1) and Figure (1). The small particles have large surface area as compare with same amount of big particles. Silver nanoparticles in diameter 5-32 nm improve antibacterial effect of different antibiotics ¹⁸. Silver nanoparticles attach and make a way into Gram-negative bacteria ¹⁹.

Biofilm formation

The results of current study showed that all *Streptococcus* spp., were strong biofilm producer when detected them by microtiter plate method, and compare it with control (broth medium only without bacteria), see table (3). *S. pyogenes* has high ability to produce biofilm as compared with other species of *Streptococcus* in oral cavity ^{20,21}. This species in biofilm form has some proteins in comparison to planktonic cultures that increase exopolyphosphatase expression

and decrease lactate dehydrogenase or pyruvate kinase expression ²². Biofilm is clinically important because this phenomenon interfere with susceptibility of bacteria to antimicrobials²³.

Antibiofilm activity of silver nanoparticles:

The antibiofilm activity of Ag NPs was carried out by using microtiter plate method, the results showed that all concentration of Ag NPs were affected against bacterial biofilm of *Streptococcus* spp., but in different percentage depending on the species of bacteria and the concentration that was used. The concentration one gave highly effect against *S. pneumoniae* and *S. pyogenes* in percentage of inhibition (87%), but effect on *S. mutans* and *S. viridans* in percentage (65% and 51%) respectively. The second concentration show highly effect against *S. pyogenes* in percentage (92%), but other strain reached in percentage (79%) respectively, the last concentration show approximately the same results of second concentration on *Streptococcus* spp in the percentage of inhibition (92%, 82%, 79% and 77%), see table (2). This result agrees with present study Pérez-Díaz *et al.* (2015) showed that nanoparticle inhibited effective the growth of a planktonic *S. mutans* clinical isolate and killed established *S. mutans* biofilms, which suggests that could be used for treatment of dental caries. The anti-biofilm effect of AgNPs was observed less effective against G+ve bacteria than on that of G-ve bacteria, this remark happened because the structural difference in the cell wall of G+ve and G-ve bacteria. Other study revealed that AgNPs have antibiofilm ability against G+ve and G-ve bacteria when catheters coated with AgNPs were tested in vitro observed almost complete prevention of biofilm formation by *E. coli*, *S. aureus* and *C. albicans*. AgNPs show the anti-biofilm activity that is why; used in coating of catheter to reduce biofilm formation of several species of bacteria such as *Pseudomonas aeruginosa*. Similar applications of using of AgNPs were used in the dental applications. The histopathological changes in group 1 (positave control) showed incomplete regeneration of the epidermal layer in the incision site under cellular debries and neutophils aggregation, also the mild neutrophils infiltratin in the dermis and subcutaneous tissue. The 3rd group (treated group) showed complete regeneration of the epithelial cell of the epidermis with mild degeneration and increase cellulartiy of the connective tissue of the derims, other section showed mild hyperplasia of epithelial cells of the epidermis. *In vivo* study showed that, histological

changes in mice skin of the first group characterized by infiltration of inflammatory cells (mainly neutrophils) during 48 hr of injury, and this indicated the first phase of normal wound healing process, while the present of fibrin plug and infiltration of fibrous connective tissue in the dermis are a normal responses represents a part of the normal healing process of the skin in immune component

animal. *S. pyogenes* cause infection of skin and soft tissues with diverse clinical entities, so histopathological changes in the skin of mice in the second group showed severe damage in epidermis, dermis and subcutaneous tissue and this may be contributed to the exotoxine streptolysin O (SLO) which is produced by all strains of *S. pyogenes* and it is toxic to many cell types such as leukocytes, endothelial cells and fibroblasts.

Table 1. Classification of bacterial adherence by tissue culture plate method

OD values	Adherence	Biofilm formation
< OD _c	Non	Non
OD < OD ≤ 2*OD _c	Weakly	Weak
2*OD _c < OD ≤ 2*OD _c	Moderately	Moderate
4OD _c <OD _t	Strong	High

Figure 1. *S. pyogenes* on A) Brucella Agar B) Blood agar at 37°C for 24 hrs

CONCLUSION

In conclusion, treatment of skin infected with *S. pyogenes* using silver nanoparticles concentration (160 µg/ml) may limited the skin damage, localized the lesion to the incision site and enhance the healing process. Biofilm experiment revealed that all tested streptococcus species produced strong biofilm. On the other hand the results of antibiofilm study showed that silver nanoparticles gave highly effect against all *streptococcus* species biofilm in different concentration and with different percentages of inhibition.

Activity Measurement of Airborne Alpha and Beta Particles in Destroyed Radiochemical Laboratories, at Al-Tuwaitha-Iraq

Iman Tarik Al-Alawy¹, Osamah Abdulameer Mzher²

¹Department of Physics, College of Science, Mustansiriyah University, Baghdad, Iraq, ²Directorates of Radioactive Waste Treatments and Management, Ministry of Science and Technology, Baghdad, Iraq

ABSTRACT

Radiochemistry laboratories are one of the most destructive nuclear facilities in Iraq. It is contaminated by many isotopes that emit alpha or beta particles. The indoor air of radiochemistry laboratories was monitored to determine alpha and beta concentrations by used the alpha/beta intelligent Continuous Air Monitor (iCAM) device. Alpha airborne particulates come from radon/ thoron, whereas beta comes from background compensation. The concentration of R-222 and Rn-220 was found to be high in most samples measured inside the radiochemistry building, ranging from 12 to 52, and 0.08 to 0.41 respectively. The annual effective dose of exposure to radon and thoron ranged from 0.03 to 0.188. The concentration of radon and annual effective dose for workers are close to anxiety levels, especially in laboratories C1 and C2, since there is no guaranteed of good air exchange.

Keywords: Radon, Thoron, airborne, activity, annual effective dose, radiochemistry

INTRODUCTION

The primary risk associated with airborne radioactivity is through inhalation. The assessment of this risk is normally determined from measurements of activity concentrations of radionuclides in the various workplaces, combined with dosimetric calculations of the radiation dose arising from inhalation of tense atmospheres. These calculations are dependent upon the physical and chemical properties of each radionuclide, the nature of the suspended particles and on biological parameters. The liberation of radioactive particles into the atmosphere of the working areas is an accidental output of all activities involving radioactive materials. Even with a high degree of sophistication and safety in the working facilities. In accidents, the amounts of radioactive releases may vary depending on the types of operations and the amounts of radioactive materials involved³. The main source of internal dose comes from Inhalation of radioactive particles. Airborne radioactivity measurements are necessary to ensure that the control

measures continue to be effective. Airborne radioactive particulate in nuclear facilities and during shut down the nuclear facility, as well as the contaminated area, will have a strong impact on the public dose if they are freed into the environment and especially into the dose received by workers. Airborne particles that occur from natural radioactive materials are radon and its daughters. Radon is a noble gas, colorless, odorless and tasteless, and an alpha emitter. The main naturally occurring isotopes of radon are Rn-222 (the daughter of Ra-226 in U-238 chain), Rn-220 (the daughter of Ra-224 in Th-232 chain), and Rn-219 (the daughter of Ra-223 in U-235 chain)^{1,2}. Radon, thoron and their decaying products represent the largest contributors to the annual effectiveness from natural background sources of radiation. In a closed area where Rn-222 and Rn-220 can exist and where ventilation is limited, the levels of these radionuclides and their decaying products can accumulate to high levels. In order to provide adequate protection for workers, it is necessary to properly assess and control these contaminants. Therefore, the objective of this study is to measure the activity of airborne radioactive particles in the atmosphere of the radiochemistry building and to assess the risks to workers.

Studied Area

Air samples were collected from the Radio Chemistry laboratory (RCL). RCL is a chemical research building at Al-Tuwaita nuclear centre in Iraq (20km southeast of Baghdad, GPS Coordinates are North= 33°12'18.3", East= 44°30'58.9"). RCL was built in 1978 by SNIA TECHINT Italian Company. RCL was used to extract radionuclides and reprocess the irradiated fuel for the extracting of plutonium for research purposes; it was destroyed in the 1991 war. This building consists of laboratories, offices, health physics control rooms, air - conditioning room, underground storage tanks (SLA) for high level liquid radioactive wastes, as well as many types of equipment such as hot - cells, glove boxes, fume hoods and ventilation trap filters. Some areas the RCL building and all equipment are heavily contaminated. Some parts of the building are very destructive especially the ventilation system.

MATERIALS AND METHOD

Air Measuring

The Alpha/Beta intelligent Continuous Air Monitor (iCAM) was used to monitor the activity of airborne alpha and beta particles in the workplace. iCAM has a Passivated Implanted Planar Silicon (PIPS) detector to detect both alpha and beta activity, with 24% alpha efficiency up to 5.7MeV and beta detection for ³⁶Cl or ⁹⁰Sr. The activity measurement was calibrated using two standard point sources, Am-241 and Sr-90 instead of the filter card. The air is withdrawn to the device at an average rate of 15–60 l/min and the particulate matter is deposited on a removable filter card 25mm (1inch) of glass fibre filter (Canberra, 2013). Each sample of air was taken within one hour and the average air flow was (40l/min).

Determine Concentrations of Radionuclide in the Air Filters

In order to determine radionuclide concentrations in air filters, the high-performance digital signal processor was used for gamma-ray spectrometer (DSPEC LF ORTEC) at a low background. The gamma-ray spectrometry system consists of a high-purity germanium (HPGe) detector of P-type with a diameter of 65mm × 50mm length with passive shielding (ORTEC). The energy calibration of the gamma spectroscopy system was performed using a mixed standard source,

550ml Marinelli beaker, containing Am241, Cd-109, Co-57, Co-60, Sn-113, Hg-203, Y-88, and Cs-137. The efficiency calibration was performed using point sources (Am-241, Cs137, Eu-152 and Na-22) with a diameter 25mm (1inch) to maintain the continuous counting geometry of the air filter card.

Dose Calculation

To assess the risk of an effective dose of radon and thoron, the effective dose can be evaluated as follows (UNSCEAR, 2006; Chege et al., 2015; Yamada et al., 2006):

Where C is the concentration of radon or thoron in Bq.l^{-1} , K is the dose conversion factor taken ($9\text{nSv}(\text{Bq.h.m}^{-3})$ for radon and $40\text{nSv}(\text{Bq.h.m}^{-3})$ for thoron), F is the indoor equivalent factor of 0.4 for radon and 0.1 for thoron, t is the number of exposure hours per year.

RESULTS AND DISCUSSION

The concentration of airborne radioactive particles varies from place to place in the same laboratory because of the laboratory environment that contains floors and equipment (hot cells, crates and foam hoods) contaminated with different concentrations and isotopes. Airborne radioactive particles (iCAM) have been measured at different locations within the radiochemistry laboratory building. Figure 2 shows the locations of air samples in the block diagram of the radiochemistry laboratories. Table 1 and 2 summarizes the data obtained from iCAM as well as the effective dose calculated from one-hour exposure to radon and thoron. Table 3 shows the measurement of the filter in a gamma-ray spectrometry system. Figure 1 shows the radon and thoron concentrations in all samples. The highest concentration of radon and thoron was found in C2 laboratories with average values of 41.7 and 0.34 respectively, as well as in C1 laboratories with an average values 31.3 and 0.16 respectively. The high concentrations of radon and thoron can be explained by the presence of highly contaminated areas and equipment in C1 and C2 laboratories, which are larger than the rest of the sites. For the same reason, it was observed that the concentration of integrated alpha and beta airborne activities was higher in the same samples as shown in figure 2. The concentration of alpha integrated airborne activity within the radiochemistry building was 0.150–1.78, also the concentration of integrated beta airborne activity was 9.9 – 55.8. Air filters were measured in

gamma-ray spectroscopy system, where some samples contained Cs-137 isotope, especially in laboratories C1 and C2 near the equipment from which samples were taken. Table 3 shows that the presence of Cs-137 in the air filter is due to the fact that the polluted dust that covers the equipment can volatilize into the air. The effective dose was calculated for 1 hour from exposure to radon and thoron using equation 1. Table 1 shows that the annual effective dose is based on the number of work

hours per year. The workers stop the operation in the decommissioning of nuclear facilities at the rate of 1000 hours per year, i.e. 4 hours a day in this work. Figure 5 shows the annual effective dose inside radiochemistry laboratories. The annual effective dose of exposure to radon and thoron inside the radiochemistry laboratories ranged from 0.03 to 0.188 while the annual effective dose inside laboratories C1 and C2 was 0.11 and 0.15, respectively.

Figure 1. Radon and Thoron Activity Concentrations.

Figure 2. Alpha and Beta integrated airborne activity concentrations.

Figure 3. Annual effective dose of exposure to radon and thoron.

CONCLUSION

The results show that radon concentrations are high inside the radiochemistry laboratories building, especially in C1 and C2 laboratories, because they contain highly contaminated areas and equipment. Also due to the closure of the building and very bad ventilation system, this contributed to the increased concentration of radon. Airborne radioactive particulate was measured via *i*CAM inside radiochemistry laboratories where the concentration of radon activity (12-52) and thoron activity concentration (0.08-0.4) were found. The annual effective dose of workers was calculated at the decommissioning of the nuclear facilities, where they were found to range from 0.03 to 0.188

Antibacterial and Anti virulence Factors activity of ZnO nanoparticles Biosynthesized by *Lactococcus lactis* ssp. *Lactis*

Afraa Ali Kadhim¹, Jehan Abdul Sattar Salman¹, Adawiya Jumaa Haider¹

¹College of Science, Mustansiriyah University, Baghdad City, Iraq

ABSTRACT

In the present we are used a probiotic bacteria *Lactococcus lactis* ssp. *lactis* which is isolated from fish intestine to produce ZnO nanoparticles. Then we conformation the synthesized of nanoparticles using different techniques such as atomic force Microscopy (AFM) X-ray diffraction (XRD): technique, Fourier Transform Infrared Spectroscopy (FTIR), Scanning Electron Microscopic (SEM) and Energy-dispersive X-ray analysis (EDX) spectra. The results of characterization showed that the nanoparticles are hexagonal ZnO crystal structure, spherically shaped with a diameter of about (31-36)nm. The biosynthesized ZnO nanoparticles were tested against pathogenic bacteria isolated from skin infections included *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, *Klebsiella pneumonia*, and *Staphylococcus aureus*. The activity of ZnO nanoparticles as antimicrobial agent was measured via the investigation of the minimum inhibition concentration (MIC). The ZnO nanoparticles had antibacterial activity, the MIC ranged between (25 -100) mg/ml. The anti-virulence factors also determined against tested bacteria. Results showed that the ZnO nanoparticles had ability to inhibit virulence factors the ability of β -hemolysin, urease and pyocyanin production were decreased after treatment with biosynthesized ZnO nanoparticles, also the best effect has been shown in biofilm formation after 72 h for all isolates, with high inhibition 62.18% against *K.pneumoniae* (K6).

Keywords: Biosynthesis, ZnO nanoparticles, *Lactococcus*, Inhibitory effect, Skin infection causative bacteria, virulence factors.

INTRODUCTION

Bacteria of lactic acid are an important microorganism in industrial microbiology; they are used in fermentation process, and in nutrition benefits. It is able to produce antimicrobial substances that used as foods preservatives. LAB has ability to produce chemicals materials such as hydrogen peroxide, organic materials, and CO₂. In addition to produces low MW antibacterial substances, and bacteriocin which is used widely in biomedical applications¹. *Lactococcus lactis* is a Gram positive, and it is used widely in industry as a food preserver and in fermentation as well as other biological activity. This bacterial strain is interestingly

used in almost modern biotechnological applications². It is used by a lot of people in industry for production and fermented dairy products. This bacterial strain could be used in extensive research like metabolic pathway to increase its efficiency for dairy production³. Recently, many studies are demonstrated the important role of this bacteria in biomedical applications such as oral vaccine, production of foreign protein, and in genetic engineering and metabolic pathway⁴. *Lactococcus lactis* have come could used in economy in industry as well as food preservatives, and widely used in medical field⁵. The role of Zinc oxide nanoparticles in medical applications have been demonstrated by several studies. Recent study provided ZnO nanoparticles as non-toxic agent to mammalian and human cells, other study refer to used these nanoparticles as antibacterial agents, and noxious to microorganisms. In addition to a good biocompatibility to human cells⁶. There are many methods are used to synthesis of ZnO nanoparticles such as chemical, physical, and biological methods. The

current study described a simple and eco-friendly way for production of zinc oxide nanoparticles using Iraqi *L. lactis* ssp. *lactis* isolate and evaluation of its antibacterial activity and Anti virulence factors against pathogenic bacteria isolated from skin infections.

MATERIALS AND METHOD

Microorganisms

Lactococcus lactis ssp. *lactis*

Lactococcus lactis ssp. *lactis* was isolated from fish intestine. Bacterial isolate was identified using many techniques such as cultural methods, and microscopical as well as chemicals method according to the protocol describe by Liu *et al.* (2014)³ then identified through Vitek2 system.

Pathogenic Bacteria

Eight isolates of pathogenic bacteria isolated from skin infections included two isolates for each of *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, *Klebsiella pneumonia* and *Staphylococcus aureus* were selected as virulence factors producer isolates. These isolates were identified throughout many techniques such as cultural methods, and microscopical as well as chemicals method according to Forbes (2007)⁷ and Vitek2 system.

Detection of virulence factors:

Urease production

Urea agar is used to determine the ability of the pathogenic bacterial isolates to produce urease enzyme pathogenic. After incubation at 37° C for 24 h the change of color from yellow to pink indicated positive result⁸.

Hemolysin production

This test is used to detect production of hemolysin enzyme. Blood agar cultured with tested bacteria, then was incubated at 37°C for 24 h, a hemolysis around the colony indicated positive result⁹.

Pyocyanin production

Pseudomonas aeruginosa isolates were cultured in nutrient broth and incubated at 37°C for 24 h and observed for color change, by visually observing culture supernatants. So, the pyocyanin production was performed¹⁰.

Biofilm formation of bacteria

Bacterial isolates were screened for their ability to biofilm formation using Microtiter plate method according to the procedure described by Mathur *et al.* (2006)¹¹. 96 flat bottom well microtiter plate were filled with one hundred eighty µl of brain heart infusion broth with 4% sucrose then inoculated with 20µl of diluted bacterial suspensions. Control wells contained two hundred µl of media which is BHI broth with two % of sucrose, then the samples were sealed with parafilm then incubated at 37°C for 24 h, the rest of bacterial cells were discarded by three times washing with PBS (pH 7.2), drying at room temperature for 15 min, then 200 µl of crystal violet (0.1%) was added to the wells; for 20 min. After removing the crystal violet solution, wells were washed three times with PBS (pH 7.2) to remove unbound dye, leave the plates at room temperature to dry, then added 200µl of 95% ethanol. After that read the absorbance at 630 nm by ELISA reader¹². The O.D value for control well was deducted from all the test O.D value.

Biosynthesis of ZnO Nanoparticles

A pure culture of *L.lactis* ssp. *lactis* (9×10^8 CFU/ml) was used for biosynthesis of ZnO particles using sterile flask contains (MRS) broth culture media, then incubated at 30 °C for 24h. After this time the pH of the MRS culture media was adjusted to 6 by 1 M NaOH to stop transformation process. Zinc Chloride ($ZnCl_2$) was used as analytical reagent grade during for preparation of 0.25 Moller strength solution at room temperature. After that, the prepared solution was added to flask containing culture media and the mixture is heated using water bath up to 80°C for 5-10 min¹³. The presence of white precipitate at the bottom of flask is refer to the transformation process then, the flasks was discarded from water bath, incubated at 37 °C for 12 h¹⁴. The final product was filtered and DW was added to ZnO nanoparticles.

Antibacterial activity of synthesized ZnO nanoparticles

The antibacterial activity of the synthesized ZnO nanoparticles by *L.lactis* ssp. *lactis* was measured via determine the, minimum inhibitory/ concentration (MIC) using micro dilution technique in the culture broth media.

Effect of biosynthesized ZnO nanoparticles on bacterial virulence factors production.

Effect on urease production

The effect of ZnO nanoparticles biosynthesized by probiotics bacteria *L.lactis* ssp.*lactis* against urease production by bacterial isolates from skin infections were studied. Briefly, 0.1 ml of sub MIC ZnO nanoparticles was added on urea agar, then left at room temperature to dry after that the samples were inoculated with bacterial isolates and incubated for 24 h at 37 °C, the ability of bacterial strains to urease production was noted by formed of pink colonies whereas urease non-producers remained yellow in color ¹⁵.

Effect on hemolysin production

The effect of ZnO nanoparticles biosynthesized by probiotics bacteria *L.lactis* ssp.*lactis* against hemolysin production of bacterial isolates from skin infections were studied by using of blood agar method as described by (Bajelan, 2014) ¹⁵.

Effect on pyocyanin production by *Pseudomonas aeruginosa*

The effect of ZnO nanoparticles biosynthesized by probiotics bacteria *L.lactis* ssp.*lactis* against pyocyanin production of *P.aeruginosa* isolates from skin infections. Overnight culture of *P.aeruginosa* isolates were diluted 1:100 in nutrient broth and then treated with subMIC of biosynthesized ZnO nanoparticles (1:1) (ZnO nanoparticles: cultures), control included culture broth only. After growth for 16 h, culture supernatants were collected by centrifugation at 6000 rpm for 15 min, then transferred into cuvettes and photographed ¹⁶.

Effect on biofilm formation

The antibiofilm activity of biosynthesized ZnO nanoparticles against bacterial isolates from skin infections has been done using procedure used by Ali (2012). Each of bacterial suspensions in brain heart infusion broth with 2% sucrose (100 µl) was added to 96- well flat-bottomed microtiter plate together with (100 µl) subMIC of ZnO nanoparticles. The control group wells contained 180 µl of brain heart infusion broth with 2% sucrose and 20 µl of bacterial suspensions, The covered microtiter plate was sealed with Parafilm during incubation at 37°C for 24 h. The suspended bacterial strains were discarded by washing

the plates more than three times with PBS (pH 7.2). After that leave the samples to dry at room temperature, then two hundred µl of crystal violet stain (0.1%) was added to the samples for 25 min. The stained attached bacterial cells were rinsed using PBS (pH 7.2) three times, then left the samples to dry at room temperature then extracted twice with 200 µl of 95% ethanol and the absorbance of each well was measured at 630 nm using ELISA Reader. The inhibition of biofilm formation for each pathogenic bacteria was measured as equation used by (Qayyum and Khan, 2016)

$$\text{Inhibition of biofilm formation \%} = \frac{\text{Control} - \text{Sample}}{\text{Control}} \times 100$$

Antibiofilm assay measures the % reduction of bacterial biofilm related to the control wells, which were set at 100% to indicate the absence of ZnO nanoparticles.

RESULTS AND DISCUSSION

Characterization of synthesized ZnO Nanoparticles

Atomic Force Microscope (AFM), is one of important test which is used to view the nanomaterials both in surface and three Dimensional view, our results found that the average size of ZnO nanoparticles between (80-89) nm. The structure and lattice parameters of ZnO nanostructure were studied by X-ray diffraction. This technique gives an indication about the grain size, formation material type, strain and dislocation density. XRD pattern of ZnO nanoparticles biosynthesized by probiotic ↑ bacteria *L.lactis* ssp.*lactis* as show in figure (1A) Mostly the XRD peak were observed between (30°-40°). Fourier transformation-Infrared spectroscopic results give information about phase composition and the way in which oxygen is bound to metal ions. The following figures show the FTIR spectra for ZnO nanoparticles synthesized by probiotic bacteria *L.lactis* ssp.*lactis* (Figure 1B) shows that the absorption peak is around (400–800) cm⁻¹ broken spectra which is related to the zinc oxide powder nanoparticles prepared. The presence of a broad absorption peak in FTIR indicates the synthesis of ZnO nanoparticles of varying sizes. The energy-dispersive X-ray analysis (EDX) spectra of the ZnO nanoparticle powder synthesized by probiotic ↑ bacteria *L.lactis* ssp.*lactis* which confirm that all the films contain the elements (Zn, O) (Figure 2A, B). The components of the growth media which are used in bacterial culture, therefore; play an important role in the production process of metallic and/or oxide nanoparticles

which is done in the current study. Energy- yielding material – suitable carbohydrate (which responsible of the rH_2 control), the ionic status of the medium pH and overall oxidation-reduction potential (Eh) of the culture medium, all these factors cumulatively negotiate the synthesis of ZnO nanoparticles in the presence of *Lactobacillus* strain. Previous studies on biosynthesis of silver nanoparticles using fungal cell-free filtrate also showed the presence of proteins on the surface of individual nanoparticles which conferred their stability¹⁶.

Antibacterial activity of synthesized ZnO nanoparticles

The antibacterial activity of ZnO-NPS isolated from *L.lactis ssp.lactis* was determined by measuring the growth obtained for some bacteria causing skin infection. From those results, the MIC for each bacteria was determined. Results showed that the MIC of ZnO nanoparticles synthesized by *L.lactis ssp.lactis* isolate was effective against all the tested pathogenic bacteria, the MIC ranged between (25 -100) mg/ml. The best effect of ZnO nanoparticles was effective against *A.baumannii* and *S.aureus* found to be 25mg/ml but the lowest effect has been recorded on *P.aeruginosa* (50 -100mg/ml).

Effect of biosynthesized ZnO nanoparticles on bacterial virulence factors

The present study has made an attempt to find out the effect of bioynthesized ZnO nanoparticles by probiotic bacteria *L.lactis ssp.lactis* on urease production by pathogenic bacteria causing skin infection. Results showed that the biosynthesized ZnO nanoparticles had effect on urease production against isolates of *S.aureus*

,*P.aeruginosa* and *A.baumannii* while do not effect against the isolates *K.pneumoniae* (K6) and *P.aeruginosa* (p9) (Table 1). One of the most enzyme inhibitors are heavy metal ions which controls rate of urea hydrolysis. These chemical materials could be damage of enzyme structure results in loss of their function. The combination between copper (II) and zinc (II) play an important role as inhibitors of jack bean urease (Wang *et al.*, 2017). The results of present study has been demonstrated that the biosynthesized ZnO nanoparticles using *L.lactis ssp.lactis* showed antibacterial activity against all bacterial strains which produce hemolysin enzyme except two bacterial isolates of *K.pneumoniae* and *P.aeruginosa* (p6) (Table 1). This study is the first to examine the inhibitory effects of ZnO nanoparticles biosynthesized by *L. Lactis ssp.lactis* against pyocyanin production of (*P.aeruginosa* 6, *P.aeruginosa* 9) isolated from skin infection. pyocyanin inhibition by the plain Solid lipid nanoparticles (SLNs) was not due to killing of the bacteria, an effect that is often associated with nanoparticles.

Effect on biofilm formation

Zinc Oxide nanoparticles synthesized by probiotic bacteria *L. lactis ssp. lactis* were studied to inhibit biofilm formation by bacterial isolates from skin infection. Results showed that biosynthesized ZnO nanoparticles recorded maximum biofilm inhibition against gram negative bacteria after incubated for 72 h reached to (59.46, 62.18)% against (*A.baumannii* A1 and *A. baumannii* A6) respectively and (51.79, 41.71) % against gram positive bacteria (*S. aureus*3, *S. aureus* 9) respectively (Table 2).

<i>S.aureus</i> (S9)	13.16	24.79	41.71

CONCLUSION

In conclusion, in this study a save and non-expensive biological, and ecofriendly method was used for production of zinc oxide nanoparticles by using *Lactococcus lactis* ssp. *lactis*. Biosynthesized ZnO nanoparticles had antibacterial and anti-virulence factors against skin infections causative bacteria.

Calculation of Optimum time Exposure of Ultraviolet Radiation for Different Seasons at Baghdad City

Ahmed Ali Hameed¹, Firas Sabeeh Basheer²

¹Directorate Space & Communications, Ministry of Science & Technology, Baghdad, Iraq,

²Mustansiriyah University, College of science, Department of Atmospheric Sciences, Baghdad, Iraq

ABSTRACT

Aims this study is focused to calculate exposure times which cause to skin damage (one minimum erythema dose) and the optimal time for exposure to sunlight that is needed to receive adequate UV for vitamin D production, without inducing erythema at Baghdad city. In this study calculated the annual and seasonal optimal time for exposure of Ultraviolet radiation and Maximum exposure time for causes skin burns in Baghdad depending on the Fitzberk classification assuming normal ozone conditions throughout the year by using Ultraviolet radiation data received from French site for Solar radiation data(SODA) in the period 1/1/2005 to 31/12/2017. The greatest time for exposure to solar radiation to create vitamin D without skin burns was 16 min in winter, 6 min in spring, 5 min in summer and 9 min in autumn, While the greatest exposure time to solar radiation that causes burns is 80 min in winter, 32 min in spring, 22 min in summer, and 46min in autumn. It was find the number of days per UV Index level was found in one year (2015) were low level 8 days, Medium level 74 days, High level 68 days, Very High level 93 days.

Keywords: Ultraviolet Radiation, Ozone, pigmentary changes, Skin Cancer, Skin Burns, Vitamin D, Solar radiation.

INTRODUCTION

The Ultraviolet radiation waveband is traditionally included in the nonionizing radiation although the UV band has enough energy to break the bond of macromolecules^{1,2}. It is divided into three bands although the exact wavelength at which the divisions are made differ in accordance with different disciplines. The Second International Congress on Light in Copenhagen in 1932 defined three regions: UVA 400-315nm, UVB 315-280nm, UVC 280-100nm. However, in photobiology the boundaries for these regions are slightly different and associated with the biological effects: UVA 400-320nm, UVB 320-290nm, and UVC 290-200nm³. Solar Ultraviolet radiation is responsible of a variety of different effects on biological systems

prolonged human exposure to solar UV radiation may result in acute and chronic health effects on skin, eyes and immune system. Sunburn and tanning are the best known acute response to excessive UV radiation exposure¹; chronic and lifetime sun exposure induce degenerative changes in cells, fibrous tissue and blood vessels and lead to premature skin ageing. Ultraviolet radiation likely to cause inflammatory reactions of the eye, such as keratitis and It can cause cutaneous malignant melanoma, non-melanoma skin cancers are squamous cell carcinomas are basal cell carcinomas in fair-skinned populations the most common⁴. The effect of excessive Ultraviolet radiation exposure is erythema, the familiar skin reddening termed sunburn, estimated at 24 h after exposure, It is considered a large dose. The erythema response depends not only on the UV dose but also on skin type. Sensitivity to sunburn is usually determined by the minimal erythema dose (MED) is the minimum dose that will make a just perceptible erythema 8-24 hours after irradiation⁵. While UV in solar radiation is needed to synthesize previtamin D in the epidermis. UV radiation very important in maintaining our health, especially in the protection of diseases caused by

deficiencies in serum vitamin D ^{6,7}. Therefore, it is important to know the convenient UV exposure time to obtain the amount of vitamin D ^{8,10}. The ultraviolet Index adopted worldwide as a standard scale to UV radiation intensity at the Earth's surface ¹¹ and serves to inform the public about the intensity of the Sun's UV radiation and the adequate sun protection actions recommended to avoid excessive exposure to UV radiation ^{12,13}. The erythemal action spectrum is a weighting function which simulates the damage process occurring in the epidermis. It is used to determine the UV index ¹⁴⁻¹⁶. The UV index is calculated dividing a summer erythemal dose rates at mid-day under cloud free conditions, which becomes a scale of 1 to 11 (or more) indicating the potential sun burning of the solar radiation[17].

becomes a scale of 1 to 11 (or more) indicating the potential sun burning of the solar radiation[17].

$$UVI = \frac{1}{25mWm^{-2}} \int_{280nm}^{400nm} I(\lambda)E_{\lambda} d\lambda \quad \dots\dots\dots 1$$

I(λ) is the solar irradiance at the surface (mW/m²/nm) and E_λ is the erythemal action spectrum:

$$\begin{aligned} E_{\lambda} &= 1 && \text{for } \lambda \leq 298 \text{ nm} \\ E_{\lambda} &= 10^{0.094(298-\lambda/nm)} && \text{for } 298 \text{ nm} < \lambda \leq 328 \text{ nm} \\ E_{\lambda} &= 10^{0.015(139-\lambda/nm)} && \text{for } 328 \text{ nm} < \lambda \leq 400 \text{ nm} \\ E_{\lambda} &= 0 && \text{for } 400 \text{ nm} < \lambda \end{aligned} \quad \dots\dots\dots 2$$

The time needed (t_E in minutes) to induce skin damage was calculated as follows:[17]

$$t_E = \frac{4000}{60} \frac{MEDF.SP.F}{UVI} \dots\dots\dots 3$$

Where: 4000/60 accounts for the conversions from UV_{Ery} to UVI and seconds to minutes; UVI is the UV Index; MEDF (Minimum Erythemal Dose Factor) is a factor to take into account the differences in skin color and SPF is the sun protection according to the Fitzpatrick skin classification (Table 1) . The optimal time for exposure to sunlight that is needed to receive adequate UV for vitamin D production, but without inducing erythema, depends strongly on season and latitude. The exposure time for sufficient vitamin D was calculated taking into account the area of exposed skin expressed as percentage of total body area (A)[19]:

$$t_D = 8 \cdot \frac{MEDF.SP.F}{UVI.R.A} \quad \dots\dots\dots 4$$

Where: R is the ratio of UV_{VitD} /UV_{Ery} ; A is the uncovered body area expressed in %

RESULTS AND DISCUSSION

For determining UV radiation exposure time for vitamin D Synthesis in the Skin without risk to health. Assuming body area exposed and no sunscreens (face and the backs of both hands) about A=0.27. The number of days of the levels of the ultraviolet radiation index was determined and shown in Table (2).

The number of days for Extreme high and very high levels for UVI constitute about 59% Where the level of Extreme(34%) and very high(25%) for

(Mar, Apr, May, Jun, Jul, Aug and Sep). Time needed for effective exposure for vitamin D synthesis has been calculated in Figure (1a) shows optimal times of exposure for skin types (II, III, IV), and these skin types have been selected because they are the most available in Baghdad. The time needed to induce skin damage for skin type II needs 14 minutes in summer While the skin type IV need of about 35 minutes. In winter it takes more time for damage, Where the skin type 11 needs 35 minutes and the type of skin in need of 88 minutes as shown in Fig (1a). In the summer skin type II (represents

light skin) needs 4 minutes to generate vitamin D While the skin type IV (represents dark skin) need of about 10 minutes to be generated vitamin D due to high levels of ultraviolet radiation as shown in Fig (1b). In winter, it takes more time for vitamin D to be produced Where the skin type II needs 11 minutes and the skin type IV need of 22 minutes to generate vitamin D.

Table 1. Skin type classifications according to the Fitzpatrick scale [18].

Skin type	Description	SED
I	Celtic (always burn)	2 - 3
II	Pale (burns easily)	2.5 - 3
III	Caucasian (may burn)	3 - 5
IV	Mediterranean (burns rarely)	4.5 - 6
V	S. American (rarely burns)	6 - 20
VI	Negroid (rarely burns)	6 - 20

Table 2. Number of days for levels of UVI

UV Index	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Low ^{1,2}	2	-	-	-	-	-	-	-	-	1	4	1
Medium ^{3,4,5}	18	6	-	1	-	-	-	-	1	7	12	29
High ^{6,7}	11	17	6	-	3	-	-	-	1	16	14	-
Very High ^{8,9,10}	-	5	25	11	6	2		9	28	7	-	-
Extreme ¹¹⁺	-	-	6	18	22	28	31	22	-		-	-

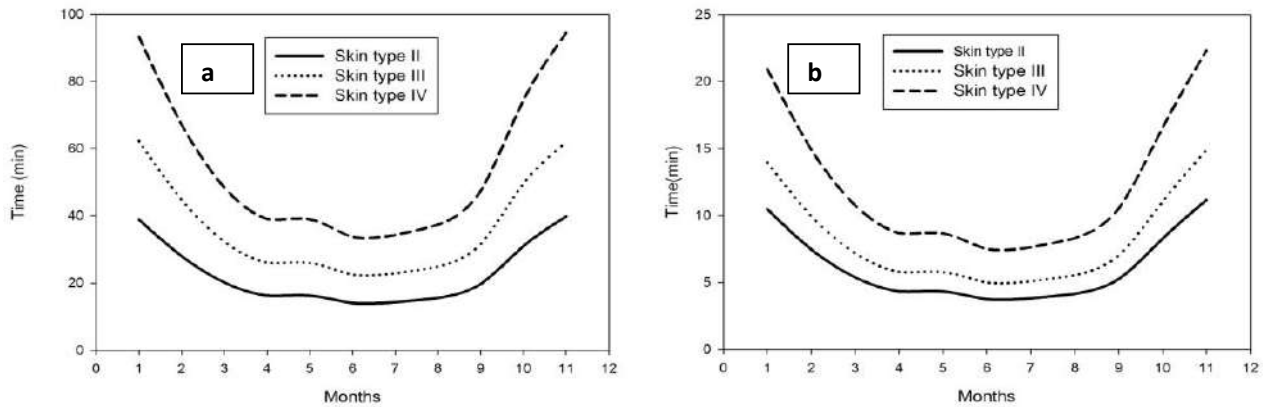

Figure 1. (a) the time taken to receive an erythema for different skin types.(b) shows the Optimum time for ultraviolet exposure to generate vitamin D for different skin type.

CONCLUSION

The number of days of levels of ultraviolet (UV) index was 127 days and about 34% from the days of the year. Therefore, UV protection should be applied regardless of the color of skin, since this high ratio is distributed over five months, from March to September. This requires the use of means and methods of protection from solar radiation during these months, especially during the hours of 11 am and 14 pm in the summer, sufficient vitamin D can be produced from a few minutes of sun exposure to the face and hands. But the exposure

time should be limited to less than approximately 10 minutes to avoid sunburn. The area of skin exposed to solar radiation (A) must be more than 27% as most people expose the face and hands only, especially for women for social reasons, which leads to a decrease in the generation of vitamin D and this vitamin is very important to the absorption of calcium in the body. It is preferable to expose a larger area, such as the shoulders and some parts of the arms or legs, rather than just the face and hands.

Cell–Cell Communication (Quorum Sensing) in Gram-Negative and Gram-Positive Bacteria: A Review

Ghaidaa J. Mohammed¹, Firas S. Abd Al-Mayahi¹, Habeeb W. Kadhum¹, Ali B. Muhsen¹

¹Department of Biology, College of Science, University of Al-Qadisiyah, Al-Diwaniyah, Iraq

ABSTRACT

Quorum sensing indicates to the capability of a bacterium to sense information from other members in the population when they compass a critical concentration and connect with them. The mode used for this intercellular connection is depend on small, self-generated signal molecules called as autoinducers. Quorum sensing is reflection to endure pathogenic bacteria mechanism to reduce host immune responses by retardant the forming of tissue-destroying virulence factors until adequate bacteria have accumulated and are destined to crush host defense mechanisms and set infection. Among these pathogenic bacteria, Gram negative bacteria such as *Pseudomonas aeruginosa*, *Vibrio* spp., and *Escherichia coli* as well as Gram positive bacteria; *S. aureus* and *Clostridium perfringens* are probably the best understood in terms of the virulence factors regulated by the Quorum sensing that plays a role in the pathogenicity. In conclusion bacteria do not live separated, but rather they communicate using varied chemical languages.

Keywords: Quorum sensing, Gram positive bacteria, Gram negative bacteria, Virulence factors.

INTRODUCTION

Bacterial cell-cell communication systems also called quorum sensing (QS) is a mechanism that regulates gene expression according to cellular density that are based on the release of signal molecules known as autoinducers(AIs), so called because they can act on the same cell that releases them, and are able to trigger gene expression throughout the population, causing a global response¹. The concentration of the autoinducer is decisive in starting the QS, the higher the population density (greater number of individuals), the higher the autoinducer's concentration in the external environment that stimulating the changes in their cell numbers and collectively alter gene expression². QS controls genes that direct activities that are beneficial when performed by groups of bacteria acting in synchrony. Different forms of QS have been discovered in various bacterial genera. The difference between them lies in the type

of autoinducer molecule used and the global response triggered in the bacteria.

Quorum sensing History

Bacterial activity involving quorum sensing was first observed in the mid-1960s by the microbiologist Alexander Tomasz in his studies of the ability *Streptococcus pneumoniae* to take up free DNA from its environment. In 1970, the first QS in bacteria *Vibrio fischeri* were observed. The researchers found that the Gram-negative bacterium that lives in a free-living in the seas and oceans. The low number does not produce luciferase but when the luminous organs of fish or marine bacteria holes cephalopods (*Euprymna scolopes*) into the holes where the organs of reproduction is and then increase the number of bacteria, QS active and causes the activation of luciferase gene and luminance phenomenon occurs³⁻⁵.

Quorum sensing in Gram positive bacteria and gram negative bacteria

Gram-positive and Gram-negative bacteria use different types of QS systems. AI molecules produced by Gram-negative bacteria diffuse passively into and out of cells, whereas AIs synthesized by Gram-positive bacteria

E-mail: ghaidaa.mohammed@qu.edu.iq.

are actively transported ⁶. Gram-positive bacteria use peptides, called autoinducing peptides (AIPs), as signaling molecules. Once produced in the cell, AIPs are processed and secreted. When the extracellular concentration of the AIP is high, which occurs at HCD, it binds to a cognate membrane-bound two-component histidine kinase receptor. Usually, binding activates the receptor's kinase activity, it autophosphorylates, and passes phosphate to a cognate cytoplasmic response regulator. The phosphorylated response regulator activates transcription of the genes in the QS regulon. In some cases of Gram-positive bacterial QS, AIPs are transported back into the cell cytoplasm where they interact with transcription factors to modulate the transcription factor's activity and, in turn, modulate gene expression changes ³.

QS Control of virulence factors in Gram positive bacteria

In Gram-positive bacteria such as gram-negative bacteria, QS has role triggering of infection, antibiotic production, biofilm, and so is the role and structure of QS molecules in Gram-positive bacteria differ from gram-negative bacteria [6]. In Gram positive bacteria more molecules of peptide Octa or Hepta who called pheromone involved in transmitting messages. These molecules that are hydrophobic low molecular weight ($5 \times 10^{-11}m$) and at least two molecules per cell of these peptides with biological activity there. Receptor agonist study suggests that these molecules messaging system similar to cytokine signaling in eukaryotic ^{6,7}. QS Controls virulence factor production in various Gram-positive human pathogens including *S. aureus*, *Listeria monocytogenes*, *Bacillus cereus*, *Enterococcus faecalis*, and *Clostridium perfringens* ^{3,8,9}.

Staphylococcus aureus Quorum Sensing

Staphylococcus aureus is a gram-positive, round-shaped bacterium that is a member of the Firmicutes, and it is found among the normal human skin flora. If the epithelial barrier is compromised, *S. aureus* can cause minor skin infections. These infections can lead to pneumonia, bacteremia, and sepsis ¹⁰. Its ability to cause disease depends on expression of an array of adhesion molecules, toxins, and compounds that affect the immune system. QS Regulates expression of genes encoding these virulence factors ³. The quorum sensing system in *S. aureus* occurs through the accessory gene

regulator (*agr*) ¹¹. It is a complex molecular mechanism and though the pathway is elucidated, the response of QS itself is not well understood. *Agr* functions to increase the expression of certain virulence factors secreted by *S. aureus* and decrease certain cell surface proteins ¹¹. There is evidence that *agr* contributes to *S. aureus* pathogenicity in several infection types, including subcutaneous abscesses, endocarditis, and arthritis. On a molecular level, the *agr* locus contains promoters P2 and P3 that encodes transcripts for RNAII and RNAIII, respectively ¹¹. The P2 and P3 operons code for different proteins that have individual roles in *agr*-sensing. P2 operon encodes the RNAII transcript that produces gene products *agrB*, *agr D*, *agrC*, and *agrA* ¹¹. These four products comprise the actual signaling system. The P3 operon encodes the RNAIII transcript that produces only one gene product—a toxin called delta-hemolysin—but that increases transcription of several virulence factors. However, it has been noted that the *agr* system is not necessary for the expression of virulence factors like toxins. *AgrD* and *AgrB* work together to produce an auto-inducing peptide (AIP). *AgrD* encodes for pro-AIP and transmembrane protein *AgrB* processes the pro-AIP to AIP, transporting it to the external cellular space. AIP will continue to accumulate in the external environment beyond the cell membrane, eventually binding to *AgrC*, a kinase embedded within the membrane. The *AgrC* kinase phosphorylates regulator *AgrA*, which then is responsible for the autoinduction of the *agr* locus by binding to the P2 and P3 promoters and initiating the cycle again. The *agr*-sensing system is a circuit that is auto-activating ^{11,12}.

Clostridium perfringens Quorum Sensing

Clostridium perfringens is a Gram-positive, spore-forming, anaerobic bacterium that is widely distributed in soil, feces, and foods as well as the normal intestinal microbiota of both humans and animals ¹³. *C. perfringens* produces various exotoxins and enzymes that cause food poisoning and gas gangrene. The genes involved in virulence are regulated by the *agr*-like quorum sensing (QS) system, which consists of a QS signal synthesis system and a *VirSR* two-component regulatory system (*VirSR* TCS) which is a global regulatory system composed of signal sensor kinase (*VirS*) and response regulator (*VirR*) ¹⁴. Both similarities and differences exist between the *Agr*-like QS system of *C. perfringens* and the well-characterized, paradigm *Agr* system of *S. aureus* ^{12,14,15}. For example,

the *C. perfringens* Agr-like QS system includes an operon encoding *AgrD* and *AgrB*, where *AgrD* is the precursor peptide for the autoinducing peptide (AIP) that mediates Agr QS signaling and *AgrB* is the integral membrane endopeptidase that is involved in processing *AgrD* to the active AIP. However, *C. perfringens* lacks the *AgrA/AgrC* two-component system that responds to the AIP in *S. aureus*¹⁵⁻¹⁷.

QS Control of virulence factors in Gram negative bacteria

The vast majority of gram-negative quorum-sensing systems that have been studied thus far utilize *N*-acyl homoserine lactones (AHL) as signaling molecules. When in high enough concentration, these molecules can bind to and activate a transcriptional activator, or R protein, which in turn induces expression of target genes²¹.

LuxI/LuxR Quorum Sensing

Gram-negative bacterial systems employ the autoinducer Homoserine Lactones synthesized by a *LuxI* homologue and a *LuxR* homologue. The *LuxR* homologue encodes a transcriptional activator protein which detects the cognate HSL inducing the appropriate phenotype. It has been established that such cell dependent phenomenon is exhibited by over 30 species of Gram-negative bacteria. Though *LuxI/LuxR* systems are used by a variety of bacteria for quorum sensing, there exists a layer of complexity in the *LuxI/LuxR* systems³. *LuxI/LuxR* homologs have been identified in more than 100 Gram-negative bacterial species²¹. AHLs produced by different bacteria possess different length side chains and side-chain decorations. Acyl chains ranging from C4 to C18 have been identified with modifications such as carbonyl and hydroxy moieties at the C3 position^{22,23}.

Vibrio cholerae Quorum sensing

Vibrio cholerae, the causative agent of the diarrheal disease cholera, exists primarily in marine environments, and infection of humans usually occurs through ingestion of contaminated water²⁶. After traversing the stomach, *V. cholerae* expresses an array of virulence factors that enable colonization of the host intestinal epithelium. The major colonization factor, toxin coregulated pilus, promotes adherence to the intestinal lining, and the subsequent secretion of cholera toxin leads to severe diarrhea and release of the bacterium into

the environment²⁷. Critical to its infection cycle is *V. cholerae*'s ability to alternate between expression of virulence traits essential for survival inside the host and expression of traits such as biofilm formation that are necessary for survival in its ex vivo marine environment²⁸. Quorum sensing in *V. cholerae* controls the expression of virulence factors including cholera toxin and biofilm formation. *V. cholerae* is regulated by two parallel QS pathways, the CAI-1 pathway, specific to *V. cholerae*, and the AI-2 pathway which is relayed between multiple species of bacteria^{29,30}. The use of two external signaling molecules allows the bacteria to accurately monitor the composition and developmental stages of its surrounding community and vary gene expression accordingly.

Pseudomonas aeruginosa Quorum Sensing

Pseudomonas aeruginosa is a Gram-negative organism that is commonly found in soil and water. Although *P. aeruginosa* can survive under multiple harsh conditions, it is an opportunistic pathogen and is only able to infect hosts with defective immune system function, such as that observed in individuals with cystic fibrosis, burns, and HIV. To facilitate the establishment of infection, *P. aeruginosa* produces an impressive array of both cell-associated and extracellular virulence factors. Several of these virulence factors have been demonstrated to be regulated by (QS)³. A second QS system in *P. aeruginosa* consists of the *RhlI* and *RhlR* proteins. The *RhlI* synthase produces the AHL *N*-butyryl-L-homoserine lactone (C₄-HSL), and *RhlR* is the transcriptional regulator³.

Escherichia coli Quorum sensing

Escherichia coli also known as *E. coli* is a Gram-negative, facultative anaerobic, rod-shaped, coliform bacterium of the genus *Escherichia* that is commonly found in the environment, foods, and intestines of people and animals. *E. coli* are a large and diverse group of bacteria. Although most strains of *E. coli* are harmless, others can make you sick. Some kinds of *E. coli* can cause diarrhea, while others cause urinary tract infections, respiratory illness and pneumonia, and other illnesses. In the bacterium *Escherichia coli*, cell division may be partially regulated by AI-2-mediated quorum sensing. This species uses AI-2, which is produced and processed by the *lsr* operon. Part of it encodes an ABC transporter, which imports AI-2 into the cells during the early stationary (latent) phase of growth. AI-2 is

then phosphorylated by the *LsrK* kinase, and the newly produced phospho-AI-2 can be either internalized or used to suppress *LsrR*, a repressor of the *lsr* operon (thereby activating the operon). Transcription of the *lsr* operon is also thought to be inhibited by dihydroxyacetone phosphate (DHAP) through its competitive binding to *LsrR*. Glyceraldehyde 3-phosphate has also been shown to inhibit the *lsr* operon through cAMP-CAPK-mediated inhibition. This explains why, when grown with glucose, *E. coli* will lose the ability to internalize AI-2 (because of catabolite repression). When grown normally, AI-2 presence is transient.

CONCLUSION

The ability to assortment behavior in a cell-density-dependent style has several apparent benefits. In the state of pathogenic microorganisms, the regulation of virulence determinants during the infection process is thought to play an important role in pathogenicity. Evading host defenses is a major aim of pathogens, and Quorum sensing provides these bacteria the appropriate time to express the immune evading machinery. Using Quorum sensing, bacteria can collect a high cell density before virulence determinants are expressed, and in doing so, the bacteria are capable to make a planned attack and produce vast virulence factors to smash the host defenses. In the future, it will be remarkable to see whether additional human pathogens utilize Quorum sensing as portion of their pathogenic lifestyle and, if so, whether production of the signal molecules, AHL or otherwise, can be utilized to control infections.

Closed Loop System Synchronization of Quantum Dot Semiconductor Lasers with Optical Feedback

Basim Abdullattif Ghalib¹, Noor D Mohammed Taqi¹, Riyad N Ali¹

¹Laser Physics Department, Science College for Women, Babylon University, Hilla, Iraq

ABSTRACT

In this work a systematic study on Close - Loop System occurring in the rout to chaos observing in integrated of quantum dot semiconductor lasers with optical feedback .The time delay of the feedback has been chosen in order to provide suitable condition for intermittent dynamics. The effect of long and short external cavity of QDSL on synchronization in a closed –loop system are studied under an enhancement factor of ($\alpha = 3.5$) value by solving the set of 6-rate equation.

Keywords: Close-loop system, Quantum dot, semiconductor laser, optical feedback, line width enhancement factor.

INTRODUCTION

Control of Chaotic synchronization in different dynamical systems has more interest attracted with potential applications on private communication ¹. Synchronization phenomena in Quantum Dot (QD) semiconductor laser chaotic has a good Subject of interesting by sensitive with optical feedback, and discrete energy for materials and low linewidth enhancement factor. This has motivated many studies, with expected benefits including elimination of lasers ². Transmitter and Receiver systems have optical feedback loops and this configuration is called a closed-loop system. on other word, two time delay on receiver laser. When another Transmitter and Receiver systems, receiver system does not have a feedback loop, transmitter laser have time delay coupling with receiver laser ,this asymmetric system is called an open-loop system. Two above system must have output a chaotic signal ³. Very small semiconductor particles with (2-10 nm) are called Quantum Dots (QDs), by confined electron and holes in all spatial dimensions ⁴. The idea of chaos synchronization between two nonlinear systems was proposed by (Pecora and Carroll), They used a Lorenz

system with three variables for the demonstration ⁵. Low threshold current density, high characteristic temperature and small linewidth enhancement factor (LEF) is the characteristic of quantum dot semiconductor laser (QDSL)⁶. Therefore, the synchronization scheme is called complete chaos synchronization and it is distinguished from generalized synchronization of chaotic oscillations ⁷. quantum dot (QD) nano structures used on telecommunication applications due to the carrier confinement in three dimensions ^{9,8}. Optical feedback is the carrier dynamics to be affects the output of QD laser ¹⁰ also optical injection ¹¹. When used with optoelectronic feedback circuits, QDSLs are more sensitive to time delay changes than other SLs ¹². Two different origins of synchronization in nonlinear delay differential systems, complete and generalized chaos synchronization. When receiver outputs a synchronized wave form immediately after it receives the transmitter signal, therefore there is a time lag between the two outputs, this system called generalized synchronization. Another type of chaos synchronization accrue when time lag is less than the signal transmission between the transmitter and receiver systems ¹³.

Rate equation of Quantum Dot Laser

In QD semiconductor devices, the carriers are first injected into a wetting layer before being captured into a dot at a capture rate that depends strongly on the dot population. The rate equations

E-mail: Basim2882004@yahoo.com.

method, includes a set of at least three coupled equations; carrier density (N), photon density (E) and the other for the occupation probability (ρ). They are given in equations (1-3) shown below^{14,15}. Thus, rate equations that commonly describe carrier dynamics of QD materials read¹⁶

$$\frac{dE_{(T,R)}}{dt} = E_{(T,R)} \left(-\frac{1}{2t_s} + \frac{g_o v}{2} (2\rho_{(T,R)} - 1) \right) + \frac{\gamma}{2} E_{(T,R)} (t - \tau_{(T,R)}) + R_{sp} \quad (1)$$

$$\frac{d\rho_{(T,R)}}{dt} = -t_n \rho_{(T,R)} - g_o (2\rho_{(T,R)} - 1) |E_{(T,R)}|^2 + CN_{(T,R)}^2 (1 - \rho_{(T,R)}) \quad (2)$$

$$\frac{dN_{(T,R)}}{dt} = J_{(T,R)} - \frac{N_{(T,R)}}{t_d} - 2n_d CN_{(T,R)}^2 (1 - \rho_{(T,R)}) \quad (3)$$

where $N_{(T,R)}$ is the carrier density in the well for transmitter and receiver lasers, $E_{(T,R)}$ is the complex amplitude of the electric field for transmitter and receiver lasers, $\rho_{(T,R)}$ is the occupation probability in a dot for transmitter and receiver lasers, t_s is the photon lifetime; t_n and t_d are the carrier lifetime in the well and the dot, respectively; N_d is the two-dimensional density of dots; and $J_{(T,R)}$ is the pump. γ and τ describe the feedback level and delay time, where $\tau = 2L/c$ is the round trip time of light within the external cavity (L) and c velocity of light [15]. C is Auger carrier capture rate¹⁶. In this work we analyze theoretically, closed-loop system consist of two type of synchronization as complete and general for transmitter and receiver quantum dot semiconductor lasers with optical feedback. Same two laser on linewidth enhancement factor (equal to 4), current, time delay, and different on time delay between two lasers τ_c .

RESULTS AND DISCUSSION

the account both photon density, occupation probability, carrier number and attractor using the fourth-order Runge-Kutta numerical method and Matlab. Photon density of (QDSL) as a function of time when $\alpha = 3.5$, ($\tau = 14.7 ns$), photon density reach to ($2.8 \times 10^{20} m^{-2}$) and reduced to a chaotic behavior at steady state. Not periodic behavior for transmitter and receiver of (QDSL) and attractor between photon density of receiver laser and transmitter laser is clearly not periodic with general synchronization time series for photon density of transmitter and receiver (QDSL) laser

when $\alpha = 3.5$, ($\tau = 15 ns$), double quasiperiodic and chaotic quasiperiodic respectively. Attractor chaotic behavior double quasiperiodic and chaotic quasiperiodic respectively when $\alpha = 3.5$, ($\tau = 14.7 ns$), ($\tau = 15 ns$) respectively. For table (2) when time delay ($\tau_{T,R} = 19.5, 20, 26 ps$), irregular quasi periodic relation between photon density of quantum dot semiconductor lasers (transmitter and receiver), and quasi general synchronization. A different on time delay equal to (0.5 ps), after (6 ps) photon density is stable with periodic behavior, and good general synchronization. For long external cavity length, when time delay ($\tau_{T,R} = 300, 310, 320, 350 ps$) for transmitter and receiver QD lasers. a chaotic behavior on all values time delay with no synchronization except when ($\tau_{T,R} = 350 ps$), we obtained good complete synchronization. that is good results for application communication

CONCLUSION

The effect of time delay on Quantum Dot Semiconductor lasers with Optical Feedback dynamics are studied in this search with one value of Linewidth enhancement factor (3.5), critical behaviour of chaotic when short external cavity and crisis general synchronization. long external cavity determine critical behaviour of chaotic and good complete synchronization at ($\tau_{T,R} = 350 ps$).

Table 1. Parameters used in the calculation for QDSEL.

Definition	Symbol	Value	Units
Photon life time	ts	3.4	ps
Carrier life time well	t_n	1	ns
Electronic charge	q	1.6×10^{-19}	C
Carrier life time dot	t_d	1	ns
Linewidth enhancement factor	α	2 , 4	-
Velocity of light	c	3×10^8	m/sec
Spontaneous recombination factor		3×10^{-5}	-
Group velocity		7.14×10^9	cm/s
Confinement factor	Γ	0.03	-
Photon decay rate		5×10^{11}	Sec ⁻¹
Number of carrier at transparency		1.8×10^{18}	cm ⁻³
Effective gain factor	g_0	0.414×10^{-16}	
Density of Quantum Dot	N_d	2×10^{14}	cm ⁻³

Table 2. Time delay and stets of Synchronization.

Time delay (ps)	$ E_T ^2, E_R ^2$ with Time	Type of synchronization
19.5	Double periodic	Quasi general synchronization
20	Chaos	No synchronization
26	periodic	General synchronization
300	Chaos	No synchronization
310	Chaos	No synchronization
320	Chaos	No synchronization
350	Chaos	Complete synchronization

The Effectiveness of Tablets in Developing Teaching Skills at the University

Ahmed Iyad Anwar¹, Haidar Hatem Al-ijrish¹

¹Basic Education/University of Babylon, Iraq.

ABSTRACT

The study aimed to identify the effectiveness of tablets in the development of skills in the university teaching. The sample was selected in a descriptive way, from the University College of Imam al-Azam, and the number of the sample (23) teaching staff, trained and developed their teaching skills through tablets, was used to describe the phenomenon accurately and express it as a qualitative or quantitative expression and description of the devices tablet, display and identification of skills, a one-set experimental curriculum for the theme of the study, measuring the effectiveness of tablets in the development of skills, and used to collect data two tools: The first: The Test of tribal and post skills, of the type of choice of multiple and have been sure to believe The test and stability as well as the statistical analysis of its paragraphs, the second instrument of observation card and after legalization has been calculated its sincerity and consistency and applied to the sample. The statistical Packaging program for Social Sciences (SPSS) was used to conduct the appropriate statistical processes for research, including the equation: (kr-20), test (Wilcoxon) and test (v) for two mean-bound, and others.

Keywords: *Efficiency, Tablets, Teaching Skills.*

INTRODUCTION

The educational field of the present era has witnessed a clear progress in the field of technology coincided with the knowledge explosion and transformed the world into a small village, so the educational and educational techniques developed, to achieve the educational goals effectively according to the Standards and educational foundations ¹. During the current decade, there has been a major shift in technology in the classroom. Students now a day live in a world surrounded by laptops and mobile devices, today's generation of students is living in an age that requires digital literacy skills (Literacy Skills) which assists them in searching for information, testing and evaluating data with their fingertips. So, integrating technology into the classroom is not just a popular obsession, but also becoming a need for today's Society ²⁻⁴. In this sense, those interested in technological science and education have begun to devise ways to help both the teacher and the teaching staff in the planning,

implementation and evaluation of attitudes. Educational, and from these means interactive whiteboard ⁵ which is a hand-held device. Therefore, it is imperative that the teaching staff be actively trained in technological concepts and skills, so that they can play their critical role and have sufficient skills to provide their lectures electronically and using tablets effectively. To save time and effort, and organize lectures in an interactive electronic way that can be displayed in a variety of ways and at multiple times through tablets that encourage self-learning as well, and collaborate in making the educational environment more effective and give students a greater opportunity to interact with lectures and motivate them to participate actively and others. The main objective is how to manage and use information and harness it to raise the learner's efficiency in the face of present and future problems, enable him to face the challenge of mystery and surprises, and increase his ability to adapt the environment and the surroundings he lives in ⁶. According to the study ⁷: Previous studies lacked education based on the use of smart cellular applications, mobile devices and tablets carried by many learners, which can become the best way to teach students

Corresponding author:

Ahmed Iyad Anwar.

Basic Education/University of Babylon, Iraq.

to be better used⁸. The rapid development of educational technologies and software has become effective tools and devices that provide ample opportunities for the university teaching staff in particular, the teacher and the instructor in general, to develop their teaching and training skills, and to strengthen the educational and educational process with the educational developments that can be employed And the investment of tablets to benefit from them.

METHODOLOGY

Includes Review of some of the previous symposia, conferences and studies related to the subject and dimensions of the study and the current study variables where the independent variable represents: tablets, and the dependent variable: developing skills in the university teaching. From what was called for to achieve the goal of the study, a series of actions were carried out in sequential steps: First the Experimental design: The choice of the experimental design suitable for the experimental study is necessary to arrive at answers to the hypotheses of the study, and has a prominent role in the experimental setting of the study, and serves as a broad lines for the implementation of the experiment and the planning of the circumstances and factors surrounding the problem closely and observation It follows closely⁹, adopting a descriptive approach to accurately describe the phenomenon and express it qualitatively or quantitatively, as well as the one-group experimental approach. Second The research community and its sample: The study community consists of all individuals, persons or objects who are the subject of the research problem¹⁰. The current research community is from the holistic Society of the Faculty of the Imam al-Azam University for the academic year (2017/2018) and the Human Resources section of the college was visited to obtain the number of teaching staff of both sexes (349). The sample of the research was made up of a random sample (23) of the total number of teaching staff for the academic year (2017/2018) and over three weeks. Third identification and preparation of research tools: (Cognitive testing, notes card). And presented to the specialized authorities. The first tool: building cognitive testing: The researcher prepared a test to measure the cognitive aspect of the effectiveness of tablets in the development of skills, and chose from the types of objective tests the type of choice of multiple. The number of paragraphs (50) Paragraph aimed at measuring skills in the university teaching and using

tablets, the test was presented to a group of experts and specialists in the curriculum and methods of teaching, measurement, evaluation and educational techniques, to benefit from their opinions and observations about it, and the amendments were made required by their guidance and observations. Eighty percent and more were adopted as criteria for the validity of the paragraphs, thus achieving virtual honesty. Internal consistency: The test was applied to the sample for calculating internal consistency, and then the degree of correlation of each test paragraph was calculated in the overall degree of the test, and table (1) shows the results obtained. Table (1) refers to the correlation coefficient values for the entire test paragraphs and is statistically significant; therefore, all paragraphs are appropriate to measure what they are developed for; the test is validated. The content of the course material trained by the teaching staff was analyzed when applying the experiment to its components, specifying the goal of the test to be achieved at the end of the course and determined the behavioral procedural objectives according to all levels of the Blum classification in the cognitive field, and then prepared the table of specifications according to the calculation The importance and relative weight of each level of cognitive objectives, so as to build the identified cognitive test of the type of multiple choice of the four alternatives, and formulas according to the objectives previously identified, the rules of preparation of the multiple choice test were taken into account when formulating test questions, and formulated The test instructions are briefly and clearly placed on the front of the test, then the content is validated. Table 2 shows the value of the stability coefficient and the overall average of the field. Table (2) shows the value of the stability factor for the five areas, and the overall stability factor of the instrument by finding the correlation coefficient between the observed performance scores, where the researcher used the card to evaluate the performance of the teaching staff in the initial lectures until they reached the final evaluation, and the coefficient was calculated The correlation between the grades observed with the initial observation and the final observation, the total value of the reliability coefficient of the note card (0.9063), and is a high persistence value. The general arithmetic mean of the domains is (2.23).

RESULTS AND DISCUSSION

Explains the results of the statistical operations showed the effectiveness of tablets where their use

has the positive effect in the development of skills in the university teaching, which may be due to: The tablets allow the teacher to rely on his skills in terms of interacting with them positively to benefit from them on the professional side which was born have fun at work made the lecture more dynamic. The difference between the before and after testing in favor of the dimensional test in the university teaching is more receptive and inclined to modern methods in the teaching process, born have more motivation to be able to skills related to tablets that have increased their eagerness to be able to have many skills. To answer the query question, how effective are tablets in developing the skills of the university teaching staff? This question was answered by testing the following two hypotheses: To verify the first hypothesis and states: there is a difference of D statistic at the level of statistical significance (0.05) between the mid-grades of the teaching staff in the experimental group in the tribal and postgraduate measurement to test the development of skills in the university teaching using tablets, in favor of dimensional measurement. It is therefore found that there is a statistically significant difference at the level of statistical significance (0.05) between the mid-grades of the teaching staff in the experimental group in the tribal and postgraduate measurements to test the skills development of the university teaching staff using tablets, for the benefit of dimensional measurement. To test the validity of this hypothesis, a statistical treatment was carried out using the Wilcoxon test (Wilcoxon) for two related samples to compare the degree of application of tribal and other tests in the development of teaching skills using tablet devices. The value of (z) calculated (8.79-) in the measurement of skills is less than the (z) tabular value of (17) at an indication level (0.05), one-party indication, and a sample (23), which shows that the teaching staff benefited greatly from the course

lectures. This may be because the lectures for the course concerned have helped to develop and improve skills and have enabled teaching staff to acquire new skills. This confirms the effectiveness of tablets in the development of skills and the development of educational process and this corresponds to many previous studies as in the study ¹¹⁻¹⁴: To verify the second hypothesis, it states: there is a difference of d at the statistical significance level (0.05) between the middle grades of the teaching staff in the experimental group in the tribal measurement and the follow-up of the note card including the development of skills in the university teaching using tablets for the benefit Dimensional measurement. To test the validity of this imposition, the value of (v) is calculated to denote the difference between the mid-grades of the teaching sample in the tribal and secondary measurements, using a two-intermediate test for the research sample, for the tribal and other applications for the results of the observation card where the value (t) calculated Reached (26.860) and is statistically function at (0.05) level and degree of freedom (34) This indicates the existence of statistically significant differences between the average grades of teachers in the results of the observation card, which indicates the development and high level of skills among university teaching staff in the use of tablets. The ultimate objective in the development of the educational and educational process. It resulted in: the course management skills of the tablets were well received by the study sample, with an average general arithmetic for the first field (2.33), and the second area: the skills of content management in tablets (1.98), and the third area: the skills of using hardware calendar tools The tablet got (2.47), and got the fourth area: the skills of using communication tools on tablets (2.25), and finally got the fifth area: the skills of using student management on tablets (2.13), while the overall average of the entire fields was good (2.23).

Table 1. Shows the results obtained, * * Function at level (0.05) * function at level (0.01)

Table 2. Shows the value of the stability coefficient and the overall average of the field

Overall average	Stability Factor value	Areas	
2.33	0.9158	First area: Course management skills in tablets	1
1.98	0.8788	Second area: Content management skills in tablets	2
2.47	0.9379	Third area: skills of using calendar tools in tablets	3
2.25	0.9017	Forth area: Skills of using communication tools in devices	4
2.13	0.8977	Area 5: Skills of using student management in tablets	5
2.23	0.9063		The total stability coefficient value of the note card, and the overall average

CONCLUSION

The use of tablets to develop the skills of the university teaching staff has proven its effectiveness. The introduction of tablets is an effective way of does his rule the right to the education of an educated in cooperation, by raising the education of the learner in the subject matter and in a way that is not and his report the traditional pattern that He used it.

Using the Constructs of the Health Belief Model in Changing the Health Beliefs of Male Nurses about Testicular Self-Examinations

Nabeel Abdulrazzaq Jasim¹, Arkan Bahlol Naji²

¹ Karbala Health Directorate, High Vocational Health Institute, Iraq,

²Community Health Nursing Department, College of Nursing, University of Baghdad, Iraq

ABSTRACT

A randomized controlled trial was used in this study, which was conducted at Al Hussein Medical City in Karbala. A random sample consisting of (80) nursing staff and males was selected. This sample was divided into two groups: the study group consisted of (40) nurses and a control group consisting of (40) nurses. A self-administration questionnaire was used for data collection and consisted of four parts: (a) demographic and social characteristics, (B) general health information; (c) identification of smoking behavior; and (d) measure of self-examination of test scores. The results of this study showed that there were significant differences between all concepts of the model of health beliefs related to tests of testicles (perceived readiness, perceived risk, perceived benefits, perceived obstacles, signs of doing work and self-efficacy) in all tests. In addition, there was a significant correlation between the perceived risk of testicular cancer and the perceived risk of testicular cancer in all tests. This study concluded that health education based on the model of health beliefs was effective in improving all the key concepts of the model of health beliefs.

Keywords: Health Belief Model, Testicular Self-Examination

INTRODUCTION

Cancer is a generic term for a wide range of diseases. Cancer is characterized by the growth from unnatural cells out of outlines that can then Piercing adjacent parts of the body or injuring the other (World Health Organization¹. Cancer causes one in eight deaths worldwide and is rapidly becoming a global pandemic (American Cancer Society [ACS], 2018). Because of the development and elderly in humans, the worldwide the burden is likely to grow to 21.7 million cancers new stats and 13 million death in cancer simply². 70% and more of all which deaths in cancer usually happened in low- and middle-income nation. This cities from expect have two-thirds new cases of carcinoma in the world. By 2050, approximately 14 million new cases will emerge compared to that in 2012 (Union for International Cancer Control [UICC], n.d.; World Health Organization³.

There are about 200 known types of cancer (UICC, n.d.), one of these is testicular cancer (TC). TC is the most common cancer and mainly affects in men 15-45 years of age. Without a identified way to avoid the illness, care giver specialists must encourage awareness and primary finding of TC⁴. Testicular tumors falls into two main types; seminoma which is a form of testicular cancer containing only one type of cancer cell. It is normally found in men between the ages of 30 and 60 years, but can happen at other ages. Whereas, non-seminoma germ cell tumor (NSGCT, often known as a non-seminoma) is made up of many different types of cancer cells grouped together. It is more common in younger men, most often between late teens and early 40⁵⁻⁷. Non-seminomas tend to grow and spread more quickly than seminomas⁵. One of the highest fears to well-being and wellness is TC among 15- 45-year-old in men. To encouraging awareness need to a intensive exertion in the literature, risk factors, and blocking procedures is warranted⁶. The lack of material distribution about the illness's occurrence, commonness, etiology, handling, and prevention procedures within the overall population

Corresponding author:

Karbala Health Directorate, High Vocational Health Institute, Iraq

contributes to a knowledge shortage concerning awareness and preventive behavior execution⁸. A hard lump in either testis is the usual symptom of testicular cancer. The lump is usually painless but in about one in 10 men, it is painful or tender. In a few men, constant backache, coughing or breathlessness, and enlarged or tender nipples may signal that the cancer has spread⁹. Early diagnosis is considered crucial in the successful treatment of TC. Testicular self-exam (TSE) is an important method to overcome the late-stage diagnosis of TC^{10,11}. TSE is a painless self-screening process, which is considered easy to learn and perform, and encourages males to take responsibility for their own health. TSE is vital in identifying early symptoms of testicular cancer when conducted properly by men in the high-risk group (15-44 years-old)¹². For men, monthly TSE, starting at puberty, is also an effective way of detecting testicular cancer at an early, and potentially curable, stage. TSE is not just a method to detect early stages of TC, but should be used to increase bodily self-awareness and raise informed decision-making (IDM) among men. By increasing IDM among men and making them further self-aware of their bodies, they may in turn feel more comfortable discussing men's health issues with others. This study aims to (1) determine the efficacy of the HBM-based health education in changing participants' health beliefs about performing testicular self-examination, (2) identify the association between participants' age and perceived susceptibility, perceived severity of developing testicular cancer, perceived benefits, barriers, cues to action, and self-efficacy of performing TSE.

MATERIALS AND METHOD

A Randomized Controlled Trial design was used to guide this study. In this study, a number of variables were examined to determine each subject's predisposition to adopt and commit to TS examinations including age, marital status, educational qualification and how many time doing TSE. The study population included male nurses who age 20–45-years who were recruited from The Imam Al-Hussein Medical City in Karbala City, Midwestern to Iraq. Sample and sampling. The Imam Al-Hussein Medical City hospital; a 400-beds hospital, was selected randomly through a simple random sampling procedure. All hospitals of the Karbala City were written in identical pieces of paper and put into a flask. These pieces were stirred well and then one of the colleagues drawn one piece. A probability systematic

random sampling method was used for selecting the study sample. The total number of nurses in this hospital is 780; of which, 260 male nurses. Of these 250, there are 225 who age between 20-45-years-old. The number of elements in the population $N = 80$ male nurses. Based on an effect size of 0.6, α error probability of 0.05, and a power of 0.80, the minimum required sample size for each group would be 36. The researcher distributed (100) copies of the study questionnaire to the accessible male nurses' with age between 20-45 years old. The returned questionnaires were 96 with a response rate of (96.0%). The number of incomplete copies was 14 which were later excluded. Thus, the final sample size $n = 40$ for each group. The list of all male nurses' aged between 22-45-years and holders of an associate and bachelor's degrees in nursing were selected. The first name was chosen randomly. This name was assigned into the study group and the next name was assigned into the control group. By dividing the population size by the desired sample size $225/40$, the result is 5.6 which means that every 6th nurse on the list would be included in one of the two groups. One of the researchers brought the nurses' names list and with a blinded eyes, the researcher put his finger on this list. The start point name was an odd on this list was assigned into the study group and next even name assigned into the control group. Every next 6th nurse; both odd and even, would be assigned into the corresponding group till getting the desired sample size. Study procedure. RCT was used in the present study with the use of pretest, posttest I, and posttest II. Both groups were pretested on February 1st, 2018. The intervention was implemented by introducing the health education materials (PowerPoint presentation and a booklet) that focused on all constructs of the HBM (perceived susceptibility, perceived severity, perceived benefits, perceived barriers, cues to action, and self-efficacy) for the study group only on February 7th-8th, 2018. The posttest I was conducted on March 20th, 2018. The posttest II was conducted on April 30th, 2018.

Perceived susceptibility scale. The first construct is perceived susceptibility was used to measure the likelihood of getting TC. This scale is a 7-point Likert type scale that is composed of six items. These items were measured on a 7-point Likert scale. Responses on this scale range from 1 (Strongly Disagree) to 7 (Strongly Agree). The total scores range from 6 to 42 with a higher score indicating higher perceived susceptibility of developing TSE. This scale showed good internal

consistency (Cronbach's alpha is 85).

The perceived severity "seriousness" scale. The perceived severity "seriousness" scale was used to measure one's belief about the seriousness of contracting TC. This scale is a 7-point Likert type scale that is composed of 12 items. These items were measured on a 7-point Likert scale. Responses on this scale range from 1 (Strongly Disagree) to 7 (Strongly Agree). The total scores range from 12 to 84, with a higher score indicating higher perceived severity of the TC. This scale showed good internal consistency (Cronbach's alpha is 85).

The perceived benefits scale. The perceived benefits scale was used to measure one's an individual's assessment of the value or efficacy of taking TC screening. This scale is a 7-point Likert type scale that is composed of three items. These items were measured on a 7-point Likert scale. Responses on this scale range from 1 (Strongly Disagree) to 7 (Strongly Agree). The total scores range from 3 to 21, with a higher score indicating higher perceived value of performing the TSE. This scale showed good internal consistency (Cronbach's alpha is 75).

The perceived barriers scale. The perceived barriers scale was used to measure one's possible obstacles to taking TSE. This scale is a 7-point Likert type scale that is composed of eight items. These items were measured on a 7-point Likert scale. Responses on this scale range from 1 (Strongly Disagree) to 7 (Strongly Agree). The total scores range from 8 to 56, with a higher score indicating higher perceived barriers to performing the TSE. This scale showed good internal consistency (Cronbach's alpha is 85). A self-report questionnaire was used for data collection. Distributing questionnaires in person enables the SR to demonstrate the instructions before the participants start answering the questions. The estimated time range for each participant to complete the study questionnaire ranged between 15-30 minutes, to be reaffirmed by the pilot study. The data were represented by levels of measurement at the nominal

level for some of the demographic variables such as the marital status, smoking status, and performing TSE. While the ordinal level data will be collected to measure participants' educational qualification. Data collection was performed through the use of the study instrument and the application of health education materials. The age mean for participants in the study group is 31.2 ± 7.1 ; more than two-third were within the age group of (22-28) years-old ($n = 17$; 42.5%), followed by those who were within the age group of (36-42) years-old ($n = 14$; 35.0%), and those who were within the age group of (29-35) years-old ($n = 7$; 17.5%). For the control group, the age mean is 33.4 ± 6.1 ; two-fifth were within the age group of age group of (22-28) years-old ($n = 16$; 40.0%), followed by those who were within the age group of (29-35) years-old ($n = 15$; 37.5%), and those who were within the age group of (36-42) years-old ($n = 9$; 22.5%). Concerning the marital status, most in the study group were married ($n = 26$; 65.0%) compared to those who not married ($n = 14$; 35.0%). For the majority are married ($n = 32$; 80.0%) compared to those who are not married ($n = 8$; 20.0%). Regarding the educational qualification, more than a half in the study group hold an associate degree ($n = 22$; 55.0%) compared to those who hold a bachelor's degree ($n = 18$; 45.0%). For the control group, most hold an associate degree ($n = 24$; 60.0%) compared to those who hold a bachelor's degree ($n = 16$; 40.0%). There is statistically inverse correlation between participants' age and their Self-Efficacy of performing TSE ($r = -.500$; at $p\text{-value} < 0.01$). The values of the Perceived Susceptibility of contracting testicular cancer for the study group noticeably decrease by time (Pretest = 14.23, Posttest I = 51.47, Posttest II = 59.04). For the control group, such values slightly decrease by time (Pretest = 22.550, Posttest I = 22509, Posttest II = 22.15). The values of the Perceived Severity of testicular cancer for the study group noticeably decrease by time (Pretest = 39.37, Posttest I = 21.10, Posttest II = 9.88). For the control group, such values slightly decrease by time (Pretest = 33.85, Posttest I = 34.75, Posttest II = 35.65).

Table 1. Participants' Sociodemographic Characteristics

	Study (N = 40)		Control (N = 40)	
	Frequency	Percent	Frequency	Percent
Age: Mean (SD) (Study G.): 31.2 ± 7.1 Mean (SD) (Control G.): 33.4 ± 6.1				
22-28	17	42.5	16	40.0
29-35	7	17.5	15	37.5
36-42	14	35.0	9	22.5
Marital Status Upper lower class				
Not married	14	35.0	8	20.0
Married	26	65.0	32	80.0
Educational Qualification				
Associate degree (Diploma)	22	55.0	24	60.0
Bachelor's degree	18	45.0	16	40.0

Table 3. Descriptive Statistics for the Values of the Perceived Susceptibility over Time

Self-Efficacy	Mean	Std. Deviation	N
Study Pretest	14.23	11.245	70
Study Posttest I	8.20	12.527	70
Study Posttest II	7.10	14.514	70
Control Pretest	22.550	6.530	69
Control Posttest I	22.50	8.105	69
Control Posttest II	22.15	7.337	69

Table 4. Descriptive Statistics for the Values of the Perceived Severity over Time

Perceived Severity	Mean	Std. Deviation	N
Study Pretest	39.73	11.245	70
Study Posttest I	21.10	12.527	70
Study Posttest II	9.88	14.514	70
Control Pretest	33.85	6.530	69
Control Posttest I	34.75	8.105	69
Control Posttest II	35.65	7.337	69

CONCLUSION

The HBM-based health education positively influenced participants' perceived susceptibility of contracting TC, the perceived severity of TC, the perceived Benefits of performing TSE, and the Perceived Barriers to perform TSE.

Effectiveness of Polytechnic (Applied) Theory in the Development of Information Processing Methods among Secondary School Students

Aarif Hatem Al-Jubouri¹, Alaa Ibrahim Razouki¹

¹College of Basic Education, University of Babylon, Iraq

ABSTRACT

The objective of the research is to identify the effectiveness of the Polytechnic theory in the development of the information processing methods of the secondary students. To achieve the goal, the zero hypothesis was established. That assumes there is no statistically significant difference at significance level (0.05) between the average scores of the experimental group who will study according to the strategies of the Polytechnic Theory And the average score of the control group who will study according to the usual method in the scale of information processing methods, and to verify them, the experiment was implemented in the second semester of the academic year (2017-2018), The study sample consisted of (64) fourth grade students in the Al-Jihad preparatory school. The two groups were equalized in the following variables: The chronological age, IQ test scores, the scale of information processing methods built by Badran (2000) was used and the experiment lasted 8 weeks. At the end of the experiment, a scale was applied to the two groups. The results were then analyzed and showed that the students of the experimental group were superior to the control group who studied in the usual way.

Keywords: *Polytechnic theory, information processing methods, secondary stage.*

INTRODUCTION

The human mind is a distinctive and important creature of man and without it, man can't follow his life properly and make the right decisions. As the mind works and thinks in orderly steps. The mind first observes the information, when specific information is mentioned, then the brain notice it, the observation may be by voice or image, after observation, the brain preserves the observation and it is concentrated in the brain in short-term memory. Then the brain begins to analyze the observation, and the brain may produce certain information through this observation then stores it in the long-term memory. The subconscious mind affects the behavior of the brain, and subconsciously stores information and transmits it to habits and behaviors over time, which leads to the human

acquisition of new actions without notice. In the case of human exposure to the problem, man identifies the problem and then analyzes it to determine its results, then looking for suitable solutions, possible and fast-acting, and if appropriate solutions are found, it is implemented immediately to resolve the problem, this is called information processing ¹. The interest in learning methods is a form of information processing that has appeared in many research and studies under multiple names such as learning how to learn, knowing how to identify, knowing how to remember, mental skills training, memory enhancement strategies, and strategies for cognitive preference ². These concepts all refer to the individual's way of thinking and his way of understanding, remembering and cognition, which is based on formulas of information classification, composition, analysis, storage and retrieval when necessary, these processes are practiced by the individual in his daily dealings with the information and the study material and contribute to the development of the individual's perception and skills and achieve excellence and high achievement ³. It is considered that the individual is capable of handling,

Corresponding author:

Aseel Tahseen Ulaiwy

College of Basic Education, University of Babylon,
Iraq

processing, storing and retrieving the information and the processes used in this are processes that take place within the mind before the response is issued, in the form of cognition, thinking and solving the problems of individual processing of information⁴. The present research aims to identify the effectiveness of the applied polytechnic theory in the development of information processing methods among secondary school students.

METHODOLOGY

It includes an overview of the procedures that have been carried out to achieve the research objectives, starting with the research methodology, experimental design, defining the research population and its sample, and the equivalence of the research groups (experimental and control), preparation of research materials and tools, procedures for applying the experiment and presentation of the statistical means used, and will be presented as follows: The researcher followed the experimental method to know: (The effectiveness of the Polytechnic theory in the development of information processing methods among secondary school students) because it is the appropriate approach to the nature of research, and represents one of the scientific research methods used in educational and psychological research.

The Experimental Design:

The researcher chose the partial control experimental design, because it is more suitable for his research procedures.

Research Population

The current research population represents fifth-grade students in the secondary day school for boys in the center of Babil province for the academic year (2017 - 2018). To choose the sample of schools, the researcher visited the General Directorate of education for Babil province under the book issued by the University of Babylon – Appendix No. (1), to identify the names of preparatory and secondary schools for boys only affiliated to them, which lies within the boundaries of the center of the province of Babylon.

Research Sample

The preparatory school for boys was selected in the center of Babil province in order to conduct the research. It was found that it consists of four divisions of the fourth scientific grade (A and B). A random sampling method

(The lottery method) was used to choose the class (A) which have (32) students to represent the experimental group, and they will study according to (Polytechnic theory strategies), and in the same way was randomly chosen class (B) to represent the control group which have (32) students who will study according to (the usual method).

Research Group Parity

The researcher conducted a statistical equivalence between the experimental and control groups in some variables that affect the results of the experiment. Despite that the researcher chose the two groups in the random lottery method, although the students of the research sample are from a very similar social and economic community and study in one school, the equivalence of the following variables was done: (the time age calculated by months, the first semester grades, and the IQ test). The researcher performed the equivalence between the two research groups in the variables mentioned above. And the results are shown in Table (1).

Preparing Research Requirements

The research requirements are the basic elements upon which the research is carried out, according to which the research procedures are continued. These requirements are as follows: (The scientific material (content): The scientific material that the researcher should teach to the students of the two research groups during the period of the experiment (second semester) for the academic year (2017-2018) was selected. The scientific material included chapters (4th, 5th, 6th) The researcher has prepared 16 plans for the experimental group that is taught according to the strategies of the Polytechnic Theory and the same for the control group which is taught according to the usual method.

Statistical Analysis of Scale Paragraphs

The analysis of paragraphs is defined as a study of evaluating their effectiveness through the students' response to each of the scales. The aim of this procedure is to keep the good paragraphs in the scale⁵. In order to verify the analysis of the paragraphs statistically, the scale was applied to the survey sample. After applying the scale, the researcher extracted the following:

Distinction strength of paragraphs

The primary objective of calculating the distinction

strength of paragraphs is to exclude paragraphs that do not distinguish between the examinees and to retain those that distinguish them. Therefore, the researcher marked the answer of the students and determined the total score obtained by each student in the scale, and then arranged grades from the highest to lowest grade, and chose (27%) of the highest grades and (27%) of the lower grades to represent the two extreme groups and to calculate the coefficient of discrimination between the groups paragraphs scores (upper and lower), the T-test was then used for two independent samples to extract the difference between the mean of the upper and lower groups in each paragraph of the scale, the results showed that all calculated (t) values were higher than the tabulated value of (2,000) at the significance level (0,05) and the degree of freedom (52).

The paragraph relating to the total degree of the scale

Since the discriminatory strength of paragraphs does not determine their homogeneity in the measurement of the phenomenon need to be measured, there may be similar paragraphs in their discriminatory strength but they measure different behavioral dimensions⁶. Therefore, the researcher found the relationship of each scale paragraph to the total degree and found that all Pearson correlation coefficient values were higher than the tabulated correlation coefficients which were (0,113) at statistical significance level (0,05) and degree of freedom (99).

Psychometric Characteristics

All the psychometric characteristics of the scale (honesty, stability) were extracted, as follows:

The structural honesty of the scale: Honesty is one of the psychometric characteristics that reveal the extent to which the scale achieved the purpose for which it was prepared. Anastasi believes that honesty is positional because it is calculated from the grades when applied to the sample of students, which is relative rather than absolute (Anastasi & Urbina, 2010: 115). This kind of honesty has been achieved by extracting two indicators: the distinction strength and the relationship of the paragraph to the overall degree.

Stability refers to the accuracy and consistency of an individual's performance, and also to the stability of results over time (Anastasi & Urbina, 2010: 142). By

calculating the stability coefficient of the scale using the general equation of Vaccronbach, the stability coefficient was (0.73), thus the test became ready for implementation.

Extracting test paragraphs

The paragraphs of the achievement test were formulated in its preliminary form in the light of the test map, the researcher chose the type of test (multiple choice) which is one of the best objective tests. The test consisted of (40) test paragraphs, which were distributed on the Blooms cognitive levels (knowledge, understanding, application, analysis, composition, rectification) from the Physics book.

Test instructions

Specific instructions and guidance were written on how to answer (choosing one correct alternative to the paragraph, answering all paragraphs, answer time, typing full name, grade, and class in the assigned space).

The honesty of the test

The honesty of the test has been verified and content certified, the results showed that the apparent honesty obtained the proportion of agreement (80%) by the arbitrators and specialists, as for the validity of the content, the results showed that all the items of the achievement test are statistically significant, so the achievement test is honest in measuring the comprehension of the fourth grade students in physics.

Statistical Methods

The researcher used the t-test for two independent samples to make the parity between the experimental and control groups. The Pearson correlation equation was used to correct the correlation coefficient between the test segments (even and odd scores) after the Pearson correlation coefficient was calculated.

RESULTS AND DISCUSSION

The search results are presented according to the sequence of its hypotheses as follows: To identify the significant difference between the instantaneous achievement scores of the experimental and control groups. The t-test was used for two independent samples, and the difference was statistically significant at significance level (0.05) with a degree of freedom (58). The calculated t-value was (6.09) which is

greater than the tabulated t value (2) as illustrated in table (2). Thus the first zero-hypothesis was rejected. To determine the significant difference between the mean scores of the information processing methods for the experimental and control groups, the t-test was used for two independent samples. The difference was statistically significant at (0.05) with a degree of freedom (58), where the calculated (T-value) was greater than the tabular value (2), as illustrated in Table (3). Thus the second zero-hypothesis was rejected. It can be said with 95% confidence that there is an ability to solve problems in the experimental group compared to students of the control group. This indicates that there is a clear effect of the Polytechnic theory strategies in teaching students of the experimental group the scientific thinking skills compared to students of the control group. The researcher found that these results were due to effectiveness of the Polytechnic theory, as it turned out that he contributed in teaching the students of the experimental group the skills of scientific thinking, and contributed in raising the level of their academic achievement as the achievement of the experimental group was better than the achievement of control group with a statistical difference. It is clear from the results of this research that the students of the

experimental group used the higher thinking processes during the analysis, synthesis and evaluation of Bloom classification and interpretation and experimentation as well as stimulate their motivation and eager to learn the skills of scientific thinking through diversity in the use of teaching methods appropriate to the teaching plans and the use of activities and teaching aids with feedback and enhancement. As well as the clarity of behavioral purposes at the beginning of the educational material as the students of the experimental group have studied the material in an unusual way they have been subjected to several positions included in the strategies of the of Polytechnic theory, For example, when teaching predictive skill to students, the researcher gives students a number of questions that measure their ability to predict after learning this skill. This leads to the organization of students' efforts towards completing the educational tasks and makes the educational process more effective and successful, and easier for both the researcher and the student. All these are positive indicators to reach the objectives of the strategies of Polytechnic theory in raising the level of achievement of students and enhance the educational - learning process.

Table 1. The equivalence between the two research groups

Variable	Group	Sample Number	Arithmetic Mean	S.D.	D.F.	T-Value		Sig. level
						Calculated	Tabulated	
Age in months	Experimental	32	171.486	12.258	68	0.997	2	Not statistically significant
	Control	32	174.943	16.451				
First Semester Grades	Experimental	32	54.657	16.916				
	Control	32	53.885	15.657				
IQ Test	Experimental	32	27.771	7.814		0.758		
	Control	32	29.143	7.277				

Table 2. T-value of the achievement test for the experimental and control groups in physics.

Group	Number of individuals	Arithmetic Mean	Variance	D.F.	T-Value		Sig.
					Calculated	Tabulated	
Experimental	32	81.6	45.15	58	6.09	2	Sig. at level 0.05
Control	32	68,2	102,61				

Table 3. T-value of the problem-solving test for the experimental and control groups (for two independent samples).

Group	Number of individuals	Arithmetic Mean	Variance	D.F	T-Value		Sig.
					Calculated	Tabulated	
Experimental	32	51.86	28.30	58	7.98	2	Sig. at level 0.05
Control	32	39.56	44.35				

CONCLUSION

Teaching using the strategies of Polytechnic theory created in students the skills of critical thinking rather than the use of traditional questions in physics. Teaching using the strategies of Polytechnic theory has increased the development of students' abilities to understand, criticism, analyze and interpret. Teaching using polytechnic theory strategies helps students to make the right decisions.

ABSTRACT

Cloud computing technologies are evolving as a good solutions to bioinformatics problems, There are today many applications within the field of Cloud-based services in bioinformatics such as: DaaS, SaaS, PaaS and IaaS referring to Data, Software, Platform and Infrastructure as a Service respectively These services were developed based on cloud platform by the big enterprises ,. This paper, will provide the specification and field of application of the such platforms as : (google genomics), Cloud Genomics, Genomics API, and Map Reduce with correlated software such as hadoop and presents a number of existing software solutions in bioinformatics domain that use the Map Reduce programming mode to enable their application and incorporation as a graphical workflow engine. Such engine allows these results to be easily grouped together and eases the advance of open-ended analyses and encourages its. The researchers `` in Cloud genomics application like Cancer and Autism, then, present new recommendations for developing the performance of bioinformatics filed.

Keywords: Cloud Computing, bioinformatics, Google genomics, Genomics API, Cloud Services, CloudGene.

INTRODUCTION

Bioinformatics tools are becoming much easier to use. Research have been done dealing with large sequencing of data without time delay ¹. On-demand and pay-as-go Cloud computing model has been used to provide dynamic computing resources for construction of physical systems without commitment or upfront costs. Cloud computing are generally used for data analysis with parallel processing tools, such as Apache Hadoop and MapReduce (a programming model consisting of map and reduce. functions that is applied in Apache Hadoop to process large data sets in parallel¹³. Bioinformatics applications have broadly implemented cloud computing with Hadoop to manage large genomic data and to perform data analysis, one of the challenges in such research is how to

understand and share the analysis processes results with others⁴. The following sections show some interesting applications of bioinformatics in cloud computing and parallel applications, (i.e. Google Cloud Platform (Google genomics), Cloud Genomics API, Map Reduce framework,) and give a case study of each application with real examples. In 1970 the term bioinformatics was invented by P. Hogeweg and B. Hesber to designate investigation of data and information processing in biotic frameworks ⁵. Bioinformatics is new discipline to collect, store, break down, analyze and incorporate natural biological and hereditary genetics data by using computer science concepts ⁶. Bioinformatics studies biology in the form of atoms or molecules and utilizes “informatics methods” used in computer science, mathematics, and statistics. The aim is to understand and sort out the related information ⁷. The objective of bioinformatics is to build an understanding of the natural biological procedures and explores the integration of subatomic science or molecular biology with computer technology. Simply put, one can say that Understanding the relationship between genetics and disease is essential

Al-Mustansiriyah University, Iraq

in biomedical research. Empowered by progressively economical next-generation sequencing technologies, many projects have tried to describe variations within and across populations and disease cohorts. Cloud computing represents a drive away from applications installed on local computer towards applications hosted online. The “cloud” refers to the Internet, the name was inspired by flow charts and diagrams that use often a cloud symbol to represent the Internet.) . Large comparative genomics studies and tools are becoming more compute-expensive as the number of available genome sequences rise. This reflects on the capacity and cost of local computing infrastructures which are likely to become unaffordable with the increase, especially as the breadth of questions increases ^{10,11}. Cloud computing environments relief this pressure and support fast, broad, and economical comparative genomics strategies.

MATERIALS AND METHOD

Bioinformatics Google genomics Applications

Google cloud platform is part of google infrastructure, it supports YouTube that can handle three hundreds 300 hrs. of video every minute and Google search which returns search results in quarter of a second with search index that is over a hundred petabytes 100pb in sites. To translate that on genomics It means data from 6 whole genome sequencing uploaded to Google servers every minute where google can both index and search the evolving of a million-whole genomic on sequences ^{14,15}. There is increasing acknowledgement on the importance of cloud computing for genomics data analysis. It allows the use of public cloud resources for storing, accessing, sharing and analysis of genomic data. Parallely there is evidence at the life scientist’s community that cloud based genomic data analysis is the future. Recent articles showing features that are cheaper faster and more flexible on the cloud computing resources compared to local data sets ¹⁵. Google cloud platform resources are even sited as key public cloud computing resource and are lately used by publicly

Case study: Google genomics in Google Cloud Platform

This case study explains how Google Genomics can help store, process, explore, and share genomic data either own or massive shared datasets, like TCGA or Autism project. It discusses why Google is interested in genome data, how Cloud Platform works, the GATK

pipeline, and other examples of how the service is being used. The volume of genomics information is increasing rapidly, the magnitude of genomic data will double every year to reach a billion genomes by 2025 ¹⁶. All this Huge data magnitude will not be useful unless scientists can manage to extract clinical meaning from it .One will need to study row data using right analytical reading methods from data mining ,novel algorithms to the virtualization and machine learning As scientist scale up their studies and begin question thousands and soon millions of genomes , they will need to have a scalable technologies to manipulate ,analyze and interpret enormous data sets without the time and cost for moving that data from place to place . Google genomics that is built on Google cloud platform intends to help organize the world genomic information and make it available and useful Google cloud platform offers both infrastructures services and platform as a service. It also builds a unique genomics API that controls many genomics specific features. One can choose which service (infrastructure or platforms) One wants and genomics specific features as content - aware storage and access via web API that implement the GA4G (global alliance of genomics and health specifications.

Bioinformatics MapReduce Applications

MapReduce designates a programming framework that supports distributed and parallel processing on large data sets. MapReduce involves two distinct tasks – Map and Reduce ^{17,18}. The reducer phase takes place after the mapper phase, where a block of data is read and processed has been completed. To produce key-value pairs as intermediate outputs. The Mapper’s (key-value pairs) output is the Reducer’s input [19]. After the reducer gets the key-value pair from numerous map jobs. it aggregates those into a smaller set of tuples or key-value pairs that constitutes the final output.

Case study: MapReduce Bioinformatics using CloudGene and Cloudman

In Spite of the clear potential of the MapReduce model and the existence of bioinformatic algorithms and applications, they are yet not widely implemented in the bioinformatics data analysis. The Hadoop MapReduce model represents a simple framework for data parallelism. This is done by providing an automated runtime retrieval (both for failures in task runtime and hardware) and implicit scalability (automatic running of parallel batch

mode tasks). Two prior conditions for wider adoption and higher utilization of MapReduce tools were found by us: Easing the technicalities composing multiple existing MapReduce tools. Providing easy access to the compute infrastructure and environment. Satisfying these requirements would allow bioinformatics experts to concentrate on the analysis while the required technical details are unseen. two platforms were presented:

CloudGene: a MapReduce tool execution platform leveraging Hadoop,

Cloudman: a cloud resource manager.

These two platforms have been combined and extended to provide an available accessible Hadoop based bioinformatics Cloud environment. CloudGene, other than integrating random MapReduce tools to perform an analysis, has been developed as a two dedicated services job execution engine: an imputation service developed jointly with the Center for Statistical Genetics, University of Michigan (can be found at mputationserver.sph.umich.edu) and a mtDNA analysis service (can be found at mtdnaserver.uibk.ac.at). Cloudman is a system generating the cluster in the cloud .and allows access to the cluster in the cloud by everyone. It is known for automatically setting Galaxy on the cloud infrastructure and supporting various cloud infrastructure such as Demonstrate web services OpenStack. Scientists using Cloudman can share instances for collaboration. A scalable processing and analyzing of large datasets is enabled by The MapReduce framework by distributing the computational load on connected computer nodes, referred to as a cluster this can store data and relaunch it later . Cloudman is Used in several infrastructures, it is used in the Amazon cloud AWS (since 2010) , also Australian cloud Necter(since 2012) and there is also a big project (2015) called The Jetstream and EGI engage H2020 project . The CloudGene objective is to establish a consistent graphical execution environment for the MapReduce programs, that can be integrated by using its plug-in interface. Users can upload own version of Galaxy on the cloud using the playbook + Packer and build images using different infrastructures.

RESULTS AND DISCUSSION

How to support scientists when using MapReduce programs by simplifying the execution of MapReduce programs including data management and simplifying access to a working MapReduce cluster and maintaining

data sensitivity. MapReduce: Simplified Data Processing on Large Clusters: CloudGene is a framework to build Software As A Service (SaaS) platforms for data analysis pipelines. By connecting command line programs, scripts or Hadoop applications to CloudGene, a powerful web application can be created within minutes. CloudGene supports the complete workflow including data transfer, program execution and data export. Finally we found that CloudGene + Cloudman have Similar ideas but different context.

Genome VIP: Genome Variant Investigation Platform (Genome VIP):

a system for performing variant discovery, annotation, and interpretation using cloud resources. Its intuitive, lightweight web interface enables users to detect genomic variants (single- and multinucleated variants, short insertions and deletions [indels], complex indels, and structural alterations that include translocations, inversions, and tandem duplications) in whole-genome or exome sequence alignment files (BAMs) ²¹. Genome VIP is a ,multiuser open-source and cloud-aware platform .It contains a web interface to perform; discovery, annotation, and interpretation of genomic variation, using cloud- or local high-performance computing infrastructure.

Genome VIP has been used for genomic analysis in large-data projects such as:

The Cancer Genome Atlas (TCGA) Pan Can Atlas :

- The International Cancer Genome Consortium (ICGC) Pilots:
- CPTAC
- ICGC-TCGA DREAM Challenges:
- the 1000 Genomes SV
- UK10K

Genome VIP Architecture

- The functionality of Genome VIP is provided through management of three central components:
- the user's web browser,
- the Genome VIP server

- a cloud-computing resource.

Genome VIP three components (web browser, server host, cloud) are coordinated by:

- Scripting languages (blue) and cloud toolkits (green).
- Interactive web pages, written in HTML (with CSS elements) and JavaScript, provide front-end functionality.
- jQuery is a JavaScript library providing methods to modify web page content with cross-browser compatibility.

Server-side PHP modules utilize Star Cluster and S3 Tools cloud toolkits to access.

Case Study: Genome VIP

EC2 Compute (gray) and storage resources (yellow) in the cloud. Genome VIP creates within EC2 a virtual cluster, based on a machine image with preinstalled variant detection tools and supports software (collectively, “Genomics Tools”) (red), that can access sequence data on S3 and EBS (Elastic Block Storage) resources (yellow). Secure channels using [HTTPS](#) and secure shell (SSH) protocols allow communication between various components.

Result of Genome VIP’s case study

Genome VIP’s provides high-confidence annotated somatic, germline, and de novo variants of possible biological implication using publicly available data sets. Users can direct Genome VIP to perform these tasks by selecting software from its palette of widely used bioinformatics tools and can specify provided best-practices discovery tool parameter sets or design a custom “execution profile” by adjusting the controls online or uploading parameters through the web interface. Genome VIP’s design brings powerful cloud resources to bear for task-specific bioinformatics analyses without any special cloud know-how required by the investigator. Genome VIP provides flexibility for use by computational biologist power users as well as by users having expert knowledge or research needs. Its design and operational aspects aim to promote the reproducibility, transparency, and uniformity of the processing of genomic data. Although we focused on Genome VIP’s cloud capability, it runs equivalently on

local high-performance computing clusters with local data with preinstalled versions of the named tools. The design and implementation of Genome VIP and its usage for modern, high sample count cancer genomics and human genetics research also serves as a starting point for integration of additional tools and capabilities and expansion to other cloud-computing platforms. The main analyzed in the paper concerns; privacy and security issues (e.g. integrity, confidentiality, authenticity, accountability, audit, on-repudiation, anonymity, unlikability), Economic opportunities, Legal aspects (e.g. the US Health Insurance Portability and Accountability Act (HIPAA) limits companies from disclosing personal health data to third parties , while the Canadian Personal Information Protection and Electronic Documents Act (PIPEDA) prohibits organizations to collect, use, or disclose personal information in commercial activities). Clouds services and Map Reduce flexibility promotes them to become the preferred approaches in the near future . MapReduce offers; higher level interface and less user’s explicit control of the parallelism, the ability to handle large data sets, the concept of computation to data moving, and cloud technologies better quality of service simplify the implementation compared to traditional systems.

CONCLUSION

Cloud computing is a style of computing in which dynamically scalable and often virtualized resources are provided as a service over the Internet. Users need not have knowledge of, expertise in, or control over the technology infrastructure in the “cloud” that supports them. Cloud computing technologies are emerging as solid and economical solutions to high performance computing. To date, these technologies have had a partial impact on comparative genomics. In this paper; the deployment of a popular comparative genomics tools is discussed. We found that in spite of the confusion that exists regarding the definition of the cloud, IT managers are deploying cloud computing initiatives aggressively to achieve bioinformatics objectives.

Effect of Strategy of “Plan” in Correcting Wrong Geographical Concepts and Commuting the Exam Concern of Literary 5th Level’s Student

Ali Salman Dhahi¹, Mahdi Jader Al-Kilaby¹, Saad Abdulrazzaq¹

¹University of Babylon, College of Basic Education, Hillah City, Iraq

ABSTRACT

The term concern comes from Latin word “Anxietes” that means a turbulence in the mind which is a psychiatric condition known in the past as a worry and sadness that hurt the human psychologically and physically, concern is a kind of tense that attack the individual because interference of many factors that lead to inability of required performance for his works and duties beside reluctance in ensuring his necessary needs easily, concern may leads to worseness in efficiency of social activities of the patient in response to these requirements in his ambient and weakness of his ability in keep promises, theories were in contrast to explain concern, Freud sees that the reason of concern is the existed ideas in daily life, and expectation of penalty as a result to express prohibited desires or any banned motives also he sees that the roots of concern that hit the human are attributed to early childhood period of his life, the test’s concern or as it is sometimes called as fear from exam (it is a psychiatric condition that a category of students have suffered from in different level of educations , elementary, secondary and university).

Keyword: PLAN, STRATEGY, EFFECT

INTRODUCTION

Education is considered a an active social process that helps the community to preserve requirements of it’s existence and continuity that is via education’s active role which interprets philosophy of society into concepts and skills the individual can earn, it also strives toward achieving a balanced growth for individual in all mental, physical and sensual sides. So, countries, according to their development level, give tremendous importance for those who are in charge of education and breeding ¹. Education is the tool of teaching in achieving it’s aims through teaching the individual, developing him to be able to adapt and interact positively with environmental, natural and social influences and feel matching and durability. Since curriculum is a part of educational process, then it is a means to achieve education’s goals,

as it helps students on comprehensive growth in (trends, directions, needs, problems, capabilities and readiness) that lead to happening of changes in their behaviors positively, curriculum represents every study, activity or experience earned by learner under supervision and direction inside or outside the classroom ². While teacher plays important role building cultures, societies and inherited factors of educational process and interact with learner and earns this interactin (trends, skills, knowledge and values) , teachers in the prospects of developed communities is not mere an eradication eraser and a teacher of sciences, knowledge and values but a countries and nations maker to make a progress in all fields ³. Successful teacher is that one who has a wide knowledge in strategies of teaching methods and it’s different styles and he can use them and join between them easily and flexibility to achieve teaching goals and realize very well that real test to his success in teaching is not about what he knows but what students learn ⁴. Geography is considered one of the eldest branch of social branches and a major corner because it concerns studying relation between human and natural environment, styles of his interaction with land and

Corresponding author:

Ali Salman Dhahi

University of Babylon, College of Basic Education, Hillah City, Iraq.

environment and influences of that interaction, that is why geography collect between the two sides natural and human ⁵. In addition, most distinctive features of this word is the rapid advancement of technology that includes all life fields, notably the field of education, many direction have appeared that call for research and investigate of teaching styles that increase effectiveness of educational process and its ability, field of education has witnessed a vast concern over all levels of local, Arabian and international levels, also it witnessed continuous and fast development like scientific and technological revolution, cognitive explosion, emerging of modern educational techniques, methods of teaching, teaching tools, hence a big aspiration toward making curriculums matching to nature of era, and education is obliged to change it's classic and limited curriculums, develop and modify it's programs and it's plans and styles to be a proper preparing process and comprehensive for present and future. Education is considered an active social process that help community to preserve it's basic requirements of existence and continuity via it's active role in interpreting the philosophy of society into concepts and skills which any individual can get, also aspires toward achieving a balanced growth for him in all his mental, physical and sensual sides, that is why countries endeavor to give big importance to those who work in this field of education and teaching up to their level of development and technology. Education develops with development of human communities, it's heritage and extent of spreading, many fields and specializations have been emerged nowadays were not known in the past, so it is mandatory to catch the quality and quantity of development and humanitarian knowledge, education poses one of humanitarian appearances, it is a real practice of ideas and concepts have features , phenomena, reasons, results, origins and methods may be clear or not clear in another times, it's basis has humanitarian nature depends upon the ability of an instinctual ability of an individual for psychiatric and social adaptation. The current research aims to know (Effect Of Strategy Of "Plan" In Correcting Wrong Geographical Concepts And Commuting The Exam Concern Of Literary 5th Level's Student). There aren't differences with statistical evidences on level (0.05) between average marks of experimental group's students that study according to strategy of "PLAN" and controlling group's students who study up to the ordinary method.

METHODOLOGY

The researcher considered the experimental method, because it is the most accurate one where the researcher takes a neutral position against the phenomena, and adjusts all variables that he considers that they influence over his research's results but one research that is intended to study it's effect over the experiment ⁶. The researcher followed the procedures that ensure achieving the two aims of research, and verifying the two hypotheses that he applied, these procedures included two stages, first one was called diagnosing which the researcher tries to explore wrong geographical concepts for literary 5th grade's students. While the second stage was called therapeutically stage through which the researcher intends to use strategy of "Plan" to correct the wrong concept for the main research's sample in the geographical concepts in geography material for 5th literary stage's students. The researcher depends on experimental design of partial adjusting for the two equivalent group's experimental and controlling ones

RESULTS AND DISCUSSION

After finishing the experiment of research according to steps and procedures were mentioned in the 3rd chapter, in this chapter, researcher will show results that he came up with up to their target and hypothesis via balancing between grade averages of students of two groups of research in testing the outcomes (therapeutically) applied at the end of experiment to measure (correcting geographical wrong concepts) and discussing the results as follows: (There are no differences with statistical evidences on level (0.05) between average degrees of two groups (experimental and controlling groups in the after test) in correcting wrong geographical concepts). After correcting answers of two groups students of test items of correcting wrong concepts, results showed that mathematic average for total degrees done by experimental groups is (39,533) degree, criteria deviation was (5.4266), mathematic average of total degrees got by controlling group students (33,733) degree, criteria deviation (6,5214), to find out the mathematic difference evidence for these averages ,the researcher used (t-test) for two independent samples. From table (1) we can find the calculated "t" value which is (3,763) is more than tabulated "t" value that is (2,001) at evidence level of (0.005)and freedom degree of (58) which refers to a difference with a statistical evidence between degree average of the two group's students for

the behalf of experimental group, based on that, zero theory is neglected and accept the replacement theory that states on (there is a statistical evidence difference between average degree of experimental group's students who studied according to the pattern of Driver and average degree of controlling group's students who

study by the ordinary method in the after-test results for correcting the wrong concepts of geography. Result of current study comes similar to some previous studies that showed preceding of strategy of "Plan" over the ordinary method.

Table 1. Evidence of difference between average of degrees for correcting wrong concepts of geography for two groups (controlling and experimental).

	Average	Deviation	Contrast	Two (t) values		Temp.	The statistical evidence
				Calculated	Tabulated		
30	39.533	5.4266	29.448	3.763	2.001	58	
30	33.733	6.5214	42.528				

CONCLUSION

In the shed of research's results, the researcher has come up with some conclusions represented by the following: There are many wrong concepts for 5th grade students in geography.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the University of Babylon, College of Basic Education, Hillah city, Iraq and all experiments were carried out in accordance with approved guidelines.

Effect of Teaching the Reading and Texts by the Two Strategies of (Slap & CSR) On Expressional Performance of 2nd Intermediate Grade Students

Aseel Tahseen Ulaiwy¹, Dihya Uweed Harbi alarnoosy²

¹ College of Basic Education/ University of Babylon, Iraq, ² College of Basic Education/ University of Babylon, Iraq

ABSTRACT

The research aims to know the effect of teaching the material of reading and texts by using the two strategies of (Slap & CSR) on the expressional performance of 2nd intermediate grade student, researcher has created a zero hypothesis compatible for research, and chooses a compatible experimental design, she compared between the two group of research, then specified subjects that she would discuss during time of experiment, she also created behavioral goals and prepared teaching plans appropriate for requirements of research, she chose Al-Rubaie criteria that consists of four spaces with extreme degree of (100) and made sure of it's credibility and truth, and applied the dimensional choice, and showed results of exceeding the two experimental groups of research against the controlling group in expressional performance.

Keywords: Reading and texts, strategies of (Slap, CSR), expressional performance, intermediate grade.

INTRODUCTION

Expression is considered a major problem for most of students, that they fail to express about any kind of subject either by writing or verbal, also teachers explore many mistakes in that expression looks like the student didn't read or brief his Arabic language nor benefit from it's main branches because Arabic language includes many sources that all pour in one main source which the expression of senses and feelings with an intact language free from mistakes ¹. One of the most reasons that led to the spreading of this weakness of expression is neglecting this material by student and teacher as there are no specified words the teacher can rely on, Muhsin Ateyah sees that "Expression's lessons rely on diligence and comprising ². Also, weak expression of student to arrange their words and terms to come up with a good expression that express what they feel may be attributed to lack of external reading, students tend to short readings and don't burden themselves to read long reading and less

writing in different subjects, in some case and for whole year they didn't write one or two subjects of expression, beside the spreading of slang language and wide spread of using it in many environments of educated people and reached to the teaching environment led to make the expression lesson a real problem because it requires talking with a formal language doesn't reside in their minds ³. Based on what is mentioned above, problem of research can emanate from the following question: What is the effect of teaching reading and texts by the two strategies of (CSR, Slap) on expressional performance of intermediate school students? Human lives a social life with a group of people connected with them by relations, neighborhood, hopes, pains, goals, ideas and emotions, so he is in need to understand them to let his life straight, human groups adopted movements, voices, symbols and means for this understanding and finalized with using the language, which is now the most important ways of understanding Language has a great social value, it is a human and conceptual behavior, has social and cultural context has it's evidence, symbols and contents, also it achieve communication between individuals, by which people get connected with each other, achieving their purposes, sharing ideas, feeling and ideas, and asking for achieving their benefits from each other, God grants

Corresponding author:

College of Basic Education/ University of Babylon, Iraq.

human being with this grace exclusively, and it is the most important medium of communication, the means of first community to dye his members with social dye that has a vital role in merging the individual with his community plus to having it or well-adjusting for it influence the behavior of individual and his thinking and feeling⁴. Arabic language is one of the most ancient languages historically, culturally and structurally because it carried Islamic flag to the whole world, God blessed it when his almighty make it the language of holly Quran, language of science and knowledge for long centuries, science can't be done without it, knowledge doesn't transfer without it, starts from different religious sciences to many other sciences⁵. Arabic language has preserved it's vitality, purity and fruitfulness on the contrary of other language like Akadian, Aramic and Kinan languages and this attributed to Holly Quran, plus it's strength against any strange assault, to result in proving us with different expression styles, flexibility and diverse of terms and words and wide meaning in short words that we don't find in another languages⁶. Reading is main source of culture and human knowledge, through which human can brief all surrounding ambient and realize every life activities and then brief his nation's history buried in books and major sources, and knowing the heritage of other nations⁷, because it follows logic serial in dealing with written deed as an ideal factor and not a random one in withdrawing the text toward more shining places, in other words, reading with written text make an excavating work with a clear purpose, and specifying this purpose in forming the first vision of reading that represents an enrolling process includes exploring and interpretation together (8). Writing expression has a big importance because it all what have been written in students copybook, and is considered the medium of contact between the individual with whom is too far from him and need for such expression is so urgent in all occupations, it is not about communication but also feelings, senses opinions, needs and transforming information by a well-written speaking with all grammars rules and include good ideas⁸. Style of teacher and his behavior in teaching in front of students is so important and influences in forming their trends and growth them. Cultured teacher is that one who makes Arabic language is correlated with free reading in home or library, he would be successful when he make a tough relation between them and book by free and diverse reading beside out of curriculum materials. It is so important for the teacher to be aware of teaching

methods and diverse strategies of teaching, ability to use them, to help him to choose the most appropriate one for student's ability, how much it connected to their life, their trends and needs and their future aspiration⁹.

Strategy of (CSR) is considered one of the important strategies that helps student to understand the read material via preliminary show and specify difficult elements as they help students to understand and remember the read material that invest the old information in cognitive structures of learners in the new teaching via exploring relations between previous knowledge and new one that are not existed in between it and previous knowledge¹⁰. The strategy (Slap) represents one of the modern strategies in the process of teaching, it focused on reaching to best learning the learner can get, because it liberate the students from the classic styles in thinking and how to express themselves, and gives them the chance of expression freely and urge them for thinking, innovation and inventing. The researcher sees that the two strategies (Slap, CSR) are important strategies that depend upon the student to get information that growth their culture and increase their magnitude of language, beside they match with intermediate student's age. Researcher chose the intermediate grade to proceed the experiment of research and it represent the transitional period from childhood to early adolescence age, that enables students to practice mental processes to be able to increase their abilities of reading, understanding, thinking and reaching to solve problems that they may confront in daily life.

METHODOLOGY

The researcher used experimental method to achieve the research's goal, experimental method is considered the appropriate method for procedures of research.

Population of research and it's sample

Population

The researcher specified the research population by students of 2nd intermediate grade in intermediate and secondary schools (day time)for girls that include two classes or more in Al-Hashmiyah district that belongs to Babel province to chose a school to be the basic research sample.

A- School's sample: The researcher used the random method to chose the research's sample which the method that ensure no bias for any

specific school, after random withdrawing (Almanar Intermediate School) in Al-Hashimiyah district to be the center where experiment was implemented.

- B- Student's sample: students sample was (97) student as (35) female student in the 1st experimental group, (32) female students in 2nd experimental group, (30) female student in the controlling group.

Equivalent of two groups of research.

The researcher compensated between two groups in the following variables: age of student, education of their fathers, grades of Arabic language in first semester (2017-2018).

Specifying the scientific material.

the researcher specified the subject of study that will be studied during period of experiment, subjects were nine, from the curriculum material of reading and texts prepared for 2nd intermediate grade's students, these subjects are (will from dying man, which one is more loyal, spring, pioneer of chemistry: Jabir Bin Hayan, fresh of hope, Beauty of my country, Noor Mohammed, intact logic).

Behavioral goals and teaching plans: The researcher has created (102) behavioral goals according to Bloom classification for behavioral goals were offered to check by experts and referees to make sure of their validity, also she prepared eight teaching plans for each group of the research's groups according to the curriculum materials, she offered three of samples to specialist expert to check their validity.

RESULTS AND DISCUSSION

Main Zero Hypothesis To verify validity of zero hypothesis after correction of student's answers, she used analyzing uni-contrast (F) to make sure of evidence difference evidence between groups table 1. After statistical processing explained above and existence of differences with statistical evidence, value of (F) calculated (14,13) is bigger than tabular value of (3,07) in the after test of expressional performance.

Zero hypotheses and their types:

To verify the validity of zero sub-hypothesis, the researcher used Shiveh's method for diverse dimensional comparison as shown in the table 2. It is clear to see in the table above, results of differences among three groups of research, average of students' grades of 1st experimental group is (62,94) , average grade of controlling group is (52,00), that refers to existence of statistic evidence differences as the calculated value is (11,17) and it is higher than the critical value (2,48), also appears that average grade of 2nd experimental group is (62,78) , average grade of controlling group is (52,00), that refers to existence of differences with statistical evidences as calculated value was (10,39) and it is higher than critic value of (2,48), average grades of first experimental group is (62,94), average grade of second experimental group is (62,78), that means no existence of difference with statistic evidences as the calculated value is (0.003) and it is less than critic value of (4,48). Results above mentioned showed exceeding of 1st and 2nd experimental group over the controlling group, and no existence of difference between the two experimental groups, the researcher attribute this result to the effectiveness of (CSR) and (SLap) from the following: Training students on scientific discussion via strategy of (CSR) participates in increasing their concentration on important ideas, and neglecting unnecessary details in text, increases the ability of students on using pronunciation and meanings in new situations. Connecting between important ideas from others and increasing of their abilities to distinguish between main ideas from sub ideas via strategy of (SLap), determining the goal that subject targets and consequently this increases ability of student to understand and realize. The two strategies of (CSR) and (SLap) help the students to participate by their ideas, feelings and excitations led to creation of a favorite environment for them, hence increasing of attention and interaction and earning of experiences then improvement of their abilities. Effectiveness of teaching by two strategies of (CSR) and (SLap), the reason may be attributed to earning of students and developing of their motivation toward learning and earning of information, led to increase of their marks and developing their criticizing thinking , the right method is that one which leads to the intended goals with simplest effort and less time, and urges the motivation of students and their self-activity toward learning and positive work and active participation in lesson.

Table 1. Analyzing uni-contrast (F) to make sure of evidence difference evidence between groups

Source of contrast	Degree of freedom	Total of squares	Average of squares	F value		Level of evidence
				calculated	tabular	
Among groups	2	2446,89	1223,446	14,13		Function
Inside groups	94	8139,35	86,589		3,07	Statistically with a level of (0,005)
Total	96	10586,24	1310,035			

Table 2. Shiveh's method for diverse dimensional comparison

Balancing		First		Second		Third		
Groups		1 st Experimental	Controlling	2 nd experimental	Controlling	1 st experimental	2 nd experimental	
	Math. average		62,94	52,00	62,78	52,00	62,94	62,78
Two values of Shiveh	Calculated	11,17		10,39		0.003		
	Critical	2,48						
Evidence of (0,05)		Function					Not function	

CONCLUSION

The two strategies of (CSR) and (SLap) have the positive effect to increase the ability of students to written expression and speed of conception for a subject. Through the interaction of the researcher with student she finds that depending the two strategies of (CSR) and (SLap) enables students to be able to connect what they have of previous information with new ones that they get.

ABSTRACT

One of the important electronic applications in recent years is organic – inorganic hybrid perovskite materials because of their many useful characterizations particularly the low cost, tunable optical properties and high-efficiency. In this work we used varieties of lead halides, PbCl_2 and PbBr_2 to prepare two types of perovskites, MAPbBr_3 and MAPbBr_2Cl by one step method then study their properties; structural, morphological and optical properties, to fabricate solar cells from these perovskites with preparation of TiO_2 nanocrystal as electron transport material ETM by hydrothermal method. The power conversion efficiency PCE achieved is 1.2 % and fill factor $\text{FF}=0.26$ for MAPbBr_3 perovskite while the power conversion efficiency PCE for MAPbBr_2Cl perovskite reached up to 0.9 % and fill factor $\text{FF}= 0.25$.

Keywords: Perovskite, TiO_2 , Nanocrystals, solar cells, ETM.HTM

INTRODUCTION

The perovskite one of the most famous materials in researches electronic attention in the last ten years ago because of there are some important properties, which including long-ranged balanced electron and hole transport, tunable bandgap, facile deposition techniques, low cost and high-efficiency¹⁻³. The chemical structure formula of perovskite it is ABX_3 ^{4,5} where A is a bulky cation which occupies a cubo-octahedral site shared with 12X anions, usually it is represent methyl ammonium group CH_3NH_3^+ or formamidinium group $\text{FA}(\text{HC}(\text{NH}))^+$, and B is a smaller cation stabilized in an octahedral site shared with 6X anions e.g. Pb^{+2} , Sn^{+2} , Cu^{+2} , Ni^{+2} , Co^{+2} , Fe^{+2} , Mn^{+2} , Cr^{+2} , Pd^{+2} , Cd^{+2} , Ge^{+2} , Eu^{+2} or Yb^{+2} , and X is anion halogen e.g. halides chloride Cl, bromide Br and iodide I, respectively^{6,7}. The perovskite kind methyl ammonium lead halide perovskite (MAPbX_3 , MA = methyl ammonium) hybrid organic-inorganic attention has recently increased with these structure in particular

as photovoltaic devices, where it's have bandgap easily effectively adjusted by changing the cation, the metal or the halide in addition the power conversion efficiency (PCE) has skyrocketed from 3.8% to more than 20% in just 10 years^{2,8}. The optical properties of perovskites explain that $\text{CH}_3\text{NH}_3\text{PbX}_3$ have a direct bandgap and equal 1.55 eV, 2.2 eV and 3.0 eV for MAPbI_3 , MAPbBr_3 and MAPbCl_3 respectively, in addition the absorption edges for $\text{CH}_3\text{NH}_3\text{PbX}_3$ perovskites its different values where the MAPbI_3 have great value while the MAPbBr_3 and MAPbCl_3 less than, this effect at the highest occupied molecular orbital (HOMO) -5.23 eV -5.6 eV -5.82eV and the lowest unoccupied molecular orbital (LUMO) energy levels -3.66 eV -3.4 eV 2.94eV^{11,12}. When mixed more one halide element with methyl ammonium under controlled ratios, we get a perovskite have optical properties are different at the primary perovskites MAPbI_3 , MAPbBr_3 and MAPbCl_3 , which sometimes using as enhancement of perovskites properties¹³. In this study, we focused at the preparation of MAPbBr_3 , MAPbBr_2Cl perovskites to fabricated a solar cells benefiting from TiO_2 nanorod.

MATERIALS AND METHOD

Materials

FTO glass, acetone, 2-propanol, Titanium(IV)

butoxide, TiCl_4 , Methylamine CH_3NH_2 (MA), Hydrobromic acid HBr, Hydrochloric acid HCl, Lead halogen PbBr_2 , PbCl_2 and dimethyl formamide DMF.

Preparation of TiO_2 Nanocrystal

TiO_2 Nanorod (TiO_2Nod) prepared by hydrothermal method, firstly we cleaned FTO glass by acetone, 2-propanol subsequently using the ultrasonic. Immersed FTO in the Teflon stainless steel autoclave contain the precursor of titanium perpend from adding 15 ml HCl, 15 ml deionized water and 0.25 ml titanium(IV) butoxide. The autoclave conducted for 7 hours at 170°C with a temperature controlled furnace¹⁴. After hydrothermal process, the samples were cleaned with in deionized water and annealing at 450°C for 45 min. The resulting of TiO_2Ncs treatment with TiCl_4 by immersed in TiCl_4 aqueous (0.57 ml TiCl_4 with 100 ml deionized water) at 80°C for 30 min then annealed at 450°C 30 min again^{15, 16}.

Preparation methyl ammonium salt MAX (X= Br, Cl) were synthesis similar report of described elsewhere¹⁷. Briefly reacting 20 ml from CH_3NH_2 with 30 ml from HBr to prepare MABr and 22 ml from HCl for MACl, in round-bottom flask beaker in the ice about 0°C for 2h with stirring. The precipitates were recovered by putting the solution on rotary vacuum to evaporated at 60°C for 1h to remove the solvents. The crystals were washed using diethyl ether and ethanol several times then dried by evaporated again for several hours to result crystal powder and stored it in dark dry place.

Perovskites preparation

MAPbBr_3 preparation mixing (0.25g) MABr, PbBr_2 (3.08 g) with 2 ml from DMF and stirring several hours at 60°C , by spin-coating we dropped the solution at TiO_2Nod for 1500 rpm/5 sec, 2500 rpm/45 sec at sequentially, then annealed at 60°C for 30min. MAPbBr_2Cl preparation by mixing equal molar ratio from MACl (0.27 g) and PbBr_2 (1.5g) dissolved in 2ml from DMF at room temperature with stirring several hours, then dropped the solution at TiO_2Ncs substrate with spin-coating for 1500 rpm/5 sec then 2500 rpm/45 sec, finally the film annealed at 120°C for 30 min.

RESULTS AND DISCUSSION

The perovskites MAPbBr_3 and MAPbBr_2Cl was

fabricated to design a solar cells, first we distinguish the crystallization of perovskites by XRD were there are peaks for MAPbBr_3 , the most important at 15, 21, 30, 33.5, 43 and 46 peaks and the indexed (100), (110), (200), (210), (220) and (300) respectively and the MAPbBr_2Cl have same peaks at 15, 21, 30, 43 and 46 for same indexed (100), (110), (200), (210), (220) and (300) respectively. The phase of the MAPbBr_2Cl it was single phase, the space group ($pm3m$) and unit cell $a=5.95$ see Figure 1^{18,19}. Figure 2a shows the absorption spectrum of the perovskites, we found the absorption edge for the MAPbBr_3 equal 520 nm and nearly 518 nm for MAPbBr_2Cl which have absorbance value higher than of MAPbBr_3 and this is due to the large grain size of MAPbBr_3 perovskite which appear in the SEM images¹⁸⁻²¹. The band gaps were calculated by using Kubelka–Munk method which dependent at reflectivity spectrum of perovskites for this perovskites, where the direct band gap about 2.28 eV for MAPbBr_3 and for MAPbBr_2Cl Figure 2b, and here, it turns out that the energy gap can be tuning by controlling the component ratios of the halogens, where the energy gap approaching the values of the main compositions (MAPbI_3 , MAPbBr_3 and MAPbBr_2Cl) depending at the I, Br and Cl. The morphology of surface devices were determine by Field Emission Scanning Electron Microscope FESEM show in the Figure 5a for the MAPbBr_3 and Figure 5b for the MAPbBr_2Cl perovskite, we can see the crystal size of MAPbBr_3 biggest than MAPbBr_2Cl perovskite. The schematic diagram of the perovskite device structure shows in the figure 3, its consist of FTO/ TiO_2Ncs / MAPbX_3 /Ag, the $\text{TiO}_2\text{Ncs}/\text{MAPbX}_3$ act as n-type and the MAPbX_3/Ag act as p-type when the light incident through the FTO glass substrate. Figure 4 shows J-V and intensity characteristic, the parameters of solar cell for MAPbBr_3 perovskite after illumination light equal 1.5 AM (100 mWcm^{-2}). The maximum values for voltage and current $V_{max} = 0.22 \text{ V}$, $J_{max} = 5.5 \text{ mA.cm}^{-2}$ when the $V_{oc} = 0.43 \text{ V}$, $J_{sc} = 10.7 \text{ mA.cm}^{-2}$ and $\text{FF} = 0.26$ which resulted 1.23 % of $PCE = \frac{V_{max} I_{max}}{P_{in}} \times 100\%$

While the MAPbBr_2Cl perovskite solar cell parameters of the perovskite which were 0.9 % for the PCE at $V_{max} = 0.21 \text{ V}$, $J_{max} = 4.3 \text{ mA.cm}^{-2}$ when the $V_{oc} = 0.42 \text{ V}$, $J_{sc} = 8.3 \text{ mA.cm}^{-2}$ and $\text{FF} = 0.25$. When compared the results in both solar cells the PCE of MAPbBr_2Cl decreased than MAPbBr_3 . This due to of

decreasing the values of V_{max} and J_{max} than the MAPbBr₃ perovskite and this because of the difference in the crystal size for these perovskites²². The J-V curve appeared near ohmic behavior which due to differ the work function between Ag and perovskites which can be enhancement by addition materials as hole transport materials like spiro-OMeTAD, and the preparation of perovskites under environment controlling of humidity .

Figure 1. XRD pattern for the MAPbBr₃ and MAPbBr₂Cl perovskites

Figure 2(a). Absorbance spectrum to the MAPbBr₃ and MAPbBr₂Cl (b) The energy of bandgap.

Figure 3. The images of FESEM (a) for MAPbBr₃ perovskite (b) MAPbBr₂Cl perovskite

Figure 4. Shows J-V and intensity characteristic for MAPbBr₃ and MAPbBr₂Cl perovskite

CONCLUSION

The solar cells fabricated after prepared of two types organic-inorganic hybrid perovskites MAPbBr₃ and MAPbBr₂Cl. Changing in the ratio and kind of halogen Br and Cl, allowed to tuning the band gap of the perovskite. These solar cells have 1.23% and 0.9% power conversion efficiency *PCE* for MAPbBr₃ and MAPbBr₂Cl perovskite respectively after illumination light equal 1.5 AM (100 mWcm⁻²). The advantage of TiO₂ Nod as electron transport materials to increase the surface area of solar cell an addition it's used as a light harvesting.

Improving an Illumination System in the Microscopic Imaging of Nuclear Tracks Using Light Emitting Diode

Saja Faez Hassan¹, Iman Tarik Al-Alawy², Hazim Gati Daway²

¹Physics Department, Education College, ²Physics Department, Science College, Mustansiriyah University, Iraq

ABSTRACT

In this study, images vision of nuclear tracks was increased using two methods. The first is to design a new light system based on Light-Emitting Diodes (LED) light instead of traditional fluorescent light used in the optical microscope. Due to the high dynamic range of the LED light, a high vision and an extra number of tracks were obtained during shooting. The second method is to establish a new scale depended on counting nuclear tracks. That is called No-Reference Image Quality Assessment Based on Wavelet Transform (NIQWT) scale. The quality of captured images was evaluated and no-reference scales like Entropy of First Derivative (EFD), Average Gradient (AG), the Measure of Enhancement by Entropy (EMEE), and (NIQWT) were calculated to be recommended. Then a good correlation coefficient was obtained for these scales. The best correlated coefficient 0.9032 was for (NIAWT) scale. Whereas, the statically results illustrated photography when using LED light much better than Florescent light in the optical microscopy. Therefore, these processes led to augment numbering of nuclear tracks discovered.

Keywords: *image quality assessment; nuclear tracks; CR-39 detector; LED light; wavelet domain.*

INTRODUCTION

Proper illumination is essential for optical microscope. Whereas in early years in candescent light was the only illumination. Today more specialized light sources, such as laser or arc lamp are being used. Due to the high efficiency and brightness of the LED, it has become a serious alternative to almost all types of illumination in the optical microscope. LED has high durability, no need for expensive electronics, and can be switched within a nanosecond. This makes them ideal sources of light when used instead of fluorescent in the optical microscope. The white color LED, which is between 2,600 and 5,000K, is an excellent choice for bright field illumination with the added advantage of simple brightness adjustments without changing the spectrum. This study discusses different types of LEDs, how they are used in fluorescence microscope, and how to use LED as specialized illumination source s for

transmitting resonance energy and fluorescent lifetime imaging microscopy ¹. No-reference quantitative evaluation of image quality is one of the most pressing and difficult problems in image processing. Generalized contrast is the most important quantitative characteristic which can determine the objective quality of the image. The objective of study is the process of no reference measurements to assess the image quality of the nuclear tracks. The purpose of the work is to increase the number of nuclear tracks detected at different levels of lightness in the optical microscope using a light emitting diode source. Actually, a new development on the quality of the reference image using the NIQWT scale for the accurate of nuclear tracks is an urgent need in nuclear studies because augmenting the analysis image has led to an increase in the number of nuclear tracks detected. This will also improve the accuracy of nuclear measurements better than conventional method of manual sorting of nuclear tracks. In fact, these methods are able to improve SSNTDs applications, particularly when by image processing techniques ³. In (2012), *Zylstra* et al. used analysis model to account the tracks in CR-39 detector ⁴. Hussain A. Al-Jobori et al. measured track parameters using MATLAB ⁵. A computer program named TRIAC

I and TRIAC II was produced in MATLAB by Patiris et al. ⁶ to recognize the tracks and track parameters measurements from CR-39 solid state nuclear track detector images.

MATERIALS AND METHOD

This work has for the first time explored a new method of the enhancement of an illumination of optical microscopy in SSTNDs applications⁷. CR-39 track detector: Polyallyle diglycol carbonate - PADC which is generally referred as CR-39 is the most sensitive nuclear detector to record nuclear tracks. It was first discovered by Cartwright ⁸, and this detector consists of short polyallyle chains joined by links containing carbonate and die ethylene glycol groups into a dense three dimensional. The chemical form of CR-39 detector is . The properties of CR-39 detector⁹:

1. Amorphous polymer.
2. Optically clear.
3. Environmentally very stable.
4. Having non – solvent chemical etchant.
5. Highly cross – linked thermoset.
6. Sensitive to heavy ion damage.

Track formation mechanisms in dielectric media

When the cellulose nitrates can record α -particles (with certain energy depending on the etching condition) The CR-39 plastic can also exposed to thermal neutrons, which yield α -particles from the (n, α) reaction on the boron (or on the lithium)[10].The latent tracks can be etched with the help of a suitable etchant (often a simple alkali or acid, e.g. NaOH or FH), so that they become visible under an optical microscope,(with diameter of a (μ m) or more).

Alpha Particle (nuclear track)

The alpha particles were emitted by Americium decay; impinge on a target, producing neutrons over a broad range of energies with an average energy 4.2MeV and a maximum 10MeV ¹¹⁻¹³.

Light Source

Light is only one part of the various electromagnetic waves that fly through space. These waves contain frequency and length. Light values can be distinguished from other forms of energy on the electromagnetic

spectrum. Light is emitted from a body due to Incandescence, Electric Discharge, Electro luminescence and Photoluminescence ¹⁴. Images cannot be found without lighting.

Moreover, the general factors that effect on the light equality assessment have been determined.

Light Emitting Diode (LED)

The basic operating principle behind light emitting diodes LED is that inducing the conduction by negatively charged carriers (n-type) and some by positively charged carriers (p-type). When charged carriers of different types recombine, the released energy may be emitted as light [15]. LED lamps are the latest and newest addition to the list of energy efficient light sources. And that LED lamps emit visible light in a very narrow spectral band, they can produce “white light”. This is achieved either a by using a red-blue-green array or a phosphor-coated blue LED lamp, as well as its light decay is less than 10,000-hour testing. Although it is still in its infancy, the LED lighting techniques are rapidly and show promise for the future.

No- Reference Image Quality

The development of NR image quality measures is largely motivated by the fact that human beings can easily identify image quality without seeing a distortion-free image, and moreover, different individual observers tend to have similar image quality opinions. However, the HVS is enormously complex and current knowledge of the human visual perception is far from complete. In particular, there exists such factors like learning, visual context, and cognitive relevance in the human visual perception that can hardly be quantified. NR image quality assessment thus turns out to be an extremely difficult task. The field of NR image quality assessment has experienced fast advances in recent years and the number of new approaches that are being proposed is growing rapidly. At present, most existing NR image quality measures are designed with prior knowledge of the distortion. Fortunately, the distortion process is known in many applications, and the task of developing distortion-specific NR quality measures is of practical importance.

Image Quality Measurement (IQM)

Measuring image quality of image is a complex and difficult process because human opinion is influenced by

physical and psychological parameters. Many techniques are proposed to measure image quality but none are ideal for measuring quality. Hence, image quality assessment plays an important role in the field of image processing. Image quality metrics are divided in to two and objective types. Most IQMs are related to the difference between the two images (the original image and the distorted). This type is called reference IQM, while the other IQM

is not related to the difference between the two images, such as the reduce reference IQM and the no reference IQM. Three no-reference scales are in use:

RESULTS AND DISCUSSION

There are two methods to improve the lighting system to shoot the nuclear tracks in the optical microscope:

$$c(u, d, T) = \int_0^T u \cdot \frac{1}{(4\pi Dt)^{\frac{3}{2}}} \cdot \exp\left(\frac{-d^2}{4Dt}\right) \quad (1)$$

where D is the diffusion coefficient of the communication medium. If more than one nanomachine diffuses a unit u molecules, a receiver nanomachine j accumulates the sensed molecules through the summation of the values of $c(u, d, T)$ over diffusing nanomachines i , i.e., nanomachine j senses molecules in total during the interval $[t, t + T]$

$$\sum_i c(u_i, d_{(i,j)}, T_i) - c(u_i, d_{(i,j)}, [T_i - T]_+) \quad (2)$$

where, $d_{(i,j)}$ is the distance between nanomachines i and j , T_i is the time that passed from the diffusion of nanomachine i up to time $t + T$, i.e., nanomachine i diffused at time $(t + T - T_i)$, u_i is the unit of molecules by nanomachine i at that time, and $[T_i - T]_+$ equals to $\max\{T_i - T, 0\}$. In other words, the receiver nanomachine senses the total amount of molecules that have been in its nearest proximity in the time interval $[t, t + T]$ without being able to distinguish which molecules come from which transmitter. If the amount of sensed molecules is greater than or equal to threshold τ , it will be considered as 1, otherwise it is 0. The curve of the function. In Figure 1, $c(u, d, T)$ (the detected molecules) is computed, which represents the peak of molecular concentration sensed by receiver nanomachines at $d= 0.01, 0.5, \text{ and } 1$ from a transmitter nanomachine. The transmitter nanomachine is assumed to diffuse $u=1$ molecule, in a medium with diffusion coefficient $D=10 \text{ cm}^2/\text{sec}$, initial value of time $t=0$ (the parameters values are based on an experiment in ¹², the value of threshold is assumed to equal $\tau=0.5$, through the experiment t is incremented by 0.01. The peak of the sensed molecular concentration is inversely proportional to the distance between transmitter and receiver nanomachines.

Time Slots Length

All the nanomachines n in the network are assumed to be synchronized, and can communicate in a predefined time slot T_0 . Where T_0 is a system parameter and its length depends on the network's geometric properties, such that $T_0 = v \frac{d_{max}^2}{D}$, where v is a constant that can be equal 1; d_{max} is the transmission range distance of $node_c$, and D is the diffusion coefficient.

New Scale Called; No-Reference Image Quality-Assessment Based On Wavelet Transform (NIQWT)

Wavelet transforms are one of the most important and beneficial tools for image processing. It has been used in image processing, data Compression and signal processing. In MATLAB program worked on the histogram for HL component for the original images means that discrete wavelet transform, there are only a limited number of wavelet coefficients for each bounded rectangular region in the upper half plan. Then the HL transform image histogram have been created. Finally the calculation of WBH which represent the inverted of a maximum histogram. This method is called No-reference quantitative assessment of image quality (NQWIT) which is one of the most pressing and difficult problems of image processing. This feature can be the No-reference quality measure.

Microscopy Florescent Light changed by Light Emission Diode (LED)

Images with good lighting and contrast are of great importance in statistics and get a clear vision of the nuclear tracks. So image quality analysis is important for these tracks. This study determined the quality of the image that changes the light and contrast by controlling the level of light captured by the tracks images under the optical microscope. A new lighting system was used with the light emitting diode (LED) to generate

different levels of lightness from (93)Lux to (1255)Lux as needed. In this work, the CR-39 detector was selected with a thickness of 500mm² and an area of (1X1) cm². It was exposed to the radioactive source for a period of 3 minutes and it was placed at 3.5 cm far from the detector. The chemical etching was then performed for 180 minutes, after which the tracks were dried. Video images were then taken at different illumination levels using LED light rather than fluorescent light. The light levels were measured by Lux meter device, with (HDEC-50B) camera size (3)μpixel with and zoom (40x) under optical microscope, see Figure (1). The aim of this work was to answer the question: What is the best level of illumination to capture the picture under the optical microscope? The answer is to propose a non-reference scale of images based on the number of nuclear tracks, as tabulated in Table 1. Then calculate the correlation coefficient for all images for different levels of lighting and for different non-reference scales such as (EFD, AG, EME, and NIQWT). At the light level (949)Lux, the highest correlation coefficient using the (NIQWT) scale was found depending on the counting of the tracks, which means that the detected nuclear tracks will be increased in this area. These results are described in table (2). Thus, different levels of lighting were applied that make the image with high quality as shown in the figure ^{3,4} which show that the use of no-reference NIQWT scale of correlation coefficient is better than other scales.

Table 1. Accounting of nuclear tracks for nine sets of images captured at different levels of lightness under the optical microscope

678	-0.0648	0.4765	0.1046	0.2418
949	0.4367	0.3510	0.2894	0.9032
1238	0.5516	0.5967	0.4121	0.6067
1255	0.6433	0.8794	0.4885	0.7870

CONCLUSION

In this work the distribution of lighting for LED source was used. LEDs have gained popularity in our homes and started to migrate to researchers and laboratories, with their ease of use, long lifetimes, and low waste; they will continue to take over the role of the traditional mercury arc lamp. Nine sets of images with different luminance were captured. New Quality scale (NIQWT) was used to calculate quality factor as well as other well-known standards (Entropy, average gradient, and EME) and the extraction of correlation coefficient with comparison of manually account for nuclear tracks for different levels lightness (93,112, 215, 334, 410, 678, 949, 1238, and 1255) LUX with their histogram. The best correlation coefficient to specify the intensity level for CR-39 detector to detect alpha particles was with best resolution for the tracks. Therefore, increasing of nuclear tracks found was due to the increase in an illumination (lightness) in which images are captured. This does not mean the necessarily of increasing in image quality. Thus, there are lighting levels that make the image having high quality which is (949) Lux:

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Physics Department, Education College, Mustansiriyah University, Iraq and

all experiments were carried out in accordance with approved guidelines.

Social Psychology, Political and Scientific Situation of the Eighth Century AH the era of the Pride Investigators (Fakhr Al-Muhakikin)

Ali Obayes Hussein¹, Yousif Kadhum Gogahle¹, Abdulsattar Nsaif Jasim¹

¹College of Education for Human Sciences, University of Babylon, Hillah City, Iraq

ABSTRACT

Social psychology uses scientific methods to study how people relate to each other. As such, many of its most basic and classic findings are relevant to civil politics. Hilla, is the city of science and scientists, which emerged many scholars and scientists, the beginning of the journey of Islamic sciences started in that era since it was established in 495 AH / 1101 AD, especially in the era of Mohammed bin Ahmed bin Idris Al Aajali, 598 AH / 1202 AD, who criticized the views of Sheikh Tusi that has turned the attentions to Hilla for four centuries, Hilla embraced the scientific schools many centuries. He gave many scholars, whether from Hilla or outside Hilla Ijazats, and most notably Mohammed bin Makki, who turned publishing the science of the people of the prophet's household outside and inside Hilla. He wrote a lot of books in the fundamentals of jurisprudence, theology and other sciences. The social status which lived in by Al-Allamma played a prominent role in Hilla and his father's great love for him and his relation to the Mughal Sultan led him to his killing, in which many scholars differed.

Keyword: *Psychology, Social, Scientific situation, Political*

INTRODUCTION

Social psychology is increasingly asked to solve the problems that civil society is facing. Major societal issues prompt fierce debates and each side tries to bolster their position by reference to scientific evidence and expertise. Social psychologists will praise the usefulness and the relevance of their theories to meet the demand of those fields ¹. It sometimes results in the same research appearing in different specialized journals – modified only to suit the conventions of that publication. If some theories are robust and have been empirically tested with success in different fields, others are more specific and can be transferred to a different field only artificially. Most of those fields are classic (health, education, law, work, organizations, etc) and usually form handbooks of applied social psychology,

together with their methodological specifics. However, in addition to these traditional fields ²⁻³, there now appear more occasional fields, such as environment, economy and finance, media and new technologies, diversity, etc, which pertain to new social needs or preoccupations. This study shed light on the character of Mohammed bin Hassan al-Hilli (the pride of investigators), one of the flags of the eighth century AH, who was characterized and called (Zain Al-Mujtahideen) and knew his knowledge from his father. Mohammad Bin Al Hasan Al Hilli was a great man of high and high regard and raised in the house of his father (Allamma Al-Hilli), he was interested in teaching, completed his father's books in response to the commandment, he recommended and presided over his father's high school (Hilli school) after the death of his father. He was taught by his father and gave a lot of (Igeazats) ⁴, we shed lights on (Igazats of the pride of investigators) to scholars and jurists from home and abroad. This research is divided into an introduction and three topics ⁵. The first deals with Hilla, the center of science, and the role of Al Hilli in this great city, who had the significant role of making (Khadbanda Muhammad), the Sultan of Mughal one of Islamic shia doctrine.

Ali Obayes Hussein

College of Education for Human Sciences, University of Babylon, Hillah City, Iraq

METHODOLOGY

The second topic deals with the Shikhs of his teaching times, his birth and his children, and the political and social situations of the Islamic eighth century AH. And the third topic is about the (Igazat), dealing with his death and his writings as well. Finally, we hope that God Almighty has helped us to show this great personality in the Islamic and social history of Iraq in general terms and in Hilla city in particular. Hilla is one of the Iraqi rich cities in science, which was characterized by scientific status and appeared in the Islamic scientific renaissance for several centuries and then increased the rise of thought by its founder Sadaqa Bin Maziad¹. It was known as (Two Mosques), which today is one of the areas of the city, compared to the two mosques in which the prince of the faithful (Ali bin Abi Talib) prayed during his return from his battles in Safin and Nahrawan 36, 377 AH / 656 AD, 657 AD, he stayed there for forty-five days waiting for one of his army commanders, Abdul Aziz Al-Saray², who was wounded, after his arrival. Imam Ali washed him and buried him and the grave was still there. Al-Hamwi⁽⁵⁾ said: Hilla is a large city located between Kufa and Baghdad and it was called (two mosques), the house of the sword of the state Sadaqah bin Dibis bin Ali bin Maysaid al-Asadi in Muharram (495 AH / 1101 AD) the first one who discovered and lived there, It was a refuge where the sepulchers were housed, He and his army were housed and built the beautiful and luxurious houses so it became a refuge for him and his people, because of that it became the most beautiful city, the merchants intended to come to the best city in the country of Iraq and the best life during (Saif Al Dawla) time. The first person who gave it the name so-called Hilla (Al saifya) is Al Imam Ali⁶ and also visited by many travelers, including what Yadge said during his visit to Hilla in 1307 AH / 1890 AD: Hilla is the most urban and educated for the past centuries⁽⁷⁾. The city of Hilla was rectangular, located on the right side of the Euphrates river, extending along the river¹, A problem was based on occurrence of a critical predicament (the divorce of his wife) that he was very angry with his wife and divorces her illegally so he gathered on the necessity of the analysts opinions, who were disagreed by the Sultan divorce of his wife thinking that the divorce was legally, one of his ministers suggested him to reference to the Shia doctrine, which says the invalidity of this divorce and brought the scholars of the doctrine of Hilla in Iraq and rely on their

options, they attended with the scholar Al Hilli expressing the invalidity of the divorce for the condition of the requirement of two witnesses, discussions were held between Al Hilli and scientists and other doctrines violently, At last, Sultan Mohammed Khadabandh believed in Al- Shia doctrine⁹, making the shia doctrine is the official one in the country. After the official declaration of Shiism by Khadbanda in all parts of the country, Hilli assigned the establishment of a "Moving school" equipped with all the equipment carried to the various regions in the Azerbaijan in summer and Baghdad in winter⁴. The activity of the intellectual movement in Hilla in the eighth century AH, and the role of scientists a prominent impact of the attention of scientists in the world to take from them sciences And they give them license, including the house of Al Alamma, which became the beacon of scientists and science, however, it was the exit of many scientists and scholars, including Alamma, which was intended to Hilla, Mr. Muhanna bin Sinan civil was the first who read his works in (717 AH) and Alamma Al Hilli praised in all his books and novels⁽²⁵⁾. Mohammad Bin Al Hasan Al Hilli was his father's partner not only at the Al- (Halayyah school) but in the house of Al-'Allamma also⁽²⁷⁾. Not only were the teaching houses, there were councils in Hilla, including the Council of Al-Hilli, the son of the Alamma, the teaching was issued after the death of the Allamma Al-Hilli his father and entered the council of a group of scientists (28). Ijazat It is an Arabic word means the permission that one person permits to another to narrate the speech, It has known as ((the words of the summary included the creation of permission in the narration of talk about him after telling him in general and the amounts of common and commonly known in his book this permission includes the mention of books and works. And to mention to the religious sheikhs of the authorized authority in the speech as well as mentioning the sheikhs opinions of each of these sheikhs in social and religious classes after another until the basic ending to the infallible people. His Ijazat (Sheikh Izz al-Din al-Hilli) Hassan bin Ahmed bin Muzaher Al-Hilli who has Ijazat from Muhamad Bin Alhasn Al Hilli in 741 AH, put him Sheikh Faqih Izz al-Din bin Muzaher and the first written on the copy (rules) and dated in (714 AH) (happy jurisprudence, Abi Abd Allah (Ahmad Bin Balko) bin Abi Talib bin Ali Sheikh Abu Abul Fotouh Al Owi for the Ijazat of the Allamma Al Hilli and about his son Muhammad 705 AH, Hassan bin Mohammed bin Ibrahim bin Sheikh Ezz

al - Din ibn Shams al - Din al - Damascene who has Ijazat of Mohammad Al Hilli 753 on the back of the rules, Imad al-Din al-Kashi, Hussein bin Mohammed bin Ahmed, the father of Sheikh Abi Saeed has three Ijazat from Mohammed Al Hilli (759 AH), Hamza bin Hamza bin Mohammed Nasser Al-Din Al-Alawi Al-Husseini is one of his students has Ijazat in the year 736 AH, Haidar bin Ali bin Haidar Al - Amali Hussein Al - Obaidly Sufi has two Ijazat of him in 759 AH and 761 AH, Abu Sa'id ibn al-Husayn ibn Muhammad ibn Ahmad al-Sheikh Taj al-Din al-Kashi has three Ijazat all in the year 759 AH, Abdul Karim Mohammed bin Ali bin Mohammed Al - Aaraj Al - Hussein Ghayath al - Din a student of Mohammed Al Hilli has it in the year 736 AH, Abdullah bin Muhammad bin Ali al-A'raj, who is Zia al-Din ibn Abd al-Din Muhi al-Din (Majd al-Din) Abi al-Fawares Muhammad ibn Ali al-Husseini, the younger brother of Amid al-Din (745 AH), and they were the sons of Al Allamma sister, Ali bin Hassan bin Ahmed bin Muzaher Zain al-Din AlHilli, the owner of the issues of demonstration and has two Ijazat in 741 AH and 755 AH, Mohammed bin Sadaqah Shams al-Din was one of the students of Mohammad Al Hilli his Ijazat in year 758 AH, Shams al-Din (Muhammad ibn Abi Talib) has Ijazat in 750 AH, Nizam al-Din Muhammad ibn 'Ala ibn al-Hasan and his Ijazat from Mohammad Al Hilli in 757 AH, Muhammad bin Hilal al-Owi is Shams al-Din Abu Yusuf Muhammad bin Hilal ibn Abi Talib bin Haj Muhammad ibn al-Hasan ibn Muhammad al-Owe has Ijazat in 705 AH of Mohammad Al Hilli, Mahmoud bin Mohammed bin Ali bin Yusuf al-Tabari, which is Mohammed al-Akbar Badr al-Din Abu al-Mahasin a student of Al Allamma and the Mohammad AlHilli in the year 708 AH, Makki bin Mohammed bin Hamed bin Ahmed Jamal al-Din Abu Muhammad al-Amli, the father of Mohammed bin Makki (734-786) and had Ijazat by Mohammad Al Hilli in the year 751 AH, Muhanna bin Sinan bin Abdul Wahab has Ijazat from Him, Al Sayedf Amin Eddin Abu Talib Ahmed bin Zahra al-Husseini has Ijazat from Mohammed Al Hilli in 756 AH, Jamal al-Din al-Istrabadi: Shaykh Jamal al-Din was a full-fledged figure. He was referred by Sheikh Abdul Muttalib bin Fakhr Abdul-Muttalib al-Khuzai as a student by Mohammad Al Hilli and his father (Alamma), and had given Ijazat, he has studied Sheikh Al-Ahli global Ijazat with (khat al fakhr), Jamal al-Din al-Istrabadi: Shaykh Jamal al-Din was a complete fad. He was referred to by Sheikh Abdul Muttalib bin Fakhr Abdul-Muttalib al-Khuzai as a student by Al Allamma

and his son, Sheikh Mohammed bin Mohammed Al-Esfandiari Amaly: Mohammad Al Hilli gave Sheikh Mohammed al-Esfandiari approved a copy of the book of Al-Murad in the explanation of the disqualification of the belief of Al-Alamma in 745 AH and then read on to His son Mohammad, Sheikh Abu al-Muzaffar Yahya bin Sheikh Fakhr Al Muhakikin (Mohammed Al Hilli): Abu al-Muzaffar Yahya bin al-Sheikh wrote a variety of classifications of his grandfather Al-Hilli, including a summary of words written by his father and his father gave him Ijazat and other Ijazats, Izz al-Din Hassan bin Qasim bin Bulbul (alive 730 AH) : The student of Mohammad Al Hilli and authorized him by saying (I have given Sheikh Faqih virtuous religious Hassan Bin Qasim bin Bulbul bin Kuttab editorial full Ijazat), Ibrahim bin Ali bin al-Hussein al-Turaihi 724 AH: one of his students, he had Ijazat in 717 AH, Ali bin Hassan Al-Sarabashnawi Al Hilli: He had Ijazat from Mohammad in (751 AH). His Works: The works of Mohammed bin Hassan al-Hilli (Fakhr Al muhakikin): Some of his work has not written yet, so next we will present most of his works: Tahseel Al Najat, Izah Al Foa'd fi Sharh Mushkilat Al Quaed =Izah Al Quaed, Jamie Alfawayid Fi Sharah Khutbat Alqawaed, Iirshad Almustarshidin Wahidayat Altaalibayn = Wajib Alaietiqad, Haashiat 'Iirshad Al'adhhan, Alhashiat Ealaa 'Anwar Almalkut Fi Sharah Alyaqut, Thlatht Wa'arbaeun Hdythana Nbwyana, Mueraj Alyaqin Fi Sharah Nahj Almustrshdin, Alfkhrya Fi Maerifat Alnya, Ghayat Alsuwawl Fi Sharah Tahdhib Alwusul 'Iilaa Eilm Al'usul, Aleaqayid Alfkhryt = Eaqayid Fakhar Aldiyn = Alaietiqadat, Sharah Alfusul Alnsyrya, Alnakt Alaetqadyt = Alrisalat Aljwabya = Almasayil Waljawabat = Alfkhrya Fi Aleaqayd, Alkhilasat Fi 'Usul Aldiyn Waleaqayid, Al Hag, Alkafiya Alwafiya Fi Alkalam, Nihayat Almamul Fi Sharah Mabadi Alwasul, Nihayat Alhal Fi 'Usul Alfaqih, Dawazidh 'Iimama, Wajibat Alslaat, Almasayil Alamlyat = Alhydrt = Al'asyilat Alamly, Almasayil Alnasryat, Almasayil Almazhryat = Alhawashiu Alfkhrya = Jawab Masayil Abn Mazahir, Almasayil Alfqhy, Almasayil Wal'ajuba, Masayil Suyl Eanha Fi Eilm Alkalam, Almasayil Alfkhrya, Wlellha Bieiniha Almasayil Almhnnya, Ujubat Almasayil Almhnnya = Almdnya, Ujubat Almasayil Alfqhy, Ujubat Masayil Fqhyat Libaed Alajila, Iijabat Masayil Alsyid Eala' Aldiyn Ely Bin Zahrt. Al-Qami said that the first person who had visited the grave of him said ((The owner of this grave must transfer, it was quoted by his father and then he mentioned the story of the one who visited the grave of his faithful

brother. Abdullah al-Mumqani said otherwise: "I did not stand on the spot of his burial place, which was transmitted by the sheikhs. His body has become unsafe for the cause of mobility, which is not advisable to transfer"⁽⁹⁰⁾. It had been known about father's love for him which his father called him the pride of investigators (Fakhr Al muhakikin) and the pride of religion (Fakhr Al dien). As well as his closeness to the Mughal Sultan and his knowledge and sciences. He was killed on Friday the fifteenth of Jumadi al-Akhra in 771 AH at the age of 89 years.

CONCLUSION

Political psychology applies what is known about human psychology to the study of political behavior, focusing on individuals within a specific political system. Topics such as terrorism, public support for fascism, and ethnocentrism are commonly studied within political psychology to gain better traction on the perennial question of how well citizens are equipped to handle their democratic responsibilities. The scholars of Hilla, especially the family of (Al-Mutaher) AL Allamma AL Hilli and his son, Fakhr Al Muhakikin (the pride of investigators) has a prominent influence in the social and political life of the rule of the Mongols, especially in the era of Muhammad (Khadbanda). Al-Hali and his son who accompanied his father Al-Hasan bin Yusuf bin al-Mutahar in his travels has founded the school in publishing the sciences of the prophet's household people. Muhammad ibn al-Hasan al-Hilli was headed in 771 AH after the death of his father the leadership of science teaching after his father. He completed and wrote his father's books, who recommended that to complete them according to his father's will. He gave many scholars, whether from Hilla or outside Hilla Ijazats, and most notably Mohammed bin Makki, who turned publishing the science of the people of the prophet's household outside and inside Hilla. He wrote a lot of books in the fundamentals of jurisprudence,

theology and other sciences. The social status which lived in by Al-Allamma played a prominent role in Hilla and his father's great love for him and his relation to the Mughal Sultan led him to his killing, in which many scholars differed. The family of Al Mutahr presented to the city of Hilla and the Islamic cities many scholars and scientists with a lot of sciences.

The Effectiveness of the Theory of Expansion in the Development of Mental Skills among Students

Dihya Uweed Alarnoosy¹, Amaal Sabah Radah Al-Taei¹

¹University of Babylon, Faculty of Basic Education, Iraq

ABSTRACT

The objectives of the current research are to identify the effectiveness of the expansionary theory in the development of mental skills among Fourth Grade students at the Faculty of Education for Human Sciences / Babylon University during the Academic Year 2017-2018. To achieve the research objectives, the researchers formulate the following hypotheses: The first hypothesis: There are no statistically significant differences at the level of significance (0.05) between the grades of the experimental and control groups in the performance of mental skills as a whole in the specified level of the questionnaire. The second hypothesis: There are no statistically significant differences at the level of significance (0.05) between the scores of the control group students in the pre-test and post-mental skills. The researchers adopted the experimental method, which has the ability to control the various factors affecting the phenomenon to be studied. The community of the study consists of (506) students, divided into (6) sections. The researchers conducted the pre-test of the sample and then their main experiment on the research sample, A curriculum based on the theory of expansion and then conducted the tests of dimension to be then processed statistically by (SPSS) program.

Keyword: *Development, Mental Skills, Effectiveness*

INTRODUCTION

The teacher preparation is one of the issues that has been and continues to occupy a large area of educational thought, and although it is one of the traditional issues, it is soon to put forward a new proposal with every development or change in dimension of the educational system, On the other hand, the success of development processes depends on the other hand. The teacher is the most important element in the educational process and its basic focus. It is the effective human element, which is the burden of the numbers and upbringing of the younger generations and giving them the basic qualities that are right and the direct responsibility for achieving the educational goals. , The efficiency of the educational system depends primarily on the efficiency and good preparation of the teacher ¹⁻³ . If the student can implement a mental skill successful implementation

of time, it means that he has the mental capacity to achieve this whenever he tried, but may be missed because his mind interferes improperly and spoils this mental and mental compatibility and reinforcement and can be demonstrated through the similarity of the process of developing the mental skill of students skills development process In technical development we show each one of them the most efficient techniques in the performance of special skill with advice on the use and with the improvement of students adapts this classical method commensurate with the body style and strength and length of the parties and the personality of the student. Al-Qatami (2011) confirms that the gradation of simple ideas to the most difficult described by the extended model helps to ensure that the learner is always aware of the educational context and the importance of different ideas being taught and allows him to learn the most appropriate level of difficulty, That ideas are not learned before their previous requirements are met and that it integrates the hierarchy with the overall structure of the extended sequence, as well as describing the use of parts of the strategies including learning sequential requirements at different points during the teaching

process⁴. In the light of what is mentioned above, it has been found that teachers in the Faculty of Education of Human Sciences, to keep pace with the modern scientific development research found the of the theory of expansion effective of the (Rijloth) in the development of mental skills of the students identified the problem of research in the question: The Effectiveness of Raigloth's Expanding Theory on Developing Mental Skills in Students. Education occupies an important place in societies progress, because it aims at bringing about changes in human behavior, developing personality and directing people towards the service of their society. This process leads to a comprehensive change in the individual's intellectual, emotional and performance behavior from the very beginning of life till the end of it⁵⁻⁷. Through their curricula, faculties of Education are tackled in three basic aspects : the academic ,the professional and cultural aspect, including the academic specialization materials that the student will teach in the future in the primary , secondary schools, and the professional side which is composed of two elements: facts and information related to the teaching profession, scientific and practical skills that enable him to apply facts and information and to help his students to complete their growth. These two elements are inseparable. They overlap and each complements the master's skill in teaching methods and educational materials .It is natural for a teacher to be successful when mastering the specialization materials, and vice versa i.e., whatever mastered of the specialization materials will help the teacher to be able to connect fully to his students .He will not be able to play his role as education professional without mastering the skills and methods of teaching and other educational materials^{9,10}. Building a professional teacher is considered one of the most important basics of enabling his student to achieve the mastery and the desired goals that designed and planned by professionals in education to meet the challenges of comprehensive progress in light of the scientific, technological, social and economic changes of contemporary societies. Due to the importance of teacher preparation, there has been developed systems and teaching methods and programs in Colleges of Education locally and globally so as to raise the faculties outputs of the Faculties of Education and to cope with current scientific and technological developments¹¹. The expansionist theory is one of the modern theories that researchers in Education attempt to use to understand educational phenomena in their multiple overlapping dimensions. The systemic approach

relies on the so-called system, which essentially means a set of objects that have been grouped together in a field with their interacting relationships to achieve specific goals. Thus, the Education researchers feel there is an urgent need to adopt the systemic approach so that they can pursue the complex nature of the educational problems that are affected by an interactive set of different variables¹². The theory of expansion is one of the useful means in organizing the American curriculum: elementary, preparatory, secondary and university taking into account the level of difficulty at each stage. It is based on the logical sequence from general to specific and from abstract to the concrete, with details of the content of the curriculum to several stages followed by the summary, synthesis and conclusion stages. It was called the expansionist theory because it deals with the content of the teaching material at the extended level. It deals with the organization of a set of general concepts, principles or procedures that are included in a curriculum unit, or a course of study taught throughout a month, semester or year. The expansionist theory aims at finding a set of codified formulas that depict the content of the curriculum and organize it in a logical sequence that starts from the general to the specific and will help to construct a knowledge-based cognitive structure. This arrangement gives a general idea and then gradually separates it. The overall introduction is followed by a detailed description of the contents of this introduction horizontally or vertically in several stages, depending on the number of stages of detail on the size and level of difficulty of the content of the course material.

METHODOLOGY

In order to achieve the objectives of this research, the researchers adopted the experimental approach which is a control of the variables and their control in experimental situations. The experimental method is characterized by the ability to control the various factors affecting the phenomenon to be studied.

Research community and Samples

Research Community refers to all individuals or objects with certain observable characteristics. The only test of society is the existence of a common property among its members, and the characteristics of the society that can be observed are "milestones of society". The research community consists of the Fourth Grade students in the Faculty of Education for Human Sciences

/ Babel for the Academic Year (2017-2018). They are (506) students.

Research Sample

The sample is a subset of a community with common characteristics, the purpose of which is to generalize the results from a larger community (Abu Hwij, 2002: 45). Researchers choose the intentional method.

Research Communities Parity

The researchers statistically paired between the two groups of research (experimental and control) statistically before the start of the program in some variables that are believed to affect the safety of the experiment and the accuracy of results. These variables are:

- A) Pre-test scores (for mental skills).
- b) Mental capacity.
- C) The time period calculated in months.
- H. Test scores of mental skills.

The researchers obtained data on the dependent variable after applying a pretest prepared to measure the previous intelligence information.

Measuring Tool

To avoid the effect of this variable, the two researchers used the two sets of research (pre-post test) of the mental skills scale: the mental skills questionnaire is used to identify strengths and weaknesses and to follow their progress. The questionnaire is an adopted one which designed by two British psychologists - University of North Wales.

The questionnaire measures seven important aspects of the mental side:

- 1- The ability to imagine.
- 2 - Mental preparation.
- 3. Self-confidence.
- 4 - Dealing with anxiety.
- 5. Ability to focus.
- 6. The ability to relax.
- 7. Motivation.

The researchers have built an objective test according to the type of importance, since this type of test has many positives like its comprehensiveness and objectivity (truthfulness and consistency), as well as the ease of correction and lack of guessing effect. It is also more exciting and interesting for the student taking no long time to perform. The test paragraphs were derived by examining a number of literature in the curricula and teaching methods, writings related to mental skills, and extrapolating previous research and studies in the field of mental skills development.

Selection of Experimental Design

The experimental design means conducting a basic structure of an experiment, including the description of the groups that comprise the experiment members and the identification of the ways in which the sample is selected). Therefore, the researchers should choose an appropriate experimental design before conducting the experiment in order to test the validity of the results, noting that the educational experimental research did not arrive at a perfect experimental design of the control, and the control process remains partial because of the difficulty of controlling all the variables in the educational phenomenon. Since there are several experimental designs, the researchers chose a design suitable for the nature of the problem in their research. This is the pretest-posttest design. This design is illustrated in Table (1).

RESULTS AND DISCUSSION

Results related to the first main hypothesis

The first major hypothesis is that “there were no statistically significant differences at the level of significance (0.05) between the scores of the experimental and control groups in the performance of mental skills. In order to verify this hypothesis, researchers use the Mann-Whitney test. It appears that there is a statistically significant difference for the benefit of the experimental group. The calculated Mann-Whitney value is smaller than the tabular value at (0.05) Table (2).

Results related to the second hypothesis

The second main hypothesis is that “there were no statistically significant differences at the level of significance (0.05) between the scores of the control group students in the tribal and remote tests. To

investigate this hypothesis, the researchers use the Wilcoxon test. The calculated value of the appears to be greater than the tabular value at the significance level (0.05). Therefore, the null hypothesis is accepted. There is no statistically significant differences between the pre and posttests of the mental skills of the control group Table (3) .

Effectiveness Ratio

To determine the ratio of the effectiveness of the

independent variable (the training program) in the dependent variable (the mental skill scale, the theoretical aspect), the researchers applied the equation of MacGujian. The efficiency ratio appears to be 0.83. This indicates that the program is effective since scales denote that it should not exceed (0.60). To verify effectiveness, and if this is less, the program is ineffective (Roebuck, 1973-472-473).

Table 1. The number of the Fourth Grade students in the Faculty of Education for Human Sciences / Babel.

No.	Department	Male	Female	total
1	Mathematics	22	99	121
2	English	14	76	81
3	Physics	21	69	90
4	Biology	26	71	97
5	Chemistry	16	31	47
6	Computer Sciences	24	46	70
total		123	383	506

Table 2. Results of the Mann-Whitney test to determine the differences between the experimental and control groups In the overall performance of the skills as measured by the observation form.

Group	Number of community	Means of rank	Rank total	Mann Whitney Value		Statistical significance 0.05
				tabular	calculated	
Experimental	12	16.67	200.00	tabular	calculated	significant difference
control	12	8.33	100.00	37	22	

Table 3. Results of the Wilkinson test to find out the differences between pre and post application to measure the mental skills on the control group.

Group	tests	No.of community	Means of Rank	Wilcoxon Value		Statistical significance 0.05
				tabular	calculated	
Experimental	post	12	3.00	tabular	calculated	No significant difference
control	pre	12	4.75	14	19	

CONCLUSION

The interactive guide is effective in developing the mental skills of students / teachers. The highest level of mental skills was the ability to imagine first and then the other skills. They are (self-confidence - the ability to relax - motivation - the ability to focus and finally, the skill of dealing with anxiety) respectively.

The Impact of the Clustering Strategy in the Acquisition of Students in Junior High in Grammar Arabic

Marwa Tawfiq Makki Al-Khafaji¹, Saad Hassan Alaw¹, Khalid Rahi Hadi¹

¹Department of Methods of Teaching Arabic Language, Faculty of Basic Education, University of Babylon, Iraq

ABSTRACT

The aim of this study was to know the effect of the clustering strategy on achievement. The experimental method was adopted as a methodology for conducting research, which included an independent variable (the clustering strategy, the usual method) and a dependent variable. And the objective of the following variables (age of time calculated months, first grade grades in the rules, educational achievement of parents, test the previous parameters), the researcher to prepare the application requirements of plans, objectives and tests for the research groups, and after the violation After applying the experiment, the researcher applied the research tools to the two research groups. After correcting the students' answers, each student obtained data for the experimental group and the control. The data were statistically processed by the independent testing of two independent samples, and showed that the experimental group according to the clustering strategy exceeded the control group which were studied in the usual way in the variable scholastic achievement.

Keywords: *Clustering Strategy, Learning Achievement.*

INTRODUCTION

The development of the year of life, and the interaction with this development is required, and the world today is witnessing remarkable progress in all areas. The nations and societies are characterized by the knowledge, science and wealth of an educated human being capable of reviving themselves through their abilities to form their future, Therefore, the educational renaissance has to retreat from time to time and return to the fields of self-criticism in order to get what is most valuable in the development of the educational process. And the educational process tracker Found that there has been a remarkable shift in the last quarter of the twentieth century to studies on learning and education, after the psychologists and education focused on the principles of behavioral theory in their interpretation of the processes of learning and education became in

the early seventies focus on the principles of theories (constructivism cognitive) ¹ Behavioral theory interprets the process of learning as measurable observation responses, reinforced by practice and reinforcement, while cognitive constructivism views this process as internal mental processes expressed by the learner's ability to visualize, understand, absorb, retrieve, and use the information presented in similar situations ². that is, knowledge is driven in the mind by mental processes and that the structure of the total mind is constantly working to reorganize the cognitive pattern of the learner where the out put is permanently renewed subject to representation and adaptation influenced mainly by the positive Science and its effectiveness and experience and its unique characteristics, which make the learning process always dynamic process active does not stop at a particular moment and make the mind renew a member at every moment, changing the contents and structure of the time and place and environment elements surrounding the recipient that is the philosophy of constructive structure Antistatic stability, and integrative processes in return for dependence on the linear analytical mind, and positive by the learner. It is certain that the educational process can achieve its objectives in society only by means of communication through which scientific educational systems can be applied, namely,

Department of Methods of Teaching Arabic Language,
Faculty of Basic Education, University of Babylon,
Iraq.

the language³. Therefore, each of the languages of the world must have rules and standards of language specific to their language, which will organize the language and make it understandable and easy to trade between their sons, without these controls and standards required by the nature of the Arabic language and the treatment of speakers is necessary was impossible to reach the meaning to the mind of the listener Or reader correctly and Understandable. Therefore, the grammars have an importance and a preference for the language, which is the balance of evaluating its validity, its pillars, the axis of its linguistic systems, and the wall that protects the Holy Quran and Sunnah from any attempt. The researcher believes that today we need to codify our science and ideas in Arabic language free of grammatical mistakes of the past and present in the future, and this will be achieved only by learning the rules of the Arabic language. Therefore, the researchers are interested in developing operational strategies followed by the teacher within the class, which is based on the theories of cognitive structure, which emphasizes the student's focus on the learning process without ignoring the role of the teacher as a key to the success of the educational process. Therefore, the educational system becomes more positive when concentrated on a group recent strategies such as self-learning strategy, problem-solving strategy, mental mapping, selective learning, exploratory learning, Active learning strategies, and clustering strategy are one of the Active learning strategies. A special structure is designed to influence the student interaction pattern and aims to improve the mastery of educational outcomes by engaging students in reviewing the covered materials for the lesson and achieving understanding of the content of the lesson. It is a sophisticated structure for students to help each other in small clusters, students seek to achieve a meaningful output for them and for members The students feel that each one of them has a specific responsibility and each one has a specific role to play in order to integrate the work of the whole group, so they become responsible for teaching each other as an alternative to traditional structures such as raising hands and then appointing a student teacher To answer the questions raised.

METHODOLOGY

It includes a presentation of the procedures followed to achieve the objectives of this research in terms of adoption of appropriate research methodology, design appropriate, the research community, the method of

sample selection and methods of equivalence of the two groups, and a description of the search requirements, tools and how to apply them and the statistical means used in data processing.

Experimental Design

Since the aim of the research was to identify the effect of teaching on the clustering strategy as an independent variable in the student achievement as a dependent variable, the researcher adopted the experimental design with partial control in two equal groups experimental study.

Research community

The current research community includes fourth grade students of all schools (secondary and preparatory) of the governmental day of the Directorate General of Education in the center of the province of Babylon for the academic year (2017-2018)

The research sample

The researcher chose the random sample of the study. It consisted of a school in the governorate center containing four divisions. Two random groups were also chosen to represent the experimental group and the control group. To achieve the objectives of the study, as in Table (1). The researcher ruled out students who failed because they had previous educational experience in the subjects that will be studied during the experiment. This affects the accuracy of the results of the experiment, although the researcher excluded them from the results only

Equal search groups before the actual teaching, the researcher carried out the equivalence of the students of the two research groups statistically in a number of variables that may affect the safety of the experiment and the accuracy of its results, as follows:

The age of the students calculated in months, the Educational achievement of the parents, the Educational achievement of the mothers, the grades of the students in the first semester of the Educational year 2017/2018 in the rule of the Arabic language

Control of the exotic variables Despite the parity procedures carried out by the researcher between the two research groups, Avoidance of the effect of some extraneous variables in the confidentiality of the

experiment, and then in the results. Here are some of these variables and how to control them. Before the actual teaching, the researcher carried out the equivalence of the students of the two research groups statistically in a number of variables that may affect the safety of the experiment and the accuracy of its results, as follows: The age of the students calculated in months, the Educational achievement of the parents, the Educational achievement of the mothers, the grades of the students in the first semester of the Educational year 2017/2018 in the rule of the Arabic language.

Control of the exotic variables Despite the parity procedures carried out by the researcher between the two research groups, Avoidance of the effect of some extraneous variables in the confidentiality of the experiment, and then in the results. Here are some of these variables and how to control them Experimental extinction: - There was no interruption of the students of the two groups of current research throughout the Experience period.

Conditions and associated accidents: Some experiments may be subjected to natural or abnormal events during the experiment, causing the experiment to be blocked and have an effect on the dependent variable next to the independent variable.

Sample Selection: Randomly selected and the two groups were checked.

The process of maturity: This factor had no significant effect in the current research, because the duration of the experiment was unified between the two research groups, as well as experimental design adopted by the researcher experimental design with partial adjustment, and on this basis, the resulting maturity and growth will return to students of my group search.

The impact of experimental procedures: The researcher worked to limit The impact of experimental procedures that can affect the dependent variable during the course of the experiment.

Preparation of research materials The research materials are basic and according to which the research procedures are carried out, which is: The educational material: The teaching material that the researcher is teaching has been determined for the students of the research groups during the period of the experiment (the second semester) of the academic year (2017-2018)

The first seven topics of grammar in the book of Arabic language (Part II) to be taught to students of the fourth.

Behavioral objectives the researcher formulated 68 goals in light of the general objectives and the content of the subject to be taught during the duration of the experiment. The researcher presented a list of behavioral objectives on the five levels of knowledge in the Bloom classification (recall, understanding, application, analysis, A selection of experts and specialists in the language and methods of teaching, and in the educational sciences to take their views and suggestions regarding the soundness of the formulation of the objectives and the extent to which the subjects of the content of the study covered by the experience,

Preparation of teaching plans: The researcher prepared a set of teaching plans for the experimental and control groups in the light of the topics of the book. The number of teaching plans (7) plans for the experimental group according to the clustering strategy and the same for the control group according to the usual method.

Research Tools: The current research requirements include the existence of a standardized tool to measure the achievement of intermediate second grade students in the Arabic Grammar for the experimental and control groups. Therefore, the researchers prepared a collection test consisting of (30)

The truth of the test: The researcher was keen to be a true instrument, and to achieve the objectives of the research so used two types of honesty: apparent honesty and trueness content The results showed that the apparent honesty obtained the percentage of agreement (80%) by the arbitrators and specialists. As for the validity of the content, the results showed that all the paragraphs of the test are statistically significant

Stability of the test: Midterm fragmentation: The researcher used the Pearson correlation coefficient to extract the coefficient of correlation between the individual and marital points of the test and was corrected by the Spearman-Brown formula. To calculate stability in this method, the researcher adopted the sample of the survey sample which reached (100) (0.86) and then corrected by Spearman-Brown equation (0.93).

Application of the achievement test before the end of the experiment a week, the researcher told the students of the research groups that there was a test for

them in the seven subjects that were studied for them. The researcher supervised with the Arabic language school the course of the test and the researcher explained how to answer the test paragraphs before the students began to answer

Statistical means

The researcher used the end-tailed(T-Test) for two independent samples: The researcher used the end-tit test for two independent samples in the equivalence between the experimental and control groups in the following variables: (the age of the students, the grades of Arabic grammar in the half year of the current year, and the final achievement test).

RESULTS AND DISCUSSION

The hypothesis of the research: “There is no statistically significant difference at the level of (0.05) between the average achievement of students of the experimental group who study the Arabic grammar using the clustering strategy, and the average score of students of the control group who study the same material in the usual way. To examine the hypothesis of the research, the statistical averages and the standard deviations of the scores of the two groups were extracted in the post-achievement test in the Arabic grammar, and the results of the T-Test were extracted to detect the significance of the differences between the averages, between the experimental and control groups on the post-achievement test in the Arabic grammar and by reference to the arithmetic averages, it is noted that these differences are in favor of the experimental group. In this way, we reject the null hypothesis and accept the alternative hypothesis, which means that the clustering strategy positively affects student achievement.

CONCLUSION

After correcting the students’ answers, each student obtained data for the experimental group and the control. The data were statistically processed by the independent testing of two independent samples, and showed that the experimental group according to the clustering strategy exceeded the control group which were studied in the usual way in the variable scholastic achievement.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Methods of Teaching Arabic Language, Faculty of Basic Education, University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

The Training Effect on Listening Skills in the Pupils' Achievement with Learning Difficulties in Reading

Nawras Fattlawi Kmil¹, Abdul Salam Jawdat Al-Zubaidi¹

¹University of Babylon, College of Basic Education, Iraq

ABSTRACT

The research aims to identify the scope of that pupils have in learning difficulties for listening skills and improve these skills by training them on it , through an organized training program, the sample was chosen from the pupils of special education in the fourth class of primary, the sample of the research has made up of (12) pupils (masculine and feminine), the researcher used a questionnaire that was presented to the arbitrators to identify the listening skills which has required for the pupils in the research sample. The test of listening skills is used to identify the scope to which these pupils' possess of these skills. The researcher used the suitable statistical methods such as percentages and (w) test , the results of research reached to put a list contains all the listening skills required, the results of the research refers to a low level of the sample in all the listening skills required especially the organization of ideas skill as it presented in the audible text.

Keywords: *Training Effect, Skills, Pupils*

INTRODUCTION

Training is a modern and effective method to improve and develop any of the different life fields, whether in the personal , academic, financial, practical, family, health, or any other fields it takes a central position in the world as an important and effective method to achieve the aims by dividing it into tasks or small skills, then it refers to the achievement of knowledge and skill, proficiencies as a result of vocational education, or theoretical skills and knowledge that relate to specific useful proficiencies that forms the essence of apprenticeship, the training aims to change behavior and attitudes then develop skills and information especially the managerial behavioral skills in order to prepare pupils for the professional future and develop attitudes , understanding and the ability to solve problems , decision making, innovation, communication, listening art and negotiation , The listening skill needs training to develop in the individual , Economics and philosophies interested in the language, then there is no a doubt that the language form the minds of the nation and guide its thinking and build it, and prepare for the

linguistic activity what drives to and reduces the hard of life. ¹ Training and human development activity have increased significantly over the past few decades according to Volmer (1988) , more than 40 billion dollars a year is spent on human resources development ¹¹ , In education, teaching and learning requires Teachers turn the educational task into a reality, and as they admit (effective teachers and lecturers are usually responsible for introducing new learning concepts which demonstrate methods of thinking). ¹² Most of specialists and practitioners agree with each other that training is organized and planned process according to a specific methodology based on sound scientific foundations. Commitment is therefore necessary for this methodology if wanted to training programs to achieve the expected aims. The design of the training programs is represented a main stage in the methodology of training process, lots of researchers refer to that the design of effective training programs isn't done only in through a scientific assessment of the actual training needs of the participants in these programs. So preparing the training program aims, the determine its content, its subjects, its activities, effectives, diagnosed the suitable training methods, identification of other inputs required by the implementation process and dependent on the assessment of the training needs to.⁷ The importance of

University of Babylon, College of Basic Education,
Iraq.

impact moving of training is that the training remains rigid and specific if it isn't move from one educational level to another. We learn to employ what we have learned in our applied life or use in facilitating learning of another kind, The concept of impact transmission is a behavioral phenomenon that's not occur spontaneously, but occurs according to objective and subjective terms. If these conditions be available, it will be easy to transform.⁶ Transition is the process that makes the use of previous education in new situations or the use of this learning to acquire another new learning, or it precedes future performance in a new situation, or the process of using something that a person has learned in another situation³. Listening is considered a linguistic art or main condition for the intellectual development, so this art is careless in our approaches especially in the Arabic countries, this is due to the lack of understanding of the listening process nature as well as its importance, the perception still that the skills development is limited to making the pupils read aloud of the open book in front of his/her classmates only to the limit that made the pupils lack of this skills and the clear lack of gotten it. So we spend most of our time listening even if there is a difference in the level of achievement and understanding. This is normal among individuals because of the individual differences, and it is a essential factor in the ability to talk, So that the learner can't pronounce the words correctly only if he/she listened well, as well as guiding between the listening skills and writing skills, because the writing mastery depends mainly on good listening that makes the learner able to distinguish between the letters and sounds, undoubtedly the good listener needs to increase the language and intellectual capital and cultural expression, that made his/her expression is more strength, although speaking expressive art and reading receptive art, but there is a great relationship between speaking and reading, each affects the other and influenced by, speaking weakness leads to the ability to read and to write, perhaps The importance of what has been revealed by some Studies that normal human takes in listening one third of what it takes in reading that is one of learning methods that helps to receive information, at the childhood level, the listening period is consider a period of custody for the rest linguistic skills of child, as the speaker reflects in the spoken language that he / she listens at home and the surroundings, so the speaker and his/her accent and fluent is effect on the listener and lead him/her to emulate what has he/she heard, Given the broadening of encouraging conditions for

listening art². The importance of language is reflected in the functions it performs. This aspect has attracted the attention of scholars, some of them have been viewed from a philosophical point of view, some of them have seen it from a social point of view and some of them have brought together the two sides, the listening is the origin of the language. But when the two languages were defined as one was audible and the other visual, so there are a lot of studies dealt with the listening skill, some Arabic studies and other foreign languages because of the importance of this skill in shaping the language of the individual, as well as its importance in developing its abilities⁴

METHODOLOGY

It includes a presentation of the procedures that were carried out to achieve the research aims, starting from research methodology, experimental design and identifying the research community and its sample, then prepared requirements and tools of research, as well as the presentation of the statistical methods used. The nature of the research requires an experimental approach that means the way that the researcher adjusts all the variables that effect of any phenomenon, Except for the (independent) experimental variable to measure its effect on the phenomenon (dependent variable).

The Experimental Design of the Research

It includes a particular independent variable (listening skills) and a dependent variable (learning difficulties). The experimental design is the search for a particular method for distributing the processors to the experimental parts so that we can obtain the least possible mistake, so the researcher used the experimental design with one group with pre-test and post- test.

Community and Sample of the Research

The community of the research made up of all pupils of fourth class in primary school of the General Directorate of Education in Babylon Governorate for the academic year (2017-2018), while the research sample, the researcher chose(Al- Al-Marifah Coeducation School) in the city center of Babylon intentionally in order to conduct her research, after choosing (Al- Al-Marifah School) the researcher found that the school made up of (100) pupils (male and female), who aged (10-13) years, the researcher applied the listening skills

test to identify pupils who had a low listening skill, After applying the test, the researcher found out that (12) pupils got the lowest marks on listening skills test. So the sample consisted of (12) Pupils, who will be trained on listening skills.

Research Instrument

The listening skills test was built to train pupils in the research sample as well as the instrument needs to require the following steps:

Preparation of the Test Items

Through the researcher's knowledge of some of the literature related to the research variables and listening skills tests, the researcher formulated the items of the listening skills test (30) items, then alternatives have given for answering (0,1) , that gives (0) for the wrong answer and (1) mark for the correct answer, so the highest mark be (30) while the lowest mark be (0).

Preparation of the Test Instructions

These instructions aim to explain the test idea in the simplest form to facilitate the process of the test applying, because the clear and understandable instructions contribute to increase the coefficients of the validity and consistency and objectivity of the test, in order to rely on the test, it is necessary to extract the psychometric properties:

The Test Validity

The validity of the test was verified and the validity of the structure was confirmed. The results showed that the apparent validity achieved the agreement percentage (80%) by the arbitrators. As for the validity of the structure, the results showed that all the test items were statistically significant, so the test considered validate.

The Exploratory Applying of the Test: that contains the following:

*** The First Test Applied:**

The listening skills test in the first test stage was applied to a group of fourth class pupils of primary without the research sample , that was (30) pupils , The purpose of it, is to know the clarity of the instructions and the test instructions, the comprehension and clarity of the test items for the pupils and calculate the time required for the test.

*** The Second Test Applied:**

The test was applied to a sample of (100) pupils in the fourth class of primary without research sample, that aims to analyze the test items statistically.

Discrimination Item:

Discrimination item is one of the most important things in test items that means the ability of items to find out about the pupils with the measured character, and the pupils who do not possess it. The value of the coefficient of distinguishing between the test items ranged from 0.32 to 0.60 that considered all the test items with a suitable and good factor.

The Test Stability

Estimation of the stability of the characteristics of the good test, although validity is more important than it, because the validity measure is constant and may not be a fixed measure is true because it may be homogeneous in its items, but measures a property other than that prepared for measuring, and to achieve the stability of the test was found to maintain the method Kyoder Richardson 20.

The Methods of Kyoder Richardson

Stability according to Kyoder Richardson 20, to determine the consistency of internal consistency, by determining how all test vocabulary is related to all other vocabulary and the test as a whole. Internal consistency results when all vocabulary or test tasks are linked. To estimate the stability coefficient, the researcher used the Kjoder Richardson equation 20 of the analysis sample The coefficient of stability of the test (0,75) was a good stability coefficient according to Ebel.

The Program Which Prepared to Train Pupils on Listening Skills:

The sessions of the program were prepared. The sessions of the program consisted of (28) sessions, and the time of each session (60) minutes in which the researcher used strategies (story strategy, summarization and taking roles) and video and recorded stories, the researcher used a variety of activities and each activity commensurate with the skill to be improved The activities and exercises have a great role in improving the listening skills of pupils, especially children, so these stories change in each session, whereas they discuss the

events of the story in the session.

The Statistical Methods Used

The researcher used Wilcoxon’s test to compare pre-test and post-test marks for test listening skills.

RESULTS AND DISCUSSION

After the researcher chose the research sample and applied the listening skills test, the program was also applied to the sample, the test was applied to the sample before and after applying the program, the researcher used the Wilcoxon’s test to identify the differences between the pre- and post-test, as in Table (1). Through the above table, the results showed that the calculated value was (292.4), which is less than the ruler value of (17) at the level of significance (0,05), indicating that there are differences between the pupils’ marks before and after the applied the program in favor of the post-test, so the null hypothesis disagreed, while the alternative hypothesis agreed. In addition, the researcher used the equation (Mac - Gujian) in the extraction of the impact size of the program effectiveness between the pre- and post-test , Table (2). The results of the this research refer to the effectiveness of the program that’s used to improve the listening skills of fourth class pupils in primary with educational difficulties. The results showed that the pupils who were exposed to the program improved their listening skills, so that the listening level increased significantly compared to listening before applying the program. The researcher attributed this positive result of the current research to that the training program was built according to the requirements of pupils with learning difficulties, and that the skills contained in the program commensurate with their abilities and potential and training to improve listening skills came in accordance with the structural theory that emphasizes the management of class discussion In addition, the researcher has used several different techniques in training to improve listening skills (verbal reinforcement, applause, praise, feedback). These methods increase the appearance of the desired response in the future and results in this Lib to strengthen its occurrence more and resurface again in other similar situations in the future. The results showed that there is no statistically significant difference between the male and female marks in the post-test within the experimental

group in listening skills as a whole. In essence, this process is successful by stimulating the pupils to the topic of the sessions so it can be said that the training programs based on scientific and objective basis may have a great role in helping pupils to face the problems they face.

Table 1. A comparison of pre-test and post-test marks shows the listening skills test

No.	The marks of the pupil in the pre-test	The marks of the pupil in the post-test	Differences
1-	23	24	1
2-	15	27	12
3-	12	25	13
4-	14	29	15
5-	18	19	1
6-	18	29	11
7-	19	29	10
8-	13	21	8
9-	17	19	2
10-	20	29	9
11-	14	29	15
12-	17	26	9

Table 2. The impact size of the program effectiveness

Average the pre-test marks	Average the post-test marks	Highest mark on the scale	Final sample size	Value of effect size
16.66	25.5	30	12	0.55

CONCLUSION

The test of listening skills is used to identify the scope to which these pupils’ possess of these skills. The researcher used the suitable statistical methods such as percentages and (w) test , the results of research reached to put a list contains all the listening skills required, the results of the research refers to a low level of the sample in all the listening skills required especially the organization of ideas skill as it presented in the audible text.

Theoretical Study of Extensive Air Shower Effects in Atmosphere by Simulating the Lateral structure of Several Cosmic Radiations

Hassanen Abdulhussain Jassim¹, A. A. Al-Rubaiee¹, Iman Tarik Al-Alawy¹

¹Department of Physics, College of Science, Mustansiriyah University, Baghdad, Iraq

ABSTRACT

Extensive air showers (EAS) are a cascade of electromagnetic radiation and ionized particles that produced in the atmosphere through the interaction of a primary cosmic ray with the atom's nucleus in the air producing a huge amount of secondary particles such as X-ray, electrons, neutrons, muons, alpha particles, etc. In this work, EAS effects were demonstrated by estimating the lateral distribution function (LDF) at ultrahigh energies of the various cosmic ray particles. The LDF of charged particles such as electron and positron pair production, gamma and muons particles was simulated at ultrahigh energies 10^{16} , 10^{18} and 10^{19} eV. The simulation was carried out using an air shower simulator called AIRES system version 2.6.0. The effect of the primary particles, energies and zenith angle (θ) on the LDF of charged particles produced in the EAS was taken into account. Comparison of LDF for charged particles and experimental results gave good agreement for electron and positron pair production and muons particles at 10^{19} eV for $\theta=0^\circ$ and 10° .

Keywords: AIRES system; lateral structure; extensive air shower; muons.

INTRODUCTION

High energy cosmic rays have been detected via the EAS that produced in the Earth's atmosphere¹. In 1930, Pierre Victor Auger, French physicist was discovered EAS through producing more and more particles in the atmosphere². A little part of the primary particle's kinetic energy has been converted into mass energy. Then, the residual kinetic energy can be distributed through the shower. The multiplication process is still continuing till the EAS particles energy still insufficient for producing more and more particles in sequential collisions. This stage of shower development can be called the maximum of shower^{2,3}. The LDF of charged particle in EAS is a requisite quantity for the observations of the Earth's cosmic radiation, which are mostly derived from the EAS observables⁴. The parameter that utilized for describing the shape of the

lateral structure density is the lateral shape parameter in the NKG function "Nishimura-Kamata-Greisen function"^{5,6}. The EAS develops in a convoluted way as a combination of electromagnetic and hadronic showers. It is important to fulfill a detailed numerical simulation of the EAS for inferring the primary cosmic radiation properties, which produce them. The number of charged particles in ultrahigh energy EAS may be enormous and may exceeding 10^{10} , therefore the simulations are an important way to challenge this situation⁷. Before the era of high-speed computing, Hitler presented a very simple model for the development of electromagnetic cascade⁸. At the time, Hitler, Rossi, and Gaisser developed more sophisticated analytical tools, which included more physical influences^{9,10}. In 2008, Cotzomi studied some observations about the LDF of charged particles at energy above 10^{17} Ev¹¹. In 2013, the age parameter of the lateral structure has been studied by Tapia by estimating the chemical composition of EAS particles¹². Recently, (in 2018), Ivanov was studied the distribution of the zenith angle of the cosmic ray showers measured with the Yakutsk array and its application to the analysis of arrival directions in equatorial coordinates¹³. The results of the current calculations show that the density

Corresponding author:

Hassanen Abdulhussain Jassim.

Department of Physics, College of Science, Al-Mustansiriyah University, Baghdad, Iraq.

of charged particles reaches the Earth's surface, such as the electron and positron pair production, gamma and muons particles, by simulating the LDF performed using the Monte Carlo AIRES system at ultrahigh energies 10^{16} , 10^{18} and 10^{19} eV. The comparison of the estimated LDF of the charged particles such as the electron and positron pair production and muons with the simulated results by Sciutto and Yakutsk EAS observatory gives good agreement at 10^{19} eV ^{14,15}.

METHODOLOGY

Hitler's model is the simplest conception of electromagnetic cascades and can extend it to the EAS. The purpose of using a very simple model is to show clearly the physics involved. Nevertheless, the most significant properties of the electromagnetic cascades has been predicted by Hitler's model ⁷. In the Figure 1a was shown a single photon that radiated by a single electron after transmitting splitting length ⁷:

$$d = \lambda_r \ln 2 \dots\dots (1)$$

Where, λ_r is the radiation length in the medium; d is the distance over which an electron loses, on average, half of its energy by radiation. After traveling the same distance, the photon is split into e^\pm pair. In either case, the particle's energy (electron or photon) is assumed to be evenly divided between two couple particles. After n splitting lengths, the distance x is given by:

$$x = n \lambda_r \ln 2 \dots\dots (2)$$

The total size of the shower for the electrons and photons is:

$$N = 2^n = e^{x/\lambda_r} \dots\dots (3)$$

When the particle energies become too low for pair production, the multiplication of EAS particles ceases. Therefore, Hitler takes this energy of electron as a critical energy that is given by the symbol (ξ_e^e) . The average energy lose of collision will exceed the radiative losses.

Through supposing a shower that initiated by a single primary photon with E_o primary energy, the cascade in this shower will reach its maximum size ($N = N_{max}$) when the produced particles have a critical energy ξ_e^e , therefor ⁷:

$$E_o = \xi_e^e N_{max} \dots\dots (4)$$

As shown in figure 1b, the air showers initiated by the hadrons were designed using a method similar to Hitler's method ⁷. Charged (π^\pm) and neutral (π^0) pions produced when hadron particles traversing one layer in atmosphere. Through this process, the π^0 pions directly will be decayed to photon particles and therefore the electromagnetic cascade initiated

⁷. Figure 1b demonstrates the electromagnetic showers through the decaying of the π^0 pions (dashed lines). While the π^\pm pions will continue interacting in the shower until their energy become below the critical pion energy (ξ_π^e) . Accordingly, the π^\pm pions will decay to muons that reach the earth ⁷.

Lateral Distribution Function

The LDF of charged particles in EAS is an important quantity of the ground surveillance for cosmic radiations, from which most cascade observables are deduced ¹². Studying of EAS may be performed experimentally on the surface of the ground, underground and at many mountain rising through determining some LDF quantities, i.e. the density of charged particles initiated in EAS as a function of the shower core distance or in another meaning, the LDF is the shower structure of the cascade at various depths in atmosphere ². The expression that used extensively for describing the LDF form is the NKG function that is given through the forum ⁵:

$$\rho(r) = \frac{N_e}{2 \cdot \pi \cdot R_M^2} * C(s) * \left(\frac{r}{R_M}\right)^{(s-2)} * \left(\frac{r}{R_M} + 1\right)^{(s-4.5)} \dots\dots (4)$$

Where $\rho(r)$ is the particle density on the distance r from the shower core, N_e is the total number of shower electrons, $R_M = 118$ m is Molier radii, s is the shower age parameter, and $C(s)$ is the normalizing factor which is equal $0.366 s^2 * (2.07 - s)^{1.25}$ ⁶.

RESULTS AND DISCUSSION

Simulating of LDF using AIRES system

AIRES is an acronym for AIR-shower Extended Simulations, which is defined as a set of programs and subroutines that used for simulating the EAS particle cascades, which initiated after interaction of the primary cosmic radiations with a high energies in the atmosphere and manage all the output associated data [14]. AIRES provides full space-time particle propagation in a true medium, where the features of the atmosphere, the geomagnetic field and Earth's curvature are taken into account adequately[14]. There are many particles are taken into account through the simulation using AIRES system such as: "electrons; positrons; gammas and muons". The incident primary particle in EAS may be primary proton or iron nuclei or other primaries that mentioned in the AIRES guide document with a very high primary energies that may exceeding 10^{21} eV [14]. Figure 2 shows the density of several secondary particles as a function of the distance from the shower axis that reaches the Earth's surface by AIRES simulation. The effect of the primary particles (proton) and energy (10^{19} eV) on the density of charged particles produced in the EAS was taken into consideration. As shown in figure 2, the density of several secondary particles decreases with increasing the distance from the shower axis. Finally, the primary energy is divided between muons and electromagnetic particles (electron and positron pair production and gamma particles) in sub-showers. Figure 3 displays the effect of the primary

particle energies on the density of secondary particles for zenith angle ($\theta = 10^\circ$) of the primary particles (iron) by AIRES simulation. Through this figure one can see that the lateral density of different secondary particles is directly proportion to the primary particle energy, i.e. the lateral density increases with increasing the primary energy.

Comparison with Sciutto experience and the Yakutsk Observatory

Figure 4 demonstrates the comparison between the present results of LDF that performed by AIRES simulation (solid lines) with the results simulated by Sciutto (triangle symbols)[14]. This figure displayed a good agreement of the secondary particles (electron and positron) that were initiated by primary proton at energy 10^{19} eV and vertical EAS showers. The Yakutsk EAS array studies the very high energy cosmic radiations, which occurs in the field of astrophysics, that is, an important area in the physics. There are two main goals for the construction of the Yakutsk EAS observatory; the 1st goal is the elementary particles investigating of the cascades that initiated by the primary particles in atmosphere. The 2nd goal is the astrophysical characteristics reconstruction of the primary particles such as: "mass composition, energy spectrum, intensity and the their origin" [15]. Figure 5 shows the comparison between the present results with the experimental data that obtained by Yakutsk Observatory [15]. The curves in this figure displayed a good agreement for (electron and positron) that initiated by primary proton at energy 10^{19} eV and slanted EAS showers with $\theta = 10^\circ$.

Figure 1. Schematic views of (a) Electromagnetic cascade and (b) Hadronic shower[7].

Figure 2. Densities of several secondary particles as a function of R that reaches the Earth's surface for vertical showers at energy (10^{19} eV) of proton.

Figure 3. The primary energy effects on secondary particle densities for primary Fe at zenith angle ($\theta = 10$).

Figure 4: Comparison between the present results of simulated LDF by AIREs system with the results that simulated by Sciutto for primary p at energy 10^{19} eV for (electron and positron) secondary particles.

Figure 5. Comparison between the present results of simulated LDF by AIREs system with the experimental data obtained by Yakutsk Observatory for primary p at energy 10^{19} eV for (electron and positron) secondary particles.

CONCLUSIONS

In the present work, the lateral distribution function of charged particles using AIREs system for two primary particles such as (proton and iron nuclei) was simulated at different ultrahigh energies 10^{16} , 10^{18} and 10^{19} eV. The simulation of charged particle lateral structure demonstrates ability for identifying the primary cosmic ray particle and its energy. The important advantage of the present work is to make a library of Lateral structure samples that may utilized for analyzing real EAS events that detected and registered with an EAS arrays. The introduced results using AIREs system are identified with Yakutsk experimental data, proving that AIREs system provides an appropriate environment for the study of high-energy cosmic rays. Therefore, charged particles reaching the Earth's surface have many effects on weather, human health and other effects.

Type II Toxin Antitoxin System in Imipenem Resistant *Klebsiella pneumoniae* in Baghdad, Iraq

Fatima S. Ali¹, Mohammed F. AL Marjani¹, Sawsan H. Authman¹

¹Department of Biology, College of Science, Mustansiriyah University, Baghdad, Iraq

ABSTRACT

Toxin Antitoxin (TA) systems have recently received much attention as one of the most promising antimicrobial targets. This study was designed to evaluate the presence of type II toxin antitoxin system and biofilm formation among imipenem resistant *Klebsiella pneumoniae* isolates in Baghdad. A total of 39(22.94%) *Klebsiella pneumoniae* isolates were collected from patients. Antimicrobial susceptibility test was performed and the biofilm formation was assayed by micro titer plate, then PCR was performed for detection of Toxin Antitoxin -Type II, Biofilm and Quorum sensing genes. The results show that the imipenem resistance was seen in 23(58.97%) of *K.pneumoniae* isolates. Then, the isolates showed levels of resistance percentage to antibiotic, with a highest resistance rate reached to (100%) for ampicillin and recorded lowest resistance rate to ciprofloxacin and levofloxacin reached to (10.26%) and (7.69%), respectively. Among these isolates, 22(56.41%) were biofilm producers. All 39 *K.pneumoniae* isolates showed different results for *ompA* and *bap* genes when were found by 9(23.08%) isolates for *ompA*, while, all isolates didn't have *bap* gene. Further, TA system genes were found by 15(38.46%), 15(38.46%), three (7.69%) and five (12.82%) for *mazEF*, *ccdAB*, *relBE* and *mqsR*. On the contrary, all isolates didn't have QS system genes as *lasIR* and *rhlIR* genes.

Keywords: *Klebsiella pneumoniae*, imipenem resistance, persister cells, plasmid.

INTRODUCTION

A toxin-antitoxin (TA) system is a set of two or more closely linked genes that together encode both a protein "poison" and a corresponding "antidote" ¹. Accumulating knowledge about structure and function correlation of toxin-antitoxin systems from pathogenic microorganisms for develop antibiotic that target specific bacteria. Toxin antitoxin systems were initially discovered as plasmid in 1983 addition systems on plasmids with low number due to their ability to stabilize plasmids by post segregational killing ². Later on, they were also discovered in chromosome play the role in the stabilization of the chromosome and integrative conjugative plasmids ³. However, the definition of toxin-antitoxin modules is no longer restricted to entities that

provide control over genetic material, but expanded to a wide range of biological functions including defense against phages, growth control, persistence, biofilm formation programmed cell death (PCD), and general stress response ⁴. TA systems were classified to six types depending on the activity and nature of the antitoxins: antitoxins :type II, IV, V and VI toxin antitoxin systems ⁵. Type II TAs, the most prevalent type on prokaryotic genomes and plasmids, are bicistronic operons which code for a toxin protein and an antitoxin protein. Most of the type II TAs are typically less than 1 kb, encode endoribonuclease toxins ⁶ and propagate through horizontal gene transfer ⁷. Numerous toxins are mRNA interferases, either ribosome dependent (e.g. RelE, YoeB, YafQ and YafO) or ribosome-independent (e.g. YhaV, MqsR, ChpBK, MazF, HicA and PemK) ⁸.

MATERIALS AND METHOD

Bacterial Isolates: A total of 343 different specimens were collected from patients in Baghdad hospitals between October 2015 and March 2016 for

isolation *Klebsiella pneumoniae* isolates, the isolates were diagnosis using and vitek 2 system.

Antibiotic sensitivity testing and MIC to imipenem

The sensitivity testing of all isolates to different antibiotics and the MIC to imipenem were testing by using Vitek-2 system using antibiotic sensitivity test number (AST-GN69) and (AST-N222) cards according to the manufacturer's instructions which included antimicrobial agents as follows: Ampicillin(AM), Amikacin(AK), Amoxicillin/clavulanic-acid(AUG), Ampicillin/sulbactam (SAM), Aztreonam(AZT), Cefazolin(CZ), Cefepime(CPM), Cefotaxime (CTX), Ceftazidime(CAZ), Ceftriaxone(CRO), Ciprofloxacin(CIP), Doxycycline(DXT), Gentamicin(GM), Imipenem(IMI), Levofloxacin (LEV), Meropenem (MEM), Nitrofurantoin(NIT), Piperacillin(PRL), Piperacillin/tazobactam(PTZ), Tetracycline(T) Ticarcillin/clavulanate (TIM), Tobramycin(TM) and Trimethoprim/sulphamethoxazole(TS).

Detection of Biofilm Formation

In the present study, we screened the isolates for their ability to form biofilm by micro titer plate according to the procedure described by Badmasti *et al.* (2015) ⁹. Briefly, *K. pneumoniae* isolates were grown overnight in LB broth+0.25 % glucose (LBG) prepared at 37 °C. On the next day, the culture diluted 1:50 in freshly prepared LBG pre-warmed to 37° C. Then, 200 ml suspension was used to inoculate sterile 96-well polystyrene microtitre plates, followed by incubation for 72 h. at 37 °C. After washes with PBS prepared any remaining biofilm was stained with crystal violet for 30 min after drying at room temperature for 15 min. Washed with PBS again. The dye bound to the adherent cells was resuspended with 200 ml ethanol/acetone (80:20, v/v) and OD570 quantified using an ELISA reader. The O.D value for control well was deducted from all the test O.D value.

Molecular Detection of Toxin Antitoxin -Type II, Biofilm and Quorum sensing genes

The imipenem-resistant *Klebsiella pneumoniae* isolates tested for Toxin-antitoxin (TA) (Type II) system genes, Biofilm genes and Quorum sensing (QS) system genes by using primers (Table 1). DNA genomes from isolates were extracted by using a commercial

purification system (Genomic DNA Purification Kit) and Plasmid DNA was extracted by PureYield™ plasmid Miniprep system, then PCR was used to amplify these genes in a total volume of 25 µl containing 1 µl PCR buffer, 2 mM MgCl₂, 2 mM dNTPs, 10 pmol of primers, 0.25U *Taq* DNA polymerase and 5 µl of template DNA. PCR products were analyzed by electrophoresis on 1% (w/v) agarose gel containing DNA safe. Agarose gels visualized by gel documentation (10).

RESULTS AND DISCUSSION

Bacterial Isolates

In this study, a total of 39 isolates (22.94 %) *Klebsiella pneumoniae* was isolated from 343 different clinical samples in Baghdad city. It was clear that it could be found as causative agent of RTI (sputum) 11(28.20%), also it is mainly associated with blood samples 9(23.08%); beside to 7(17.95%) from burns and 6(15.38%) from wound swabs; with low percentage from urine samples and ear infection which showed, 4(10.26%) and 2(5.13%), respectively.

Antimicrobial Susceptibility of *K. pneumoniae* isolates

In current study, isolates of *Klebsiella pneumoniae* showed a different levels of resistance rate to antibiotic (table 2), with a highest resistance percentage reached to (100%) for ampicillin, (89.74%) for piperacillin, (84.62%) for cefazolin, ceftazidime and cefepime, (82.05%) for ampicillin/sulbactam, ceftriaxone, aztreonam and cefotaxime, (76.92%) gentamicin, (71.8%) ticarcillin/clavulanic acid, (66.67%) amoxicillin /clavulanic acid and tobramycin, then moderate resistance percentage reached to (48.72%) for nitrofurantoin, (30.77%) for tetracycline and doxycycline, and recorded lowest resistance rate to ciprofloxacin and levofloxacin reached to (10.26%) and (7.69%), respectively. The numbers of *K. pneumoniae* isolates that gave MIC values more than break point for imipenem were 23 (58.97%) and these values assure resistance of studied *K. pneumoniae* isolates for this antibiotic.

Biofilm Formation

The results obtained that out of 39 *K. pneumoniae* isolates, 22(56.41%) were biofilm producers isolates by using micro titer plate. The current results recorded

that the highly percentage of biofilm production, and imipenem resistance for *K.pneumoniae* isolates was located within the weak and then moderate patterns. Therefore, these isolates may need this resistance but in this type of patterns of biofilm formation more than other patterns. From weak pattern of biofilm producers for *K.pneumoniae*, results showed that the highly number of biofilm producer's isolates and biofilm producers imipenem resistant isolates were isolated from sputum specimens. The results showed that the *ompA* gene was present in 9(23.08%) isolates of *K.pneumoniae*, while, all isolates didn't have *bap* gene.

Detection of Toxin-antitoxin (TA) (Type II) and QS systems genes

All *K.pneumoniae* isolates were tested for detection of toxin-antitoxin (TA) (Type II) and Quorum sensing (QS) systems genes by PCR technique. The PCR products have been confirmed by comparing its molecular weight with 100 bp DNA Ladder (table 3). The presence of *mazEF* system genes that which composed of *mazF* and *mazE* genes were in 15(38.46%) isolates (figure 1) and also *ccdAB* system genes that which composed of *ccdB* and *ccdA* genes were present in 15(38.46%) isolates of *K.pneumoniae* (figure 2). On the other hand, results showed that *relBE* system genes (*relE* toxin and *relB* antitoxin) were present in three (7.69%) isolates (figure 3). All isolates contained plasmids. Eight of isolates has just one mega-plasmid (more than 10kb). Seventeenth of isolates has just one large plasmid, their molecular size between 4kb-10kb. In addition, three of isolates has just one large plasmid their molecular size more than 2kb. While, six of these isolates pose more than one plasmids, their molecular size between (4kb-10kb). On the other hand, 4, 14 and 4 eluted plasmid DNA of *K.pneumoniae* were positive to *mazEF*, *ccdAB*, *mqsR* genes respectively, while 11, 1, 3 and one isolate were positive to *mazEF*, *ccdAB*, *relBE* and *mqsR* when we applied monoplex PCR on the chromosomal DNA of these isolates.

Relationship between biofilm formation and genes of biofilm, TA and QS systems for all imipenem resistant isolates under study

All of imipenem resistant isolates showed different results between them after tested for detection of some genes under study and their relationship with biofilm formation. From the detection results, 17 *K.pneumoniae* isolates which imipenem resistant and biofilm producers

showed positive results for *ompA* reached to seven (41.18%), while didn't have *bap* genes. Further, for TA and QS system genes, these isolates showed positive results reached to seven (41.18%), 10(58.82%) and three (17.65%) for *mazEF*, *ccdAB* and *relBE*, while didn't have other genes as *mqsR*, *lasIR* and *rhIR*. Therefore, the results revealed that no-relationship between biofilm production and these genes except *ccdAB* and it is interesting, for clarify the relationship between these parameters may be need to study gene expression for these genes to determine this relationship. DNA sequencing was performed on PCR products, sequenced PCR products revealed strong sequence identity (99 -100%) to the reference TA system sequence. Interestingly, results in present study showed approximately that all *K.pneumoniae* isolates were multidrug resistant isolates (MDR). Fouzia and Damle, (2015)¹¹ observed that $\geq 80\%$ isolates of *K.pneumoniae* were resistance to third generation cephalosporins and other antibiotics, making them multidrug resistant (MDR) isolates. The results of antimicrobial susceptibility test of *K.pneumoniae* in current study were consistent with other results as Al-Sehlawi (2012)¹² who showed that the resistance rate of *K.pneumoniae* isolates toward the antimicrobials was (92.2%) to piperacillin, followed by (59.2%) to nitrofurantoin, (50%) to gentamicin and (48.5%) to tobramycin. Recently, the study by Hussein and Hamed (2017)¹³ obtained the antimicrobial resistance patterns of isolates was (100%) resistance for ampicillin, (87.6%) for cefazolin, (85.71%) ceftazidime and trimethoprim/sulf., (83.92%) cefepime and ceftriaxone, (78.58%) ampicillin/sulbactam, (66.07%) gentamicin, (57.14%) tobramycin. Local study done by Al-Marjani and Khadam (2016) showed that 64.29% and 85.71% of isolates were resistant to ceftazidime and cefotaxime respectively and ciprofloxacin 37.5%. From weak pattern of biofilm producers for *K.pneumoniae*, results showed that the highly number of biofilm producers isolates and biofilm producers imipenem resistance isolates was isolated from sputum specimens. One of the present study objectives was to detect the existence and prevalence of common biofilm encoding genes among all clinical isolates. The results showed that the *ompA* gene was present in 9(23.08%) isolates of *K.pneumoniae*, while, all isolates didn't have *bap* gene. The antitoxin physically forms a toxin-antitoxin complex (TA complex), resulting in toxin sequestration from the cellular target. The antitoxins have a high turnover rate due to rapid degradation by proteases like

Lon, while toxins are relatively stable. The TA complex binds to the promoter/operator region of the TA operon, thus inducing transcriptional repression. This auto-regulatory mechanism prevails in most of the type II TAs characterized to date⁸. One of the powerful antibacterial strategies is an artificial activation of the toxin, which could be accomplished by using small compounds or peptides as inhibitors of the protein (toxin)-protein (antitoxin) interactions¹⁴. Then, from PCR analysis of

plasmid DNA did not yield any positive amplification, indicating that in *A.baumannii*, the screened TA systems were chromosomally mediated. Then, Yamaguchi *et al.*(2011)⁸, revealed to the presence of at least 33 TA systems in *E.coli* and more than 60 TA systems in *M. tuberculosis* suggests that the TA systems were involved not only in normal bacterial physiology but also in pathogenicity of bacteria.

CONCLUSION

In conclusion, the *mazEF*, *ccdAB*, and *mqsR* are widespread in *Klebsiella pneumonia* clinical isolates in Baghdad.

Fiber Content and Acceptability of Rice Bran Cookies for Young Women in Mamuju Regency

Zaki Irwan

*Department of Nutrition, Health Polytechnic of Mamuju Health Ministry,
Jl. Poros Mamuju Kalukku Km. 16 Tadui West Sulawesi Indonesia*

ABSTRACT

Obesity is a detrimental overweight medical condition and it increases health problems. adolescentPrevalence (very fat) aged 13-18 years of West Sulawesi Province at 2.1%. Fiber is a substance that can prevent the occurrence of obesity. Rice Bran is a by-product of rice mills, with a total production of 4.8 million tons / year. Rice Bran contains high enough fiber, which can be processed into various products, one of them is cookies. The purpose of the study was to determine the fiber content of the substitution of rice bran cookies and acceptability. This research is a laboratory experiment to find out the absorption capacity, while the acceptability uses an organoleptic test that uses as many as 30 young women as panelists in Mamuju Regency. Fiber content was obtained from gravimetric tests and acceptability was obtained through organoleptic tests using a questionnaire. The results of this study indicate that the highest fiber content of rice bran cookies is 45% from bran substitution with an average of 5.65% with an acceptance test of 70% likes of taste, 70% likes of texture , 80% likes of color, and 60% likes of flavor. Rice bran cookies can be a rich in fiber snack for teenagers, especially for young women.

Keywords: *bran, cookies and fiber.*

INTRODUCTION

There are currently many health-labeled food products in accordance with the global trend. One message that emerges is fibrous food products. Pastries or cookies are food products that are requested by Indonesian people. Purchases, both home-made and factory-made, increase every holiday. The average consumption of cookies in Indonesia is 0.40 kg / capita / year¹. Food fiber is part of food that cannot be digested by human digestive enzymes. According to the Nutrition Adequacy Rate (AKG) in 2012, the amount of dietary fiber that must be consumed by adults is 20-35 grams / day.

Basic Health Research data in 2013 shows that prevalence of overnutrition nationally in adolescents aged 13-15 years in Indonesia amount to 10.8% consisting of 8.3% fat and 2.5% very fat (obesity). Prevalence of adolescents at the age of 16-18 years experienced a significant increase from 2007 of 1.4% to 7.3% in 2013. Prevalence of obesity in West Sulawesi Province aged 13-15 years was 1.5% and the age of 16-18 years was 0.6%.

Rice Bran contains fiber that is high enough, every 100 grams of bran contains 25.3 grams of fiber². Rice bran is the outermost part of the grain that is wrapped by chaff or is a byproduct of rice mills, with a number of production 4.8 million tons / year³. Besides containing fiber that is good for the body, rice bran also contains antioxidants, such as vitamin E which can prevent diabetes mellitus, coronary heart disease and slow aging. The use of rice bran is limited as animal feed so far, this condition causes the sale value of rice bran to be low.

This study aims to determine fiber content and acceptability (taste, texture, color, and flavor) substitution of bran flour in cookies.

RESEARCH METHOD

Materials and tools

The material used in this study consisted of ingredients for making cookies and determining fiber content. Flour, bran flour, butter, sugar flour, vanilla powder, eggs and corn starch were used. In making cookies, While chemicals were obtained from the Makassar Institute of Health Laboratory. the tools used are mixers, ovens, cookie cutters, containers, and scales.

Experimental design

This study uses a completely randomized design. The sample of this research is cookies with the substitution of rice bran flour 0%, 15%, 30%, and 45% with 3 times of each repetition. The fiber content analysis was carried out at the Makassar Institute of Health Laboratory and

the acceptance test which included taste, color texture and flavors with 30 panelists.

Rice bran- Cookies Making Process

Cookies that will be substituted for bran flour are 0%, 15%, 30%, and 45% as shown in the following Table 1.

Table 1. Formulation of the addition of bran flour to cookies

ingredients	Bran Flour Substitution (%)			
	0	15	30	45
Wheat flour (gr)	200	170	140	110
Rice bran flour (gr)	0	30	60	90
Butter (gr)	150	150	150	150
Sugar flour (gr)	75	75	75	75
Vanilla powder (tsp)	1	1	1	1
Egg yolks (grains)	15	15	15	15
Corn starch (gr)	25	25	25	25

RESULTS

Fiber Content

Determination of fiber content was carried out by the gravimetric method in which each sample was tested three times (triplo) and obtained results in Table 2.

Table 2. Test Results of cookies' fiber content

Sample code (%)	Testing	Fiber content (%) (%)	Average (%)	gr/100gr
0	1	3,69	3,29	3,29
	2	3,32		
	3	2,87		
15	1	4,23	3,95	3,95
	2	3,69		
	3	3,95		
30	1	5,09	4,90	4,90
	2	4,88		
	3	4,74		
45	1	5,92	5,65	5,65
	2	5,24		
	3	5,81		

Acceptability Test

Organoleptic tests of rice bran cookies were carried out to get the author’s response towards taste, color, texture and flavors of the rice bran cookies . Panelists responded to the taste of rice bran cookies in the substitution of 45% bran flour by 70% likes. Based on the texture of Rice Bran cookies, the average panelist (90%)likes the highest texture at 15% substitution. The color of rice bran cookies with the highest presentation at 45% substitution by 80% likes of the Panelists. And 90% of panelists like 15% of substituted bran cookies (Table 3).

Table 3. Distribution of the rice bran cookies acceptance test results

Bran Substitution (%)	Assessment criteria				total
	likes		dislikes		
	n	%	n	%	n
taste					
15	25	33,4	5	16,6	30
30	9	30,0	21	70,0	30
45	21	70,0	9	30,0	30
Texture					
15	27	90,0	3	10,0	30
30	21	70,0	9	30,0	30
45	21	70,0	9	30,0	30
color					
15	22	73,3	8	26,7	30
30	20	66,7	10	33,3	30
45	24	80,0	6	20,0	30
Flavor					
15	27	90,0	3	10,0	30
30	10	33,3	20	66,7	30
45	18	60,0	12	40,0	30

Table 4. Distribution of the rice bran cookies acceptance test results`

Substitution (%)	Fiber content (gr/100gr)	Acceptability Test			
		taste (%)	Texture (%)	Color (%)	Flavor (%)
15	3,95	83,4	90,0	73,3	90,0
30	4,90	30,0	70,0	66,7	33,3
45	5,65	70,0	70,0	80,0	60,0

The accuracy analysis of the fiber power test and the acceptance test (Table 4) found that the substitution of 15% of rice bran cookies had the best acceptability.

DISCUSSION

The latest definition of dietary fiber delivered by The American Association of Ceral Chemist is an edible part of a plant or an analogue carbohydrate that is resistant to digestion and absorption in the small intestine with complete or partial fermentation of the large intestine. According to the USDA, rice bran fiber content per 100

grams is 25.3 grams., rice bran can be used as a substitute with its high nutrition for nutritional enrichment of a processed food product⁴.

The test results in Table 2 can be concluded that the highest fiber content is found in the bran with the highest substitution, which is 45% with fiber content of 5.65 grams. The higher the substitution of rice bran

flour in cookies, the greater the fiber content produced. it is known that the fiber content is 1 gram⁵In the cookie products on the market, from the data it can be concluded that the fiber content found in cookies with bran substitution is 45% higher than the cookies on the market.

70%Panelists like the substitution of 45% rice bran flour. The more granting of rice bran flour in the process of making cookies gives a bitter taste. Rice Bran contains saponin compounds which can cause bitter taste. Saponins are glycosidic compounds which perfectly hydrolyzed produce sugar and non-sugar compounds called saponin⁶. The high concentration of rice bran flour that is used makes a rather bitter taste in fried bran noodles⁷.

Based on the texture, the panelists gave a good response for all samples of the substitution of rice bran flour. The process of making rice bran cookies uses eggs, where the use of eggs makes the bran become soft because it contains lecithin as a natural emulsifier which is useful as a softener so that it affects the texture of the bran product produced⁸. Starch flour will absorb water and will form a mixture with gluten, then it will be converted to gelatin by heat so that it makes the dough fused and smooth. Protein in wheat flour will bind water so it will expand and elastin. The elastin dough indicates gluten in flour works well⁹.

Panelists likes the colors produced even though the colors produced from each rice bran substitution are different. The brown color of the bran cookies is produced from the base color of creamy bran flour and the addition of bran flour which is growing in number. The greater the concentration of rice bran flour, the darker the color of the noodles produced^{10,11}. The higher addition of bran flour affects the color produced in cookies so that it affects the panelist's assessment of color.

The panelists' response to 45% substitution of flavor is they like the smell produced by bran products that comes from bran flour. The amount of rice bran concentration that is used makes the flavors even more pronounced. basically the substitution of bran in the manufacture of cookies can be a snack product for teenagers, especially for adolescent who are obese because these cookies contain high fiber content¹²⁻¹³.

CONCLUSION

The highest fiber content in 45% of rice bran flour substitution with fiber content of 5.65%. The results of the acceptance test for 45% of bran flour substitution is 70% panelists like the taste, 70% % panelists like the texture, 80% % panelists like the color, and 60%% panelists like the flavor.

The Role of Religion and Spiritually in the Care of Patients in Family Medicine

Rafid Hadi Hameed

Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

Religion and health care are two subjects that important to a patient suffering from any illness. However, the two concepts drifted apart at the start scientific revolution era although today the disciplines are closely connected. The study investigated the association of the two subjects by use of questionnaires which were mailed to 158 patients. The results were analyzed using various statistical methods and revealed that nearly 88 % of the respondents appreciated the role spirituality and religious beliefs played in medicine and healthcare. However, nearly 57 % percent of patients had a discussion on religion matters with their family doctors because of varied reasons such as time constraints and different religious background. The study revealed that spiritual and religious beliefs play an important role in the patients' medicine and healthcare.

Keywords; *spirituality, religious beliefs, medicine, health care.*

INTRODUCTION

People are confronted with life threatening diseases that leave them questioning the reasons for their existence or the purpose of their life. Thus they turn to their religious beliefs to strengthen their sense of control, support their hope or relieve their stress. Although the patient may seek medical help from specialists, they also turn to the creator in prayers and trust that the supernatural being will render a helping hand ¹. Thus for many centuries science and religion has always been closely interlinked. Actually, history indicates that medical and spirituality care was be conducted by the same individual. Christianity provides record of instances when God healed using similar remedies that were practiced in medicine. However, at the beginning of the Renaissance era, scientific revolution took place and faced rejection from the religious communities. Thus there occurred a drift between medicine and religion, because the earlier adopted the advanced scientific methods while the later served as a barrier to both knowledge and advancement. For instance, the Cartesian philosophy that was adopted by medicine viewed body and mind as two different items thus widening the gap between religion and spirituality ^{2,3}. At the start of 1900s the idea of importance of spirituality in medicine and psychological health was reintroduced by Carl Jung. He indicated

that in all his patients, the religious outlook in their life has always been their last resort ⁴. More so, Victor Frankl who survived the Nazi concentration suggested in his book named *Man's Search for meaning* that was published in 1946 stated that spirituality has a role to play in the mental health⁵. Religion and spirituality do not follow the scientific conventions and could thus be alienated further whenever its contribution to medicine is gauged using the scientific models. However, their main objective is to help an individual find the purpose of life and find their place in the world. Thus various prayers have been conducted to ailing persons as they continue with their conventional medication and positive outcome has been observed as indicated on this study. The duration between 1980 and 1990 witnessed the increased integration of religion and spirituality in medicine and healthcare. Popular press has published numerous articles that highlight the connection between of the two concepts in relation to both healing and comfort. Some of the practices that are applied are pastoral counseling, prayer in healing, evoking forgiveness or compassion. A survey was conducted by the National Center or Complementary and Alternative Medicine (NCCAM) in 2004 and discovered that prayer was preferred among the approaches that were listed in the survey. Thus the religious affiliation in addition to the patient's religious practices was related to their health and mortality ⁶. Lee-

Poy conducted an in-depth interview on patients as well as a survey on family physicians. The outcome showed that religious and spiritual beliefs were crucial in the patient care in family medicine. However, the barrier that was identified was the physician comfort level but could be enhanced through medical education on religion and spirituality⁷. There is evidence that indicate that the importance of spirituality in coping with illness because it offers protection against despair in patients with terminal illnesses⁷. Saliman attended to persons termed as challenging patients that were referred to him by physician-in-chief in his medical center. One of such patient was Tina who believed that she had multiple sclerosis which she felt was not being treated properly even with her monthly visit to the Emergency Department (ED) for magnetic resonance imaging. The results read normal and this made her really upset thus prompting her to write complaint letters after every visit. However, after she visited Saliman's office, her attitude changed because when he noticed she was wearing a golden cross on her neck, he requested they pray after every session. Tina was fighting to be given 1g of IV steroids but the physician reasoned with her that she cannot be given medication without evidence of what was being treated. The prayer session continued for nine months and she kept away from ED and instead of asking for steroids, visiting ED or writing complaint letters she wrote commendation letter to the hospital administration. The medical practitioner concluded that prayer is a crucial component in patient's lives and thus he welcomed any chance of saying a prayer at the end of office visits⁸. Analysis on various studies on how patients pray reveals that some individuals preferred conversational prayers while others relied on memorized prayers like the Lord's Prayer for Christians or seven tools for Muslims. Some patients did not have a specific time or place for prayer and some appreciated praying with others⁹⁻¹². A literature review conducted by Jors et al.,¹³ provided some of prayer items that patients include as well as the quotes they refers to in table 1. According to Ellen Barlow,¹⁸ potential effect of spirituality and religion on a person's health cannot be ignored. The Spirituality, Health and Health Disparities Symposium conducted in December 2014 by the Harvard Medical School indicated that religion offers patients an opportunity to share their pain thus becoming more bearable and gain an intense sense of power. A medical practitioner named White-Hammond highlighted the experience of a 5-year-old girl who was suffering from Leukemia and stated that

healing includes exercising compassion to ease pain and not necessarily save lives. Mindfulness techniques such as relaxation, meditation, yoga and prayers have both psychological and physiological changes.

MATERIALS AND METHOD

Various studies have been conducted regarding the importance of discussing with patients about their spiritual and religious beliefs. Some of the studies are directed towards the physicians' practices and opinions on asking their patients about their religious beliefs thus measuring their comfort levels when handling the topic^{7, 19, 20}. This study will follow the same procedure; however, it will focus on the role of religion and spirituality in patients' healthcare.

Design and sample

This was a cross-sectional study with self-administered questionnaire mailed to patients about the role of religion and spirituality in the healthcare. The sample frame was obtained from the general practitioners and physicians practicing between 2009 and 2018 in Kitchener and Waterloo, Ontario region. The list of family physicians was obtained from the Ontario Medical Association. The sample size was 158.

The development of questionnaire

The self-administered questionnaire was organized to assess how the patient's religious beliefs helped me in their recovery or coping with their illness. It also assessed how they felt when the family physicians discussed with them about their spiritual beliefs during their office visits. The questions were drafted based on the previously conducted studies' literature search although they did not indicate any authenticated questionnaire⁷.

Data collection

The self-administered questionnaires were distributed using a revised Dillman method thus increasing the response rates of the mailed questionnaires to the patients²¹. Together with the mailed questionnaires was a stamped return envelope and a reminder postcard was sent to non-responders two weeks later. Additionally, a second set of questionnaire and a stamped envelope was sent again five weeks later followed with final reminder postcard in the ninth week.

Variables and data analysis

The 5-point Likert scale consisting of variables such as never, rarely, sometimes, most of the time and always was used to measure the role of religion and spirituality in the medicine and healthcare of patients. The independent variables consisted of patients' demographic characteristics, their religious and spiritual beliefs, and their opinion on the role of religious beliefs on their healthcare as well as the frequency of discussing their beliefs with their family doctors. The 1-way ANOVA that analysis variance and *t* tests was used to carry out bivariate analyses as appropriate. The Multiple linear regressions were used to conduct multivariate analysis on the role of religious beliefs, frequency of their discussion with their physicians. In the bivariate analysis, the independent variables were statistically significant ($p \leq 0.05$).

RESULTS AND DISCUSSION

Out of the 158 questionnaires that were mailed to patients, 140 returned thus, a response rate of 88.6%. The patients responded differently to the five questions that were provided. For example, 140 provided their demographic details, 130 provided the number of years they have been sick while 115 indicated they were spiritually inclined and confirmed that religious and spiritual beliefs helped them to cope with their illness while 25 felt religious beliefs have no connection with health care and recovery. However, 80 indicated to have regular discussion with their family doctors regarding their religious beliefs or pray together their office visits. Additionally, the only similarity between the 18 non-respondents and respondents is that they were of the same gender but there was no other similarity in terms of variable was established. Approximately 51.4 percent of the respondents were female. Age ranged from 27 to

70 and their mean was 48.9 and standard deviation (SD) of 9.5 years. The patients had been sick between 2 to 42 years, thus a mean of 20.8 and SD of 10.3 years. 82.1% were spiritually focused and relied on their spiritual beliefs to cope and maintain a positive outlook. They participated in pastoral programs, attended seminars, yoga program or counseling programs. The patients were Christians, Muslims or Buddhists. 57.1% discussed with their family doctors their religious beliefs, prayed together or shared a scriptural thought together or received a recommendation of pastoral and counseling programs. However 42.9% did not discuss with their family doctors any religious matter because of varied reasons such as the perception that religious and spiritual beliefs were personal matter, they were not relevant to the healthcare, there was limited time for such discussions or the family doctors were either not religiously inclined or had a different religious background. Thus the patients and the physicians were reluctant to share their religious or spiritual beliefs. The multivariate analysis, 6 factors were statistically significant in the bivariate analyses and were thus included in the analysis of multiple linear regressions. The importance level of religion and spirituality ($p < 0.001$) and the patients opinion on the role of religion and spirituality in the health care of a person ($p = 0.01$). The study indicates that it is important for the patients to have religious and spirituality beliefs because it helps them in their recovery and to cope with their illness. There are some studies that support the discussion of the religious and spiritual beliefs with their patients²². This study confirms too that religious ad spirituality contribute significantly to the well-being of the patient. Thus the family doctors should take an interest in the discussion with their patients about their spiritual beliefs because it enhances their recovery and coping with terminal illnesses or any other form of diseases.

Table 1. Example of quotes.

Category	Example quote
Improvement in patient's health and wellbeing	"When in pains and aches or whatever, Pray to God and will He relieve it" ¹⁴
Disease management and decision-making	"Pray when scared, and ask God for wisdom, understanding and insight when making decisions." ¹⁵
Prayers for others	"Focus on praying for your family members, friends as well as other loved ones because they love and need you too." ¹⁶

Table 2. Demographic characteristics of the respondents: N=140

Gender	
Male (%)	Female (%)
48.6 (68)	51.4 (72)
Ages in years (percentage)	
< 40	20 (14.3%)
41- 50	40 (28.6%)
51-60	36 (25.7%)
≥ 60	44 (31.4%)
Number of years of being sick : N= 130	
< 10	22 (16.9%)
11 - 20	49 (37.7%)
21 - 30	31 (23.8%)
≥ 30	28 (21.6%)

Table 3. Factors statistically significant in the bivariate analysis.

Factors	B coefficient	P value
Demographic details		
Gender	0.023	0.761
Age	0.021	0.789
Opinion on having religious and spiritual beliefs		
Importance of spirituality	-0.116	0.138
Role of religious and spirituality beliefs o health care and medicine		
They help in recovery and coping	0.277	0.001
Importance of discussing with family health care		
importance to discuss	0.010	0.905

CONCLUSION

Religion and medicine was initially closely linked together and was offered by the same person. However during the Renaissance era the two subjects parted ways because of the widening gap in the understanding of body and mind. However, various studies indicate that spirituality and religion is important in the recovery of the patient because it helps them to find the purpose of their life. Many patients have been prayed for either knowingly and unknowingly and have positive outcome. Many popular presses have published articles that show the linkage between medicine and spirituality. Medical schools in America have also incorporated spirituality and faith related courses in their programs. The study on the 158 patients gathered 88.6 % responses and out of the 140 who responded 115 indicated that they possessed

some spirituality and religious beliefs opinion and were important in coping with their illnesses and maintenance of a positive outlook in life. On the other hand, 11.4 % felt spirituality is not linked to their recovery and medication was sufficient in their recovery. However, 57.1 % of the physicians have a regular discussion with their patients about their religious beliefs as well as pray together with them when they visit their offices. Therefore, spirituality and faith courses should be included in the medical curriculum to reinforce the practitioners comfort levels thus increase such interactions. This will enable them to engage patients on such topics because they play an important role in the patients' medicine and healthcare.

Analysis of the Association between Sebum Levels and Staphylococcus Epidermidis Infection Identified by PCR in Comedonal, Papular, and Nodular Acne Vulgaris

Farida Tabri

Department of Dermatology and Venereology, Faculty of Medicine, Universitas Hasanuddin, Makassar

ABSTRACT

Acne vulgaris is a common inflammatory disease of pilosebaceous follicles. This study aims to determine the relationship between sebum levels and Staphylococcus epidermidis infection in patients with acne vulgaris through PCR. The study was conducted in Dr. Wahidin Sudirohusodo Hospital, several network hospitals, and several high schools in Makassar City from May 2016 to June 2016. The study used cross sectional research design. The samples were patients aged 15 – 25 years, with mild, moderate, or severe type of acne vulgaris who came to the dermatovenereology clinic of Wahidin Sudirohusodo Hospital, other network hospital, and several high schools around Makassar City. A total of 45 subjects were identified and were divided into three equal groups each consisting of 15 subjects with mild, moderate, and severe acne, respectively. Samples from comedonal, papulopustular, and nodular lesions were taken followed by examination for Staphylococcus epidermidis infection. The results showed a quite high incidence of Staphylococcus epidermidis infection in acne vulgaris patients, with positive PCR results in 32 out of 45 samples, while 12 samples showed negative PCR results, suggesting Staphylococcus epidermidis as a dominant bacteria in such disease.

Keywords: *Acne Vulgaris, PCR, Staphylococcus epidermidis*

INTRODUCTION

Acne vulgaris is a chronic and multifactorial skin condition which predominates in patients aged 11 – 30 years. The characteristics of this disease include open and closed comedones, papules, nodules, and cysts which, in mild type are located on the face and around body in severe type. The condition may then be followed by post inflammatory pigmentation that may give rise to adverse psychosocial effect. Hence, acne vulgaris is one of the most common reasons to visit dermatologists.¹

Acne is formed in hair follicles of skin consisting dead cells. The accumulation of such cells together

with hyperkeratosis retention and an increase in sebum production lead to the formation of comedones (follicles blocked by sebum, keratin, and normal flora), which was then followed by inflammation. The normal bacteria inside the follicles is known as *Staphylococcus epidermidis*. It is not a pathogen but is involved in acne development. The gathered bacteria will release proinflammatory mediators that cause papules and pustules formation that may worsen the condition. These papules and pustules can develop into nodules and cysts which will be a concern for the dermatologists.² The classification is based on comedonal, papulopustular, and nodulocystic types. Pustules and cysts are considered inflammatory types.

A previous study conducted by Dhillon et al in India aimed to detect bacterial agents behind acne vulgaris through culture examination and followed by the evaluation of broad spectrum antibiotic sensitivity.³ The samples were collected from nodulocystic and pustular lesions of 50 subjects aged between 18 and 27 years. The

microorganisms found from the lesions in both aerobic and anaerobic conditions included *Propionibacterium acne*, *Micrococcus spp*, *Staphylococcus epidermidis*, and *Staphylococcus aureus*. Different bacteria were discovered from different types of lesions that were cultured in different conditions in both males and females. In an aerobic condition, the incidence of *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Propionibacterium acne*, and *Micrococcus spp* infection were 45%, 49%, 0%, and 45% respectively. Meanwhile, the culture from anaerobic condition showed 41% *Staphylococcus aureus* infection, 20% *Staphylococcus epidermidis* infection, 32% *Propionibacterium acne* infection and none of *Micrococcus spp* infection. Regarding antibiotic sensitivity, it was found that *Propionibacterium acne*, *Staphylococcus epidermidis* and *Staphylococcus aureus* infection tended to be more sensitive to Rifampicin. It was revealed that the effect of the combination between Clindamycin and Benzoin Peroxide was not superior to Rifampicin alone. The study also showed different effects of antibiotics to isolated bacterial from pustular and nodulocystic types.

Another study in Brazil examined *Staphylococcus epidermidis* which carried biofilm-producing genes through multiplex PCR examination.⁴ The study used 18 reference strains and 149 clinical *Staphylococcus* strains and aimed to identify *Staphylococcus epidermidis* and its three gene sequence: *recN* for recombinant protein coding, *mecA* for methicillin resistance, and *icaAB* for biofilm formation. Amlicons from 219 bp (*S. epidermidis-recN* gen), 154 bp (*mecA* gen), and 546 bp (gen *icaAB*) were obtained. The result revealed that the multiplex PCR approach was beneficial for an accurate identification of methicillin-resistant *Staphylococcus epidermidis* which is capable of producing biofilm.

The objective of this study is to evaluate the association between sebum levels and *Staphylococcus epidermidis* infection using PCR method.

MATERIALS AND METHOD

Location and Time

The study was conducted in the dermatovenereology clinic at Wahidin Sudirohusodo Hospital, Hasanuddin University teaching hospital, several high schools around Makassar, South Sulawesi, Indonesia, and Hasanuddin University teaching hospital laboratory from May to June 2016.

Study Design and Variables

This study used a cross sectional research design. The variables examined consisted of independent variables (endogenous and exogenous factors), dependent variables (mild, moderate, and severe acne vulgaris), and intervening variables (sebum level and *Staphylococcus epidermidis* identification).

Population and Samples

The population of this study was female aged 15-20 years with mild, moderate, or severe acne vulgaris who came to the dermatovenereology clinic at Wahidin Sudirohusodo Hospital, Hasanuddin University teaching hospital, and several high schools around Makassar City. Subjects who did not receive retinoids, antibiotics or anti-inflammatory drugs in the last one month were assessed for acne severity with the Lehman Criteria and classified into mild, moderate, or severe acne vulgaris.⁵

Data Collection

Sebum level was measured using Sebumeter SM 815 (Courage & Khazaka Electronic Co, Cologne, Germany). The plastic film from the device was applied to the skin for 30 seconds to allow the sebum to be absorbed; which was then analyzed by the photometer inside the device. in $\mu\text{g}/\text{cm}^2$.

Specimens obtained from comedonal, papulopustular, and nodular lesions from patients with acne vulgaris were evaluated for the presence of *S. epidermidis* by using PCR (Biorad®, California, USA) examination the following primer sequence; forward (PR 264): 5-GCA GGC AGA GTT TGA CAT CC-3, reverse (PPA.R): 5-ATG TTG AGG GCG GTG ACG TT-3, and target ban 334 bp. Informed consent from each subject has been previously acquired.

Data Analysis

Data were analyzed using Statistical Package for Social Sciences (SPSS) 18.0 for Windows (SPSS Inc. Chicago, IL, USA). All results were presented in tables and graphs. The Mann-Whitney test was used and significant results were denoted by a p-value of < 0.05 with 95% CI.

RESULTS

A cross sectional study was conducted to identify the association between sebum levels and *Staphylococcus*

epidermidis infection in acne vulgaris using PCR method. The study was done in the dermatovenereology clinic at Wahidin Sudirohusodo Hospital, Hasanuddin University teaching hospital, several high schools

around Makassar City, and the laboratory at Hasanuddin University teaching hospital from May to June 2016. There were 45 female participants with mild, moderate, and severe cases of acne vulgaris.

Table 1. Differences of PCR Results between the Mild, Moderate, and Severe Acne Group

Group	Positive	Negative	P-value
Severe Acne	5.122 ^a	8	0.744
Moderate Acne	5.476	8	0.706
Mild Acne	.381	1	0.537
Total	46		

Note: Chi-Square Test

There was no significant difference in *Staphylococcus epidermidis* infection between lesions from mild, moderate, and severe acne vulgaris lesions (Table 1). However, sebum levels between the three grades of acnes differed significantly ($p < 0.05$). P-values of those in mild-moderate group, mild-severe group, and moderate-severe group were < 0.001 , 0.005 , and 0.005 respectively (Table 2).

Table 2. Distribution of Association between Sebum Levels and *Staphylococcus epidermidis* Infection in Different Grade of Acne (Mild, Moderate, Severe)

(I) Acne	(J) Acne	Mean Difference (I-J)	Std. Error	Sig.
dimension3	Moderate	231,34167*	16,03518	,000
	Mild	279,20000*	16,29176	,000
dimension3	Severe	-231,34167*	16,03518	,000
	Mild	47,85833*	16,03518	,005
dimension3	Severe	-279,20000*	16,29176	,000
	Moderate	-47,85833*	16,03518	,005

*. The mean difference is significant at the 0.05 level.

It was found that the sebum levels were significantly associated with acne vulgaris grade (mild, moderate, severe) ($p < 0.001$). Meanwhile, *Staphylococcus epidermidis* infection was not associated with acne vulgaris grade ($p = 0.439$) Table 3.

Table 3. Distribution of Sebum Levels and *Staphylococcus epidermidis* Infection through PCR

			Acne	PCR	VAR00009
Spearman's rho	Acne	Correlation Coefficient	1,000	-,117	-,841**
		Sig. (2-tailed)	.	,439	,000
		N	46	46	46
	PCR	Correlation Coefficient	-,117	1,000	,020
		Sig. (2-tailed)	,439	.	,897
		N	46	46	46
	VAR00009	Correlation Coefficient	-,841**	,020	1,000
		Sig. (2-tailed)	,000	,897	.
		N	46	46	46

** . Correlation is significant at the 0.01 level (2-tailed).

Staphylococcal infection was found in 9 cases of severe acne vulgaris (28.1%), 12 cases of moderate acne vulgaris (37.5%), and 11 cases of mild acne vulgaris (34.4%) Table 4.

Table 4. Distribution of the Association between *Staphylococcus epidermidis* Infection and Acne Grading System (Mild, Moderate, Severe)

Positive Negative			PCR		Total
Acne	Severe	Count	9	6	15
		% within Acne	60,0%	40,0%	100,0%
	Moderate	Count	12	4	16
		% within Acne	75,0%	25,0%	100,0%
	Mild	Count	11	4	15
		% within Acne	73,3%	26,7%	100,0%
Total		Count	32	14	46
% within Acne			69,6%	30,4%	100,0%

DISCUSSION

This study showed that the incidence of *Staphylococcus epidermidis* infection in patients with acne vulgaris was quite high. There were 32 out of 45

samples with positive PCR results for *Staphylococcus epidermidis* and 12 out of 45 with negative results.

The data showed that there was no significant difference in PCR examination between the mild,

moderate, and severe acne vulgaris patients. This study aims to identify *Staphylococcus epidermidis* infection associated with three gene sequences: recN for recombinant protein coding, mecA (methicillin resistance) and icaAB for biofilm formation. Amplicons from 219 bp (S. Epidermidis-recN gene), 154 bp (mecA gene), and 546 bp (icaAB gene) were obtained. The results that achieved 100% of strain were then evaluated showing that the new multiplex PCR approach can benefit to accurately identify methicillin-resistant *Staphylococcus epidermidis* due to its potential for biofilm formation.⁴

The age distribution of subjects consisted of 33 patients aged 15-16 years and 12 patients aged 17-18 years. Based on this data, it was suggested that adolescents are more prone to have acne compared to the other age. The initial lesion starts to be visible at the age of 8-9 years and approximately in more than 50-60 % juveniles.⁶ The prevalence of acne vulgaris in adolescence is around 80-85% with its peak incidence is between the age of 15 and 18 years old, 12% in women aged more than 25 years and 3% in those who aged 35-44 years. 58% cases is affected those who aged 15-25 years. According to many studies, mostly the disease affects subjects who are 18-25 years old. Another also suggested the age of 12-39 years is the most common one.⁷

Meanwhile, the sebum levels of those with had mild, moderate, and severe acne vulgaris differed significantly. As we know, increased sebum level is one of the pathogenesis of acne formation. There are many ways to measure sebum level in skin such as gravimetric method using white film, cigarette paper method, photometric, and sebumetric. The parameter used to quantify sebum excretion is casual level (CL), defined as the amount of sebum per unit skin.^{8,9}

CONCLUSIONS AND SUGGESTIONS

The available data suggests that acne grading is associated with sebum concentration, both from the significance and empirical aspect. The incidence of *Staphylococcus epidermidis* infection was higher in the mild, moderate, and severe acne vulgaris compared to other bacteria such as *S.aureus*, *Bacillus*, *Bacillus,sp*, *Enterobacter*. However, it was not found to be significantly associated with acne vulgaris severity. Future related study is needed to compare the identification of *Staphylococcus epidermidis* between

PCR and microbiological culture.

ABSTRACT

Diabetes mellitus suffers from insulin deficiency which inhibited the transfer of glucose to cells in body tissues that cause starvation cells and in the increase in glucose in the blood that leads to muscle weakness thus disrupt the body's balance and increase the risk of falling. Diabetic foot exercises aim to improved blood circulation in the feet of people with diabetes mellitus, so that nutrient smoothly to the network. The purpose of this study to determine the effect of diabetic foot gymnastics on body balance elderly people with diabetes mellitus in Diabetic Club Gatoel Hospital Mojokerto in the 27 February – 25 March 2017. This research used a Quasy Experimental method with Pretest-Posttest with Control Group Design. The sampling technique used Simple Random Sampling with the sample of 17 respondents for the control group and 17 respondents for the intervention group. Wilcoxon Signed Rank Test obtained p-value $0,000 < 0,05$ concluded that there is an influence of diabetic foot exercises on body balance in elderly people with diabetes mellitus in Diabetic Club Gatoel Hospital Mojokerto. The study recommended that elderly people with diabetes mellitus is expected to take advantage of diabetic foot exercises as an effort to improve the balance of the body to reduce the incidence of fall.

Keywords : *diabetic foot exercises, body balance, diabetes mellitus*

INTRODUCTION

Elderly is a part of family members and communities that are increasing in number in line with increasing life expectancy. The older a person, he will experience a setback, especially in the field of physical ability, which can lead to a decrease in social roles that lead to dependence. In old age, a good balance is needed by someone in supporting their daily mobility.^{1,2}

The prevalence of diabetes mellitus based on physician diagnosis and symptoms increases with age, in East Java (2.5%) and increases in age 55-64 years (5.5%). In Mojokerto City the percentage of the elderly population was (9.94%), with the percentage of men (9.26%) and women (10.62%) and an estimated 20% of elderly people suffered from diabetes mellitus. (BPS East Java Province, 2015). Based on the results

of a preliminary study on December 6, 2016, at 11.00 WIB in the Diabetic Club of Gatoel Mojokerto Hospital, there were 50 elderly people with diabetes mellitus who received gymnastics. And there are 10 elderly diabetics who complain of foot tingling and numbness.

Diabetes mellitus is a major risk factor for impaired lower limb function, balance disorders, and mobility. Compared to other elderly people, the risk of physical limitations is 2-3 times that of elderly people with diabetes mellitus, and this risk is greater in women. The impact of all this is that more elderly women with diabetes mellitus experience falls and fractures. Balance in the elderly also experienced a setback. The existence of a balance disorder in the elderly will cause falls in the elderly^{3,4}. In addition, other researchers regarding the influence of elderly gymnastics on body balance in the elderly in the Dajan Bingin Sading environment showed

a significant change between the balance of the elderly body before and after being given gymnastics for 35 minutes in the afternoon for four weeks. This is evident from the improvement of the balance of the elderly body after being given gymnastics for the elderly^{5,6}. In addition, hatha yoga modification training and tai chi exercise can also improve balance.

Physical exercise of diabetic foot exercises keeps it moving because by moving indirectly it will keep the muscles and joints to regulate the balance of both legs and strengthen joint muscles in order to reduce the risk of falling in the elderly with diabetes. and the risk of other complications⁷. Diabetic foot exercises are carried out 2-3 times a week for 15 minutes to get effective results.^{8,9}

The research objective was to analyze the effect of diabetic foot gymnastics on the body balance of elderly people with diabetes mellitus in the Diabetic Club of Gatoel Hospital in Mojokerto.

MATERIALS AND METHOD

This research was conducted using the experimental Quasy design with Pre-Posttest design with Control Group Design. This research was conducted at the Diabetic Club of Gatoel Mojokerto Hospital on 27

February - 25 March 2017. The population in this study were 50 elderly people with diabetes mellitus in the Diabetic Club of Gatoel Mojokerto Hospital and sampling techniques with Simple Random Sampling as many as 17 samples respondents for the control group and 17 respondents for the intervention group.

Measurements were carried out in two ways, namely pretest and posttest, a pretest was before being given diabetic foot exercises using Berg Balance Scale (BBS) and posttest was given diabetic foot exercises using Berg Balance Scale (BBS) 2 times a week for 4 weeks.

RESULTS

Table 1. Distribution of Pretest Body Balance Frequency in Control Groups and Intervention Groups

Based on table 1. shows that the pre-test in the intervention group more than 50% of respondents have a good body balance that is 10 respondents (58.8%). Whereas in the pre-test control group, the majority of respondents had a good body balance as many as 11 respondents (64.7%). Based on the research data, the body balance of respondents with diabetes mellitus before intervention tends to be in the medium category.

Table 2. Distribution of Posttest Body Balance Frequency in Control Groups and Intervention Groups

Post Test	Group	Body Balance						Total	
		Good		Medium		High			
		F	%	f	%	F	%	F	%
	Control	10	58,8	6	35,2	1	6	17	100
	Intervention	15	88,2	2	11,8	0	0	17	100
	Total	25	73,5	8	23,5	1	3	34	100

Based on table 2. shows that in the intervention group almost all of the post-test respondents have a good body balance that is 15 respondents (88.2%). Whereas in the control group most of the respondents in the post-test had good body balance (58.8%). Based on research data it was found that respondents who did diabetic foot exercises 2 times a week experienced a significant increase in body balance compared to respondents who did not do diabetic foot exercises.

Table 3. Frequency Distribution of the Effects of Diabetic Foot Gymnastics on Body Balance in the Elderly Patients with Diabetes Mellitus in the Diabetic Club of the Gatoel Mojokerto Hospital on February 27 - March 25, 2017

No.	Body Balance	Control				Intervention			
		Pre Test		Post Test		Pre Test		Post Test	
		f	%	f	%	f	%	f	%
1.	Good	11	64,7	10	58,8	10	58,8	15	88,2
2.	Medium	4	23,5	6	35,2	6	35,2	2	11,8
3.	High	2	11,8	1	6	1	6	0	0
	Total	17	100	17	100	17	100	17	100
	p value	Uji Wilcoxon Signed Rank Test = 0,131				Uji Wilcoxon Signed Rank Test = 0,000			

Based on table 3. using the Wilcoxon Signed Rank Test test in the control group with a significance value of $0.131 > 0.05$ indicating that there is no effect of diabetic foot gymnastics on body balance in elderly diabetics in the Diabetic Club of Gatoel Hospital in Mojokerto. While the Wilcoxon Signed Rank Test test in the intervention group with a significance value of 0.000 or $p < 0.05$, which means that H_1 is accepted means that there is an effect of diabetic foot gymnastics on body balance in elderly people with diabetes mellitus in the Diabetic Club of Gatoel Hospital in Mojokerto.

DISCUSSION

1. Body Balance Before Given Diabetic Foot Gymnastics in the Control Group and Intervention Group

A speed of reaction time, relaxation and functional work. Furthermore, decreased function and muscle strength will result in a decrease or decline in the ability to maintain body balance. Obstacles in sitting motion to standing increased the risk of falls, changes in posture. Problems with the ability to move and function, are closely related to muscle strength that is individual in the elderly¹⁰. With sports such as jogging, running, lifting weights, badminton, tennis or other sports will maintain the bone density of the elderly. In addition, exercise can also strengthen the muscles of the elderly and help balance the posture so that the possibility of fracture (fracture) is smaller¹¹. Patients with diabetes mellitus have characteristics of hyperglycemia, high blood sugar

levels cause various disorders of the somatosensory system (visual, vestibular, proprioceptive) and motoric (musculoskeletal, muscle, soft tissue joints) which can interfere with the balance system thereby increasing the risk of falls. In addition, diabetics have insulin deficiency which inhibits the transfer of glucose to cells in body tissues which causes cells to starve and an increase in glucose in the blood. This creates obstacles in perfusion to muscle tissue which will result in muscle tissue getting less oxygen and nutrients which causes cells to lack the material for metabolism so that the energy produced decreases which result in the onset of weakness and can further result in muscle atrophy. Muscle weakness causes interference in static and dynamic body balance. These disorders will cause the body to falter and become unstable, increasing the risk of falls and fractures¹².

Physical activity can be done at leisure, the scope of work, and daily routine activities such as homework, gardening, hobbies, recreation, and sports¹³. This is reinforced by the opinion of Lord, et al which states that the average incidence of falls in elderly women is 40% while men 38% and will continue to increase at the age above 65 years. This event can be caused by reduced muscle strength in elderly women and lack of ability of elderly women to restore body stability. Elderly women also experience muscle weakness in the lower extremities so that they cannot support their weight.

The results of the analysis of the researcher, respondents who participated in this study were aged 60-74 years old who had entered the elderly but were

still active in gymnastics activities and the majority of respondents were mostly female. The risk of physical limitations in elderly people with diabetes mellitus is greater in women, the same effect is that more elderly women with diabetes mellitus experience falls and fractures.

2. Body Balance After Given Diabetic Foot Gymnastics in the Control Group and Intervention Group.

Based on the research data in table 2. it was found that almost all respondents in the treatment group experienced an increase in body balance to be good, namely 15 respondents (88.2%) while almost half of the respondents in the control group had a moderate body balance, namely 6 respondents (35.2%). This means that respondents who did diabetic foot exercises 2 times a week experienced a significant increase in body balance compared to respondents who did not do diabetic foot exercises.

The results of this study are in line with the research in Switzerland by Rocher cited by Wibisono in patients with diabetes mellitus with neuropathy, the results of irregular exercise research are at risk of developing diabetic ulcer 4 times higher than regular exercise¹⁴. The results of this study are consistent with a statement explaining that the physiological effects of foot exercises routinely will achieve simultaneous or separate effects. Therefore, diabetic foot exercises that are carried out regularly and in a balanced manner can have a positive impact on elderly people with diabetes mellitus, especially those who experience body balance disorders.

3. The Effect of Diabetic Foot Gymnastics on Body Balance in the Elderly Patients with Diabetes Mellitus in the Diabetic Club of Gatoel Hospital in Mojokerto.

The results of the analysis of the researchers, the increase in body balance from the medium to good after diabetic foot exercises in elderly people with diabetes mellitus in the intervention group in the Diabetic Club of Gatoel Hospital in Mojokerto was due to the respondents doing diabetic foot exercises correctly and regularly according to the movements determined by the frequency of exercise 2 times a week for less than 10-15 minutes in 8 weeks. Diabetic foot exercises physical exercise is able to keep it moving because by moving indirectly

it will maintain the muscles and joints to regulate the balance of both legs and strengthen joint muscles as a way to reduce the risk of falling in the elderly and the risk of other complications.

CONCLUSION

Based on the results of the discussion about the effect of diabetic foot gymnastics on the balance of the body between groups that apply diabetic foot exercises and not in elderly diabetes mellitus can be concluded that :

The balance of the body before being given diabetic foot exercises in the control group and the intervention group in the elderly with diabetes mellitus in the Diabetic Club of Gatoel Mojokerto Hospital tend to be in the medium category.

The balance of the body after being given diabetic foot exercises in the control group and the intervention group in the elderly with diabetes mellitus in the Diabetic Club Gatoel Mojokerto Hospital experienced an increase from the moderate to the good category in the intervention group.

There is an effect of diabetic foot exercises on body balance in elderly people with diabetes mellitus in the Diabetic Club of Gatoel Hospital in Mojokerto.

The Model of Supervision for Impermanent Food Sellers by Women Volunteer in Kendari City Indonesia

Tasnim Tasnim¹, Maria Inge Lusida²

¹Public Health Department, STIKES Mandala Waluya, Kendari, Indonesia,

²Institute Tropical Disease, Airlangga University, Surabaya, Indonesia

ABSTRACT

Objectives: Many fast food sellers emerged in Kendari city of Southeast Sulawesi Province Indonesia. The number of staff in Environmental division in Primary Health Services was limit, so they could not supervise for all fast food sellers in that area. Therefore, involving of women volunteer in the villages of Kendari City was necessary. Therefore, this study aimed to find out the model of supervision for impermanent food sellers by the women volunteers in Kendari City, Southeast Sulawesi Province in Indonesia.

Methods: This study used Quasy Experiment with the One-Group Pre-test-Post-test Design. The study was conducted in 3 villages in Kendari City. This study recruited 17 women volunteers and 39 fast food sellers. The statistical analysis used linier regression.

Results: The model of supervision under the women volunteers could be found in this study. The characteristic of women volunteers which involved and be active to supervise were they who have be active in social activities in their village. They have also been involved in Primary Health Services in the village for more than 6 years, they were above 41 years old. They were married and had 3 children in average. Each village involve about 4-10 women. Each village was organized by 1 person as a village coordinator. The village coordinator had responsibility to communicate or mediate to primary health services, especiallay to environmental division. Every month the coordinator reports the results of women's supervision for the fast food sellers. The time of reaching the fast food sellers was found to be significant relation with the seller's behavioural change and fast quality improvement.

Conclusion: Women volunteers can supervise to the fast food sellers in kendari City in southeast Sulawesi Province, Indonesia. They have closed with the food sellers and with sanitation and environmental staff in primary health service.

INTRODUCTION

Insecure food remains globally crucial issue, including in Kendari City of Southeast Sulawesi Province, Indonesia. As reported by Kendari City Health Department¹, there were about 176 food sellers

(20.21%) who were insecure in Kendari City in 2015. This number was the highest compared to other districts, such as South Buton (7.19%) and North Konawe (10,09%)¹. That condition has increased the incidence of diarrhoea and hypertension in Kendari City. In 2015, the incidence of diarrhoea in Kendari city was about 63,28%¹. This incidence was higher than North Konawe (6,64%) and Wakatobi (15,87%)¹. While the prevalence of hypertension were also higher (14,83%) compared to 7.15% of Bau-Bau city in 2015¹. To reduce the negative effect of hazardous food in the public places, so the government applies several strategies as

E-mail: tasnim349@gmail.com

described in the strategic planning in 2015-2019. The strategies include collaborated programs between the producers, governments, non-government organization and communities². Because the fast food sellers were huge, while there were a few health workers in Kendari City Health Department, so communities had big responsibilities to involve in controlling the fast food which were sold in the public places. However, the community involving model is unclear. Therefore, understanding the model of community involvement in the fast food control is necessary in Kendari city. Based on that phenomenon, the aim of this study is to find out the model of community involvement in controlling to fast food sellers in Kendari city to increase the quality of food hygiene and sanitation.

MATERIAL AND METHOD

Research Design

This study applied a Quasy Experiment method using The one-Group Pretest - posttest Design as described below.

notes:

O₁ : Pre-test

X : treatment from communities as controller and educator

O₂ : Post-test

The Study Site and Time

This study was conducted in Andonohu, Rahandauna and Wundumbatu villages in Kendari City. This study was conducted from February to July 2018.

The Population and Samples

a. Population

The population of this study were all of the fast food sellers in Kendari City namely 119 sellers.

b. Sample and sampling technique

This study recruited 39 fast food sellers in 3 villages in Kendari City with 5% of error tolerance. The samples were selected with using the purposive sampling. The

inclusive criteria of sampling technique included the sellers were included in 3 villages, the fast food sellers and there were civil communities who willing to control the fast food sellers.

Data collection

Data was collected through in-depth interview, observation and laboratorial test of food sample. The interview was purposed to the fast food sellers, women volunteer, health workers in Health Department of Kendari City and Poasia Primary Health Care Services.

Data analysis

The data was analysed through descriptive and inferential analysis. The descriptive analysis produced distribution of each variable such as the characteristic of

women volunteers, the model of the fast food supervision. The inferential analysis was proposed to understand the relationship between the time of supervision and the food seller's behavioural change to the quality improving of the food hygiene and sanitation. The statistical analysis used linier Regression.

RESULTS

Characteristic of Women volunteers

This study identified 17 women volunteers who could take supervision to the fast food sellers in Andonohu, Rahandauna and Wundumbatu Villages of Kendari City. The characteristic of women volunteers who actively involved in this study is presented in this below table.

Table-1. The Women volunteers' characteristic who involved in the Fast food control in Andonohu, Rahandauna and Wundumbatu Villages of Kendari City

characteristics	Number	Percentage

DISCUSSION

This study showed the women volunteer could supervise the fast food sellers in 3 villages in Kendari City. This can be explained that the women volunteers can help Poasia Primary Health Care Services especially for environmental division. As identified that the women volunteers who were active in social activities in their village. They have been trained by Poasia Primary health care services³. The women volunteers who involved in this study have been the health volunteer about 6.9 years in average. They have also gotten training or workshop about 9.2 times. They are given responsibility to do health planning and health promotion to the communities in their village³. This means they have had huge experiences, especially in community engagement towards better healthy life behaviour. Furthermore, they got support from their family member including from their husband because all of the cadres were women (94.1% of married and 5.9% of widow). Family support is reinforcing factor to determine the individual behaviour.

Thus, women volunteer have high motivation to take social responsibilities⁴. As mentioned in the above table that about 52.9%, they passed from senior high school. This means they could synthesize health information which they got⁵. Women Volunteer with more higher educational level tends to have awareness about science and information⁵. Some previous study also found that individual knowledge is determinant factor of successful cadres to take their responsibility in the comprehensive community health care services in the village⁶.

Furthermore, motivation is also the essential factor of successful for women volunteers. Motivation has significant relationship with human basic needs⁷. The human basic needs include physiological, safety, love, esteem and self-actualization needs⁷. This is true that women volunteer’s involvement in the fast food control in this study because they want to get new experiences and self-actualization. This is based on depth interview with women volunteers. Another thing, they hope to get an incentive from Poasia Primary Health Care Centre or from their village leader. Some of them (70.6%) do not

have job. They are wives who do domestic chores only. If they got incentive such as a few money, there will be increasing their family income. Additional household income will give significantly impact for their children nutrition because they will increase their purchasing power for food⁸. Increasing in the household income also can improve their household facilities such as water and latrine facilities. The housing condition also influence significantly to their under-five children's nutrition status⁹. Some of women volunteers have under-five years' old children. Also, they can buy gasoline for their motor cycle because there are about 82.4% of them used motor cycle when they supervise the fast food sellers. This means that incentive includes in intrinsic factor which motivate the human to involve in the activity like involving in the fast food control. Other previous study also argued that women volunteers' motivation was important factor for them to be active in the social activities in their village⁶.

Other important factor why they were effective to involve in the fast food control is they have lots of free time. As above mentioned that there were about 70.6% of cadres were no job. Thus, they had lots of time to involve in the fast food control. This activity took about 6.7 minutes only. Even some of cadres (29.4%) who had a job, they still could use their free time to involve in this activity. The distance between the women volunteers' home and the fast food seller is about 766 meters in average. They have 3 children in the average. Therefore, they do not have heavy burden between their responsibility in their home and in this fast food control. As we known, the wives in this culture have responsibility to child rearing including the domestic chores.

Furthermore, women volunteer have had some experiences in the previous activity could do the best approach and communication with the fast food seller. Thus, they could also give health promotion to the sellers during supervision. They were about 41.5 years old in the average. They included in the adult people who changed their interest and responsibility towards socialist people¹⁰. With the simple instrument of control the fast food quality, the women volunteers could show their ability to involve in the fast food control. The form includes several aspects such as about environment, the seller's behaviour towards the food hygiene and sanitation. Thus, they could give health education for the food sellers during supervision. The number of

assessment (0-10) of the quality of the food hygiene and sanitation is easier for them. The number of 5 becomes the basic to determine the good or poor because this number was agreed as a middle number.

The mechanism of reporting to the environmental staff in the Poasia primary health care services also could be done by the cadre because the coordinator only who reported to the environmental staff every month. The women volunteers have become familiar with all of health staff in this primary health care service. Every Saturday morning, they also take gymnastic in this primary health care. The gymnastic is purposed to increase fitness for people who are above of 40 years old and prevent for the chronic diseases such as hypertension, stroke and others. Therefore, their involvement in the fast food control was significant effective to increase the quality of the fast food.

CONCLUSIONS

This study has explained that the women volunteer can supervise the fast food traders in Kendari city, especially in Andonohu, Rahandauna and Wundumbatu villages. They are volunteers who have gotten lots of trainings and experiences in the health promotion program by primary health care services and others. Thus, they can influence the fast food traders to change their hygiene and sanitation to manage their fast food. The women volunteers can use their free time in the social activity because they have trained to manage their time effectively.

Resistance Status in *Aedes Aegypti* Strain from North Toraja, Indonesia to Malathion and Temephos Insecticides

Hasanuddin Ishak¹, Sepri Ponso²

¹Department of Environmental Health, ²Graduate School of Public Health, Faculty of Public Health
Hasanuddin University, Makassar, Indonesia

ABSTRACT

Organophosphates is the main choice in controlling *Aedes aegypti* mosquito as the main vector of Dengue Hemorrhagic Fever. This study aims to determine resistance status of *Aedes aegypti* collected North Toraja District to malathion and temephos. This type of research is a quasi experiment. Assays to determine resistance status were conducted using WHO standard method. The samples were 600 *Aedes aegypti* F1 3rd and 4th instar larvae; and adult *Aedes aegypti* F1 female mosquitoes aged 3-7 days obtained from ovitrap survey at high dengue endemic area (Rantepao sub-district) and non endemic area (Sanggalangi sub-district) in North Toraja District. The adult samples were tested to Malathion 0.8% and 5%. The larva samples were tested to Temephos 1% concentration with 3 times replication, the number of each test was 20 mosquitoes. The statistical test used is univariate and probit analysis. The results showed that *Aedes aegypti* (high endemic strain) adults was resistance to Malathion 0.8% concentration, and that was tolerance to Malathion 5% concentration, whereas *Aedes aegypti* larvae was susceptible to Temephos 1%. *Aedes aegypti* (non endemic strain) were susceptible to Malathion 0.8%, Malathion 5% and Temephos 1%. There were a difference in lethal time (LT50, LT90, LT95, and LT99) between *Aedes aegypti* high endemic and none endemic strains to both malathion and temephos. The value of lethal time of *Aedes aegypti* high endemic strain were higher than those non endemic strain

Keywords: resistance test, malathion, temephos, *Aedes aegypti*

INTRODUCTION

Aedes aegypti is a major vector in the spread of dengue virus. DHF can occur throughout the year and can affect all age groups^{1,2}. According to WHO, it is estimated that the number of dengue fever cases amounts to 390 million per year, of which 96 million are serious cases. Southeast Asia, the United States and the Western Pacific are high dengue-endemic areas where 2.5 billion people or two-fifths of the world's population are at risk of contracting DHF. In Southeast Asia, Indonesia is one of the endemic countries of DHF. An estimated 500,000 people with DHF incidents require hospitalization each year and about 2.5% of them experience death³.

Vector control using insecticides is one of the strategies in eradicating mosquitoes that are considered more effective, fast and easy⁴. Resistance occurs when a vector cannot be killed by a standard dose or a vector successfully avoids contact with an insecticide⁵.

Continuous exposure to insecticides causes mosquitoes to adapt so that the number of resistant mosquitoes multiplies. The resistant mosquito can bring resistance to its offspring⁶.

Salim et al⁷ was found in Palembang city, that the adult stage of *Aedes aegypti* mosquitoes are still susceptible to malathion dose 5%. Suwito⁸ found in Surabaya, that in the location with high case of dengue fever already exist mosquito population that tolerant to insecticide malahion dose 5%. Research in three municipalities of DKI Jakarta shows that *Ae. aegypti* has been resistant to 1% temephos insecticide⁵. Research Handayani et al⁹ found in Semarang that *Ae. aegypti* larvae in the Tanjung Emas port in the perimeter region is already tolerant and in the buffer region has been resistant to temephos.

North Toraja is a dengue-endemic district in South Sulawesi Province. According to the North Toraja Health Office, there were 31 cases (IR = 13,84) in 2014,

increasing by 39 cases (17.29) in 2015 and increasing dramatically in 2016 with 96 cases¹⁰. These conditions allow the occurrence of resistance to *Aedes aegypti* due to the use of insecticides in fogging and abatezation in the eradication of DHF vectors. Until now, the North Toraja Health Office still uses 5% malathion insecticide in fogging and 1% temephos for abatezation.

This study aims to determine resistance status of *Aedes aegypti* collected from North Toraja District to malathion and temephos.

MATERIALS AND METHOD

Aedes aegypti was collected using ovitrap at locations representing different endemicity levels in North Toraja District, namely: high endemic (Rantepao sub-district) and non endemic (Sanggalangi sub-district). This type of research is quasi experiment.

The population in this study were all *Aedes aegypti* mosquitoes in high endemic areas and none endemic DHF in North Toraja District, while the samples of *Aedes aegypti* larvae F1 third and fourth instar amounted to 240 larvae and *Aedes aegypti* F1 3-5 days old was 360.

Assays to determine resistance status were conducted using WHO standard method. Testing of *Aedes aegypti* resistance status to the concentration of malathion and temephos refers to Bottle Bioassay test. Bioassay tests were conducted at the Entomology Laboratory of Faculty of Medicine Hasanuddin University. Primary data were obtained from observation of larvae and *Aedes aegypti* mosquito larvae during contact with insecticide for 1 hour observation, (as follows 5 minutes, 15 minutes, 30 minutes, 45 minutes, 60 minutes) and death within 24 hours. DHF incidence data as well as fogging and abatization program data were received from North Toraja Health Office.

Univariate analysis was done to know the frequency distribution and percentage of mosquito mortality test against malathion and temephos insecticides. Probit test was done to analyzed lethal time values (LT50, LT90, LT95, and LT99).

RESULTS

The results showed that *Aedes aegypti* resistance status in North Toraja *Aedes aegypti* high endemic area was resistant (mortality 55%) to malathion concentration 0.8%, and that was tolerance (mortality 93.5%) to

malathion 5% and that was vulnerable (mortality 100%) to 1% temephos; whereas *Aedes aegypti* non endemic area is still susceptible (mortality 100%) to insecticide malathion concentration 0.8%, 5% and temephos 1% (See Figure 1). Table 1 shows a significant difference in *Aedes aegypti* mortality in high endemic and none endemic strains to malathion exposure of 0.8%, 5% and 1% temephos. The result of chi-square test for malathion insecticide 0,8%, 5% and temephos 1% had significant p value = 0,000 <0,05.

Table. 1. Chi-Square test results difference in mortality of *Ae. aegypti* high endemic and none endemic strains to exposure to malathion and temephos insecticides.

Concentration of insecticide	Significance
Malathion 0,8%	0,000
Malathion 5%	0,000
Temephos 1%	0,000

The lowest (55%) average *Aedes aegypti* mosquito mortality of endemic strain against exposure to Malathion concentrations of 0.8%; and the highest mortality (100%) of none endemic strain to Malathion exposure concentrations of 0.8% and 5%. Figure 2 shows the difference in mean percentage mortality of *Aedes aegypti* larvae at each time observation of 1% temephos exposure in non endemic areas higher than endemic areas up to 60-minute interval. In 1440 the average number of *Aedes aegypti* larvae mortality was 100% in high endemic areas and not endemic. Figure 3 shows the values of LT50, LT90, LT95, and LT99 malathion insecticides concentrations of 0.8%, 5% and 1% temephos in high endemic areas higher than non endemic areas.

Figure 1. Average mortality of *Aedes aegypti* high endemic and non-endemic strains in North Toraja to Temephos 1%

DISCUSSION

This study shows that *Aedes aegypti* mosquitoes have been resistant to Malathion 0.8% in high endemic areas of North Toraja. The results of this study are similar with research conducted by Prasetyowati et al⁵, in East Jakarta, West Jakarta and South Jakarta found that the three regions of the *Aedes aegypti* mosquito were resistant to Malathion 0.8%. In line with the research of Widiarti et al (2011), conducted in Central Java and Yogyakarta that *Aedes aegypti* mosquitoes were resistant to Malathion insecticides in very low concentrations of 0.8%.

This study shows that *Aedes aegypti* is tolerant to Malathion concentration of 5%. This result is similar to that of Suwito⁸, finding that *Aedes aegypti* mosquito populations are already tolerant to 5% malathion. In line with Sing et al (2011) research, in Koderma, India it was found that *Aedes aegypti* mosquitoes had a mortality of 95.83% against malathion 5%, which means that *Aedes aegypti* mosquitoes at the site have been in tolerant or potential resistance category.

However, different conditions were found in several regions. Research conducted by Sundari & Orbayinah¹², in Yogyakarta found that *Ae. aegypti* from endemic research sites (Bogoran and Badegan) are still susceptible to malathion insecticides.

This study shows that *Aedes aegypti* is still susceptible to temephos 1% in high endemic areas and not endemic to North Toraja. This research is in line with research conducted by Salim et al⁷, in Palembang City found that *Ae. aegypti* larvae stage still tend to be susceptible to temefos dose 1%. Research by Sinaga et al (2016), found that larvae *Aedes aegypti* from Jatiasih Village, Bekasi City, is still vulnerable to temephos. In Buah Batu Subdistrict, Bandung City, it was also found that *Aedes aegypti* larvae were still susceptible to 1% temephos¹³.

Polson research in Phnom Penh (Cambodia) found that the difference in susceptibility of *Aedes aegypti* to insecticides between regions due to the different intensity and duration of insecticide use. The more frequent use of these insecticides, the faster resistance will occur¹⁴. This can be seen from the differences in *Aedes aegypti* mortality in high endemic areas and not endemic in North Toraja.

Another factor that influences the vulnerability of *Aedes aegypti* based on endemicity is population density. The denser an area of vector density is also increasing, the greater the potential for transmission of DHF, so the use of insecticides for vector control is also getting bigger¹⁵.

CONCLUSION

In this study, although the concentration of 5% is still tolerant of *Aedes aegypti* mosquitoes in high endemic areas, but the lethal time value shows a long time (LT99) 1827.26 minutes (30.45 hours) or 1 day 6 hours, when associated with biting characters which is multi-biter (repeatedly bites) then with the chance to live even if only 1 day 6 hours allows mosquitoes to still be able to play a role as transmitters of the dengue virus. These results indicate that a concentration of 5% is not effective for use in high endemic areas in North Toraja.

Can The Length of Nurse Employment Lead to Work-related Stress at Inpatient Ward in Hasanuddin University Hospital, A Teaching Hospital, Makassar, Indonesia

Andi Indahwaty Sidin¹, Adellia U.A.Mangilep¹, Sri Dewiyanti¹

¹Departement of Hospital Management, Hasanuddin University, Indonesia

ABSTRACT

Nurse is the most common stressed profession. They works with life threatening patients, emergency and stressed patients. The sources of stress can be personal, interpersonal and environment factors. Some literature stated that a new graduated nurse may feel more stressful when they work at hospital for the first time. This condition can decrease nursing performance and become harmful to patients. However, the study of correlation between work experience and work related stress in teaching hospital is still limited. Therefore, this study will analyze the correlation between length of nurse employment and work related stress on nurse at in-patient ward in Hasanuddin University Hospital, a teaching hospital in Makassar, Indonesia. This study is a quantitative study with applied cross sectional study. This study collected information from 72 sample (total sampling). They filled in valid questionnaires regarding work related stress. The length of nurse employment was how many years of samples works as a nurse. Chi-square was applied to this study and the result showed that p value is 0,038. It means, statistically, there was a correlation between the length of nurse employment and work related stress on nurse at inpatient ward in the hospital. The shorter of the length of employment, the more stress on nurse. This fact showed that inexperienced nurse will get more stress than experienced nurse when they work in hospital. The result implies that self efficacy of graduated nurses and working environment are important to reduce their stress. Working in a good condition can improve patient safety

Keywords: Working experience; nurse; work related stress

INTRODUCTION

Nurse is the most common stressed profession in the world. There is a substantial evidence to support this statement. A survey in France found that work related stress on nurse was 74% of all nurses. Gong *et al.*¹ reported that in France almost 30% of nurse managers got depressed and in Canada 1 out of ten nurses were depressed due to their professions and in 2012, there were 35.28% of Nurse working in a emergency ward become stress in Iran. Gholamzadeh *et al*² also found that 27% nurse were suffered from psychosomatic symptom and 38% visit doctors. They work with life threatening, emergency and stressed patients. In addition, most of them have heavily workload, lack of power, role ambiguity and role conflict³⁻⁸.

Work related stressed (WRS) can be recognised from somatic symptom such as emotional exhaustion, low

back pain⁹. This condition will influence productivity of nurse, thus WRS has to be well managed, otherwise it would have impact on nurse performance, such as inefficiency, ineffectivity and the most considerable impact is patient safety. Some research showed that a lot of adverse events in hospital occurred due to burnout and occupational stressed. Nielsen *et al*¹⁰ stated that the incidens of adverse events increased as a result of work related stress among nurses. Other studies reported that the work hour of health care workers have impact on adverse events. Some radiologist did misconduct by cause of stress syndrome^{11,12}.

In a decade, the topic of WRS among health care professional has been studied seriously. Moustaka & Constantinidis¹³ researched the causa of work related stress among nurses. They said that nurses had ambiguity in their task and sometimes come to conflict. They have responsibility to care patient, sometimes they have to

be a pharmacist regarding administer drugs to patients, occasionally, the nurses should be a psychology, at the same time they have to do administrative work as a result they get exhausted. This condition exist in midwife as well¹⁴. Other researchers has concerned counterbalancing of work related stress in intensive care unit¹⁵. Likewise Deklava *et al.*¹⁶ studied stress coping mechanism and professional burn out among lativian nurse. Golubic *et al.* identified some factors can be 'occupational stressors, they are financial issues', 'public criticism', 'hazards at workplace', 'interpersonal conflicts at workplace', 'shift work' and 'professional and intellectual demands'. Even though nurses are the most stress profession, the number of graduated nurse growth steadily in Indonesia. Board for development and empowerment human resources of health in Indonesia reported that From 2015 the number of nurse students were 17,779, then in 2016 19.058, it increases steadily to 21.017(Indonesia 2018). It seems graduated nurse to be large workforce

Recent years, the government has development some new teaching hospitals like Hasanuddin University Hospital, it has responsibility to employ them. Nevertheless, the majority studied revealed that more novice nurse experienced stress when they start to work at hospital for the first time. Their psychosocial and psychology changed because of environmental change from education to working environment. They were lacking in self confidence in caring patients, they have to be real professionals, having new role, new friends and new regulation¹⁷⁻²⁰

As discussed previously, it may be harmful for

patients if they are handled by a novice nurse. Hence, most hospital may not recruit new graduated nurse unless they have some experience before working at their hospital. The length of employment for nurse reflects the experience of nurse. Thus, the research question is that can the length of nurse employment lead to work-related stress at inpatient ward in Hasanuddin university hospital, a teaching hospital, Makassar, Indonesia, so this study will analyze the correlation between length of nurse employment and work related stress on nurse at in-patient ward in Hasanuddin University Hospital, a teaching hospital in Makassar, Indonesia

MATERIALS AND METHOD

This study was a quantitative study with applied cross sectional study. Population is all nurses working in inpatient wards at Hasanuddin University Hospital (72 respectively). The research has been conducted for a month, during April 2017. It collected information from 72 sample (total sampling) regarding their physical symptom when they were in the working place. The change of physical sign such as the increase of pulse, heart rate, headache, palpitation, fatigue syndrome, dizziness are functional somatic syndrome (FSS) resulting from decrease quality of life, anxiety and depression. They are recognized as stress symptoms²³. The respondents were asked to give their perception regarding their physical sign when they were working. Their perception was categorized into 4 categories: never, seldom, almost and frequently. Than, the data was analyzed using chi square test. This test was used for several reasons; 1) this study analyzed association between two variables from one population, 2) the data was categorical.

RESULTS

Table 1. Association Between The Lenght of Employment and The Work Related Stress at inpatient wards in Hasanuddin University Hospital, A Teaching Hospital, Makassar, Indonesia

The Length of employment (year)	Work Related Stress				Total		Statistic Test
	No		Yes		n	%	
	n	%	n	%			
0 – 3	4	25	12	75	16	100	p = 0,038
4 – 5	26	49	27	50	53	100	
6 – 7	3	100	0	0	3	100	

As seen in this tabel that most of nurses with the length of employment 0-3 years felt stress when they were working. However, nurses had the length of employment more than 5 years had no stress. Chi squire test showed p value = 0,038 < α = 0,05 means hyphothesis null was rejected and hyphothesis alterinative was accepted. It reflected that statistically, there is association between the length of employment and work related stress in the inpatient wards at the teaching hospital of Hasanuddin University.

DISCUSSIONS

Although this study is based on small sample in a teaching hospital in Indonesia, the result proved that the inexperience nurse had more stress than experience nurse when they worked at teaching hospital. The symptom of stress can be determined from their answer. Most of nurses had worked for 1-3 years at hospital answered that, they got headache when they were in working place, their heart rate increased progressively when they met patients. They also experienced like fatigue syndrome, such as lack of energy and tired. They stated that they placed under pressured, sometimes they felt guilty, hopeless when they were working. All this feeling may evoke because the inexperience nurse perceived that they lost confidence in caring patients. In addition, high demand nursing care from patients triggered this situation.

Moreover, in the teaching hospital like this hospital, nurses have other responsibilities to coach a nurse student. Some of them may feel stranger among the experience nurses. They have to adapt to new environment, new responsibility, new role, at the same time they have to handle with care anxiety patients and family.

The majority of studies were in favor in this situation. Duchscher²⁴ revealed that most of novice nurse experienced exhaustion at the first 18 months at working place. The novice nurses need to adapt the transition period from education to working environment. At this stage, new graduated nurse perceived all situation become complex, uncertainty, difficult and puzzlement. They will start to work professionally and become member of a teamwork. Team work in hospital consists of multi professions, the nurse requires professional integration. However most of inexperience nurse is lack of confidence working with other professional²⁵.

CONCLUSION

Statistically, there was a correlation between the length of nurse employment and work related stress on nurse at inpatient ward in the hospital. The shorter of the length of employment, the more stress on nurse. This fact showed that inexperienced nurse will get more stress than experienced nurse when they work in hospital. The result implies that self efficacy of graduated nurses and working environment are important to reduce their stress. Working in a good condition can improve patient safety.

ABSTRACT

Background: Rheumatoid arthritis is an autoimmune disease and need the balancing of immune system. Foxp3 Treg level is one of critical regulator to balance system immune. This study aim to analyze potential of propolis and honey propolis for prevention rheumatoid arthritis based on Foxp3 Treg as a target. **Methods:** It was a quasi-experimental study with pretest-posttest control design, Subject divided into 3 groups, group 1 control did not give anything, group2 given propolis 60 mg/capsule and group 3 given honey propolis 35 mg/pack. Propolis and Honey Propolis Trigona was giving through 14 days and blood sample for ELISA examination taken three times, Before intervention (baseline), 7 day after intervention and 14 days after intervention. **Results:** Analysis mean difference between baseline data with 14 days data show giving honey propolis has the highest increase of Foxp3 Treg and giving propolis has the lowest increase of Foxp3 Treg. Among the three groups, only the group given honey propolis has a significant effect. **Conclusion:** Honey propolis has potential effect as therapy for prevention arthritis rheumatoid by increase Foxp3 Treg level. Adherence to consume honey propolis is necessary to provide the maximum effect.

Keywords: Honey Propolis, Trigona, Arthritis Rheumatoid, Autoimmune

INTRODUCTION

Rheumatoid arthritis (RA) is a severe inflammatory disease and categorized as one of autoimmune disease, unproper treatment will make it improve to joint damage and disability. The most disturbing is pain and swelling due to inflammation. In advanced conditions, the disease may increase the risk of cardiovascular disease and changes in bone metabolism.^{1,2}

T regulatory (Treg) cell is critical regulator in autoimmune disease, impaired self-tolerance in autoimmune diseases such as rheumatoid arthritis occurs due to Treg cell failure to regulate its suppressive function. Reduction of Treg frequency correlate with increase of RA.

Manipulating Tregulator cells with Foxp3 as transcription factor or marker of Treg as a target of prevention and therapeutic is a very important factor in immune homeostasis.^{1,3-5}

Several studies has tried Treg injection to the the patient and successfully affect the duration of remission.^{6,7} Several studies also use Salmonella bacteria that has been attenuated as a vaccine for cases autoimmune diseases, it has ability to induce Foxp3 Treg. Although successful in inducing the expression of Foxp3 Treg, using pathogenic bacteria is still being debated.⁸ Tregulator cell involvement is the latest pathologic mechanism developed in the therapeutic target of rheumatoid arthritis, but it requires intervention to increase of Foxp3 Treg without debate and doubts about intervention safety.

South Sulawesi is one of honey and propolis producing regions and honey bee products include propolis and honey has ability to promote Foxp3 Treg both in healthy and unhealthy subject. This ability

associated with polyphenol, quercetin and vitamin content of its.¹⁰⁻¹² Studies of honey and propolis and its correlations with immune systems have been numerous, but studies that correlate honey and propolis with Foxp3 Treg are rare. The combination of honey and propolis is also rarely studied and usually researched distinctly.

This study aim to analyze potential of propolis and honey propolis for prevention rheumatoid arthritis based on Foxp3 Treg as a target.

MATERIAL AND METHOD

Material

Trigona honey and propolis used was local honey bee products, it was taken from Masamba, a district in South Sulawesi. Honey bee farmer has been produce in a large scale and become the raw material for some industries of honey and propolis.

The water content of honey is lowered dehumidifier up to 20% then stored for 3 days in a stainless container to precipitate the dirt. Propolis extracted using water and dried using fresh dryer as long as 24 hours. Honey propolis then mixed with 85% honey and 15% honey in 35 mg/pack. Propolis packed in capsule as much as 60 mg/capsule.

Methods

Protocol Recruitment of Subject

Ethical clearance has been accepted by Hasanuddin University Ethical Committee (1046/H4.8.4.5.31/PP36-KOMETIK/2017). To recruit subject of study, we offering free rheumatic screening to those who have a rheumatic-like symptom. Thirty people were willing to take part and twenty of them were positive for rheumatic suspect (examination of ASTO, CRP and Rheumatoid Factor). They were giving information about protocol of study and asked to join the study, informed consent were giving both to them who had suspect of rheumatoid and normal subject.

Design and protocol of Study

It was a quasi experimental study with pretest post control design, Ethical Clearance from Ethical Committee of Medical faculty, Hasanuddin University). Subject divided into 3 groups, group 1 was control did not given anything, group2 given propolis 60 mg/capsule and group 3 given honey propolis 35 mg/pack. Group 1 and 3 consist of 10 subject and group 2 consist of 7 subject, because 2 subject exclude after informed consent given because they had allergic with honey.

It was a quasi-experimental study with pretest-posttest control design, Subject divided into 3 groups, group 1 control did not give anything, group2 given propolis 60 mg/capsule and group 3 given honey propolis 35 mg/pack. Group 1 and 3 consist of 10 subject and group 2 consist of 7 subjects, because 2 subjects exclude after informed consent given because they had allergic to honey.

Propolis and Honey Propolis Trigona was giving through 14 days and blood sample for ELISA examination taken three times, Before intervention (baseline), 7 day after intervention and 14 days after intervention. Protocol of ELISA was use standard od human ELISA Kit produced by mybiosource.

Statistical Analysis

Data analyse using Statistical Package for Social Sciences (SPSS), statistical test were Wilcoxon and Paired-Sample T Test to compare of mean. Mean difference considered significant if probability value (p-value) less than 0.05.

RESULT

Analysis result after seven days giving honey propolis, it has the highest effect to increase Foxp3 Treg, and it is significant statistically while propolis and control also increase Foxp3 Treg but it is not significant (Table 1). After 14 days, data indicated a decline of foxp3 both group giving honey and honey propolis while control group shows an increase of Foxp3 Treg (Table 2).

Table 1. Comparison of Mean Difference Between Baseline with 7 days After Intervention

Groups	Level of Foxp3 (pg/ml)			P
	Mean±SD			
	Baseline	7 days	Mean Difference	
Control (n=10)	0.898±0.343	1.071±0.612	0.173	0.416*
Honey Propolis (n=10)	0.538±0.539	0.901±0.581	0.363	0.005**
Propolis (n=7)	0.417±0.581	0.425±0.110	0.008	0.917**

*Paired Sample T-Test

**Wilcoxon

Analysis mean difference between baseline data with 14 days data show giving honey propolis has the highest increase of Foxp3 Treg and giving propolis has the lowest increase of Foxp3 Treg. Among the three groups, only the group given honey propolis has a significant effect (table 3 and 4).

Table 2. Comparison of Mean Difference Between 7 days with 14 days After Intervention

**Wilcoxon

DISCUSSION

Intervention use honey propolis showed the significant increase of Foxp3 Treg compare to another group, both control and propolis intervention. Analysis in detail shows that increase of Foxp3 Treg happens in the first week and in the second week Foxp3 decline, we have an assumption that adherence of subject is determinant why the data is not consistent. In the first week, all subjects reported that they did not take their honey propolis and propolis regularly. Majority of subjects give a reason, they forget ones or too busy even we have remembered them. It shows that adherence is just consistent in the first week.

Propolis has the anti-inflammatory and immunosuppressant effect, the component of it that maybe has a role is Artepillin. Mechanism how propolis and honey bee products affect immunosuppressant still not clear and this study may be one explanation that Foxp3 Treg is the keyword of it.¹³⁻¹⁵

Prevention from arthritis was associated with increased of Foxp3 Treg ratio and decrease of inflammation such as IL-17.¹⁶ Rheumatoid arthritis is a chronic systemic autoimmune disease characterized by synovitis and joint erosion and involves activation of T cells in its pathogenesis.¹⁷ The abnormality that is encountered in rheumatoid arthritis due to the growth of synovial cells that damage bone and cartilage. The pathogenesis is the activation of autoreactive T cells that migrate into the synovial cavity and B cells, through a cytokine that is folded by T cells. The synovial membrane becomes hypercellular due to the accumulation large amounts of lymphocytes in various stages of activation, plasma cells and macrophages. All cells exhibit high activity and interactions between the cells that form the formation of immunoglobulin and rheumatoid factor.¹⁸⁻²⁰ Activation of excessive immune cells and the inability to recognize self-antigen is a determinant for arthritis rheumatoid an another autoimmune diseases, for this problem requires therapy that can lead to homeostasis of the immune system.

One of the main targets of therapy in rheumatoid arthritis patients is restore the immune balance system, regulatory T cells are the ideal targets in this case because their function can suppress inflammation. The better thing is that the increased amount of Treg to prevent inflammation will not inhibit the ability of the immune

response to fight infection.^{6,21,22}

Honey propolis has a potential effect to promote Foxp3 Treg in human suspect arthritis rheumatoid. This study just an eliminary study and need more studies that controls more variables so it is clear that the effect of immune balance is derived from the intervention that is done.

CONCLUSION

Honey propolis has potential effect as therapy for prevention arthritis rheumatoid by increase Foxp3 Treg level. Adherence to consume honey propolis is necessary to provide the maximum effect.

ABSTRACT

Currently, in urban dwelling planning, the comfort and the health of the human living is set with parameters of the design standard. The human's dimension as the residents has not been considered to play actively in realizing the health of self and their residence. Meanwhile, the density and limitation of urban dwelling is an issue that causes the difficulty in designing the comfort and the health adequately. The purpose of this study was to reveal that the human dimension can play a role in the health of their home by identifying the indoor air quality. The method was quantitative and used Structural Equation Modelling (SEM). Human dimension in urban dwelling involved the dimension of residents and managers and was influenced by their knowledge. The residents' dimensions that assessed were the physical comfort, psychic comfort, potentially pollutant activity, and health participation. The result of this study indicates that the human dimension can contribute 19% in the realization of the residents' health via indoor air quality beside the design standard. The recommendation of this study is the need to include a human participation program in the policy of applying the health in an urban dwelling.

Keywords: *urban dwelling, human dimension, indoor air quality, health participation*

INTRODUCTION

Previous studies on the measurement of building quality and the environment tend to assess buildings and their environment with certain parameters professionally recognized. These studies have not place the role of humans as a factor that can be an assessment tool in influencing the value of the measurement of the buildings and the environment.¹² Unfortunately, such studies revealed that all interested human and being part of apartment operations are not already intended to optimize their healthier dwelling.³⁴ Residents and managers without good awareness tend to reduce the quality of building and its environment atmosphere that affect human health. Preliminary investigation proved that educated residents and managers still carry out actions which cause negatively the indoor health quality such as smoking, using chemical finishing materials, do not clean the room, and do not even care about things that can damage the health of neighboring units. Thus, a study that explores the role of the human dimension in this focus of residents and managers to maintain the

health in building through air quality becomes important.

The novelty of this study is the health in an urban dwelling can be optimized with the unity of the human dimension: the residents and managers through the right knowledge, behavior, and participation. The healthy urban dwelling is not only determined by luxury finishing, the reliability of occupancy, ventilation system and outdoor air quality but is also influenced by the unity of knowledge, behavior, and participation of the residents and managers as the social capital in an urban dwelling.

Jakarta has developed into a megapolitan city where many economic interests are intertwined with the surrounding cities. Therefore, Jakarta as big-city influences the lifestyle of their inhabitants and the workers particularly who work in this urban area interested live in vertical housing. Vice versa, sometimes, they still carry on negative behaviors from their origin when they live in an urban dwelling densely. They did not realize that living in an urban dwelling there are some disciplines in order

living sustainably. Meanwhile, the hazardous of IAQ was potentially caused by 4 things, that are contaminated outside air penetration, indoor human activity that carried out combustion activities (like cooking and smoking), inappropriate waste management, cleaning with chemical liquid, and building finishing materials which contains certain chemicals.⁵ The operations in building through the maintenance activities need to be supported by a social-cultural system.⁴ The supporting data shows that the prevalence of respiratory disorders in urban vertical dwellings in Jakarta was 42.4% while the Basic Health Research⁶ on the prevalence of ARI (Acute Respiratory Infection) in Jakarta was 22.6%.⁷ This shows that apartment residents are more likely to be infected with ARI double greater than the general occupancy in Jakarta.

The factor of the human dimension that care on the good ventilation condition is social capital that is important in realizing healthy air quality indoor in the urban vertical housing.⁸ Researchers looked at the factors of knowledge, behavior, and participation based on the fulfillment of the physical and psychological aspects of occupants by managers will affect the sustainability of urban dwellings. If the role of the human dimension of the occupants and managers can be improved through the right perception, behavior, and participation, then the healthy and sustainable urban dwelling can be realized.⁹ Maslow¹⁰ uses the fulfillment of physiological terms, security, ownership and love, self-esteem, self-actualization, and self-transcendence to describe patterns that motivate people to move. Thus, the interests of the fulfillment of the physical and psychological comfort of residents can be predicted as a factor that influences health in addition to directed activities and participation to realize shared health. In addition, the manager's capacity will certainly influence his ability to encourage residents. In Indonesian Government Regulation 1988 number 4 on Flat Housing,¹¹ it is stated that there are 3 manager capacities, they are the ability to manage, ability to inspect, and ability to serve. In this study, the author added a capacity manager, it is the ability to motivate according to Maslow's theory.

MATERIAL AND METHOD

The data were taken on the middle-income apartment located in central Jakarta. the total area of the apartment is 2.9 ha, located on the main road of Ahmad Yani Road with the density of the vehicle is quite dense. The road

consists of 8 lines and freeways (4 lines) and vehicle speeds between 60-120 km/hour, so it is quite noisy and the hazardous level of air pollution.

Most of the participants have lived in this apartment for 2-4 years. Most of the residents' participants live in 2 towers of the 6 towers that have been built, namely the blue and yellow towers. The youngest participant is 16 years old while the oldest is 60 years old. Participants occupy almost evenly at the levels of apartment towers. A unit of participants is occupied by 1 to 4 people but most of them are occupied by 2 people. Unit area is 33m², consisting of 2 bedrooms, 1 living room, 1 bathroom and 1 balcony. The balcony is very narrow, it can only be put for cleaning equipment and AC machine. Manager participants are from related divisions to IAQ services: maintenance staff, garbage attendant, technician, customer service, and human resource development. Manager participants are between the ages of 23 to 50 years and on average have worked between 2 and 6 years in this company. The total number of participants is 176 people, 88 residents, and 88 managers. Data collection is mostly carried out from June to August 2017 but the measurement of biological pollutant data was taken in February 2018.

This study used a quantitative method. For collecting participants data was used a questionnaire. The residents' questionnaire consists of 4 part which are the physical comfort, psychological comfort, potentially pollutant activity, and health participation. The managers' questionnaires consist of 4 parts, which are the ability to serve, ability to inspect, ability to manage, and the ability to motivate. The IAQ data consists of the measurement of physical pollutants, chemical pollutants, and biological pollutants by IAQmeter. The questionnaires and the measurements use a Likert scale (1-5). The physical pollutants were temperature, humidity, and particulate meters. The chemical pollutants consisted of carbon monoxide, carbon dioxide, and formaldehyde. Furthermore, for biological pollutants, only bacterial data was taken. The parameter for determining the scale range of pollutant measurement was used regulation of the ministry of health of the Republic of Indonesia, number 1077.¹²

The participants data were as the dependent variable and the measurements data were as the independent variable. There was a suppressor variable which strengthened the influence of the variable dependent to

the independent variables that were the residents' knowledge and managers' knowledge. The knowledge consisted of the education level, the knowledge of the pollutants impact, and the knowledge of hygiene. All data were processed using the SmartPLS 3.2 with a reflective order formation.

Figure 1 . The construct of SEM: the human dimensions of the Residents-Managers

Figure 1 shows how to meet the interests and responsibilities of residents and managers. From the residents' dimensions, the physical comfort relates to personal space, social space, public space, and equipment maintenance. It meets to manager's dimensions, which are an ability to manage and ability to inspect. The psychological comfort relates to space relief, economic opportunity, environmental capacity, and socio-cultural and meets the manager ability to serve. Apart from this, for this research intervention, added one variable indicator related resident and manager participation, those are the health participation and the ability to motivate.

FINDINGS

The observation and IAQ measurement show that the unit condition was influenced by the resident behavior such as determining the finishing material, doing hygiene lifestyle, and checking AC regularly.

The unit which is finished with the wallpaper showed the higher formaldehyde which prevalence causes respiratory symptoms.⁵ Although the measurement results do not exceed than the parameter limit, this could be a warning that this common wallpaper is not good for children health,¹³ moreover in the new apartment.¹⁴ The daily materials which particularly annoying smell was revealed: cigarette smoke, strong odor food which thrown to sink, and chemical air fragrance. The strong odor food that thrown away to the sink, can be smelled by the others unit via the plumbing pipes, which caused an unpleasant smell or the neighbors. The residents who choose a good quality and care the maintenance of AC, do the indoor air condition feel fresher. The unit with good quality AC has the humidity and temperature and meet the parameters. Then, a unit which is inhabited by people who diligently clean their room, has a low bacterial number and determinate to ventilate the spaces.¹⁵

Figure 2. The characteristic of the residents' participants: Age, Level of knowledge consists of pollutant impacts and hygiene, and Education Level.

Figure 2 shows that most residents' participants are the young age 18-40 years old. The young age even single and spouse enjoy new life experiences, living in an urban dwelling as a trend lifestyle in Jakarta. Related the experience, young adults choose to live in a metropolis with mixed-use facilities and ease of transportation in one place.^{16 17} It is moreover for creative and good education workers.¹⁸ The education level shows that most residents graduated bachelor, a good education level. According to PERMENDIKTI number 44/2015¹⁹ in Indonesia, diploma and bachelor graduates are categorized as a level who able to work as executors and analysts and have the critical knowledge to solve the problem. This figure also shows that almost all of the resident state they know the hygiene and the elder age has more this knowledge than the younger. However, they confess do not have enough knowledge of pollutant impacts. Almost half of the residents have lived for 2 years and the rest have been more than that. It shows that the residents still in the adjustment period living in an apartment and newly married couples. At this stage,

learning to live independently far from parents and need the presence of people nearby can help to provide the instrument and emotional support.²⁰ This means they need to do social support for fulfilling comfort living.

According to the theory of human dimension in architecture perspective, there is two dimension of human which fully needed that are physical and psychological comfort on indoor.²¹ Figure 3 shows the residents' physical comfort and residents' psychological comfort. For the physical comfort, the residents stated the furniture size quite decent. Figure 3 reveals that most residents feel the private room is already comfortable. It means the private room is relieved enough to do their private activities. However, half less of them do not feel comfortable for the family activity. It is concluded that the residents agree that the unit room good for a couple but not good enough for a family. Further, most of them feel comfortable in the neighboring space. It means the residents are satisfied with the public space around the building.

Figure 3. The physical and psychological comforts of the Residents

Further, Figure 3 shows the resident psychological on relieved space, economic opportunity, environmental capacity, and socio-cultural program. Most residents feel that the rooms in this dwelling are relieved, especially for the couple. It means that they feel appropriate on the wide of spaces. The residents state that the economic opportunity in this apartment is less good related to the cost of living, savings, and money-making opportunities

in this area. On environmental capacity, most residents feel its support for their activities. Then, for the socio-cultural program, a half residents state that less program for it. In fact, there were some like joint gymnastics and worship together on Muslim holidays but those are the rare event. The improvements in quality of life and life satisfaction while health assessment and education programs encourage positive health behaviors.²²

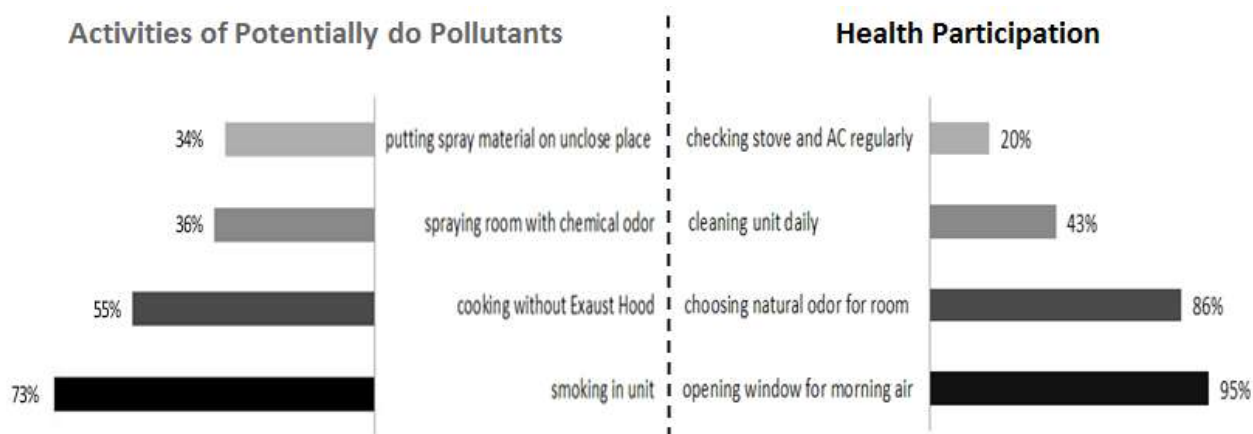

Figure 4. The activities of potentially do pollutants and health participation that influence IAQ in unit

Based on the result above, then the following discussion on its relation to their behavior which is revealed in Figure 4. Figure 4 shows the residents' activities which potentially do pollutants such as putting spray material on unclose place, spraying chemical fragrance, smoking, and cooking in large quantities. Unit room needs to be circulated in order the chemicals are sucked out through exhaust fan and AC. The ventilation

can accelerate pollutant trapping due to temperature inversion.²³ The opposite, the health participation show the residents' behavior which affects positively to IAQ such as choosing natural odor for the room, opening window for fresh air, checking the stove and AC periodically, and cleaning the rooms of dust and mold. These reveal that human dimension can play the role in realizing health air in the apartment.

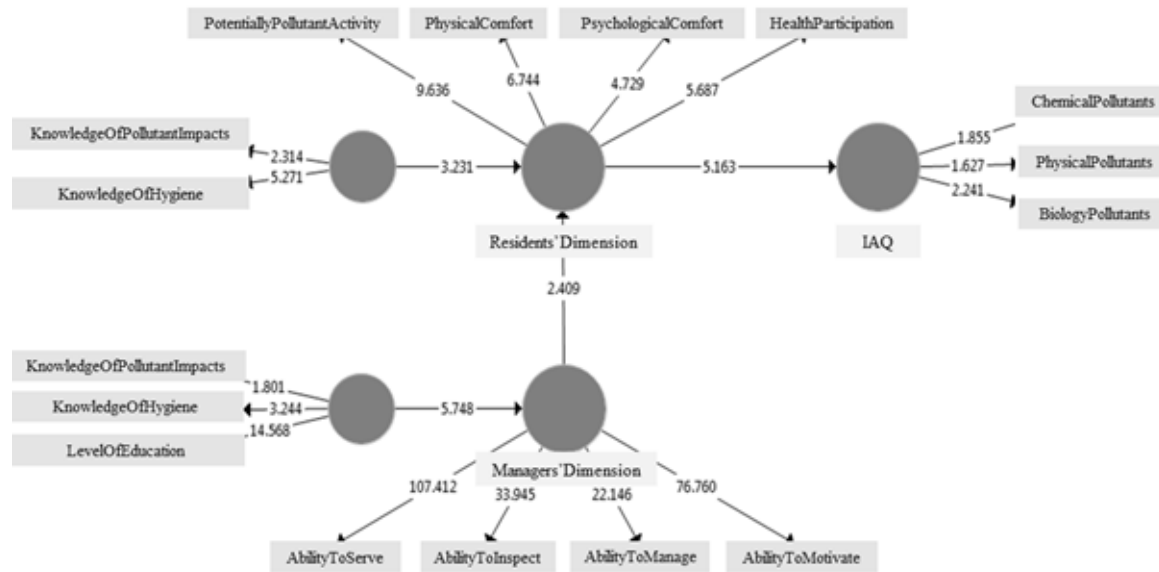

Figure 5. The human dimensions' construct in SmartPLS and the relationship values

The following discussion is on the influence of human dimension construct to IAQ. Figure 5 is a construct of the influence of the human dimension to IAQ using SmartPLS analysis. The results of the calculation of the SmartPLS, produce certain relationship values between them. However, the education level of the resident does not support this construct, its value attenuates. It reveals that awareness to participate not depends on the education level of the resident, but needs the knowledge of hygiene and pollutant impacts. Figure 5 shows all values of the outer model of all latent variables meet the requirements with >0.4 with Residents' Knowledge and Managers' Capability as suppressor variables. The capability of managers determines the improvement of residents' behavior.^{24 25} The relationship between services provided by private companies (managers) and residents' satisfaction are firm, which is supported by hygienic conditions as a major role.²⁶ Apart from that reason, the inner model value between latent variables becomes strong (5,163) and meets the reliability requirements >1.96. This means that this SEM construct

is right for this research study and confirms the human dimension can influence IAQ in urban dwelling in Jakarta, Indonesia.

To assess the value of the influence among the latent variables, it can be seen through R Square Adjusted in percentage. This analysis result shows the influence of all variable latent as the dependent variable: Residents ' Knowledge, Managers' Dimension, Managers 'Capacity, and Residents' Dimension to IAQ that is 19%. This percentage shows that the Residents' Dimension and Managers' Dimension as a human dimension influencing IAQ condition as 19%. In the theory of architecture and building equipment,²⁷ IAQ is generally influenced by the condition of air ventilation, air quality outside the building and indoor spaciousness. The result of this study indicates that the human dimension through perception, behavior, and participation can influence IAQ by 19% beside the influence of air ventilation condition, air quality outside the building and indoor spaciousness.

CONCLUSION

An effective human dimension is the manager's dimension as a driver of the resident's dimension which then influences IAQ. The managers' capacity which consists of the level of education, knowledge of the impact of pollutants and hygiene knowledge is very significant in positively encouraging the resident's dimension to IAQ. Thus it can be said that an effective human dimension for realizing the health in urban dwelling in Jakarta is by increasing management capacity that can encourage residents to behave healthily. Although this construct is only 19% as part of all variables which influence IAQ in an urban dwelling, it is a social capital can optimize the health in the unit the hidden place avoid from city hazardous pollution.

It is important to include a human participation program in the government policy of applying air quality in an urban dwelling. The residents' role is important in determining their own unit comfort and health and their neighbors. Then, to realize the role of the human dimension fully potential, the next study should include the other human role such as planners, policymakers, implementers.

Maternal Education Level and Parental Income Toward Stunting to Students of Salulayang Elementary School in Mamuju Regency

Adriyani Adam¹, Andi Salim¹

¹Nutrition Department, Health Polytechnic Mamuju Health Ministry, Jl. Shaft Mamuju Kalukku Km.
16 Tadui West Sulawesi Indonesia

ABSTRACT

Stunting is a major public health problem in most developing countries and part of the risk factors toward the high incidence of diseases both directly and indirectly. In Indonesia, stunting is a national problem with the percentage of incidence above the tolerance limit set by the World Health Organization (WHO) which is $\leq 20\%$ (WHO, 2010). The results of Basic Health Research (2013) stated that stunting in children under five in Indonesia in 2010 amounted to 41.6% increased to 47.9% in 2013 and for Mamuju Regency in West Sulawesi the percentage of stunting was 47.26%. There are several factors that influence the incidence of stunting, including maternal education and parental income. The level of maternal education and low parental income will result in family limitations in providing nutritional needs both in quality and quantity. The purpose of this study was to determine the relationship between the level of maternal education and parental income with the incidence of stunting. This study was a cross sectional study conducted at SDN Salulayang Mamuju District with a sample of all 90 students. Variables were measuring through direct interviews and questionnaires methods. The results showed that the variables of maternal education levels were significantly associated with the incidence of stunting ($p = 0.005$), as well as parental income significantly associated with the incidence of stunting ($p = 0.006$). It is necessary to increase knowledge about nutrition, especially about stunting with the aim of prevention and the need for economic improvement through community empowerment so that there is no stunting problem caused by poverty.

Keywords: *Stunting, Level of Education, parental income*

INTRODUCTION

Stunting is one of the major health problems in Indonesia, especially in West Sulawesi. Stunting (extremely short) is a form of malnutrition characterized by height according to age based on WHO standard. According to WHO Child Growth Standard, stunting is based on body length index compared to age (BL / A) or height compared to age (H / A) with a limit (z-score) of less than $-2 SD$ ¹.

Stunting prevalence in Indonesia is 37.2% and in West Sulawesi especially Mamuju Regency is 47.26% (Riskedas, 2013). According to the results of the South East Asia Nutrition's Surveys (SEANUTS in the Ministry of Health, 2014) about 24.1% of boys and 24.3% of girls in Indonesia experienced short body size (stunting). A survey of more than 7,000 elementary school children in Indonesia aged 6-12 years shows that around 1 of 3 children in Indonesia experience height growth problems. If it compared with countries in ASEAN such as Vietnam, Malaysia, and Thailand, Indonesia had a greater number of children with short body sizes^{2,3}.

Childhood is a kind of period that is very sensitive to the environment so that specific handling is needed, especially nutritional intake. Stunting as one of the nutritional problems can inhibit the development of

children which can affect the next period of life such as susceptibility to disease, intellectual decline, decreased productivity, babies born with LBW conditions (Low Birth Weight) to cause poverty. Therefore the role of the mother is needed in supporting efforts to overcome the stunting problem.

One of the main causes of stunting is socioeconomic status, including maternal education level and parental income. The results of Basic Health Research⁴ show that the incidence of stunting in children under five is influenced by low income and low parental education. Families with high parental income will allow the family to obtain optimal nutritional intake both in terms of quality and strength to produce better health. Low parental income is considered to have a significant impact on the possibility of children being thin and short³.

A high level of maternal education will be easier to access information, especially about nutrition and health compared to mothers with lower levels of education. This is consistent with the Salimar study which states that a higher level of maternal education (above high school) will have 1.405 times of chance to get children with normal nutritional status compared to mothers with low education. It was found from the study that to predict the occurrence of stunting maternal education can be used as a change factor⁵.

MATERIALS AND METHOD

Types of research

This research uses a survey design with a cross sectional study approach. This study determines the relationship between independent variables (maternal education level and parental income) with the dependent variable (Stunting incidence) in the same observation period. The relationship test is using the Chi Square test. If the Chi Square test is not eligible, the relationship analysis uses the Fisher Exact test.

Research sites

This research took place at Salulayang Elementary School in Mamuju Regency. It was chosen as the

research location due to school is in the native settlement of Mamuju Regency and it is located outside the urban area so automatically the students in the school are also native inhabitants of Mamuju Regency. This is different from elementary schools in urban areas where students are from outside Mamuju Regency.

Population and Sample(s)

The population in this study was taken using total sampling technique. The samples in this study were students in grades 1 - 5 with a total of 90 students. At the time of the research, the 6th grade students had graduated because they had gone through the national examination process.

Research Instruments

The variables in this study were measured through direct interviews using a questionnaire. The questionnaire contains questions about the level of maternal education and income of parents. While the *stunting* indicator is carried out through anthropometric measurements to students through height measurement using a microtoice. The height measurement results are then compared to the age of the student then using WHO NCHS references to assess the incidence of student stunting.

RESULTS AND DISCUSSION

Research on the relationship between maternal education level and parental income with the incidence of stunting was carried out at Salulayang Elementary School, Mamuju Regency, located in Bambu Village, Mamuju District. The samples in this study were selected by using total sampling technique in 90 students. The research that has been carried out starts with direct interviews with students of Salulayang Elementary School in Mamuju Regency. The interview was conducted using a questionnaire containing questions about research variables. Then the next step is to measure height to assess nutritional status (stunting) for all students of Salulayang Elementary School in Mamuju Regency. The results of this study can be seen in table 1 below:

Table 1. Distribution of Respondents Based on maternal Education Levels And Parental Income with Stunting incidents

characteristics	Stunting				Total		P ^a
	Stunting		Non-Stunting		n	%	
	n	%	n	%			
Maternal education							
low	36	49,3	37	50,7	73	100	0,005*
high	2	11,8	15	88,2	17	100	
Parental income							
<RMW	37	48,0	40	52,0	77	100	0,006*
≥ RMW	1	7,7	12	92,3	13	100	

^a Chi Square * p <0.05

Based on table 1 shows that the incidence of stunting in Salulayang Elementary School students in Mamuju District as many as 38 children (42.2%) and those without stunting were 52 children (47.8%). The occurrence of *stunting* in students of Salulayang Elementary School in Mamuju Regency has a difference that is not too far from students who do not experience stunting. Children who grow short have a 27 times risk for staying short before entering puberty and conversely children who grow normally at an early age can experience *growth faltering* and have a 14 times risk of short growth in pre-puberty age². *Stunting* is an illustrate of malnutrition that occurs over a relatively long period of time. The *stunting* indicator used in this study is that the Height/ Age index illustrates the nutritional status of children in the past so that the effect on malnutrition will eventually affect the child's height.

The level of maternal education based on table 1 shows that for distribution of low maternal education level (<Senior high school) as many as 73 students (81.1%) while the high level of maternal education (≥Senior high school) as many as 17 students (18.9%). For further analysis in this study shows that the relationship between the level of maternal education with the incidence of stunting in students of Salulayang Elementary school in Mamuju Regency shows a significant relationship. It shows that mothers who are highly educated will give birth to a healthy generation so that they would avoid health problems, especially stunting.

Contrary on mothers with low education will have the opportunity to give birth to children with stunting

conditions. This study is in line with research in Cambodia by Ikeda, et al⁶ and Tiwari, et al⁷ in Nepal that maternal education is a risk factor for the incidence of stunting in children under five years.

The level of maternal education will determine the level of understanding of the knowledge of nutrition obtained. The ability to have a broader knowledge of child care practices and ability to maintain. Families who are educated will live in small households, in more decent homes, can use health services that are better and more adept at maintaining a clean environment⁸. Parental income distribution shows that the incidence of stunting is more common in families with income below the Regional Minimum Wage (RMW), as many as 37 people (48%) and those who did not experience stunting with family income above the RMW as many as 12 people (92.3%). The results of statistical analysis shows the value of p <0.05 (p = 0.006) so that there is a relationship between parental income and the incidence of stunting in children of Salulayang Elementary School. The results of this study indicate that the higher income of parents will affect the health status of children, especially the incidence of *stunting*. low income will have an impact on expenditure for nutritious food. This research is in line with research conducted by Nadyah et al.⁹ in the provinces of Bali, West Java and NTT that there is a significant relationship between family income with stunting in children. Based on these studies, it was explained that economic status has more influence on linear growth than growth in body weight¹⁰. Families with high income will be able to manage a better family diet. Families will choose food ingredients in good quality and quantity to improve family health status

especially in children. Nutritious and balanced foods do not have to come from expensive foodstuffs but it can be realized through a balanced diet by prioritizing simplicity and not deviating from the general guidelines of balanced nutrition¹¹⁻¹⁴.

CONCLUSION

The results of this study indicate that there is a relationship between the level of maternal education and parental income with the incidence of stunting. Efforts are needed to improve maternal education and knowledge about nutrition, especially stunting problems so that the role of mothers in household management, especially child care and provision of food ingredients, is better and in accordance with nutritional guidelines. Then it is necessary to improve the economic status of the community through economic value productivity so that *stunting* problems no longer occur from poor families.

ABSTRACT

The purpose of the study to find out the influence of factors of education, interest and motivation towards the behavior of early detection of ca cervix in the women of childbearing age in the health Kembangbahu Lamongan design research using observational analytic with cross design sectional. The entire population is women of childbearing age was 9476 in UPT Kembangbahu Lamongan with 369 samples of respondents taken with engineering proportional cluster random sampling. Data analyzed with logistic regression test. There are educational factors influence behavior towards early detection of ca cervix in the women of childbearing age (p-value 0.000), there is interest in behavioral factors influence early detection of ca cervix in the women of childbearing age (p-value 0.000), there is the influence of motivation factors against the behavior of early detection of ca cervix in the women of childbearing age (p-value 0.05) and there the influence factors of education, interest and motivation towards the behavior of early detection of ca cervix in the women of childbearing age (p-value 0.000). to make the behavior is indeed needed a variety of factors as predisposing factors include education, interest, and motivation. It was concluded that educational factors, interest, and motivation being the dominant factor against the behavior of early detection of ca cervix in women of fertile age. It is recommended that place research improve outreach regarding early detection of ca cervix in the women of childbearing age.

Keywords: Educational, Interests, Motivation, Behavior, Early Detection, Cervical cancer

INTRODUCTION

In Indonesia based on basic health Research data the year 2013 figures recorded the incident Ca cerviks on women as much as 522,354 sufferers¹. In East Java, basic health Research data based on the year of 2013 recorded the numbers of Genesis Ca cerviks on women as much as 1.6/100%¹. Given the impact that there is that it should be done to avoid the Ca cervix. The first is ever having sexual intercourse, then having to do early detection of Caucasian with Pap smear tests regularly every two years until the age of 70 years. Abnormal symptoms such as bleeding, especially after coitus (intercourse). The third thing is don't smoke. Other methods besides pap smear are by visual inspection with acetic acid. Current cervical cancer can also be prevented

by administering the HPV vaccine. This step can cause genital warts and cervical Ca²⁻⁵.

The problem is that there are still many fertile women does not implement early detection of Ca cervix. Many of the factors that are led to the lack of implementation of early detection. According to Green^{6,7}, someone wants to do things like early detection of the cervix, he or she will know if the purpose and merits. After know will determine attitudes i.e. agree or disagree with that program. After that also depends on perception, values, belief. So, will depend on enabling factors such as the presence of affordable health facilities for early detection, the presence of social support and so on. Maslow's motivation theory says that people will be compelled to act based on need, as well as desire or

interest or motivation. A powerful motivation or impulse must be related to sufferers through various approaches. The hope will soon arise interest to implement early detection of Ca cervix.

MATERIALS AND METHOD

Analytic observational research design with cross-sectional approach i. The population is the whole fertile age of women who are on the Clinic Kembangbahu Lamongan as much as 9,479 women of childbearing age, the number of respondents as many as 369 respondents use proportional cluster random sampling. Education data collection, interests, motivation to use the questionnaire and conduct early detection of the cervix using observations that are given to women who are in the Clinic Kembangbahu, Lamongan. then analyzed by Logistic Regression.

RESULTS

Table 1. Result of Logistic Regression

Variables	B	Sig	95% C.I.for EXP(B)	
			Lower	Upper
Education	4.430	.000	21.207	332.234
Interest	1.877	.000	3.363	12.687
Motivation	-1.225	.040	.091	.944
Constant	-7.268	.000		

The results of the logistic regression test Education Factor Influences, interests and motivation towards the behavior of early detection of Ca Cerviks in women of fertile Age in the health Kembangbahu Lamongan April 12 until May 12, 2017

DISCUSSIONS

1. Implementation Of Education Ca Cervix

Almost half of the respondent's cervix ca education implementation in women of fertile Age categories include less. This is due to the implementation of this required cervix ca educational facilities and infrastructure including the existence of a program for this activity. Facilities and infrastructure in question is of the required learning media such as books, magazines, newspapers or even internet public awareness by health workers. This means it is not necessarily for everyone have it. This includes the already popular is the internet,

not all people use the android handphone that can be used to access the internet to read ca cervix are common among women of fertile Age.

In addition to the above factors is also related to the status of gravida from respondents. Based on the results of the analysis of the obtained most of the respondents were multigravida with educational categories include less. This is because in general people were less concerned with preventive action regarding the disease. Including less care about the troubles of ca cervix. Therefore despite already belongs to multigravida, besides being still about ca cervix is still lacking.

2. Interest in the early detection of Ca Cervix

Based on result above known to almost half of the respondents including the high interest has to implement early detection of ca cervix IE as much as 163 respondents (44.2%) of a total of 369 respondents.

The results of the research supported by the existence of previous research results conducted^{8,9} claims based on a test of paired t-test is known to result in the amount of 0.005 0.000 significantly and this means there are influences counseling about cancer of the cervix against interest do the pap smear. Changes between the pre-test post-test with IE the number of 29 respondents. Experience increased interest in better, thus it can be concluded that the granting of an extension of cervical cancer by the method of buzz group have the influence of maternal interest significantly to do pap smears. With the extension of the mother's interest in doing a pap smear examination be increased, because at the time the extension this is going on the transfer of knowledge and insight about cervical cancer so that increases interest in the early detection of ca by cervix Pap smear or IVA

3. Motivation towards early detection of Ca Cervix

Based on result above is known to almost half of the respondents included have low motivation to implement early detection of ca cervix IE as much as 149 respondents (40.4%) of a total of 369 respondents.

The results of this research are consistent with previous research by which stated there is influence significant (OR = 4.700; 95% CI 1.379 hingga16,016; p = 0.013) with mother motivation behavior between checks IVA. Thus the motivation can give directions

and activities that should be carried out in accordance with the outline of the objectives planned previously and selection of works, i.e. determining what works to do matching to achieve the goal, by opting out of the works that are not useful for the purpose. A selection of works that are already defined or worked on will give you the confidence that high because it is already in the process of selection.

The results showed almost half of the respondents included have low motivation to implement early detection of ca cervix. This is due to the onset of high motivation indeed must be supported by the presence of a very strong feeling of need to implement early detection of ca cervix.

4. The behavior of early detection of Cancer Cervix with Pap smear Test

Other factors that also supports the majority of the respondents including implement early detection of ca cervix with the pap smear is the age, education, occupation, status of gravida or information. In terms of age factor known to most respondents aged 35 years old with behavior > pap smear categories include Yes (do). This is due to the age that the older people are increasingly aware of the health risks. Included with age 35 years > for women are also increasingly at risk of experiencing ca cervix. Therefore in this age group most widely implement early detection of ca cervix.

Factors that affect behavior are also visible in the early detection of ca cervix is the status of gravida. The assumption is with the higher the gravida, the more so the more positive experience to early detection of ca cervix. Based on the results of the analysis of the obtained most primigravida pap smear behavior including did. This is because with his status primigravida which means the number of children 1 child, causing concern for the better so there is encouragement implement detection of ca cervix. Haliniyang behavior accomplishing the cause to implement early detection of ca cervix.

5. Influence factors of Education against the behavior of early detection of Ca Cerviks

Based on result above revealed the influence of the educational factor against the behavior of early detection of ca cervix in women of fertile age in the health Kembangbahu Lamongan (p-value 0.000).

The results of this research are consistent with previous research⁹⁻¹² stating that the most dominant factor influencing the behavior of the early detection of cervical cancer is educational intervention methods wish and drive with a value of $p = 0,010$ and OR 3.050. This is due to the method of education wish and drive became the deciding factor because it is a health education given to the respondents to pay attention to the background of the client and his needs, education is providing a form of learning with a variety of lectures covering the stimulus using LCD, CD playback, sharing, peer discussion booklets, demonstration examination pap smear and counseling involving the family as supporters.

6. Influence factors of interest in the behavior of early detection of Ca Cervix

Based on result above revealed the influence of the factor of interest in the behavior of early detection of ca cervix in women of fertile age in the health Kembangbahu Lamongan (p-value 0.000).

Interest as a tendency or desire a high against something. Interest makes a person try and apply yourself to it and eventually gained a deeper knowledge of explains that the interest is the consciousness of a person against an object, person, problem, or situation related to her. This means that the interest should be viewed as something that is conscious. Therefore interest is the psychological aspects of a person to pay attention to high specific activity against and encourage those concerned to carry out such activities. In terms of the principal elements of interest is the concern, the thrust of each individual and pleasure. The influence of positive interest will make someone they are interested to experiment like to feel pleasure, joy, and joy. Pintrich and Schunk also mentioned that interest is an important aspect of the motivations that influence attention, learning, thinking and achievement¹³.

7. Influence factors of Motivation against the behavior of early detection of Ca Cervix

Based on result above in mind there is a motivation factors influence behavior towards early detection of ca cervix in women of fertile age in the health Kembangbahu Lamongan (p-value 0.05).

The results of the analysis showed the p-value of 0.004, which means that the value of the consistency of the results of this research are 4/1000 or have an

inconsistent or there's an error four times if the research is repeated as many as 1000 times. This shows a very high trust value about the influence factors of motivation against the behavior of early detection of ca cervix in women of fertile age. Means that the results of this study provide information very credible because of the significant requirements of no more than 0.05 or there's an error 5 among 100 repetitions.

8. Influence factors of Education, interest, and Motivation towards the behavior of early detection of Ca Cervix

Based on result above revealed the influence of factors of education, interest and motivation towards the behavior of early detection of ca cervix in women of fertile age in the health Kembangbahu Lamongan (p-value 0.05).

Many of the factors that led to the lack of implementation of early detection. The study of an aspect of behavior according to Green (Notoatmodjo, 2010) someone wants to do something such as early detection of ca cervix will know if the purpose and merits. After know will determine attitudes i.e. agree or disagree with that program. After that also depends on perception, values, belief.

There are educational factors influence, interest, and motivation towards the behavior of early detection of ca cervix in women of fertile age due to behavior accomplishing indeed needed a variety of factors as predisposing (predecessor) behavior accomplishing. Many experts conduct that has already suggested this, good Green, Snehendu B Kar, the WHO or the others have suggested this. Without knowing the intent and purpose of the preventive action that so then people would never think about early detection of cervical cancer. After people already know the advantages of implementing the early detection of cervical cancer then people will want to carry it out.

CONCLUSION

Based on the research results analysis, there are educational influence, interest and motivation towards the behaviour of early detection of ca cervix in women of fertile age in the UPT Clinic Kembangbahu Lamongan. so the dominant variables can be inferred is the educational value of the regression variables 4.430 with p value $0.000 < 0.05$ then H_0 denied. Midwife or

health worker is expected to further enhance training, mentoring, and the granting of health information especially about ca cervix thoroughly in order to make the public understand and are aware of the importance of detecting early ca cervix and willing to participate in a program of early detection of ca cervix.

Ineffective Regulation of Narcotics Crime Prevention (Criminology Perspective)

Amir Ilyas¹, Rini Anggraeni², Yuyun Widaningsih³

¹Department of Criminal Law Hasanuddin University Makassar, ²Public Health Faculty Hasanuddin University Makassar, ³Medical Faculty Hasanuddin University Makassar

ABSTRACT

The reality is that it should be a reason for us to worry because it threatens the future of the young generation who are the holders and successors of the nation's relay. That said because the impact caused by drugs is so tragic. The impact of drugs includes physical, psychological, social and economic impacts. This study aims to find out the causes of the increasing number of crime narcotics in the perspective of criminology. This type of research is an empirical research. Police officials, advocates, and narcotics abusers were taken as samples in this study. Data collection is done through interviews and documentation. The results showed that the regulation of narcotics crime prevention has not been effective in practice. Narcotics crime should have been reduced to the lowest in the presence of Act Number 35 the Year 2009 on Narcotics, but in reality, tend to increase every year. In the perspective of criminology with the observation of the age, sex, education, and work of narcotics perpetrators, it is found that multiple factors are interrelated, including psychological factors, sociological factors, and economic factors as criminal etiologies that trigger an increase in narcotics crime.

Keywords: *Narcotics crime, Criminology, Crime etiology.*

INTRODUCTION

The danger of drugs is no doubt. However, drug abuse is increasingly prevalent in various countries around the world, including Indonesia. When someone starts taking drugs, there is a high chance of experiencing addiction. The longer, the user will need a higher dose in order to feel the same effect. When the effects of drugs begin to disappear, users will feel uncomfortable due to the appearance of withdrawal symptoms and will want to use them again ⁽¹⁾.

Drugs that dissolve in the body will be channeled through blood throughout the body, including the brain. The effects of drugs depend on the type consumed, dosage, duration of use, and body size of the person who consumed them. In addition to influencing the body, the danger of drugs can also cause things that interfere with a person's quality of life. An addict is also more susceptible to sexually transmitted infections, accidents, and suicide attempts due to being under the influence of drugs⁽²⁾

According to data quoted from the Provincial National Narcotics Agency (BNNP) of South Sulawesi, the impact of drugs includes physical, psychological, social and economic impacts. Physical effects such as nervous system disorders (neurological): convulsions, hallucinations, and disturbances of consciousness. The psychological impact is not the normal ability to think, feeling anxious. Dependence/always need medicine. Socio-economic impacts, for example, always harm the community, both economic, social, health and legal.⁽³⁾

Drug distribution and use at this time are very worrying. In a sign that Indonesia is a transit place for drug trafficking by the international kingpin. We should be concerned and alert to the dangers of drugs that threaten the young generation of this nation. Drugs have a very broad impact and can damage the joints of the nation's life. The danger of drugs is actually very massive, even less destructive than the dangers of corruption itself.⁽⁴⁾ The crime data cited above is the result of the national scale collection of the Republic of Indonesia case. In the local scale, it is also found that crime statistics tend to increase every year. In Makassar

City in the period of 2012 till. In 2015 the crime rate was: in 2012 there were 288 people, in 2013 there were 255 people, in 2014 there were 323 people, and in 2015 there were 429 people data from Polrestabes Makassar, 2016. Only in 2013 did the number of Narcotics crimes experience a decline, which is 33 people decreased, and in 2015 again increased to 106 people.

Subjective approach is to look at individual factors as determinants of the occurrence of crime, wrong because of your own fault (SS). In essence, this approach is influenced by indeterministic theory ⁽⁵⁾. While the objective approach is to look at factors outside individual conditions as the cause of crime, wrong because the Environment is Wrong (LS). This approach is influenced by deterministic theory.

MATERIAL AND METHOD

Research sites

This research was carried out in Makassar City, namely at the Makassar Polrestabes. The researcher took this location, considering that at that location, it was the first time that narcotics crime cases were examined by police law enforcement officers.

Type of Research

The type of research in this study is empirical research. The goal is to reveal the etiology of narcotics crime with the aim of providing legal solutions to the increase in crimes from a criminological perspective.

Data Collection Techniques

In this study interview and documentation, techniques were used. The interview technique was carried out on police law enforcement officers, advocates, narcotics abusers including users, dealers and narcotics dealers in the city of Makassar. While documentation is carried out through the collection of statistical data on crimes found in the Makassar Police

Data analysis

The data analysis method used is qualitative

analysis, by analyzing and describing the data obtained both from primary data and secondary data, the results of research through a criminological approach to the etiology of narcotics crime and its countermeasures.

RESULT AND DISCUSSION

Criminology as the science of various knowledge, the body of knowledge, is dominantly defined as the science that seeks to investigate the causes of the symptoms of evil in ways that exist in it. By conducting an investigation into the causes of these crimes, this is then the scope of the study of criminal etiology which is none other than one of the main branches of criminology ⁽⁶⁾. Related to the increasing number of narcotics crimes with a view to revealing their criminal etiology, four variables will be used which consist of the age of the perpetrator, the sex of the perpetrator, the education of the perpetrator and the work of the perpetrator.

As stated above, that because criminology uses various sciences, then to measure all four variables, it cannot be separated from anthropological approaches, psychological approaches, and sociological approaches as well as in the applied field of criminology: criminal anthropology, criminal psychology, and sociology criminal.

Age of Narcotics Crime Actors

Formulation of different criminal responsibilities between children (12 to 18 years) with adults is a further consequence of a person's cognitive phase to be able to think fully or not be able to think fully

In a psychology perspective, especially developmental psychology, adulthood should be one of the physical variables that can prevent a person from committing a crime. Ansem of developmental psychology if connected with statistics of narcotics criminals based on one's adult age, it does not support the reduction in the number of narcotics criminals. This can be noted through the following table 1:

Table 1: Number of Narcotics Crimes in Makassar City Based on the Age of the Perpetrators (2012 to 2015)

Years 10-17	Age (year)				
	18-20	21-25	26-30	> 31	
2012	15	36	59	70	122
2013	18	27	63	42	105
2014	20	39	61	75	131
2015	19	44	103	85	178
Total	72	146	286	272	536

Data Source: Makassar Polrestabes (2015)

The interesting thing from the presentation in Table 1 above is that the increase in the age of narcotics criminals is directly proportional to the increase in narcotics criminals. Physical and biological development of the stage of perfection, but perfectly cognitive is unable to hold the offender acting based on the norms of goodness contained in him as a reflection of his social environment. According to National Police Headquarters data contained in the book Population Perspective of Islam written by M Cholil Nafis, from 2004 to March 2009, there were 98,614 cases (97% more) teenage children were drug users⁽¹⁾.

Narcotics perpetrators from 10 to 17 years of age and 18 to 21 years of age are essentially unable to live independently. He has not been able to make a living on his own, has not been able to earn money independently, even if there is money in his hand it is usually obtained from his close relatives. He was most likely to get close to giving his mother's father. Therefore if you want to use or consume narcotics that are expensive, you will certainly be constrained from the financial aspect to buying narcotics ingredients.

Crime is learned through interaction with other people by learning techniques of crime, distinctive motivation, encouragement, rationalization, and attitude⁽⁶⁾. While narcotics crimes committed by adults are not influenced by totality alone. The country of Indonesia as a developing country with a poverty rate is still high, and at the same time more and more demands to live in luxury⁽⁷⁾ cause social consequences of irregularities. The deviation is by becoming a narcotics dealer so that the finances are sufficient to meet all needs that can

increase its prestige.

Gender of Narcotics Crimes

Comparing the quantity of crime based on sex, the perpetrator is still a series of individual factors as their physical and psychological state. Although in examining narcotics crime by looking at the sex of the perpetrator, it cannot be separated from environmental factors. The combination of these individual factors and environmental factors is then referred to as the bio-sociological approach⁽³⁾. The quantity of narcotics criminals who are always dominated by male-sex offenders rather than a female can be considered in the following Table 2:

Table 2: Number of Narcotics Crimes in the City of Makassar Based on Gender Actors (2012 to 2015)

YEAR	Gender	
	Male	Female
2012	259	17
2013	243	21
2014	269	39
2015	369	45
TOTAL	1.140	122

Data Source: Makassar Polrestabes (2015)

Based on Table 2 above, there are two things that need to be explained further, namely: (1) Why are the number of narcotics perpetrators dominated by male

sex offenders? (2) Why do narcotics perpetrators, both male and female, tend to increase every year? Although in 2013, male sex offenders experienced a decline. The opportunity is that men who are more demanding work to be outside the home, than women are more at home taking care of their children, family, and husband’s eating needs, of course, the opportunity for men to become narcotics abusers is more open than with women ⁽⁸⁾

It is different from narcotics abusers who are female, the cause they commit crimes is not because of economic problems which are the main reason. They become more abused by their association with the workplace. In some cases the average woman is also a narcotics abuser because the family conditions are broken (broken home), so by becoming a drug user, her family’s problems for a moment do not burden her mind again ⁽⁹⁾.

Education Status of Narcotics Crime Actors

The purpose of education for everyone is essential to form their personality with integrity, responsibility, and agility in differentiating a good and right decision. The

analogy is that the higher the level of education a person means the more his experience goes through the process of internalization of a shared value so that the output is easier to avoid all actions that have been criticized by the community in their environment.

One research in the United States also shows that prison inmates at the “Richland Parish Detention Center,” Louisiana, generally only have education in grade 2 elementary school to grade 1 junior high school (second grade to seven grade). Those with low education are always wrong in having perceptions about life and law ⁽¹⁰⁾. Some of the results of the above research, in fact, contradict the results of research found on the number of narcotics crimes in the city of Makassar, when viewed from the education status of each perpetrator. It is precisely at the level of high school education, the perpetrators are more compared to narcotics criminals who are in junior and elementary education levels. More details about the conflict can be noted in the following table 3:

Table 3: Number of Narcotics Crimes in Makassar City Based on the Level of Education Actors (2012 to 2015)

Years	Education				
	Elementary School	Junior High School	Senior High School	College	
2012	15	36	195	42	
2013	41	55	152	7	
2014	66	90	147	20	
2015	68	127	216	18	
Total	190	308	755	87	

Data Source: Makassar Polrestabas (2015)

Based on Table 3 above shows that the highest number of narcotics abusers occurs at the level of high school education compared to the level of elementary and junior high school education. Only the narcotics abusers with higher education status then the number of perpetrators, suddenly shows a decrease.

Apart from that which is a striking difference, so that narcotics criminals with higher education status suddenly decline, none other than because the population in Makassar city is far more high school educated than

college graduates.

Job Status of Narcotics Crime Actors

A person’s work will certainly be a reflection if the economic situation becomes sufficient to meet his life’s needs. If many people crave a profession as a civil servant, actually they are craving for a more established economy. A person’s job status that is directly proportional to the economic situation, associated with the potential or not to become a narcotics abuser is very difficult to measure.

Someone who has financial supplies, in the sense of an established economy, has the potential to become a narcotics abuser. For those in the group, even though the price of narcotics is expensive, it is definitely affordable, at least as a user.

The criminologist's conclusions about the close relationship between work and crime will be supported by the results of this study. The highest number of narcotics perpetrators is in fact played by those who are unemployed. This can be noted through the following table,

Table 4: Number of Narcotics Crimes Based on the Workers' Acts (2012 to 2015)

Occupation	Year (person)			
	2012	2013	2014	2015
Student	12	5	13	6
Collage Student	20	23	23	13
Government Employee	5	10	3	5
Private Employee	92	54	68	79
Police	5	-	1	-
Entrepreneur	59	58	67	108
Farmer/Fisherman	-	2	1	2
Daily Labour	40	46	63	95
Unemployment	71	57	84	121
Total	304	225	323	429

Data Source: Polrestabes Makassar (2015)

Based on Table 4 above shows that the highest number of narcotics abusers occupy the first position in each year (other than 2013), namely those who are only unemployed. Then followed by those who work as entrepreneurs, day laborers, and private employees. It was found in this study that narcotics criminals with unemployment status, the main factor causing them to be involved in these crimes, are mostly caused by economic motives compared to other reasons, such as severe stress so that narcotics are considered as life escape. This grouping is more dominant, the perpetrators act as dealers or bookies.

For narcotics abusers who come from the daily labor profession, the same situation applies to the entrepreneurial profession, which is only as a user, but not used during breaks. Daily laborers actually use narcotics with the aim to boost adrenaline work while eliminating fatigue after a full day's work. While narcotics offenders who come from the entrepreneurial profession and private employees are caused by their orientation in a social class. One experiences a shift from one choice to another because it is faced with different social activities. Then the narcotics offenders

who come from the profession of daily labor, are mostly caused by ecological and physical factors, each of these factors intertwines, narcotics cannot be separated from their parts of life and work.

CONCLUSIONS AND SUGGESTIONS

The results of this study indicate that the regulation of narcotics crime prevention has not been effective in practice. The narcotics crime rate should have been reduced as low as possible, but in reality, it tends to increase every year. In a criminology perspective with observations of age, sex, education, and occupations of narcotics criminals, it was found that multiple factors are interrelated, including psychological factors, sociological factors, and economic factors as criminal etiologies that trigger an increase in narcotics crime rates.

Reaction to the breaking law against these crimes is by eliminating the criminogenic factor which is the cause of the crime (abolitionist system). Priority should be given to increasing employment opportunities, then counseling and education of narcotics hazards in all lines regardless of the age and profession of each

person. Police and BNN must prioritize capturing narcotics dealers because these are the main causes of the emergence of dealers in the narcotics business with very promising benefits.

Multivariate Analysis of the Occurrence of Needlestick Injuries on the Nurses at X Hospital in Makassar

Atjo Wahyu¹, Rostati¹, Sudirman Nasir²

¹Department of Occupational Safety and Health FKM UNHAS,

²Department of Health Promotion and Behavioral Sciences, FKM UNHAS

ABSTRACT

Needlestick Injuries (NSI) and sharps injuries are often experienced by nurses. This research aimed to find out the factors related to the incident of needlestick injuries (NSI) on the nurses at Ibnu Sina Hospital, Makassar. The study was analytical observational using the cross sectional study approach. The Samples were chosen using the proportional stratified random sampling technique with the total sample of 107 respondents. The collected data include age, sex, years of services, education level, employment status, enabling factors, reinforcing factors and NSI incident. The data were analyzed using the Chi-Square test for bivariate analysis and logistic regression test for the multivariate analysis. The research results indicated that 66.4% of the respondents were 20 to 29 years old, 73.8% were non-permanent employees, and 61.7% had adequate enabling factors. There was a significant correlation between the age ($p = 0.011$), employment status ($p = 0,006$) and enabling factor ($p = 0,047$) with NSI incident on the nurse at Ibnu Sina Hospital, Makassar. The result of the multivariate analysis revealed the most closely related employment status with the value $p = 0,009$. Thus, the employment status was very influential on the incident of NSI, because most employees at Ibnu Sina Hospital, Makassar were non-permanent employees.

Keywords: Needlestick injury, age, employment status, enabling factors.

INTRODUCTION

Needlestick Injuries (NSI) and sharps injuries are often experienced by nurses. Nurses have the highest prevalence of injury among healthcare workers. Research Jaber & Farideh¹ said that the age, gender, length of <2 years and significant education with NIS in 97 health workers at a teaching hospital in Iran. Research carried out in June and December 2014 at 168 randomly selected nurses who served in different wards at the University Hospital of Shiraz, Iran said that the majority injuries occur puncture needles on the morning shift (57.8%) and the cause is 41.4% because recap

needles after use (recapping needles). There is a 60.2% not report NSI with severe clinical reasons (46.7%) and the perception of the risk of infection is low (37.7%). Factors that significantly affect NSI are sex, occurred on the morning shift, work hours per week and the number of shifts per month shift².

Research in December 2014 in four hospitals of Southeast Ethiopia Bale zone of 362 randomly selected health workers. Nearly 6 out of 10 injuries (58.7%) were not reported. The main reason not report the injury is time constraints (35.1%), a sharp object causing injury is not used in any of the patients (27.0%), patients have no injuries source of infectious diseases (20.3%) and lack of knowledge that NSI and sharps injuries should be reported (14.9%). Half of health workers who were injured have sought medical treatment on their own initiative. Respondents with low pay six times more likely to report occurrence of NSI compared to respondents with high salaries³

Number of accidents at the Hospital of Gadjah Mada (UGM) still exceeds the target of zero accident (no accident). Most accident classification by type of injury was in contact with needles and other sharp objects (69.6%), according to the cause by a portable work equipment (69.9%). Shift occurred in the morning (69.6%) in the work unit Pharmacy / Sterilization and there were 26.1% in the emergency department⁴.

Research conducted at the paramedics on duty in the emergency room, hospitalizations, ICU, operating rooms and clinical laboratories Rumkital Dr. Midiyato S Tanjung Pinang November to December 2012 the dominant factor related to adherence to SOPs paramedics and universal precautions significant program with the reinforcing factors, enabling factors and factors of perception⁵.

Factors that cause workplace accidents are very diverse, especially the incident of NSI. There are several instances of workplace accidents are never reported include NSI. Therefore, this study aims to analyze correlation between age, gender, education level, length of employment, employment status, enabling factors, reinforcing factors to the onset of NSI at Ibnu Sina Hospital in Makassar.

MATERIALS AND METHOD

Research sites

Research conducted at Ibnu Sina Hospital, Makassar in operating rooms, emergency departments, nursing and ICU. Starting from 24 April to 24 May 2017.

Population and Sample

The population was all nurses working at Ibnu Sina Hospital in Makassar amounted to 157 people. A sample of 112 nurses who work in emergency departments, operating rooms, patient wards and ICU selected by proportional stratified random sampling method with a sample selection of the population is not homogeneous and stratified proportional. Samples that meet the inclusion and exclusion criteria were 107 people.

Data collection

After obtaining permission to conduct the study, researchers identify and approach potential respondents to explain the purpose and benefits of their participation, as well as guarantee the confidentiality of prospective

respondents. Collecting respondents who selected and according to the inclusion and exclusion criteria, to explain about informed consent and how to fill out the questionnaire, and then distributed the questionnaire to be filled. Collecting the questionnaire after complete.

Data analysis

Univariate analysis to describe of variables in general. Bivariate analysis to see some of the great associated between the independent variables of individual factors, occupational factors, enabling factors and factors reinforcing with the dependent variable (Needle stick Injury). Multivariate analysis to see independent variables most associated with the dependent variable.

RESEARCH RESULT

Characteristics of Respondents

Table 1 shows that the respondent most female sex as much as 84.1% or 90 respondents. Age of the most respondents in the range 20-29 years 66.4% or 71 respondents. Most work period on working life of > 3 years employment 82.2% or 88 respondents and the most respondents in the operating room space by 15% or 16 respondents. Most respondent employment status is not fixed employment as much as 73.8% or 79 and is the highest level of undergraduate education level, amounting to 60.7% or 65 respondents.

Distribution of Needlestick Injuries (NSI)

In Table 2 shows as much as 62.6% or 67 respondents experienced of NSI. There is a 55.1% or 59 respondents had experienced NSI 1-2 times. There is a 47.8% or 32 respondents had NSI when the afternoon shift. Respondents experienced NSI when recapping syringes practice as much as 41.8% or 28 respondents. There is a 55% or 33 respondents did not report NSI because of the possibility of infection is low.

Distribution Factors Enabling and Reinforcing factors

Table 3 shows the factors enabling adequate as much as 61.7% or 66 respondents and the reinforcing factors were adequate as much as 62.6% or 67 respondents.

Respondent Characteristics relationship on the incident of NSI

Based on bivariate analysis with test Chi-Square in Table 4 variables significantly to NSI events were age ($\rho = 0.011$), employment status ($\rho = 0.006$) and $\rho = 0.047$ enabling factor.

The most variable associated on the incident of NSI

The test results of multivariate logistic regression in Table 5 shows that the employment status variables ($\rho = 0.009$) most associated with the incidence NSI.

Source: Primary Data, 2017

DISCUSSION

This research results obtained Chi Square test, variable employment status has a significant relationship to NSI, with values obtained $\rho = 0.006$. These results are also in accordance with multivariate analysis obtained by value $\rho = 0.009$. It is known that Ibnu Sina Hospital in Makassar more nurse status of temporary employees (non-permanent, fixed fees and prospective employees)

compared to nurses permanent employee status. NSI is one of the most important issues in terms of health and safety in health services, especially for nurses. NSI can cause blood-borne infectious diseases, especially HIV that causes AIDS, hepatitis B and hepatitis C. The risk of infection after exposure to infected blood varies by bloodborne pathogens. Injury can occur at any stage of its use, demolition or disposal.

Research in the Department of General Surgery, Albany Medical Center, Albany, New York by Choi et

al (2016), said that 55% of respondents had a history NSI, a surgical nurse more frequently reported NSI than surgeons with reason patients who were at risk of infection are low and no time reporting (65%) and fear of punishment. In this study as much as 62.6% or 67 respondents experienced NSI. There are 59 respondents (55.1%) said they had experienced NSI (2012 to 2016) as much as 1-2 times and reporting on events NSI just as much as 7 respondents (10.4%) while that did not report the incident of NSI 60 respondents (89.6%) citing lower chance of infection as much as 33 respondents (55%). NSI occurred on the afternoon shift as much as 32 respondents (47.8%) and at the time recapping of syringes by 28 respondents (41.8%).

Research at the University Hospital Shiraz Iran NSI produce very high prevalence (66%) occurred in the morning shift, working practices recapping the needle, the injection device type, working hours / week and the frequency shift of the shift / month is a major factor related to NSI Jahairi et al.,² Research in the hospital Gadjah Mada in 2015 said the accident classification majority (69.6%) were injured due to needlestick and sharps⁴. Research in Iran showed a relatively high NSI prevalence among health workers, especially at a young age and nurses who rarely attend training Age categories experienced NSI 20-29 years which included the young age. Usually young nurses tend to work in a hurry or are not careful so it tends to hurt. This study is in line with research Gholami et al⁶, which is a significant age category 20-29 years ($p = 0.001$) and the incidence NSI. Responden more employment status not continue to have NSI. Temporary staff at Ibnu Sina Hospital was included in three (3) groups: non-permanent employees, salaries and prospective employees remain with the facilities provided are also different. This study is in line with research Jangjaer et al⁷ the University Hospital of Taiwan that 21.28% NSI events tend to occur during dental nurse intern (Temporary staff) with the skills and clinical experience is still low. Amira & Awobusuyi⁸ Research, said that the tenure of > 3 years of significant events NSI to nurses in Nigeria Hemodialysis Unit.

Research on hospital nurse in Bale Zone of Ethiopia by Bekele et al, said that there are (60%) of nurses had low salaries experiencing NSI and reported the incident. Which includes categories enabling factor is the hospital rarely do training in universal precautions, some nurses who have long working lives only attended 1-2 times training. This is in line with research Helmut et al⁹ which

says that education NSI the number of reported events NSI. Hospitals rarely provide a copy of the SOP for each medical action. Hospitals provide personal protective equipment (PPE) gloves but usually respondents do not wear it because it considers that it is common medical procedures done and the risk of infection is low¹⁰⁻¹².

CONCLUSIONS AND RECOMMENDATIONS

Employment status ($p = 0.009$) are the factors that most influence to the incident of NSI on the nurses at Ibnu Sina Hospital Makassar. Ibnu Sina Hospital should conducted precautions training and reporting of NSI way for nurses on a regular basis.

Factors That Affect the Quality of Life of Pregnant Women

Muhammad Anwar¹, Saifuddin¹, Ridwan Amiruddin¹, Ridwan Thaha¹

¹Faculty of Public Health, Unasman, Polewali

ABSTRACT

Background : Health problems in pregnant women due to physiological changes, both physically and psychologically, have an impact on the quality of life of the mother. Physically, pregnant women experience back pain in pregnancy. It is estimated that around 50% of pregnant women will suffer from low back pain during their pregnancy or during the postpartum period. While the prevalence of depression often occurs in pregnancy by 4% to 29%.

Objective: to determine the relationship of family support, information media and ANC services to the quality of life of pregnant women in the work area of Massenga Health Center, Kab. Polewali Mandar in 2018.

Method: This research is quantitative with a study design *cross sectional*. Data collection of pregnant women is 176 respondents with questionnaire direct interviews about family support, information media and ANC services on the quality of life of pregnant women. Data analysis using the test *chi-square*.

Results: There is a significant relationship between family support and the quality of life of pregnant women (*Chi Square* p value <0.05; (p = 0,000). There is a significant relationship between counseling media and quality of life of pregnant women (test *Chi Square* p = 0,000 < 0.05) There is a significant relationship between ANC visits and the quality of life of pregnant women (test *Chi Square* p value = 0.035 <0.05)

Conclusion: Improving quality of pregnant women through family support, and information media on the quality of life of pregnant women. Suggested It is necessary to have good coordination between the Puskesmas and other health services

Keywords: *Quality Life, Pregnant Women, Family Support*

INTRODUCTION

Pregnancy is the most anticipated phase generally for women, as an expression of the sense of self and identity as a woman. Pregnancy is also a worrying episode in a woman's life. adjustments to these conditions, because it can have a major effect on the physical condition and the psychological state of a woman I've never experienced it. Pregnancy for a woman is a thing that is full of happiness as well as anxiety, anxious about bad things that can befall her and her fetus, especially during labor¹.

According to the *World Health Organization* (WHO) maternal mortality is still quite high, every day around the world around 800 women die from complications in pregnancy or childbirth. According to WHO, 40% of

maternal deaths in developing countries are caused by anemia during pregnancy. In 2013, there were 289,000 women died during and after pregnancy and childbirth. Between 1990-2013, the maternal mortality rate in the world (ie the number of maternal deaths per 100,000 live births) decreased by only 2.6% per year. This figure is still far from annual target of reducing the Maternal Mortality Rate (5.5%) needed to achieve the *Millennium Development Goals* 5th. Therefore the assessment of the quality of life of pregnant women is important in determining appropriate preventive measures and leads to an increase in quality of care and their well-being, with an emphasis on the health of pregnant women.²

The highest maternal mortality rate in Indonesia compared to other countries such as Thailand is only 44

/ 100,000 live births, Malaysia 39 / 100,000 live births, and Singapore 6 / 100,000 live births. The maternal mortality rate (MMR) and Infant Mortality Rate (IMR) in Indonesia is still high. Based on the Indonesian Maternal Health Demographic Survey (SKDI) in 2012, MMR reached 359 per 100,000 live births and AKB reached 32 per 1000 live births³.

Based on the West Sulawesi Health Profile in 2016 the number of maternal deaths according to the regency, namely Polewali Mandar district became the District with the highest number of maternal deaths with 14 cases of death compared to northern Mamuju by 11 cases, Majene with 8 cases, Mamuju 7 cases, Mamasa 6 cases and Mamuju 1 case⁴.

The quality of pregnant women can not only be reviewed for its impact on mortality aspects but also on aspects of morbidity, such as physical and psychological. Physically, pregnant women experience back pain in their pregnancies is It estimated that around 50% of pregnant women will suffer from low back pain during their pregnancy or during the postpartum period⁵. Depressed pregnant women have a lower quality of life⁶. While the prevalence of depression often occurs in pregnancy by 4% to 29%⁷. Besides that, there are other complaints such as nausea, vomiting and fatigue that can affect the decrease in quality of life of pregnant women. The percentage of each of nausea, vomiting and daily fatigue was 33.6%, 9.6% and 44.4%.⁸

Based on the report of Massenga Polewali Mandar Health Center, in December 2016 the number of pregnant women was 596 people. Pregnant women who are at high risk are 119 people, who follow first coverage (K1) of 49 (88.59%) visits, the fourth visit (K4) is 36 visits (65.60%), while those who experience bleeding are 17 people. Furthermore, the number of pregnant women in 2017 is 605 people. There were 121 high-risk pregnant women, who followed the first visit coverage (K1) as many as 419 (69.3%) visits, while only K4 coverage was 474 (78.3%) people visited. From the observations there are still many pregnant women who do not follow the first visit coverage (K1) and the fourth visit coverage (K4) high risk pregnant women are still high.

RESEARCH METHODOLOGY

This research is a type of research quantitative with a cross sectional approach. namely observations about the influence of a variable affecting other variables

simultaneously both independent and dependent variables, which are intended to analyze the relationship of quality of life of pregnant women.

The variables independent are family support, information media, and ANC services. While the variable dependent is the quality of life of pregnant women. Determination of the location of the study by purposive sampling, the number of Hami samples in this study was 176 respondents.

RESEARCH RESULTS

Univariate Analysis

Table 1. Characteristics of respondents

Characteristics	Amount	Percentage%
Age		
<20 years	12	6.8
20-34 years	128	72.7
> 35 years	36	20.5
education		
Elementary/ equivalent	5	2.8
SMP / equivalent	62	35.2
SMA / equivalent	70	39.8
PT / equivalent	39	22.2
Employment		
IRT	148	84.1
PNS	2	1.1
Employees	4	2.3
Entrepreneurship	22	12.5
TOTAL	176	100.0

Based on the table above shows that the characteristics of respondents according to age group are generally between 20-34 year as many as 128 respondents (72.7%), at least <20 years old as many as 12 respondents (6.8%). While the data obtained by the distribution of respondents based on education shows that the majority of respondents are high school / equivalent education level as many as 70 respondents (39.8%) and the least elementary school as many as 5 respondents (2.8%).

Furthermore, the distribution data of respondents based on work shows the majority of respondents as IRT (Housewives) as many as 148 respondents (84.1%), PNS 2 respondents (1.1%), employees as many as 4 respondents (2.3%) and entrepreneurs 22 respondents (12.5%).

Bivariate Analysis

Table 2. Relationship Family Support, information media and ANC services with quality of life pregnant women.

Family Support	Quality of Life		Total	P
	Poor	Fair		
Less than	55 (64.7%)	30 (35.3%)	85 (100.0%)	0,000
Enough	30 (33.0%)	61 (67.0%)	91 (100.0%)	
Total	85 (48.3%)	91 (51.7%)	176 (100.0%)	
Information Media				
Less	60 (68.2 %)	28 (31.8%)	88 (100.0%)	0,000
Enough	25 (28.4%)	63 (71.6%)	88 (100.0%)	
Total	85 (48.3%)	91 (51, 7%)	176 (100.0%)	
ANC Services				
Less	32 (60.4%)	21 (39.6%)	53 (100.0%)	0.035
Enough	53 (43.1%)	70 (56.9%)	123 (100.0%)	
Total	85 (48.3%)	91 (51.7%)	176 (100.0%)	

Based on the results of research conducted using Test Chi Square where the value of p value = 0,000 (p-value ≤ 0.05), shows a significant relationship between family support and the quality of life of pregnant women.

Furthermore, testing the relationship of counseling media with the quality of life of pregnant women using Test results Chi Square where the value of p value = 0,000 (p-value ≤ 0.05), indicating the existence significant relationship between counseling media and the quality of life of pregnant women.

Based on the results of research conducted at the mass health center using Test Results Chi Square where the value of p < 0.05; (p = 0.035), indicating a significant relationship between ANC services and the quality of life of pregnant women.

DISCUSSION

In this study there was a significant relationship between family support and the quality of life of pregnant women. The quality of pregnant women is directly affected by family support. Meanwhile the incidence of stress with the role of family support relates indirect relationships⁹. Maintaining stress or depression during pregnancy is very important. Because women who experience symptoms of depression at the beginning of their pregnancy have a poor quality of life for their health¹⁰

The role of husbands is enough to affect the physical and psychological health of the mother during her pregnancy. Forms of husband’s role such as delivering prenatal care, maintaining feelings in communication and giving advice on prenatal care. According to Calou¹¹, family support (husband) was a positive predictor and

found a significant relationship with quality of life.

In fact, according to Arini, states the importance of family support in pregnancy is very significant for women's adjustment in the first pregnancy. indicated by the correlation coefficient (r) of 0.7311 with $p < 0.01$. This means that the higher the family support, the higher the adjustment of women in the first pregnancy and vice versa¹². Even family support is not only during pregnancy, but also has a strong correlation with the quality of life of the mother after giving birth.¹³

This is also in line with the theory that explains family as an affective function, namely family functions related to internal functions of the family in providing psychosocial protection and support for family members. Family as a source of love, recognition, appreciation, and primary source of support, Satir, in Friedman,. Therefore family support has an important concern, especially pregnant women who experience various health problems of their pregnancy.

Furthermore, the analysis of the relationship between counseling media and the quality of life of pregnant women shows a significant relationship. Therefore, the right role of counseling media can improve the health of pregnant women, and lead to the impact of improving the quality of pregnant women themselves. According to Lupton 2016, digital media can provide the information needed in detail when they have the opportunity¹⁴.

Social media is very useful in changing general health behaviors¹⁵. The majority of studies report that women use the internet as a source of information about pregnancy. Women seek information at least once a month, especially the topic of fetal development and nutrition at pregnancy¹⁶. Besides that, it is very helpful for health workers in their efforts to improve the health of pregnant women in their working areas.

The most commonly used communication methods are 3 types. First, internet (46%), Second, talking with health care providers (33%), and third, talking to family (32%). A higher preference for talking to health care providers is high-income individuals compared to lower income¹⁷.

Furthermore, the analysis of the relationship between ANC services and the quality of life of pregnant women showed a significant relationship. Therefore it is necessary to get the attention of health workers to

improve the health of pregnant women. Even though the initial inspection visit is already high, if you look at the complete inspection (K4), it is still low. This situation occurs due to other factors, such as; the number of other health facilities and the level of mobility of the population is quite high, so there are services for pregnancy in other places as well as some pregnant women who specifically come just for maternity.

The study, supported by Nicholson¹⁸, states that almost all women (98.9%) had antenatal examinations during pregnancy, but had less (26%) of the recommended minimum number of four visits during pregnancy¹⁸. Even though the benefits obtained from prenatal care are very useful. According to the WHO Antenatal Care Trial, the results of a randomized trial show that high frequency and regular visits in the third trimester can reduce perinatal mortality¹⁹. To increase the proportion of mothers who conducted 4 antenatal visits and improve the quality of care through the use of cell phones^{20,21}

According to Chemir²², ANC services were also determined by the level of community satisfaction. Unfortunately, based on the satisfaction rate of pregnant women who received special antenatal care services, they were only above (60.4%) who were satisfied. Difficult to increase visits of pregnant women with dissatisfaction with service²². Especially with the increase in the target of visits announced by WHO^{23,24}, a minimum of eight contacts for antenatal care can reduce perinatal deaths by 8 per 1000 births when compared to a minimum of four visits.

CONCLUSION

There is a significant relationship between family support, information media and ANC services with the quality of life of pregnant women in the Massenga Health Center area.

Suggestions

Increasing awareness of healthy pregnancies needs to be supported by the support of immediate families such as husbands and parents and information media such as social media / internet.

There needs to be good coordination to obtain real ANC visit data between Puskesmas and other non-government health services.

ABSTRACT

Background. In medical faculty, clinical skills learning has been taught since the early years. Methods in clinical skills learning need media as mannequin and standardized simulated patient. The price of mannequins is expensive and its maintenance and the availability of spare parts are difficult because of product import. Therefore, research and development of low cost and easily maintenance mannequin are needed to solve the problems.

Aims. To develop and validate low cost male catheterization mannequin as learning media in clinical learning

Method. This was a research and development study. The research start with designing, making, then validating the mannequin. There are 18 validators who are anatomist, urologist, surgeon, internist, medical educator, and general physicians.

Results. There are 3 parts of the designed male catheterization mannequin, which are outer body part, penis part, and inner structure. The anatomy of the mannequin is alike with human body. It has light weight and portable. Another advantages are easier maintenance and cheaper than standardized mannequin. Although there is smooth leak in the urethral valve.

Conclusion. Mannequin produced from this research is a low cost and high technology product that can be used as learning media in clinical skills learning.

Keywords. *Male catheterization mannequin, low cost, clinical skills, learning media*

INTRODUCTION

Clinical skills are required for medical students to become a doctor. In medical faculty, clinical skills learning has been taught since the early years. Students learn clinical skills such as communication, examination skills and procedural skills¹. Methods in clinical skills learning need media as mannequin and standardized simulated patient.

Mannequins are used in exchange of real human body to practice procedural skills those are invasive, so it is impossible to be applied to standardized patients. Therefore students can repetitively practice without fear of mistakes and hurting patients. Furthermore, it can increase their confidence and prepare mentally before entering clinical education in hospital².

There are many clinical skills that are taught using mannequins, such as Intravenous catheterization, Basic Life Support, Leopold Examination, Neonatal Resuscitation, Gynecologic Examination, Intra uterine device (IUD), Baby Delivery, Airway Management, Male and Woman Catheterization and Nasogastric Tube Insertion. According to Indonesian Medical Council that

male catheterization is a procedural skills at level 4A. It means that this skill should be performed by a doctor independently⁵.

For some medical institutions, specially in developing countries, found a major problem in managing clinical skills laboratory. Budget costs for purchase, repairmen and maintenance of mannequins are enormous³. The price of mannequins are expensive, mostly imported products. In addition, maintenance, spare parts, and mannequin durability can be a problem for clinical skills management. Mannequin ranks first in the learning system in clinical skills before students move on to the next stage of practicing with friends, practicing with simulated patients and the latter being down directly to the community. Therefore, research and development of low cost and easily maintenance mannequin are needed to solve this problems.

METHOD

This was a research and development study. The research started with designing, making, then validating the mannequin. There were 18 validators who were anatomist, urologist, surgeon, internist, medical educator, and physicians. Data were collected through in-depth interview and analyzed in qualitative.

RESULTS

The first phase, designing phase begin with planning the material that will be use for making the mannequin. There are two main material used, which are silicone rubber and fiber. Other material will be taken from wasted material such as used bottle and hoses. There are 3 parts of the designed male catheterization mannequin, which are outer body part, penis part, and inner structure. The outer body consist of parts of stomach and thighs. The penis part consists of penis and scrotum. And the inner structure consists of bladder and urethra. Materials used were low-cost that can reduce production costs. In the outer body of the abdominal and thigh body parts used fiber and the the penis part used silicone rubber.

The second phase is making the mannequin. The step of mannequin manufacturing starts from the manufacture of outer body and penis molds using silicone rubber. The second step is to make the outer body of mannequin using resin and fiber. The next step is to make a penis part using silicone rubber added with yellow dye to find the closest color to the skin. And the last one is to make

the structure in bladder using bottles and building hoses. The urethral valve uses silicone rubber.

Figure 1. Outer part of male catheterization mannequin

Figure 2. Inner structure of male catheterization mannequin

The third phase is the mannequin validation. The validation phase is the phase of developing the mannequin model of male catheter installation that has been created by collecting opinions from the experts about the mannequin, especially to find limitation and the feedbacks on repairing the mannequin to be realistic and can be used as learning aid. Validation is done in two stages. Validations aims to determine whether the mannequin is eligible as a tool for learning clinical skills. After the first stage validation, the mannequin will be repaired according to he feedback. Subsequently, the mannequin will be validate again by the experts as the second stage validation. At the end, there will be final revision of the mannequin that signifies the mannequin is eligible to be used as learning media.

In the first stage of validation, the mannequin was validated by the experts and 3 types of limitation were found in the mannequin. First, the glans penis mannequin looks has not been circumcised and too stiff.

Second, mannequin's urethra when can only be passed by catheter size of 12-16 while the most commonly used catheter size 18 can only enter about 5 cm. And the last the valve of bladder had not functioning optimally so that leakage of fluid when catheter inserted into the bladder.

The limitation is then corrected, then the second validation is performed. The results are the mannequin

is good enough and can be used as a learning aid in the Clinical Skills Laboratory. Although there is still a lack of urethral valve is still leaking smooth, which can be repaired by adding water tape.

The advantages and limitations of this mannequin are shown in Table 1.

Table 1. The difference of standardized and low cost male catheterization mannequin

	Standardized	Low cost
Advantages	Mannequin is standardized	Original body-like anatomical design Lighter weight Portable Easy to maintain Production is easier and faster breaking parts Low production cost
Limitations	Expensive Difficult to maintain	Smooth leak in the urethral valve

DISCUSSION

First mannequin developed for learning purpose was cardiopulmonary resuscitation, which was called Resusci-Anne. The mannequin was developed in the early 1960s⁶. Nowadays, there are several research about developing low fidelity mannequin as learning media^{7,8,9}.

Low fidelity mannequin can be used as learning media. Munshi et al said that high fidelity is not always greater than lower-fidelity. The result is depend on the type of task and the learner's level¹⁰. Conlon et al stated that there is no difference in test scores or perceived instructor or course quality among the groups who get low fidelity, mid fidelity and high fidelity mannequins¹¹.

Mannequin are created to be simple for used. This mannequin is built from low cost and easy to find material. Alike with Kumaresan et al who developed simplified suturing model from three easily available materials⁷. Another advantages are easier maintenance than standardized mannequin. maintenance becomes easier because when the mannequin is damaged, it can be replaced on the damaged part only. Moreover, It has light weight and portable.

CONCLUSIONS

Mannequin produced from this research is a low cost and high technology product that can be use as learning media in clinical skills learning. The anatomical design is

body-like and the sense obtained in the catheter insertion procedure has approached the original, therefore this mannequin can be used as a learning media in Clinical Skills Laboratory.

As the continuation of the research, future research needs by evaluating the usability of mannequin by students.

New Approach for Referral Preparation to the Health Care Center in Denpasar City and Bogor Regency

Ni Komang Yuni Rahyani¹, Gusti Agung Ayu Budi², Wayan Dian Ekayanti²

¹Midwifery Department Polytechnique of Health, Ministry of Health, Diploma 4 Study Program, Jalan Raya Puputan Nomor 11 A Renon Denpasar, Bali, Indonesia, ²Midwifery Department Polytechnique of Health, Ministry of Health, Diploma 3 Study Program, Bogor City, West of Java, Indonesia

ABSTRACT

Knowledge, attitudes and skills of pregnant women to recognize danger signs during pregnancy to postpartum period and newborn baby is a strategic effort to prevent maternal and infant mortality. The aim of the study was to find out the results of guidance interventions for pregnant women and husbands using video media, pictorial fans with five finger signs, pocket books and maternal and child health books between before and after guidance at three Health Centers in Denpasar City and Bogor Regency. The study design was quasi-experimental with nonrandomized pretest-posttest with control group design. The research subjects were 204 pregnant women in the three intervention groups who had fulfill inclusion and exclusion criteria. The intervention group on the subject was divided into interventions 1 (video media, fans with five finger signs and and maternal and child health books). Group intervention 2 (pocket books, fans with five finger signs and maternal and child health books) and control groups (maternal and child health books). The instrument used was a questionnaire containing the socio demographic characteristics of the subject, knowledge, attitude and observation of skills. The results showed that there were differences in the scores of knowledge, attitudes and skills in the intervention among groups 1 and 2 ($p < 0.05$). The multivariate test results showed that there were four variables that consistently affected the skills score of pregnant women significantly including guidance intervention, maternal occupation, income and residence ($p < 0.005$). It is necessary to consider the awareness of midwives at the health center to innovate in order to increase alertness and early detection through family-based empowerment.

Keywords: *danger signs guidance, pregnancy, health center, empowerment*

INTRODUCTION

According to estimates from world health organizations or the World Health Organization (WHO), as many as 358,000 maternal deaths occur every year (WHO,¹ and as many as 88-89% of these deaths can be avoided. The attitudes of health workers (especially midwives and doctors), besides motivation, knowledge and practice are other factors that influence the dynamics of the need for services that forming an important basis for improving maternal and infant health^{2,3}. The maternal mortality rate (MMR) in Indonesia according to data from the Indonesian Demographic and Health Survey (IDHS) in 2012 was 359 per 100,000 live births. The MMR is much higher compared to the 2007 IDHS results of 228 per 100,000 live births.

Maternal and newborn health conditions still need serious attention from various parties, not only in Java, but also in Bali. Thus, basic efforts are carried out by midwives in order to prevent death and illness in mothers and children through efforts to increase the knowledge and awareness of pregnant women and families regarding danger signs to mothers and infants. This effort has a large impact to prevent late referrals, especially the delay in recognizing problems that generally cause delays in making decisions and referring to health facilities⁴.

Maternal mortality rate in Denpasar City fluctuating quite significantly, up to 2014 MMR had been reduced to 16.1 per 100,000 live birth but increased back in 2015 and 2016. Maternal mortality rates in the Denpasar City in 2016 (54 per 100,000 live birth) still lower than the

target of the Denpasar City Health Office Strategic Plan in 2016 (100 per 100,000 KH). During 2016 in Denpasar City there were 7 maternal deaths consisting of 5 deaths of pregnant women and 2 during delivery. All mothers die in health facilities (hospitals). Four maternal deaths in Denpasar City are caused by Non Obstetric Disease, namely 2 people due to heart disorders, 2 people with dengue syock syndrome.

The main objective of this research is to compare the skills of pregnant women and their husbands / families regarding danger signs to pregnant women and infants to prevent delays in obtaining appropriate care between before and after guidance. In this study, personal guidance methods were used in the two intervention groups and one control group. Guidance media is using videos, fans with five fingers on the left and right hand regarding danger signs picture, pocket books and maternal and child health books.

We need to know the most appropriate approach to increase knowledge, attitudes and skills of pregnant women and families to prevent delays in recognizing problems and seeking help.

MATERIALS AND METHOD

The study design was quasi-experimental, pretest-posttest control group design. Respondents were divided into two groups, namely the control group and the treatment group (1 and 2). The control group (pregnant women in South Denpasar II and Ciomas) were given guidance according to the MCH books at the health center or Puskesmas. Intervention group 1 (Puskesmas I Denpasar Timur and Ciri Mekar) were given guidance using video media, fans with five fingers on the left and right hand regarding danger signs picture and maternal and child health/MCH books. Intervention group 2 (Puskesmas II Denpasar Barat and Sukaraja) given guidance using pocket books and fans and MCH books. The sample size in the control and treatment groups will be calculated according to the population of second trimester to third trimester of pregnant women in selected health centers in Denpasar City and Bogor

Regency, which amounted to 34 pregnant women in each selected health center or 204 pregnant women in health center. Conducted pretest and posttest for pregnant women regarding danger signs for pregnant women and newborns. Data collection is carried out for three months (July to September 2017).

Pregnant women and husbands who were involved in intervention groups 1 and 2 were given a pretest before guidance. In the control group, pregnant women were given a pretest and were then asked to read maternal and child health books regarding danger signs and preparation for referrals. The time taken from the pretest to posttest is one month. Guidance in the intervention group and the control group was carried out after the pretest 3 meetings for one hour at each meeting. Guidance is carried out by the MCH management midwives who have been trained in the selected health care.

Data analysis was univariate, bivariate and multivariate analysis. Univariate analysis by calculating the mean. Bivariate analysis to analyze the relationship between independent variables and dependent variables, the intermediate variable with the dependent variable using paired t test and chi square analysis. Multivariate analysis to analyze the relationship between all research variables using multiple regression tests and modeling.

RESULTS

The homogeneity test shows if the respondent characteristics are generally homogeneous ($p > 0.05$). There were differences in the pretest and posttest scores in the intervention group on the score of knowledge, attitudes and skills ($p < 0.05$) except in the control group did not show differences in the skill score ($p > 0.05$). The results showed that if intervention 2 had a significant difference in knowledge, attitudes, and skills scores when compared with intervention group 1 and control group. In the table 1 below, the results of differences in pretest and posttest scores were displayed on the knowledge, attitudes and skills of pregnant women.

Table 1. Differences in Pretest and Posttest Scores between Intervention and Control Groups (n=204 pregnant women)

		adjusted variance	z	p-value
Knowledge	Intervention group			
	1	24650.75	2.357	0.18
	2	24528.00	4.431	0.000
	Control	25068.00	2.239	0.025
Attitude	Intervention group			
	1	26258.38	1.858	0.063
	2	26451.13	3.034	0.002
	Control	25909.38	1.948	0.051
Skill	Intervention group

The multivariate test results using general linear model (GLM) analysis showed that there was no significant relationship in the intervention group and maternal age with a knowledge score ($p > 0.05$). There was no significant relationship between intervention and maternal occupational factors with attitude scores ($p > 0.05$). Consistently intervention, maternal occupation,

income and place of residence were significantly associated with maternal skills scores regarding danger signs for mothers and newborns baby and neonates ($p < 0.05$). The table 2 below shows the results of the analysis between the intervention, the work of the mother, income and place of residence with the skill score.

Table 2. Results of General Linear Model Analysis between Independent Variable, Intermediate and Skill (n=204 pregnant women) in 2017

	Skills				AIC
	coeff	z	p	95% CI	
Intervention group					7.275

Source : Primary data analysis (2017)Discussions

In general the characteristics between the intervention groups were not different ($p > 0.05$). Differences were found from the characteristics of income or socio-economic level, residence, and means of transportation used by subjects to health facilities ($p < 0.05$). The sociodemographic characteristics of the subject can affect service quality as measured by knowledge, attitudes and skills the subject knows and manages the problems faced.

According to the World Health Organization¹, there are several determinants that influence client visits to health facilities, especially to obtain reproductive health services, including: financing factors or ability to pay, distance factors to health facilities, client knowledge, education level and social status economy. Agreeing with the results of a study in Ethiopia by Tesfahun, Worku, Mazengiya, Kifle⁵, that maternal health care utilization is influenced by accessibility factors, socio-cultural beliefs, individual attitudes and health seeking behavior.

There were differences in the pretest scores of knowledge, attitudes and skills between the intervention group 1 and 2 and the control group significantly ($p < 0.05$), although the results showed that the most significant difference was in the intervention group 2. The skill score showed that only the control group who

did not show a significant difference ($p > 0.05$) when compared with intervention group 1 and 2. This was caused by factors of resistance or design invalidity, including: the interaction of the given test, the interaction of the results of the selection with the results and the existence selection with the results and the existence selection bias⁶.

The selection bias in terms of the invalidity of interaction factors from the intended test is that there is a weakness of the video media in the intervention group 1 due to the availability of a video watching device at home that is not shared by all subjects in the group, in addition to the obstacles that explain content or content of the video. Another problem with invalidity is that the characteristics of the subject from the beginning have been different, especially in the intervention group two which shows if the initial results of the pretest are much higher than the other groups⁶.

There was no significant difference between the pretest and posttest scores according to the characteristics of the transportation facilities and the distance to the health facilities with scores of knowledge, attitudes and skills ($p > 0.05$). Knowledge, attitudes and skills of individuals or subjects are influenced by socio-economic factors, values that are believed, and intention to behave. Different results were obtained by Tesfahun,

Worku, Mazengiya, Kifle⁵, that the factors that influence the utilization of postpartum care are: time constraints, transportation costs, shelter, distance from home to health facilities, previous ANC history and ability health workers provide solutions to problems faced.

The results of multivariate tests using GLM were obtained if there was only a very significant relationship between intervention, maternal work, family income, and place of residence with a skill score ($p < 0.05$). The results of the study by Amenu, Mulaw, Seyoum & Bayu⁷ and Salam, Lassi, Das and Bhutta⁸ that positive health behaviors are influenced by various factors, including: complex phenomena related to availability, quality, service financing, structure social, health beliefs and characteristics of clients or service users⁹. The success of communication between midwives and clients or pregnant women greatly influences patient / client satisfaction, increases understanding, increases mutual trust and increases the ability of pregnant women and families in decision making¹⁰. Mother's knowledge is not directly affected by the number of ANC visits due to differences or gaps between the ability of officers / midwives and the limited information provided by midwives regarding danger signs to mothers during pregnancy to postpartum, newborn baby and neonates¹¹⁻¹⁵. The husband's education contributes to the participation of husbands in delivering mothers to health facilities and helping to make decisions more precisely and quickly¹⁶.

CONCLUSION

The use of media and interesting information delivery techniques are determinants of the success of training. It is necessary to consider the characteristics of the research subjects, such as the availability of VCD devices, other communication media in the form of mobile phones for intervention groups that receive training using video media.

ABSTRACT

Dengue Fever is a worldwide health problem including Indonesia. Samarinda, as the capital city of East Kalimantan Province, has incidence of dengue fever every year. Generally, *Aedes sp* found inside and outside of the houses. Prevention of dengue fever could be done by some ways. One of alternative is utilization of ovitrap as a trap of larvae. This study would like to comprehend the difference existence of *Aedes sp* larvae based on locating inside and outside of the house. Research design was quasi-experimental design posttest only used control group without randomization. Ovitrap has been placed inside and outside of the house in 30 samples of the houses. Larvae existence monitored after a week of ovitrap locating. Observation result compared between ovitrap locating inside and outside of house. The research result showed that there was a difference existence of *Aedes sp* larvae based on ovitrap location (p value: 0.000 < 0.05, significantly different). *Aedes sp* larvae found more in the outside of the house of ovitrap location. Ovitrap could be used as the alternative of survey device of *Aedes sp* larvae existence in the dengue fever high risk area to prevent and control the density of *Aedes sp* in the community environment.

Keywords: Ovitrap, *Aedes sp* Dengue Fever

INTRODUCTION

Dengue fever is a public health problem in the world.. There were 2.5 billion of population (40%) was located in the high risk area of dengue fever. There were 500.000 cases and 22.000 mortality every year. Population of South East Asia country placed about 70% of citizen with high risk of dengue fever¹. Indonesia is an endemic area of dengue fever in the South East Asia area . Based on the Indonesian Health Profile in 2014, there were 100.347 cases with 907 mortality cases happened in 34 provinces in Indonesia (IR: 39.80/100,000 citizens, CFR : 0.90%). East Kalimantan Province was a province with the highest cases of dengue fever in 2014 with 4.752 cases and 55 mortality cases (IR: 135.46/100,000 citizens, CFR: 1.16%). In 2012-2014, there were 11.612 cases². Samarinda is the capital city of East Kalimantan. Report from Department of Health of East Kalimantan showed that in 2014, Samarinda was a city with the highest incidence with 1147 cases (IR : 118.7%, CFR :1.24%). One of area with the incidence was Harapan Baru Sub District. The data of Department of Health

Samarinda 2015 showed that Harapan Baru Sub District had increasing of dengue fever cases in 2013 – 2015 which included 8 cases (2013), 45 cases (2014) dan 87 cases (2015).

Geographically, *Aedes sp* mosquitos found more in the city and related to the water storage building. *Aedes sp* larvae found more in the indoors rather than outdoors. Flower vase, water storage bucket, bathroom water box, and water storage teapot were some indoors places for mosquito's development. Outdoor places included former wheel, former bottle, former glass, cuts of bamboos, and bird drinking storage and other water containers which can save the rain water could be some places for mosquito's development. The dengue fever controlling could be done by the government and community independently. It caused by the dengue fever could decrease the quality of public health. There are some ways to control the dengue fever include chemical control used larvacide and imagocide, biological control used the microorganism care through the larvae eater, environmental control and self protect used *repellent*³.

Using ovitrap (egg trap) could be done to decrease the risk of dengue fever in the environment. Utilization of ovitrap included a black water container given by enough water and closed by the filter paper. The ovitrap then placed outside and inside of the house in the dark and moist environment.

The result studies about ovitrap showed that ovitrap could be used for monitoring and controlling *Aedes sp* development in the environment. Ovitrap is an economic, specific, and sensitive controlling alternative to the sampling in the wider area. Positive larvae ovitrap of *Aedes sp* could be used as the surveillance device to indicate the real existence of *Aedes sp* mosquitos in the real environment. The decrease of density of *Aedes sp* mosquito will influence to the decreasing of dengue fever virus transmission and finally decrease the risk of incidence of dengue fever in the community.

MATERIAL AND METHOD

This research was analytic research used quasy experimental approach with posttest only control group design. The research aim was to comprehend the difference existence of *Aedes sp* larvae based on locating inside (indoors) and outside (outdoors) of the house. Population of this research was 69 houses in area of household 22. Sampling technique used purposive sampling with inclusion and exclusion criteria. Samples were 30 houses. One ovitrap located inside and outside of 30 houses. Observation did after a week ovitrap locating through larvae checking at ovitrap inside and outside of the house. Instrument used on this research was observational paper of *Aedes sp* larvae existence. Larvae checking did by the larvae monitoring group at the research location. The result of observation of larvae at ovitrap then compared between the result of ovitrap inside and outside of house. Data analysis used *Chi Square* test to compare the difference between two nominal scale variables.

RESULTS

Ovitrap used in the black bucket filled by half of water and closed by the curved filter fabric touch the water surface in the bucket with ovitrap then tighten by the rope in the outside. This study placed the 60 ovitraps in the 30 samples of houses. Each of them divided to 30 ovitraps outside the house and 30 ovitraps inside the house. Ovitrap has been placed in the potential place for *Aedes sp* mosquito's development. Indoors placing was

inside of the rest room or the kitchen as the dark place without disturbing the house owner activity. Outdoors placing was around the dark and moist garden without disturbing the daily activity. After a week of ovitrap placing, it has been examined for the larvae existence at the ovitrap inside or outside of the sample's house.

Regarding to the observation, the outdoors ovitrap with larvae inside found in the 24 ovitraps between 30 ovitraps. In the indoors ovitrap, there were 10 ovitraps with larvae inside between 30 ovitraps. *Chi Square test* showed that *Asymp.Sig.(2-sided) Pearson Chi-Square* was $0.000 < \alpha : 0.05$, H_0 was rejected. It can be concluded that there was significance difference of *Aedes sp* larvae existence based on ovitrap locating inside and outside of the house in Harapan Baru Sub District Samarinda City. Outdoors ovitrap had more larvae compared with the indoors one. It indicated that the *Aedes sp* mosquito's population more found in the outside of the house rather than inside of the house in Harapan Baru Sub District Samarinda City.

DISCUSSION

Indonesia is the endemic country with the high number of dengue fever cases. Outbreak has been happened during 3-5 years in Indonesia that caused the mortality especially for children⁴. From the past till the recent, there was no any vaccination found to the dengue fever disease. The best prevention of dengue fever is controlling the vectors of *Aedes sp's mosquitos*⁵. High density population, poor sanitation, and the easiness of transportation accessibility from one place to the other place will help the *Aedes sp* mosquito's distribution to the human environment.

Entomology survey used the ovitrap mostly used to detect the existence and distribution of the *Aedes sp's mosquitos* in the community environment. Mosquito's survey used the ovitrap was more economically efficient, sensitive and reliable to detect the existence of *Aedes sp's mosquitos* rather than the container survey⁶. Ovitrap utilization will be effective in a week. If it placed more than a week, the ovitrap could be a new place of *Aedes sp* mosquito's growth and development. Ovitrap placing could be used as the accurate device to observe the *Aedes sp* mosquito's growth in the community household⁷.

The study result based on the larvae observation in the ovitrap locating showed that the ovitrap with the positive larvae inside were found more in the outdoors

rather than indoors. The result was the same with the research of ovitrap locating in Bandung city which found that *Aedes sp* found more in the outside rather than inside of the house⁸. The other study found that there was *Aedes sp's mosquito's* egg more in the outside of the house in the Kranji village of working area of the East Purwokerto Public Health Center II⁹. The other supporting study was a study in the Uttarakhand State in India which found from the surveillance of ovitrap that the highest index number of ovitrap is in the outside of the house placing rather than in the inside of the house¹⁰.

The different findings found that the total analysis of the *Aedes sp* mosquito's egg from the ovitrap observation in the indoor and outdoor were not different significantly which means that *Aedes sp* mosquito's larvae indoor and outdoor was not different. In fact, there was found that amount of egg at the ovitrap which is placed outdoor was more than the indoor. In the indoor setting, ovitrap has been placed in the bedroom, kitchen, restroom, and the other closed rooms. Outdoor placing involved areas around the garden such as in the flower vase, around the trees, near the hedge or the other open places. In the outdoor ovitrap, it found that more larvae of *Aedes sp's* mosquito, it caused by the more amounts of the storage room and animal's stable. Those condition help the *Aedes sp's* mosquito to find the food source (blood animal) and made it as suitable place for growing an developing of *Aedes sp's* mosquito¹¹.

The amount of ovitrap which contain the *Aedes sp* larvae in the environment caused by the location of study was the area with the high incidence of dengue fever. Generally, amount of the egg will found in the area with high incidence of dengue fever rather than the lower one¹². Moreover, the *Aedes sp* larvae existence found more in the outside of the house caused by some factors. One of them is the community environment condition which increased the *Aedes sp's* mosquito's growth. Study location was an area with the swamps which has high moist condition. The study location bordered with the forest that contained of many trees for mosquito's place. The other factor was the community habit to save the rain water in to use in the daily need. *Aedes sp's* mosquito's places for growth were the water container place inside or around the house which is not directly touch the sands. That kind of place such as the drum, bucket, water box, banana stem, cuts of bamboo, piece of coconut shell, flower vase or the former can around the house¹³.

The other condition that could influence the *Aedes sp's* larvae existence was the high density in the study location due to the city area which only had the short distance between one house to the other houses. The distance between the buildings was a factor that could influence the mosquito's spread. The more the distance between the buildings, the more the mosquito could spread in the community environment^{14,15}.

The other result form the other study found the different result, which showed that from the ovitrap observation, the larvae found more in the inside of the house more than the outside of the house. The *Aedes aegypti's* mosquitos found more inside of the house and the *Aedes albopictus* found more in the outside of the house⁶. Studies about utilization of ovitrap in Malaysia showed that most of *Aedes albopictus* larvae positive found in the environment outside of the house with the ovitrap raneg index (37-78%) compared than the *Aedes aegypti* larvae index (8-47%)¹⁶. *Aedes sp's* mosquito had a habit which prefers to take a rest in the dark, moist, and hide place. It could be affected to the placing of mosquito's egg of *Aedes sp*^{17,18}.

Dengue fever prevention and controll in an area should be done quickly with the right method. The first step to determine the prevention effort from the government and the community was entomology survey used the ovitrap. Ovitrap is a simple device which effective and efficient to find the existence of *Aedes sp's* mosquitos in the community residence. By finding the existence of the *Aedes sp's mosquito's* existence inside and outside of the house hopefully could help the community to determine the independent prevention efforts to decrease *Aedes sp's* growth. The effort hopefully could decrease the *Aedes sp* mosquito's spread and decrease the risk of dengue fever in the community environment.

CONCLUSION

Regarding to the research result, there was a difference of *Aedes sp* larvae existence in the environment based on the ovitrap locating inside and outside of the house. *Aedes sp* larvae found more in the outside of house compared with the inside of house. Generally, the supporting studies showed that the *Aedes albopictus* was a common type found in the outdoors. *Aedes aegypti* found more indoors. *Aedes sp* larvae Existence which is found outside of the house could be influence by the local environment. Ovitrap could be used

as the alternative device for *Aedes sp* larvae existence survey, especially in the high risk area of dengue fever. Moreover, the ovitrap could be used for controlling the *Aedes sp* mosquitos development which worked as the effective and efficient trap of larvae to be used with the community. The efficient utilization of ovitrap could decrease the population of *Aedes sp* mosquitos in the environment and decrease the risk of dengue fever cases.

Ethics approval and consent to participate

This study did not involve living things (humans or animals) directly in the experimental research conducted. But to fulfill the research ethics in the field, informed consent was provided to the research location community to give permission for the implementation of the research.

Competing Interests: The author have no conflicts of interest to disclose

ABSTRACT

Sleep quality is a measure of where the person is obtained the ease in starting and maintaining sleep, sleep quality of someone can be described with a long sleep and perceived grievances while sleeping or after waking up sleep. Sleep patterns that are less good or less sleep will be bad for psychics one of them is declining student learning motivation, thought processes and decrease in brain activity. The motivation of learning influenced several factors such as physical, psychological factors, social and non-social. This research aims to know the relationship of sleep quality with students' learning motivation in Nursing Academy 17. The type and design of the research is quantitative with cross sectional approach. The number of population are 39 respondents. The technique of sampling method is the total sampling, and the data collection using the questionnaire. The analysis of this study uses univariate and bivariate analyses. The Chi Square test results show the value of $0.005 p \alpha \leq 0.05$, so it can be concluded that there is a relationship of sleep quality with the learning motivation of students in Nursing Academy 17 of Karanganyar. Someone with a good quality of sleep has a high learning motivation, but a bad sleep quality did not result in a decline in students' learning interest significantly.

Keywords: *quality of sleep, motivation, motivational learning*

INTRODUCTION

Rest and sleep are basic needs that are very and needed for human health. Everyone needs rest and sleep so that the body can function normally. When we rest and sleep the body will do the recovery process so that when we wake up the body condition becomes optimal and can carry out daily activities^{1,2}.

Several factors that influence the quality and quantity of sleep are physiological factors, psychological factors, environment and lifestyle. From the physiological factors have an impact with a decrease in daily activities, weakness, fatigue, decreased immune system, and instability of vital signs, while psychological factors impact depression, anxiety and difficult to concentrate^{3,4}.

Learning motivation is internal and external encouragement to students who are learning to conduct behavior, in general with several indicators or supporting elements. These indicators include: successful desire

and desire, encouragement and needs in learning, hopes and aspirations for the future, appreciation in learning, and a conducive learning environment⁵⁻⁷. Motivation is closely related to one's desire to learn and carry out tasks in fulfilling his developmental tasks entering young adulthood. Dariyo (2008) states that young adults are those who are generally aged 20-40 years. Most young adults sleep at night an average of 6 to 8.5 hours a day, but in this case vary³. The prevalence of adults who experience sleep disorders is still high, the data from WHO (World Health Organization) $5 \pm 18\%$ of the world's population have experienced sleeplessness (Lanyawati, 2001). In Indonesia, the exact number of people who experience sleep disorders is unknown, but the prevalence in adults reaches 20%⁸

Based on Fitri Rahmawati's study of the relationship between sleep quality and student learning interest, the results of the analysis showed that there was a significant relationship between sleep quality and learning interest. These results indicate that the higher the PSQI score, the

higher the interest in learning or the worse the quality of sleep, the lower the interest in learning. However, poor sleep quality does not result in a significant decrease at student learning interest.

MATERIALS AND METHOD

This study uses a *quantitative* research design with the approach used is a *cross sectional* approach. The population in this study were students of the first grade of Nursing Academy 17 of Karanganyar, with total amount of 39 students. While the sampling technique used in this study with *total sampling* is to use the entire population of 39 students. The independent variable of this study is sleep quality while the dependent variable is learning motivation. Data collection tools in this study used a sleep quality questionnaire, *the Pittsburgh Sleep Quality Index (PSQI)*, while the learning motivation questionnaire was modified by Dewi, 2014. Data analysis consisted of univariate and biivariate analyzes. Univariate analysis is used to see each frequency distribution variable, in this study univariate analysis is presented in table form, while bivariate analysis is used to see the relationship between variables. *Bivariate* analysis in this study using *chi square* test.

RESULTS AND DISCUSSION

Table 1 Frequency Distribution of Respondents by Gender and Age

Characteristics	amount	
	Frequency (n)	Percentage (%)
Gender		
Man	8	20,5
Woman	31	79,5
Total	39	100,0
Age		
18-19	33	84,6
20-21	5	12,8
22-23	1	2,6
Total	39	100,0

Based on the results of frequency distribution in table 1, it was found that students from the first grade of Nursing Academy 17 of Karanganyar showed that 39 respondents surveyed, respondents are male respondents they are 8 respondents (20.5%) and women are 31

respondents (79.5%).

Frequency distribution results in the table 1 shows that respondents with the aged 18-19 years are 33 respondents (84.6%), aged 20-21 years are 5 respondents (12.8%) and those aged 22-23 years are 1 respondent (2.6%).

Table 2. Frequency Distribution of Respondents Based on Sleep Quality

Variable	Amount	
	Frequency(n)	Percentage (%)
Sleep Quality		
Good	17	43,6
Bad	22	56,4
Amount	39	100,0

Based on Table 2, it is known that students from the first grade of Nursing Academy 17 Karanganyar show that from 39 respondents who are researched, the respondents who have good sleep quality are 17 respondents (43.6%) and those who have poor sleep quality are 22 respondents (56.4%).

Table 3. Frequency Distribution Based on Student Learning Motivation

Variable	Amount	
	Frequency (n)	Percentage (%)
Learning Motivation		
Low	12	30,8
Medium	13	33,3
High	14	35,9
Amount	39	100,0

Based on Table 3 it is known that students' learning motivation from the first grade of Nursing Academy 17 Karanganyar shows that the respondents who have low learning motivation are 12 respondents (30.8%), and who have moderate motivation learning are 13 respondents (33.3%) and who have high learning motivation are 14 respondents (35.9%).

Table 4: Relationship between Sleep Quality and Student Learning Motivation

Sleep Quality	Learnig Motivation			Total	r	Score	P
	Low	Medium	High				
Good	1	6	10	17	0,316	10,513	0,005
Bad	11	7	4	22			
Amount	12	13	14	39			

The results of table 4 can be seen from the results of the *chi square* test of 39 samples obtained 17 respondents with good sleep quality who have high learning motivation are 10 respondents, moderate learning motivation are 6 respondents, and poor learning motivation are 1 respondent, while respondents who have poor sleep quality that have high learning motivation are 4 respondents, moderate learning motivation are 7 respondents and low learning motivation are 11 respondents.

The *chi square* test results on 39 samples produced a statistical value (X²) of 10,513 with a significant level of 0,05 which was 0,316 obtained p value 0,005 where p value <0,05. Thus it was concluded that H_a was accepted that is the relationship between sleep quality and student learning motivation. Even so, there is out the possibility that there are respondents who have good sleep quality but low learning motivation and vice versa who have poor sleep quality that high learning motivation this is because there are other factors that influence learning motivation other than sleep quality.

CONCLUSIONS AND RECOMMENDATIONS

Based on the research conducted on 39 respondents about the relationship of sleep quality with students learning motivation at Nursing Academy 17 Karanganyar, shows that respondents who have good sleep quality as many as 17 respondents (43.6%) and who have poor sleep quality are 22 respondents (56.4%) while respondents who have low learning motivation are 12 respondents (30.8%) who have moderate learning motivation are 13 respondents (33.3%) and who have high learning are 14 respondents (35.9%).

The results of the *chi square* test showed a significant relationship between the quality of sleep with student learning motivation with statistical values (X²)

of 10.513 with a significant level of 0.05, namely 0.316 obtained *p value* of 0.005 where *p value* <0.05. It can be concluded that there is a relationship between sleep quality and learning motivation of first-grade students at Nursing Academy 17 of Karanganyar.

Students should improve the quality of their sleep, so that the quality of sleep will be better so learning motivation that is still low can be improved. However, students are also expected to maintain high learning motivation and increase the spirit of learning so that the achievement will increase.

ABSTRACT

Bats are suspected as vectors of some diseases. Bat area roaming large enough and has a complex social structure makes the bat more interesting and unique to discuss the risk of disease transmission to humans and to other animals, especially from bacteria that exist in bats. The study was conducted from March 2017 to March 2018. The research sites in the southern region of Lombok Island consist of Selong Belanak, Semeti, Areguling, Kuta and Tanjung Ringgit. Bats were collected using mistnet. Bacterial data collection comes from examination of the mouth, nose, feces, and bowel bats. The identification of bacteria based on colony morphology observation. The results show that there are 14 species of bacteria isolated from 4 species of bats. Species of bacteria are *Providencia stuartii*, *Aeromonas caviae*, *Citrobacter freundii*, *Escherichia coli*, *Serratia ribidaca*, *Klebsiella oxytoca*, *Acinetobacter calcoaceticus*, *Alcaligenes xylosoxidans*, *Neisseria sicca*, *Staphylococcus aureus*, *Providencia penneri*, *Proteus vulgaris*, *Citrobacter freundii*, and *Citrobacter aerogenes*.

Keywords: Bats, Disease, Bacteria, Humans, Animals

INTRODUCTION

The existence of bats is very important for people's lives, namely as a complement to the ecosystem, for example, bats can be dispersed fruit seeds including *Anacardium sp*, *Adenathera sp*, *Ceiba sp*, *Convolvulaceae*, *Poaceae*, *Syzygium sp*, *Musa sp*, *Muntingia sp*, and *Annona sp*, pest control insects, and guano fertilizer producers¹. In addition, Wijayanti² states that bats can act as key providers of ecosystem energy (the key factor in cycle energy) for organisms that are in the cave. Related to this, caves play an important role in maintaining the existence of bats. But there are concerns about humans and animals that interact with bats and concerns about the bat population.

Bats have recently been reported to carry several diseases that are harmful to humans and animals.

According to Veikkolainen et al.³, states that bats are effective reservoirs for the presence of human pathogenic bacteria. Some of these diseases are carried by several organisms or bacteria that live in the body of the bat. Microbes are one that is in the body of a bat. The presence of microbes can have a beneficial and detrimental impact. The beneficial impact on bats as revealed by Hyot, et al.⁴ states that bacteria found naturally in bats can inhibit the growth of *Pseudogymnoascus destructans*. So that it can protect bats from white-nose syndrome (White Nose Syndrome) and some other diseases among influences for individuals, populations, and species. Adverse effects of bats can cause several diseases to humans or other animals. Common types of bacteria found in bats are *Bartonella mayotimonensis*^{3,5}, *Pasteurella sp*, *Leptospira sp*, *Salmonella sp*, and *E. coli*⁶.

The abundance of microbes in bats is quite high, almost all types of bats have species of bacteria with various species that are diverse and even the same. This is caused by the bat's life behavior which consists of many colonies in one perch area. Bats can infect humans and animals because they have a close relationship. For

Corresponding author:

Siti Rabiatal Fajri

Email: sitirabiatalfajri@ikipmataram.ac.id

example, the human interaction that enters the cave where the bat habitat is located, besides the presence of bats that are close to human settlements and the tendency of humans to use guano as biological fertilizer^{7,8}

Based on the description above, researchers feel interested in conducting research on the risk of transmission of diseases from bat bacteria to humans and animals. This research was carried out considering the bat spread is quite broad and very close to the daily lives of humans and animals. This study identified bacteria in several parts of the body of the bat including the mouth (saliva), feces, nose (nasal fluid), the whole body.

MATERIAL AND METHOD

Research Site

The study was conducted from March 2017 to March 2018. The location of the sampling was carried out in the southern part of Lombok Island, the location determination was based on the abundant distribution of bats in the area (9). In addition, the sampling location is a tourist area located on the island of Lombok. The sampling locations included Mount Prabu, Selong Belanak, Semeti, Areguling, Kuta and Tanjung Ringgit. The following is a map of the sampling location in Figure 1.

Figure 1. Research Site

Observation of Microba

Examination of microbial samples found in bats by examining several parts of the body from bats includes mouth swabs (saliva), feces, nasal cavity (nasal fluid) and smears throughout the body. Identification of bacteria can be carried out based on colony morphological observations, microscopic observations using various staining reactions and biochemical tests. Colony morphology observations include observation of the shape and color of colonies¹⁰. Gram staining is used to determine bacterial morphology and distinguish between Gram-positive bacteria and Gram-negative bacteria. Furthermore, bacteria can be identified through various biochemical tests, including carbohydrate fermentation

test, Triple Sugar Iron Agar (TSIA) test, motile test, indol test, citrate test, Methyl Red (MR) test and Voges Proskauer (VP) test.

RESULTS

Bacterial examination was carried out on 4 species of bats obtained in 6 locations in the southern part of Lombok Island. Examination of bacteria in 4 bat species is based on the abundance of these species in the southern region of Lombok Island based on Fajri et al⁹ report. 4 species of bats include *Eonycteris spaleae*, *Hipposideros diadema*, *Rhinophoma microphylum* and *Rhinolopus simplex* (Figure 2).

Figure 2. Species of bats; a. *Hipposideros diadema*, b. *Rhinolopus simplex*, c. *Eonycteris spaleae* and d. *Rhinophoma microphylum*

Based on the results of examination of bacterial species in 4 species of bats, there were 14 species of bacteria that were identified. The species include *Providencia stuartii*, *Aeromonas caviae*, *Citrobacter freundii*, *Escherichia coli*, *Serratia ribidaca*, *Klebsiella*

oxytoca, *Acinetobacter calcoaceticus*, *Alcaligenes xylosoxidans*, *Neisseria sicca*, *Staphylococcus aureus*, *Providencia penneri*, *Proteus vulgaris*, *Citrobacter freundii*, and *Citrobacter aerogenes*. Example of a bacteria colony in Figure 3.

Figure 3. Colony Bacteria

Eonycteris spaleae is one of the bats that have abundance high enough in the southern part of Lombok Island, its presence in all sampling sites. Considering that this research is interested in identifying bacteria in some parts of the body. based on the results of the study there were 5 bacteria that were identified among themProvidencia stuartii, Aeromonas caviae, Citrobacter freundii, Eschericia coli, and Serratia ribidaca. Hipposideros diademais one of the bats whose existence is found in the Tanjung Ringgit cave and the Buwun cave. This bat successfully identified 6 species of bacteria among themKlebsiella oxytoca, Providensia stuartii, Acinotobacter calcoaceticus, Alcaligenes

xylosoxidans, Neisseria siccaand Eschericia coli. Rhinophoma microphylumis a new record species on the island of Lombok¹¹. the existence of this bat is found in the Buwun cave and the Gale-gale Bangkang cave. this study managed to find 2 species of bacteria in the body of Rhinophoma microphylum. the bacterial species include Staphylococcus aureusand Providensia penneri. Rhinolopus simplex is a bat found in Gale-gale Bangkang cave and Buwun cave. from this bat managed to identify 3 species of bats among themProteus vulgaris, Citrobacter freundii, and Citrobacter aerogenes. More details can be seen in Table 1.

DISCUSSION

Based on the results of the study, there were 14 species of bacteria that were identified from several parts of the body of the bat. The goal is to find out what kind of bacteria there are in some parts of the bat’s body.

Thus, it can be a reference if there is an interaction with bats in their habitat or in human habitation. Bacteria that have been identified are harmful bacteria that can cause disease in organisms that interact with them, for example, humans or other animals. The presence of bacteria in bats comes from food sources and bat-foraging habitats, even

though he knows very little about this. Bacteria found in bats can become reservoirs and zoonotic pathogens in humans and other animals.

Bacteria in this study that are commonly found in bats are *Citrobacterfreundii*, *Escherichia coli*, *Klebsiellaoxytoca*, *Proteusvulgaris*, *Providenciapenneri*, *Providenciastuartii*, and *Staphylococcus aureus*. The bacteria have also been reported in bats as reported by Allocatiet⁶ and Muhldorfer¹². In addition, Muhldorfer¹³ states that there are several pathogenic bacteria found in the body of bats that can cause disease in humans and other animals including *Pasteurellasp*, *Salmonella sp*, *Escherichia coli* and *Yersinia spp*.

Citrobacterfreundii is an opportunistic bacterium and is also a nosocomial pathogenic bacterium, capable of causing neonatal meningitis among other diseases^{14,15,16}. *Escherichia coli*, a pathogenic bacterium, has also been reported in other caves visited by humans, such as Lascaux Cave in France¹⁷, six caves in northern Alabama and northwest Georgia, USA¹⁸, and diverse caves in Mizoram in northeast India¹⁹. *Klebsiellaoxytoca* is a bacterium that can cause colitis and sepsis, this bacterium also has human defilements (20). *Proteus vulgaris*, generally distributed in soil and water is responsible for approximately 90% of all *Proteus* infections in humans, especially in the urinary tract. Members of *Providenciasp* are also bacteria commonly found in soil and in water, can cause opportunistic infections in humans, including the urinary tract and eyes, as well as causes of diarrhea, abdominal pain, fever, and vomiting²¹. *Staphylococcus aureus* is one of the bacteria that cause infections in the skin and bacteremia (Sepsis). This bacterium has been reported in *E. Helvum* bats in several regions in Nigeria, Africa^{22,23}.

The types of bacteria that have never been found before in the body of the bat are *Acinetobactercalcoaceticus*, *Neisseria sicca*, *Serratia ribidaca*, and *Aeromonascaviae*. This type of bacteria is very common in humans and some other mammals. *Acinetobactercalcoaceticus* or *Acinetobacterbaumannii* are known as nosocomial pathogens that can cause skin infections in humans. The severe potential caused by *Acinetobacterbaumannii* is bacteremia and pneumonia²⁴.

Neisseria sicca is a commercial bacterium that is commonly known to be in the upper respiratory tract and is very rarely found to cause meningitis, endocarditis or

bacteremia^{25,26,27}. In addition, *Neisseria sicca* can cause a decrease in endurance with cutaneous erythematous nodules. This report adds to growing evidence that these bacteria can cause disseminated infections and cutaneous manifestations²⁸.

CONCLUSION

There are 14 species of bacteria isolated from 4 species of bats. Species of bacteria are *Providencia stuartii*, *Aeromonas caviae*, *Citrobacter freundii*, *Escherichia coli*, *Serratia ribidaca*, *Klebsiella oxytoca*, *Acinetobacter calcoaceticus*, *Alcaligenes xylosoxidans*, *Neisseria sicca*, *Staphylococcus aureus*, *Providencia penneri*, *Proteus vulgaris*, *Citrobacter freundii*, and *Citrobacter aerogenes*. The risk of transmitting the disease to humans or to other animals is quite high. This can be seen from the life cycle of bacteria that involves humans and other animals as hosts and intermediate hosts in completing their life cycles. Besides that, some bacteria are also able to cause harm to the body of the bat itself so that it will have an impact on the reduction of the bat population in every habitat.

ABSTRACT

Islamic boarding school is one area that has a high incidence of scabies. The poor personal santri hygiene is one of the causes of the spread of scabies. Santris' knowledge needs to be increased to reduce the spread of scabies in Islamic boarding school. The aim of the study is to determine the effectiveness of health education on improving santris' knowledge about the dangers of scabies in Islamic boarding school Al Muftadi'ien Bahrul Ulum Tambak Beras Jombang. The design of the study is pre-experimental pre-test - post-test control group design. The population was all male students who live in Islamic boarding school Al Muftadi'ien Bahrul Ulum Tambak Beras Jombang as many as 60 people, with a sample of 30 people obtained by accidental sampling. The independent variable is health education, while the dependent variable is known. The health promotion methods were used for the health education by using video as the media, while to explore the knowledge about the danger of Scabies, it used the questionnaires that were tested the validity and reliability. The data analysis used Wilcoxon matching pairs. The results obtained before the health education of the danger of scabies, most students have a sufficient category of knowledge as many as 20 people (66.6) and improved to 19 people (63.3%). It is concluded that there is an influence of health education knowledge of students about the dangers of scabies at Islamic boarding school Al Muftadi'ien Bahrul Ulum Tambak Beras Jombang.

Keywords: health education, personal hygiene, scabies;

INTRODUCTION

Scabies is a parasitic skin disease caused by *Sarcoptes scabiei*, that is characterized by strong local itching and non-specific skin changes patterns^{1,2}. The Indonesian Ministry of Health showed that the prevalence of scabies in Indonesia reached 4.6% - 12.95 the % year 2012 and ranked in the third from 12 most common skin diseases. In 1989 and 1990, the prevalence of scabies was 6% and 3.9% (Ministry of Health of the Republic of Indonesia, 2004). The prevalence of adolescents and children for scabies tends to be high at around 6% - 27% of the

general population and adolescents (Sungkar, 2005). Of the 10 biggest diseases in Indonesia, Scabies ranks in the third position with the prevalence of 4.60-12.95%.

Islamic boarding school is one of the environments where scabies is often found. Research by Dan Ratna, I., Rusmartini, T., Wiradihardja³ stated that the incidence of scabies at the Sukahideng Islamic Boarding School in Tasikmalaya Regency is quite high (27.21%). There are various causes of the scabies occurrence underlying the outbreak of the disease in the boarding school. Starting from the low knowledge of the students, students attitudes that tend to not support Clean and Healthy Life Behavior (PHBS), the hygiene issue, and the student's behavior that facilitate the transmission of scabies in the boarding school.

The preliminary study conducted by researchers at Al Muftadi'ien boarding school found that the 15 santri is 100% experienced Scabies. The results of interviews with the respondents revealed that they often take turn using towels, lending the towels and other personal items. In addition, they assume that scabies is a natural disease experienced by them and does not become a burden for them. In fact, they are proud if they have experienced it, because of the wrong perception of students. With the scabies disease, religious knowledge has penetrated to the santri. The lack of knowledge of scabies is one of the important backgrounds to take an action. Of various brief information from some of the santri, researchers consider the need for health education to increase the students' knowledge. From the background above, we aim to examine the effectiveness of health education on improving students' knowledge about the dangers of scabies at Islamic boarding school Al Muftadi'ien Bahrul Ulum Tambak Beras Jombang 2017

MATERIALS AND METHOD

This study is a pre-experimental study pre-test post-test control group design. The population is all male students who live in Islamic boarding school Al Muftadi'ien Bahrul Ulum Jombang, as many as 60 people, with a sample of 30 people obtained by accidental sampling. The independent variables are health education, while the dependent variable is known. The health promotion methods were used for the health education by using video as the media, while to explore the knowledge about the danger of Scabies, it used the questionnaires that were tested the validity and reliability. The data analysis used Wilcoxon matching pairs.

RESULTS

Table 1. Distribution of frequency based on students' age at Islamic boarding school Al Muftadi'ien Bahrul Ulum Tambak Beras Jombang 2017

Age (Year)	F	%
Early adolescents (10-15)	22	73,3
Mid adolescent (16-20)	8	26,7
TOTAL	30	100

Table 1 shows that most students are in the category of early adolescents (10-15 years) of 22 people (73.3).

There is an influence of health education on the knowledge of students about the dangers of scabies at Islamic boarding school Al Muftadi'ien Bahrul Ulum Tambak Beras Jombang (p value 0.001).

DISCUSSION

Before the health education, most of the santri were fairly knowledgeable and few were still lack of knowledge about the dangers of scabies. This data shows that students' understanding of the dangers of scabies is still in below category. After given the health education, there was an increase in knowledge, from most were fairly knowledgeable to be well-informed. From these data, it can be explained that there is an improvement in the knowledge of students about the dangers of scabies.

The fair and poor knowledge of santri regarding scabies is influenced by many factors. One of them is the age factor. Most of the students who experienced scabies are in the category of early adolescents, 10-15 years old (the sample is students between 0-6 years old who live in the Islamic boarding school). Accordingly, Muhammad Zayyid, Saidatul Saadah, Adil, Rohela, & Jamaiah⁴ stated that 31% of the prevalence of scabies in Penang, Malaysia is children aged 10-12 years. Early adolescence is a transition stage from childhood to adulthood. At this stage, it is the initial stage of the students to enter the Islamic boarding school that is assumed by the researchers as a beginning to adapt and finds close friends. In order to get the recognition and effort to find friends, it is possible to begin the interaction by "feeling the same", away from the family and starting to feel a sense of cooperation among students.

Santri knowledge is related to age factors. The younger a person is, the harder it will be to understand information. Scabies incident that happened to students in Islamic boarding school Al Muftadi'ien was also due to the lack of students' ability to understand or perhaps

had never heard of scabies, and may not have had experienced scabies before. The new experience of living inside the boarding school may also be one of the factors of ignorance of the disease. Mubarak (2008) stated that age is one of the factors that influence the acceptance of knowledge and attitude. In line with Wawan, A and Dewi (2010), the more efficient an individual's age, the level of maturity and strength of a person will be more mature in thinking and working. The knowledge of santri increased with the existence of health education about scabies. This health education opens and adds knowledge and helps students to maintain personal hygiene better while staying in the boarding school. Even though it is still regarded at a young age, it is hoped that students will be able to receive, digest and understand scabies.

The The use of media that involves many senses will be more able to provide additional knowledge than those that involve a few media. Knowledge is obtained through the sense of hearing and sight. If the senses of sight and hearing are involved, then the message given will be better received than by only involving one sense.

The opinion is based on the essence what is expected in a health education is to form a better santri behavior. Santris who have less knowledge about scabies will also have a poor understanding of how the parasite scabies spread, one of which is strongly influenced by the personal hygiene of the santris themselves. The lack of understanding emerges unsupportive attitudes and even the apathetic tendency of maintaining personal hygiene so that eventually exposed to scabies. Students who have experienced scabies must take a treatment for themselves, and the treatment should be carried out to all the Islamic boarding school residents through the role of the health center. Fuller stated that santri who have poor knowledge about the disease, a long incubation period, and difficulties in treating scabies will have an impact on prolonged scabies⁵. So it is true that the knowledge is related to scabies in santri. Accordingly, Dan Ratna, I., Rusmartini, T., Wiradihardja³ who conducted research at Pondok Sukahideng, Tasikmalaya Regency, stated that knowledge is related to scabies incidents. The health education about scabies was given to all male students. However, both male and female can experience scabies. Chosidow⁸ stated that male, female, all ages, ethnic groups, and various socioeconomic levels have the potential to experience scabies if they live in unhealthy communities.

Scabies is becoming a trend disease among Islamic boarding schools, where there is a mixture of santri behavior and habits that cannot be underestimated. The lack of parents supervision while studying at Islamic boarding schools to always maintain personal hygiene, enrich scabies in that schools. Scabies is an infectious disease that is often experienced by a group of people whose personal hygiene is not maintained. Terry et al⁸ conducted a study of rural areas in Thailand or a camp of homeless children in Sierra Leone about scabies and stated that scabies often attacks poorly clean institutions that take care of the children. It is also revealed by Koene et al.⁹; that staffs, employees or children who are and live in the community, will experience scabies. Agoes R, Oehadian¹⁰ stated that this disease is commonly found in children and adults who have poor hygiene, rarely bathing and changing dirty clothes, often exchanging clothes, and rarely washing bed linen. Most cases are experienced by students who live in dormitories, Islamic boarding schools, orphanages, etc.

Afriani¹¹ found a significant correlation between the incidence of scabies and poor bathing practices, the practice of maintaining hand and nail hygiene, the practice of maintaining the cleanliness of clothes and towels, the practice of exchanging clothes and towels, and the practice of maintaining the cleanliness of beds. Azizah¹² in her study at the Al-Hamdulillah Islamic boarding school in Rembang also agreed that the frequency of bathing and shampooing, the soap sharing with other students, exchanging clothes with friends and staying in the boarding school for long periods of time relates to the incident scabies.

The result of health education is the establishment of good knowledge. Good knowledge usually has an impact on good attitude in addressing the transmission of scabies and is expected to force good behavior of students as well as starting to care about personal hygiene and avoid unhealthy behavior that will harm the santri themselves. First, the student must have a good understanding of personal hygiene which is the main key to scabies transmission. A poor understanding, less supportive attitude or even careless about the transmission of scabies will make it difficult for other students who are trying to free themselves from the scabies disease. Termination of the chain of transmission begins with the knowledge justification, changes in attitude and finally the behaviors establishment that is far from the risk of disease. Attitude is the basis for the

establishment of santri acts¹³⁻¹⁵

CONCLUSION

Health education is effective in increasing the knowledge of male students about the dangers of scabies at Islamic boarding school Al Muftadi'ien Bahrul Ulum Tambak Beras Jombang. It is suggested for further researchers to include determinants of scabies disease and health education for the owners of Islamic boarding schools

New Approach for Referral Preparation to the Health Care Center in Denpasar City and Bogor Regency

Ni Komang Yuni Rahyani¹, Gusti Agung Ayu Budi², Wayan Dian Ekayanti²

¹Midwifery Department Polytechnique of Health, Ministry of Health, Diploma 4 Study Program, Jalan Raya Puputan Nomor 11 A Renon Denpasar, Bali, Indonesia, ²Midwifery Department Polytechnique of Health, Ministry of Health, Diploma 3 Study Program, Bogor City, West of Java, Indonesia

ABSTRACT

Knowledge, attitudes and skills of pregnant women to recognize danger signs during pregnancy to postpartum period and newborn baby is a strategic effort to prevent maternal and infant mortality. The aim of the study was to find out the results of guidance interventions for pregnant women and husbands using video media, pictorial fans with five finger signs, pocket books and maternal and child health books between before and after guidance at three Health Centers in Denpasar City and Bogor Regency. The study design was quasi-experimental with nonrandomized pretest-posttest with control group design. The research subjects were 204 pregnant women in the three intervention groups who had fulfill inclusion and exclusion criteria. The intervention group on the subject was divided into interventions 1 (video media, fans with five finger signs and and maternal and child health books). Group intervention 2 (pocket books, fans with five finger signs and maternal and child health books) and control groups (maternal and child health books). The instrument used was a questionnaire containing the socio demographic characteristics of the subject, knowledge, attitude and observation of skills. The results showed that there were differences in the scores of knowledge, attitudes and skills in the intervention among groups 1 and 2 ($p < 0.05$). The multivariate test results showed that there were four variables that consistently affected the skills score of pregnant women significantly including guidance intervention, maternal occupation, income and residence ($p < 0.005$). It is necessary to consider the awareness of midwives at the health center to innovate in order to increase alertness and early detection through family-based empowerment.

Keywords: *danger signs guidance, pregnancy, health center, empowerment*

INTRODUCTION

According to estimates from world health organizations or the World Health Organization (WHO), as many as 358,000 maternal deaths occur every year (WHO,¹ and as many as 88-89% of these deaths can be avoided. The attitudes of health workers (especially midwives and doctors), besides motivation, knowledge and practice are other factors that influence the dynamics of the need for services that forming an important basis for improving maternal and infant health^{2,3}. The

maternal mortality rate (MMR) in Indonesia according to data from the Indonesian Demographic and Health Survey (IDHS) in 2012 was 359 per 100,000 live births. The MMR is much higher compared to the 2007 IDHS results of 228 per 100,000 live births.

Maternal and newborn health conditions still need serious attention from various parties, not only in Java, but also in Bali. Thus, basic efforts are carried out by midwives in order to prevent death and illness in mothers and children through efforts to increase the knowledge and awareness of pregnant women and families regarding danger signs to mothers and infants. This effort has a large impact to prevent late referrals, especially the delay in recognizing problems that generally cause delays in making decisions and referring to health facilities⁴.

Corresponding author:

Ni Komang Yuni Rahyani

Email: yunirahyani@yahoo.co.id,

Phone: 081236308392

Maternal mortality rate in Denpasar City fluctuating quite significantly, up to 2014 MMR had been reduced to 16.1 per 100,000 live birth but increased back in 2015 and 2016. Maternal mortality rates in the Denpasar City in 2016 (54 per 100,000 live birth) still lower than the target of the Denpasar City Health Office Strategic Plan in 2016 (100 per 100,000 KH). During 2016 in Denpasar City there were 7 maternal deaths consisting of 5 deaths of pregnant women and 2 during delivery. All mothers die in health facilities (hospitals). Four maternal deaths in Denpasar City are caused by Non Obstetric Disease, namely 2 people due to heart disorders, 2 people with dengue syock syndrome.

The main objective of this research is to compare the skills of pregnant women and their husbands / families regarding danger signs to pregnant women and infants to prevent delays in obtaining appropriate care between before and after guidance. In this study, personal guidance methods were used in the two intervention groups and one control group. Guidance media is using videos, fans with five fingers on the left and right hand regarding danger signs picture, pocket books and maternal and child health books.

We need to know the most appropriate approach to increase knowledge, attitudes and skills of pregnant women and families to prevent delays in recognizing problems and seeking help.

MATERIALS AND METHOD

The study design was quasi-experimental, pretest-posttest control group design. Respondents were divided into two groups, namely the control group and the treatment group (1 and 2). The control group (pregnant women in South Denpasar II and Ciomas) were given guidance according to the MCH books at the health center or Puskesmas. Intervention group 1 (Puskesmas I Denpasar Timur and Ciri Mekar) were given guidance using video media, fans with five fingers on the left and right hand regarding danger signs picture and maternal and child health/MCH books. Intervention group 2 (Puskesmas II Denpasar Barat and Sukaraja). given guidance using pocket books and fans and MCH books. The sample size in the control and treatment

groups will be calculated according to the population of second trimester to third trimester of pregnant women in selected health centers in Denpasar City and Bogor Regency, which amounted to 34 pregnant women in each selected health center or 204 pregnant women in health center. Conducted pretest and posttest for pregnant women regarding danger signs for pregnant women and newborns. Data collection is carried out for three months (July to September 2017).

Pregnant women and husbands who were involved in intervention groups 1 and 2 were given a pretest before guidance. In the control group, pregnant women were given a pretest and were then asked to read maternal and child health books regarding danger signs and preparation for referrals. The time taken from the pretest to posttest is one month. Guidance in the intervention group and the control group was carried out after the pretest 3 meetings for one hour at each meeting. Guidance is carried out by the MCH management midwives who have been trained in the selected health care.

Data analysis was univariate, bivariate and multivariate analysis. Univariate analysis by calculating the mean. Bivariate analysis to analyze the relationship between independent variables and dependent variables, the intermediate variable with the dependent variable using paired t test and chi square analysis. Multivariate analysis to analyze the relationship between all research variables using multiple regression tests and modeling.

RESULTS

The homogeneity test shows if the respondent characteristics are generally homogeneous ($p > 0.05$). There were differences in the pretest and posttest scores in the intervention group on the score of knowledge, attitudes and skills ($p < 0.05$) except in the control group did not show differences in the skill score ($p > 0.05$). The results showed that if intervention 2 had a significant difference in knowledge, attitudes, and skills scores when compared with intervention group 1 and control group. In the table 1 below, the results of differences in pretest and posttest scores were displayed on the knowledge, attitudes and skills of pregnant women.

Table 1. Differences in Pretest and Posttest Scores between Intervention and Control Groups (n=204 pregnant women)

		adjusted variance	z	p-value
Knowledge	Intervention group			
	1	24650.75	2.357	0.18
	2	24528.00	4.431	0.000
Attitude	Control	25068.00	2.239	0.025
	Intervention group			
	1	26258.38	1.858	0.063
	2	26451.13	3.034	0.002
	Control	25909.38	1.948	0.051

	2	26746.63	7.145	0.000
	Control	26755.13	1.284	0.199

Source : Primary data analysis (2017)

The multivariate test results using general linear model (GLM) analysis showed that there was no significant relationship in the intervention group and maternal age with a knowledge score ($p > 0.05$). There was no significant relationship between intervention and maternal occupational factors with attitude scores ($p > 0.05$). Consistently intervention, maternal occupation, income and place of residence were significantly

associated with maternal skills scores regarding danger signs for mothers and newborns baby and neonates ($p < 0.05$). The table 2 below shows the results of the analysis between the intervention, the work of the mother, income and place of residence with the skill score.

DISCUSSIONS

In general the characteristics between the intervention groups were not different ($p > 0.05$). Differences were found from the characteristics of income or socio-economic level, residence, and means of transportation used by subjects to health facilities ($p < 0.05$). The sociodemographic characteristics of the subject can affect service quality as measured by knowledge, attitudes and skills the subject knows and manages the problems faced.

According to the World Health Organization¹, there are several determinants that influence client visits to health facilities, especially to obtain reproductive health services, including: financing factors or ability to pay, distance factors to health facilities, client knowledge, education level and social status economy. Agreeing with the results of a study in Ethiopia by Tesfahun, Worku, Mazengiya, Kifle⁵, that maternal health care utilization is influenced by accessibility factors, socio-cultural beliefs, individual attitudes and health seeking behavior.

There were differences in the pretest scores of knowledge, attitudes and skills between the intervention group 1 and 2 and the control group significantly ($p < 0.05$), although the results showed that the most significant difference was in the intervention group 2. The skill score showed that only the control group who did not show a significant difference ($p > 0.05$) when compared with intervention group 1 and 2. This was caused by factors of resistance or design invalidity, including: the interaction of the given test, the interaction of the results of the selection with the results and the existence selection with the results and the existence selection bias⁶.

The selection bias in terms of the invalidity of interaction factors from the intended test is that there is a weakness of the video media in the intervention group 1 due to the availability of a video watching device at home that is not shared by all subjects in the group, in addition to the obstacles that explain content or content of the video. Another problem with invalidity is that the characteristics of the subject from the beginning have been different, especially in the intervention group two which shows if the initial results of the pretest are much higher than the other groups⁶.

There was no significant difference between the pretest and posttest scores according to the characteristics of the transportation facilities and the distance to the health facilities with scores of knowledge, attitudes and skills ($p > 0.05$). Knowledge, attitudes and skills of individuals or subjects are influenced by socio-economic factors, values that are believed, and intention to behave. Different results were obtained by Tesfahun, Worku, Mazengiya, Kifle⁵, that the factors that influence the utilization of postpartum care are: time constraints, transportation costs, shelter, distance from home to health facilities, previous ANC history and ability health workers provide solutions to problems faced.

The results of multivariate tests using GLM were obtained if there was only a very significant relationship between intervention, maternal work, family income, and place of residence with a skill score ($p < 0.05$). The results of the study by Amenu, Mulaw, Seyoum & Bayu⁷ and Salam, Lassi, Das and Bhutta⁸ that positive health behaviors are influenced by various factors, including: complex phenomena related to availability, quality, service financing, structure social, health beliefs and characteristics of clients or service users⁹. The success of communication between midwives and clients or pregnant women greatly influences patient / client satisfaction, increases understanding, increases mutual trust and increases the ability of pregnant women and families in decision making¹⁰. Mother's knowledge is not directly affected by the number of ANC visits due to differences or gaps between the ability of officers / midwives and the limited information provided by midwives regarding danger signs to mothers during pregnancy to postpartum, newborn baby and neonates¹¹⁻¹⁵. The husband's education contributes to the participation of husbands in delivering mothers to health facilities and helping to make decisions more precisely and quickly¹⁶.

CONCLUSION

The use of media and interesting information delivery techniques are determinants of the success of training. It is necessary to consider the characteristics of the research subjects, such as the availability of VCD devices, other communication media in the form of mobile phones for intervention groups that receive training using video media.

ABSTRACT

Unsafe food threatens global health and puts everybody at risk. Fried Onion is a home industry product in Palu City, Indonesia. Due to its popularity, it is distributed cross the country and overseas. The main material of fried onion is raw onion which can easily be contaminated by biological, physical and chemical contaminants. This study is a descriptive observational study to examine the implementation of Good Manufacturing Practices and Hazard Analysis Critical Control Point (HACCP) at one of famous fried onion home industries in Palu City using a observational descriptive study. The GMP assessment was conducted by using a Self-Assessment Questionnaire on good manufacturing practices by Food Supplement Europe. The study found that eventhough the observed home industry has implemented the GMP, it still needs improvements in terms of transportation and distribution aspects. It is also found that the Critical Control Points of this industry are in the stages of washing the onion, frying stage I and drying the onion.

Keywords: *Fried Onion, Traditional Food, GMP, HCCP.*

INTRODUCTION

Food safety is an integrated process to ensure food safety related to both healthy and safe techniques for preventing infection and contamination in the food production chain, and helping to ensure the quality and healthy food maintenance for health improvement^{1,2}. Unsafe food can pose health problems both in local and global scope³.

GMP is a quality assurance to ensure that products are manufactured and controlled consistently based on proper quality standards as required by the marketing authorization. GMP is broadly categorized into two groups: cross contamination/mix-ups and fake labeling³

HACCP is a system designed to ensure that manufactured products are safe for consumption and

can prevent food product quality from any problem or hazards. HACCP will be able to identify critical control points (CCPs) in production systems that can potentially reduce product quality⁴. Red onion has huge use and benefit, however red onions can also potentially harm the body due to microbiological contamination including *Shigella* spp, *Bacillus cereus*, and *Salmonella*^{5,6}

Palu City is well-known with its fried onion products which are usually as a gift for visitors. The most famous fried onion in the city is UD X fried onion. Therefore, the product of UD can reach across the nation and other countries. The researchers conducted GMP and HACCP analysis on fried onion products in UD X to ensure that the fried onion products marketed are safe for consumption.

MATERIALS AND METHOD

This research is an observational descriptive study. It aims to examine the implementation of GMP and HACCP on UD X fried onion in Palu City, Indonesia. The sample of this research was UD X fried onions. The study observed all production steps based on

the scope aspects of GMP and HACCP. The GMP assessment used a “Self-Assessment Questionnaire on Good Manufacturing Practice” questionnaire published by Food Supplements Europe and was assessed based on the gutman scale. The research setting was in UD X because UD X is the largest fried onion industry and the first home industry introducing the fried onion business typical in Palu City. UD X has been able to produce 300 kg fried onions per day, located strategically and very close to the airport, making UD X very famous and easily accessible by tourists who come or go outside the Palu City.

RESULTS

UD X is one of trading businesses classified as a cottage industry in the Palu City with its main and very famous product is fried onion. UD X also produces many products including *abon ikan* (made from sea fish), *abon ayam* (made from chicken) and *abon sapi* (made from beef). All of these products are sold directly at UD X's stores located in South Palu

Product description that will be made for GMP and HACCP planning only focuses on fried onion products, as presented in table 1.

Table 1: Product Description and Its Usage

PRODUCT DESCRIPTION	
Company Name	UD X
Characteristic Summary	
Product Description	Organoleptic Characteristic: Texture/Physical: Solid Colour: Golden Brown Fragrant: Typical Onion Aroma Taste: Savory
Composition	Red Onions (<i>Allium ascolonicum L.</i>), Starch Flour, Maizena Flour, Salt, Cooking Oil, Water
Processing Unit Capacity	300 kg/day
Usage Requirements	Products are placed in the cool place and avoid from direct sunlight
Transport/Packaging Condition	Products are Packaged by Plastic having <i>Zipper Lock</i>
Product Usage	
Fried Onion Product can be consumed by public, without any restrictions for the ages.	
Place of Sales	UD X Shop
Rule of Law	Business Act

Table 2: GMP Anayisis

GMP Indicators	The number of Questions	The number of Answers “Yes”	GMP Score
Primary Production			
Production Process	57	53	$53/57 \times 100\% = 0.92 = 92\%$
Recovery and Rework	11	11	$11/11 \times 100\% = 1 = 100\%$
Food Product and Development Process	9	9	$9/9 \times 100\% = 1 = 100\%$
Design and Facility			
Room and Equipment Place	53	41	$41/53 \times 100\% = 0.77 = 77\%$
Operation Control			
Management Quality	17	15	$15/17 \times 100\% = 0.88 = 88\%$
HACCP	6	0	$0/6 \times 100\% = 0 = 0\%$
Laboratory testing	10	2	$2/10 \times 100\% = 0.2 = 20\%$
Documentation	22	21	$21/22 \times 100\% = 0.95 = 95\%$
Maintainance and Sanitation			
Storage	18	16	$16/18 \times 100\% = 0.88 = 88\%$

Cont... Table 2: GMP Analysis

Personal Hygiene

Product Information and Customer Awareness			
Complaint Procedures, Product or Food Withdrawals and Emergency Procedures	15	9	9/15x100%=0.6 =60%
Training			
Personnel dan Training	23	17	17/23x100%=0.73 =73%
Sub Contract Operations (Cooperation Contract as Partner)	11	0	0/11x100%= 0 =0%
GMP UD X Results	286	211	211/286x100% =0.73 =73%

GMP analysis on UD X in table 2 shows that UD X has applied GMP based on all indicators of GMP implementation, namely 1.1, 1.2, 1.3, 2.1, 3.1, 3.4, 4.1 and 5.1 . This can be seen from the score obtained $\geq 75\%$. Other indicators also show that UD X has applied GMP to its business units, which can be seen from indicators 7.1 and 8.1 with a score of $<75\%$. The final result shows that UD X has adequately implemented GMP in its business unit.

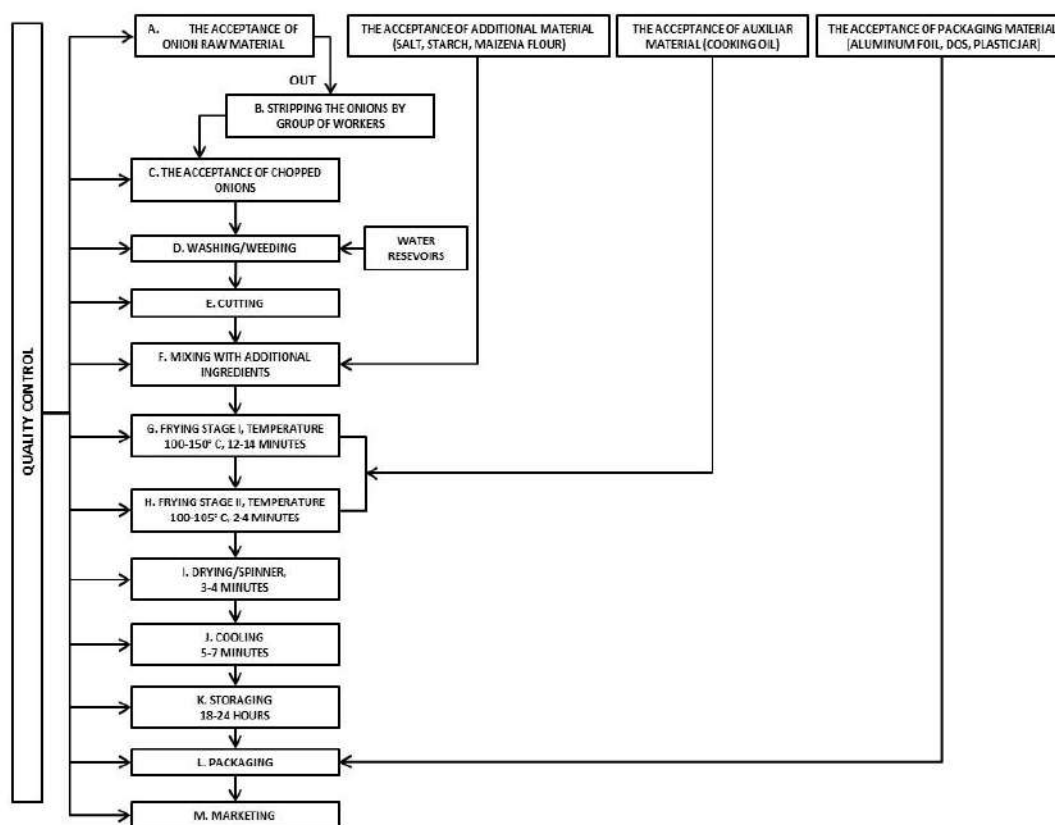

Chart 1 Flow of Fried Onion UD X Processing Process Table 3 shows that from 11 assessment stages, IR obtained is at the lower risk level ($4 \geq IR \leq 8$), increased risk ($8 \geq IR \leq 12$), satisfactory risk ($IR \leq 4$) and critical risk ($12 \geq IR \leq 16$). Table 4 shows that the washing stage, frying stage I, and draining stage are CCP. The washing

stage needs 5 minutes as CCP. The temperature of $180^\circ C$ for 2-4 minutes becomes an important aspect to reduce the risk. Lastly, the speed of rotation (650 rpm) and time of the spinner machine (10 minutes) is an important aspect to eliminate the risk.

Tabel 3: Hazard Analysis and Identification of CCPs

Process	Hazard(Biology (B)/ Physics (P)/ Chemistry(C))	Hazard Sources	Potential Hazard			Preventive measure	Decision Tree				CCP / Not CCP
			Chance	Severity	IR		Q1	Q2	Q3	Q4

Draining	C : Trans fatty acid	Round Speed and Spinner Machine time	Draining the onions about 3-4 minutes by using <i>spinner</i>	Using <i>spinner</i> in the speed of 650 rpm within 10 minutes	What: Chemical hazards are trans fatty acids How: Measure speed and time When: After the stage II onion cooking process Who : Workers on duty	Redraining if it still looks wet

DISCUSSION

The score of $\leq 46\%$ in point 6 (transportation) indicated low quality of transportation process particularly in cleanliness of vehicles, vehicle check up, and separation of contaminated material and sterile material. Finished food (packed food) should be separated with raw material that can potentially contaminate the final food⁷.

UD X also does not implement GMP on indicator 3.2 (HACCP), 3.3 (laboratory testing) to 8.2 (sub-contract operation) with a score of $\leq 20\%$. The indicator was not achieved because UD X has HACCP system and laboratory. Laboratory testing on food production is important to detect microbial contaminants⁸.

Although UD X has not applied HACCP officially, there are some points that can eliminate the risk. Identification starts from the initial stage, the handling of the raw materials, stage 2 onion stripping, stage 3 onion washing, stage 4 onion cutting, stage 5 mixing additional ingredients, stage 6 frying I, stage 7 frying II, stage 8 draining, stage 9 cooling, stage 10 storage, and stage last packing.

From all the steps, there are microbiological hazards such as *E. coli*, *Salmonella*, *Shigella* spp, *Bacillus cereus*, hepatitis A, norovirus, and rotavirus. However, those bacteria can not live in such high temperature from 100 to 105°C for 12-14 minutes at the frying stage I⁹. The *E. coli* bacteria are likely to appear from the contaminated soil, contaminated water, and hand contamination¹⁰.

Physical hazards such as soil and dust also appear in raw materials, stripping onions, washing onions, and the cooling stage. To prevent this problem, the soil and dust must be separate from the onion and other material by washing properly.

In addition, chemical hazards can appear from oil in the frying stage I, frying stage II and the stage of draining in the form of trans fatty acids. Cooking oil used by the company is utilized repeatedly with high temperatures so that it can damage the quality of the product¹¹. Repetition of frying at high temperatures will affect the chemical quality and organoleptic of cooking oil (E and D, 2007). Thus, cooking oil can be reduced by drying onions. Draining with a spinner will separate oil from the fried onion¹².

From the 11 stages, based on the determination of IR, 3 stages are the most dangerous stages including receiving raw materials, frying stage I and frying stage II. The chances of contamination at these stages are very high due to lack of hygiene, which raises microbiological, physical and chemical hazards.

There are 3 CCP namely the onion washing stage, the frying stage I and the draining stage. The washing duration, 4-5 minutes, is a crucial aspect to eliminate the physical hazards. However, washing time also must not be too long to keep nutrition substances¹³. The frying stage I was a CCP because high temperature can eliminate biological hazards. The parameters used are temperature and frying time of 100-105°C for 14-18 minutes. The temperature and time must be control to ensure onion not overcook. The cooking oil also must be control regularly^{14,15}.

The draining stage can remove or reduce chemical hazards, cooking oil, from the frying stage I and II. The critical limit at this stage is the scouring of onions for 3-4 minutes using a spinner. The target value that can still be consumed according to¹⁶ is by drying/draining onions using a spinner with a speed of 650 rpm for 10 minutes.

CONCLUSION

Overall, UD X has applied GMP. However, there are some issues related to transportation and distribution of the products. This study has also identified the Critical Control Point of the industry that is in the washing stage of onions, frying stage I and draining stage. The application of GMP and HACCP is important to ensure good quality of fried onion products in the home industry.

Economic Burden of Cancer Patients at Hasanuddin University Teaching Hospital, Makassar : A Qualitative Study.

Amran Razak¹, M Alimin Maidin², Muhammad Tamar³, Zuardin⁴

¹Department of Administration and Health Policy, Faculty of Public Health, Hasanuddin University; ²Department of Hospital Management, Faculty of Public Health, Hasanuddin University, ³Department of Psychology, Faculty of Medicine, Hasanuddin University, ⁴Faculty of Psychology and Health Science, Sunan Ampel State Islamic University, Surabaya

ABSTRACT

Introduction: Cancer can cause disasters, economic-social consequences for individuals and household sufferers. This study reveals the phenomena experienced by cancer patients to inform the development of patient-centered policies. This paper provides a qualitative understanding of the economic and social consequences of cancer.

Method : Interviews were conducted on patients who conducted examinations and referrals at Hasanuddin University Teaching Hospital, Makassar (n=30). Data interpretation uses content analysis.

Results: The affordability of medical treatment and care needed to manage disease is identified as a key aspect of economic difficulties, which endangers the capacity of patients to proactively manage their illnesses and reduce risk. Factors that exacerbate difficulties are mainly not covered by the National Health Insurance scheme (JKN), and other government benefits. Economic burden are not only felt for those who do not have JKN and other government benefits, but also those who receive insufficient subsidies to meet the costs of managing their long-term illness over and above necessary daily living expenses.

Conclusion: This study provides insight into the economic burden of handling cancer, which shows that economic difficulties require households to make difficult decisions between medical expenses and basic living expenses.

Keywords: *Economic burden, cancer patient, social consequences*

INTRODUCTION

Cancer is a catastrophic disease with characteristics that require high costs and a large number of sufferers and diseases that are at risk of death. Cancer is the leading cause of death worldwide in both developed and developing countries. However, the burden of cancer is more prominent in developing countries¹. Lung, liver, stomach, colorectal, and breast cancer are the biggest causes of cancer deaths every year². When a person is diagnosed with cancer and must be hospitalized in the hospital, the financial consequences are a burden

that must be borne by the patient³. In Indonesia, the prevalence of cancer patients in 2013 was known to be 1.4 cases per 1000 inhabitants. Nearly 50% of them occur in populations aged > 75 years⁴.

Research findings from The Action Study Group show that out of 9,513 patients who were followed up in the 12th month, nearly 50% of cancer patients experienced bankruptcy, while 29% experienced death. In addition, almost half or 44% of survivors will experience economic difficulties caused by cancer, so use future savings⁵.

The average cost for treatment of breast cancer can reach \$ 15,000 or around Rp 207,569,923 per year. Patients with an income of \$ 1,100 (or around Rp.

15.221 795) or lower per month will have difficulty paying for their treatment. With a 2014 per capita average GDP (Gross Domestic Product) of \$ 3,553.75 or around Rp.49,176,775 for the eight countries involved, almost all cancer sufferers must use their savings and experience bankruptcy while maintaining their quality of life. Bankruptcy or Financial Catastrophe is defined by spending as much as 30% or more of the household's main income and pocket money on cancer treatment costs 5,6.

There are many things that are not yet known about unpredictable costs for health services needed by cancer patients for example young age, low income, living opportunities, and other supporting services that are supportive⁷. So that it greatly affects the family economic burden of cancer patients. Based on data from the Basic Health Research (Riskesda) in 2013 in Eastern Indonesia, South Sulawesi Province was the province with the highest number of cancers, namely 1.7 1,7 or around 14,119 people⁸. Based on observations and preliminary surveys researchers in cancer patients originating from Eastern Indonesia in general will be referred to the Hasanuddin University Makassar Hospital.

MATERIALS AND METHOD

The informants in this study were around 30 people who were related to the economic burden of cancer patients at RSUP Unhas, Makassar. Ethical approval was given by the Health Research Ethics Committee of Hasanuddin University. All informants gave informed consent before the interview was conducted. The interview began by asking: "what does it feel like to live with cancer now," followed by questions about the challenging and useful aspects of their experience. All interviews are recorded electronically and transcribed word for word. Qualitative analysis data uses content analysis¹⁰.

RESEARCH RESULTS

General Characteristics of Informants

The general characteristics of the informants included dominance (residence), gender, age and marital status and their level of education.

Table 1. shows that informants from South Sulawesi province were 23 people (76.7%) and informants from

outside the province of South Sulawesi as many as 7 people (23.3%), the number of male informants was 10 people (33.3%) and 20 female informants (66.7%). The most age is 46-60 years which is 19 people (63.4%). Generally, there were 26 married informants (86.7%). The disease burden category perceived by patients as many as 23 people (76.7%) stated weight.

Table 1. General Characteristics of Informants

Informant characteristic	Number	(%)

Family Treatment		
By family	12	100,0

The utilization of hospitals is 30 people (100.0%) with frequency of visits 1-2 times, private practice doctors as many as 23 people (76.7%) with a frequency of 1-2 times, and alternative treatments 19 people (63.3%) among them 17 people (56.7%) frequency of visits 1-2 times, while 3-4 times there are 2 people (6.6%). All cancer patients (100.0%) were cared for by their families, not only the nuclear family but also their close relatives.

Characteristics of Informants Based on Economic Status

Table 2. shows the employment status of informants where as many as 11 people (36.7%) as civil servants / TNI / Polri, entrepreneurs as many as 10 people (33.3%) and not working or as Housewives (IRT) there are 9 people (30, 0%). Their income above UMP is above Rp. 2,400,000 - up to Rp. 5,000,000 as many as 22 people (73.3%) and income of more than Rp. 5,000,000, - as many as 8 people (26.7%). Most of the informants have health insurance such as the Health Insurance Agency (BPJS) in the Health and Card Health Center (KIS) sectors with 24 people (80.0%).

Economic and Social Consequences

The main dimensions of the results of in-depth interviews are economic consequences (affordability of treatment, affordability of consumption of other goods, and factors that influence economic difficulties) and the social consequences of patients [11,12], as explained in the following detail.

Economic consequences

1. Treatment work

Affordability of treatment refers to the patient's ability to pay for the treatment and care needed to manage the disease condition and its consequences. The patient expressed concern about the financial pressures he felt as a result of the high costs of treating and managing his illness (for example, pocket expenses for medicines, routine checks, specialists and other medical care), often accompanied by existing economic constraints and lack of supporting resources.

As an example :

"I use free medication using the Indonesia Healthy Card (KIS), but experience cost difficulties when there are additional costs that are not covered by KIS" (Housewife, 37 years old)

The results of the in-depth interviews also showed that all informants experienced financial difficulties when they had to meet other maintenance costs, outside the National Health Insurance (JKN) scheme such as BPJS Health / Employment and KIS.

As an example :

"Before doing chemotherapy there is usually a laboratory examination, patients have to spend millions of dollars. Often the medicine for chemotherapy is not available so the patient is told to go home, if he has to buy it himself. The cost is very expensive so it cannot afford to buy and choose the medicine available "(Housewife, 52 years old)

As an example :

"Every time I take medication to the hospital, I have to pay a transportation fee of Rp. 1 million per trip, the cost of boarding is Rp. 500 thousand and for credit at least Rp. 200 thousand." (Civil Servants, 50 years)

Cost constraints to access health services, especially felt for patients from outside the province of South Sulawesi because they have to pay for transportation, boarding and communication costs.

As an example :

“Every time I take medication to a private practice doctor, I spend at least Rp 2 million for multivitamin purchases and so on.” (Private employee, 41 years)

Alternative medicine is a conventional and herbal treatment / therapy effort as an alternative or complementary to modern medicine. Some informants said “The cost of alternative medicine is only Rp. 50,000 - Rp. 100,000, - once a visit. Usually in the form of clear water, rubbed on a place that is sick or drunk. Herbal medicines can reach IDR 2,000,000 / package. We use it at most twice just because it’s expensive.”

1. Affordability of Other Goods Consumption

Affordability is also related to the patient’s ability to pay for the additional needs needed to manage their disease, such as: healthy food, exercise and healthy walking membership for cancer patients through the Indonesian Cancer Foundation (YKI) and other social activities.

Discretionary expenses include reducing more expensive and healthier foods, reducing participation in regular sports programs at the gym or other places.

As an example :

“I cannot do vacation activities or renovation of houses that incur quite high costs.” (PNS, 47 years). Incidental costs (make a choice between expenses for health care or other daily expenses). Generally informants do not have incidental costs, they tend to choose to meet their daily needs if they have to be faced with the cost of medical treatment. “If I am given a choice between medical expenses and the daily cost of living, it will prioritize daily expenses.”

2. Factors that influence economic difficulties

Factors that influence whether patients experience economic difficulties include pension salary recipients, pension savings (taspen), health insurance such as BPJS and KIS.

As an example : “I have retired, but still guaranteed

by the health BPJS, thus reducing medical expenses. After all, I received a retirement salary and had a retirement savings account (Taspen). “(Retired, 62 years old). But for some informants, this support is still inadequate to overcome economic difficulties and the additional costs not covered by the National Health Insurance (JKN) scheme or other supporting actions are an economic burden on their lives. For those who do not receive pension benefits or other government subsidies, economic difficulties are tightly felt and recognized to have a significant impact on the management of their disease.

As an example: “I don’t work, and my husband is only a private employee with a mediocre salary. I feel the burden of medical expenses and care imposed on the family.” (Housewife, 52 years)

2. Patients’ Social Consequences

As an example : “My husband is looking for other jobs that can be better expected to cope with a significant decline in income so that he can still take care of me” (Housewife, 39 years old). One of the things that made us burdened by debt was burdensome because of the arrears of credit at the Bank.

DISCUSSION

This research is in line with some of the previous studies conducted by the Group⁵, Davidoff¹³, and Guy¹⁴, where the symptoms of financial catastrophe in patients were experienced by almost all patients who spent as much as 30% or more of their primary income. stairs and pocket money for cancer treatment costs. Other problems faced by patients, especially those domiciled outside the province of South Sulawesi, such as the provinces of Southeast Sulawesi, East Nusa Tenggara and North Kalimantan, experience difficulties in accessing health services in the form of transportation, accommodation and communication costs. They have to spend an additional million rupiah to buy airplane tickets, rent boarding houses, and buy credit¹⁵⁻¹⁷. Additional incidental costs are faced with the difficulty of making a choice between spending on medication and health care or other daily expenses. They can only compromise if they want to meet their child’s needs. This means that even paying the lowest cost of living poses a challenge.¹⁸⁻²¹

With the implementation of Universal Health Coverage in Indonesia starting January 1, 2019, it is expected that no more sufferers of cancer will escape government support through their participation in the JKN scheme. However, the desire of BPJS Kesehatan to cut service facilities for patients with catastrophic diseases such as cancer, will become a new problem for health services, especially for people with cancer. The decrease in income revealed in this study was mainly due to the decline in patient productivity due to cancer. The decrease in income also results in the ability to pay for medical and non-medical expenses. This has social consequences, especially in redeeming the additional costs of treatment and care that is quite large. Significant financial consequences for cancer sufferers (having to reduce expenses, drain savings, borrow money or add bank credit), a combination of additional costs and drastic expenses, can cause anxiety and stress. It can even increase financial stress (financial stress), then it will also increase depression, anxiety and stress in cancer patients²²⁻²³.

CONCLUSION

This research is a qualitative study that examines the economic burden of cancer based on the perceptions of patients and their families. This study provides insight into the economic stress factors associated with treating cancer and evidence that these economic difficulties require households to make difficult decisions between the cost of care and basic living costs, triggering the symptoms of financial catastrophe.

The Effectiveness of 0.03% Bimatoprost Solution Vs Minoxidil 5% in Androgenic Alopecia

Farida Tabri¹, Anis Irawan Anwar¹, Anni Adriani¹, Dwi Aryaningrum¹

¹Department of Dermatology and Venereology, Faculty of Medicine, Universitas Hasanuddin, Makassar

ABSTRACT

Introduction. Androgenic alopecia (AGA) is the most common type of progressive hair loss with an incidence that increases with age. The role of dihydrotestosterone in AGA pathogenesis has been well-established. However, an incidental eyelash and eyebrow growth in patients treated with prostaglandin analogues, bimatoprost and latanoprost, has led to a hypothesis of their possible roles in inducing scalp hair growth. **Methods** This randomized-controlled trial included 6 male subjects, randomized into 2 groups, each consisting of 8 subjects which were given either topical bimatoprost 0.03% or topical minoxidil 5%. Hairs on the affected areas were shaved and both the terminal hair (hairs with diameter of >1 mm) diameter and terminal hair count were measured using a dermoscope on week 0, 4, 8, and 12. A hair sample from the target area was taken and the prostaglandin D2 level was examined before and after 12 weeks of therapy by using ELISA. Independent T-test and paired T-test were used to compare the result. **Results** When both groups were compared, no significant difference in terminal hair count and diameter was observed ($p > 0.05$). Both the bimatoprost and minoxidil group showed a mean increase of terminal hair diameter and hair count after 12 weeks ($p < 0.05$). There was a decrease PGD2 concentration in bimatoprost 0.03% group, but an increase in the minoxidil 5% group ($P > 0.05$). No significant side effects were observed. **Conclusion;** A 12-week topical application of bimatoprost 0.03% results in a significant increase in terminal hair diameter and count. Further studies with longer follow-up duration are needed to establish the effectiveness of bimatoprost in AGA treatment.

Keywords: bimatoprost 0.03%, minoxidil 5%, androgenic alopecia, prostaglandin

INTRODUCTION

Androgenic alopecia (AGA) is the most common type of progressive hair loss with an incidence that increases with age.¹ It is estimated that 30% of Caucasian males will develop AGA by the age of 30 years and the risk rises up to 80% by the age of 70 years.² This rate appeared to be lower in the Asian and African-American population.³

The idea that dihydrotestosterone plays an important role in the pathogenesis of AGA has been extensively

studied, resulting in treatment options that aim to inhibit its formation.⁴ However, an incidental eyelash and eyebrow growth in patients treated with prostaglandin analogues, bimatoprost and latanoprost, has led to a hypothesis of their possible roles in inducing scalp hair growth.^{5,6}

Bimatoprost is a prostaglandin analogue of prostaglandin F2 α and studies have shown that the application of topical bimatoprost results in increase eyelash hair growth, with extensive efforts to treat alopecia on the scalp.⁷ Garza et al showed a positive effect on hair growth as a result of the effects of Bimatoprost towards prostaglandin E2 (PGE2) and prostaglandin F2 α (PGF2 α).⁸

Prostaglandins are selectively called prostanoids which is formed when arachidonic acid, an unsaturated fatty acid containing carbon atoms, released from the

plasma membrane by phospholipase and metabolized through prostaglandin G/H synthetase or cyclooxygenase. There are 4 main bioactive prostaglandins produced in vivo; prostaglandin E2 (PGE2), prostacyclin (PGI2), prostaglandin D2 (PGD2), and prostaglandin F2α (PGF2α).⁹ Prostaglandin D2 (PGD2) has recently been identified as a risk factor in androgenic alopecia.⁷ PGD2 inhibits the growth of human hair follicles and inhibits hair growth in rats through prostaglandin receptor type II (DP2). Based on these findings, the PGD2-DP2 pathway has been proposed as a new potential target for the treatment of androgenic alopecia, but the underlying mechanism is still unclear.¹⁰ In addition, to date, no clinical trials observing the effect of bimatoprost on hair growth are available.

This study aims to evaluate the effectiveness and safety profile of bimatoprost as an alternative treatment in patients with androgenic alopecia by comparing it to minoxidil, which is the standard therapy for androgenic alopecia.

MATERIALS AND METHOD

The study was conducted in the Dermatovenereology Department, Faculty of Medicine, Hasanuddin University and has obtained approval from the Institutional Ethical Review Board. This was a clinical trial using a prospective pre-and post-treatment method.

A total of 16 male subjects, randomized into 8 subjects per treatment arm, were included in this study. Patients eligible in this study were 20 to 40-year-old males with androgenic alopecia (Norwood-Hamilton degrees ≥ III) and willingness to maintain the same hairstyle, length and color of hair during the study. Informed consent was obtained from each subject. The exclusion criteria were the use of low level light comb for hair care, application of topical steroids / NSAIDs on the scalp and subject with scalp infections and various disorders of the scalp.

All subjects were diagnosed with androgenic alopecia from history taking, physical examination and dermoscopic examination. Hairs on the affected areas were shaved 1-2 cm above the scalp on the initial visit and every follow up visit on week 0, 4, 8, and 12. The target therapeutic area was marked using a tattoo with a size of 1 cm x 1 cm. During each follow-up visit, the terminal hair (hairs with diameter of >1 mm) diameter and terminal hair count were measured using a dermoscope (Firefly™ model DE350). Documentation and side effects were recorded in each follow up visit. In addition, a hair sample from the target area was taken and the level of prostaglandin D2 was examined before and after 12 weeks of therapy by using ELISA (Human PGD2 ELISA Kit, Cat No. E0989Hu, Bioassay Technology Laboratory).

The data in this study was analyzed using Statistical Package for Social Sciences (SPSS) 21.0 for Windows (SPSS Inc. Chicago, IL, USA). Results were presented in the form of tables and charts. The statistical tests used were independent T-test and paired T-test. A p-value of less than 0.05 was considered as significant.

RESULTS

A total of 16 subjects were included in this study. Most participants were in the 30-39 years age group with a total of 9 subjects (56.25%). This was followed by the 20-29 years age group with a total of 6 subjects (37.5%), and the ≥40 years age group with 1 subject (6.25%). Eleven subjects (68.75%) had a family history of androgenic alopecia. Six subjects (37.5%) were classified as grade III and IV according to the Norwood-Hamilton classification, three subjects with grade VI (18.75%), and one subject with grade V (6.25%).

Table 1 showed the comparison between terminal hair diameter and terminal hair count on the affected area in all subjects in each follow-up visit. There was no significant difference between both groups at the beginning, during and the end of the study (p> 0.05).

	Minoxidil 5%	8	24,625	13,15	

***Independent T-test**

Both groups did show a significant increase before and after treatment as shown in table 2. The bimatoprost group showed a mean increase of 0.0568 and 20.75 in the terminal hair diameter and hair count after 12 weeks, respectively, which was statistically significant ($p < 0.05$). The minoxidil group also showed a mean increase of 0.0259 and 18.625 in the terminal hair diameter and hair count, respectively, with a statistically significant result recorded in the terminal hair count ($P < 0.05$).

Table 2. Terminal hair diameter and hair count before and after treatment

Time of Measurement	Group	N	Mean	P-value
Terminal hair diameter (T0-T12)	Bimatoprost 0.0 3%	8	0,0568	0,012 0,484
	Minoxidil 5%	8	0,0259	
Terminal hair count (T0-T12)	Bimatoprost0,03%	8	20,75	0,012
	Minoxidil 5%	8	18,625	0,012

***Paired t-test**

Table 3 showed PGD2 concentration before and after treatment in both groups. There was a decrease PGD2 concentration in bimatoprost 0.03% group, but an increase in the minoxidil 5% group. There were no significant results in the concentration of prostaglandin D2 before and after therapy in both groups ($P > 0.05$).

Table 3. Prostaglandin D2 concentration before and after treatment

Time of Measurement	Group	N	Mean	SD	P-value
PGD2 on day 0	Bimatoprost 0.03%	8	199,32	199,65	0,394
	Minoxidil 5%	8	66,39	104,29	
PGD2 on week 12	Bimatoprost 0.0 3%	8	192,31	268,75	0,911
	Minoxidil 5%	8	179,35	320,21	

***Mann-whitney test**

The side effects of this study were shown in table 4. Erythema and pruritus were observed in both groups. More than half (62.5%) of the subjects in the minoxidil groups experienced erythema. These side effects, however, were mild and did not require treatment cessation.

Table 4. Side effects found during the study

Groups	Side Effects	N
Bimatoprost 0,03%	Erythema	3
	Pruritus	3
Minoxidil 5%	Erythema	5
	Pruritus	2

DISCUSSION

Androgenic alopecia (AGA) is known as a pattern of hair loss in men and women characterized by progressive miniaturization that does not cause scarring of hair follicles with a distribution pattern that tends to men compared to women.¹¹ AGA prevalence varies between races and ethnics. In Asian population, several studies have been carried out showing lower rates in white skin population with a prevalence of 20% in men and 5-6% in women. Prevalence increases according to age in all populations. Hair thinning occurs at the beginning of puberty.¹² Studies by Faghihi et al showed that from 94 samples aged >18 years old, the mean age was 30.46 ± 6.28 years old.¹³ Study by Olsen et al showed from 352 subjects with MPHL age 20-49 years with a mean age of 39.2 years old.¹⁴ The results of our study has similar result with the highest frequency found in 9 subjects (56.25%), with an average age of 32.62 ± 5.795 years old. Severity of AGA is directly proportional with increasing age.

This study showed that there was a significant increase in terminal hair count in both groups ($P < 0.05$). In terms of terminal hair diameter, the results were significant in the bimatoprost 0.03% group ($P < 0.05$) but not significant in the minoxidil 5% group ($P > 0.05$). A study showed that Bimatoprost 0.03% solution was shown to increase the percentage of eyelash follicles in the anagen phase and prolong this phase. In addition, bimatoprost 0.03% induces stimulation of melanogenesis, which results in darker eyelashes and increases the size of the dermal papilla and hair bulb thus affecting the thickness of the eyelashes.¹⁵ The results of this study are in accordance with a double-blind, randomized phase II study conducted on 244 men

to compare two formulations of bimatoprost solution with vehicle, which showed a greater change in the terminal hair count in the target area in group 1 and 2 (Bimatoprost) with the vehicle compared to the initial condition (group 1: 12.7, group 2: 9.3 and group 3: 5.8 terminal hair/cm²) and changes in terminal hair diameter were greater in group 1 and 2 compared to the vehicle group after 6 months of therapy (group 1 = $0.067 \pm 1,185$, group 2 = $0,92 \pm 1,435$ vehicle group $0.05 \pm 1,018$ mm/cm²).¹⁶

This study showed a decrease in PGD2 concentration in the bimatoprost 0.03% group but there was an increase in PGD2 concentration in the minoxidil 5% group before and after treatment ($p > 0.05$). There is a fundamental role of prostaglandins in modulating the cycle of hair follicles and regulate hair growth, especially prostaglandin D2, prostaglandin E2 and prostaglandin F2 α . Prostaglandin D2 inhibits hair growth in AGA.⁹ However, the underlying mechanism has not been clearly identified.¹⁷ Bimatoprost is a prostaglandin F2 α analog. The mechanism of action of the prostaglandin analogue on hair growth is still unclear. It is suspected that prostaglandin analogues induce hypertrichosis through their effect on the prostaglandin target receptors in the hair follicles.¹⁵ The prostaglandin D2 receptor is in the outer root sheath of the hair follicle. The exact location of the receptor illustrates the importance of hair follicle activity. Minoxidil, the current approved and most widely used treatment, was also shown to have an effect on prostaglandins.⁷ An in vitro study showed that minoxidil stimulates prostaglandin E2 and leukotriene B4 in dermal papilla cells, while prostacyclin synthesis is inhibited. In addition, minoxidil increases the expression of one of the four PGE2 receptors (EP2) which contribute to prolonging anagen.⁹

The side effects occurred in during this study in both groups were erythema and pruritus. This result is consistent with the study conducted by Zaher et al, in which side effects found during application of bimatoprost 0.03% were folliculitis, erythema and pruritus and a burning sensation in the application area.¹⁸ We hypothesize that these occurrences might be due to mild allergic or irritant reaction towards the active compound and/or solvent. In this study, no subjects dropped out as a result to the side effects.

The limitation of this study is that the hair growth phase (anagen, catagen, or telogen) was not identified and hence more precise examination was unable to be conducted.

CONCLUSION

A 12-week topical application of bimatoprost 0.03% results in a significant increase in terminal hair diameter and count. Further studies with longer follow-up duration are needed to establish the effectiveness of bimatoprost in AGA treatment.

ABSTRACT

Introduction: Miana is one of the most widely used medicinal plants in Indonesia because its antibacterial activity, but its mechanisms not clear. This study aims to determine mRNA TLR-4 expression in Balb/c Mice induced by *Salmonella typhi* after miana leaf extract (MLE) treatment.

Material and Method: Mice were divided into four groups, antibiotic (levofloxacin eight mg/kg body weight) as positive control, placebo (Na CMC), MLE and mixed of MLE and antibiotic. Blood of the mice was taken before (H0) and after induction of 103 CFU/mL *Salmonella typhi* (H1) and seven days after intervention (H7). The mRNA TLR-4 expression was measured by real time PCR. The results obtained were processed using SPSS.

Results: There were significant difference in H0-H1 for all groups. TLR-4 expression in H1-H7 had a different pattern between placebo and positive control, MLE, and the mixed of MLE and antibiotic. In placebo, there was an increase of TLR-4 expression in H1-H7). In the positive control, MLE treatment group and the mixed of MLE and antibiotic, there was a decrease in TLR-4 mRNA expression.

Conclusions: Miana leaves treatment in Balb/c mice induced by *Salmonella typhi* significantly gave the same effect as positive control to expression of mRNA TLR-4.

INTRODUCTION

Typhoid fever is an acute infection of the digestive tract caused by *Salmonella typhi*. Typhoid fever is an endemic disease in Indonesia and often cause an outbreak.¹⁻³ According to WHO data in 2008, patients with typhoid fever in Indonesia recorded 81.7 per 100,000.⁴ Typhoid fever in most developing countries is underestimated so that many cases are undiagnosed.⁵

Salmonella is a gram-negative rod-shaped bacteria, Enterobacteriaceae family, comprising 2463 serovars.⁶ *Salmonella* has a Vi antigen, an acidic polysaccharide polymer present on the surface of the membrane. *Salmonella typhi* is an intracellular facultative microorganism that can live and even multiply in macrophages, resistant to lysosomes, has the ability to prevent and inhibit fusion of phagolysosomes.⁷⁻⁹

One of immunological mechanism against *Salmonella typhi* is by spurring macrophage function to destroy and eliminate bacteria. By complex of Toll-like receptors (TLR)-5 and TLR-4/MD2/CD-14, macrophages recognize pathogenic molecular patterns

(PAMPs) such as flagella and lipopolysaccharides.²⁻³ The bond between LPS and TLR4 that activates MyD88 plays an important role in controlling exponential growth of *Salmonella typhi*.¹⁰

The existence of resistance problems of some antibiotics in the treatment of typhoid fever encourages the development of a new paradigm in traditional to treat typhoid fever.¹¹ Natural products comprise one of the most popular sources of complementary and alternative medicines for treating inflammatory and immune disorders.¹² The facts show that medicinal plants play a vital role in maintenance health because they have many advantages, among others, easy to obtain, very cheap and have very little side effects.¹³⁻¹⁵ The use of medicinal plants in most developing countries as a primary means for maintaining health has been considerably observed by UNESCO.¹⁶ Miana leaves contain flavonoid and tannin compounds, in which flavonoid has antibacterial activity because it can denature and coagulate bacterial cell protein.¹⁵

MATERIALS AND METHOD

Settings and Design

This study was conducted at Laboratory of Molecular Biology and Immunology, Faculty of Medicine, University of Hasanuddin, Makassar, South Sulawesi, Indonesia. This was a laboratory experimental study in Balb/c mice animal model with a simple randomized design.

Balb/c mice

Balb/c mice (35-50 grams) were obtained from the Laboratory of Molecular Biology and Immunology, Faculty of Medicine, Hasanuddin University, Makassar, Indonesia. They were well kept under both 12-h light and 12-h dark periods, fed and drink sufficiently for seven days. They were divided into four groups (n = five/group) based on intervention, positive control (antibiotics), negative control (placebo), MLE; and mixed of MLE and antibiotics. Blood samplings were performed three times, before *Salmonella typhi* induction (H0), a day after *Salmonella typhi* induction (H1) and seven days after intervention (H7).

Miana Leaf Extract (MLE)

Leaves of miana were obtained from Tana Toraja district, South Sulawesi, Indonesia and extracted at

Phytochemical Laboratory, Faculty of Pharmacy, Hasanuddin University, Makassar, Indonesia. Miana leaves powder were macerated with alcohol 70% for about 48 h occasional shaking. Dose of MLE used in this study was 510 mg/kg body weight (bw), suspended with natrium CMC 15 w/v.¹⁶

Salmonella typhi preparation

S. typhi bacteria was from the Molecular Biology and Immunology Laboratory, Faculty of Medicine, University of Hasanuddin, Makassar, Indonesia. The amount was 10³ CFU/mL (Mc Farland Standard).

Nucleic Acid Extraction

The sample volume of about 100 µg/ul blood was fed into 900 µl of "L6" solution consisting of 120g of Guanidium thiocyanate (GuSCN) in 100 ml 0.1 M Tris HCl, PH 6.4, 22 ml 0.2 M Ethylene Diamine Tetra Acetate (EDTA) pH 8.0 and 2.6g Triton X-100 (Packard, Instrumens) with final concentration 50 mM Tris HCl, 5 M GuSCN, 20 mM EDTA, 0.1% Triton X-100. Next played at 12,000 rpm. The sediment added a 20 µl diatom suspension consisting of 50 ml of H₂O and 500 µl of 32% (w / v) "Celite" (Jansen Chimica, Beerse, Belgium, 10,846.79), then vortex and centrifuged in a 1.5 ml eppendorf tube at 12,000 rpm for 15 min. The supernatant was removed and the sediment was washed with a solution of "L2" consisting of 120 g of GuSCN in 100 ml 0.1 M Tris HCl, pH 6.4 by adding 1 ml of "L2" solution. Then vortex and centrifuged at 12,000 rpm for 15 min, then washing repeated 2 times using "L2" solution, followed by washing with 1 ml of 70% ethanol twice and 1 ml of acetone. The result was then heated in a water bath at a temperature of 56°C for 10 min and added 60 µl of "TE" solution comprising 1 mM EDTA in 10 mM Tris HCL pH 8.0, then vortex and centrifuge followed at 12,000 rpm for 30 s, then incubated in Oven for 10 min at a temperature of 56°C. Then performed vortex and centrifuge again for 30 sec at a speed of 12,000 rpm and taken supernatant. The supernatant of this process will be obtained by nucleotide extraction and stored at -80° C before PCR analysis.¹⁷

Real Time Polymerase Chain Reaction

Quantitative Real-Time PCR analysis total RNA was extracted from blood using L6 buffer according to the Boom methods. RNA quality and concentration were detected by a NanoDrop 2000 device (Thermo Scientific,

Wilmington, DE, U.S.A.). In a reaction volume of 20 μ L using M-MLV reverse transcriptase, 2 μ g RNA was then reverse transcribed to cDNA using a RT-PCR kit. The mRNA level of the target gene was quantified by real-time PCR using a SYBR® Premixed E x Taq kit on a CFX Connect system, Biorad Laboratories, Real Time PCR 96 well 0.1 ml, USA. The standard PCR conditions were as follows: 95°C (10 min), 40 cycles of 95°C (15 s) and 60°C (1 min), followed by a standard denaturation curve. mRNA expression levels of the relevant genes and β -actin were determined using relative quantification by comparison with a standard curve for each gene, which was included in each PCR run generated from the serial dilution of a cDNA pool from the blood samples in the study. The primer pairs TLR-4 For: TGACAGGAAACC CTATCCAGAGTT and TLR4 Rev: TCTCCACAGCCACCAGATTCT and β -actin For: AGA GGGAAATCGTGC GTGAC and β -actin Rev: CAATAGTGATGACCTGGCCGT. Relative mRNA levels were calculated using the 2- $\Delta\Delta$ Ct method with data normalized to the Beta actin housekeeping gene.¹⁸⁻²¹

STATISTICAL ANALYSIS

All groups of data are normally distributed with significant values of 0.076-0.200 (Kolmogorov-Smirnov Test) and 0.064-0.964 (Saphiro Wilk Test). Repeated Anova was used to test the mean difference on mRNA expression of TLR-4 between H0, H1 and H7 in each group. All statistics were performed on IBM SPSS version 20 statistical software.

RESULTS

This study showed a significant difference in mRNA TLR-4 expression in H0-H1 for all groups with p = 0.000. Differences in mRNA expression of TLR-4 in

H1-H7 had a different pattern between negative control and positive control, MLE treatment group and the mixed of antibiotic and MLE treatment group (Figure 1). In the negative control, there was an increase in mRNA expression of TLR-4 from H1 to H7 with significance level p=0.000, mean difference 4.94 and CI95% 4.71-5.17. In the positive control group, MLE treatment group and the mixed of antibiotic and MLE group, there were decrease in mRNA expression of TLR-4 with mean difference in negative values (Figure 1).

Figure 1: Trend mRNA TLR-4 Expression for placebo, positive control, MLE and Mixed of MLE and Antibiotic in H0, H1 and H7

In the positive control, there was a significant decrease in mRNA expression of TLR-4 with significance level p=0.000, mean difference -1.70 (CI95% (-2.02) - (-1.38)), had a greater decrease than the MLE group with mean difference -0.98 (p=0.000, CI 95% (-1.18)-(-0.77)) whereas in the mixed of antibiotic and MLE group had the highest decrease mRNA expression of TLR-4 with mean difference -2.01, significance level p = 0.000 and CI 95 % (-2.27)-(-1.75) (Table 1).

Table 1. Differences Analysis of mRNA expression of TLR-4 Balb/c Mice between before (H0) and 24 hours after (H1) Salmonella typhi induction and Seventh Day After Intervention (H7)

Group	H0	H1	Mean Difference (95%CI)	P*	H7	Mean Difference (95%CI)	P*
	Mean±SD	Mean±SD			Mean±SD		
Negative Control	5.058±0.495	7.025±0.128	1.96(1.82)-(2.11)	0.000	11.971±0.114	4.94(4.71)-(5.17)	0.000
Positive Control	5.057±0.078	6.970±0.225	1.91(1.60)-(2.22)	0.000	5.265±0.238	-1.70(-2.02)-(-1.38)	0.000
MLE	5.071±0.094	7.148±0.132	2.07(1.90)-(2.24)	0.000	6.164±0.118	-0.98(-1.18)-(-0.77)	0.000
MLE+AB	5.069±0.099	7.111±0.118	2.04(1.93)-(2.15)	0.000	5.100±0.102	-2.01(-2.27)-(-1.75)	0.000

DISCUSSION

Significant increase of TLR-4 expression occurred in H0-H1 for all groups. *Salmonella typhi* has a very immunogenic structure called lipopolysaccharide (LPS). LPS are bound by LPS-binding protein (LBP) in the blood and then activate TLR4. The activated TLR4 recruits the MyD88 adapter protein. Then MyD88 conscripts IRAK4, IRAK1 and IRAK2. The IRA kinase then phosphorylates and activates the TRAF6 protein allowing NF κ B to diffuse into the nucleus and activate the transcription and induction of inflammatory cytokines.^{3,10,22-23}

At H7, the MLE group showed a significant decrease in TLR-4 expression, as did the positive control and the mixed of antibiotic and MLE group. Alleviation of TLR-4 expression at H7 in the group administered by MLE, positive control and the mixed of antibiotic and MLE group were linear to LPS levels in mice's blood indicating a healing process of *Salmonella typhi* infection in body of mice. In contrast, TLR-4 expression in negative control continued to increase until H7 indicating that LPS remained high. Another study said that the most vital thing in stimulating a non-specific immune response against LPS as a part of *Salmonella typhi* is activation of TLR-4. The presence of LPS will stimulate TLR-4 then cause nuclear translocation of NF κ B and TNF- α cytokines as well as inducible NO synthase (iNOS).²²

One of the herbal mechanisms as complementary and alternative medicine (CAM) in improving immunity is modulation of pathogen response/T cell regulation. Herbs can enhance immunity by changing the balance between inflammatory and anti-inflammatory cytokines and modifying the level and quality of immune responses of T cells, B cells and cytokines.²⁴ Miana as one of the medicinal plants family lamiaceae contain among other essential oils, flavonoids, tannins and alkaloids.¹⁵ Administering of MLE and combined antibiotic and MLE had an effect for mRNA expression of TLR-4 subsequently affecting host immunity (mice).

Previous study showed that MLE contains active substances such as alkaloids, saponins, steroids, tannins, triterpenoids, flavonoids and polyphenols that are potential as immunomodulators. MLE contains chemical components as active substances that have antioxidant activity with IC50 MLE value = 34.407 ppm.¹⁵ Another study mentioned that the main active substance of

the plant *Coleus aromaticus* is an essential oil. The potential of *Coleus aromaticus* therapy can be used as a potential source of bioactive compounds. *Coleus aromaticus* antioxidant activity is reported mainly due to rosmarinic acid, chlorogenic acid and caffeic acid. Essential oils have a large antimicrobial activity in gram-negative, gram-positive, drug-resistant microorganisms, phytopathogenic microorganisms and fungi.^{13,25} According to Kouakou (2013), immunomodulatory activity is determined by knowing the ability of plant extracts to induce NO (nitric oxide), cytokine production and activated mitogen protein kinase fosforilase (MAPK).²⁶

CONCLUSIONS

MLE with dosage 510 mg/kg body weight in Balb/c mice induced by *Salmonella typhi* showed a similar value to positive control on mRNA TLR-4 expression. This study represent that MLE could be a pledging alternative medicine in patients with *Salmonella typhi* infection.

Correlation of Stimulation with Development of 2-Year-Old Babies (Baduta) in Mamuju District, West Sulawesi

Supratti

Department of Nursing, Ministry of Health Polytechnic Mamuju, West Sulawesi

ABSTRACT

Children are the nation's future generation. One of factors that influences children's quality is early stimulation. Early stimulation is given according to the children's development. *Baduta* or infants aged 0-24 months is the baby's golden period (golden age period) which is a period where the baby's brain is experiencing very rapid development, because at this time the baby's brain is functioning properly so that it can absorb up to 100% of information affecting and determine their next development. The purpose of the study was to determine the effect of stimulation on the level of development of *Baduta* (2-year-old babies) in Mamuju District, West Sulawesi. This research is an analytic observational study with cross sectional design. The population in this study were all infants aged 0-24 months in the working areas of Binanga, Bambu and Tampapadang Public Health Centre. Sampling using accidental sampling, the number of samples is 96 infants. The Pre-Screening Development Questionnaires (KPSP) were used at the age of 3-24 months, KPSP measured gross motor development, fine motor development, speech and language skills, socialization and independence skills, and stimulation questionnaire according to the development of children aged 3-24 months. The data was collected by distributing stimulation questionnaires according to the child's development and direct observation of the level of development using KPSP according to the age of the child, giving explanations to their parents if there is a statement in the questionnaire is not understood. Research shows that there is a significant influence between stimulation ($p = 0.039$) with the level of development of *Baduta* in Mamuju District. Parents are expected to provide stimulation according to the child's development continuously with loving care, doing early detection to child development, and giving health counseling to parents about the importance of parents' role to provide early stimulation to children according to the stage of child development.

Keywords: *development, stimulation, baduta, 2-year-old babies*

INTRODUCTION

Children are nation's next generation, one of the nation's determinants in the future. The quality of the next generation is determined by the success of growth and development in childhood. Early stimulation according to children's development is one of children's intelligence determinants. Development requires stimuli, especially in families¹. This is similar with the results of the study by Iin which states that there is a correlation between developmental stimulation and the development of 0-5 years old children in RW 8 Kalicari Village, Semarang City². The same research was done by Febrina Suci Hati and Prasetya Lestari, their results showed that there was a correlation with strong and statistically significant strength between stimulation of

growth and development of children aged 1-3 years in Sedayu District³.

Children are individuals who are in a range of changes in growth and development starting from babies to adolescents. This period starts from the baby (0-1 years) playing age/toddlers (2-3 years), pre-school (4-6 years), school age (6-12 years) to adolescence (13-18 years). This range is different from one child to another, changes in growth and development can take place sooner or later. Given the large number of children under five in Indonesia, which is about 10% of the entire population, then as a prospective future generation, the quality of child development in Indonesia needs serious attention such as getting good nutrition, adequate and affordable stimulation by quality health services

including early detection and early intervention of growth and development deviations to children. This can be included in the monitoring program for child development at the family stage as the beginning of the formation of a child's life^{1,4}

Coverage services for Early Stimulation, Detection and Intervention of Toddler Growth and Development in Mamuju District have not been maximal, especially in infants aged 0-24 months. This can be seen from the report of the Family Health Development Division of the District Health Office in 2015, the coverage of children (infants aged 0-23 months) weighing 6,156 million or 55.3% of the total number of children reported as many as 11,136. Compared to 2014, there was a decrease in the amount of the total coverage of 6,485 million or 66.4% of the total reported million of 9,769. Coverage of children under five who received health services (at least 8 times) was 90.9% or as many as 16,953 toddlers, decreased from the previous year where the coverage of under five children who received health services (at least 8 times) in 2014 was 93.92% or as much 18,585 toddlers. The coverage of BGM toddlers in Mamuju Regency in 2015 was 575 or 4.44%, had an increase from 2014 in which the BGM Toddler Cover was 564 or 3.47%. Child development data using SDIDTK evaluation has not been reported in the working areas of the District Health Office. Mamuju

Baduta or infants aged 0-24 months is the baby's golden period (golden age period) which is a period where the baby's brain is experiencing very rapid development, because at this time the baby's brain is functioning properly so that it can absorb up to 100% of information affecting and determinetheir next development. This period is the right time to teach everything about life even though its nature is still limited. To optimize the

growth of the brain, parents need to provide nutrition, good emotional connection, proper parenting and stimulus and early detection of growth and development, so that even the slightest abnormality, if not detected and not handled properly, it will reduce the quality human resources later.

The efforts to get high quality children can be achieved through Early Stimulation, Detection and Intervention of Child Growth and Development at the Basic Health Service Level (SDIDTK). The Indonesian Ministry of Health has issued facilities to carry out simple growth and development monitoring, namely the Pre-Screening Development Questionnaire (KPSP). Monitoring efforts are carried out to find out as early as possible the existence of irregularities in growth and development and to follow up on parents' complaints regarding the problems of growth and development of the infants and toddlers¹.

MATERIALS AND METHOD

This research is an analytic observational study with cross sectional design. The population in this study were all infants aged 0-24 months in the working areas of Binanga, Bambu and Tampapadang PublicHealth Centre. Sampling using accidental sampling, the number of samples is 96 infants

Data analysis was carried out by univariate analysis by displaying the distribution and percentage of each variable. Furthermore, bivariate analysis was performed using chi-square to determine the correlation of stimulation, maternal psychology and parenting to the level of development of *baduta* with a 95% confidence level (α 0.05).

RESULTS

Univariate Analysis, a. Characteristics of respondents

Table 1. Characteristics of Respondents

Characteristics of Respondents		n = 96	%
Mother's age (years)	< 20	3	3,1
	20 – 35	84	87,5
	> 35	9	9,4

Cont... Table 1. Characteristics of Respondents

occupation	housewives	62	64,6
	businesswoman	3	3,1
	nurse	2	2,1
	farmer	1	1,0
	government employees	17	17,7
	entrepreneur	11	11,5
education	College	25	26,0
	Senior high school	28	29,2
	Junior high school	8	8,3
	Elementary school	17	17,7
	No education	18	18,8
Infants' age (months)	0 – 3	12	12,5
	> 3 – 6	17	17,7
	> 6 – 9	18	18,8
	> 9 – 12	15	15,6
	> 12 – 15	7	7,3
	> 15 – 18	9	9,4
	> 18 – 21	3	3,1
	> 21 – 24	15	15,6
Infants' gender	boys	41	42,7
	girls	55	57,3

Table 1 shows the highest number of respondents' ages are mothers aged 20-35 years as many as 84 people (87.5%). The highest number of jobs are housewives (IRT) as many as 62 (64.6%). The highest number of education is high school as many as 28 (29.2%). The most age of infants are > 6-9 years as many as 18 (18.8%). The highest number of sexes is 55 (57.3%) women.

Research variable(s)

Table 1 Frequency Distribution of Research Variable

Research variable(s)	n = 96	%
Infants development		
appropriate	69	71,9
inappropriate	27	28,1
stimulation		
good	68	70,8
less	28	29,2

Table 2 shows the development of *baduta* according to the stage of growth and development is 69 (71.9%). Good stimulation was carried out by 68 (70.8%).

Bivariate analysis

Bivariate analysis was conducted to determine the correlation of stimulation given by the family to the level of development of *baduta*. The test performed is

Chi-square Test.

correlation of Stimulation to *Baduta* Development Level

Table 2: Correlation of Stimulation to *Baduta* Development Level

stimulation	<i>Baduta</i> Development				Total		p
	appropriate		inappropriate				
	n	%	n	%	n	%	
good	53	55,2	15	15,6	68	70,8	0.039
less	16	16,7	12	12,5	28	29,2	
Total	69	71,9	27	28,1	96	100	

Table 3 shows the correlation of stimulation to the level of *Baduta* development. Chi-square test shows that there is a significant correlation between stimulation to the level of *baduta* development with a value of $p = 0.039$.

DISCUSSION

This research was carried out in the working areas of the Binanga Bambu and Tampapadang Public Health Center. This region was chosen with considerations of the largest number of million populations in Mamuju City. Primary data collection uses questionnaires for respondents totaling 96 parents and children. The sample consisted of 55 girls, more than boys if compared, with 41 boys. The results showed the development of *baduta* in this study were 71.9% in accordance with the growth stage. children begin to experience very rapid development because children at this age have demonstrated the ability to move more activities, develop curiosity and explore objects around them⁶.

Developmental aspects that can be assessed in monitoring development are divided into 4 (four) parts, such as the development of social personal, fine and gross motor development and language skill. These developments are interconnected with each other. If there is a developmental disorder in one aspect of development, it can affect other aspects of development. For this reason, development monitoring needs to be carried out early to immediately recognize child with developmental disorders so that the development of movement, speech and language, socialization and independence in children according to their ages optimally⁷

Children development can be influenced by internal and external factors. This study looks at the influence of external factors, stimulation of the level of *baduta* development. The existence of a meaningful correlation between stimulation to the level of development of children under five in this study is in line with the research conducted by Lestari and Hati which states that there is a positive and significant correlation and the strength of the correlation between stimulation of growth and development by the mother to the development of toddlers aged 1 -3 years⁸. Stimulation must be given routinely and continuously with love, playing methods, etc. so that the child's development will run optimally. The correlation of language skills with stimulation is also related to the golden period, window of opportunity, as well as the critical period of brain development in children aged 1-4 years. the ability of brain plasticity at this time causes children more easily to accept the learning process and stimulation, also more sensitive to supportive environments such as nutritional status, stimulation and health status⁹ It is in line with Gogia S's research, Sachdev HS says zinc is very important for the formation and migration of neurons along with the formation of neuronal synapses. Its deficiencies can interfere with neural pathway formation and with neurotransmission, thus affecting behavior (eg attention, activity, involvement, temperament) and development (eg, gross and fine motor skills, social skills¹⁰. Grantham-McGregor SM, Fernald LCH, Kagawa RM, Walker S (2014) also conducted research on the effects of developmental stimulation and nutritional intervention on child development, the results of the trial showed that nutritional interventions usually profitable nutritional status and sometimes profitable children's development. Stimulation is consistently beneficial for

child development. There were no significant effects that were lost when the intervention was combined, but there was little evidence of a synergistic interaction between nutrition and stimulation in child development¹¹.

The earlier stimulation is given, the better the child's development will be. The more stimulation that is given, the children's knowledge will be broad so that the child's development is more optimal. The brain tissue of children who get a lot of stimulation will reach 80% development at the age of less than 4 years. Conversely, if the stimulations never given to the child, the brain tissue will shrink so that brain function will decrease. This is what causes the child's development to be hampered¹².

The success of stimulation is also influenced by the basic abilities of individuals, health, family, environment and socio-economic conditions. In line with Miller S, Maguire LK research, Macdonald G (2011) states that parenting competence and environmental quality play an important role in supporting the development of children and parents have an important role in optimizing child development and reducing the negative impact of social losses¹³. Another study conducted by Bryanton J, Beck CT, Montelpare W states that education about infant behavior increases maternal knowledge about infant behavior four weeks after birth¹⁴.

Besides, it is also influenced by the initial time the stimulations given, how long and how to do it. The child's development ability has a distinctive characteristic, which has a fixed pattern and occurs in sequence, so that early stimulation must be directed and emphasized first for the formation of basic abilities before developing cognitive-academic abilities and more complex behaviors¹⁵⁻¹⁷. To achieve optimal development of *baduta* physical education from the role of nurses as part of the integration of health services is inseparable including documenting the care provided accurately, up to date, and relevant according to the needs of *baduta*¹⁸⁻²⁰.

CONCLUSIONS AND RECOMMENDATIONS

The level of *Baduta* development in Mamuju district generally accordance with the development stage. There is a meaningful correlation between stimulation, maternal psychology and parenting to the level of *baduta* development in Mamuju District. Parents are expected to provide stimulation according to the child's development

continuously with loving care, early detection of child development, and giving health counseling to parents about the importance of the role of parents to provide early stimulation to children according to the stage of child development.

Analysis of Malaria Incidence based on Behavioral Factors in the Islands

Irma Muslimin¹, Andi Salim²

¹Department of Nursing, Ministry of Health Polytechnic Mamuju, West Sulawesi,

²Department of Nutrition, Ministry of Health Polytechnic Mamuju, West Sulawesi

ABSTRACT

Malaria is still one of the most serious public health problems which is faced by developing countries in the world, especially in tropical and sub-tropical countries, including Indonesia. This study aims to determine the relationship of behavioral factors with the incidence of malaria in the islands. The type of research is cross sectional study with a population consists of 515 people. 254 samples were selected by Exhaustive sampling. Bivariate statistical test with Chi Square and Multivariate with Logistic Regression.

The results of the research showed that the habit of going out at night ($p = 0.019$) and the use of mosquito nets ($p = 0.046$) were related to the incidence of malaria. Whereas the use of mosquitoes repellent ($p = 1,000$) is not related to the incidence of malaria. Multivariate logistic regression test found that the habit of going out at night was the most influential factor on malaria incidence (Wald 4.096; $p = 0.043$). This study found that the habit of going out at night and using mosquito nets was associated with the incidence of malaria. Some efforts should be made to develop community empowerment programs, especially to increase prevention practices, such as providing information to the public about the importance of avoiding the habit of going out at night, using mosquito nets, and using mosquitoes repellent to reduce contact with Anopheles with healthy humans.

Keywords: malaria incidence, behavior

INTRODUCTION

Malaria is still one of the most serious public health problems faced by developing countries in the world, especially in tropical and sub-tropical countries, including Indonesia¹.

WHO data shows that the estimated deaths globally caused by malaria in 2010 were 655,000 cases of malaria worldwide. In addition, 86% of deaths occurred in children under 5 years. The sufferers of the disease are spreading in many areas around the world, especially in endemic areas such as Africa and Asia². The malaria prevalence in Ethiopia shows that despite the tendency of positive malaria cases showing a pattern of decrease in the overall of five-year malaria prevalence data from hospitals (2009-2013) revealed that the number of children who infected <10 years is still higher³.

The percentage of malaria incidence in Indonesia in 2013 decreased as much as 1.9% compared to 2007

(2.9%), but in West Papua there was a sharp increase in the number of malaria sufferers. Malaria prevalence in 2013 was 6.0%. The five provinces with the highest incidence and prevalence were Papua (9.8% and 28.6%), East Nusa Tenggara (6.8% and 23.3%), West Papua (6.7% and 19.4%), Central Sulawesi (5.1% and 12.5%), and Maluku (3.8% and 10.7%). There were 15 provinces of 33 provinces in Indonesia which have malaria prevalence above the national figure, most of them were in Eastern Indonesia, due to limited government resources in the matter of labor and funds and the high differences in inter-regional endemicity are also considered to be a challenge for malaria prevention. Provinces in Jawa Bali are areas with lower malaria prevalence than the other provinces⁴.

Indonesia is an archipelago that has thousands of islands. The Central Statistics Agency (BPS) in 2016 recorded the number of islands in Indonesia is 17,504 islands. The number of islands, causes Indonesia having

a diversity of cultures, habits, regional characteristics and other diversity. Indonesian people in each areas have their own habits, thus forming a pattern of community life that characterizes the habits of the Indonesian people. The general life style in a daily habit that humans do for interests of their lives. This modern era has a lot of people who want to be instantaneous in doing everything that is supported by technological advancements in facilitating interests and human desire. This instantaneous desire has an impact on the healthy lifestyle of the community⁵.

During 2000-2009 period, rates of malaria endemic throughout the country tended to show an increase. In Java and Bali, Annual Parasite Incidence (API) during the period of 1995 - 2000 per 1000 population increased rapidly from 0.07 (1995), 0.08 (1996), 0.12 (1997), 0.30 (1998), 0.52 (1999), and 0.81 (2000). In 2002 the API dropped from 0.47 and became 0.32 in 2003 per 1000 population. Outbreaks of malaria during 1998 - 2003 period have been attacked 15 provinces, including 84 endemic villages with a total of 27,000 sufferers with 368 deaths⁶.

Malaria is still a health problem for Indonesian people, especially in eastern part of Indonesia⁷. In South Sulawesi, 24 districts / cities that reported in 2007 about the number of clinical Malaria sufferers was 13,029 patients with a positive number of 1,927 people (14.79%) with the highest cases in Selayar District, Bulukumba, Enrekang and Tator. Whereas for 2008 the number of clinical malaria sufferers decreased to 8,886 cases with a positive number out of 1,153 cases (12.98%). The highest case occurred in Selayar District, Pangkep, North Luwu, Enrekang and Tator or AMI amounted to 1.14 per 1000 inhabitants⁸.

There was an increase in malaria cases in Islands Pangkajene Regency, especially in Kapoposang Island, in 2000 found 262 cases, whereas in 2001 there were 1106 clinical sufferers. Parasite rate (PR) reported for the last two years also increased from 5.14% (2000) to 13.76% (2001)⁹. In 2010 the incidence of malaria in Mattiro Ujung Village was 33 people out of 1,309 population. In 2010 the Kapoposang island reported API = 17.57 permille and AMI 25.21 per mile. This figure causes the Kapoposang island as the meso-endemic area to malaria.

Malaria appears as a result of interactions

between agent (Plasmodium), transmission and host processes (humans and anopheles) which are all affected by the environment¹⁰. The existence of community housing that has a condition of an open house without ceilings, ventilation without wire netting and the wall condition of the perforated house is one of the risk factors for the occurrence of malaria. This is because mosquitoes are very easy to enter the house which is not closed like a wall with holes.

Habitat breeding of anopheles is puddles of both fresh water and brackish water that must always be associated with the soil. The breeding place for brackish water anopheles found in estuaries and covered swamps. Research conducted by Kazwaini (2006) found that the anopheles breeding site is in the form of a lagoon to become a potential breeding place for mosquitoes with turbid and clear conditions¹¹.

Socio-culture also affects the incidence of malaria, such as: the habit of going out late into the night, where the vector is exophilic and exophagic will be easy contact with mosquitoes. The level of community awareness about the danger of malaria will affect the willingness of the community to eradicate malaria such as environmental sanitation, using mosquito nets, installing wire netting on the house and using mosquito repellent. Various human activities such as dam building, road building, mining and the construction of new settlements / transmigration often result in environmental changes which is profitable to malaria transmission¹².

MATERIAL AND METHOD

The study is an observational study with a Cross Sectional Study design. The population in this study were all inhabitants living on the island of Kapoposang, Pangkajene Regency and Islands. Sampling taken by non probability sampling with "Exhaustive sampling", which every individual who lives on the island and has been tested for blood as many as 254 people.

Primary data was obtained by taking blood samples, conducting direct interviews with respondents based on the available questionnaires which contained questions and statements used to extract information about the variables to be analyzed in this study which were closely related to the incidence of malaria. Data analysis in this study uses univariate, bivariate and multivariate analysis. Display of categorical data in frequency and percentage and bivariate analysis using chi square with fisher exact

test with $\alpha = 0.05$ and multivariate with logistic multiple regression.

RESULT AND DISCUSSION

Malaria causes problems, especially endemic areas that cause humans trying to find the right methods to eradicate them. The disease is caused by a certain agent which is infective by the plasmodium parasite by the intervention of the anopheles which can be spread from one source of infection to humans. Physical

environmental health, chemical, biological, and socio-cultural factors are very influential on the spread of malaria.

The number of malaria sufferers in this study was 5 people. All malaria sufferers are male sex with varying ages, levels of education and occupation. Distribution of malaria sufferers according to the characteristics of the location of residence, age, sex, level of education and occupation can be seen in Table 1.

Table 1. Distribution of Malaria sufferers by Residential Location, Age, Gender, Educational Level and Employment on Kapoposang Island Pangkep Regency

Malaria Sufferers	residence	age (years)	sex	Education level	occupation
sufferer 1	RT 1	45	man	Not graduating from ES	fisherman
sufferer2	RT 1	9	man	Primary school	Go to school
sufferer 3	RT 1	20	man	Graduated from primary school	fisherman
Sufferer 4	RT 1	11	man	Graduated from primary school	Go to school
Sufferer 5	RT 1	64	man	Graduated fro Senior high School	Village chief

Source: Primary Data

The results of the study are in line with the research conducted by Ahmad, et al (2013) who found that men were more infected with malaria than women, which is 58% of cases in men and 42% occurred in women. Possible reasons for the high incidence of malaria in men compared to women because women are more exposed to malaria parasites than men. In addition, men who work in the field would have a higher chance of

infection. Kapoposang island people, especially men, have jobs as fishermen, where their habit of fishing is to work at night until dawn, thus the possibility of being bitten by mosquitoes is greater than women¹³.

Statistical Test Results (Table 2) show that the habit of going out at night and using mosquito nets is related to the incidence of malaria, while the use of mosquito repellent is not related to the incidence of malaria.

Table 2. Results of Bivariate Analysis of Variable(s) Examined in Kapoposang Island in Pangkep District in 2011

Source: Primary Data

The habit of going out at night is an effective time for transmission. Female anopheles bite humans or animals for the development of their eggs. Anopheles actively foraging at night usually begin to bite late in the evening until early morning with a peak bite for each different species. The habit of going out at night by most residents of Kapoposangisland. Due to their occupation, because almost all household heads on the island work as fishermen. They start working at night that they have a greater chance of being bitten by mosquitoes

The use of mosquito nets is the most effective effort to prevent mosquitoes from being bitten during sleep compared to other efforts. The use of mosquito nets

is better than the use of mosquito repellent in various ways. These risks include being able to avoid the entry of insecticides into the human body through inhalation or skin tissue and other risks of burning mosquito repellents, especially for people who have respiratory system disorders. The use of mosquito repellent is a way to avoid contact or bite from the anopheles at night by using mosquito repellent, either in the form of mosquito repellent, spray, electric or repellent¹⁴⁻¹⁶

Statistical test results (Table 3) show that the variable habit of going out at night is the most influential factor on malaria incidence with a wald value of 4.09.

Table 3. Model of Multiple Regression of Logistics Spatial Patterns and Analysis of Malaria incidence on Kapoposang Island in Pangkep Regency in 2011

Variable(s)	B	Wald	Sig,	Exp(B)
Habit of going out at night	-2,299	4,096	,043	,100

Source: Primary Data

CONCLUSION

This study found that the habit of going out at night and using mosquito nets was associated with the incidence of malaria. Some efforts should be made to develop community empowerment programs, especially to increase prevention practices, providing information to the public about the importance of avoiding the habit of going out at night, using mosquito nets, and using mosquitoes repellent to reduce contact with Anopheles with healthy humans.

ABSTRACT

Efforts to empower communities in community-based total sanitation program through health education methods play an important role in program effectiveness. This study aims to determine the effect of health education by using lecture and discussion methods towards knowledge, attitude and action changes of the community in East Tande Sub-district and Adolang Dhua Village, Majene District. This study is a quantitative research through experimental approach with design non-equivalent control group with pre-test – post-test which is conducted from September - October 2016. Method of determining samples in this study using purposive technique so that obtained 66 people consist of 2 groups, the group with discussion method treatment in Tande Sub-District, and the group with lecture method treatment in Adolang Dhua Village. Data collection conducted by giving pre-test questionnaire, and then gave them intervention, and end up by giving the post-test questionnaire to the respondents. Data were analyzed using paired t-test, wilcoxon test and Mann-Whitney test. Independent variables in this study are health education by using lecture method and group discussion method while the dependent variables are knowledge, attitude and action. The results showed that the knowledge variable influenced by lecture method but not influenced by group discussion method, while the attitude variable is not influenced by lecture and group discussion methods. For the third variable, the action variable is not influenced by the lecture method but influenced by the group discussion method. Meanwhile, the lecture method is more effective in changing respondent knowledge, attitude and action in the effort to empower communities to obtain STBM facilities.

Keywords: *community empowerment, health education, community-based total sanitation*

INTRODUCTION

The poor condition of basic sanitation has effect to the decrease of the environmental quality and pollution to clean water source used by communities to fulfill their daily necessity, so that the patient number of environmental-based diseases are increasing, especially for children under five. Related to this, the access to proper basic sanitation in Indonesia is still under Philippines, Singapore, Laos, Myanmar, Thailand and even neighboring Malaysia. In West Sulawesi Province in 2013, Sub-districts/ villages which carrying out STBM are 354 of 645 Sub-districts/ villages. Villages which stop doing BABS (defecate at random) is 100 Sub-districts/ villages (28.25%)^{1,2}

Low community action towards STBM can be seen through ODF (Open Defecation Free). In Majene District, there are 82 Sub-districts/ villages (89.02%) which implement STBM, only 4 Sub-districts/ villages of ODF (On Defecation Free). The results of 2015 researchers' study using qualitative research method indicates that in East Sub-district as the ODF location, community knowledge, attitude, and action support the formation of ODF while in Adolang Dhua Village (not yet ODF) knowledge and attitude stated good, unless the community action.

The effort is necessary to empower the community in solving the problem by implementing 5 (five) pillars of STBM, which are stop defecation at random place

(SBABS), hand washing with soap (CTPS), household drinking water and food management (PAMM-RT), household waste management (PS-RT) and household waste water management (PLC-RT), through health education by group discussion method using guideline book and lecture method using guideline book^{3,4}.

In line with this, the actions to improve basic sanitation facilities through STBM need to be encourage in communities, especially in areas which have not been ODF yet. According to Wijayanti³, health education with folder is better compared with health education without folder. Therefore, at this study location, the SBTM study will try to be conducted by discussion and lecture methods.

Based on some descriptions that the researcher pointed out above, that the pro-active behavior to encourage the STBM program is necessary for the promotion of STBM through health education by group discussion and lecture methods, because both methods will facilitate and accelerate the increase of knowledge, attitude and action in obtaining basic sanitation facilities (5 Pillars STBM) in each resident’s house.

MATERIALS AND METHOD

This study design is quazi experimental with design of non-equivalent control group design with pretest - posttest. The study was conducted in East Tande Sub district, East Banggae Subdistrict and AdolangDhua Village, Pamboang Sub-District, Majene District, West Sulawesi Province. The study was conducted from September to October 2016. The population is residents

in East TandeSub-District, East BanggaeSub-District and AdolangDhua Village Pamboang Sub-District, Majene District. The sampling technique was purposive sampling that obtained 66 samples which consist of 2 groups. The group with discussion method treatment in Tande Sub-District, and the group with lecture method treatment in AdolangDhua Village..

Data collection in this study was conducted by the researchers along with the facilitators by using questionnaires consist of three categories of knowledge, attitude and action. Each questionnaire has 25 questions. Questionnaires were distributed prior to health education by using lecture and discussion methods, after the questionnaires were collected, health education was conducted. Health education using lecture method was conducted in Adolang Village while group discussion method was conducted in East TandeSub-District, each group consist of 33 people.

Data obtained in this study were processed and analyzed by using paired t-test, wilcoxon test and Mann-Whitney test.

RESEARCH RESULTS

General characteristic of respondents

Based on the study results that has been done, it is found that most respondents in the lecture method group which total 33 people, are in the age range between 41 – 50 years old, while in the group whit group discussion method which also 33 people, most respondents are in the age range <21 years (see table 1).

Table 1. Respondent Characteristics by Group Treatment

Characteristic	Lecture		Discussion		Total (n=66)	%
	n=33	%	n=33	%		
Age						
< 21 yo	1	3.0	14	42.2	15	22.7
21 – 30 yo	10	30.3	11	33.3	21	31.8
31 – 40 yo	7	21.2	5	15.2	12	18.2

Differences Pre-Test and Post-Test Results regarding Knowledge, Attitudes and Action between Lecture and Discussion Methods

Knowledge

Based on the Wilcoxon test output, it showed differences in knowledge prior and after health education by lecture method. There are 3 people who had decreased knowledge after health education by lecture method compared to prior the lecture, 25 people had increased knowledge and 5 people had steady knowledge. While the result of health education with group discussion method, there are 10 people who had decreased knowledge after discussion compared to prior discussion, 18 people had increased knowledge and 1 person had steady knowledge. Based on Wilcoxon test, it showed that there was significant difference to respondents' knowledge between pre and post-test of health education by using lecture method, while there was no significant difference to respondents' knowledge between pre and post-test of health education by using group discussion method, in the effort to empower the community to obtain STBM facilities (see table 2).

Table 2. Knowledge Differences of Pre-Test and Post-Test Respondents with Lecture and Discussion Methods

Method	Pre and Post Test Score	n	Z	p
Lecture	Decrease	3	-3,282	0,001
	Increase	25		
	Steady	5		
Group Discussion	Decrease	10	-1,739	0,082
	Increase	18		
	Steady	1		

Attitude

Based on Wilcoxon test output, it showed attitude comparison between prior and after health education by using lecture method and group discussion method. There were 15 people who had decreased attitude after health education with lecture method compared to prior the lecture, 15 people improved their attitude and 3 people had steady attitude. As for health education with group discussion method, there were 18 people had decreased attitude after group discussion compared to prior discussion, 14 people improved their attitude and 1 person had steady attitude. Based on the Wilcoxon test, it showed that there was no significant difference in both health education by using lecture method and group

discussion method towards the respondents' attitude pre and post-test, in the effort to empower the community to obtain STBM facilities (see table3)

Table 3. Comparison Respondent Attitude of Pre-Test and Post-Test with Lecture and Discussion Methods

Method	Value Pre and Post Test	n	Z	p
Lecture	Decrease	15	-0320	0,749
	Increase	15		
	Steady	3		
Group Discussion	Decrease	18	-0,122	0,903
	Increase	14		
	Steady	1		

Action

Based on the Wilcoxon test output that showed comparison of 'Action' prior and after health education by using lecture method. There are 9 people had decreased practice after health education by using lecture method compared to prior lecture, 17 people had improved practice and 7 people had steady practice. Based on Wilcoxon test, it showed that there was no significant difference in practice between respondents' pre and post-test of health education by using lecture method while for group discussion method there was significant difference to respondents' practice, in the effort to empower community to obtain STBM facility (see Table 4).

Table 4. Comparison Respondent Action of Pre-Test and Post-Test with Lecture and Discussion Methods

Method	Pre and Post Test Score	n	Z	p
Lecture	Decrease	9	-1,686	0,92
	Increase	17		
	Steady	7		
Discuses*		33	-3,038*	0,005

Note: *Paired t-test

Effectiveness of Health Education by Lecture and Group Discussion Methods on Improving Knowledge,

Attitude and Action of STBM Management

Based on Mann-Whitney value test, it was found that Z test statistical value were: knowledge -4.062, attitude -3.188 and action -1.582, while the sig.2-tailed value were: knowledge 0.000 <0.05, attitude 0.001 <0.05 and action 0.114 > 0.05. Based on the output rank, we can see that the mean value of respondents' knowledge, attitude and action who had been given health education by using lecture method is greater than the mean value of respondents who had been given health education by using group discussion method which were: knowledge (42,98 > 24,02), attitude (41.02 > 25.98) and action (37.21 > 29.78).

Table 5. Effectiveness of Health Education by Lecture and Group Discussion Methods in Improving Knowledge, Attitudes and Action of STBM Management

Variable	Mean Rank	Z	p
Knowledge Lecture Discussion	42,98 24,02	-4,062	0,000
Attitude Lecture Discussion	41,02 25,98	-3,188	0,001
Action Lecture Discussion	37,21 29,78	-1,582	0,114

DISCUSSION

'Knowledge' Pre and Post-test Differences between Lecture and Discussion Methods

This result means that after the respondents were given health education by lecture method and group discussion method respectively, there respondents whose knowledge were increased, decreased or even steady of their pre and post-test, but the increased knowledge of both group were different, where in lecture group, the increased knowledge of post-test was higher than the discussion group.

The presence of respondents whose post test score is lower than the pre-test score was probably due to get

boring in reading the distributed questionnaires so that they are lazy to re-read after being treated, but they just fill it out without reading it.

Based on p-value of pre and post-test knowledge with lecture method, p-value was; 0.001 or $\alpha (0.05)$ and the group discussion method p-value was; 0.082 or >math>\alpha (0.05)</math>. It can be concluded that there was difference of pre and post-test knowledge in lecture method but there was no difference of pre and post-test knowledge in group discussion method

This suits with the Notoatmodjo opinion⁵ who said that the lecture method is a good method for the target of people with both high and low education. This lecture method is effective when the speaker can master the target of the lecture. Health education with lecture method was conducted in Adolang Village, besides guided directly by the Researcher Lead, also involved the Health Center Sanitarian, because they were considered very familiar with the target background, because the village has been fostered for about 3 years so they provides material according to the necessity and language which can be understood by the target^{6,7}.

In line with the above theory, this study is also in line with the study result conducted by HendraHibrata⁸ which aims to see the different knowledge about STI (sexually transmitted infection) by using lecture, discussion and leaflet method at SMK Tangerang Airport. The result of this study indicates that there is an increase in knowledge after being given health education by lecture, discussion and leaflet method, which obtained smaller ρ value ($\alpha = 0.05$).⁹

Other study result that also support this study was also conducted by Mely Sakiyah, Jaji and PutriWiditaMuharyani⁹ about the effectiveness difference of discussion and lecture method on the worker knowledge about personal protective equipment (PPE) in welding workshop of Bukit Lama Sub-district, Palembang. In this research, it is found that there is difference of respondent knowledge between prior and after health education by discussion method with p value 0,001 and also there is difference of respondent knowledge between prior and after health education by lecture method with p value 0,001.

'Attitude' Pre and Post-test Differences between Lecture and Discussion Methods

This result means that after the respondents were given health education by lecture method and group discussion method respectively, there respondents whose attitude pre and post-test were increased, decreased or even steady, but the increased attitude of both group were different, where in lecture group, the participants number who had increased and decreased attitude post-test are the same, while in discussion group, the participants number with decreased attitude was higher than the increased one after they were given health education.

Based on p-value attitude pre and post-test, p-value of lecture method: $0,749 > \alpha (0,05)$ and p-value of discussion method: $0,903 > \alpha (0,05)$. It can be concluded that there are no difference of attitude pre and post-test both in lecture and discussion methods.

This study was also in line with the study result conducted by Aris Ardila, Abduh Ridh, Abdul HarisJauhari¹¹ a case study on teenagers class X IPA at SMA Negeri 01 Bengkayang about the effectiveness of group discussion and lecture methods to increase adolescent knowledge and attitude regarding premarital sex behavior. The result of this study indicates that there are differences in students attitude prior and after given counseling using lecture method.

However, there is study result that opposite with this study result which is a study conducted by Dwi Novrianda¹² regarding the effectiveness comparison of health education to the mother knowledge and ability to treat infants ARI (acute respiratory inspection) at Padang Pasir & Health Center. Study result which conducted to the respondents regarding the ability of treating under-five children with ARI after being given health education through lecture method in Padang Health Center and Pauh Health Center area showed significant difference with p value = 0,004. The ability of mothers in ARI treatment is the ability of mothers in treating children with ARI. The increasing of mother's ability to take care for children under five with ARI is influenced by the method usage in providing health education. Dwi research has opposite result study with this study result which actually there is no significant difference in lecture methods to change the respondents actions.

Comparative effectiveness of Lecture and Discussion method

This study result indicates that the lecture method is

more effective in improving the knowledge, attitude and action of respondents about STBM in Majene District. This can be seen from the average score of knowledge, attitude and action are higher in the lecture method group compared with the average score of knowledge, attitude and action in the group of group discussion method.

This due to in the discussion method all participants are required to be actively involved in expressing their opinions and experiences, as well as discussing STMB materials which are distributed until getting the appropriate conclusion. While based on the observation to the respondents, in this case the discussion participants are divided into three groups, each consisting of 11 people, generally only acting as a listener and not able to play an active role in the discussion process, they prefer to be silent and heard than to convey the idea.

Discussion and lecture are methods that can be used in health education to measure someone's knowledge. Discussion and lecture methods will be effective in improving knowledge if the delivery way is conducted properly. The difference between these two methods can be seen through the way the information is delivered, but both methods have its respective advantages that can improve someone's knowledge.

Through the way of delivering information, discussion method is able to more develop thinking ability of each participant in expressing the opinion that can trigger the interaction and reciprocity of information from each participant so that the information obtained can be diverse and can be more increasing the participants' knowledge. While in lecture method the one who plays more role is the researcher because the communication that occurs only one direction. Participants are more likely to listen and are given few opportunities to ask if there is something that is not understood so that the information obtained is also not too broad⁵.

However, this study has the opposite result to the study conducted by Tarigan in his thesis regarding the effectiveness of group discussion and lecture methods towards knowledge and attitude about reproductive health in adolescents at the Pendidikan Harapan Mekar Foundation, Medan, which stated that the method of group discussion is more effective in improving students' knowledge and attitude about adolescent reproductive health. The differences in the result with this study is due to differences in respondents' characteristics.

CONCLUSIONS

There is influence of health education by lecture method but there is no influence of health education with group discussion method to the knowledge in the effort to empower the community to obtain STBM facilities

There is no influence of health education by lecture and group discussion methods to the attitude in the effort to empower the community to obtain STBM facilities

There is no influence of health education by lecture method but there is influence of health education by group discussion method to the action in the effort to empower the community to obtain STBM facilities

Lecture method is more effective in changing knowledge, attitudes and practice of the respondents in the effort to empower the community to obtain STBM facilities

Changes in Attitudes in Stunting Prevention through ASAKI Animation Media for Pregnant Women

Andi Salim

Department of Nutrition, Health Polytechnic Ministry of Health Mamuju, West Sulawesi

ABSTRACT

The prevalence of short-sized toddlers is a public health problem if the prevalence is 20% or more, according to WHO, The percentage of short-sized children under five in Indonesia is still high and it is a health problem that must be addressed. Based on data from the Basic Health Research / Riskesdas in 2013 there were about 37% (nearly 9 million) of children under five experienced stunting and in worldwide, Indonesia is the country with the fifth largest stunting prevalence and West Sulawesi is the second highest for stunting problems in Indonesia (48%). ASAKI (Animation Media Development Model (to overcome Early Stunting) is one of the educational methods created to provide understanding to pregnant women especially that West Sulawesi is in an emergency stunting condition. The purpose of this study was to see changes in attitudes in the prevention of stunting through ASAKI Animation media. The type of research used is the Quasi Experiment study, with 57 samples. The results showed that there were differences in attitudes before and after intervention until 1 week after the intervention, then there was a significant difference in the attitude of pregnant women before and after intervention until 4 weeks after intervention. Based on the results of this study can be formulated further research related to behavioral models that are effective against the prevention of stunting.

Keywords: *Stunting, Attitudes, ASAKI Animation Media*

INTRODUCTION

Stunting or short-sized child is described as a toddler with a height lower than the height of a toddler's height in his age. Stunting is one of the characteristics that indicates the occurrence of recurrent and long-term nutritional problems. In early childhood, stunting is known to have a lower level of intelligence, motor ability, and neurosensory integration. Thus, stunting during infancy will affect the quality of life at school age, adolescence, and even adults¹.

The prevalence of short-sized toddlers is a public health problem if the prevalence is 20% or more, according to WHO,. The percentage of short-sized children under five in Indonesia is still high and it is a health problem that must be addressed. Compared to several neighboring countries, Indonesia is the country with the fifth highest prevalence of stunting for Asian countries compared to Myanmar (35%), Vietnam (23%), Malaysia (17%), Thailand (16%) and Singapore (4%) (UNSD, 2014). The Global Nutrition Report in 2014

shows that Indonesia is one of 117 countries that have three nutritional problems, such as stunting, wasting and overweight in toddlers. The magnitude of the stunting problem in Indonesia in 2012 is estimated to have 162 million short-sized toddlers. it is projected to be 127 million in 2025².

Based on data from the Basic Health Research / Riskesdas in 2013 there were about 37% (nearly 9 million) of children under five experienced stunting and worldwide, Indonesia is a country with the fifth largest prevalence of stunting. The percentage of nutritional status of short-sized (short and very short) toddlers in Indonesia in 2013 was 37.2%, compared to 2010 (35.6%) and in 2007 (36.8%) did not show a significant decrease / improvement. The highest percentage in 2013 was in East Nusa Tenggara Province (51.7%), West Sulawesi (48.0%) and West Nusa Tenggara (45.3%)³.

According to the results of Nutritional Status Monitoring (PSG, 2015) 29% of Indonesian toddlers are in the short category, with the highest percentage in the

provinces of East Nusa Tenggara and West Sulawesi. Whereas the 2016 PSG results, short-sized toddler presentations were 27.5% and the highest percentage were in East Nusa Tenggara and West Sulawesi Provinces. Both the data collection above shows that West Sulawesi is in the second highest position for stunting problems.

Stunting can specifically originate from a pregnant mother. Nutritional conditions of pregnant women, before becoming pregnant even afterwards will determine fetal growth. Pregnant women who are malnourished will be at risk of giving birth to low birth weight babies, and this is the main cause of stunting⁴. After birth, babies who are not breastfed properly will be at risk of suffering from various infections due to eating patterns that are not sufficiently nutritional and unhygienic. Feeding babies and children determines the growth them. After the age of 6 months the child needs to get nutritional intake that can fulfill the needs of micronutrient intake, macro nutrition and safe⁵

Interventions that can be used to overcome child stunting are prenatal and postnatal as specific and sensitive interventions according to the World Health Organization. Along with this, prenatal and postnatal interventions through nutritional improvement movements focus on the first 1000 days of life at the global level, through the SUN (Scaling Up Nutrition) strategy and referred to as the National Movement for Nutritional Awareness in Indonesia.

Specific nutrition of intervention efforts for stunting toddlers were focused on the 1000 First Day of Life (HPK) group, such as Pregnant Women, Breastfeeding Mothers, and Children aged 0-23 months, because the effective short-sized toddler prevention was carried out on 1,000 HPK. The 1,000 HPK period includes 270 days during pregnancy and the first 730 days after the baby is born has been scientifically proven to be the period that determines the quality of life. Therefore, this period is called as a “golden period”, “critical period”, and the World Bank (2006) calls it a “window of opportunity”. The adverse effects that can be caused by nutritional problems in that period, in the short term are disruption of brain development, intelligence, impaired physical growth, and metabolic disorders in the body. Whereas the bad consequences that can be in the long term caused decreased cognitive abilities and learning achievement, decreased immunity so that it is easy to

get sick, and a high risk of diabetes, obesity, heart and blood vessel disease, cancer, stroke, and disability in old age and uncompetitive work quality which results in low economic productivity.

ASAKI Animation Media Development Model (to overcome Early Stunting) is one of the animation media developed as a form of nutritional education which aims to provide information to pregnant women about stunting. Animated media is used as a facility of nutritional education because the messages conveyed can be more interesting and understood, so that the target can learn the message until deciding to adopt positive behavior and audiovisual media also has advantages that are not available in other media, including all senses, face to face, and more interesting because there are sounds and moving images⁶

this animation will contain information in the form of understanding, causes and prevention of stunting. This method is carried out on classes of pregnant women in the Binanga Health Center area which has been formed and then given nutritional education regarding the risk of stunting using animated media. Based on the explanation above, researchers will measure changes in attitudes before and after the use of ASAKI animation media.

MATERIALS AND METHOD

The research's type used the Quasi Experiment study, which wants to see the influence of the ASAKI Animation media development model on attitudinal changes in pregnant women about prevention of stunting in the Binanga Health Center area on 2017.

The study was carried out in the working area of the Binanga Health Centre of Mamuju District. In 2017. The population in this study were all pregnant women in the Binanga Health Center work area in 2017. Samples were taken by purposive sampling as many as 57 people.

RESULTS AND DISCUSSION

The results of the study showed that the characteristics of respondents based on age group, the highest result was in the age group 19-29 years (36.8%) where respondents in the age group 19 to 38 years. Characteristics of respondents based on the level of education, the highest was in the group graduating from high school (42.1%), the level of education was in the

group not schooled to college. Characteristics of Respondents based on employment, the highest was in the non-working group (91.2%) (Table 1).

Table 1. Characteristics of Respondents by Age Group, Level of Education and Employment

Characteristics of Respondents	n	%

The analysis' result by paired samples test found that shortly after the intervention of the pre-test the average test was 64.91 and the post test was 66.88 with a value of $p = 0.001$. This means that the average attitude score results of the pre and post test respondents increased and showed that there were differences in attitudes of respondents before and after being given counseling through ASAKI animation media with a significance level of $p < 0.05$. The results of the analysis after 1 week intervention mean pre-test were 64.91 and 66.89 post tests with $p = 0.001$. This means that the average

attitude score results of the pre and post test respondents increased and showed that there were differences in attitudes of respondents before and after being given counseling through ASAKI animation media with a significance level of $p < 0.05$. The results of the analysis of 4 weeks of pre-test intervals were 64.91 and post test were 67.40 with $p = 0.001$. This means that the average attitude score results of the pre and post test respondents increased and showed there were differences in attitudes of respondents before and after being given counseling through ASAKI animation media with a significance level of $p < 0.05$ (table 2).

Table 2. Analysis' Results of Paired Samples Test of Attitude Variable based on Intervention Time

Intervention duration	average	Sig
Shortly After Intervention		
Pre Test	64,91	0,001
Post Test	66,88	
One Week After Intervention		
Pre Test	64,91	0,001
Post Test	66,89	
Four Weeks After Intervention		
Pre Test	64,91	0,001
Post Test	67,40	

Attitude is an operational form of behavior that is the inner response to the stimulus from outside the subject. Attitudes can be interpreted as the degree or level of suitability of a person towards a particular object. Attitude is a tendency to carry out certain actions against an object in a way that expresses signs to like or not to enjoy the object. Attitude is only part of human behavior⁷. Psychology views human behavior as a reaction that can be simple or complex. In humans, in particular and in various animal species, there are generally forms of instinctive behavior based on the nature to sustain life. One of the characteristics of an interesting human behavior reaction is its divergence. It means, one stimulus can cause more than one different response and several different stimuli can cause the same response. Kurt Lewin in Azwar, on 2009, formulated a behavioral relationship model which says that behavior was a function of individual and environmental characteristics. Individual characteristics include various variables such as motives, values, personality traits and attitudes that interact with other environmental factors in determining behavior. Environmental factors have great power in determining behavior, sometimes its strength is bigger than individual characteristics⁸. This is what makes predictions of behavior more complex. Behavioral problems are the cause of various health problems. Public health experts agree that to overcome this, an effort is needed in the process of public health education. It is expected that behavior changes will occur towards achieving healthy behavior through this process⁹.

According to Newcomb in Notoatmodjo suggests that attitude is readiness or willingness to act and is not an implementer of a particular motive. Attitude is not an action or activity, but it is a predisposition to an act of behavior, as well as the attitude of respondents to malaria is still a closed reaction¹⁰. The results of this study are in line with the research conducted by Andriani, et al that the differences in maternal attitudes were also shown in the ranking of minimum scores and maximum scores in the pre-test and post-test. The influence of personal experience is one factor that influences the formation of one's attitude. Personal experience must leave a strong impression to be able to become the basis of attitude formation. Attitudes will be easier to form if the personal experience involves emotional factors¹¹. The experience of mothers through the process of health education through ASAKI Media. The longer and more focused the mother follows the ASAKI educational video screening,

the more likely it is for mothers to understand things related to stunting and try to prevent it through changing attitudes. The influence of others is considered to be important and quite influential. In general, individuals are conformist or in line with the attitudes of people they consider to be important. This tendency is motivated, among others, by the desire to be affiliated and the desire to avoid conflict with people who are considered to be important¹². This research activity was carried out by gathering respondents at a place to watch ASKI's animated video as a form of education to respondents. Mother's willing to join in watching ASAKI animation videos certainly cannot be separated from the influence of others, whether support from family at home or perhaps calls and insistence from friends or neighbors or health cadres in the local area¹²⁻¹⁴. Personal experience and influence from other people that are considered to be important, indicate the occurrence of an increase in attitudes towards mothers of children under five due to the knowledge gained can generate understanding and confidence in their needs as a mother of toddler who also has to prevent stunting before entering the next pregnancy or at during the first 1000 days of life^{15,16}.

The results of this study are also in line with research conducted by Dewi and Mimin (2016) regarding the effect of nutritional education on feeding practice, which found that the interventions provided during the study could improve the attitude and feeding behavior of research subjects. The results of this study indicate that, the more frequent interventions given to respondents, the higher the attitude changes that occur in general^{13,14}.

CONCLUSION

Based on the results of the research that has been done it can be concluded that there are differences in attitudes before and after the intervention until 1 week after the intervention, then there is a significant difference in the attitude of pregnant women before and after intervention until 4 weeks (after the intervention).

ABSTRACT

A quantitative trait related to the strength of sensing behavior associated with stimuli. Behavior is all human action caused by encouragement and psychological desires as well as the effect of society and culture. This study aims to determine whether there is an influence between pornographic access to adolescent sexual behavior in MTS "X" kalipare. The design used in this study is quantitative descriptive, with a cross sectional study design. The population is all MTS X students as many as 150 students, with a sample of 109 respondents taken Simple Random Sample using a questionnaire. Then analyzed by person / product moment test. From the results of the study, the results for the category of pornography access in Kalipare MTS X are mostly classified as rare as 72.5%, while the good category is 25.7%, and the category never is 1.8%. For the category of sexual behavior, the results were mostly classified as quite as much as 65.1%, while the good category was 34.9%, and the less category was 0%. Based on the results of the test person / product moment in getting the results ($p = 0,000 < 0,05$, H_0 is rejected). Then it is known that there is an influence between the influence of pornographic access to adolescent sexual behavior in MTS X in Kalipare village. Accessing pornography is a deviant behavior, because it is expected to be the basis for making policies related to the use of social media in students as well as supporting government policies related to efforts to combat cases of sexual deviation.

INTRODUCTION

The development of information and communication technology has become one of the efforts to realize an advanced and intelligent generation of Indonesians. Information and communication technology can be used as a tool for students to expand their knowledge and develop themselves in order to achieve quality life. But on the other hand, the existence of communication and information technology tools actually creates a negative threat to children's behavior¹⁻⁴.

Indonesia in 2012 reached 60 million people or around 23.5% of the total population and of that number,

40% of them accessed the internet more than 3 hours a day. The number of internet users who use mobile phones reaches 58 million. Based on data obtained from Internet World Stats in 2012 Indonesia is the number eight largest internet user in the world after China, America, India, Japan, Brazil, Russia and Germany with a total of 55,000,000 users out of a total population of 359 million or as many as 2.3% of world internet users.

Internet users in Indonesia in 2014 have reached 82 million people. With these achievements, Indonesia is ranked 8th in the world. Of the number of internet users, 80 percent of them are teenagers aged 15-19 years. For Facebook users, Indonesia is ranked 4th in the world. The survey results from Frontier Consulting Group, adolescents aged between 13-19 years in six major cities in Indonesia in 2011 showed that 91.2% of teenagers have social media accounts. This percentage increased in 2012 where as many as 97.5% of teenagers had social

media accounts⁵⁻⁷.

The mass media currently also shows a lot of shows that highlight the pornography aspect which is believed to be closely related to the increase in various cases of sexual violence. The progress of communication technology that occurs at this time, has resulted in almost no power capable of controlling or censoring news and entertainment including news or impressions that are included in the pornography category.

Data from Statistics Pornography shows that as many as 12% of sites on the internet contain pornographic content. Every second there are 28,258 people viewing pornographic sites and from all types of data downloaded on the internet 35% download content containing pornography. Data on age of access to pornographic sites aged 18-24 years is 13.61%, age 25-34 years is 19.90%, age 35-44 years is 25.50%, age 45 - 54 years is 20.67% and age 55 years and over as much as 20.32%, and the average age of children who first access porn site sites is 11 years.

Based on preliminary studies that have been carried out in MTS "X", the results show that the total number of 9th grade students is as much as 50 students consisting of A class with 25 students, class B with 25 students. According to one BK teacher, in the 2009/2010 school year there were 2 students who quit / resigned from school and it turned out that after being traced the student came out due to an unwanted pregnancy (KTD). in the 2015/2016 school year there was one student who was expelled from school because the student had an unwanted pregnancy (KTD). Researchers interviewed 25 students on the "X" MTS by asking the question "Do students access social media every day?", 90% said accessing social media every day and 10% said it was rare because they did not have the facilities to access social media. The purpose of this study was to determine whether there was an influence between pornographic access to adolescent sexual behavior in the "X" MTS kalipare.

RESEARCH METHOD

The design used in this study is quantitative descriptive, with a cross sectional study design. The population is all MTS X students as many as 150 students, with a sample of 109 respondents taken Simple

Random Sample using a questionnaire. Then analyzed by person/product moment test.

RESULTS

Subject Characteristics

Table 1. Characteristics of respondents in this study include age, sex, education, parent's job, access to pornography and sexual behavior.

No	Karakteristik	ΣN	Σ%
1	Age (year) 13-17	109	100
2	Gender Man Female	48 61	44 56
3	Education No school Elementary school Junior high school Senior high school University	10 43 34 18 4	9,2 39,4 31,2 16,5 3,7
4	Parent's job Government employees Employees Entrepreneur Farmer etc	3 14 22 50 20	2,8 12,8 20,3 45,9 18,3
5	Access to pornography Often Rarely Never	28 79 2	25,7 72,5 1,8
6	Sexual behavior Good Enough	38 71	34,9 65,1
	Total	109	100

STATISTICAL TEST RESULTS

Table 2. Pearson Statistical Test/Momet product Pornographic Accessibility With Sexual Behavior

Correlations			
		Access to pornography	Sexual behavior
Access to pornography	Pearson Correlation	1	.681**
	Sig. (2-tailed)		.000
	N	109	109
Sexual behavior	Pearson Correlation	.681**	1
	Sig. (2-tailed)	.000	
	N	109	109
**. Correlation is significant at the 0.01 level (2-tailed).			

The table above explains that the results of the product moment / Pearson analysis test obtained a p value of 0,000 then H0 is rejected and it can be concluded that there is an influence of pornographic access to adolescent sexual behavior in the “X” MTS Kalipare.

DISCUSSION

Pornography Accessibility at MTs “X” in Kalipare Village

According to this study that pornography access in the “X” Kalipare MTs is often as high as 25.7%, while the rare category is 72.5%, and the never category is 1.8%. Teenagers often engage in conversation around sex, promiscuity, love, recreation, and so on as a result of being accustomed to seeing pornographic scenes. Teenagers are often seen walking hand in hand, embracing the opposite sex, hugging in public places without being awkward and shy. The results of a survey conducted during 2010 by an NGO regarding the frequency of accessing pornographic sites in Indonesia showed that the Indonesian people were in the fourth place in the world who opened internet for pornographic sites. In 2008 and 2009, the survey showed that Indonesians accessing the internet with the keyword “sex” are usually between 14 and 16 years old and 30 to 45 years old and spread evenly throughout Indonesia.

Based on the research conducted by the author, there are students who conduct pornography behavior as there are students who abuse the internet to access pornographic things, there are students who save porn

videos from internet downloads on their mobile phones, there are students who watch porn videos at rest or at hours empty at school, there are students who imitate pornographic scenes due to accustomed to watching porn videos, there are students who are alone and embrace the shoulders in the school environment, and so on.

Adolescent Sexual Behavior at MTs “X” in Kalipare Village

According to the data presented in the previous chapter that adolescent sexual behavior in Kalipare “X” MTs is known that most are classified as sufficient, namely 71 respondents (65.1%).

Adolescent pornography behaviors are adolescent sexual behavior related to biological needs or sexual needs as well as things that influence it such as pornographic images and videos, which are based on emotional aspects that play a role namely sexual desire to get pleasure or enjoyment of sexual organs through intercourse, making love and dating. Another opinion says that the behavior of teenage pornography is all forms of sexual behavior that is influenced by pornographic content that gives rise to sexual fantasies that encourage someone to do pornographic behavior^{3,12,13} argues that in relationships especially during courtship, adolescents experience an increase in hormones inside themselves so that dreams or fantasies of sexual acts arise because of natural sexual desire, so that it requires channeling in a form of behavior. certain behavior.

The Influence of Pornography Accession to Adolescent Sexual Behavior in MTs “X” in Kalipare Village.

The results of the product moment / Pearson analysis obtained p value of 0.000 where 0,000 is less than 0.005, then H0 is rejected and it can be concluded that there is an influence of pornographic access to adolescent sexual behavior in MTS “X” Kalipare.

Increased sexual drive makes teenagers try to find various sexual information. From the information sources they managed to get, generally only a few teenagers get sexual ins and outs that are not necessarily appropriate, for example at school, discussing with friends, books on sex, mass media or the internet. Teenagers today can easily access sites, images or shows that smell porn through internet on their mobile phones.

Instilling religious norms is considered to have a very large role to face the globalization situation which results in a shift in the value of life. Teenagers who adhere to religious norms will be protected or able to withstand the adverse effects of their environment. In addition, sexual education can also be done to overcome adolescent sexual problems. Sexual education is a way of teaching that can help young people to deal with life problems because of sexual drive. This education intends to explain everything related to sex and sexuality in a reasonable form. In this case sexual education should ideally be given first time by parents at home, remembering that the one who knows best about the child’s situation is his or her own parents¹³⁻¹⁷.

CONCLUSION

From the results of the questionnaire on pornography access, the majority of respondents rarely access pornography as many as 79 respondents (72.5%).

From the results of the questionnaire on sexual behavior, it was found that the majority of respondents had enough sexual behavior as many as 71 students (65.1%),

The results of the statistical test Effect of Pornography Accessibility on adolescent sexual behavior from statistical analysis obtained Pearson test results of 0,000 where 0,000 is less than 0.005 then H0 is rejected and it can be concluded that there is an influence of pornographic access to adolescent sexual behavior in the “X” MTS Kalipare.

Developmental and Growth Delays (Stunting) on Students of Salulayang Elementary School in Mamuju Regency

Yudianti

Nutrition Department, Health Polytechnic Mamuju Health Ministry, Jl. Shaft Mamuju Kalukku Km. 16 Tadui, West Sulawesi, 91511 Postal Code, Indonesia

ABSTRACT

Stunting in Indonesia becomes national problem because the percentage of stunting is above the tolerance which is only 20% set by the World Health Organization (WHO, 2010). Results of Basic Health Research (2013), the incidence of stunting nationally occurred about 30.7% in children aged 5-12 years. Stunting percentage in West Sulawesi Province is above the national percentage. The incidence of stunting is very closely related to zinc levels in the body that can be observed through hair. The study was a cross-sectional study, conducted on all students of Salulayang Elementary School in Mamuju Regency. Hair samples were examined in Makassar health laboratory using the AAS (Atomic Absorption Spectrophotometry) method. The results showed that hair zinc level with the incidence of stunting in elementary school children had no correlation with $p > 0.005$ because this study only have a small proportion of children who experienced stunting and school-age children were in static growth periods that is not too sensitive to detect zinc deficiency. Researcher needs more observation to find out correlation to hair zinc levels, such as environmental factors (air, soil, water) and infectious diseases.

Keywords: *Stunting, Zink Level, growth delay, environmental factors and infectious diseases.*

INTRODUCTION

Stunting is a growth delays in a child with an index of body length or height below -2 SD growth according to WHO. This occurs due to inadequacy food intake that insufficient as a daily need as well as frequent children experiencing infectious diseases during the first 1000 days of life¹.

Stunting in Indonesia becomes national problem because the percentage of stunting is above the tolerance which is only 20% set by the World Health Organization². Results of Basic Health Research (2013), the incidence of stunting nationally occurred about 30.7% in children aged 5-12 years. SEANUTS data shows that growth based on 4 indicators in pre-school children and school age in Indonesia is still below WHO standards³.

The main factor causing zinc deficiency is the inadequate daily intake of zinc. Low Zn absorption due to phytate fiber from vegetal foods, disease status (hypoalbumin, impaired zinc absorption and infection), and physiological status (rapid growth and pregnancy).

Zinc deficiency in children can result in loss of appetite, disorders of taste, growth disorders, alopecia, immune dysfunction, hypogonadism, long illness and cognitive impairment. Zn status measurement can be measured through various parameters such as plasma / serum levels, hair and red or white blood cells. The tissue that contains lots of Zn, is in the hair. Analysis of Zn level in hair can describe long-term Zn status, which is more sensitive and stable than Zn level in blood or urine⁴. Analysis of Zn levels in hair describes more accurately chronic-zinc levels in the past so it is appropriate to measure zinc levels in a long term of malnutrition.

The low level of zinc in infancy is visible in growth delay and lack of appetite which has an effect on hair zinc levels $< 1.07 \mu\text{mol/g}$ ⁵. Study in Malang Regency showed that there is a correlation between hair zinc levels and the incidence of stunting in elementary school children. Hair zinc levels show stable results, are not easily fluctuated, most trace elements have a high concentration of hair than the other parts of body⁶⁻⁷.

METHODS OF RESEARCH

Types of research

The type of research conducted in this study was analytic research using a *cross sectional study* design, to determine the correlation between independent variables (Zn levels in hair) and the dependent variable (Stunting incident) which was observed simultaneously at one time period.

Research sites

The study was conducted at Salulayang elementary School, Mamuju regency, with the consideration that the school was located outside Mamuju City and was a reflection of the native population of Mamuju Regency. It is contrast to elementary schools which are located in the center of Mamuju Regency with students coming from outside and from within Mamuju regency. Research was conducted in May to November 2016.

Population and Sample

The population and samples in this study were all students of Mamuju Regency Salulayang Elementary School by using total sampling technique. Samples taken were students in grades 1-5

Research Instruments

Anthropometry instrument consisting of weight scales in digital stepping scales with accuracy of 0.1 kg and a height measuring device that is *microtoice* with accuracy of 0.1 cm. Laboratory examination to determine zinc levels in children's hair. Measurement of zinc hair content was carried out in 2 stages: wet destruction process and reading of Atomic Absorption Spectrophotometer (AAS) which was taken for 3 times. Hair samples taken by cut around 4-5 cm from the scalp or if the hair is less than 4 cm, it is taken from the tip to the base of the hair. Hair is taken randomly in the occipital head using stainless steel scissors. Samples of hair taken are approximately 50-80 mg and stored in polyethylene

plastic. Samples of hair that have been collected are dried and washed with water and then put into Erlenmeyer and added 10 mL of aquaregia consisting of concentrated HCl (chloric acid) and HNO₃ (nitric acid) with a ratio of 3: 1. Then the hair sample is allowed to stand for 1 night, then heated until boiling using a hotplate until the hair sample is mixed, then it got to be cooled. Samples of hair that have been mixed into solvent are being diluted using aquadest to a volume of 25 mL. The solvent is a result from destruction of hair samples to be analyzed by AAS reading. AAS readings of hair zinc levels are expressed in parts per million (ppm).

RESULTS

The study was conducted at Salulayang Elementary School in Mamuju Regency during June - October 2016. The sampling technique was total sampling technique, by taking all students as many as 90 students as samples study. Salulayang Elementary School is one of the primary schools located in Mamuju District, Bambu Village, which is located on the Salulayang street. Salulayang Elementary School is one of the public elementary schools in Mamuju Regency.

This study began with an assessment of all students of Salulayang Elementary School in Mamuju Regency by doing anthropometric measurements in body weight (BB) and height (TB) of all students. Hair samples are used as a *biomaker* to determine zinc levels. Analysis of Zn levels in hair describes more accurately chronic-zinc levels in the past so it is appropriate to measure zinc levels in a long term of malnutrition. The hair sample taken from occipital head hair (back of the head) along 1.5 - 3 cm from the scalp with a total hair weight per sample of 0.3-0.5 grams. Examination of hair zinc levels using the Atomic Absorption Spectrophotometry (AAS) method with Perkin Elmer spectrophotometer at the Makassar Health Laboratory in August - October 2016.

Zink Levels (Zn) Toward Stunting

Table 1. Correlation between Zink Hair Levels and Stunting

Zn Level	Sample				Total		P ^a
	Stunting		Non-Stunting				
	n	%	n	%	n	%	
Less	5	71,4	2	28,6	7		0,12
Normal	33	40,0	50	60,0	83	100,0 100,0	

^aFisher $p < 0,05$

Table 1 shows that zinc levels in 83(92.2%) primary school students were normal and the results of statistical analysis showed $p > 0.05$ ($p = 0.12$) so that there was no correlation between the incidence of stunting and zinc hair levels on students. This research is similar with Oktiva BR, Adriyani M's research; Nur, R. et.,al^{8,9} that there is no difference in zinc levels.in toddlers either stunting or non-stunting. Zink (Zn) is a trace element that plays an important role for growth and reproduction, the immune system. The low regulation of growth hormone can inhibit linear growth. Zinc deficiency results in impaired bone development, delayed child sexual maturation, hair loss (alopecia), and vitality decreased.

Zinc in the hair can provide information on past nutritional status because zinc deficiency will affect hair growth. Analysis of zinc levels using hair is also more stable because it is not much affected by daily food intake and changes in zinc levels which occur in periods of 3-6 months or even more. High levels of zinc hair can be influenced by long-term diet, gender, age, coloring, shampoo, economic status, consumption of drugs, supplements, smoking habits and environmental status (air, water, soil)¹⁰⁻¹², The low level of zinc hair in children is an indicator of low zinc status in the body, but zinc levels in normal hair as in this study cannot fully describe the body's zinc status. High levels of hair zinc can also be influenced by external factors such as dust, dirt or shampoo, and has not been observed. Beside school age children is a relatively static growth period.^{13,14}

CONCLUSION

Hair zinc levels with the incidence of stunting in elementary school children have no correlation because the age of the sample is in a period of static growth as well as the level of zinc hair can be influenced by

external factors such as shampoo, dust, dirt.

ABSTRACT

The Linear Feedback Shift Register is utilized in testing for ASIC chips by producing pseudo random patterns. This compacts with low power LFSR's design through the use of GDI method. The GDI method is the low power technique utilized to executing the different advanced circuits. This method utilizes 2 transistors to configure quick and low power circuits with enhancement in features of power. The conventional and GDI technique is used to execute the LFSR in Cadence Virtuoso at 90nm technology. In previous work 4-bit LFSR is designed in cadence tool in 90nm technology and we are proposing the same work in 8-bit LFSR in 45nm cadence tool. The power and delay values are calculated and compared with traditional CMOS logic. Comparative analysis shows up to 45.4 % in power in Gate Diffusion Input technique. The area of the circuit is reduced in this technique when compared to CMOS. The analysis shows the 20% reduction in area. In chip manufacturing method, diminishment in size of chip retains great concern for power dissipation. The testing of low power has become a significant problem like power dissipation through testing mode will be high as compare with typical mode. Hence the GDI technique is most efficient than CMOS.

Keywords: Logic Gates, Transistors, CMOS technology, VLSI, Built in self test

INTRODUCTION

Linear Feedback Shift Register (LFSR) will be a shift register whose input bit is a linear function of its past state. The X-OR gate may be utilized to give response to the register¹ that moves from left to right. The maximum arrangement holds all probable state except the "0000" state. Typically XOR gate will be favored for linear function for single bits. Therefore, an LFSR is frequently a shift register whose input bit will be driven by the X-OR (Exclusive-or) of a few bits of the complete shift register value¹. An LFSR could a chance to be identified through its generator polynomial over a Galois field^{2,3}

The starting value of the Linear Feedback Shift Register is termed as seed. Since the procedure of the register is deterministic, the vast number of values happening from the register will be totally decided by its (or present) state. Correspondingly, the register has permanent probable conditions it should enter a rehashing cycle⁶. The arrangement of numbers made through LFSR or its X-OR counter segment might be treated as the natural binary code or Gray code⁷ the

settlement of taps for reaction in a Linear Feedback Shift Register could a chance to be proclaimed in finite field arithmetic with a polynomial of mod 2. The polynomial's coefficients should be 0's or 1's.

The vast number for Linear Feedback Shift Register's output may be dependent upon determinism. You might envisage the following state just when you recognize the current state and the sequence of the X-OR gates in Linear Feedback Shift Register. It will be not conceivable when irregular occasions happen. It will be significantly simpler to execute the following state, with minimal-length LFSRs, as there are just an effectively set amount of them to every length. The stream for yield will be reversible a LFSR for comparative taps will happen through the yield management in opposite order. Subsequent state just when you recognize the present state and the sequence of the X-OR gates in the Linear Feedback Shift Register. It is not probable when irregular occasions happen. It is much simpler with figure those next state, with minimal-length Linear Feedback Shift Registers, as there is only an effortlessly finite number of them for every length⁸. The stream of

yield may be reversible a Linear Feedback Shift Register with comparative taps will happen through the yield succession for opposite order.

Now-a-days power consumption is considered as a major design concern due to the fast development in the technology of portable devices and mobile communications that uses portable power supplies. The requirement of low-power systems has prompted the development of basic cells that are more power efficient. While making an attempt to decrease the power⁹ consumption, maintaining the high performance is the most challenging task. The intensified research efforts in low-power microelectronics.

The “VLSI systems” have been in demand due to massive growth in the usage of mobile communication devices and technology scaling. Today, there is a high demand for low-power small-area high-throughput circuitry for portable applications. Therefore, for microprocessor and system component design, circuits with low power consumption are the first choice. The battery technology does not increase at par with the microelectronics technology and for the mobile systems the available power is limited.

Executing and simulate of the LFSR in the GDI method and executing it in sub threshold, power consumption, and decreases the power and are delay product with respect to the conventional CMOS circuits. The binary logic has been broadly utilized in the electronic^{10, 11} fields. It is traditional and more than the multiple valued logic. Nevertheless, along the electronic industry and the information booming, the absences of binary circuits initiated to develop.

Proposed Architectures

In this chapter inverter, NAND gate, D-Flip Flop, X-OR gate and LFSR has been designed in Cadence Virtuoso tool. And their features are deliberated.

Inverter

The inverter is elementary gate in electronics. It contains of a PMOS (P-channel Metal Oxide Semiconductor) and NMOS (N-channel Metal Oxide Semiconductor) linked as shown in Fig.4.1. It yields the output that is the exact opposite of input. The working of inverter is same in GDI and CMOS technique.

CMOS based NAND gate

The NAND gate is the two input gate and the NAND gate is the universal gate. The NAND gate’s outcome is logically 1, when one of the inputs is low. Whether both the inputs are high then the output is logically 0.

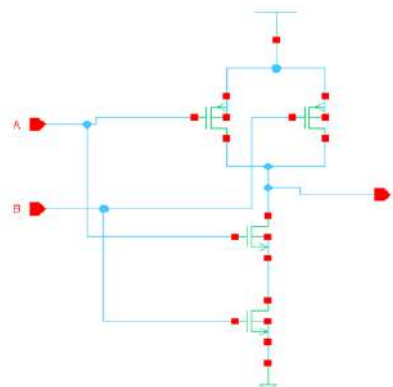

Figure.1. CMOS NAND architecture

CMOS based X-OR gate

The X-OR gate is two input gate. The X-OR gate’s output is logically 1, when one of the inputs is logic 1. If both the inputs are equal, that is logic 1 or logic 0. Then the output is logically 0.

Figure.2. CMOS X-OR architecture

CMOS based D-flipflop

The CMOS D-Flip Flop contains 4 inputs. In which D & CLK are synchronous inputs and CLEAR & PRESET are asynchronous inputs. The D-Flip Flop’s output is depends on the CLR and PR values. The output is same as input when the CLK input is active low and PR & CLR values. CMOS D-Flip flop architecture.

GDI based X-OR gate

The GDI based X-OR consists of less number of transistors. The output of the GDI X- OR is logically 1, when one of the inputs is high. The output is logically 0, when both the inputs are equal that is either logic 0 or logic 1.

GDI based D-FlipFlop

The GDI D-Flip Flop has 3 inputs. In which D & CLK are synchronous inputs and PRESET is asynchronous inputs. The D-Flip Flop's output is depends on the PRESET value. The output is same as input when the CLK input is active low and Preset is low.

CMOS based LFSR

The Linear Feedback Shift Register is a shift register whose input bit is a linear function. It is a shift registers that when clocked changes the signal through the register from one flip flop to next flip flop.

The Linear Feedback Shift Register's primary value is termed as seed, and due to the procedure of the register may be deterministic, the arrangement of values generated by the register is totally confirmed by its present state. Similarly, due to the register has a limited number of probable states, it should inevitably enter a rehashing cycle. Nevertheless, a Linear Feedback Shift Register with a well-selected feedback function could transform an arrangement of bits that need a long cycle and that seems irregular in nature.

Figure 3. CMOS LFSR architecture

Several outputs are mixed in X-OR configuration to create a feedback device. A Linear Feedback Shift Register might be created by implementing X-OR on the yields of 2 or more flip flops together and serving those yields back into the input of one of the flip flops as depicted in Fig.3.

METHODOLOGY

GDI Architecture

The Gate Diffusion Input permits to execution of a extensive variety of complex logic functions utilizing two transistors only. The inputs are straightforwardly diffused under the gates PMOS, NMOS transistors.

Consequently, it is termed as a Gate Diffusion Input. This strategy is suitability for fast, the low power circuits decreasing to the number transistors as contrasted with CMOS⁴. This strategy will be dependent on the basic mobile as demonstrated in the figure.

GDI X-ORGATE

X-OR Gate is implemented and the comparison is done among typical GDI and CMOS methods and outcomes are stated. Among all the executed techniques Gate Diffusion Input consumes the least number of transistors and the least power. If one of the inputs is logic 1 then we will get the output as "1" if not the output is "0".

GDI Based Linear Feedback Shift Register

The Linear Feedback Shift Register is a sequential shift register whose input bit will be a linear function dissimilar to the majority commonplace gadgets whose operations and inputs are adequately predefined. The Linear Feedback Shift Register, when clocked changes the indicator through the register starting with particular case flip flop to next. A portion of the outputs are consolidated in X-OR configuration to structure a feedback mechanism. A linear Feedback Shift Register¹² might be shaped by executing the X-OR on the outputs of two or a greater amount of the flip flops together and bolstering the outputs back under the input of one of the flip flop.

LFSR is a combination of the logic circuits to generate a pseudo-random sequence of binary numbers. The LFSR X-OR gate is used as a feedback of series of flip flops. The generation of sequence depends on the choice of the taps given to X-OR. Primary value of Linear Feedback Shift Register is termed as seed value and the maximum sequence contains all possible states except the zero's states. The maximum length of the sequence is $2^n - 1$ where n is bitvector.

RESULTS

Input and Output Wave form of Inverter

The net (5) is the input pin and Y pin is the output pin. If the input signal is high or low the output will be inversion of the input signal. The Figure.4 below shows the input and output wave forms of the inverter.

Figure 4. Inverter waveform

The above Fig.5.1 depicts the power consumption of Inverter is 9.20 Nano watts and the delay is 20.8 nano sec and the supply voltage is 1 volt.

Input & Output wave form of NAND Gate

It is a two input NAND gate. The input pins and Y pin is the output pin. If one of the input signals is low then the output will be high. The Fig.5 below shows the input and output wave forms of the NAND gate in CMOS.

Figure.5. CMOS NAND waveform

Table.1. Comparison of power and delay values in NAND gate

Parameters	CMOS
Power (nw)	11.97
Delay (ns)	20.57

The above fig.5.2 it is evident the design of NAND gate in CMOS technique is an advantage of low power consumption. The power consumption of NAND gate in CMOS is 11.97 nano watts and the delay is 22.57 nano sec and the supply voltage is 1 volt.

Input and output waveform of X-OR inCMOS

It is a two input X-OR gate. The net (4) and net (5) are the input pins and Y pin is the output pin. If the input signal is 1 or 0 and 0 or 1 then the output will be high. The Fig.6 below shows the input and output wave forms of the X-OR gate in CMOS.

Input and Output Wave form of X-OR inGDI

It is a two input X-OR gate. The net (4) and net (5) are the input pins and Y pin is the output pin. If the input signal is 1 or 0 and 0 or 1 then the output will be high.

The Fig.6 below shows the input and output wave forms of the X-OR gate inGDI.

Figure.6. GDI X-OR waveform

Table.2. Comparison of power and delay values in X-OR gate

Parameters	CMOS	GDI
Power(nw)	14.15	9.34
Delay(ns)	25.5	15.08

The above Fig.5 it is evident the design of X-OR gate in GDI technique is an advantage of low power consumption. The power consumption of X-OR gate is 9.34 nano watts and the delay is 78.3 nano sec.

Table 3. Comparison of power and delay values in D-flip flops

Parameters	CMOS	GDI
Power(nw)	102.7	45.11
Delay(ns)	40.22	15.35

The above Fig.5 it is evident the design of D-flip flop in GDI method is an advantage of low power consumption. The transistors used for the D-flip flop in GDI and CMOS are not same. The power consumption of D-flip flop is 45.1 nano watts and the delay is 15.35 nano sec.

Table 4. Comparison of power and delay values in LFSR

Parameters	CMOS	GDI
Power(μ w)	17.22	6.71
Delay(ns)	65.97	25.25

The above Fig.6 It is evident the design of LFSR in GDI technique is an advantage of low power consumption. The transistors used for the LFSR in GDI and CMOS are not same. The power consumption of LFSR is 65.97 micro watts and the delay 25.25 nanosec.

Comparisons

Table 5. Comparison of CMOS and DELAY techniques

Parameters	Power(nw)	Delay(ns)	Number of Transistors
Inverter	9.20	20.8	2
CMOS X-OR	14.15	25.5	14
GDI X-OR	9.34	15.08	4
CMOS DFF	102.7	40.22	38
GDI DFF	45.11	15.35	20
CMOS LFSR	17.22	65.97	304
GDI LFSR	6.71	25.25	160

To analyze the 8-bit LFSR will be analyzed in table 5.5. The Investigation is carried at 45nm technology utilizing cadence virtuoso tool the yield waveform of the LFSR indicating the distinctive

arrangements acquired for circuit testing is showed in Figure 5.4. The correlation of DFF and Linear Feedback Shift Register in terms of number of transistors, delay and power utilizing GDI and conventional method is explained in table 5.4 and table 5.5. The execution of the circuit will be resolved in regard of power dissipation at 25 MHZ frequency is shown in Figure 5.8. The execution of the circuit may be resolved at supply voltage for 1 volt. The over table indicates development in power dispersal with expansion in supply voltage and recurrence of operation and additionally indicates the number of transistors need to configure GDI and CMOS.

CONCLUSION

A new GDI procedure to low-power configuration might have been introduced. An 8-bit CLA adder might have been created utilizing CMOS and GDI utilized as a test vehicle. Various high-level advanced circuits and logic gateways are executed in different techniques, and their experimental outcomes are deliberated. Correlations for existing TG systems and N-PG systems were conveyed out, demonstrating an dependent upon 45% diminishment for power-delay result in the test contribute GDI again CMOS Also huge upgrades the preferences about GDI method, specifically, Shannon-based outline algorithm, two-transistor usage of intricate logic functions, and in-cell swing rebuilding under specific working conditions, need aid exceptional inside existing low-power outline systems. This, together with sure estimation Also reproduction results, gives proof that GDI plan could improve the toolmaker about VLSI circlet designers. We trust that those exhibited comes about will sway further re- look exercises on the GDI strategy. Usage about different sorts for advanced and blended circuits must a chance to be conveyed out in request with figure out those fields for meandering the place GDI will be unrivaled over different styles.

ABSTRACT

The present work proposes the Image processing plays a vital role in medical diagnosis system. Out of various processing tools, image segmentation is very crucial in identifying the exact reason of disease. Image segmentation clusters the pixels into silent image regions i.e. regions corresponding to individual surfaces, objects or any part of objects. Various algorithms have been proposed for image segmentation. We have analyzed the various systems that have been developed to medical diagnosis analysis. Reviewing of these frameworks will be dependent upon level set strategies from claiming segmenting pictures. The theme, merits, faults from claiming Different frameworks will be talked about in this paper. Dependent upon that, another framework need been suggested to segmenting those MRI picture utilizing variety level situated calculation without re initialization for MRI image. Those framework could be used both to recreated and also genuine images.

Keywords: MRI, Segmentation Level set, Image processing

INTRODUCTION

Force level in homogeneity regularly happens previously, real-world pictures because of Different factors, for example, spatial varieties previously, brightening and imperfections from claiming imaging gadgets on particular, picture division might be extensively was troublesome to pictures with power previously, homogeneities because of those overlaps between the ranges of the intensities in the areas will fragment¹. This makes it incomprehensible will distinguish these locales in view of those pixel power. The individuals generally utilized picture division calculations generally depend around force homogeneity, Furthermore consequently would not appropriate with pictures with power in homogeneities. Clinched alongside general, power in homogeneity need been a testing challenge on picture division.

The level set method, initially utilized Concerning illustration numerical method to following interfaces What's more shapes¹⁴, need been progressively connected should picture division in the secret word decade^{2,4,5}. In the level situated method, forms or surfaces would spoken

to Likewise the zero level set of a higher dimensional function, as a rule known as An level situated capacity. For those level situated representation, those picture division issue could make figured Furthermore tackled Previously, a principled route In light of well-established scientific theories, including analytics of varieties and potential differential equations (PDE).

Most of region-based models need aid In light of the supposition about force level homogeneity. An ordinary sample will be piecewise steady (PC) models recommended over⁴, level situated techniques need aid suggested In light of a general piecewise smooth birch (PS) plan initially suggested Toward Mumford Furthermore shah¹³. These strategies don't expect homogeneity about picture intensities, Also consequently would equipped to section pictures for force level in homogeneities. However, these routines would computationally excessively awful exorbitant and need aid truly delicate of the introduction of the shape¹⁰, which incredibly cutoff points their utilities. Edge-based models utilize edge majority of the data to picture division. These models don't expect homogeneity from claiming picture intensities and along these lines could

make connected on pictures for power in homogeneities. However, this kind of strategies are as a rule truly touchy of the beginning states Also regularly endure from genuine limit spillage issues in pictures with feeble item limits.

In this paper, we recommend a novel region-based strategy to picture division. Starting with An for the most part acknowledged model from claiming pictures for force in homogeneities, we infer An neighborhood force level grouping property, What's more In characterize An neighborhood grouping paradigm capacity to the intensities to An neighborhood of every purpose. This nearby grouping paradigm is coordinated again those neighborhood focal point should define a vitality functional, which is changed over with a level set detailing. Minimization for this vitality will be attained toward an interleaved transform for level set advancement Furthermore estimation of the segregation racial inclination field. Concerning illustration a critical application, our strategy might be utilized to division and inclination revision about attractive reverberation (MR) pictures. Note that this paper may be a stretched out rendition for our preliminary fill in introduced in our meeting paper⁹.

Literature Survey

Mohamed Lamine ¹ the examination which addresses those infections of the mind in the field of the dream toward machine may be a standout amongst those tests as of late in medicine, the particular architects also specialists as of late propelled tests should do innovations for innovation pointed clinched alongside symbolism. This paper keeps tabs around another calculation for cerebrum division from claiming color pictures In view of fluffy order to diagnose faultlessly those area from claiming tumor and the region for epilepsy. Done a principal venture it returns by a fine division utilizing the calculation from (FCM). It At that point applies an test combination about fluffy classes. Those aftereffect may be a coarse segmentation, the place every locale is those unit for Primary locales developed from FCM. Those fluffy C-Means (FCM) grouping may be a iterative parceling strategy that produces ideal c-partitions. That standard FCM algorithm takes quite a while to segment an expansive information set. The recommended FCM system must peruse the whole information situated under a memory to transforming. Our Outcomes indicate that the framework execution will be hearty to diverse

sorts of pictures.

Matei MANCAS² our Scrutinize bargains for a semi-automatic region-growing division method. This system just necessities one seed inside the area for interest (ROI). We connected it to spinal line division at it also indicates outcomes to parotid organs or Indeed tumors. Moreover, it appears should a chance to be a all division technique concerning illustration it Might a chance to be connected for other PC dream domains that point medicinal imaging. We use both that thresholding effortlessness and the spatial data. Those gray-scale What's more spatial distances from the seed will every last one of different pixels are registered. By normalizing What's more subtracting with 1 we acquire that likelihood for a pixel to have a place with the same district Likewise the seed. We will demonstrate those calculation what's more demonstrate a few preliminary comes about which need aid swaying.

Weibei Dou[3]A skeleton from claiming fluffy data combination may be recommended in this paper to naturally section tumor regions about human mind starting with multispectral attractive reverberation imaging (MRI) for example, such that T1-weighted, T2-weighted Also proton thickness (PD) pictures. An from the earlier learning around tumors portrayed Toward radiology masters to diverse sorts from claiming mri will be extremely supportive with aide An programmed Also an exact division. However, the wording utilized toward radiology masters may be variable on expression about picture sign. So as to profit from claiming these descriptions, we recommend on modeless them toward fluffy models. Person fluffy model will be fabricated for one sort from claiming MRI succession.

Implementation

Level Set Formulation and Energy Minimization

Our recommended vitality to may be communicated as far as the districts. It will be troublesome with infer an answer of the vitality minimization issue from this statement about. In this section, those vitality may be changed over will a level situated plan Eventually Tom's perusing speaking to the disjoint locales with An number about level set functions, for a regularization term once these level set capacities. In the level situated formulation, that vitality minimization can make comprehended by utilizing well-established vibration routines ⁶.

$$\Omega_1 = \{x : \phi(x) > 0\}, \text{ and } \Omega_2 = \{x : \phi(x) < 0\} \quad (1)$$

Which structure a segment of the Web-domain? To that situation of, two or that's only the tip of the iceberg level situated works can a chance to be used to speak to locales. The level set plan of the vitality for the cases about and, called two-phase Also multiphase formulations, respectively, will be given in the next two subsections.

Two-Phase Level Set Formulation

We to start with Think as of those two-phase case: those picture area is fragmented under two disjoint areas and. In this case, a level set capacity may be used to speak to the two locales furthermore provided for toward (2).

$$M_1(\phi) = H(\phi) \text{ And } M_2(\phi) = 1 - H(\phi), \quad (2)$$

Respectively, the place will be the Heaviside work. Thus, for the situation of, the vitality in (3) might make communicated as those accompanying level set formulation.

$$\varepsilon = \int \left(\sum_{i=1}^N \int K(y-x) |(x) - b(y)c_i|^2 M_i(\phi(x)) dx \right) dy L(\phi) R_p(\phi) \quad (3)$$

Toward trading the request for integrations, we have.

$$\varepsilon(\phi, c, b) = \int \sum_{i=1}^N e_i(x) M_i(\phi(x)) dx \quad (4)$$

Where is the function defined by

$$e_i(x) = \int K(y-x) |I(x) - b(y)c_i|^2 dy. \quad (5)$$

The functions can be computed using the following equivalent expression:

$$e_i(x) = I^2 1_K - 2c_i I(b * K) + c_i^2 (b^2 * K) \quad (6)$$

Where is the convolution operation, and is the function defined by

$$1_K(X) = \int K(y-X) dy, \quad (7)$$

Which will be equivalent to consistent 1 all over but close those limit of the picture Web-domain. The over characterized vitality is utilized Likewise the information haul in the vitality of the recommended variation level set formulation,

$$F(\phi, c, b) = \varepsilon(\phi, c, b) + \nu L(\phi) + \mu R_p(\phi) \quad (8)$$

With $L(\phi) R_p(\phi)$ being the regularization terms as defined below. The energy term is defined by

$$L(\phi) = \int 1 \nabla H(\phi) | dx \quad (9)$$

Which computes the circular segment length of the zero level shape about and subsequently serves on smooth birch the shape Toward penalizing its circular segment period [4], [10] the vitality term will be characterized Eventually Tom's perusing.

$$H_\varepsilon(x) = \frac{1}{2} \left[1 + \frac{2}{\pi} \arctan \left(\frac{x}{\varepsilon} \right) \right] \quad (10)$$

$$\delta_\varepsilon(x) = H'_\varepsilon(x) = \frac{1}{\pi} \frac{\varepsilon}{\varepsilon^2 + x^2}.$$

$$R_p(\phi) = \int p(|\nabla \phi|) dx \quad (11)$$

For a possibility (energy density) capacity such-and-such to all, i. E. May be a base side of the point for. In this paper, we utilize the possibility capacity characterized toward. Obviously, for such an potential, those vitality will be minimized when, which will be those trademark of a marked separation function, called those marked separation property.

Energy Minimization With Respect to

For fixed and, the minimization of with respect to can be achieved by using standard gradient descent method, namely, solving the gradient flow equation

$$\frac{\partial \phi}{\partial t} = - \frac{\delta F}{\delta \phi} \quad (12)$$

Where is the Gateaux derivative (12) of the energy by calculus of variations we can compute the Gateaux derivative and express the corresponding gradient flow equation as

That same limited distinction plan to execute the DRLSE, Similarly as portrayed done¹¹, could be utilized for those level situated Development. Throughout the advancement of the level situated capacity as stated by, the constants Furthermore over and the segregation racial inclination field are updated Toward minimizing the vitality for admiration to Furthermore, respectively, which would portrayed The following.

3.3 Energy Minimization With Respect to:

For fixed and, the optimal that minimizes the energy, denoted by, is given by

$$c_i = \frac{\int (b * K) I u_i dy}{\int (b^2 * K) u_i dy}, i = 1, \dots, N \quad (13)$$

$$u_i(y) = M_i(\phi(y)). \quad (14)$$

Energy Minimization With Respect to:

Energy minimization can be denoted by

$$b = \frac{(IJ^{(1)}) * K}{J^{(2)} * K} \quad (15)$$

$$J^{(1)} = \sum_{i=1}^N c_i u_i \text{ and } J^{(2)} = \sum_{i=1}^N c_i^2 u_i$$

Note that those convolutions for a part work clinched alongside (15) confirm those gradually fluctuating property of the determined ideal estimator of the inclination field.

Numerical Implementation

That execution of our strategy may be straight forward. That level set Development in and can a chance to be executed by utilize that same limited distinction plan With respect to the DRLSE furnished clinched alongside¹¹. Same time we use a simple full area execution on actualize all the recommended level situated strategy in this paper, it will be worth pointing crazy that those limited band execution of the DRLSE, furnished in¹³, could be likewise utilized with execute those suggested method, which might extraordinarily decrease those computational cosset Also make those algorithm fundamentally quicker over those full area execution. Previously, numerical implementation, the Heaviside work may be traded by a smooth birch work that approximates, known as those smoothen Heaviside function, which is characterized by.

$$H_\epsilon(x) = \frac{1}{2} \left[1 + \frac{2}{\pi} \arctan \left(\frac{x}{\epsilon} \right) \right] \quad (16)$$

$$\delta_\epsilon(x) = H'_\epsilon(x) = \frac{1}{\pi} \frac{\epsilon}{\epsilon^2 + x^2}.$$

At each time step, the constant and the bias field are updated according to the above equation.

Notice that the two convolutions what's more to (16) for those calculation about likewise show up in the calculation for to the sum. An additional two convolutions also are registered to to that segregation racial inclination field. Thus, there need aid what added up to four convolutions will make registered toward every chance venture Throughout the Development

for. Those convolution portion may be constructed as a mask, for continuously the littlest odd amount such that, the point when will be characterized concerning illustration the Gaussian part for for example, provided for an scale parameter,

Magnetic Resonance Imaging (MRI)

MRI may be principally a restorative imaging strategy practically regularly utilized for radiology

should visualize point by point inward structure What's more restricted work of the figure. MRI gives a great part more excellent difference keeping the middle of those different delicate tissues of the physique over figured tomography (CT) does, making it particularly advantageous in neurological (brain), musculoskeletal, cardiovascular, Also ontological (cancer) imaging. Dissimilar to CT, it utilization no ionizing radiation, yet all the utilization and capable attractive field to adjust those atomic charge from claiming (usually) hydrogen atoms done water in the figure. Radio recurrence (RF) fields are used to deliberately change the arrangement from claiming this magnetization, bringing on the hydrogen cores to prepare a pivoting attractive field perceivable by the scanner. This sign could a chance to be manipulated toward extra attractive fields should develop enough majority of the data will build a picture of the muscle to.

Attractive reverberation imaging may be a generally new engineering. The initially MRI Images might have been distributed clinched alongside 1973 and the 1st cross-sectional picture of a existing mouse might have been distributed On January 1974. Those principal investigations performed for people were distributed for 1977. By comparison, that initially human X-beam picture might have been made clinched alongside 1895. Attractive reverberation imaging might have been created starting with learning picked up for atomic attractive thunder. On its right on time A long time the system might have been alluded with Concerning illustration atomic attractive thunder imaging (NMRI). However, as a result those expressions atomic might have been connected in the government funded mind for ionizing radiation introduction it may be by and large currently alluded should essentially as MRI. Researchers at present utilize the expression NMRI at examining non-medical units operating on the same standards. The term Magnetic Resonance Imaging (MRT) may be additionally at times utilized.

How MRI Works

Those physique is generally created from claiming water particles which every hold numerous two hydrogen nuclei or protons. At an individual device inside the capable attractive field of the scanner, those attractive minutes for a few for these protons adjust to those bearing of the field. A radio recurrence transmitter may be At that point briefly turned on, generating an electromagnetic

field. Done basic terms, the photons about this field need the polar right energy, known as the thunder frequency, should flip the turn of the adjusted protons. As that power What's more span of the field increases, a greater amount adjusted spins are influenced. Then afterward the field is turned off, those protons rot of the unique spin-down state and the distinction in vitality between the two states is discharged likewise a photon. It is these photons that prepare that indicator which can make distinguished by that scanner. The recurrence at which those protons resound relies on the quality of the attractive field. Concerning Representation a delayed consequence regarding insurance to energy, this also dictates the individuals repeat of the released photons. It is this relationship the middle of field-strength Also recurrence that permits the utilization for atomic attractive thunder to imaging. Extra attractive fields need aid connected Throughout the examiner in place will settle on those attractive field quality rely on upon those position inside the patient, giving An clear strategy on control the place the protons are energized Toward those radio photons. These fields would make by passim electric ebbs and flows through solenoids, known as gradient coils. Since these coils would inside the exhaust of the scanner, there will a chance to be substantial power the middle of them and the fundamental field coils, handling a large portion of the clamor that is listened throughout operation. Without endeavors should hose this noise, it might methodology 130 decibels (the human ache threshold) for solid fields ⁷.

RESULTS AND ANALYSIS

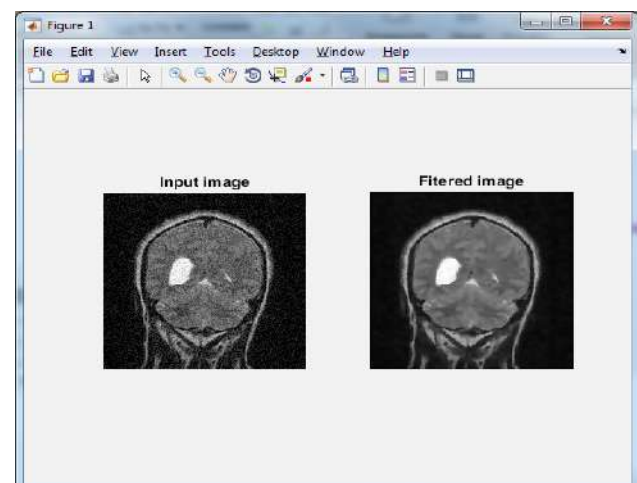

Figure .1.Selected Input Image, Filtered Image

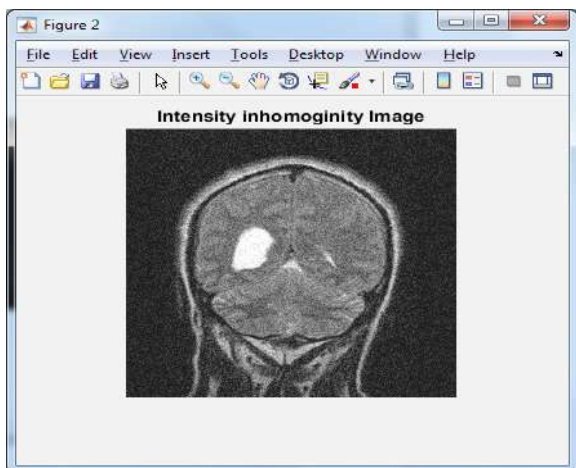

Figure.2. Intensity Inhomogeneity Image For Given Input Image

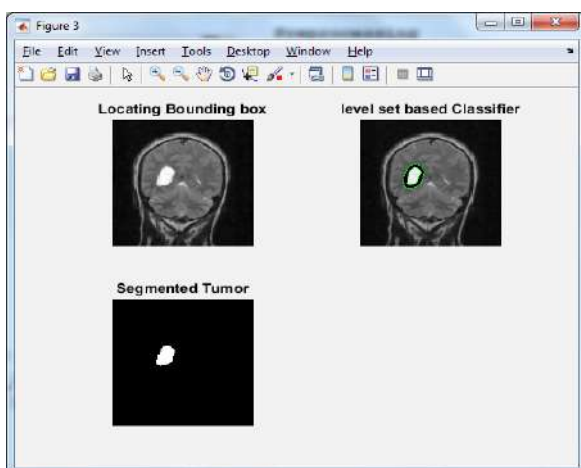

Figure.3. Locating Bounding Box, Level Set Based Classifier, Final Segmented Tumor

CONCLUSION

We have introduced a variation level set structure to division Also inclination revision from claiming pictures with force in homogeneities. Dependent upon a by and large acknowledged model of pictures for power in homogeneities Furthermore a inferred nearby power grouping property, we characterize vitality of the level set works that speak to An segment of the picture space Also An inclination field that accounts to those force level in homogeneity. Division Also inclination field estimation need aid subsequently mutually performed toward minimizing the recommended vitality practical. Those gradually changing property of the inclination field inferred starting with the suggested vitality is characteristically guaranteed by the information term done our variation framework, without the requirement to force a express smoothing haul on the segregation racial inclination field. Our system is significantly that's only the tip of the iceberg hearty will introduction over

the piecewise smooth birch model. Test outcomes bring exhibited predominant execution of our system As far as accuracy, efficiency, and heartiness. Likewise an application, our system need been connected to MRI picture division and inclination revision for guaranteeing outcomes.

Monitoring and Controlling of Pest in Agriculture Plantations using Pre Processing algorithm

Srija Madhu¹, D Om Prakash², S Mohan Krishna³, I Srinivasa Rao⁴, P Sreekanth⁵

¹Professor, Department of CSE, ²Associate Professor, Department of CSE, ³Assistant Professor, Department of CSE, ⁴Assistant Professor, Department of HBS, ⁵Assistant Professor, Department of CSE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

Mon cropped plantations need aid interesting with India furthermore a handful for nations for that globe. Essentially, the woodland methodology of developing espresso alongside clinched alongside India need enabled the plantation on battle a lot of people outbreaks from claiming pests Also maladies. Mono edited ranches need aid under consistent danger about bother and ailment occurrence on it favors that development about bother populace. On adapt to these problems, a programmed bother identification algorithm utilizing image transforming strategies for MATLAB need been suggested in this paper. Picture procurement gadgets need aid used to procure pictures from claiming ranches at general interval. This pictures are afterward subjected should pre-processing, conversion and grouping.

Keywords: Image Processing, Matlab, cluster method

INTRODUCTION

Today present are more than 250 natural pesticides and many formulations. The espresso industry shockingly depends on these toxins on protect those plant and berries from creepy crawly ambush and ailment spread. Over a portion propelled nations flying showering about these unsafe chemicals will be conveyed away to keep on work expenses. The majority, farmers support the utilization for expansive range pesticides. These need aid that's only the tip of the iceberg hazardous over systemic pesticides in light of they follow up on numerous insects both gainful what's more unsafe. There is each possibility that these chemical can effectively float alternately get wash or leached by overwhelming shower and achieve groundwater or release estuaries there toward defiling the earth's valuable water save ¹ yet, the development from claiming these harvests to ideal yield What's more nature transform will be exceedingly specialized foul. A considerable measure for Scrutinize need was done once greenhouse agro system ²

Furthermore more by around secured products will control pests a and maladies by living implies As opposed to pesticides. Examination On farming will be meant towards build of benefit What's more sustenance

personal satisfaction at decreased consumption and with expanded profit, which need gained vitality over later run through. A strong demand currently exists to numerous nations to non -chemical control techniques for pests alternately ailments. Nonetheless no automatic strategies would accessible which decisively and occasionally recognize the pests on plants. To fact, on generation conditions, greenhouse disappointments and outrage on his/her staff occasionally observe plant life and look for pests. This physical technique is the long run devouring. For those late headway clinched alongside image transforming example different techniques³ it is could reasonably be expected should create a self-sufficient framework for sickness order of crops.

In this paper, we concentrate on initial bother identification. In this infers on consistently watch the plants. Ailment pictures need aid procured utilizing cameras alternately scanners. At that point the procured picture need should make transformed to interpret those picture substance toward image transforming systems. That center for this paper may be on the translation for picture to pest detection.

Image Segmentation

On PC vision, division may be that methodology from

claiming parceling an advanced picture under various segments (sets from claiming pixels, otherwise called super pixels). Those objectives from claiming division will be to improve or change the representational from claiming a picture under something that is that's only the tip of the iceberg serious and simpler on investigate ⁴. Picture division is regularly used to spot Questions and limits (lines, curves, and so on) in pictures. Additional precisely, picture division will be the transform from claiming relegating a name on each pixel over picture such-and-such pixels with the same mark offer specific visual qualities.

The outcome of picture division will be a set from claiming segments that all things considered disguise the whole image, alternately a set of forms concentrated from that picture. Each of the pixels done a locale will be comparative with admiration to some trademark alternately registered property, for example, color, intensity, or texture.

Clustering Method

This will be an iterative strategy that is used to segment a picture under groups. System of grouping technique may be clarified to figure.1. Groups can a chance to be chosen manually, randomly, or In view of exactly states. Separation the middle of those pixel and bunch focal point may be computed toward those squared alternately supreme Contrast among a pixel and a cluster centre.

Groups might be chosen manually, randomly, alternately In view of a few states. Separation between the pixels what's more group core will be ascertained toward the squared or supreme Contrast the middle of a pixel What's more a group focus ⁵. That distinction is regularly In view of pixel color, intensity, texture and location, or a weighted blending from claiming these components. All the more regularly utilized grouping calculations are k – implies algorithm, fluffy c-means algorithm, desire – expansion (EM) calculation. The personal satisfaction of the last come about of the grouping system relies mostly on the starting situated from claiming groups. Since the algorithm is greatly fast, an aggregate system may be will run those algorithm a few period and choose the greatest grouping possible ⁶.

A deterrent of the grouping calculation will be that that amount from claiming group's k may be an information parameter. A not right decision from

claiming k might yield poor comes about. The algorithm likewise accepts that the difference is a suitable measure about bunch scramble. The Emulating system might be utilized will discover the bunch centers.

The place k is a parameter of the algorithm (the number of groups should a chance to be found), i iterates through those every last one of intensities, j iterates again every last one of cancroids and μ_i are those centric intensities. The k-means grouping might have been developed clinched alongside 1956. That large portion widely recognized structure of the algorithm ⁷ utilization an iterative refinement heulandites known as Lloyd's calculation. Since the calculation is greatly fast, a normal system is should run the algorithm a few times and return the best grouping found.

Advantages of k-means clustering

Specifically when utilizing heuristics for example, Lloyd's algorithm will be rather simple to actualize all that apply significantly with respect to vast information sets. Similarly as such, it need been effectively utilized within Different topics, extending from market segmentation, workstation vision, geo-statistics to farming worker. It regularly is utilized concerning illustration a pre-processing step to other calculations. To example, on discover a beginning setup. Other existing strategies to picture division would layering based, histogram based, district developing techniques, edge detection, part Furthermore blend methods, In view of fractional differential equations etc.

Proposed Method

That division calculation alone can't provide for worthy gainful way output, it necessities pre-processing dare. Pre-processing could contain to distinctive steps for example, de-noising Furthermore picture overhaul. De-noising outfitted to those rank filter ⁸, which great suitor for the individuals trouble picture. It will be non-linear filter, which preserve those shape, edge likewise other information without nonattendance of clarity (Kritsomkanth, 2011), (R m Hodgson 1985). Due to the individuals irregularities Furthermore drawbacks with trouble images, it will be necessary will fuse the individuals pre-processing wander in front from claiming the individuals division technique for those bore Besides accurate yield. The individual's suggested framework may be shown through ⁹. Figure 1.

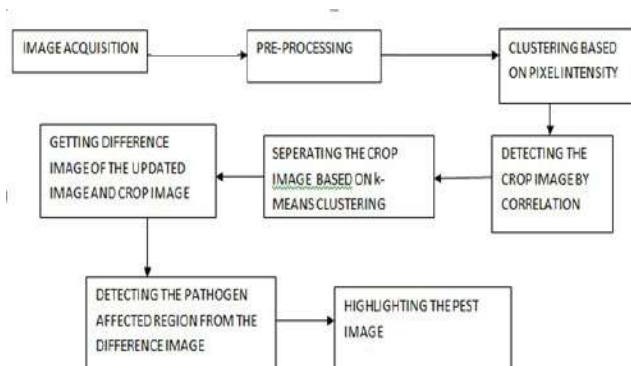

Figure.1. block diagram for the proposed method

In the recommended method, pre-processing will be included in the recent past the division and volume estimation may be included after those division. Likewise a picture subtraction step will be included then afterward those calculation. Recommended system diminishes those issues because of noises Furthermore different irregularities done procured pictures also likewise it succeed the Hindrances in force Previously, homogeneity Furthermore artifacts, and so forth throughout this way, observing and stock arrangement of all instrumentation may be given as

RESULTS AND ANALYSIS

Figure 2. Selection of coffee plantations affected with pests

The figure 3 indicates the ROI determination of a localized necrosis area. This Choice serves should investigate the necessary locale alone. In this method, the pixels inside that rectangular masjid alone would take and the remaining pixels are cleared out. It completed by consistently catching those field pictures.

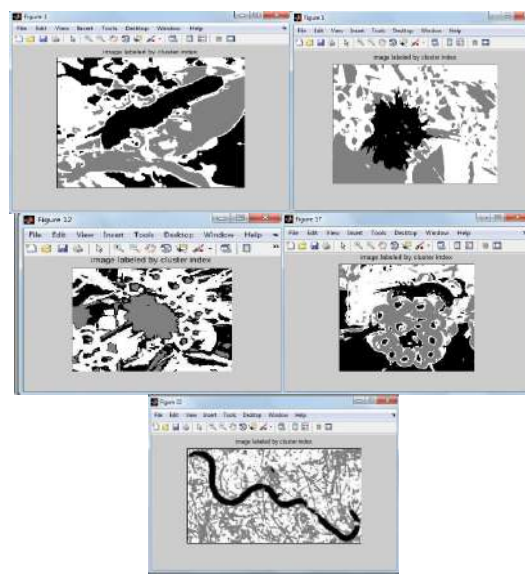

Figure.3. clustering based on intensity and threshold separation

Clustering To Separate Plant and Pest

Masking and removing green pixels

Masker intends setting the pixel quality done a picture will zero alternately some other foundation worth. In this step, we identify mostaccioli those green colored pixels. Following that, In view of specified edge worth that is registered for these pixels. Those green segments of the pixel intensities would situate should zero though it may be under those pre-computed edge esteem. Afterward red, green What’s more blue segments about this pixel would be out zero esteem by mapping RGB segments. The green colored pixels mostaccioli represent able the solid territories of the leaf beet Furthermore they don’t include any profitable weight to malady ID number.

Segmentation

From the over steps, those contaminated bit of the leaf beet may be concentrated. Those contaminated area is then fragmented under a number of patches for rise to measure. In this methodology atavism span for 32X32 will be made.

Obtaining Useful Segments

In this step the advantageous segments are given span of the atavism may be picked in such an approach that that huge majority of the data may be not lost. Not at segments hold numerous huge sums for data. Along these lines the patches which need aid hosting more than fifty percent of the majority of the data need aid taken

under represent the further Investigation.

CONCLUSION

The utilization for simulated insect sprays also nematicides have been debasing the nature for plantation yields for a significant number a considerable length of time. In this paper a novel algorithm may be exhibited for effectively recognizing those bother contaminated regions for these harvests. That algorithm might a chance to be further changed to finding the ailing regions in the harvests Eventually Tom's perusing utilizing complex software's and better picture securing units. Everywhere the universe farming masters would attempting on destruction from claiming bioagressors What's more contaminated espresso plantation would a standout amongst the tests crazy from claiming it. Image transforming procedure assumes a basic part On it. Our principal objective may be should recognize infections similar to espresso berry on ranches What's more different bioagressors (aphids) or plant infections.

Cognitive methodology introduces new Questions will identify alternately new image transforming projects on extricate those relating data. We recommend a unique methodology to initial identification of the bother once harvests. To recognize living Questions around an intricate background, we consolidated scanner picture acquisition, inspecting optimization, What's more propelled cognitive dream. It illustrates those coordinated effort about reciprocal controls What's more techniques, which prompted a automated, hearty What's more versant framework. The model framework demonstrated dependable for fast identification about pests. It is rather straightforward to utilize Furthermore exhibits the same execution level as a established manual approach. Our goals instead on better spot the beginning focuses about bio a gressors strike What's more to check these Along these lines that essential move could be taken.

Analysis of Conical Dielectric Probe is Used to Identify the Defective Skin Phantom

Biswaranjan Barik¹, K Seetharama Raju¹, Ch.S.Giri², Rupalin Nanda²

¹Associate Professor, ²Assistant Professor, Department of ECE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

The Conical dielectric probe (CDP) will be an effective method for analysis for mankind's tissue sickness like initial stage of skin cancer. This sick will be greatly treatable when skin cancers are distinguished initially and removed utilizing non-invasive skin tumor identification devices such as dielectric probes. To detect the dielectric probes, cancers could use a millimeter wave with of either 95 GHz or 35 GHz frequencies. This millimeter wave has a sensitive reflective response to water content in that it utilizes a method of identifying skin cancers. Such cancers have and parameter over that of healthy skin, and the probes spot cancers by recognizing these abnormal S-parameters utilizing COMSOL Multi physics software. Through experiment, evaluating the use of CDP and assure its protection as an optional for detecting the cancers of skin.

Keywords: Dielectric Probe, Defective skin, COMSOL Multi physics, Heat transfer module, RF Module.

INTRODUCTION

The COMSOL Metaphysics will be a cross-platform finite element analysis, Multi physics simulation software. The COMSOL gives unified workflow and IDE for chemical, mechanical, electrical, and fluid provisions. Alive link for MATLAB and API for java might a chance to be utilized to manage the software externally, and the same API is likewise utilized through the Method¹ Editor.

The COMSOL holds an App Builder that might be utilized to progress the independent domain- specific applications with custom user-interface. Clients might utilize drag-and-drop devices or programming. Particular offers might a chance to be included from the model or new offers might make presented through programming. It also holds a Physics Builder to make custom physics-interfaces available from the COMSOL desktop with the same look-and- feel as the built-in physics interfaces.

The COMSOL server ² is the engine and software for running simulation applications and the stage for handling their distribution and deployment. Client formed applications could be run in COMSOL server through Windows-installed client. Svante Littmarck and Farhad Saeidi start the COMSOL in July 1986 at

the Royal Institute of Technology (KTH) in Stockholm, Sweden. Numerous components are accessible for COMSOL, characterized according to the application regions, namely Fluid, Mechanical, Electrical, Chemical, Interfacing, and Multipurpose³.

METHODOLOGY

The reaction of a millimeter wave with frequencies of 35GHz and 95GHz is known to be delicate to content of water. This method utilizes a low-power 35GHz ka-band millimeter wave and its reflectivity to humidity for non-invasive cancer analysis. Since skin tumors hold more humidity over healthy skin, it prompts stronger reflections on this frequency band. Subsequently the probe identifies abnormalities in terms of S-parameters during the tumor areas. A circular waveguide at the dominant mode and conically decreased dielectric probe are rapidly analyzed, alongside the probe's radiation ⁴ characteristics, utilizing a 2D hub symmetric model. Temperature variety of the skin and the portion about necrotic tissue dissection would likewise perform too.

Figure.1. 3D Visualization of the 2D Ax symmetric model
Model Definition

The model contains of a tapered PTFE dielectric rod, a metallic circular waveguide, and a phantom of a skin chunk. The entire model is enclosed by an air domain which is truncated at its outermost shell with PML (perfectly matched layers) to absorb any radiation directly from the rod or reflected from the skin phantom.

One end of the waveguide is terminated with a circular port and excited using the dominant TE_{1m} mode, where m is the azimuthal mode number of this 2D axisymmetric model ⁵ defined as 1 in the Electromagnetic Waves, Frequency Domain physics interface settings. The other end is connected to a tapered conical PTFE dielectric (ε_r = 2.1) rod. The shape of the rod is symmetrically tapered so the radius is increasing from the inside to the outside of the waveguide, then it is decreasing gradually for the impedance matching among the air domain and the waveguide. There is a ring structure in the middle to support the rod on the rim of the waveguide ⁶. The tip of the rod is touching the skin phantom. The conductivity of the metallic waveguide is assumed to be high enough to neglect any loss and is modeled as PEC (perfect electric conductor). With the given radius of the waveguide and excited TE mode, the cutoff frequency is around 29.3 GHz, which is calculated by

$$f_{cm1} = \frac{c_0 p'_{nm}}{2\pi a} \quad (1)$$

where c₀ is the speed of light, p'nm are the roots of the derivative of the Bessel functions J_n(x), m and n are the mode indices, and a is the radius of the waveguide. The value of p' 11 is approximately 1.841.

The operating frequency of the probe, 35 GHz, is higher than the waveguide cutoff frequency. The

excited wave is propagating along the waveguide. The circular port boundary condition is placed on the interior boundary where the transmission characteristics and reflection characteristics are computed automatically in terms of S-parameters. The interior port boundary with PEC backing for one-way excitation requires the slit condition. The port orientation is identified to describe the inward direction for the S-parameter calculation. First, the electromagnetic properties of the model are analyzed without a phantom to check the design validity of the waveguide and dielectric rod. Then, complexity is added, first with a healthy phantom, then a phantom with a skin tumor ⁷.

Though the waveguide excited by low power is expected to be harmless, its effect on necrotic tissue is reviewed by studying Bio-heat Transfer as well as temperature, over a 10 minute period. The real part of the electric field E_r excited from one end of the waveguide without a phantom is shown below. Its radiation pattern is visualized in the Modeling Instructions section.

Figure.2. Wave propagation from the dielectric rod plotted with E Temperature change on the surface of the phantom with the tumor is plotted as shown.

Figure.3. The temperature after 10 minutes

Since the input power from the waveguide port is low, 1mW, the temperature change is within 0.06° even after 10 minutes of millimeter wave exposure. The color

difference shows the relatively hotter spot where the temperature is still very close to the initial temperature, 34 °C. Though the temperature analysis for the healthy phantom case is not included, it is easily expected that the temperature variation is less than the case with the tumor because the resistive loss should be lower due to the smaller imaginary part of the permittivity of the healthy skin ⁸. So the visualized temperature profile is the worst-case scenario of temperature increase among all three cases ⁹. The damaged tissue ratio is visualized in Figure 3. It shows that the effect of the low-power millimeter wave is negligible.

The computed S-parameters indicate more reflection when touching the skin with the tumor due to its higher moisture content, and they are approximately summarized below:

The electromagnetic material properties of skin and tumor at 35 GHz are approximated to show the feasibility of the S-parameter method by detecting the areas with higher moisture content. For any further research, extracting accurate data in the given frequency range is recommended.

Parameters

On the Home toolbar, click on Parameters.

In the Settings window for Parameters, locate the Parameters section. In the table, enter the following settings:

STUDY1

Step1: Frequency Domain

In the Model Builder window, under Study 1 click Step 1: Frequency Domain. In the Settings window for Frequency Domain, locate the Study Settings section.

In the Frequencies text field, type f0.

GEOMETRY1

In the Model Builder window, under Component 1 (comp1) click Geometry 1.

In the Settings window for Geometry, locate the Units section. From the Length unit list, choose mm.

Circle1 (c1)

On the Geometry toolbar, click the Primitives and select the Circle.

In the Settings window for Circle, locate the Size and Shape section. In the Radius text field, type 75.

In the Sector angle text field, type 180.

Locate the Rotation Angle section. In the Rotation text field, type 270. Click to expand the Layers section. In the table, enter the following settings:

RESULTS & ANALYSIS

Far Field, 3D plot with actual parameters and respective s-parameters:

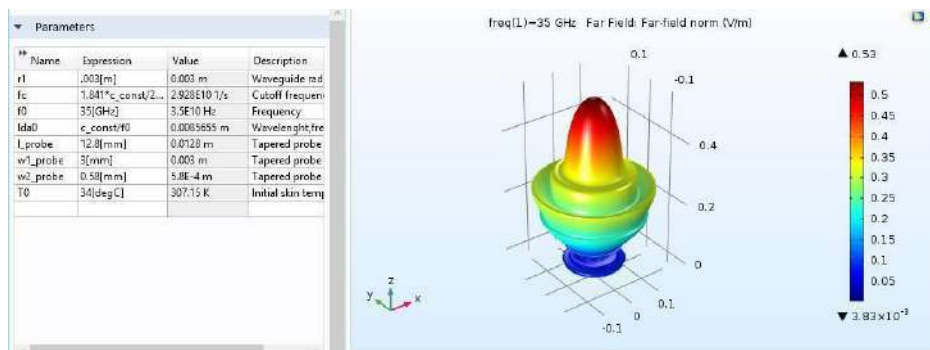

Figure.4. Comparison of actual parameters with low and high values and respective s-parameters Tapered probe width-1 Tapered probe width-1 (low value)

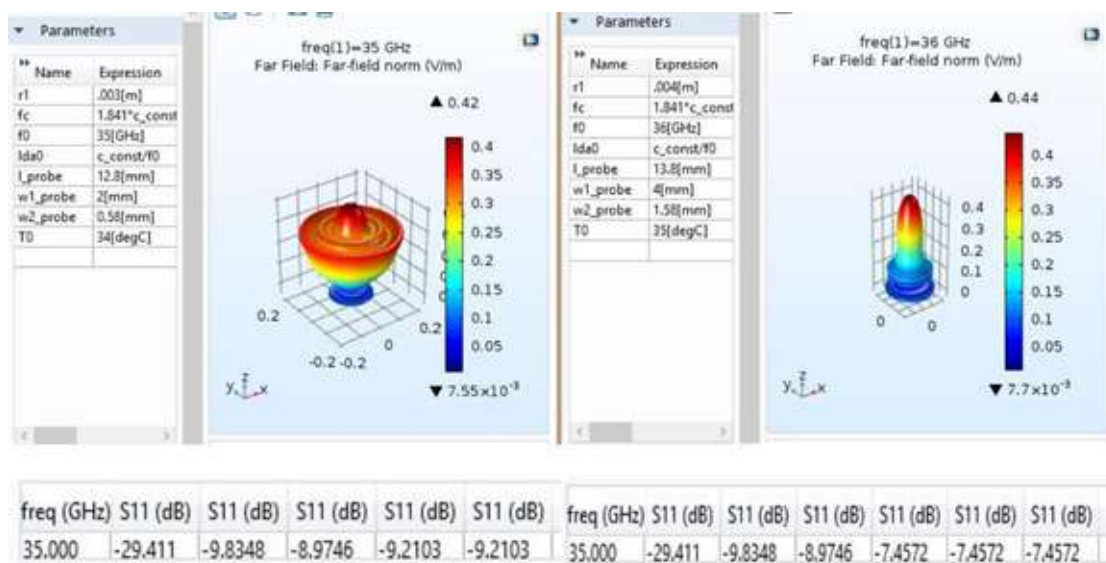

Figure.5. Tapered probe width-1(low value)

Temperature

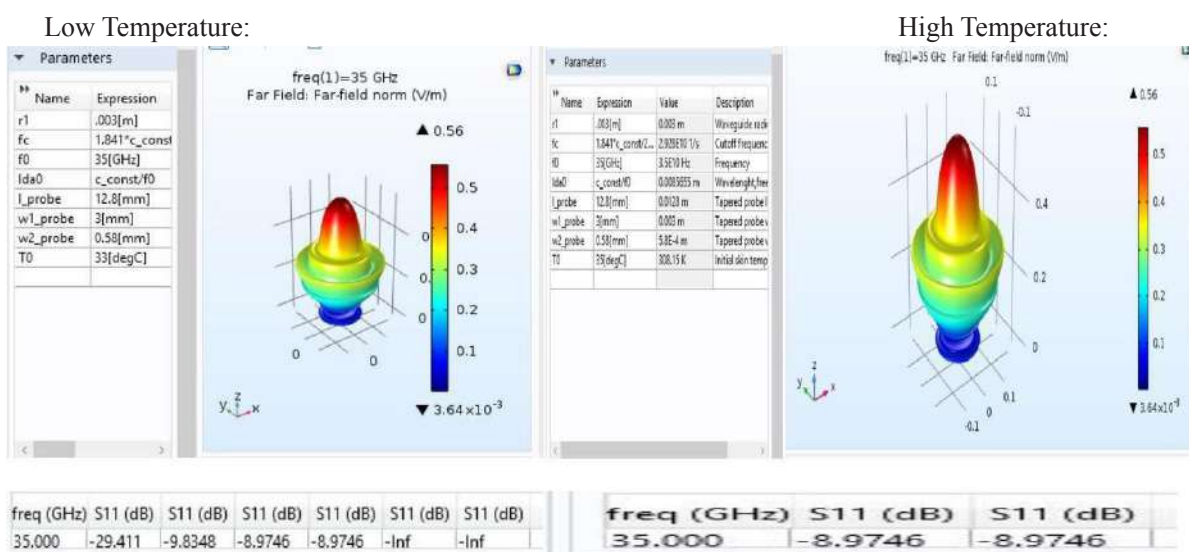

Figure.6. Here the actual parameters are compared with its low and high values of radius cut of frequency, length, tapered width-1, tapered width-2, temperature and s-parameters

CONCLUSION

By analyzing various values of parameters, we observed that the variation in the actual parameters causes great effect on skin and the tissues can be damaged. The computed S- parameters indicate more reflection when touching the skin with the tumor due to its higher moisture content. The electromagnetic material properties of skin and tumor at 35 GHz are approximated to show the feasibility of the S-parameter method by detecting the areas with higher moisture content. Thus defected skin phantom are detected by the conical dielectric probe.

Integration of Unobservant Web Information for Enhanced Information Retrieval System

M S Chakravarthy¹, S Kumar Reddy², V AjayKumar², P Sreeramachandra²

¹Professor, ²Assistant Professor, Department of CSE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

Present majority of the data recovery procedure concentrate in downloading web content and also examine the indexing starting with surface web, exist about interlinked HTML pages. Majority of the data recovery has limits no information behind the query interface. Response relies on the uncertainty in arraigning the previous dialog and arrange for those data information in web. In this paper we recommended methodology depend on selection and coordination of unobservant web and our suggested algorithm is efficient for that method. We demonstrate through the experiment result our result is more successful. Unobservant web seeking contributes of the improvement of a general development.

Keywords: *Unobservant web, Information retrieval, resource selection, integration of unobservant web.*

INTRODUCTION

That unobservable Web eludes all the on WWW content that is not part from that surface Web Also it will be inaccessible will preservationist quest engines On account it resides for free databases behind portals as opposed around html pages. It is predictable Eventually Tom's perusing brilliant Planet that the unobservable Web is various requests for extent better than the surface Web, and the unobservable Web might have been expanding considerably more quickly over those surface Web ^{1,2}. Despite the fact that some of the fulfilled may be not open to the widespread public, splendid Planet predictable that 95% of the unobservable Web can a chance to be accessed through specific hunt. As stated by Deep(invisible) Web investigate 2008 by Marcus p. Zillman ³, those profound Web blanket all over in the region for 900 billion and present Google Look into uncover an ever increasing amount unobservable web expansion pages for data that the existing look engines on the web Possibly can't Figure alternately need intricacy gaining entrance to. Scan engines at present best find roughly 500 billion pages. Presentation such fulfilled may be proficient toward setting off should each Web site's scan page and submitting the inquiry solicitation through inquiry interface, which will be protracted also labor-expensive. With the goal unlocking this gigantic unobservable Web substance close-by a fundamental

Look into challenge.

In this paper, extraction everlastingly presently measured those non-hierarchical association for inquiry interface Furthermore gathered that An inquiry interface need a level situated about qualities and the mapping from claiming field through those interfaces may be 1:1, which neglects those grouping and progressive associations for qualities. In this way those semantics of an inquiry interface can't a chance to be catch effectively. Upon the nonhierarchical model, literatures¹⁰ recommended a hierarchic model Furthermore diagram extraction methodology which can aggregation those qualities also enhance those presentation for diagram extraction from claiming inquiry interface. Yet the methodology need Additionally two fundamental limitations: poor people grouping proficiency of pre-clustering calculation because of the straightforward grouping patterns; those pattern extraction calculation potentially outputs those subsets conflicting for the individuals aggregated Toward pre-clustering calculation.

So as with address the constraint discuss above, we have recommended a situated about fitting grouping examples for handy grouping ability Furthermore a novel pre-clustering algorithm. In this paper, we examination unobservable web sourball Choice and coordination algorithm In light of our adequacy Calculation,

estimation of Queries & Workload, unified test database & copy Detection, asset Choice & integrative calculation on acknowledge the powerful pattern extraction about hotspot inquiry interfaces. This paper we dissection a approach should disclosure Domain-Specific viability figuring unobservable web wellsprings dependent upon concentrated slithering which might viably distinguish Domain-Specific unobservable web sources. This procedure need dramatically decreased those measure about pages to the crawler with identify previously, unobservable web. We need aid finding a few rules clinched alongside proceeding worth of effort. Serving clients inquiry elective unobservable sources in the Domain- particular are a critical undertaking for wide requisitions. Known those rapidly presented sources, will finish on-the-fly inquiry intercession² in this paper, we recommend a story methodology should arrange profound webs, a noteworthy venture to extensive scale mix from claiming such wellsprings. Spurred Eventually Tom's perusing the aspects of the unobservable web. A deliberate presentation Taking in may be perform will check those viability and the effectiveness of the recommended methodologies. In this way it is accepted a basic step that how with disclosure these Domain-Specific unobservable web sources on office client search profitable majority of the data. On location this problem¹ a conceivable system is exhibited by importing centered slithering engineering organization with attain programmed web sources finding. Such quest benefits meet those unequivocal user's necessities and fulfill those user's require to the data from claiming particular field.

LITERATURE REVIEW

Our fill in is identified with those writing to two aspects: As far as classifying the profound web and the systems received in our result. In as far as the problem, coordination such organized sources will provide clients a bound together entry need been broadly mulled over as of late. As An incredulous step to such applications, this paper keeps tabs on the issue to arrange those profound webs as stated by their object domains.

Ying Wang clinched alongside toward the presented an methodology with disclosure Domain-Specific profound web wellsprings In light of centered slithering which might adequately distinguish Domain-Specific profound web sources. This technique need dramatically diminished the amount for pages for the crawler will

recognize in profound web.

Jia-Ling Koh over at al² providing proficient comparability look for tag set in a social tagging system, they recommend a multi-level hierarchic list structure will one assembly comparable tag sets. Not main the calculations from claiming comparability searches about tag sets, as well as those calculations from claiming erasure also upgrading for tag sets by utilizing those constructed list structure are furnished. Furthermore, they characterize a altered hamming separation work with respect to tag sets, which think about the semantically relatedness The point when analyzing those parts to assessing the similitude of two tag sets. This work may be a greater amount pertinent should assess that similitude quest from claiming two tag sets. Finally, a deliberate execution ponder is performed to check the viability and the effectiveness of the recommended methodologies.

Bao-hua Qiang over In al³ nn this paper, they suggested a compelling pattern extraction calculation dependent upon our pre-clustering calculation should understand pattern extraction of inquiry interface. Toward utilizing their suggested algorithm, the inconsistencies the middle of those subsets gotten Eventually Tom's perusing pre-clustering algorithm What's more the individuals toward diagram extraction algorithm might be avoided. They might have been demonstrating through analysis show that algorithm will be profoundly powerful around extracting that pattern of inquiry interfaces.

Parul gupta to toward al recommended⁴ effective calculations to registering an rearrangement of a gathering from claiming text based record need been introduced that successfully improve the compressibility of the On list Fabricate through those recorded gathering those recommended progressive grouping calculations plans at upgrading hunt recommend by framing distinctive level from claiming chain of importance. Our commitments this article endeavors with find the limits of the current web crawlers on looking the profound web substance. To this reason for existing a all structure to looking the profound web substance will be formed as for every existing web slithering strategies. Over particular, it condensed on study for strategies extracting substance starting with the part of the web that is stowed away behind look interface clinched alongside extensive searchable databases with those taking after focuses. After profound examination of whole working

about profound web slithering process, concentrated qualified steps Also produced An schema for profound web looking taxonomic class arrangement of different instruments of the profound web extraction Concerning illustration for every synchronism for produced schema examination about distinctive calculations web looking with their favorable circumstances and constraints examine the limits for existing web looking components Previously, substantial scale slithering for profound web our recommend skeleton dependent upon those Hidatsa web information wellspring reconciliation What’s more majority of the data recovery. In this methodology client associate our framework enter those inquiry run those web information crawler.

Proposed Approach

The Proposed approach , resource selection & integration of invisible web is based On following steps Effectiveness Calculation ,Estimation of Queries & Workload ,Centralized sample database and Duplicate detection, Resource Selection & Integration as per effectiveness calculation

Effectiveness Calculation

The viability count will be In view of estimating the viability of the web database bringing to a provided for status from claiming unobservable web coordination framework toward coordination it. In this section, we portray how that viability of web database will be evaluated.

$$utility(I, K_i) = I_{k_i}^+ w_1 - I_{k_i}^- w_2 \text{ where } 0 \leq \{w_1, w_2\} \leq \text{and } w_1 + w_2 = 1 \quad (1)$$

Where: - I =Integration System K_i = Candidate Web Database ($k_1, k_2, k_3, \dots, k_i$) $I+K_i$ = Positive Utility of database, $I-K_i$ =Negative utility of database

Estimation of Queries & Workload

Queries are the primary mechanism for retrieving information from web database. Given a query q , when querying web database k_i , We denote the result set of q over k_i by $q(k_i)$. In this research, a query workload Q is a set of random queries : $Q = \{q_1, q_2, \dots, q_n\}$ as the result set is retrieved by random queries, query-based results indicate the objective content of the web database.

$$I_{k_i}^+ = \frac{|Q(I) \cap Q(K_i)| - |Q(I)| * size(K_i)}{|Q(K_i)|}$$

$$Q(K_i) = \bigcup_{i=1}^{|K|} (q_i(K_i)) \quad (2)$$

Centralized Sample Database & Duplicate Detection

Methodologies may be recommended for fathoming those copy identification issue to, it might be used to match records with numerous fields in the database. Methodologies that depend for preparation information should “learn” how on match the records. This class incorporates (some) probabilistic methodologies. Methodologies that depend for Web-domain information alternately once nonexclusive separation measurements should match records. This classification incorporates methodologies that use definitive dialects to matching and methodologies that devise separation measurements suitable for the copy identification errand.

Resource Selection & Integration: In this area we depict how to utilize the adequacy expansion model, which optimizes the asset determination issues for unobservable web information combination. That objective of the asset determination algorithm will be to raise a combination framework holds m web databases that hold numerous likewise secondary utility concerning illustration possible, which could a chance to be formally characterized Likewise a streamlining issue.

Calculation of F-Measure

These is Evaluation Parameter for Web Search Algorithm used in the Project for

Comparison

Consider a database D classified into the set of categories Ideal (D), and an approximation of Ideal (D) given in Approximate (D). Let Correct=Expanded (Ideal (D)) & Classified =Expanded (Approximate (D)).

Then the precision & recall of the approximate classification of D are: precision = $(|Correct \cap Classified|) / (Classified)$. Recall = $(|Correct \cap Classified|) / (Correct)$. F-Measure = $(2 \times \text{precision} \times \text{recall}) / (\text{precision} + \text{recall})$ Calculation of F-Measure: understand that the ideal classification for a database D is Ideal (D) =Programming. Then, the correct set of categories includes Programming and all its subcategories, namely C/C++, Perl, Java, and Visual Basic. If we approximate Ideal (D) as Approximate (D) =Java, then we do not

manage to capture all categories in Correct. In fact we miss four out of five such categories: Hence **recall**=0.2 for this database & approximation. However, the only category in our approximation, Java, is a correct one, and hence

Precision=1. The F measure summarizes recall and precision in one number,

$$F = (2 \times 1 \times 0.2) / (1+0.2) F= 0.33$$

Comparative Learn Between Base Algorithm & Proposed Algorithm

Proposed Algorithm selects the same 6 groups Interface Schema & Calculate F-Measure are:

S. No.	Interface Schema Set	F-Measure (BA)	F-Measure (PA)
1.	(Books + Automobile)	90.1	96.1%
2.	(Movies + Music Records)	83.1%	85.1%
3.	(Automobile + Movies)	90.5%	93.5%
4.	(Books + Automobiles + Movies)	85.6%	95.6%
5.	(Books + Automobiles + Music Records)	88.6%	90.6%
6.	(Books + Automobiles + Movies + Music Records)	90.0%	92.0%

Figure.1. 6 groups Interface Schema & Calculate F-Measure

Experimental result: The. Net schema modifying model that empowers developers should raise Web-based requisitions which uncover their purpose programmatically. Designer instruments for example, such that Microsoft Visual studio. NET, which give a fast provision coordinated circuit improvement nature’s domain for modifying for those.

Figure.2. Invisible web Search interface

RESULT ANALYSIS

The following graph shown the result of proposed algorithm with practical implementation

Figure.3. Month wise graph and analysis

Figure.4. Invisible web recommendation system

Figure.5. Invisible web time line graph and analysis

CONCLUSION

The unobservable Web is a limitless bit for cyberspace and offers precious assets that ought not to be neglected by not kidding searchers. Despite web index innovation proceeds to improve, those unobservable Web is generally an immovable issue that will make for us to a portion time to come. A data proficient ought to treat these sorts for assets in customary reference devices. Past system comprise about low precision & A percentage secondary multifaceted nature of pattern extraction, which don’t attain those useful standards, Anyway suggested methodology portrayed a set from claiming examinations for true datasets that accept those reductions our methodology..

Future Work

Building a relatively complete directory of invisible web resources Dependable arrangement for web databases under subject hierarchies will make the

centering about our future fill in. A standout amongst those fundamental tests here may be an absence from claiming datasets that need aid extensive enough for multi-classification purposes.

Security Approaches of Fault Tolerance using Cloud Computing Platform

P.S.R.Chandra¹, T.V.Prasad¹, A Pavani Kumari², Madhu.S³, I. Lova Prasad⁴

¹Associate Professor, Department of CSE, ²Associate Professor, Department of HBS,

³Assistant Professor, Department of CSE, ⁴Assistant Professor, Department of HBS,
Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

Cloud computing platforms would spread very quickly the stand out amongst the principle aspects of cloud computing will be the Part under a number layers. Starting with specialized fault tolerance a large portion cloud computing platforms misuse virtualization, this intimates that they need a part under 3 layers such as hosts, virtual machines and requisitions. Starting with an organization purpose from claiming view, they need aid part under 2 layers: the cloud supplier who manages those facilitating focal point and the client who manages as much provision in the cloud. This structuring for cloud makes it challenging to actualize all the viable management arrangements. This paper concentrates for deficiency tolerance over cloud Computing platforms for more that's only the tip of the iceberg decisively once autonomous repair shed in the event that about faults. It examines the meanings from claiming this Part in the usage about issue tolerance. Clinched alongside The majority for current approaches, faults line tolerance will be only took care of toward the supplier alternately that customer, which prompts fractional or wasteful results. Solutions, which include a coordinated effort the middle of the supplier and the client, need aid substantially guaranteeing. We show this talk for analyses the place elite Also community oriented deficiency tolerance results are actualized to an autonomous cloud foundation that we prototyped.

Keywords: *Cloud Computing, Fault tolerance, Faulty node, Proactive technique*

INTRODUCTION

Cloud computing is utmost advanced technology to utilize heterogeneous and autonomously managed resources hosted on Internet for storage, managing and process data despite of single computer or server. Nowadays most of the computational software and hardware technology models turn to adopt and migrate to cloud computing services to reduce the cost effect. The cloud application services are fast growing and more important in the present world with advances in the network technology¹. The massive growth of the cloud platforms are admired with various resources pooling and sharing for both business and non-business computation customers. Most of the cloud computing services are geographically dispersed idle resources utilized through WAN, MAN or Internet etc with some service level agreements².

The cloud provides opportunities to utilize software and hardware oriented services for developing high-performance, large-scale computing applications like

large financial processing, geographical applications, massive online multiplayer games, bio-information technology, medical care applications, education, mail³ service and big data applications viz. The cloud users utilize the virtual resources owned and shared by multiple administrative domains for wide variety of applications.

Objectives

In order to address the above issues the subsequent research proposals are described. The first aspect is to introduce an automated self-service network security mechanism for cloud service intrusion attacks. In this approach the cloud application network security dynamically changes over time-to-time based on the user requirements.

The second aspect in fault tolerance is check pointing, which is one of indispensable technique to recover application from the failure⁴. Check pointing is a process of preserving a snapshot of the application state that will allow continuation of computing from the point of time. But more checkpoints again cause a

hurdle for applications maintenance at server. The major proposal is to provide optimal number of checkpoints for fault tolerance in cloud computing task to minimize the checkpoints overhead.

Another research direction in cloud platform services to develop a simulator for software fault tolerance and security issues such as monitoring and detecting faults, intrusion detection and avoidance⁷, and software reliability models. These proposals will serve as a good foundation for security issues and failure of resources in cloud computing environment.

Brief Survey of research work already done in areas of research

Fault Tolerance Techniques in Cloud Computing

FT systems endeavor on manage those administration through recuperation system. A portion of the strategies that need aid ordered similarly as sensitive approach needs aid provided for below:

Check pointing/Restart: those occupation restarts starting with the as of late checked side of the point in the event of disappointment. Replication: various duplicates would support and run on distinctive assets for compelling issue tolerance. Job migration: Assignments would migrated to different machines in the event that of disappointment. Check pointing: Check pointing may be a ft system that takes snapshots of the framework state Furthermore spares it over a lasting stockpiling (checkpoint). The framework rollbacks to that state in a faults line is distinguished by those system, as opposed to restarting starting with the starting. Number papers need improved checkpoint component utilizing separate calculations. Those worth of effort optimized the amount of checkpoints by utilizing formulas⁵ will make it quicker Also lessen capacity. There would a few favorable circumstances for utilizing check pointing procedure because of its low expense and secondary execution. However, overhead will be those fundamental disservices of utilizing weigh pointing.

Replication: Replication will be duplicating all files should an alternate capacity device; those stockpiling ability will be not an impediment so as should move forward framework accessibility. The perfect gas amount about reproduce is determined and the load parity is attained utilizing answer. The points of interest

from claiming answer system incorporate expanded parallelism (i. E. Quicker inquiry execution), higher performance, and expanded velocity clinched alongside preparing. The drawbacks of answer method incorporate expanded overhead Also cosset from claiming answer.

Job Migration: Relocation is those supplanting of the running VM done an alternate VM over unique physical hosts which separates equipment Also programming will settle on oversaw economy less demanding. A few papers endeavored to figure out the long haul on perform VM relocation suggested another technique will foresee the movement execution Furthermore vitality cosset. Favorable circumstances of vocation movement incorporate not difficult management; load balancing, Also administration accessibility throughout movement. Those Hindrances about vocation movement incorporate cosset What's more helter skelter overhead. Moreover, there may be plausibility that those entireties VM is pernicious.

Fault Tolerance Models in Cloud Computing (FTMCC)

We categorize FTMCC into three groups according to the FT techniques discussed earlier: checkpoint based models, replication based models, and models based on multiple techniques. Replication based fault tolerance: Cloud computing environments¹ basically need predefined fittings excess built FT, Likewise those reaction time may be a huge parameter answer built FTCC fluctuate done taking care of faults. To example, a latent answer model may be fit of best tolerating crash faults same time animated answer model could endure byzantine faults.

An productive answer plan may be recommended to². It transparently tolerates crash disappointments Also offers secondary availability, helter skelter performance, generality, transparency, also consistent disappointment recuperation. A standout amongst the primary drawbacks from claiming this model is the latency, as that system buffering makes execution overhead it obliges extra fittings. It will be a productive answer built model Anyhow fundamentally introduces organize delay. Thus, it may be not suiting to provisions that need aid delicate with organize delay alternately inactivity. This detriment is succeed on³ by generally diminishing the outer organize buffering that brought about those organize inactivity. A middleware called

Niagara that offers secondary accessibility Furthermore low inactivity. Shadow answer may be suggested for ⁴ to guarantee fruitful vocation fruition.

Byzantine Fault Tolerance (BFT) Models need aid answer based models that would be endured by byzantine disappointments. Byzantine shortcoming tolerance structures to voluntary-resource cloud Computing may be introduced in that endure faults for example, crash, arbitrary, and practices.

The system follows the same message algorithm that used in Practical Byzantine Fault Tolerance (PBFT) but they are different in the number of replicas. High scalability and less overhead are the advantages of using Zyzyva. A Hybrid Quorum (HQ) protocol for BFT is presented in ⁵. It switches between BFT and quorum-based protocol -i.e. Query/Update (Q/U) - according to the failure occurrence.

Checkpoint based fault tolerance: Check pointing consists of three main types: coordinated check pointing, uncoordinated check pointing, and Communication Induced Check pointing (CIC). CIC is an equal cost check pointing scheme with varying checkpoint interval.

Checkpoint based issue tolerance for cloud Computing will be suggested on ⁶ this model employments an alternate Uni record framework (AUFS) so as to recognize read-only properties starting with read Also compose parts On VM picture. An alternate model for a union record framework is introduced in that utilization the long fault VM checkpoints.

CONCLUSION

The cloud Computing business sector will be just setting off will develop likewise for every. Computing situations would pretty much inclined should failure, powerful faults line tolerance systems need aid an absolute necessity to guarantee dependability over these cloud frameworks Likewise their disappointment Might a chance have errors. For this suggested model we worked Previously, Proactive shortcoming administration Web-domain whereby we To begin with foresee. The hubs which need aid the greater part inclined should encountering issue with those. Naïve Bayes classifier et cetera applying shortcoming tolerance. Systems to guarantee improved dependability of the framework with our proposed model, we could upgrade the unwavering quality of the system, dependability qualities. Need aid used to. Estimate. The disappointment from claiming any part for example, such that hub for our situation.

Reliability of the framework will be measured utilizing. MTBF element with that provision for Naïve Bayes gives the numbers for hub disappointments with the precision of almost 87%. There will be an extent for utilizing other arrangement calculations for that could have a chance to be compared.

Recognition of Object using Improved Features Extracted from Deep Convolution Network

D Satti Babu¹, Leelavathy N², Ramakrushna Rath³, M.V. Satish Varma³

¹Professor, ²Associate Professor, ³Assistant Professor, Department of CSE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

Object recognition will be a methodology uses a particular object done a picture. Object recognition calculations rely ahead matching learning is an example recognition calculations utilizing presence built alternately characteristic based strategies. Object recognition systems incorporate characteristic extraction Furthermore machine taking in models, profound taking in quest Likewise CNN. Profound taking in convolution neural system (CNN) need been demonstrated with be altogether compelling to characteristic extraction. CNN will be compacted for you quit offering on that one alternately All the more convolution layers et cetera emulated Eventually Tom's perusing you quit offering on that one alternately that's only the tip of the iceberg completely joined layers. To picture classification, the fill in with classifiers expects during exploring the greater part proper classifiers for large amount profound features. Those features concentrated starting with that picture assumes a paramount part in picture arrangement. Characteristic extraction will be the methodology for retrieving the imperative information from crude information. Characteristic extraction will be discovering those set of parameters that remember those item decisively Also particularly. Done characteristic extraction each character is spoken to toward a characteristic vector, which turns into its personality. Those real objective from claiming characteristic extraction is on extricate An situated about features, which expand those recognition rate.. In this work the features extracted from CNN applied as input to train machine learning classifiers and perform image classification. A systematic comparison between various classifiers is made for object recognition.

Keywords: Feature extraction, Neural networks, Object recognition, Machine learning.

INTRODUCTION

The first intention of trying to “understand the scene” is one of the base ideas in computer vision that lead to a continuous increase in the need to apprehend the high-level context in images regarding object recognition and image classification. By becoming a fundamental visual expertise that Computer Vision systems require, the field has rapidly grown. Images have become ubiquitous in a variety of fields as so many people and systems extract vast amounts of information from imagery. Information that can be vital in areas such as robotics, hospitals, self-driving cars, and surveillance or building 3D representations of objects¹⁻³. While each of the above-mentioned applications differs by numerous factors, they share the common process of correctly annotating an image with one or a probability of labels that correlates to

a series of classes or categories. This procedure is known as image classification and, combined with machine learning, it has become an important research topic in the field, and on account of the focus on the understanding of what an image is representative of. The complex process of identifying the type of materials in diverse tasks linked to image-based ⁴ scene perspectives has taken advantage of the combination of machine learning techniques applied to the up-to-date development of neural networks. This outlines the challenging problem of material classification due to the variety of the definite features of materials ⁵.

The state of the-art solutions rely massively on the attention that Computer Vision systems have received, which led to a series of algorithms being developed and images being collected in datasets. People are able to recognize the environment they are in as well

as the various objects in their everyday life no matter the influence on the item's features or if their view is obstructed, as this is a standout amongst the thick, as to start with abilities we take starting with the minute we are conceived. Computers, on the other hand, require effort and powerful computation and complex algorithms to attempt to recognize correctly patterns and regions where a possible object might be. Object detection and recognition are two main ways that have been implemented over multiple decades that are at the centre of Computer Vision systems at the moment⁶. These approaches are presented with challenges such as scale, occlusion, view point, illumination or background clutter, all issues that have been attempted as research topics that provided functionality that led to the introduction of Neural Networks and Convolutional Neural Networks (CNN). The newly added functionality is composed of distinct types of layers that consist of many parameters that are able to figure out the features present in a given image. These architectures have since been built on and a more complex structure with hidden non-linear layers between the input and output layers of a CNN has been identified as Deep Convolutional Neural Network (DCNN). In Computer Vision systems, datasets are divided into two main categories: a training dataset used for training the algorithm learn to perform its desired task and a testing dataset that the algorithm is tested.

Extraction about discriminative features from enter pictures is a standout amongst those the greater part testing errands on object recognition frameworks⁷. Considerably exertion need meant during deciding ideal characteristic sets for a particular task, dependent upon the qualities of Questions should be perceived Furthermore classifiers to make utilized. Huge numbers from claiming these offers handled precise guaranteeing effects. However, because of those uncertainty and absence of all task-independent decides for ideal characteristic selection, the transform of information arrangement has been done different methodologies utilizing neural networks⁸ that critical focal point of these neural system methodologies will be that throughout the preparing transform that system self-determines the ideal set for Characteristics starting with that information. The disservice is that substantial preparation information sets might a chance to be needed and hence the preparation transform Might be precise protracted. Neural networks bring been indicated with gatherings give fantastic execution in numerous picture

order⁹.

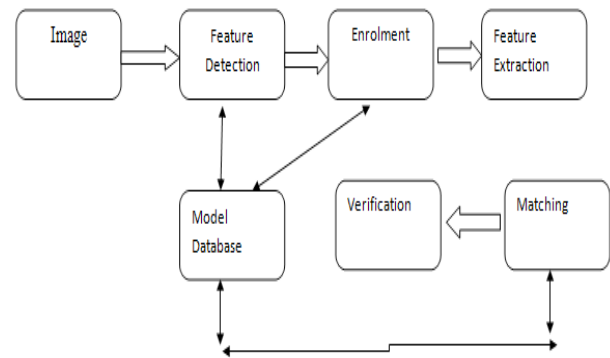

Figure 1. Components of object recognition

Object Recognition Algorithms

In this chapter, famous algorithms from the most promising approaches are demonstrated. Short descriptions and the general function of SIFT and SURF, which are examples for the feature-based approach, PCA and LDA, which are appearance-based methods, and convolutional neural networks are displayed.

SIFT - Scale-Invariant Feature Transform

The scale-invariant feature transform (SIFT) is an algorithm in computer dream will recognize Also depict nearby offers clinched alongside pictures. Those calculation might have been protected in canachites Canadensis toward those college about British Columbia and distributed by david Lowe done 1999. Filter enter focuses about Questions would to start with concentrated from a set for reference pictures¹¹ also put away on a database. An object will be perceived on another picture toward separately contrasting every characteristic from that new picture with this database Furthermore discovering hopeful matching Characteristics In view of Euclidean separation for their characteristic vectors. Starting with those full set of matches, subsets about key focuses that consent on the article Furthermore its location, scale and introduction in the new picture need aid identifier with channel out great matches. The determination about reliable groups will be performed quickly toward utilizing an effective hash table usage of the summed up Hough change¹². Every bunch for 3 or more Characteristics that agrarian looking into an article Furthermore its pose may be that point liable will further nitty gritty model confirmation Also thusly outliers are disposed of. At last that likelihood that a specific situated about offers demonstrates the vicinity of an item will be computed provided for those correctness

of fit Furthermore amount about possible false matches. Article matches that pasquinade all these tests can be distinguished similarly as right for high certainty.

Algorithm

Filter will be exactly an included calculation. It need a considerable measure setting off on also can ended up confusing, something like that part up the whole algorithm under numerous parts. Here’s a system explains about the algorithm.

Constructing a scale space this is those starting preparation. You make inward representations of the first picture to guarantee scale invariance. This may be finished by generating a “scale space”. LOG Close estimation the Laplacian from claiming gaussian is incredible for discovering fascinating focuses (or key points) for a picture. However it’s computationally unreasonable. Thereabouts we trick Also estimated it utilizing the representational made sooner. Discovering magic focuses for the super quick approximation, we presently attempt on find magic focuses. These are maxima What’s more minima in the distinction for gaussian picture ¹³ we figure to step 2.

SURF - Speeded-Up Robust Features

That SURF method (Speeded up Robust Features) is a quick and strong algorithm to local, comparability invariant representational What’s more correlation of pictures. Also to large portions different neighborhood descriptor based approaches, investment focuses of a provided for picture would characterize likewise remarkable features from a scale-invariant representational. Such a multiple-scale Investigation is furnished by those convolution of the starting picture for discrete kernels in a few scales (box filters). Those second step comprises over building introduction invariant descriptors, by utilizing nearby gradient detail (intensity & orientation). The principle enthusiasm of the surf approach lies clinched alongside its quick calculation for operators utilizing box filters, hence empowering ongoing provision for example, such that following Furthermore object recognition

PCA - Principle Component Analysis

Principle component analysis (PCA) is a procedure of statistics which reduces the dimensionality of a collection of observed data. In general, PCA is an

orthogonal linear transformation which transforms data to a new coordinate system. The first coordinate equals to the direction of the greatest variance of the data, this is called first principle components. The second principle component equals to the second greatest variance and so on.

Figure 2. Collection of data with two principle components λ1 and λ2.

In Figure.2. The two axis λ1 and λ2 represent the two principle components of the observed data, where λ2 is the first principle component. In PCA for object recognition mostly the first principle component is needed as it still contains most information about the data. The data is projected on the first principle component in order to maintain maximum variance.

$$w(1) = \operatorname{argmax}_{\|w\|=1} \{ \|Xw\|^2 \} = \operatorname{argmax} \left\{ \frac{w^T X^T X w}{w^T w} \right\} \quad (1)$$

LDA - Linear Discriminator Analysis

Another famous appearance-based algorithm is called linear discriminate analysis (LDA). It is a method used in statistics for dimensionality reduction or classification. Each class is represented by mean μi and the same covariance Σ. The algorithm minimizes the intra-class variance Σ, while the inter-class variance Σb is maximized. With C as the number of classes and μ as the mean of the class means one obtains:

$$\Sigma b = \frac{1}{C} \sum_{i=1}^C (\mu_i - \mu)(\mu_i - \mu)^T \quad (1)$$

the class separation S in direction #»w is calculated:

Figure.3. A projection can lead to good or bad class separation.

As means and covariance are not always known, different approaches have to be applied to still be able to use LDA. Maximum likelihood estimation or maximum a posterior estimation can help.

Characterization of General Object Recognition Strategies

Appearance-based Method

The concept of the appearance-based object recognition strategy is presented. Appearance-based methods are popular for face or hand-writing recognition. For this strategy, a set of reference training images, which are highly correlated, is needed. For example, 100 images of faces and a set of images containing background or random objects. This dataset is compressed using dimensionality reduction techniques to obtain a lower dimension subspace, also called Eigen space. Parts of the new input images are projected on the Eigen space and then correspondence is examined. More details about appearance-based methods are when describing the two famous algorithms PCA and LDA.

Feature-based Method

The next strategy is called feature-based, because algorithms recognize objects based on specific features. Features are supposed to be characteristic for each object; often one object is not only described by one attribute but multiple features. Colors, contour lines, geometric forms or edges (gradient of pixel intensities) are popular choices. The basic concept of feature-based object recognition strategies is following: Every input image is searched for a specific type of feature; this feature is then compared to a database containing models of the objects in order to verify if there are recognized objects. As already mentioned, object features can have many faces, but simplified spoken, they all can be divided in just two categories. Features and their descriptors can be either found considering the whole image (global feature) or after observing just small parts of the image (local feature). An histogram of the pixel intensity or color are simple examples for global features. It is not always reasonable to compare the whole image, as already slight changes in illumination, position (occlusion) or rotation lead to significant differences and a correct recognition is not possible anymore. [GL] Descriptors of local features are more robust against these problems and therefore algorithms with local features often outperform global feature-based methods. In general concept of local

feature-based algorithms can be seen. Two small patches are compared and not the whole image, these patches may be rotated and normalized first in order to achieve higher accordance. This approach has lead to much progress on research in object recognition.

Pattern Matching

Methods of pattern matching, or sometimes called template matching, are often used because of their simplicity. Template matching is a technique for finding small parts of an image which match a template image. The computation is quite easy: In above equation, the squared differences between an image patch I and a template M are summed pixel wise. A threshold has to be provided in order to let the algorithm decide whether a template matched and an object was recognized.

$$a. r(x, y) = \sum_{i \in M} \sum_{j \in M} (I(x+i, y+j) - M(i, j))^2 \quad (1)$$

The result can be adjusted in order to stabilize against small distortion and light changes with where n is the number of pixels in the template.

$$b. r = \frac{\sum I M - \sum I \cdot \sum M}{\sqrt{(n \sum I^2 - (\sum I)^2)(n \sum M^2 - (\sum M)^2)}} \quad (2)$$

One famous application of template matching is traffic sign recognition, small parts of the input image are tried to be matched with a database full of different images of traffic signs. As this approach has lots of disadvantages such as problems with occlusion, rotation, and scaling, different illuminations and so on, it will not be given further attention in this work.

Artificial Neural Networks

Artificial neural networks are models inspired by biological neural networks. Such a model consists of several layers, as it can be seen in below fig, in which each layer is composed of a certain number of neurons. An input and an output layer is the minimum amount of layers a network can have, but normally hidden layer are included to be able to learn more complex things such as object recognition.

Figure.4. Neural Networks

All neurons from one layer are connected to all neurons from the next layer and therefore create a huge network with millions of parameters. All of these connections have a weight which is updated during learning phase. Neurons are activated if the sum of the input signals is above a certain threshold and a activation function triggers the output.

layers account for non-linearity in the model. Pooling layers down sample the data to reduce the number of inputs to the next layer. The final layer is fully connected, mapping to each input into single output.

Extreme Learning Machine

Extreme Learning Machine (ELM) as a kind from claiming summed up single-hidden layer feed-forward networks (SLFNs) need showed its beneficial generalization execution for amazing quick taking in velocity over huge numbers benchmark and true provisions. This paper further investigations the execution of ELM and its variants in object recognition utilizing two diverse characteristic extraction techniques. Those initially technique extracts composition features, power Characteristics starting with histogram what more Characteristics starting with two sorts for colors space: HSV & RGB. Those second strategy extracts state offers dependent upon radon convert. The order exhibitions of elm Also its variants are compared for that execution from Support Vector Machines (SVMs). Likewise checked Eventually Tom’s perusing reproduction results, elm accomplishes finer testing precision with considerably lesquerella preparation chance for lion’s share cases over SVM to both characteristic extraction techniques. Besides, the parameter tuning methodology for elm may be considerably simpler over SVM too.. specified a dataset $X=[x_1,x_2,\dots,x_N]\in\mathfrak{R}^d$ of N samples with label $T=[t_1,t_2,\dots,t_N]\in\mathfrak{R}^c$, where d is the dimension of sample and c is the number of classes. Note that if $(i=1,\dots,n)$, belongs to the k-th class, the k-th position of $(i=1,\dots,n)$ is set as 1, and -1 otherwise. The hidden layer output matrix H with L hidden neurons can be computed as

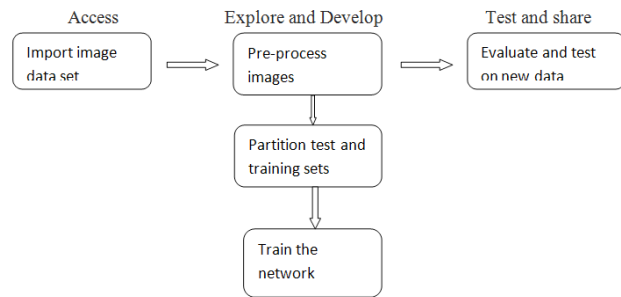

Figure.5. Deep learning workflow

Features extracted from CNN applied as input to train machine learning classifier. Systematic comparison between various classifiers is made for object recognition. We will present a study of Nearest Neighbor (NN) , Support Vector Machine (SVM), Least Squares, Extreme Learning Machine (ELM).

Figure.6. Block diagram

Convolution Neural Networks (CNN) is composed of several inter-connected hidden layers which process and transforms inputs to outputs. They are inspired from the biological structure of the visual cortex (the part of the brain responsible for sight). Convolution layers map inputs to certain neurons in different regions Convolution

$$H = \begin{bmatrix} h(w_1^T x_1 + b_1) & h(w_2^T x_1 + b_2) & \dots & h(w_L^T x_1 + b_L) \\ \vdots & \vdots & \ddots & \vdots \\ h(w_1^T x_N + b_1) & h(w_2^T x_N + b_2) & \dots & h(w_L^T x_N + b_L) \end{bmatrix}$$

where $h(\cdot)$ is the activation function of hidden layer, $w=[w_1,\dots,w_L]\in\mathfrak{R}$ and $b=[b_1,\dots,b_L]\in\mathfrak{R}$ Are haphazardly produced enter weights Also inclination between those information layer Furthermore Hidatsa layer. For such a stowed away layer yield grid H, elm might make figured Likewise takes after.

$$\min_{\beta \in \mathfrak{R}^{L \times c}} \frac{1}{2} \|\beta\|^2 + C \frac{1}{2} \sum_{i=1}^N \|\varepsilon_i\|^2$$

$$a. \quad s. t. h(x_i)\beta = t_i^T - \varepsilon_i^T, i = 1, \dots, N \leftrightarrow HB = T^t - \varepsilon^T \tag{14}$$

RESULTS

That examination about two classifiers, the Extreme Learning Machine (ELM) and the Support Vector Machine (SVM) may be viewed as for execution. Test exhibits that the ELMs beat SVMs in cross-domain recognition errands. Test outcomes plainly exhibit that ELMs beat SVM based classifiers in distinctive settings. For particular, portion elm (KELM) demonstrates state-of- the-art recognition execution “around the introduced 5 prominent classifiers.

Table.1. Accuracy Results

Trained Image (Amazon)	Tested Image (DLSR)	Accuracy												
		<table border="1"> <thead> <tr> <th>Method</th> <th>A → D</th> </tr> </thead> <tbody> <tr> <td>NN</td> <td>78.7± 0.59</td> </tr> <tr> <td>SVM</td> <td>80.5± 0.79</td> </tr> <tr> <td>LSSVM</td> <td>82.5± 0.54</td> </tr> <tr> <td>ELM</td> <td>82.59±0.54</td> </tr> <tr> <td>KELM</td> <td>83.9± 0.44</td> </tr> </tbody> </table>	Method	A → D	NN	78.7± 0.59	SVM	80.5± 0.79	LSSVM	82.5± 0.54	ELM	82.59±0.54	KELM	83.9± 0.44
Method	A → D													
NN	78.7± 0.59													
SVM	80.5± 0.79													
LSSVM	82.5± 0.54													
ELM	82.59±0.54													
KELM	83.9± 0.44													

Test effects plainly exhibit that ELMs beat SVM based classifiers in distinctive settings. In particular, KELM indicates state-of-the-craft recognition execution around the introduced 5 mainstream classifiers.

Table 2. Experimental Results Chart

Comparative Study of Object Recognition methods:

The Comparative Study of Various methods and its accuracy rate, Time efficiency and user rate are given below

Table 3. Comparative Study of Object Recognition methods

Methods	Accuracy Rate	Time Efficiency	User Rate
Deep Learning	High (85%)	High	80%
Affine scale invariant feature transform (ASIFT)	Moderate (76%)		60%
Background subtraction	Moderate	Moderate	40%
Optical Flow	Moderate	High	20%
Frame Differencing	High	Low to Moderate	30%

CONCLUSION

For the assistance about object recognition particular idea we can essentially distinguish the Questions available over a picture or a feature succession. There need aid number of systems and that systems might have a chance to be connected to Hosting those fancied outcome. Similarly as human might essentially identify the item Furthermore actually might recognize, yet all the to machine it is not a simple task, consequently those fill in could a chance to be done with the help of the idea of computerized reasoning. Convolution neural net is a prominent profound taking in system to present visual recognition errands. Such as the sum profound taking in techniques, CNN will be Verwoerd reliant on the size Also nature of the preparation information. Provided for a great readied dataset, CNNs are skilled of surpassing people during visual recognition assignments. However, they need aid even now not hearty to visual artifacts for example, glare and noise, which people have the capacity should adapt. The hypothesis of CNN may be still being created What's more analysts need aid working with enrich it for properties for example, such that dynamic consideration and web memory, permitting CNNs should assess new things that are unfathomably unique in relation to the thing that they were prepared once. This exceptional emulates the mammalian visual system, accordingly moving towards a smarter simulated visual recognized system.

Future scope

Concerning illustration object recognition may be the idea for identikit the article in a picture and feature. It might a chance to be utilized for particular provision to upgrading the offers about a requisition to example, machine vision, What's more modern dream et cetera. It can be a point of reference previously, future particularly for commercial enterprises to decrease the mankind's fill in Also expansion the effectiveness and speed of the fill in.

ABSTRACT

The manuscript goal is to develop a framework that makes utilization of piezo and solar energy for rural electrification. The piezo and solar energy will be treated as renewable energy source. The framework additionally utilizes inverter to switch the AC gadgets. The paper makes utilization of piezo sensors and solar panels. The vitality acquired is saved to a battery. The battery supply is fed to pulse generator and in turn to a MOSFET that will be able to produce ON/OFF pulses of diverse frequencies. This is fed to a step up transformer to produce a low voltage AC. The vitality gotten will be provided as supply to AT89S52 microcontroller. A temperature sensor LM35 may be interfaced with microcontroller. An electrical machine may be associated so that it will work in dependent upon temperature.

Keywords: Piezo Electric Cell, Temperature Sensor, Microcontroller, Photo Voltaic Systems

INTRODUCTION

In recent day's energy is the most significant issue around the universe. The renewable energy sources might be an incredible networking to resolve this vitality emergency issue. As we recognize natural assets will complete one day. That's the reason specialists would attempting will present substitute vitality sources from environment. That should be green and not unsafe to nature. The energy harvesting is characterized as catching minute amount of vitality starting with you quit offering on that one or a greater amount of those encompassing vitality sources. People need at that point began to utilize vitality collecting innovation in the structure of windmill, geothermal and sun powered vitality. The vitality went from common sources, known as renewable vitality. Renewable vitality collecting plants produce MW or kw level power; it will be termed as macro vitality collecting innovation organization. Moreover, micro vitality likewise might generate from the sources of nature that are known as micro energy harvesting ¹. Micro vitality collecting innovation may be In light of mechanical vibration, mechanical anxiety Furthermore strain, warm vitality starting with furnace, heaters and rubbing sources, sun light alternately space light, human body, compound or living sources, which might produce mW or μ W level control. Micro energy supply needs

may be expanding significantly for duration of the time Likewise our engineering organization will be moving of the micro and Nano creation levels. Our discourse with respect to this will be In view of generating micro vitality starting with vibration Also weight utilizing piezo electric material ²

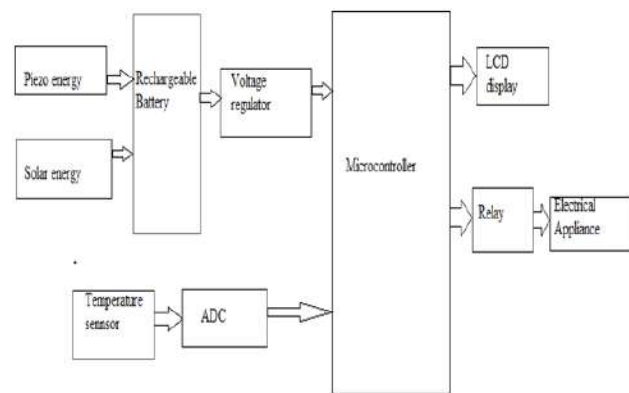

Figure.1. Block Diagram
Piezoelectric Sensor

This day the vast majority of the examination in the vitality field will be to develop the energy sources for future. It will be time to identify the renewable sources of vitality for the upcoming days. The Piezoelectric resources are being more concentrated on as they turn out will a chance to be abnormal materials with very

interesting and particular assets. Actually, these materials bring the capacity to process electrical vitality from mechanical vitality for case they might change over mechanical performance such as vibrations into power. Such gadgets would ordinarily suggest to as vitality harvesters and could be utilized within provisions the place outside power may be inaccessibility and batteries would not a possible selection. Same time later examinations have demonstrated that these materials might a chance to be utilized as energy generators, the amount of vitality handled is still exact low^{3,4} consequently the Piezoelectric materials have 2 properties, which are characterize as direct and converse effect. The direct effect is the property of some materials with create electric change on their surface when mechanical anxiety is exerted looking into them, same time converse impact will be the property of a few materials to develop mechanical anxiety when an electric charge will be prompted⁵.

Solar Panels

The solar energy begin with the solar panels and sun also termed as PV panels are utilized to change over light from the sun that may be collected of energy particles are mentioned as photons, into power that might make utilized to power electrical loads solar panels could be utilized for numerous applications together with remote power systems for remote sensing, cabins, telecommunications equipment, and obviously for the generation of power by private and business sun oriented electric systems.

LITERATURE REVIEW

This project executes an effective approach to power generation framework, utilizing sun based power and piezoelectric power. The solar energy framework may be utilized to gather most extreme power from sun. The thought will be to utilize the sunlight based panels more effectively and to carry out the sensible evaluation method to improve the sun based yield power to a noteworthy level. The piezoelectric based energy producing method may be connected to produce power from mechanical vibrations (stress). Utilizing piezoelectric material to harvest vibration energy from apparatus vibrating, people walking, will be an area of extraordinary interest, due to this vibration energy will be otherwise undiscovered. Since development is everywhere, the capacity to catch this vitality affordably

might be a noteworthy advancement through the cleaner energy production and efficiency. The objective of this experiment is to examine if piezoelectricity might have the capacity to provide sufficient source of voltage to charge the parent battery in the event of cloudy or rainy times. This setup permits the two sources to provide the load independently or concurrently relying upon the energy sources accessibility. This undertaking performs an effective approach to produce power utilizing sun based power and piezoelectric energy harvesting circuit.

Implementation

Fundamentals of Photovoltaic Systems

A solar cell (see Fig.1) is essentially a photo detector containing a p-n junction that is illuminated to generate DC current. A distinctive silicon solar cell is collected of a thin wafer layer of n-type silicon on top, and a thicker layer of p-type silicon is shown in Figure 2. The contact between the two materials forms the p-n junction, which has a built-in electrical field in the depletion region.

Figure. 2. Picture of a solar cell.

The photovoltaic process of current generation in a solar cell involves two key steps. The first step is the absorption of incident photons to produce electron-hole pairs. The electron-hole pairs can be created only if the incident photons have energy greater than the semiconductor band gap. The next step is that electrons and holes are detached by the electrical field in the junction depletion region and flow through the external circuit.

Figure.3. Structure of solar cells

However, the detailed study of the physics of solar cells is considerably complicated and is beyond the scope of this thesis. Knowing the electrical characteristics of solar cells, modules, and array in different environment (irradiance and temperature) is sufficient for the fault studies of PV systems.

Solar cell Technology

The photovoltaic modules and cells vary in their output efficiency, essential materials, and costs.

The Table 1 depicts the comparison of accessible solar cell methods.

Table.1. Summary of solar cell technologies

	Crystalline Silicon	Thin Film
Picture		
Module types and module efficiency	<ul style="list-style-type: none"> • Mono-crystalline Silicon (15-18%) • Poly-crystalline Silicon (13-16%) 	<ul style="list-style-type: none"> • Amorphous Silicon (5-7%) • Copper Indium Diselenide (CIS) (9-11%) • Cadmium Telluride (CdTe) (7%)
Advantages	<ul style="list-style-type: none"> • More efficient • Requires less space • Long track record 	<ul style="list-style-type: none"> • Less manufacturing costs • Very versatile • More shade tolerant • Less temperature sensitive

PV technologies are versatile and widely used to generate electricity for many applications, from small to large power levels. Individual solar cells are used for powering small appliances such as electronic calculators. Large PV arrays are consumed to generate power to the utility grid, such as PV plants.

As basic photovoltaic devices, solar cells are often electrically encapsulated and connected in an environmentally protective laminate as a PV module.

Temperature Sensor (LM35)

The LM35 sensor series are also known as precision integrated-circuit temperature sensors, whose yield voltage will be linearly proportional to the Centigrade temperature. The temperature sensor consequently

has a benefit over linear temperature sensors adjusted to ° Kelvin, Likewise the client may be not obliged to subtract an extensive consistent voltage from its yield will get advantageous Centigrade scaling. The LM35 don't want any outside arrangement to supply the run of the mill correctness of $\pm 1/4C$ at room temperature and $\pm 3/4C$ over a full -55 to +150°C temperature range.

Relay

The relay is also known as an electromagnetic device that will be utilized to connect 2 circuits magnetically and disconnect those circuits electrically. They are very helpful devices and allow one circuit to switch other circuit whereas they are entirely different. They are repeatedly utilized with interface an electronic circuit that works at during low voltage with an electrical circuit that works at during high voltage. For example, to switch a 230V AC mains circuit, a relay is used to make a 5V dc battery circuit. Therefore, a little sensor circuit might an electric bulb or fan.

CONCLUSION

This paper is profitably tested and executed that is the best reasonable, affordable energy to ordinary people. In rural regions where the power supply is completely absence or less, then we can utilize this type of energy. As India will be a developing nation where management of energy is an enormous challenge for a massive population. Toward utilizing this paper we might drive both AC and Dc loads as stated by the energy we connected on the piezoelectric sensor and with solar energy.

Future Scope

Men have consumed vitality during an increasing rate for the prosperity and sustenance since the time immemorial. Due to this many energy resources have been wasted and fatigued. Proposal for the utilization of waste vitality of foot power with mankind's motion may be very much applicable and significant for profoundly populated nations such as India where the temples, hospitals, and so on, are overloaded. The point when the flooring may be engineered with piezo electric method, the electrical vitality generated by the pressure is caught toward floor sensors and changed to an electrical charge by piezo transducers then stored and utilized likewise a power source. Furthermore, this power source has a lot of applications as in cultivation, and as energy source for sensors in remote locations, and home provision.

ABSTRACT

This paper suggests a structure for possibility management utilizing smart loads that are acknowledged through the rising standard of the IoT (Internet of things). LSEs (load-serving substances), operators of this system, and the end-users with smart home management frameworks, which mechanically control the adaptable loads are involved in this framework. The operator of the framework uses a proficient linear equation solver to quickly compute the load reduction required at every bus to release congested lines after a possibility. In this reduction request, a power allowance is calculated by LSE, for each of its end-user to increase the aggregate client utility.

Keywords: Smart grid, Internet of things, power management, contingency management.

INTRODUCTION

Contingencies which lead to failure are same significant problems in power systems operation. A framework for contingency management has been proposed in the IEEE paper. The paper provides an efficient algorithm called “WRAP (Welch Based Reactive Appliance Prediction)” as a solution for determining the curtailment at each bus; this is achieved by calculating the power allowance for each client and then predicting the future performance of the user so that the impact at the time of contingency can be minimized. The results obtained were tested on New England 39 bus system [1].

In the report by Texas, Instruments IOT enhances the customer’s experience by allowing greater interaction and control for users by providing accessibility and connectivity. Using Wi-Fi, the user can connect to the internet with a smart phone and get the information. It presents with IoT of data hence the cost can be reduced through diagnostics [2].

The probability for the occurrence of contingency is very low, but they can lead to blackout on a large scale. As per analysis is done by the U.S. Executive Officer of President around the years 2003 to 2012 around 679 power outages have occurred on a large scale in the U.S. Each outage has affected around 50,000 customers. This

even affected the economy. The cost ranged from 18 to 33 billion U.S. Dollars per year [3].

This project proposes an efficient method of energy consumption. Energy management is becoming very important. Today, most modern houses monitor their energy consumption, since energy costs have become a primary factor in household budgeting. Energy management is about accurately monitoring and getting the data about power usage. The long-term goal of energy management is to reduce the cost of energy and save money. Consequently, in this work, all controlled loads, excluding critical loads are automatically turned off once they cross the threshold limit. The usage can be monitored through any Android device, with the help of the Internet of Things [2].

Related Work

Lot of efforts was made for managing the contingencies with the fluctuating demand. In [4] and [5] describes the response factor is being considered to be an essential aspect. In the case of [4] demand response is being discussed to calculate the frequency after the contingency has occurred. In the case of [5] demand response is being used for effective use of the transformers during the contingency. The contribution [7] corrects the voltages by adjusting the post-contingency demands. These three works take demand response into

account for managing contingency, but post contingency there are a few risks. There are multiple works [8], [9] present which predicts the user's power consumption for each appliance.

An algorithm was proposed for finding out the usage of appliances (only residential) by each individual [8]. Another algorithm was proposed to reduce the user's discomfort. It finds out and tells which all appliances are to be turned off when the system is at peak. This method claims the significance of each appliance to the client is well-known well before [9].

By using IOT as a platform a project was developed for easy monitoring of power [6]. The major drawback in this is the use of the GPRS module. The privacy of the user is not protected because anyone can access and get to know the trend of power consumption of individual user and use the data for illegal purposes. This work takes a step more from the existing proposed [1], [6]. A prototype is designed with a simplified version of prediction WRAP algorithm. It takes three different power values into account. They are the SET value (it depends on the initial loads), AVG value (it depends on the usage) and MAX value (it depends on the loads initial as well as additional if any). Based on the usage the AVG value is calculated using the below formula:

$$AVG = [ENERGY + TOTAL ENERGY] / 2$$

Energy Power consumed at nth interval

Total Energy Power consumed till (n-1) intervals based on the user is predicted and contingencies are managed.

The usage of Wi-Fi module preserves the privacy of the individual user because Wi-Fi module can be accessed through SSH and only by authorized personnel.

The manuscript is divided as follows. Section 3 is the working, 4 describe the System Model, 5 is Software description, and 6, 7, and 8 concludes the paper.

METHODOLOGY

Wi-Fi is a host device. Android device can be connected to Wi-Fi module through SSH. Here an application called Juice SSH is used for establishing a connection. Once the connection is established the readings can be obtained. There are two modes of operation depending on the occurrence of the

contingency.

The process is clearly explained in Figure 1.

Normal Mode

There are three values being considered here. First one is the set value. Set value depends on the initial load this value is fixed throughout it won't change. The second one is the Max value. This is also dependent on the load. It is initially the same as the set value. But whenever the load changes the value also varies according to the load being added or removed. The third one is the Average value, and this depends on the usage. In normal mode as there is unlimited power supply even when additional loads are added it keeps on allowing the usage without any limitation.

Inverter Mode

Because of contingency the input supply is limited hence depending on the individual is using the threshold is set. The threshold value will be an additional forty to the set value. The other forty is provided for emergency usage. The supply being provided will be sufficient for the individual because it is being provided after taking into account their usage. Once the threshold is crossed the supply will automatically be turned off. The cutoff occurs because of the relay.

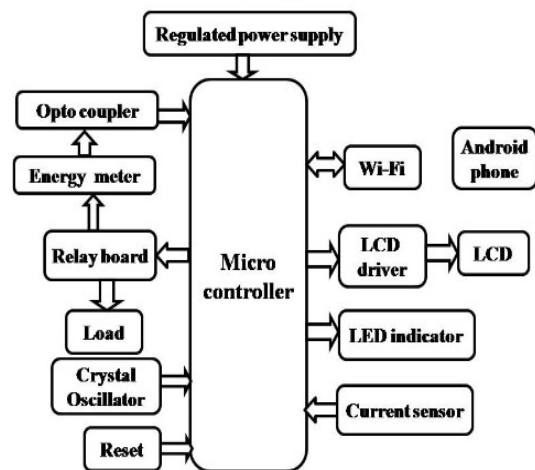

Figure.1. Block Diagram

The main blocks shown in Figure 1 are:

- Microcontroller
- Regulated Power Supply
- Wi-Fi
- LCD display with the operator

- e. Opt coupler
- f. Energy Meter
- g. Loads
- h. LED Indicators
- i. Crystal Oscillator
- j. Relay
- k. Reset

The working protocol of PIC Technology is being used because of its low cost, flexibility and future smart home implementations. It allows the use to pair with Android devices through Wi-Fi module. PIC Microcontroller has RISC architecture. The code is very proficient, permitting PIC to run with less program memory. PIC requires a clock to work. It improves the speed of execution [10], [11].

The WIFI is a host device and is connected to the mobile through SSH (secured shell) [2].

A 5V DC is fed to the microcontroller, relay, WIFI module and LCD Display

The energy meter is connected to the loads. It internally consists of current sensors. The current sensors sense the current usage of the loads. The energy meter gives pulses based on the usage. These pulses are fed to the microcontroller. The power usage is calculated using the algorithm by the microcontroller. Auto coupler is being used for calculating the time for which each load is being used. Crystal Oscillator increases the execution speed.

The relay is shown in Figure 4 is used for auto cut off to occur in inverter mode.

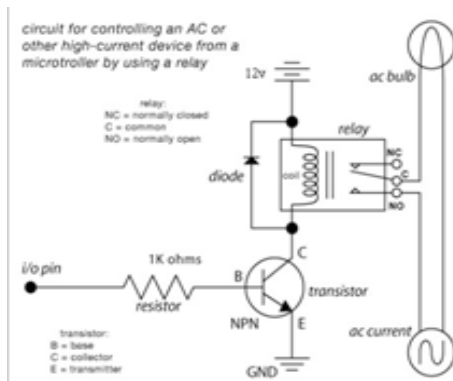

Figure.2. Relay

A maximum of 1000W input loads can be used beyond that this framework is not suitable.

Software Description

The software's were used for implementing the project. They are:

PIC C Compiler

Proteus

PIC Kit2

PIC compiler is used for generating the hex file. The code is written in the pic compiler, and the hex file is generated. This is needed because we need a low-level language. The code is a high level. Hex file generated is nothing but hexadecimal hence it is a low-level language. The hex file gets generated only if there are no errors present if there are any warnings those can be ignored. Along with the hex file an error file and backup file are also generated. The backup file can be used to recover the hex file if it is lost.

Proteus is used for testing. All the components present are placed, and the connections are made. Once the connections are done, the hex file generated is dumped. If there are no errors, the LEDs placed for testing will blink. Indicating the there are no errors. This is shown in Figure5.

After testing the hardware, the code is dumped into the controller using PIC Kit 2 as shown in Figure 2.

CONCLUSION

This system allows operating efficiently in contingency mode with the help of a simplified algorithm. That is (i) the normal mode operation is the regular operation. Results of normal mode are as shown in Figure 6. (ii) At the time of contingency, the operation shifts to inverter mode, in this threshold limit is set and additional 40W is given for the user to adjust the loads to avoid cut off. (iii) If the threshold limit is crossed the cut off will occur. The results of inverter mode are as shown in the Figure 7.(iv) This system is adequate for a

maximum of 1000W input load. Interfacing with a GSM Module can further extend this project, it can also be used to monitor the energy values as well as to control the load consumption from anywhere in the world. The prototype is as shown in Figure8.

School Children's Vehicles Tracking and Identifying System by using GPS and IoT Technology

A.Abdul Rahman¹, Sujata.B¹, A.Vandana Peter², Radha Mohan Patnaik², M.V.N. Lakshmi Durga²

¹Associate Professor, ²Assistant Professor, Department of CSE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

The principal goal is the child safety by utilizing GPS and IOT technique to track and identify those children's vehicle. A proficient vehicle tracking system is implemented and designed for tracing the motion of any provided vehicle from any place. The suggested framework is beneficial of well-known technology, which combines a smart mobile phone application with a microcontroller. When compared to others, this is simple to make and low-cost. The design in vehicle gadget works utilizing a GPS and GSM, which is a very most familiar way for vehicle-tracing. In real-time, embedded is in the vehicle whose location may be described and tracked. A MC is utilized to control the GPS and GPRS modules. Google maps API for ios may be utilized to show a vehicle area on a smart mobile application in utilizing an HTTP-request in real-time. The API naturally controls access to the Google Maps servers, displays map, and reply to client movements, for example, drags and clicks. Suppose a human in the vehicle has extreme alcohol then alcohol identification will be carried out towards the sensor then MC provides an elevated pulse to the buzzer and buzzer-circuit will be turned on and at the similar time transfer will be turned off. Because of this ignition of the vehicle is destroyed.

Keywords: Microcontroller, GPS module, sensors, Keil software

INTRODUCTION

Vehicle tracking system major goal is to provide protection to all vehicles. Accident alert system principle goal is to rescue people in mishaps. This will be enhanced protection frameworks for vehicles. Now a day, the current global positioning system is very beneficial of this system empowers the holder to track and notice his vehicle and determine the vehicle motion and its previous actions of vehicle. This latest technology, prominently known as vehicle tracking systems that did numerous admirations in the protection of the vehicle. This equipment will be fixed^{1,2} on to the vehicle in this way, which it is not noticeable to anyone who will be outside or inside of the vehicle. Consequently, it is used as a conversion unit that ceaselessly or by any disturbs to the system, sends the locality information to the tracking unit.

When the vehicle is theft, the locality information from tracing system might a chance to be utilized to

determine the area and might be update to the police for other movement. Some vehicle tracking system could considerably identify unapproved motions of the vehicle and then alert the manager. This provides an edge through other types of methodology for the same motivation³. This accident alert system in it identifies the mishap and the area of the mishap ensued and sent Global positioning system communicates to the particular computer, smart phones, etc. The fire detecting circuit is used to detect the heat in the vehicle. When An solicitation toward those customer might be sent of the add up during those modem, those schema regularly sends a give back answer-paid to that particular versatile demonstrating the area of the vehicle as far as longitude and latitude⁴. A system have be improved that may be utilized to localize the correct location of the vehicle and also to navigate trace of the moving vehicle on Google map.

Figure.1. System Block Diagram

METHODOLOGY

This methodology includes communication, GSM, GPS, and others. In any case, we utilize SIM 908 module that is the mixture of 2 units called GSM and GPS. The accident alarm system has 2 parts the initial part is controlling devices that send the communication and the second part is mobile unit that receive the message⁵ The system procedure, data transmission, connections, interfaces, and reception of information among the controlling device and mobile unit are working effectively.

This device incorporates a MEMS sensor that measures vibration and detects mishaps. It also integrates theft identification and obstacle with of IR sensors. The gas sensing module may be used to sense the existence of poisonous gasses such as CO, LPG, and different poisonous gasses inside the vehicle and this system will be utilized for identifying the alcoholic drivers with the use of an alcohol sensor (MQ3). The temperature sensor is also an accident alarm device that identifies the fire^{6,7}. This scheme is completely based on the embedded device. The GSM board has a legal SIM card through appropriate recharge amount to send SMS. If some of these sensors stimulated then the message of the present area will naturally send of the pre-loaded mobile number. A position first name is allocated for every longitude and latitude. The GSM receiver in the motor vehicle,

receive this information and offers to the PC by the serial port. Then the PC examines the information with its database and shows the information of the vehicle on the display⁸. The gadget will be secret key controlled i.e. the man who knows the gadget secret key only capable to activate. In case of any accidents, for example, fire, temperature, robbery or obstacle, gas sensor crosses the threshold quality then the gadget will naturally send a caution to the registered number, which is feeded into the MC memory.

Vehicle Tracking Features

It is profit for the organizations that are based on the transport system. While it could demonstrate the location of all vehicles in real-time, thus that they might make the probable information consequently. These tracing device could store the entire information where did it stop, and how much time it takes at each stop and could make complete information analysis. It may be utilized for trains and buses, to evaluate how far they are, and how much time it takes for them to come to the specific stop⁹ these devices are utilized to information investigation, information capture, information storage, and finally information exchange. By extra sensors, for example, gas sensor, liquor sensor, temperature sensor, and infrared sensors and system could have a chance to be enabled with identify fire, robbery, and obstacles.

System Overview

This vehicle tracking device takes information from GPS and sends it through the GSM module to mobile or laptop utilizing the mobile-communication. Vehicle tracking device is one of the greatest technical advancement to track the actions of the vehicle. The safety system employs Gps, to discover the area of the monitor or track motor vehicle and then employs satellite or radio device to send the coordinate and the area information to the monitor center. At monitoring center different software's are utilized to find the vehicle on a map. In this manner, the owners of vehicle can trace the motor vehicle on a real-time base. Because of the real-time track facility, vehicle tracking system is getting to be progressively prevalent among owners of costly vehicles.

Figure.2. System Working

The main module is GSM and GPS devices are used to receive the message and position in sequence from the satellite in the appearance of Latitude and longitude in real time information. The GSM transfer the SMS to the authorized person. Other module is MEMS sensor it can provides the four directional data to the vehicle location by value to x-axis, y-axis and z-axis.

Obstacle sensor is use to sense the any obstacle in frontage of the motor vehicle to avoid mishaps, alcohol sensor is use to sense range of alcohol if the driver is drunk or not. Temperature sensor is use to observe the high temperature inside the vehicle has caught fire or not

14.

Implementation

In this project, it is suggested to plan an embedded framework that will be utilized to tracing and locating of the vehicle through the use of GPS and GSM In this

project, LPC2148 may be utilized for interfacing with different hardware equipments¹³. The present plan will be an embedded application that will ceaselessly shows a moving vehicle and report the condition of the vehicle.

The following internal circuit diagram consists of LPC2148 mic, MAX232, and control supply. The LPC2148 is internally associated with GSM, GPS, theft, module, temperature, obstacle, alcohol, gas, and MEMS sensor.

Temperature Sensor

Thermistors need aid thermally delicate resistors whose unique ability may be will indicate a massive, predictable and precise progress previously, electrical safety At subjected around equal advancement Previously, human body temperature. Positive temperature coefficient (PTC) thermistors show grow for electrical safety At subjected to a ascent On human body temperature and Negative temperature coefficient (NTC) thermistors exhibit an diminishing on electrical safety a subjected should a Ascent for human body temperature .

Alcohol sensor MQ3

The alcohol sensor MQ3 will be appropriate for identifying alcohol, and this sensor might have a chance to be utilized within a breathalyzer.

The MQ-3 gas sensor has high sensitivity to alcohol has useful conflict to interrupt vapor gasoline, and smoke. The sensor might be utilized to recognize alcohol with diverse concentration; it is with low expense and suitability for diverse applications.

Gas sensing module

The gas sensing module will be used to sense the existence of dangerous gases, for example, CO, LPG, and other hazardous gases inside the vehicle. If significant levels of gases were found, that is if the CO exceeds 20ppm and the level of LPG exceeds 10,000ppm and then the digital information from the gas sensing module may be sent to the MC that shows the data about the gas leakage inside the vehicle and produces an alarm to alert the person inside the vehicle. It additionally sends a content message to the official person through the GSM modem associated to the MC such that remedy measures might have a chance to be taken by the official person and to provide appropriate medical treatment to them if

required.

Obstacle Detection

The obstacle sensing module will be used to sense the static obstacles in front of the vehicle such that mishaps because of unwanted stopping of the vehicles and collision with trees and different objects particularly during the night time could be avoided. These obstacles might be distinguished by utilizing different strategies for example, such that ultrasonic sensors and so on ⁶. the working standard of the obstacle sensor.

An IR module is used to identify the vehicle in front obstacles, it comprises an IR transmitter and a collector that merges to structure an “obstacle sensing module.

Micro-electro-mechanical sensor (MEMS)

Micro-electro-mechanical sensor or MEMS will be a method of mixing electrical and mechanical segments on a chip. MEMS sensor used to identify unexpected vibrations when a mishap happens. It also sends a text message to the official person through the GSM modem associated to the MC such that the official person might take remedy measures and to provide correct medical treatment to them if needed¹⁰.

There are numerous kinds of accelerometers reported and developed in the review. The more substantial part is dependent upon piezoelectric crystals however they are too large and too clumsy. Human being attempted to develop something smaller, which might increment applicability and started looking in the field of micro-electronics. MEMS (micro-electro-mechanical systems)

GSM Module

A “GSM module” is a particular kind of modem that acknowledges a SIM card and works over a contribution to a mobile operator, just such as a mobile telephone. A GSM modem looks like a mobile phone from the mobile operator perception.

GPS Module

A GPS navigation system is a gadget, which perfectly calculates geological area by getting data from “GPS satellites. Primarily, it might have been utilized by the United States military, however, now lots of receivers are in smart phones and automobiles.

Fire detector

A fire identifier may be a fire alert system intended will respond the point when the converted thermal vitality for fire expands that high temperature of the fire delicate component. The conductivity Furthermore warm impostor of the protocol controls the rate stream from claiming temperature under the protocol. All temperature identifiers have this thermal-lag. Fire detectors bring two standard characterizations to operation, rate-of-rise and also fixed temperature.

Internet of things (IoT)

The IoT is developing systems of physical objects that have physical connectivity and communication through IP address between webs empowers gadgets and objects.

Figure.4. Internet of Things

The suggested framework holds the ESP8266 will be the Wi-Fi module that is utilized to associate to the server. Therefore the Wi-Fi system through IoT information will be read on the webpage ⁸. To make a simple TCP/IP connection utilizing Hayes-style commands Wi-Fi system will be associated with a little module i.e. MC. The ESP8266 will be an ESP8266 with 1 MB regarding inalienable flash, permitting to single-chip units’ proficient of interfacing to Wi-Fi.

RESULTS

Figure.5. Results will get in smart phone

CONCLUSION

A successful result is provided to increase the intellectual system for vehicles that will monitor different parameters of the vehicle in between consistent time-period and will send this information of the base unit as clarified in this paper, by utilizing hardware platform who's Core is GPS & GSM module, Android, and alcohol sensor mq3. The designed system might complete the function of communicating with the base station through GPS, GSM and control of different parameters and also this device utilized for protection reason of a driver to alert the driver if any fire mischance or any gas leakage, then it inform the driver via buzzer to avoid vehicle from the mishap. The obstacle identification, temperature sensor, and alcohol sensor are utilized to other safety system in the vehicle. This vehicle tracking and accident caution characteristics play an essential part in daily life.

Smart Grid System Architecture over Embedded System using Internet of Things

M Saritha Devi¹, D.Vijendra Kumar², A Madhu², B Naveen Kumar²

¹Professor, ²Associate Professor Department of ECE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P., India

ABSTRACT

This paper refers advanced smart Grid architecture executed with the help of internet of things. Internet of things contains a set for Web administrations have highest priority over internet enabled embedded devices. The Web program on computer could go an interface over service provided by this web of things. Those Embedded devices such as ARM Cortex M3 Processor built gadgets with Ethernet abilities. CMSIS Real time embedded systems will be utilized to transform control on each on these electronic gadgets. LwIP Protocol stack may be actualized on highest priority on each of these units along with the IP connectivity. Those Web interfaces gatherings give us constant majority of the data for each of the energy meters that are introduced with respect to webpage and communicate with web units utilizing MODBUS correspondence protocol. Constant real time energy source scheduling and selection, energy association and separation are some of the administrations that would be given with a on-line verified client. The inserted embedded systems lab framework at the TIFAC center to 3G/4G correspondence toward national institute of science and technology might have been utilized for that equipment testing of the embedded modules. We were mostly helped by the product developers during NIST innovation consultancy administrations over outlining those web provisions and also interface for our Web of things construction modeling.

Keywords-Internet of things, Smart grid system, MODBUS correspondence protocol, Renewable energy sources, Global warming, Ethernet

INTRODUCTION

Utilization of renewable energy sources in house electrical works depend on a large portion used to minimize the amount of carbon discharges that we help towards the combined carbon discharges for this planet over the world. These carbon discharges will give rise to worldwide warming because of exhaustion of the ozone layer. Utilization of other sources like solar oriented water heaters serves to decrease unique carbon emission foot impression upon nature. Yet the utilization of this source is localization and atmosphere subordinate.

That power grid supply to our homes still stays that elementary source of energy to the majority of the Appliances clinched alongside our homes. Additionally the reconfiguration of the electrical meandering of the whole home may be a bulky procedure to those end client In the clients need aid given with a modest methodology will design the energy supply from claiming their homes

as for every requirement, the utilization about created renewable vitality can be a chance to be expanded. This might in the end place a sway on the aggregate carbon emanations because of those era procedure about energy from non-renewable vitality sources.

Those Web about things ^{1,2} contain of an amount about web enabled inserted gadgets which give acceptable such an interface of the client toward method for Web benefits. The end client could right this through a web program about any machine for a web association.

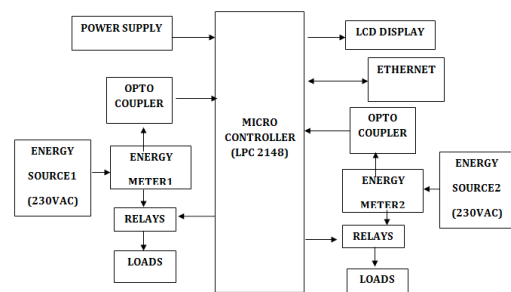

Figure.1. System Block Diagram of WoT and energy management

User main necessities are username and password on get right will these benefits starting with at whatever PC associated with the web. The regulating of the vitality sources to each home will be carried by perusing those help about source changers. These wellspring changers need aid regulated by perusing installed gadgets. The installed units sit tight to those direction book starting with those server which is Moreover guideline by those verified client with switch those vitality sources ^{3,4}.

Literature Survey

Web of things comprise of a situated of Web administrations gave with respect to highest priority on a numeral of web helped inserted gadgets. Those Web program for at whatever machine could fill in Likewise an interface or no right to gain entrance to the administrations given toward these Web from claiming things. (Sawat Mohanty, Bikash Narayan Panda, 2014). The written works states that those Web interfaces offer us constant majority of the data looking into each vitality meters that are mounted for area What's more convey of the installed web units utilizing MODBUS correspondence protocol. Constant energy source arrangement, energy source selection, energy association and separation are a few of the civilities that need aid given on an once -line recognized client. Those inserted systems lab substructure during those TIFAC center for 3G/4G correspondence at national foundation about science Furthermore engineering organization might have been connected to those equipment testing of the inserted parts. We were greatly helped by programming developers in NIST innovation organization consultancy benefits to outlining those web requisitions and interfaces to our Web for things building design. Mahesh Hiremath, Prof. Manoranjan Kumar(2012). wherein people communicate with data and vice versa, including remote control to objects by humans, and objects. According to Liu Hua¹, Zhang Junguo, Lin Fantao ³, implementation in the construction of smart grid which is depend on Internet of things are made, and the design and implementation in typical application links, including wind power estimation, condition monitoring of overhead transmission lines, power analysis, smart home and asset management are evaluated insistently

Existing System

The advanced mobile grid ^{4,6} is an shrewdly

force generation, distribution, and control system. The recommended framework is supportive clinched alongside accumulation and examination from claiming constant information alongside those control for electrical loads to vitality decrease. Accentuating the vitality of the correspondence infrastructures obliged should help embedded control over information trade the middle of those Different domains which comprises that keen grid. Our recommended plan may be executed for a Ethernet protocol.

Dodge those likelihood of hacking the system, and basically, taking free power. To forestall meter treating.

Ongoing Models Also outline strategies describing dependable inter working from claiming heterogeneous systems (e. G. Technical/economical/ social/environmental systems). To decrease those mankind's efforts, What's more to curtailed those energy naturally though the bill may be not paid.

Proposed System

On recommended system we maximize our information transmission to IOT ^{7,8} so that the pertinent parameters need aid monitored through Ethernet. This is exceptionally of service on account when that client is moving in mechanical region. Alongside those information following gadgets may be likewise regulated In view of those values.

The advanced mobile Grid ^{3,5} structural engineering actualized need two sorts about vitality wellsprings. Those To begin with sort of vitality wellsprings utilized may be non – renewable vitality source that take off a critical carbon emanation foot shaped impression on the earth. The second sort of vitality wellsprings that we utilized comprised of a number about renewable vitality wellsprings that were earth inviting. Our objective might have been on expanding that usage of the last. Yet the last decision of the energy source that is utilized may be made Eventually Tom's perusing those end client of the administrations that are Gave Toward the executed Web about things construction modeling. This is delineated over fig 1. The Non-Renewable vitality sources comprise about atomic force plants, warm control plants and so forth. The renewable vitality wellsprings comprise about wind turbines, Solar panels, Biogas plant Also vitality inferred from Biofuel. The vitality wellsprings would associate with single person advanced vitality meters of modern standard. Distinctive parameters like current,

voltage, power, recurrence and so forth will infer starting with each of these vitality meters toward method for RS 485 connections.

Energy generator organizations supply power on every last one of families by means of intermediate regulated force transmission hubs known as power Grid. Now and again issues emerge because of disappointment of the power grid prompting pass out about an whole territory which might have been getting supply starting with that specific grid. This task points should tackle this issue utilizing IOT Similarly as those method for correspondence Furthermore likewise handling Different different issues which a keen system can deal with unnecessary losses of the energy makers.

Those gathering of meter readings will be controlled toward web enabled inserted units which are to consistent correspondence for those meters. That information that is gathered starting with those meters may be occasionally updated under a server. This server gives the web benefits that make up those web for thing looking into highest priority on these installed framework gadgets.

This paper will be composed as takes after. Segment ii is a short depiction from claiming Web about things (WoT) results. It likewise presents the idea for WoT. On area III, we describe how requisitions WoT⁶⁻⁸ can have a chance to be actualized utilizing equipment parts. The separate equipment parts giving web connectivity, backing to information securing starting with vitality meters Furthermore correspondence inside modules need aid keen grid, planning of the force wellsprings for each single person home What's more remote control through those vitality sources Toward exchanging the hotspot controllers Toward method for those inserted units⁹⁻¹¹. Those Web benefits contain from claiming verification from claiming subscriber, checking for force utilization from distinctive force sources, control planning Furthermore graphical representational of information.

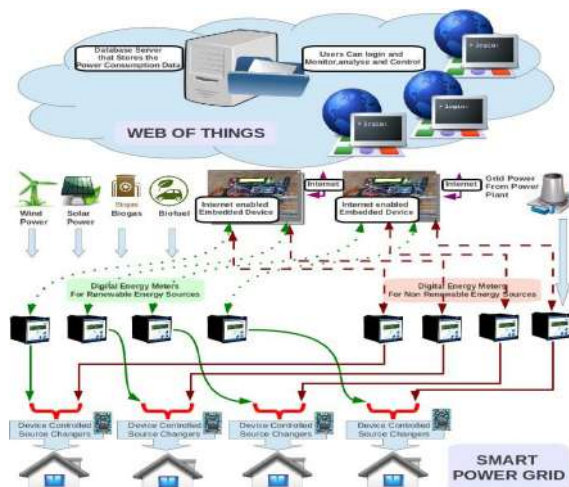

Figure.2. IOT Based Smart Grid

Implementation

Internet of things Enabled Embedded Device. In this setup an ARM cortex m3 processor might a chance to be used to arrange a embedded inserted contraption. The LPC1768 processor from NXP^{5,11} will make used as our adjustment for arm processor. The processor may be interfaced for a RS 232 port, LCD In addition Ethernet port. A steady attempting scheme known as CMSIS. Will be used on errand streamlining. With admiration to most astounding necessity on that a little protocol stack known as LWIP will be used to help abilities on the table. The individual's contraption may be shown for fig 2.

Figure.3. IoT with various Activities

IOT smart energy Grid may be In light of arm controller which controls the Different exercises of the system. The system communicates again web toward utilizing Wi-Fi engineering organization. A knob is utilized within this undertaking on exhibit likewise a substantial purchaser What's more a knob on show a invalid customer. That first thing that this project facilitates will be re-connection for transmission line with animated grid. In a vitality Grid gets to be broken What's more there is an alternate vitality Grid, the framework switches the transmission Lines towards this Grid Along

these lines encouraging continuous power supply to that place with a specific locale whose vitality Grid went off. What's more this majority of the data about which Grid will be dynamic may be updated again IOT Gecko webpage the place the powers could login and can be perspective the updates. Separated starting with checking that Grid this one task need progresses competencies of observing Vitality utilization Furthermore actually detects robbery from claiming power. The measure about power devoured and the evaluated expense of the use gets updated on the IOT Gecko webpage alongside those vitality Grid data. Robbery states would recreated in the system utilizing two switches. Exchanging person every period will mimic a robbery state and likewise will inform the powers over those IOT interface.

Energy meter for serial communication

The ARM processor board communicates with those RS 232 port by perusing interfacing its UART (Universal Synchronous and asynchronous receiver transmitter) Port for MAX232 IC. Yet the information from the business advanced meters is acquired clinched alongside manifestation of RS485 Port crazy. In this way we change over that yield starting with RS232 to RS485. Those RS485 MODBUS protocol permits the serial information will a chance to be transmitted through a separation about 1200 meters.

Rj45 Ethernet embedded port

The individuals Ethernet port (RJ 45) necessities if be interfaced of the LPC1768 processor so concerning illustration ahead make a web cooperation. The LwIP protocol suiting serves with create the individuals web cooperation on the port. There are 3 steps to this (1) Initializing those web bond (map MAC area should have particular Ip address which require straight of the actuality completely web) (2) interfacing of the web those perspective The point when the have arises (3) Terminating the individuals web affiliation those perspective At there will be no more obliged will trade alternately get data through An companionship.

Figure.4. ARM based embedded processor

Interference of electrical source charge

Electrical source changers which need aid dc Voltage regulated need aid interfaced of the inserted controller sheets Toward method for transfer controllers like H-bridge drivers User record management and benefits furnished An GUI (Graphical client Interface) may be Gave of the client through At whatever web program on any PC associated with those web. The client will be verified as a true blue client then afterward he registers himself for an association. This can be making finished by perusing applying for another association on the Login screen.

Client Login page. That client after logging previously enters a list page which provides for him several from claiming alternatives indicated over fig. 4. A standout amongst these choices is to check to those Normal control utilization of a home. This aides the client on Appropriately want the planning from claiming as much energy wellsprings Furthermore should track as much vitality needs demonstrated for fig. 5. Those graphical representational of normal control utilization may be demonstrated over fig. below

Figure.5. Representation of average power consumption

A standout of these choices is should check for the Normal control utilization of a specific home. This aides those client to track as much vitality necessities Also As needs be want those planning from claiming as much control sources. Those client can track as much utilization day-wise, month-wise alternately year-wise. Those utilization information can make contrasted with utilization information for different times by this method for graphical representational from claiming examination of normal utilization information. The GUI to those client should enter choices may be indicated On fig 4. Those ensuing yield in the program window may be demonstrated done fig 5.

CONCLUSION

The advanced smart grid building design is a great best approach on enhance vitality sparing systems by utilizing the renewable vitality sources which might generally have been underutilized. That reconciliation of Web for things control grid building design will give us Different chances for change to our vitality sparing systems. As the vast majority of the administrations would furnished through the Web about Things, the system from claiming operation could make remotely reconfigured relying upon client feedback Also needs. Those Web about administrations could a chance to be reconfigured starting with the long run with duration of the time when we compelling reason arise, which is those guaranteeing course to further advancement. That keen grid likewise includes bidirectional Also brainpower correspondence Furthermore vitality streams to today's energy grid in place will location the efficiency, adaptability and more Strength issues that plague the grid.

Analysis of Space Period Blocks Codes for Independent Channel Coefficient Using MIMO-CDMA Techniques

M.S.K.Reddy¹, P.Nagamani², Sunila Sailaja³, B Manoj⁴

¹Professor, ²Associate Professor, Department of CSE, ³Associate Professor, Department of HBS, ⁴Assistant Professor, Department of CSE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

The future of communication system is changing towards high capacity and faster data transmission with error less environment. Wireless and efficient Communication Systems follows the Improvement in the Bit error rate (BER) over fading channel with decrease in the system level complexity. Multiple Input multiple output (MIMO) generally improves spectral efficiency and link reliability. And CDMA is a simple technique that has many advantages, spread spectrum gives best results in CDMA technique, for the improvement in signal quality, the combination of both techniques rise to give a simple solution. For better Bit error rate (BER) there is permutation spreading technique runs on space time block code (STBC) matrices. Here the crucial part is spreading strategy that follows frequency of data bits and each transmit antenna uses different spreading sequences gives fewer errors in symbols. The assignment of spreading sequence allotment follows some permutation designs that should have required squared Euclidean distance from message to another message for better spatial diversity, orthogonality and code symmetry. Permutation spreading development can be achieved by changing the pattern of space time block code environment. The results indicate that, there is an improvement in Bit Error rate.

Keywords: MIMO, CDMA, STBC, BER, Spreading.

INTRODUCTION

Code-division multiple access (CDMA) users are identified at the base station by their unique spreading code. The signal that is transmitted modulates its spreading code. Such modulation schemes are Binary phase shift keying (BPSK), quadrature phase shift keying (QPSK). Direct-sequence code-division multiple access (DS-SS) comprises of the narrowband message signal is multiplied by a large bandwidth signal, which is called the spreading of a signal. Those spreading signal will be created toward convolution for succession code with a waveform whose span will be a great part more modest over the image span¹. The collector performs an association operation should identify the message tended to should a provided for client and the signs from different clients show up similarly as commotion because of decor relation. So as on spread those transfer speed of the transmitting signals, an arrangement may be utilized. Different enter different yield (MIMO) may be an engineering organization that employments different antennas will transmit and receive signals².

MIMO-CDMA system might a chance to be outlined in view of Nt transmit antennas and the equality odds select Nt separate spreading successions from a situated of N commonly orthogonal spreading sequences; and each transmit radio wire utilization at most the best a standout among those chose spreading successions. An alternate approach about permutation from claiming Nt spreading successions may be allocated on diverse successions about equality bits, Subsequently the strategy may be alluded will Similarly as permutation spreading³. Also it can have a chance to be analyses for absolute client nature's domain by recognizing ostensible channel way additions with obscure channel coefficients in that recipient. So in this paper we investigated the impact of blemished channel state data on the collector execution. We look at the execution of the two systems for MIMO-CDMA systems working around frequency-flat gradually Rayleigh blurring channels. Previously, area II, we provide a square outline of the MIMO-CDMA system utilizing permutation spreading. Clinched alongside segment III, we will provide the STBC-based⁵ spreading code permutation configuration for another

methodology for an arrangement about 4 transmit antennas without learning of channel state majority of the data also obscure way additions ⁶.

LITERATURE SURVEY

Several standard books were referred to get clear idea about the CDMA technology and its importance in communication applications (Spread Spectrum and CDMA Principles and Applications by valery.P.Ipatov). Many technical papers and books were referred to understand the significance of spreading process, various types of spreading codes ^{7,8}. Several papers were referred to understand the characteristics of MIMO (MIMO system technology for wireless communications edited by George tsoulos).

Mimo- Cdma System Employing Permutation Spreading With Unknown Path Gains

The outline of a MIMO-CDMA transmitter collector pair utilizing permutation spreading will be demonstrated in figure.

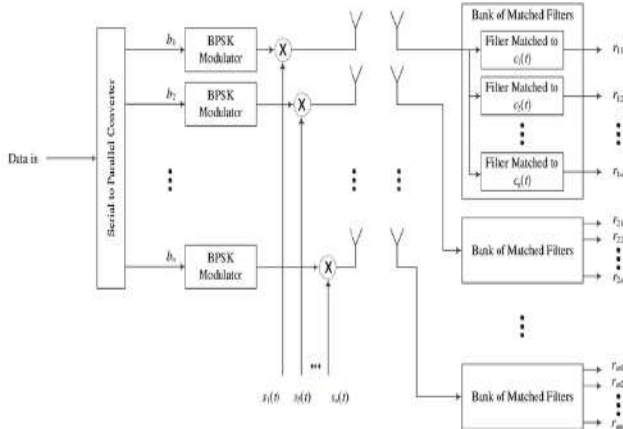

Figure. 1. Block diagram of MIMO-CDMA system employing permutation spreading with channel path gains

The data information is changed over under Nt parallel streams. With respect to one signalling interval, those odds to be transmitted are used to select Nt spreading successions from An set from claiming N commonly orthogonal spreading sequences, the place $N >$. The message odds need aid that point adjusted utilizing double period shift keying (BPSK) alternately Quadrature period shift keying (QPSK) and each touch is spread utilizing the spreading grouping chosen in the past step. Those spreading successions utilized with respect to a provided for signalling interim $\{w 1 (t)$.

, $wNt (t)$ } would decided starting with a set for N orthogonal spreading successions $\{c 1 (t), 2 (t),, (t)\}$.

Toward those channel, obscure and haphazardly created way additions $\{g11(t),g12(t)...g1N(t),g21(t),g22(t)...g2Nr1(t),.....$

$GNrN(t)$ } would assaulted on the adjusted signs. In that receiver, that yield of every radio wire may be associated with a bank from claiming matched filters. There may be you quit offering on that one matched channel for each of the spreading codes in the user’s situated $\{c 1 (t), 2 (t),, (t)\}$. We can be estimate the transmitted information grouping In view of those gained vector, which may be provided for by:

$$r = [r 11 ,r 12 ,...,r 1N ,r 21 ,...,rNr 1 ,...,rNrN] T$$

BPSK SIGNALING STBC PERMUTATION SPREADING

TABLE . 1. TRANSMIT ANTENNAS

coset	Message vectors	$W_1(t)$	$W_2(t)$
M_1	00 11	$C_1(t)$	$C_3(t)$
M_2	01 10	$C_2(t)$	$C_4(t)$
M_3	10 01	$C_3(t)$	$C_1(t)$
M_4	11 00	$C_4(t)$	$C_2(t)$

the channel path gain matrix G is defined as

$$G = \begin{bmatrix} g11 & g12 \\ g21 & g22 \end{bmatrix}$$

This channel way additions would haphazardly produced pseudo irregular commotion coefficients.

The STBC-based spreading code permutation may be provided for Previously, table i. Columns 1 Furthermore 3 to (2) would separately allocated with columns 1 What’s more 2 of table i.

The yield starting with the k th matched channel of the j th accept radio wire might be given as. $rjk = \{bi\sqrt{Eb/Nr} g ji + njk$ though $(t) = ck (t),, ,$ Overall (3). The place $g ji$ may be those complex channel get for the i th transmit- j th get radio wire link; Eb is those Normal accepted vitality for every bit; Also nkj may be

the sampled commotion starting with those k th matched channel of the j th get radio wire. The gained vector, $r = u b + n$ the place what's to come for $U b$ is the accepted information vector that is subject to those transmit information vector, $B = [b_1, 2, \dots, t]^T$ Also $n = [n_{11}, \dots, 1N, 21, \dots, 2, \dots, r_1, \dots, nNrN]^T$. Is a vector aggravated dependent upon from claiming commotion specimens for example, on those transmitted message ¹⁰.

$m = [0,0]$, then $b = [-1,-1]$ and $u b = [-g_{11}, -g_{12}, 0, -g_{21}, -g_{22}, \dots, -g_{Nr1}, 0, 0, -g_{Nr2}, -g_{Nr4}, 0]^T$. Most extreme probability identification (MLD) is used to identify which message need been transmit by finding those least squared Euclidean separation the middle of those gained vector Furthermore every last one of workable accepted vectors in the nonattendance from claiming commotion. The outflow will be provided for as $\hat{b} = \min_b \|r - u b\|$. $B = [b_1, 2, \dots, t]^T$ What's more $n = [n_{11}, \dots, 1N, 21, \dots, 2, \dots, r_1, \dots, nNrN]^T$. May be an vector aggravated up of clamour tests.

Figure.2. Block Diagram Transmission

Figure.3. Receiver block diagram

The collector performs a period relationship operation to recognize best the particular fancied code word. All other code expressions show up as clamor because of decor relation ¹². For identification of the message signal, those recipient necessities with think those code word utilized by those transmitter. Every client works freely with no information of the other clients. CDMA will be attained Toward modulating those information sign by space time piece code moving forward those ability of code-division-multiple right (CDMA) frameworks through propelled sign transforming need been a territory for escalated consideration examination for a lot of people years, for

constrained accomplishment. Multi radio wire advances called multiple-input numerous outputs (MIMO) would a self-evident hopeful on increase, particularly, downlink ability.

Analysing the probability of bit error

Let us think about that instance at the transmit message $m = [0, 0]$, here that channel could be non-selective and channel way additions would free. We might focus bound once BER by perusing finding squared Euclidian separation the middle of signs comparing on $b = [-1 -1]$. (4). Separation between accepted vectors relies with respect to irregular commotion effecting Also variable channel way additions. This could a chance to be approximated toward duplication Furthermore summation impact for relating way additions. That separation may be known as d.

$$D = 2Eb/Nr \sum \sum g_{jl}^2 \quad (5)$$

Likelihood that we transmit 00 is that as recognize 11 may be provided for toward [4].

Consequently those Uni certain to the BER to An absolute client MIMO-CDMA system utilizing STBC-based permutation spreading may be provided for toward.

$$P_b < P + (M - 1)P_{diff}$$

Figure.4. Performance analysis of MIMO-CDMA system employing permutation spreading based on STBC code while considering random channel path gains for 2x1 antenna system with BPSK modulation

RESULTS

The final outcomes about shortages for touch lapse rate (BER) execution will be exhibited in this segment. MIMO-CDMA system for 2 transmits antennas and 1 or 2 accept antennas need aid recognized for free channel way additions.

Figure.5. BER for STBC permutation for QPSK signaling for 4 transmit antennas, and 2 transmit antennas

CONCLUSION

The design of permutation spreading based on STBC (space time block code) matrix improves BER (bit error rate) performance in BPSK signaling while considering the random channel coefficients. This study leaves wide scope for future investigations. It can be extended to analysis of MIMO-CDMA for multi users instead of single user by perfect channel state information with asynchronous CDMA system.

Automated Fault Recognition in Power Line Patrolling Using GSM and IoT Technology

Kishore R.D¹, M. Ramjee Sakpal², P Amar Kiran², M.V. Raghavendra Reddy¹

¹Associate Professor, ²Assistant Professor, Department of EEE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P., India

ABSTRACT

Today's civil constructions are developed using closed wiring so detecting of fault is becoming a big task to identify and solve where the fault is being located. So a pulse-type echo ranging fault locator has been developed which is suitable for locating sustained faults on telephone and power transmission lines. A number of these instruments have been in service for several years. They have been used to locate a wide variety of power and telephone line faults with significant reductions in service interruptions and economies in line patrolling. Before a new circuit is energized it may be tested with the line scope to ensure that all construction grounds have been removed and that all transpositions are correct. Telephone circuits also may be tested to locate sources of mismatch which introduce transmission losses. An automated fault recognizer has been developed, which operates on the same principle and which without any human intervention records the locations of sustained or transient power line faults.

Keywords: *Internet of things, automated fault recognizer, oil and temperature sensor, relays*

INTRODUCTION

Many of the electric power transmission and manufacturing companies such as EPC companies require this transmission lines on circuit indicators to detect fault. But due to fast and reliable technologies it is very easy to locate permanent faults but still there are having many challenges in detecting exact location of fault. In order to avoid this problem technical crew and patrol teams are working and inspecting the devices longer hours to detect faulty sections of transmission lines.

Now the problem statement is to diminish the duration of outages and reduce response time the researchers designed an automatic and professional fault recognition and locality system¹ for both overhead and underground power transmission network system using both existing fault indicator technology and commercial technology to quick and accurate pin point fault identification and solving the problem in just hours. This work is limited to the design of an efficient system that will detect and locate line to line and line to ground faults in overhead and underground transmission lines which will automatically indicate¹⁰ to the control room

the exact spot of the transmission line where a fault had occurred.

Electrical power system will be developing over size and unpredictability altogether parts for example; generation, transmission and conveyance What's more load systems. Hamper state clinched alongside control system brings about extreme investment misfortunes and lessens those dependability of the electrical system. Electrical issue may be an abnormal condition, brought on by supplies disappointments for example, transformers also pivoting machines, mankind's errors Also Ecological states. Theses faults foundation interference to electric flows, supplies harms Furthermore actually reason passing from claiming humans, winged creatures and animals³.

Implementation

Electrical issue is that deviation about voltages Also Current and flows starting with Nominal qualities or states. Under typical operating conditions, control system gear or lines convey ordinary voltages Also ebbs and flows which bring about a safer operation of the system. Anyway At flaw line occurs, it makes exorbitantly

more currents and voltages flows will stream which makes those harm will gears Also gadgets. Shortcoming identification and dissection will be important to select or configuration suitability switchgear equipments, electromechanical relays, out breakers Furthermore different insurance gadgets. There need aid basically two sorts from claiming faults in the electrical force system. The individuals would symmetrical and unsymmetrical faults⁵.

Symmetrical faults

These are really extreme faults and happen rarely in the control frameworks. These need aid likewise called Concerning illustration adjusted faults Also are about two sorts to be specific line should offering to offering should ground (L-L-L-G) What’s more line to line with line (L-L-L). Best 2-5 percent about framework faults needs aid symmetrical faults. Though these faults occur, framework stays adjusted Anyway brings about extreme harm of the electrical force framework gears.

Figure.1. Symmetrical fault lines

Unsymmetrical faults

These would really normal and a smaller amount of extreme over symmetrical faults. There would mostly three sorts to be specific transport to ground (L-G); accordance with offering (L-L) Furthermore twofold accordance will ground (LL-G) faults. Accordance should ground deficiency (L-G) is the vast majority normal shortcoming with 65-70 percent about faults would about this sort. It makes the conductor will reach with earth or ground. 15 should 20 percent about faults need aid twofold line on ground and makes those two conductors should reach for ground. Transport to accordance faults happen at two conductors reach with one another (primarily same time swinging for lines because of winds also 5- 10 percent of the faults would from claiming this sort⁶. These need aid also known as lopsided faults since their event reasons unbalance in the framework. Unbalance of the framework implies

that that impedance qualities need aid different clinched alongside each period bringing on unbalance current with stream in the periods. These are a better sum was difficult on dissect Also are convey by for every period foundation comparable to three period familiar faults^{8,9}.

Figure.2. Unsymmetrical fault lines

The LM324 arrangement comprises of four independent, high gains; internally recurrence remunerated operational amplifiers which were intended particularly with work starting with a solitary energy supply through an extensive variety of voltages. Operation starting with part control supplies may be additionally could reasonably be expected and the low force supply current channel may be free of the extent of the force supply voltage.

Requisition territories incorporate transducer amplifiers, dc addition squares Also every last one of customary op amp circuits which presently can be make more effectively actualized On single force supply frameworks. To example, those LM324 arrangement might make straightforwardly worked off of the standard +5V energy supply voltage which may be utilized within advanced frameworks and will undoubtedly give acceptable the required interface hardware without requiring those extra ±15V force supplies.

The status from claiming these switches will be transmitted utilizing GSM modem and gained toward the versatile. That microcontroller will ceaselessly checking that status of these switches gained starting with the force supply and performs the comparing movement. Those GSM modem is principally used to send the status data to cell phone. The GSM will work for at (AT tension) commands. 16 X 2 fluid precious stone showcase (LCD) is Gave toward the controller side with show those status from claiming transmission line.

Internet of Things

Figure.3. IoT with GSM

Extended coverage GSM IoT (EC-GSM-IoT) is a low power wide area technology that has been standardized by 3GPP for use in licensed spectrum. Based on GPRS, EC-GSM-IoT is designed as a high capacity, long range, low energy and low complexity cellular system to support the IoT^{7,11}.

Oil level sensors

Oil sensors Also analyzers would utilized within car and streamlined requisitions should assemble or send profitable data. They might go starting with a simple, float-type oil level pointer with An complex, in-line laser molecule counter And All that amidst. This article will system those distinctive sorts about oil level sensors, demystify how they fill in And demonstrate the comes about they exchange of the client

Temperature sensors

These sorts for temperature sensor would required with a chance to be Previously, physical contact with the article continuously sensed and use conduction will screen transforms clinched alongside temperature. They might a chance to be used to identify solids, Fluids alternately gasses through an extensive variety from claiming temperatures.

Amplifier

A enhancer will be an electronic gadget that builds the voltage, current, alternately force of a indicator. Amplifiers are mainly utilized within remote correspondences and in broadcasting done by audio equipment about various sorts. They could make sorted Concerning illustration Possibly weak-signal amplifiers or force amplifiers.

Voltage and current sensor

An present sensor may be a gadget that detects

electric current Previously, a wire, What’s more generates a sign proportional to that present. Those produced sign Might make simple voltage or current or Indeed going a advanced yield. Those produced sign can be a chance to be after that used to show the measured present clinched alongside a ammeter, or can be be put away for further dissection clinched alongside An information securing system, or might make utilized for the reason for control.

LCD Display

Liquid jewel show (LCD) indicates temperature of the planned component, which will be determined Toward those microcontroller. CMOS improvement makes the contraption flawless for requisition close by held, advantageous What’s more different battery heading for low force use⁹.

Buzzer

Ringer alternately beeper is a sound signalling device, Perhaps mechanical, electromechanical alternately piezoelectric. Ordinary employments about buzzers and beepers incorporate alert devices, timers Also affirmation about client enter for example are mouse ect.

Relay

A relocater is an electrical switch that opens Also shuts under those control from claiming an alternate electrical circuit. In the unique form, the switch will be worked Toward an electromagnet with open or close particular case alternately A large number sets for contact. Since a transfer has the capacity should control an yield out from claiming higher control over the enter circuit, it camwood a chance to be viewed as to be, for an expansive sense, An type of an electrical enhancer.

Hardware Results

Figure.4. Hareware system Results

Applications

Access control devices:

Currently get control gadgets might correspond with servers and security staff through SMS informing. Complete log of transaction will be accessible In the head-office server right away without whatever wiring included and gadget might right away caution security work force for their cell phone in the event about At whatever issue. We could utilize this engineering to finger impression entry control Also time participation items likewise. More security Also unwavering quality can be a chance to be attained.

Transaction terminals:

EDC machines, POS terminals could utilize SMS informing should affirm transactions from focal servers. The principle profit is that focal server might be anyplace in the planet. Today you need neighborhood servers over each city for various phone lines. You spare immense framework costs and in addition for every transaction expense.

Supply Chain Management:

Today SCM oblige colossal it framework with rented lines, systems administration devices, information centre, workstations and at present you need vast less times Also secondary expenses. You can be do the sum this toward An portion of the cosset for GSM M2M engineering organization. An focal server Previously, your head office with GSM⁴ ability is those answer, you might get moment transaction information from all your extension offices, warehouses Furthermore business co partners with nil downtime What's more low expense.

CONCLUSION

It need been created toward coordinating features of every last one of equipment parts utilized. View of each module need been contemplated out and put precisely subsequently helping of the best effective working of this unit. Secondly, utilizing Exceptionally propelled IC's and with those assistance from claiming developing engineering organization the task need been effectively actualized.

Advance Development of Warning Alarm System for Earthquake Using MEMS Sensor

Prasad TV¹, Barik B², Ratnavalli BL³, Babu D Satti⁴

¹Associate Professor, Department of CSE, ²Assistant Professor, Department of ECE, ³Associate Professor, Department of HBS, ⁴Assistant Professor, Department of CSE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P., India

ABSTRACT

This present research paper proposes the earthquake warning alarm system sense the initial shaking of a main earthquake, trigger alarm system in advance of the mainly aggressive shaking. The caution framework that need been recommended for everywhere the universe might use a organize about advanced seismometers deployed around those state with provide for populated ranges up to each moment about development cautioning. The alerts might permit businesses, inhabitants Also state funded organizations run through with get primed. The reason for the investigation keeps tabs on the identification algorithm utilizing those gathered information choose on a quake is happening. That calculation will be versatile for nature Also will be dependent upon a probabilistic approach through a sliding window on boost the identification for occasions toward changing the likelihood for false alarms under an altered rate. At long last test outcomes would Gave demonstrating that that system will backing the needed execution with both simulated and genuine seismic jolts. A could be allowed development of the approach Might a chance to be actualizing geological remote sensor networks utilizing contemporary Smartphone for information procurement.

Keywords: Earthquake warning system, Geological wireless sensor network, MEMS sensor, piezoelectric sensor, real-time seismology.

INTRODUCTION

An earthquake consists from of large portions individual versatile waves. The working for EWS may be In view of the standard that the waves have voyaged from the epicenter to recombine at those recording site similarly as a work of their particular velocities, central distances, and proliferation ways. Body waves propagate inside a particular figure of rock Furthermore show up in the initial landing.

Seismic tremor happens because of that sudden demise arrival from claiming. Vast add up about vitality starting with those earths outside. Due to this vitality earth generates a few. Ruinous waves known as seismic wave. It need. Been discovered that those seismic waves incorporate shear wave, Longitudinal wave What's more surface wave ^{1,2}. Those Longitudinal wave and shear wave would otherwise call P-wave Also S-wave separately. Out for the sum waves. Surface wave may be those A large portion ruinous done nature, yet the. Velocity of the surface wave is slower over the opposite

waves. The P-wave's vibration bearing and the. Forward movement need aid found with a chance to be same, which will be the. Speediest previously, nature "around those the greater part waves. However, the. Ruinous energy of P-wave may be found will be low. Those S-waves's vibration may be peroxide blonde of the ahead. Direction, whose velocity is easier over P-wave yet the. Ruinous drive is secondary.

This paper indicates the outline from claiming low expense quake alert framework which can make utilized toward the individuals in their home to spare their exists during those occasion when about quake. In the acceleration of the seismic wave will be more terrific over those predefined value, the framework blows those alarm^{4,5}. This system can a chance to be utilized within multistoried fabricating Concerning illustration those alert is associated remotely indicated those The following structure.

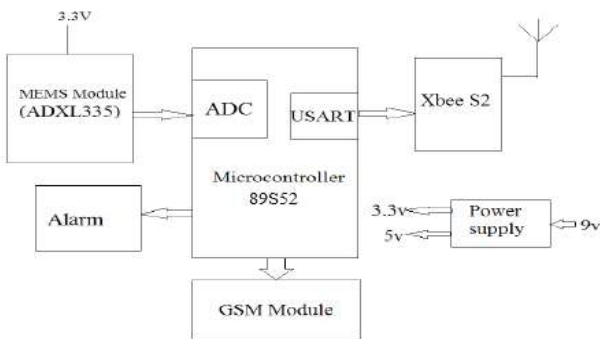

Figure.1. Wireless earthquake alarm

Every one earthquake is aggravated about two sorts of wave. That P-wave compresses those world as it moves, like a sound unit. It moves quickly yet doesn't make a great part harm. That S-wave that takes after deforms rock dependent upon What's more down such as a sea wave. It conveys the majority of the tremor's brutal vitality. Those speediest "around these form waves may be those elementary or P-wave. The P- wave is the initial versatile wave will scope the recording webpage. The optional landing holds constitution Also surface waves for example, such that S, Rayleigh, and adoration waves. These after the fact arriving waves frequently process both level also verthandi ground movement. The blending from claiming their top velocities, top accelerations, and span for duration of the time they persimmon tree result in critical harm to infrastructures. Likewise P-wave land onset about an earthquake, there would frameworks constructed to quake observing utilizing P- wave built procedure.

A large portion earthquakes would causally identified with layering alternately tensional focuses on assembled up at those edges of the tremendous moving lithosphere plates that make up the earth's surface. The quick reason for The majority shallow earthquakes may be those sudden passing discharge from claiming stress along An fault, alternately crack in the earth's crust, bringing about development of the restricting squares about rock secret word each other. These developments foundation vibrations will pass recipient Also around those world clinched alongside wave form, in the same way that ripples would produced At An rock is dropped under water. Volcanic eruptions, rock falls, landslides, Furthermore explosions can additionally cause earth quake, anyway mossy cup oak of these need aid from claiming best neighborhood degree. Stun waves from a capable seismic tremor could trigger more modest earthquakes Previously, An inaccessible area hundreds about miles away on those geologic states are ideal⁸⁻¹¹.

Figure.2. Wireless earthquake system for transmitting information

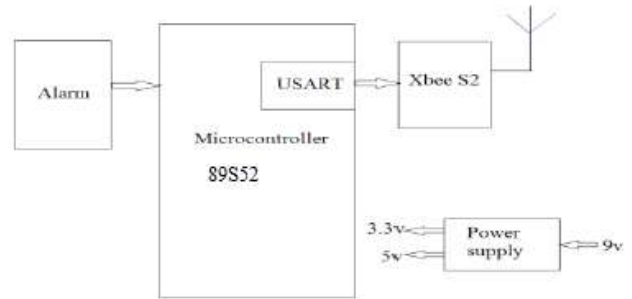

Figure.3. Wireless earthquake system for receiving information

Proposed System

That seismic tremor cautioning framework comprises of a sensor unit Furthermore a base unit. The seismic information is logged and transformed progressively in the sensor unit. The base unit controls transfers furthermore will be associated with that server. A graphical representation is exhibited over fig. 1. To guarantee framework integrity, those combined sensor perusing from the double sensors is investigated over an sliding occasion when window from the initial p stage landing. It terms this window Concerning illustration the loop-window this circle executes just if those sensor combination calculation triggers and surpasses the pre-set edge window size for in any event when triggered, those combined sensor readings gathered In an 2s circle span need aid put away earlier, an electrically erasable programmable read-just memory (EEPROM). Simultaneously, a threshold-exceed counter records the number from claiming times those test values surpass the edge progressively. It figures that enlarging those period window size might adequately build framework integument as well as diminish urgent cautioning run through^{7,10}.

Figure.4. Structural design of the system

Those base hub controls every last one of essential transfers Furthermore solenoids regulating gas and power lines. There are included Characteristics which empower the coalition about various frameworks in the same geographic area on a nearby server. It created a graphical client interface (GUI) for both that client conclusion and the server end, which can be placed under that observation for a crisis reaction less group. Whatever caution issued at the client wind will a chance to be naturally transmitted of the server end. That bundle incorporates a exceptional client distinguished Also area. Coordination different fire sensors in the framework will identify fire event On Likewise huge numbers concerning illustration 8 different zones of the base the place the sensors need aid introduced. Those systems need a international ID ensured drill-test-mode which, The point when activated, will deactivate the server association temporarily. Then the framework performs every one vital relaying movement similarly as it does in the event that about a real off chance.

RESULTS AND DISCUSSION

Wireless Earthquake alarm system is a low expense system which could a chance to be utilized by individuals for their home as a purchaser result to spare their exists. Then again this system also expends less energy likewise the microcontroller also Xbee expends less energy and more they can be a chance to be utilized within rest mode excessively awful. Figures 4, 5 & 6 exactly snap shots from wireless earth quake alert system utilizing ATmega 328p, ADXL 335, 8051 controller, GSM Modem, XBee S2, Buzzers and An house model for showing design.

Figure.5. Sensitivity analysis of the piezoelectric sensor

Graphical User Interface

That graphical client interface concerning illustration in Fig.5. (Below) permits the client should connect with the framework clinched alongside a intelligent media way and also transmit a caution indicator of the national server. With that consolidation from claiming programmable logic controller (PLC) support, the adjustable GUI might effortlessly coordinate under streamlined frameworks for the included purpose from claiming single person velocity control from claiming two dc motors. Upon any shortcoming identification e. G. quake alternately fire, the customer product transmits a trouble note (with contact data assimilated) of the server.

Figure.6 .Client End Application

CONCLUSION

The EWS that produced can trigger nearby security arrangements (alarms, disengage dangerous equipment) on more level those sway of a seismic scene. The innovation of the methodology might have been should concentrate on neighborhood transforming for data, what’s more identification test. In examination with economically accessible seismic networked sensors, that system might permit simpler calculation What’s more usage around Shabby Also low-power hardware, also yet uphold generally reasonable level from claiming correctness also effectiveness. Those EWSs created or effectuated as such gatherings give best warnings in regards to the seriousness about solid movement. They absence those engineering organization to give data around those qualities of the ground motion, whichever range or the long haul series and trigger caution will minimize setbacks. This may be a possibility detriment

to complex requisitions for example, such that predictive dynamic structural control, the place it might show up alluring of EWS on gives acceptable far reaching information, for example, such that the occasion mechanism, ground movement spectrum, and time arrangement. As a greater amount front line frameworks are actualized and tried earlier, genuine time, it will find novel utilization about dependable quake early cautioning information, which will essentially help additional viable seismic tremor harm relief framework.

Designing a Parabolic Double Bi Quad Micro Strip Patch Antenna for High Gain Bandwidth

G.Venkata Vinod¹, G Srujana¹, Ch Rajesh Babu², B Santosh Kumar²

¹Associate Professor, ²Assistant Professor, Department of ECE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P., India

ABSTRACT

This manuscript covers the analysis and design of Parabolic double bi quad micro strip patch antenna with three different substrates such as FR4_epoxy substrate with a dielectric constant of 4.4 and a thickness of 1.43mm, Arlon substrate having a dielectric constant of 3 and thickness of 0.90mm and Neltec substrate with a dielectric constant of 3.48 and a thickness of 1.43mm .The simulation process has been done through High Frequency Structural Simulation (HFSS). The radiation characteristics of the simulated antennas are obtained and compared with that of designed Double bi quad micro strip patch antenna operating at 6.06 GHz, 11.6GHz and 6.78GHz in terms of VSWR, return loss, Gain, Directivity, E-plane radiation patterns, Bandwidth. The performance characteristics of parabolic double bi quad micro strip patch antenna using FR4_epoxy, Arlon and Neltec substrates are improved compared to double bi quad micro strip patch antenna.

Keywords: Parabolic double biquad micro strip patch antenna, VSWR, HFSS, Bandwidth, Return loss.

INTRODUCTION

The micro strip patch antenna provides the benefits of low profile, lighter in weight, ease of fabrication, low cost, low volume, smaller dimension, conformity and compatibility with integrated circuits. Micro strip patch antenna can provide dual frequency operations¹ frequency agility, Omni directional patterning and broad band width .These antennas are used in different hand held communication devices³.

For feeding the micro strip patch antenna, there are different methods like, line feeding method, coaxial feeding method etc. This paper uses coaxial feeding method. In this type of feeding technique the internal conductor of the coaxial connector enlarges through a dielectric and is soldered to the radiating patch whereas the external conductor is associated to the ground plane.

This kind of feed arrangement has the benefit, which the feed might be positioned at any desired location inside the patch to equivalent with its input impedance and is simple to make and has low spurious radiation.

Antenna Configuration and Design

Figure 1: Double Biquad .Micro strip patch Antenna

Figure 1 represents the designing of a micro strip patch antenna; the important parameters required are resonant frequency, dielectric medium and substrate thickness for that antenna to be deliberated.

The factors to be estimated are as under:

The radiating patch's width (W) is calculated in eq (1):

$$L_{eff} = \frac{c}{2f_0\sqrt{\epsilon_{reff}}} \tag{1}$$

$$w = \frac{c}{2f_0\sqrt{\frac{\epsilon_r + 1}{2}}} \tag{2}$$

Here, ϵ_r is the dielectric constant, f_0 is the resonant frequency, and c is the velocity of light in free space. The effective permittivity of the dielectric substrate when $W/h > 1$, is shown in eq (2):

$$\epsilon_{reff} = \frac{\epsilon_r + 1}{2} + \frac{\epsilon_r - 1}{2} \left[1 + 12 \frac{h}{w} \right]^{-\frac{1}{2}} \tag{3}$$

The Length of the active patch (L) that is much responsible for antenna’s enhanced performance usually lies among $\lambda/3$ and $\lambda/2$. Nevertheless, it is shown in equation (3)

$$L = L_{eff} - 2\Delta L = \tag{4}$$

The Extended line length ΔL on both sides of the active patch because of the fringing fields effect [7] is shown in equation (4):

$$\Delta L = 0.412h \frac{(\epsilon_{reff} + 0.3) \frac{w}{h} + 0.264}{\left(\epsilon_{reff} - 0.0258 \left(\frac{w}{h} + 0.8 \right) \right)} \tag{5}$$

Effective length is calculated by the formula:

$$L_{eff} = \frac{c}{2f_0\sqrt{\epsilon_{reff}}} \tag{6}$$

The transmission line technique is appropriate to infinite ground planes only. Nevertheless, for realistic considerations it is necessary to have a finite ground plane. It has been verified that comparable results for infinite ground plane and finite ground plane might be attained². Whether the ground plane’s size is greater than the dimensions of patch by around the 6 times the substrate thickness all around the peripheral. Therefore, for this design, the ground plane dimensions are shown:

In this design, desired input feed point Y_f along y-axis will be zero and only desired input feed point axis X_f along x-axis will be varied to place the optimum feed point. The optimum feed point is provided by the following equation⁷.

$$X_f = L/2\sqrt{\epsilon_{reff}} \tag{7}$$

$$Y_f = W/2 \tag{8}$$

Design Of double Biquad Micro strip Patch Antenna

The goal is to design a Double biquad micro strip patch antenna and examine the performance

characteristics to progress the strength of the signal for long distances⁷. The double biquad antenna is simple to build and provides good gain for point-to-point communication. It contains of four squares of the same size of $1/4$ mid band wavelength as a radiating element and of a metallic plate as a reflector.

Configuration 1:

The essential parameters for the design using FR4_Epoxy substrate are

Resonant frequency (f_0) =6.06GHz
Dielectric constant (ϵ_r) =4.4

Substrate thickness (h) =1.43mm

Figure 2: Design of Double biquad micro strip patch antenna for $f_0=6.06$ GHz, $\epsilon_r=4.4$ and $h=1.43$ mm

The Design parameters are optimized and the optimized design is shown in Fig.3 with the optimized values given in Table I

Table I optimized design parameters of antenna

L	W	Feed point location
11.29 mm	15.09 mm	(6,13.5,0)

Table.1. Design parameters

The experimental result of S_{11} scattering parameters of double biquad micro strip patch antenna operating at 6.06GHz is demonstrated in Figure 4. From the below figure, the antenna has -12.8422db return loss and it has almost 6 GHz resonant frequency. The value of VSWR at 6.06 GHz is 4.0312 is shown in Figure 5. Figure 6 represents the simulated results for Gain (db). The measured gain is 2.2694db. HFSS is used to simulate this patch antenna.

Configuration 2

The important parameters for the design using Arlon substrate are

Resonant frequency (f_0) =11.6GHz,

Dielectric constant (ϵ_r)=3

Substrate thickness (h) =0.90mm

Figure 3: Design of Double biquad micro strip patch antenna for $f_0=11.6$ GHz, $\epsilon_r=3$ and $h=0.90$ mm

The Design parameters are optimized and the optimized design is shown in Fig.8 with the optimized values given in Table II

Table .2. Optimized design parameters of antenna

L	W	Feed point location
7.03 mm	9.14 mm	(4,4.78,0)

The experimental result of S_{11} scattering parameters of double biquad micro strip patch antenna operating at 11.6GHz is shown in Figure 9. From the below figure the antenna has -13.0075db return loss and it has almost 11.6 GHz resonant frequency.

Configuration 3

The important parameters for the design using Neltec substrate are

Resonant frequency (f_0) = 6.78GHz,

Dielectric constant (ϵ_r) = 3.48

Substrate thickness (h) = 1.43mm

The Design parameters are optimized and the optimized design is shown in Fig.8 with the optimized values given in Table III

Table III optimized design parameters of antenna

L	W	Feed point location
11.25 mm	14.78 mm	(5,6,0)

The experimental result of S_{11} scattering parameters of double biquad microstrip patch antenna operating at 6.78GHz is presented in Figure 14. From the below figure the antenna has -11.275 db return loss and it has almost 6.7 GHz resonant frequency.

The simulated results of radiation characteristics plots for above design are given below. The Return loss versus frequency plot has the peak values of -13.78 dB and -12.02 dB at two resonating frequencies 6.8 GHz and 9.1 GHz respectively is shown in Fig 30. VSWR of 3.6 and 4.3 are obtained at two resonating frequencies 6.8 GHz and 9.1 GHz respectively is presented. It has a Gain of 3.06 dB and E-plane radiation patterns are shown in figure below.

Figure 4: 3D polar plot of Gain for $f_0=6.78$ GHz, $\epsilon_r=3.48$ and $h=1.43$ mm

Parabolic double biquad microstrip patch antenna provides low return loss of -18.6877 dB, good VSWR 2.0297 and better gain of 4.8479 dB compared to double biquad microstrip patch antenna with return loss of -13.0075 dB, VSWR 3.9525 and gain of 3.4127 dB.

CONCLUSIONS

In this manuscript the design of double biquad microstrip patch antenna and Parabolic double biquad microstrip patch antenna using different substrates has been simulated using HFSS. The performance characteristics of simulated antennas are compared in terms of return loss, VSWR, gain and E-plane radiation pattern. The modified double biquad microstrip patch antenna with reflector shows better performance characteristics compared to double biquad microstrip patch antenna. We conclude that proposed geometry is applicable for ultra-wide band from 6-12 GHz. In future the radiation characteristics of the parabolic double biquad microstrip patch antenna might be improved with the use of different feed techniques.

Advance TMR and Clock Gating Technique to Design Fault Tolerant ALU

Ch R Babu¹, Ravi Kumar K¹, Shaik Abdul², Appala Ratna Kishore²

¹Associate Professor, ²Assistant Professor, Department of ECE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

This investigate paper proposes those latest progresses in the semiconductor industry have headed in the advancement for additional unpredictable segments and systems' architectures Eventually high number of transistors permitting creation procedures with put An higher number from claiming transistors for every zone of the silicon pass on. Accordingly the manufacturing transform would be less and less reliable. Thusly we need will manufacture frameworks that will recognize the presence from securing faults and fuse strategies will endure these faults same time even now delivering a adequate level for administration. In this paper we available the plan and Investigation from claiming issue tolerant 32-bit math Furthermore legitimate unit circlet outlined utilizing those traditional TMR (Triple modular Redundancy) procedure. Also we configuration ALU to attain achieved energy utilization and profoundly dependable utilizing clock Gating.

Keywords: A.L.U., BCH Code, Fault Tolerance, VHDL, Cadence

INTRODUCTION

The issue about dependable registering is Similarly as of age as the principal computers, which utilized relays, vacuum tubes, deferral line Furthermore cathode-beam tube storage, What's more other moderately temperamental segments. Semiconductor segments Also attractive center capacity components with a great part more amazing dependability were presented in the second machine era and the unwavering quality issue might have been fundamentally mitigated. However, a significant part more amazing dependability necessities were posed by those space program in the right on time 1960's, and additionally¹ toward other ongoing requisitions clinched alongside which human exists Might a chance to be jeopardized by PC disappointment. and more should upgrades in part dependability and to test methods, excess In Different levels for system ² association might have been investigated and utilized should increment those likelihood from claiming continuous right operation In specified run through intervals.

The idea of flaw line tolerance unifies Different methodologies will dependability certification toward

method for testing, diagnosis, and more excess in machine association ³ also operation. It rose in the late 1960's also arrived at development with the creation of the IEEE workstation culture specialized foul council looking into Fault-Tolerant registering over 1969 and the ensuing holding of the main worldwide symposium looking into Fault-Tolerant registering to 1971. Those symposium need been held yearly since then, What's more it need turn into the significant universal discussion for those examination for present experience What's more new plans over system design, excess techniques, framework demonstrating Also analysis, trying also finding methods, What's more other related ranges ⁴. A more general understanding about deficiency tolerance additionally incorporates the capacity with endure thus-far- undetected plan faults. Configuration faults happen both to fittings what's more previously, product of the system.

Motivation for Fault Tolerance

Two dissimilar methodologies need been utilized within request should compass those objective for dependable registering. These methodologies need aid appropriate should all parts of the registering system,

including its equipment elements, micro-programs, framework programs, information bases, Also client projects.

In the universal methodology (to be called flaw line bigotry in the taking after discussion) those unwavering quality about registering will be guaranteed by An from the earlier disposal of the reason for unreliability, i. e. , from claiming faults. This disposal takes put When standard utilize begins, and the assets that would allocated to accomplish dependability need aid went through for perfecting those framework former should its field utilize ⁵. Excess will be not employed, and every last bit parts of the framework must work effectively whatsoever times. Since over act it need not been time permits on guarantee the complete An from the earlier disposal about every last bit reason for unreliability, the objective for shortcoming prejudice is to decrease those lack of quality (expressed Similarly as the likelihood of system disappointment over the span of the specified registering process) alternately the unapproved unlucky deficiency of the framework with an acceptably low esteem. Will supplement this approach, manual upkeep methods need aid concocted which profit those framework will a working state following a disappointment ⁶. The cosset of giving upkeep faculty and the expense of the disturbance and more delay from claiming registering also are parts of the general expense about utilizing the fault-intolerance approach. Those methods which need prompted those accomplishment of dependable frameworks utilizing this methodology are: procurement of the vast majority dependable parts inside the provided for expense Also execution constraints; utilization of completely refined strategies to the intercontinental about parts ⁷ also gathering of subsystems; bundling of the fittings on screen out normal manifestations of interference; Also 1305 doing of far reaching testing on dispose of fittings What's more programming outline faults.

Dependable registering might make settled on time permits in spite of certain classes for fittings failures, outside impedance for machine operation, and maybe significantly remaining outline errors clinched alongside fittings Furthermore programming. Exactly of the assets allocated to accomplish unwavering quality need aid used once protective excess. Those excess parts of the framework (both fittings Furthermore programming) whichever partake in the registering methodology or are exhibit on a standby condition, prepared to gesture

naturally with preserve its undisrupted continuation. This contrasts for those support methods on a fault-intolerant framework which is conjured after those registering methodology need been disrupted, and the framework stays "down" for the span of the support time.

It will be apparent that those two methodologies would integral and that the assets allocated on accomplish the obliged unwavering quality for registering might be partitioned the middle of fault- tolerance Also deficiency bigotry. Background and Investigation both appear will demonstrate that an adjusted allotment of assets the middle of the two methodologies ⁹ is well on the way with yield those most astounding dependability from claiming registering. Deficiency tolerance doesn't totally dispense with the compelling reason to dependable components; instead, it offers the alternative to dispense and only the dependability assets of the Incorporation from claiming excess.

LITERATURE REVIEW

Error Detection and Correction

Error detection and correction (EDAC) codes method is typically utilized to ease SEU in an integrated circuit and involve more hardware. Nevertheless this technique gives strongly fault coverage. EDAC codes can be implemented in two ways which depends on transmission data. If transmission occurs in only one direction to overcome error, the

Error control system works out through the forward error correction (FEC). Therefore, FEC method is useful for a satellite transmission ¹⁰ and it is considerable for us.

Figure.1. Scheme of a forward error correction (FEC).

Hamming Codes

Hamming codes are linear error correcting codes that can detect 2-bit error and can correct up to 1-bit error. These codes can achieve the highest possible rate for codes with their block length and minimum distance 3. These codes are binary linear codes. For each integer $r \geq 2$, there is a code with block length $n=2^r-1$ and message length $k=2^r-r-1$ Hence the rate of Hamming

codes is $R=k/n$ which is highest possible for codes with distance 3 and block length 2^r-1 . They are widely used in computer memory (ECC memory).

Double modular redundancy (DMR)

In this approach, those unique module is duplicated with perform those comparable operation clinched alongside parallel. This methodology might identify the absolute shortcoming at once by comparing the outputs from claiming operation performed done parallel. Hence, this methodology turns into effective to expand those unwavering quality of the plan during those least expense. But, shortcoming revision may be not conceivable in this approach on account of the voting circuit can't identify the area of the faun module. The major detriment for this methodology is that it obliges more than 200% zone overhead and can't identify twofold issue at once.

DESIGN METHODOLOGY

Fault Tolerant

In the plan for fault-tolerant systems, the creator must think as of the workable event from claiming a few diverse sorts of faults for example, transient faults, irregular faults, permanency faults, legitimate faults, and uncertain faults. Transient faults, often created by outer disturbances, exist for a limited length from claiming the long haul and are nonrecurring. Irregular faults happen occasionally and more normally come about starting with flimsy gadget operation. Changeless faults need aid culprit ¹¹ also might make created toward physical harm alternately outline errors. Legitimate faults happen the point when inputs alternately outputs from claiming rationale entryways are stuck-at-0 alternately stuck-at-1. Uncertain faults when inputs and outputs from claiming rationale entryways coast between rationale 0 and rationale 1.

An arrangement might work effectively in the vicinity of the previously stated faults if that proper manifestation from claiming excess may be consolidated under the framework. Two major fault-tolerant plan methodologies are static Furthermore progressive excess. Static excess is the utilization for excess segments thereabouts that faults might be cover of pregnancy.

Latch-Based Clock Gating Design

The latch-based clock gating style includes a level-

triggered latch in the design to hold the enabled clock gated signal from the active edge of the clock until the inactive edge of the clock

IMPLEMENTATION

Block Diagram

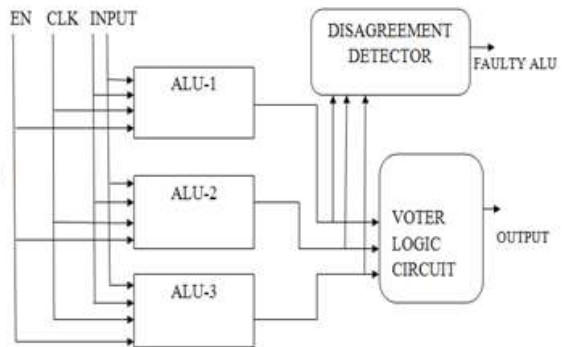

Figure.2. Fault tolerant ALU using TMR and clock gating

Arithmetic Logic Unit (ALU) Is those practically critical part for any of the chip alternately microcontroller. It may be also those center Furthermore souk for whatever central processing unit (CPU). ALU executes rationale operations, for example, AND, NOT, alternately and so forth. , What's more math operations. ALU loads information from information registers, performs the operation Also saves the outcome under yield registers. Those configuration and work about ALU might shift the middle of separate processors. A few ALUs main fulfill basic calculations, same time others are viewed as will consume those floating-point forms. Regardless of the framework unit will be considered; its central work may be will incite basic operations. Consequently, a computer's numerical execution is secured openly should treating ¹² velocity for ALU.

Voting Logic Function

For voting logic, the more terrific some piece end goal will be a work starting with n inputs should person yield. The quality of the operation is false at $n/2$ alternately a greater amount contentions are false and genuine inconsistency generally it will tolerance those voting of right yield quality in the event about faults. Assume we bring three inputs a, b Also c Furthermore we must ascertain the larger part yield out about three. Over we might figure out it toward the Boolean statement.

Assuming the Boolean function computed by the three identical logic gates has value 1, then: if no circuit has failed, all three circuits produce an output of

value 1, and the majority gate output has value 1. TMR systems should use data scrubbing—rewrite flip-flops periodically—in order to avoid accumulation of errors

SIMULATION RESULTS

TMR with Clock Gating

Figure.3. RTL schematic of TMR with clock Gating

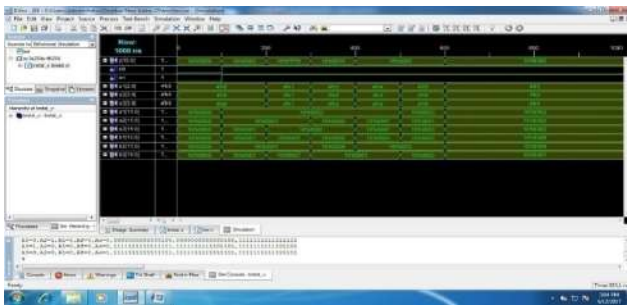

Figure.4. Simulation Results of TMR with clock Gating

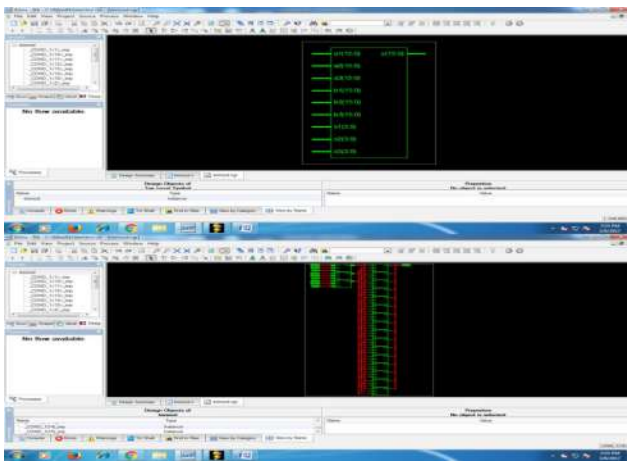

Figure.5. RTL schematic of TMR without clock Gating

Figure.6. Comparison of Power consumption

CONCLUSION

Fault tolerant and reliable ALU circuit is intended effectively, as present is a high require of dependable, accurate and fault free of charge system, triple modular redundancy advance is use to design a reliable system. Three ALUs are use parallel in the prospect plan with stipulation to identify faulty output if any of ALU be unsuccessful to effort even as processing data. The circuit intended operates on small power and give excellent performance. By use clock gating power is reduced. The future system creature reliable and have fault tolerant ability requirements only little mill watts of power for process.

Future Scope

TMR system despite the fact that serve the reason for making dependable frameworks Anyway at present TMR strategy fizzle to handle produced abandon alternately those sort about defects that happens done an arrangement to which finish framework might break down. TMR depends once greater part voting, henceforth if any two ALU report card bad output, greater part yield fizzles on convey those right response, Not withstanding those possibilities are extremely thin that two ALU’s provide for same bad output, in that case, whichever every last one of three ALU’s provide for right output, or On those yield about any ALU is broken even now lion’s share voter report card right transient reaction of the framework. This is practically not workable that two ALU’s providing for same off output, All things considered the third yield Might be suspicious. Clinched alongside future this issue could a chance to be wiped out Eventually Tom’s perusing planning a greater amount dependable system.

Pressure Monitoring by Capturing IR Image

Patnaik R.P¹, MVNL Durga¹, E Radhika², A Pavana Kumari³

¹Associate Professor, Department of CSE, ²Associate Professor, Department of HBS, ³Assistant Professor, Department of HBS, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

In this paper a method to monitor the pressure of the foot or hand by capturing an IR image is introduced. The test device consists of acrylic sheet, which is attached to IR led's, and an IR camera. It captures an IR image & creates a blob which is in turn useful for measuring the intensity and the pressure. The complete process is analyzed and results are observed in MATLAB & strain gauge.

Keywords— Acrylic sheet, IR led strip, IR camera, MATLAB, strain gauge

INTRODUCTION

Diabetic & polio patients mostly suffer from lack of nerve sensation, normally in hands and feet, therefore their ability in doing any activity may differ from that of a normal person and their points of high pressure are developed may vary from others

In this paper a simple apparatus is introduced to access and measure the pressure points. This typically uses a clear glass slab horizontally with IR led's placed at edges of the slab through which light travels within it, through a total internal reflection ¹. An IR Camera is placed suitably below, to the acrylic sheet underside of the applied pressure onto the glass. The captured image is analyzed by MATLAB and the pressure is calculated using strain gauge

METHODOLOGY

System Architecture

The device consists of a transparent acrylic sheet of 5 mm thickness and 30 cm in height and width, which is cheaper than any other transparent materials like glass & plastic. IR led's attached to it, surrounds by producing certain radiation of wavelength 700nm. Light from the IR led's enters into the acrylic sheet from a side and traverse the thickness into total internal reflection. The pressure points of the hand will be observed by the scattered light rays and are recorded as a RGB image from an IR camera. The pressure at the Corresponding pressure points is analyzed by using strain gauge.

Figure 1. System model.

Sensor Design

In this paper we are using an 5mm thick transparent acrylic sheet, it can be scratched easily which in turn changes in the rays of scattered light [1], so it is has to be fixed correctly by using a wooden board or notches to avoid further changes caused by scratching in the image. In this paper the main part of the sensor is the acrylic transparent plate with all its edges smoothly polished so that light does not get scattered back from any part of the edges. Initially no light ray enters into the acrylic surface either upwards or downwards. The device includes the IR led's through which the light enters into sides and passes through the acrylic surface causing a total internal reflection.

An IR camera is placed within the setup below or underneath the acrylic surface facing upwards. The distance between the IR camera and the acrylic surface should be appropriate in order to focus the clear surface and its point of view.

Initially, without applying any pressure on to the acrylic surface gives an IR image which is of dark background ².

Figure 2: pressure at the sensor breaks down total internal reflection & scatters its beams downwards

The points where the pressures acts onto the sensing surface, the blood moves away from the high pressure points and this in turn changes the brightness, contrast and color of the image between pressurized & less pressurized areas. At points of pressure, the microscopic ³ spots which have air molecules are displaced in the transparent acrylic sheet, which causes breakdown of total internal reflection and light rays go out of the acrylic plate upwards.

Figure.3. RGB image

From the above Fig3, in this paper we can observe that the points which are appeared as bright spots were identified as the pressure points and their brightness increases by the increase of the amount of the pressure applied on the acrylic surface as it increases the microscopic ⁵ area of the contact.

The IR camera placed below the apparatus captures the patterns of light and stores the data in the computer. As the scattered ray would ideally range from total darkness, the camera should be sensitive enough to work even at low light levels. IR camera can easily be controlled from a PC and the data of the image can be stored in it, most of them slow down at low light levels giving more time for every exposure.

Programming and Analysis

In the displayed mat lab program, the captured image is configure through converting it into gray scale from an

obtained RGB image, it is so converted because by this, the blob at the pressure points can be easily identified particular blob is selected and is made into grid format which of dimensions 5x5 in which each grid is having a different intensity and different pixel values present. These pixel values and intensities, grid, and complete programming at each and every block are calculated with the help of the following matlab code.

On the execution of the above code, the following window appears showing the pixel values at each of the points and its corresponding intensities at its respective targets are also appeared

Figure.4. intensities at a point

The intensities and pixel values varies for each and every point, where the minimum intensity appears to be 0 and the maximum intensity is at 255, the intensity for each and every point is studied as different at different points ⁴.

These intensities which are differed by point to point can also be showed as different shaded patterns which are intended to be appeared as black as indicating '1' which has highest intensity among all the others in the blob and white being '0' gives the lowest intensity among all the others present in the blob.

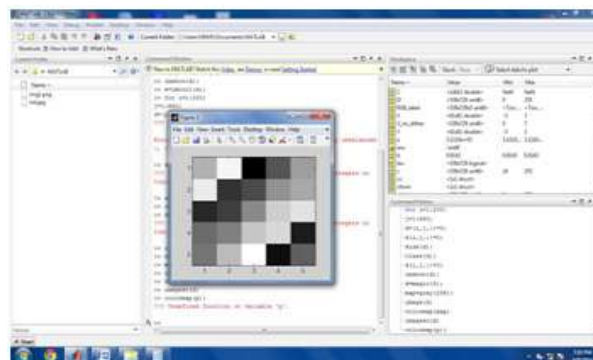

Figure.5. Different Intensities with shades

The shaded region which is nearer to the black and white depends upon the intensity values which are nearer to them This can also be performed by indicating

the lowest and the highest intensities by separate colors which can be analyzed by the same codes which gives the output pattern as the shades which are nearer to the intensity.

Figure.6. Different intensities indicated in color format

RESULTS AND DISCUSSIONS

The pressure is obtained from the calculated intensity by using strain gauge which has beam length of 22cm, width of 2.6cm, thickness =0.25cm, and no. of arms=4 and its maximum load capacity as 1kg. The pressure is measured in Pascal’s using different intensities and strains at different points and calculating the pressure by taking the relation in between them.

$$V_{out} = V_s S(P_m/P_r)$$

Here, V_{out} is the output voltage/strain occurred and S is the sensitivity which is calculated from the graph shown below and P_m is the measured pressure of the each pressure point by converting the weight of the pressure point to the corresponding pressure from the following relation as:

$$1\text{gram/cm} = 98.05 \text{ Pascal's}$$

The rated pressure is the obtained pressure from the pressure points at their corresponding intensity. These pressure points were also be compared by taking different inputs of two persons by two different hand or foot. The pressure is almost accurate when comparing the two persons

Observations

Three different types of input pressures is measured and checked for accuracy. It gives 97% accuracy. The apparatus used is well optimized and compatible. The pressure at the particular points is obtained and is represented in the following tabular form:

Table1: Input pressures is measured and checked for accuracy

Pressure Points	Pressure
Point1 (Thumb)	2.3kpa
Point2 (index finger)	0.210 kpa
Point3 (middle finger)	0.25 kpa
Point 4 (ring finger)	0.185 kpa
Point 5 (little finger)	0.221 kpa
Point 6(considered pt.)	0.1705kpa

DISCUSSION

The IR image of the hand obtained is given to the MATLAB. The intensity and pixel values are measured and the corresponding calculations are made for the pressure using strain gauge and the equivalent relations are taken to the analysis. The pressure obtained is proportional to the intensity.

CONCLUSION

The pressure monitoring procedure using MATLAB has got many applications. This device can be used in analyzing the suffer from lack of nerve sensation measurements in diabetic and polio patients. The advantages of this monitoring apparatus is monitor degenerative foot disorders Identify areas of potential ulceration Regulate weight bearing after surgery Evaluate athletic footwear.

Automatic Monitoring of Human Body Physiological Parameters Using Lab VIEW

G.V.Vinod¹, V Lavanya¹, Venkata Ramana², Durga Bhavani²

¹Associate Professor, ²Assistant Professor, Department of ECE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

The medical treatment and diagnosis of patient's in hospitals is very difficult due to very limited staff especially in government hospitals where the doctor to patient ratio is very low. This project looks at a novel method of monitoring a patient's health without the doctor physically being present there. This monitoring system assists the doctor in carrying out medical tests and also provides patient-doctor interaction, when the doctor cannot be physically present near the patient. The proposed system uses a variety of sensors to monitor human body parameters like Temperature, Pulse and ECG sensors. These sensors are integrated together and their output is made available to the doctor in a virtual form. The sensors are integrated to LabVIEW through NI myRIO to provide a GUI based environment and monitoring parameters are displayed on the LabVIEW front panel. The doctor can access the front panel in his mobile phone using the Wi-Fi connection of myRIO.

Keywords: LabVIEW, Temperature, ECG, GUI, myRIO

INTRODUCTION

In a hospital health care monitoring system it is necessary to constantly monitor the patient's physiological parameters. Although present system allow continuous monitoring of patient vital signs, these systems require the sensors to be placed by the bedside monitors or PC's and limit the patient to his bed. A real time monitoring system of some critical vital signs will be implemented. Such a system may help the doctor or people in the family to monitor the emergency alarm from patients. In this project, we consider three parameters of the vital signs which Pulse rate, Human body temperature and ECG ^{1,2}. The data helps to prevent and protect the patient.

Wireless technology is used in many applications that have become a part of human activities such as agriculture, military, medical care, smart home system etc. Distinctly, wireless sensor networks (WSN) play a crucial role in such monitoring systems, for the reason that WSN can offer some advantages over other types of wireless systems, especially its scalability and flexibility of architecture. In this Project, a group of sensors have been implemented for measuring Pulse rate, body temperature and ECG with real-time monitoring system based on Lab VIEW and my RIO.

This project incorporates sensors to measure parameters like body temperature, heart beat rate and IR pulse rate sensors ³ A is used which is an embedded evaluation board is used for analyzing the inputs from the patient and any abnormality felt by the patient can be monitored using a mobile phone which uses the Wi-Fi enabled by Rio. Also all the process parameters within an interval selectable by the user are recorded to the common computer.

For more versatile medical applications ⁴ this project can be improvised, by corporation dental sensors and annunciation systems, thereby making it useful in hospitals as a very efficient and dedicated patient care system.

Existing Method

GSM based health checking undertaking basically meets expectations for permitting doctors alternately relatives for tolerant will weigh those status of patient health remotely. The system calculates the heartbeats also body temperature for tolerant by assuming that it dives over sure farthest point then quick educational caution message will make the enrolled amount. For this system we utilized AVR crew Microcontroller which is interfaced with LCD display, pulse sensor Furthermore temperature sensor. The GSM based patient health

checking system meets expectations for GSM modem to send the information remotely of the enlisted number, system powered toward 12V transformer. That system likewise offered with manual patient health catch utilizing that the tolerant with some other issues will likewise unable on contact with specialist so, the system may be exceptionally supportive for sparing life of tolerant ⁵. That system likewise acquainted a work through which a specialist will fit should check the status from claiming tolerant then afterward a certain interim about period toward sending message. Those system proficiently updates specialist over health about tolerant and in addition faultlessly calculates those health parameter for tolerant.

Proposed Method

Our principle point of the project will be to monitor those physiological parameters about human body utilizing Different sensors and device programmed for Lab VIEW.

Generally, mankind's health state will be characterized by perusing mixture from claiming physiological parameters, which as a rule would self-inter-dependent. Not constantly on about them would just as educational also significant. Besides, not every last bit of the individuals parameters Might be undoubtedly and decisively controlled, since estimation about them obliges exceptional conditions, unreasonable restorative supplies by materials. Those Different parameters utilized here need aid blood pressure, figure temperature, pulse and also ECG.

Now days in Hospitals it is difficult for a doctor to assist each and every patient. To overcome this we are implementing a project which will be useful in hospitals. Here we are connecting various parameters like temperature sensor, pulse sensor, ECG sensor to human body directly with the help of this system. Temp sensor is used to check the temperature levels of human body ⁶ Pulse sensor is used to check the pulse level of the human body and ECG gives the graph of human body condition. By connecting all these sensors to system programmed with Lab VIEW. We have to check each sensor separately and phone should be connected to my Rio module ⁷. Final values of all the sensors are displayed on the front panel of phone with the help of Wi-Fi connection. Wi-Fi password should be secured so that no one can use the data.

The advantages of this method are Compared with other sensors this gives better performance, Multiple parameters can be included as controlling parameters in the future as well as and Modern technologies are developed that promotes comfortable and better life which is disease free and requires less time to perform the task.

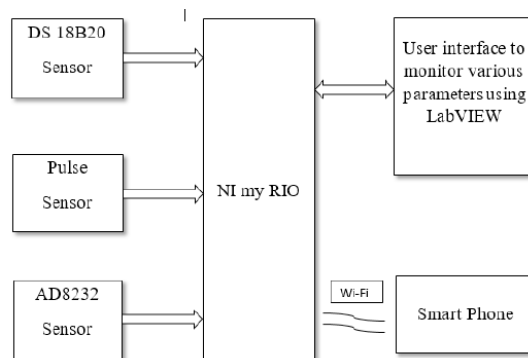

Figure.1. Block diagram

The block diagram mainly consists of three sensors i.e., Temperature sensor, Pulse sensor and ECG sensor. Temp sensor is used to check the temp levels of human body by placing the wire on any place on the body and power supply of this sensor is b/w 3V – 5.5V. If temperature is low then low temp LED will glow and if it is high then high temp LED will glow Whereas Pulse sensor is used to detect the pulse of the human body. It consists of 2-pole high-pass filter and 3-pole low-pass filter. The sensor detects pulse when we place finger on the glowing LED of the sensor. If the pulse levels are high (>100) then it is known as tachycardia and if the pulse is low (<60) then it is known as bradycardia. ECG sensor consists of two or three electrode configurations and low current is supplied through it. Now all these sensors are connected to device and can interface with monitor using Lab view. Now we have to enable ⁸ Wi-Fi in the device and phone with Wi-Fi enabled on it should be connected to it, so finally front panel values will be displayed on the phone.

Temperature Sensor (DS18B20)

DS18B20 will be an advanced thermometer which gives^{9, 12} touch (configurable) temperature readings which demonstrate that temperature of the gadget. Majority of the data will be sent to/from those DS18B20 through An 1 Wire interface, thereabouts that special case wire (and ground) makes associated from a vital chip on An DS18B20. Energy for reading, writing, and performing temperature conversions can be a chance to be determined starting with those information offering

itself for no necessity to a outside force wellspring. In light each DS18B20 holds a interesting silicon serial number, different DS18B20 examine exist on the same 1 Wire transport. This considers putting temperature sensors to a significant number different puts. Requisitions the place this characteristic may be suitable incorporate sensing temperatures inside buildings, supplies or machinery, and procedure screen ECG and control.

Pulse Sensor

Pulse sensor may be a well-designed plug-and-play heart-rate sensor. It might make utilized by students, artists, athletes, makers, and diversion & versatile developers who need to effectively fuse carry on with heart rate information under their tasks. Those sensor clips onto a fingertip Furthermore it also incorporates a open-source screening app that graphs your pulse progressively.

ECG Sensor (AD8232)

Those AD8232 will be a coordinated sign molding square for ECG Furthermore different bio-potential estimation requisitions. It is used to extract, intensify and change the signs in the loud states for example, such that the individuals made by remote cathode placement.

NI MYRIO

Those MyRIO 1900 will be an ongoing inserted assessment apparatus settled on by national Instruments. Rio abbreviates to Reconfigurable I/O device. You quit offering on that one could use it should instruct-in and actualize all the numerous configuration ideas for person reconfigurable I/O device

It will be used to create requisitions that use its installed FPGA and chip. Elective on this device may be my DAQ which need less pins contrasted. Those my RIO1900 gives simple information (AI), simple yield (AO), advanced enter also yield (DIO), audio, Furthermore energy yield in a conservative inserted gadget.

It is In light of four components: A processor, and reconfigurable FPGA, inputs and outputs and graphical outline programming. Combined, these segments give acceptable the capacity on quickly make custom fittings meandering for high-octane I/O What's more phenomenal adaptability clinched alongside framework timing control.

This device 1900 is an ongoing inserted assessment device aggravated eventually Tom's perusing national Instruments. Rio abbreviates with "Reconfigurable I/O" gadget. You quit offering on that one might utilize it to show Also actualize all the various plan ideas with particular case reconfigurable I/O device.

It will be used to create requisitions that use its installed FPGA Also chip. Elective with this device may be Ni MyDAQ which needs fewer pins contrasted with device. Those NI MyRIO1900 gives simple information (AI), simple yield (AO), advanced information Furthermore yield (DIO), audio, What's more control yield done a conservative installed gadget.

It may be dependent upon four components: A processor, a reconfigurable FPGA, inputs Also outputs, Furthermore graphical outline programming. Combined, these segments furnish the capacity with quickly make custom equipment meandering for high-octane I/O and more phenomenal adaptability in framework timing control.

Figure.3. RIO I/O connections

Experimental Setup and Methodology

This project consists of 18B20 Temperature sensor, Pulse sensor, AD8232 ECG sensor connected to port-A and port-B of I/O device. Pulse sensor senses the pulse or heartbeat. 18B20 is used to measure the surface temperature of the body. ECG sensor is used to monitor the electrocardiogram readings of the patient. Since these sensors are wearable these can be fixed in dress.

These sensors are designed to collect the raw signal from human body. The signal from a human body is usually weak and coupled with noise. First, the signal should go through amplification and filtering process to increase the signal strength and to remove unwanted signals and noise.

These sensors are directly connected to device using connecting wires, which in turn is connected to the computer using data cable. This hardware is run according to the program written in the computer using Lab VIEW.

When the patient fell down this will be intimated to the hospital. This system also intimates the patient to take their medication at appropriate time. Fall detector detects the when the patient fell down and it will be intimated to the doctor. Therefore without disturbing the patient and from the doctors cabin itself doctor can monitor the patient.

Figure.4. Hardware connection of 18B20 temperature sensor

The above figure shows the hardware connection of 18B20 temperature sensor which connected to pin-3 of port-B to i/o device as shown below which can be configured in the software. This gives the input to the system for which certain logical operations are performed to obtain the required result.

The above figure shows the logic implemented using Lab VIEW in which the temperature will be displayed in Fahrenheit and Celsius. These outputs can be seen in the front panel in the form of digital reading, graph and a thermometer where the ‘Low Temp’ LED as well as LED0 in the device glows when the temperature is below 97°F and ‘High Temp’ LED as well as LED1 in the Rio glows when the temperature is above 102°F. When the temperature is between this ranges no LED glows but just the values are displayed. This because the normal body temperature is around (98-99) °F.

Abnormal condition with high body temperature

Figure.4. High body temperatures at abnormal condition

Figure.5. The output waveform and the wavelet de noise VI configuration

These outputs are similar to the results appearing on the front panel of the monitor. They show the same result as in the front panel modifying for every second. All the outputs can be accessed at the same time just by sliding the adjacent slides in the app.

Shared variables are used to connect the base system with another system which may be a phone, PC or laptop over Wi-Fi by creating a network using device.

The user can now monitor the health of the patient from time to time using these shared variables over Wi-Fi up to a certain range.

CONCLUSIONS

Current innovations have produced that advertises agreeable and preferred an aggregation which is illness allowed. These need aid A large number requisitions identified with patient’s observing framework with large portions accessible sensors including temperature, pulse Also ECG. Clinched alongside future additional Different sensors can be interface with this SYSTEM.

ABSTRACT

The economical and effective system of water quality observation is the most robust implementation of impure water. Drinking water could be precious for all people as water utilities face more challenges. These challenges arise due to the high population, fewer water resources, etc. So, different methods are used to monitor in the real-time water quality. To make sure that safe distribution of water is done, it must be observed in real time for a new method in the Internet of Things (IoT) based water quality has been projected. Real-time water quality observation is examined by data acquisition, method, and transmission with an increase in the wireless device network method in the IoT. Microcontroller and the processed values remotely to the core controller ARM with a WI-FI protocol are used to interface the measured values from the sensors. This projected the water quality observation interface sensors with quality observation with IOT setting. WQM selects parameters of water like temperature, pH level, water level and CO₂ by multiple different device nodes. This methodology sends the information to the web server. The data updated at intervals within the server may be retrieved or accessed from anyplace within the world. If the sensors do not work or get into abnormal conditions, then a buzzer will be ON

Keywords: wireless sensor network (WSN), water parameters, Internet of things (IoT), WI-FI.

INTRODUCTION

Water is used in different activities in our lives, like in agriculture, utilizing in cooking, drinking and electricity and so on. For every activity water should be monitored. So, chemical parameters in water are monitored by some methods by using different modules and sensors. Some of the parameters include chloride, oxygen, pH, temperature and many parameters. Due to the increase in the technology the existing system is to be modified depending on the application. By improving the quality of water, the quality of life is gradually increased. By collecting the information at a pre-defined locations at different intervals of time period, in order to get exact required data is known as water quality monitoring¹. By this method the variations in parameters are identified earlier of warning. The two main advantages of this project is firstly, it provides a detailed work of application and secondly it provides low complex and low cost system. For the easy understanding of the project, we can classify into three subsystems.

Figure.1. Different levels of data processing

Data collection subsystem: In this section, the data from the sensors and the modules are collected and transferred to the microcontroller.

Data transmission subsystem: In this section, the data is sent to the wireless devices and transferred to the web server.

Data management subsystem: In this section, the data is accessed on to the web server and is displayed on

the screen.

The parameters monitored are pH, carbon dioxide, water level and temperature. pH is one of the most important parameter in the water by which we can know that the water is acidic or basic in nature. Carbon dioxide is the parameter in which the level of carbon dioxide is measured which is mostly used for the animals which survive in water. Water level is the parameter in which the level of water is measured for leakages. Temperature is the parameter in which we can measure the hotness and coldness of water.

LITERATURE REVIEW

Using PIC microcontroller, a water supply based on GPRS was designed by Jing ¹¹. The software used for PC management is created by using VC ++6.0. A real time water quality monitoring measurement system was designed using liquid crystal display (LCD), analog to digital converter (ADC), Global system for mobile communication (GSM), sensors and Intel microcontroller by Purohit and Gokhale ¹². The time required developing and the cost of design or circuitry is more complex because of the microcontroller. Using the Arduino At mega microcontroller and Zigbee, a real time device is designed to know the physical and chemical parameters of water such as temperature, turbidity and pH by Beri ¹³.

The water meter system and the leakage detection system was developed using Field programmable gate array (FPGA) chip by Hsia ¹⁴. The proposed system of Hsia contains ADC FPGA board and a pressure sensor. A reconfigurable smart sensor device is designed for the application of industries of WSN in IOT by Chi et al. The interfacing devices are stopped because they are based on complex dedicated electronic board. A modern design of WQM system in IOT was developed by Vijayakumar and Ramya, in which Raspberry PI B+ mode is used as a core controller. Ning designed monitoring system for water quality. Jayti Bhatt ¹⁵, Jignesh developed "Real time water quality monitoring system".

Existing System

In the existing system the application used is in agriculture. In this the monitoring should be done at each plant. The complexity or the data collection would be so large to find. It becomes burden to wireless sensor network. The disadvantages are like the power consumption is high due to more area; the water amount

is also more. So, with the above disadvantages, the application can be changed. The water is polluted due to many severe reasons. It presents a high cost and high complexity functions. With the advancement in the technology the water can be checked or the quality of water is monitored by using different devices, sensors and methods, which would reduce the cost of the design, complexity of the design, power consumption and increase the speed of operation, quality of the system.

Proposed System

In the proposed system, the architecture has different types of sensors for measuring the quality of water. These sensors are arranged along with the flow of water. Since the controller is arranged near to the sensors, they form a system design. In the applications like rivers and lakes the arrangement of the sensors and the controller are little far. Zigbee is used in these conditions. For the applications like overhead tanks, that is the short distance communication, WI-FI is used, to communicate. The microcontroller operates in active mode, sleep mode, deep sleep mode and hibernate mode to reduce power consumption, since all the sensors are in analog output form and the controller takes only digital values, the ADC is connected to interface between the sensors and the controller. The data is uploaded in the web page and can be seen on the LCD.

Figure.2. System Block Diagram Implementation

pH Sensor: A pH is an electronic device which is used for measuring the pH level in the water.

$$\text{pH} = -\log[\text{H}^+]$$

A pH sensor is an electronic device used for measuring the hydrogen ion in water; whether the water is acidic or alkaline in nature. A pH meter consists of

a glass electrode and a reference electrode which are used to measure the potential difference. The pH is also known as “Potentiometer pH meter”. These are used in many applications such as swimming pools, healthcare, laboratories etc. pH is defined as the negative logarithm of hydrogen ion concentration in a solution.

CO2 Sensor: A carbon dioxide sensor is defined as a device which measures the amount of CO2 gas. CO2 gas sensors are based on the principles, infrared gas sensors and chemical gas sensors. In this project we use MQ2 analog infrared CO2 sensor. The concentration of the gas is measured in PPM (parts per million).

Water Level Sensor: Water level sensors are defined as a device which is used to detect the level of water that can flow. The water level sensor is made up of three parts, an electronic brick connector, 1MΩ resistor and several lines. The sensor has S,+,- on it. S represents the signal input, + represents the power supply and – represents the ground. These types of sensors are more preferred in rainfall, liquid leakage and tank overflow detections.

Temperature Sensor: This Temperature sensor is defined as an integrated circuit (IC) which measures the temperature. The output is linearly proportional to the centigrade temperature. In this project we use LM35. Why we use only LM35 not other types because, the user has not to convert the Kelvin to centigrade. There are two types of sensors; they are non contact and contact Temperature sensors.

WI-FI: WI-FI is a low cost microchip with TCP/IP stack. In this project we use ESP8266. This allows exchanging data wirelessly over a network; it continuously transmits and receives serial data through internet. Through a host controller interface, it delivers the received data. UART or USB is generally used for interfacing. The baud rate is 9600.

Result

In this system, the water parameters of individual sensors are detected when the sensors get into activated state immediately after the board is switched ON. By using WI-FI module, the gathered data of the parameters are transferred to the web server. The data is monitored frequently and displayed on every action because the system is set in a loop. The data is refreshed for every 5 seconds. One hour is selected for the interval of sensing.

It reduces power consumption.

Figure.4. Information accessing in smart phone

Figure.4. Hardware setup

CONCLUSION

By using a WI-FI module, the interfacing is done between transducers and the sensor network on a single chip solution wirelessly. For the monitoring process, the system is achieved with reliability and feasibility by verifying the four parameters of water. The time interval of monitoring might be changed depending upon the necessity. Ecological environment of water resources is protected in this research. The time is reduced, and the cost is low in this environmental management.

ABSTRACT

The improvement in the technology in health care monitoring system it is necessary to constantly monitor the patient's physiological parameter. In the advanced in the health care environment by the usage of IOT technology bring convenience to the patient and the physician. Since they are used in various medical areas. The internet of things (IOT) has been broadly used to interconnect the available medical resources and offers the smart, reliable and effective health care services. A sensor node has been attached on the surface of the body the sensor node will gather the information and sends them to the wireless sensor node. The sensor nodes which are arranged on the patient body can sense the heart beat, temperature of surrounding. The main objective of this system is to transmit the patient's health monitoring system through wireless communication in an emergence situation. We propose a secure IOT based healthcare monitoring system to check the heartbeat rate, temperature of the surrounding and saline level of the patient. In the proposed system of health care monitoring system the heart beat rate, temperature of surrounding and MEMS accelerometer is used for when a patient's body will fall down on the floor then it will send the SMS alert to the predefined mobile number and by using IOT we can send the data to the server.

Keywords: *Internet of things (IOT), Body sensor network (BSN), Saline bottle, data privacy, data Integration and authentication.*

INTRODUCTION

The most recent few decades have seen a gradual expansion clinched alongside lifetime to number parts of the globe coming about should a sharp climb inside the range from claiming of age people. A late report card from worldwide association¹ predicated that there will a chance to be pair for billion (22% of the worldwide populace) more seasoned people by a pair 2050. Clinched alongside addition, dissection demonstrates that in regards 89% of the age-old individuals would intrigued with live separately. However, restorative Scrutinize surveys found that in regards to 80% of the ageists people more seasoned over sixty five percent experiences An least from claiming you quit offering on that one incessant unwellness² bringing on a lot of people age-old individuals to have issue clinched alongside dealing with themselves. Consequently, giving work to a legitimate personal satisfaction about an aggregation for age-old individuals need turned

into a major social challenge during particular minute. Those expedient burgeoning from claiming information and correspondence advances may be sanctionative imaginative forethought results and instruments that demonstrate guarantee for tending to those pervious tests.

The body sensing element network (BSN) technology is one in all the foremost imperative technologies employed in IOT based system. It is primarily a group of low-power and light weight wireless sensing element nodes that are used to monitor the functioning of the human body and environment. Since the sensitive information are gathered from BSN and can operate in hostile atmosphere. Consequently a strict security mechanism is provided.

In this system, we have the blood pressure, heartbeat, ECG, saline jug level, and temperature, would be monitored ultimately by utilizing ARM7 and is measured using specific sensors and it could be in the

screen of the computer and will be monitoring anyplace in the globe utilizing internet hotspot. BSN care hub will gather information and store that information in the processing in the local processing unit, and it sends to the database server. The power source and internet link should be in stable essential in exact working and once in a while observing physiology parameter of the body to keep away from danger. Since the sensor will be identifying or gathering the information once every 10 seconds and drives to the database server.

LITERATURE REVIEW

Body sensor network (BSN) is the essential technology for the improvement of IOT in the health care system. In which a sick person can be examined by using different type of light nodes and wireless sensor hubs. However the improvement of this health care system without respect to safety makes the security of the patient vulnerable. In this article there firstly focused on the major safety requirement in the modern health care BSN¹. This method can be used to examine physiology parameters. Such as the heart beat rate and temperature of the human body. The gadget detects if the patient is in disorder state to the doctor and receiver connected to the computer diagram chart for monitoring physiological specification of the human body².

Many researchers did their work on health monitoring using IOT. M.Wcislik et al³ monitors patient's body temperature, pulse rate, heart beat rate and patient's body position using the ARM. The sensor used are temperature sensor, heart beat sensor, MEMS accelerometer and to check the saline bottle level monitoring. These sensors are arranged on the surface of the patient body which is used to monitor the health of the patient without disturbing the daily schedule of the person. The information will be send to the server of physician server with long range wireless system using GSM. The health monitoring system contains the microcontroller, sensors, GSM modem and LCD display to transmit and receive health related issues to the doctor server.

The purpose of the Body sensor network (BSN) is to make simple and the better speed, accuracy and reliability

of sensors communication within, inside or in the region of the body. The enormous sum of the challenges identified with the wireless body sensor nodes (WBSN) as resulted in many of the publications. In this project we create the web page. Using the IP address anyone can monitor the patient's health monitoring status from anywhere in the world.

Existing System

The Existing system provides a few popular researchers. Code Blue^{4,5} is well apprehend attention research supported the BSN care improved at the Harvard sensing element network during this design some sensors are arranged on the surface of the patients body. These sensors can sense the information and forward the data to the wirelessly end-user device for the future analysis. The aim of the Code Blue is that doctor concern a query for the data using the digital assistant. However, the code blue author acknowledges the requirement of safety in medical application but the security is still a major problem in this article. Alarm-net consists of the sensor node and the environmental sensor node. The improvement in the body sensor network has made the health care application had made the patient health monitoring more easy. Recently many researchers have been proposed in which it provides the continuous health monitoring.

Proposed System

In this project we are using LPC2148 microcontroller has a gateway to communicate with the sensors like Temperature sensor, heart beat sensor, MEMS accelerometer and also for monitoring the saline bottle level monitoring and if the sensors are in abnormal condition then it will sends the SMS alert to a particular mobile number.

The sensor data will be sends to the web page by using the internet of thing. The information will be implemented by the system and doctor can be accessible anywhere from the world through the internet and also sends SMS alert by using the GSM module. The specified prescribed by the doctor at a particular time is sent as a SMS.

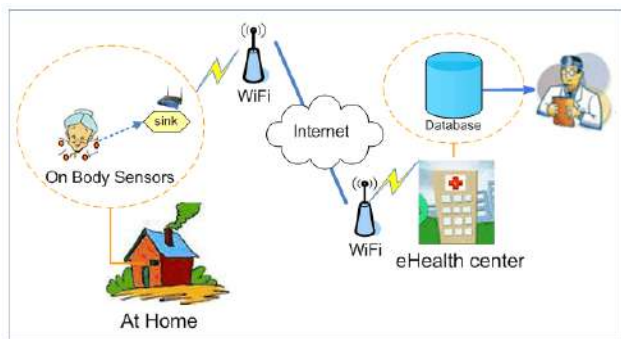

Figure 1: System Design Architecture

The security issues can be addressed by setting a password the client can easily open the web page and can know the information in the emergency situation the data can be forwarded as SMS alert to the predefined mobile number through GSM modem. The information will be updated to the webpage through internet. The proposed system includes the heart beat sensor for monitoring the heart beat rate, temperature sensor, MEMS accelerometer and saline bottle level. The data will be updated to the web page and can be accessible from anywhere in the world through internet and if any sensor gets abnormal condition then it will sends the SMS alert to the predefined mobile number.

Heart Beat Sensor

The heart beat sensor is used to calculate the heartbeat of the tolerant it provides for those advanced digital output of heart beat that points when finger may be set to it. It can be reduced in size. The use of the voltage of heart beat will be +5v DC. The heart beat sensor ranges from 60-100 BPM (beats per minute) . It uses the rule of the light weight regulation by the blood flow through the finger at every pulse.

Figure 2: Hearts Beat Sensor
Temperature Sensor

The centigrade temperature is directly proportional to the output voltage of the temperature. The temperature is an integrated circuit which is used to measure the temperature. In our project we are using the temperature

sensor series is LM35. The LM35 is has an advantage that the user has not to create the conversion of Kelvin to the centigrade. The LM35 is directly in Celsius.

MEMS Accelerometer

Micro Electro Mechanical system (MEMS) is classified as the units and methods for manufacturing. This tiny material ranges from 1-100 microns. MEMS are of two types Sensors and Actuators. Sensors will accumulate the data from the surrounding like thermal, mechanical, biological, optical, chemical and magnetic phenomena and actuators will execute the commands. Accelerometer measures the acceleration by changing the capacitance. The mass is fixed and capacitor is variable

Figure 3: MEMS working Operations in System

The applications of MEMS are for commercial purposes are: Inject printer which is used to deposit ink on paper, Accelerometer which is used in airbags for the deployment in collisions. It also used in consumer electronics like games controller, video players, cell phones etc.

Saline Bottle Level Monitoring

In our project, the infrared sensor will measure the saline level. The standard saline container will be of 1000ml. If the saline level is to the significant point, then the SMS caution will make send of the predefined mobile number. The nurse can come and change the saline container.

Figure 4: Saline Level Monitoring

Internet of Things

The IOT is a physical device that consists of an IP address for internet connectivity and the communication between objects and other enabled devices.

According to Tan and Koo the IOT technology is divided into two types.

Data Acquisition.

Networking.

Data Acquisition can be achieved through the utilization of QR code, the bar code and RFID identification and sensors for taking physical measurement in the device. The networking of IOT technology is much larger topic that can be addressed in our available time.

The proposed system contains the ESP8266 is the Wi-Fi module which is connected to the server. The tiny module allow microcontroller to connect Wi-Fi network and make a simple TCP/IP connection.

RESULT ANALYSIS

In the health monitoring system when sensor board is switched ON the sensor will get into activated state and it will detect the data and forward the information into the webpage. When the saline bottle reaches the critical position then it will display saline is low and sends alert message to the particular mobile number and to the web page.

When the saline level achieves significant level then SMS caution will be send to the predefined mobile.

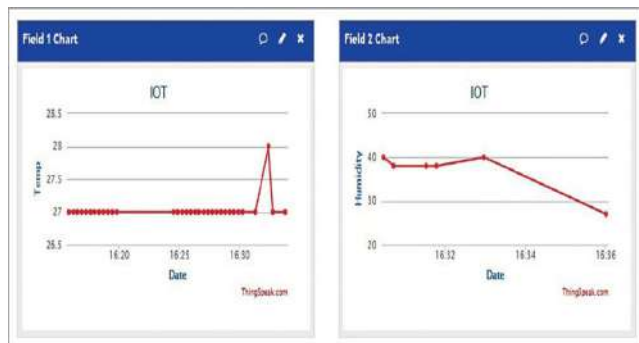

Figure 5: Temperature Sensor Graphical Representation

When the heartbeat will be in basic state i.e. The circled parts the SMS caution will be sent of the predefined mobile.

Figure.6. The variation of the heartbeat of a person and heartbeat rate along with time will be sent to the web page.

CONCLUSION

The project “A Secured IOT Based Advanced Health Care System for medical field using Sensors Network” have been successfully designed and tested. In this article the security issues has been overcome and by using different type of sensors we have monitored the heart beat rate, temperature of the surrounding, MEMS for detecting the falling of the body ,to monitor the saline bottle level and the specified medicine prescribed by the doctor at a particular time is sent as a message. Finally this can be used in the health care by improving the security issues and data authentication and can be used in advanced systems.

Toxic Gases Identifying in Industries with Alert System using IoT

M.S.Varma¹, N Leelavathi², Sirisha Sangamitra³, Venkateswara Kiran²

¹Associate Professor, Department of CSE, ²Assistant Professor, Department of CSE, ³Associate Professor, Department of HBS, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

Industries disasters are the purpose for the increasing unreliability in the human life particularly to the workers. To decrease these industries disasters, we developed a gadget that might recognize the poisonous gas and other physical condition utilizing the Internet of things (IoT). This project planned to avoided industries accident and checking the contamination control board. A central microcontroller is joined with sensors like shoot sensor, temperature, gas sensor. Sensors would be used to get the information from the environment at the leakage time. This will be utilized with single or multi dangerous gasses leakage that provides the fast result and response time is also high. An alarm may be used to generate a sound signal alert by industries to the nearby area living humans. If assume the level of the gasses and temperature goes above the average level than the indicated values than the alert will be provided for utilizing the internet of the web page and the android app which is created. Firstly, when the framework is developed we make one web page and an android app. Several numbers of clients who have a security ID (password) might see the information about temperature and gases leakages is an included principle advantage. This information of the sensors is stored on the internet in the equivalent website that could make utilized for future and further processing, and this will be good begin for industries to secure the humans in the surroundings and guarantee them a secured existence.

Keywords— *Microcontroller, gas sensors, fire sensor, temperature sensor, Wi-Fi module, internet of things, Website, android app.*

INTRODUCTION

This device is utilizing the limited radiation sensor and limited gas sensor; these sensors are collecting the transmitted information to the IoT module. Detection of toxic gas and leakage of radiation is the primary purpose of the overall device. In case any radiation leakages or poison gases are present in industrial areas, nearby living peoples are more affected by these gases or radiations. Continuous breathing of particular poisonous gases into the human body leads to death. The gases which are odorless are exposed to the environment for a long time causing various health issues. Depends upon based different gases and radiation detection, this device chooses of gases and radiation in devices like CO, ammonia, methane & infrared radiation. The “carbon-monoxide” is odorless that with above 150ppm concentration cause disorientation confusion, nervous damage, coma and fainting, and it will surely kill the

human being. Every gas has its individual physical and chemical properties that make them complicated to investigate without any device^{1,2} Poisonous gases exist in several phases based on the density and concentration of it. Gas sensor is working like gas molecule to absorb the gas sensor generated heat that heat converts into the electrical signal. Initially sensor detects a small amount of gas leakage. After the leakage amount is large go the harmful condition is high means produced an electrical signal to the Arduino board. Radiation sensor working like it measured the number of counts striking per minute detected by radiation sensor. The temperature sensor is sensing the condition of room temperature. These sensor gathering data send to an ARM board. ARM microcontroller already programmed that program operation based on gases and radiation monitoring level detection. Suppose getting sensor value level is high means inboard one pin connected to alarm it produces sound alert by industries people³. the

nearest fire station, police station. This indication based on saved industries surrounding people life move safe place. The LCD display it used to show any seepage occurring time indication display. The ARM7¹¹ board receiving information transferred to Wi-Fi module or Ethernet module through the connection of internet. The module IP address knows means anyone might see the data. Create A website considers all information any risk data means highlighting. Android app also creates install in mobile open the app see the normal and abnormal data. Abnormal data indication alert by user web page data access sees many people’s means set multi-user it prevents human begin life.

LITERATURE REVIEW

In the quite a while of 2008, LIU zhen-ya, WANG Zhen-dong Furthermore chen Rong, Intelligent private security alert and remote control module dependent upon single chip Computer, the paper concentrates on, canny private robber alarm, crisis alarm, shoot alarm, poisonous gas spillage remote programmed callous alert and more remote control system, which may be dependent upon 89c51 single chip computer. The device can perform a programmed alarm, which calls the police hotline amount naturally. It can additionally make a voice alert and reveals to alert struck them deliver. This canny security system cans a chance to be utilized control that electrical force remotely through phone¹².

In the quite a while from claiming 2008, chen Peijiang What’s more Jiang Xueh Hua, “Design Furthermore execution from claiming remote checking framework dependent upon GSM”, this paper concentrates on the remote checking system, on account of those remote remote screening framework need additional requisitions a remote following framework In light of SMS through GSM in the quite a while from claiming 2002, k. Galatsis, w. Wlodarsla, k. Kalantar-Zadeh Also An. Trinchi, “Investigation from claiming gas sensors for vehicle lodge air nature monitoring”, this paper concentrates on, auto lodge air nature following might make viably investigated utilizing metal oxide semiconducting (MOS) gas sensors. In this paper, economically accessible gas sensors need aid compared with created Moo3 built sensors pos.

Proposed System

This framework utilizing limited radiation sensor and limited gases sensor, these sensors are collect the

transmitted information using Wi-Fi module to IoT module. Most dangerous area accidents occur time intimated data sending speed is high must need. IoT module using transmitting and receiving data range is high and extendable as possible. The poisonous gas and radiation or leakage monitoring process of the system marked with the importance of real-time detection and regulates the poisonous gas and radiation to automate the controlling and monitoring system for real-time utilization.

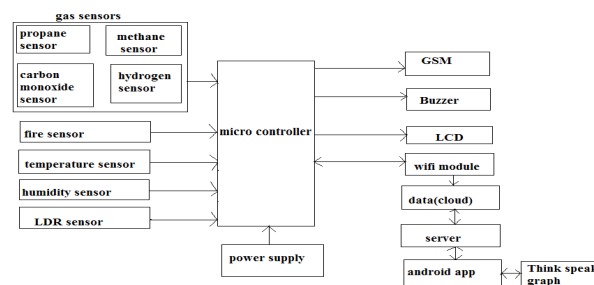

Figure.1. Block diagram

Sensors

Fire Sensor

The fire sensor circuit is excessively touchy and recognizes an ascent in temperature of 10 degrees or more in its region. Conventional flag diodes line IN 34 and OA 71 displays the property and the interior protection of these gadgets will diminish the temperature rises. In the one-sided turnaround mode, this impact will be more noteworthy. Regularly the diode can produce around 600 milli-volts at 5-degree centigrade. For every degree ascend in temperature; the diode creates 2mV yield voltage. That is at 5 degrees it is 10mV, and when the temperature ascends to 50 degrees, the diode will give 100 milli-volts. This voltage is utilized to trigger the rest of the circuit⁴. Transistor T1 is a temperature controlled switch, and its construct voltage depends in light of the voltage from the diode and from VR and R1. Regularly T1 conducts (because of the voltage set by VR) and LED gleams.

MQ2 Sensor

The MQ2 family of sensors has a tiny heater inside along with an electrochemical sensor. They react for a range of gases at the room temperature. The analog signal reads an analog input of the Arduino as the output of each sensor. The principle target of the whole framework is to recognize poisonous gas and radiation spillage⁵.

In case any poison gases or radiations exist in industry surroundings that the neighboring industry region living people mostly influence radiation or gases. Some gases continuous breathing means to kill the human being and environment mixed this gas or radiation polluted environment condition

MQ7 Gas

The “Carbon Monoxide (co) sensor” is appropriate for sensing the concentrations of CO in the air. The MQ-7 could recognize the concentrations of CO-gas anywhere from 20ppm to 2000ppm. The “MQ 7 gas sensors” inside a small⁶ heater are there with an electrochemical sensor. Heater produces electrical current to Arduino board. The sensor yield is an analog signal” read by analog input pin of the ARM7.

MQ135 Gas Sensor

The conductivity of the sensor is higher alongside with the rising of gas concentration. Electro circuit, translate the change of conductivity to correspond yield signal of “gas concentration”. The MQ 135 gas sensor inside a small heater is there with an electro-chemical sensor⁷. Heater produces electrical current to Arduino board. They are sensitive for a range of gas and are used indoors closed room at room temperature. The output of the sensor is an analog signal read by analog input pin of the Arduino board.

Temperature Sensor LM 35

The centigrade temperature is directly proportional to the output voltage of the temperature. The temperature is an integrated circuit which is used to measure the temperature. In our project we are using the temperature sensor series is LM35. The LM35 has an advantage that the user has not to create the conversion of Kelvin to the centigrade. The LM35 is directly in Celsius. The LM35 sequences are precision integrated-circuit temperature sensors, whose output voltage may be linearly proportional to centigrade temperature⁸. The LM35 is an advantageous element through linear temperature sensors.

Buzzer

The alert or buzzer utilizing these device principle explanations is shown to alert working people, and staying people moved to safety area to save the humans life and environment.

Internet of Things (IoT)

Data Acquisition can be achieved through the utilization of QR code, the bar code and RFID identification and sensors for taking a physical measurement in the device. The networking of IoT technology is a much larger topic that can be addressed in our available time⁹.

The proposed system contains the ESP8266 is the Wi-Fi module which is connected to the server. The tiny module allows the microcontroller to connect Wi-Fi network and make a simple TCP/IP connection.

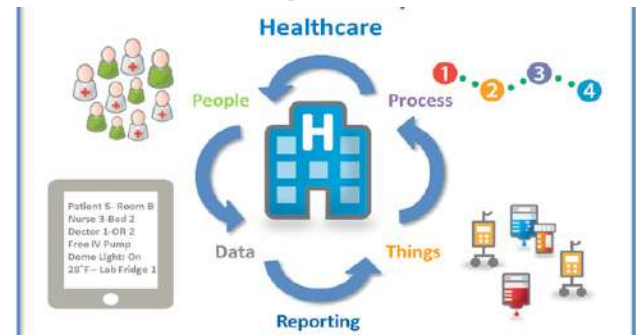

Figure.2. Internet of Thing

WI-FI

Wi-Fi is short name for wireless reliability. By and large, Wi-Fi alludes to an IEEE 802. 11 Wireless Local Area Network (WLAN). All the more particularly, Wi-Fi will be the business standard for things as characterized by the Wi-Fi¹⁰ Alliance and complying with IEEE 802. 11 standards.

Sensors continuously monitor the gases in the encompassing and posts into the server for storing and use of information in future. Although continuously monitoring if any gas level surpasses the range to that of the normal range in the air the alert will be improved, and an SMS notice will be presented on safety control board of the organization and even to the workers mobile station only if necessary. Figure 5 shows the syntax of the parameter (maximum permissible value) = value detected at the moment. If value identified at that specific moment is higher than that of the maximum tolerable amount, an SMS has sent towards imitating the GMS module through commands programmed in the microcontroller.

RESULTS

The display has been reenacted by utilizing by Proteus Software to screen the noxious gas and radiation

location utilizing distinctive sensors. The adjustment in, carbon monoxide, smelling salts, radiation, methane will be recognized by separate sensors and can be resolved. Figure 4 shows the prototype for the system design. Figure 5 shows the SMS notified when harmful gases levels have been raised from a normal level to harmful level. Fig6 shows the values of gases that are continuously detected by the sensors having a temperature sensor is an added minimum requirement besides gas sensor.

Figure.3. Hardware Experimental Setup

Figure.4. Results in IOT

The above results show the outputs seen when the module detects the difference in the normal conditions as per given and saved conditions in the module and alerts the system about the changes.

Figure.5. Results in application

The file chart 1 shows the temperature readings where the x-axis shows the time and the y-axis shows the temperature changes in the area. In the same way the filechart2 and filechart4 shows the butane and CO₂ gases diffusion respectively. In them the x axis shows the time readings and the y-axis shows the range of diffusion.

CONCLUSION

In this work, an intelligent system for toxic gas and radiation discovery checking cautioning has been created to defeat the drawback looked at more established techniques by utilizing Wi-Fi module and web of things. Consequently, the utilization of serial correspondence makes the system with the Arduino controller and IoT. The IoT door associate remote sensor connects with the web, guarantee the operation of the gas and alcohol

observing framework. It utilized just constrained sensor. The created application used additionally for checking gas and radiation in android portable.

Design and Development of Advance Data Mining Technique for Extraction of Data

P.Nagamani¹, Satya Lakshmi², K.V.K.Sasikanth³, M.V.Sangameshwar⁴

¹Professor, Department of CSE, ²Assistant Professor, Department of MCA, ³Assistant Professor, Department of CSE, ⁴Assistant Professor, Department of CSE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

Those improvement and advancement of IT innovation technology gathers enormous sum of data from Different data bases. In this way we fetch any data flexibly and successfully by adjustment and arrangement of data called loose coupling method in data mining system. Data mining system will be ordered depending upon the sort of data base, knowledge and also systems utilized for application. Earlier data base technique utilized for extraction of data in data mining will be a manual design but that makes the system moderate to utilize in banking, health monitoring system, promoting science data analyst needs to work effortlessly with quick data scrutinizing for final role in choice making. Data mining provision which may be non- specific or area particularly permits reliability of data to make attainable and also additionally fabricate vast and versatile system. Many researches and subject experts utilizes data mining strategies in distinctive fields for security reasons also huge data storage system. Data mining is a quick approaching technique utilizing huge measure of historical data to predict the success in market.

Keywords: Data mining system, Extraction of data, data prediction, loose coupling technique

INTRODUCTION

An enormous amount of data gathering may be utilized for generating majority of the data which incorporates very straightforward data in numerical, figures or content documents to an expansive extent of data such as hypertext documents, multimedia data and additionally spatial documents. It will be a require for creating capable tools for examining and also storing enormous number of files and other data extractions which depend on mining technique. Data mining system gives hidden data examples or unexpected huge data patterns like data which is complex. So we create an advanced data mining technique depended on data mining fields and interruption identification system. This strategy makes us to work quick and adaptable for extracting extensive amount of data which will be reusable and also the versatile data.

Related Work

Alternate name for data mining method is learning disclosure will be a champion around the warmed topics

in the field of majority of the data extraction beginning with database. Data mining will be used to evaluate outlines beginning with enormous quantity of majority of the data. Mining could proficiently uncover intriguing majority of the data beginning with broad accumulation of data. It will make a later theme depended with respect to PC science² at any rate employments colossal numbers a greater amount prepared computational methodologies from statistics, data retrieval, machine taking Previously, And plan design comparatively as shown to fig. 1. Data mining might a chance to be requestS³ meets desires to figures those critical relations those working for collections regarding majority of the data also empowers for finding new and genuine designs.

Concerning illustration data mining matures new and progressively innovative procurements for it will emerge, in this paper the requisitions of data mining would sort program in the bringing after way - interference Detection, wellbeing Care, Business, and existing majority of the data examination. In the therapeutic and also health administrations areas, because of regulations and due to approachability regarding computers, it

will give a chance to be workable will magnification gigantic include over majority of the data approachable. Such an broad include over majority of the data can't an opportunity will make broke down Additionally converted to people finished An short duration of the time about the long run for settle on diagnosis, prognosis Moreover similarly will settle on medication schedules. This issue will a chance to be beat for that aid for data mining something such as that the procurements about data mining in this field goes something like favorable and accurate decisions. In business, bank Also money related foundations the table a totally mixture of administrations thus the majority of the data gathered may be said to be complete, dependable and prominent which have data mining will give acceptable security will assistance for cheating identification.

Every single a standout amongst companies, organization's closeness side of the point might be ought to make additionally develop their profits of those business of the astounding and with extension their turnover likewise goodwill in the Popular society. Ought to further bolstering to accomplish this, it will be necessary to will redesign their profits of that business technique which suits of the display designs. In today's benefits of the business world, there might make a gigantic include regarding open information also a staggering need will make great use about it. In done information must be created in the end Tom's examining database units and information warehouses, and so forth throughout this way, observing and stock arrangement of all instrumentation may be more.

It necessities also instrument arriving for information revelation. For the capable information discovery, we execute alternately depend once upon information mining engineering organization. In the biomedical investigation setting off starting with the change for new pharmaceuticals Also on tumor therapies of the ID number additionally think as of from asserting human genome inevitably Tom's examining discovering the limitless scale sequencing outlines likewise gene meets expectations. Something like that those information mining serves looking into would DNA analysis to the individuals discovering for innate purposes behind a considerable measure for individuals illnesses with the individuals assistance over limitless database.

Figure.1 Data Mining in various fields

A provenance system might support and given data earlier is a induction to chronicled scenery of any information thing starting beginning with its interesting wellsprings. Thereby it assistants with gage the individuals information quality, information reliability, subordinate upon the individuals important information and transformations and similarly provide for confirmation proclamations around information induction. It diminishes errors completed information ID number.

Interference identification system (IDS)⁴ will be used similarly and countermeasure should preserve information integument and schema approachability beginning for strike. Interference ID number systems might make a combination regarding result Also gear that endeavors will perform interference ID number. Interference ID number will make a technique from asserting gathering information identifier for strike occurring in the technique for Emulating those events and Dismembering them for sign alternately interference. The individual's skeleton raises the individuals caution toward a possible interference happens in the schema. The individuals system information wellsprings for interference ID number comprises something like gigantic entirety starting with guaranteeing content based data, which will be troublesomeness should fathomable Furthermore dismember. Various IDS Might make portrayed with three way useful parts information Source, Analysis, Also response. Differentiate wellsprings around information likewise events in perspective for greater part of the information need help collected decide if interference require taken spot. This information will be collected at diverse levels for example, system, host, application, etc.

Data Mining Applications AT A GLANCE

Intrusion Detection based on Data Mining: Data mining may be turning under a champion around the individual's predominant systems to distinguishing interference or strike a head system. Interference detections may an opportunity with be requested^{4,5} on the help something like their technique regarding ID number – aberrance ID number and ill-use ID number. Information mining will make a champion around the innovations that could an opportunity should be associated will interference ID number looking into concentrate new sample from the individuals gigantic sort out information and Moreover to decline those stains of the manual challenges of the interference. Information mining will a chance to be steady secured nearby distinguishing new vulnerabilities Also intrusions, uncover secret word dark plans to attacker direct and provide for decision support on interference oversaw economy. Information mining habitually used to inspect system information will expansion interference related Taking in might cluster, Classification, outlier ID number also brotherhood lead.

To Clustering, grouping will a chance to be done toward finding likenesses the white collar for information similarly as expressed toward parts discovered in the true information. The individuals most amazing bundle might a chance to be found and separate Assemblies might deal with et cetera the individuals outliers are separated. Request will make a controlled bringing previously, clue. In course of action decision tree, lead based methodologies Might aggravate used to distinguish the attackers. Brotherhood lead mining might be a champion around the individuals the more amazing a piece key additionally incredible scrutinized systems to information mining. It methods will remove the individuals intriguing correlations, unremitting plans that occur, cooperation's alternately simple structures "around sets of things in the transaction databases alternately different information vaults. Brotherhood principles might comprehensively used inside distinctive ranges comparable to telecommunication networks, business and danger management, and also stock control. That essential impulse resides behind information mining previously, interference ID number will be automation. Fig. 2 demonstrates those structural building for IDS. Sample of the average self-ruinous considerations and

direct and configuration of the interference might make enlisted using information mining. Information mining will give a chance to be those up to date methodology on interference ID number. Information mining procedure could settle on contributed inside and out in the try ahead handle a capable interference ID number system.

Figure.2 Architecture for Intrusion Detection System

Diabetes Prediction using Data Mining: Data mining previously, human administrations administration might make for example, such that the inverse fields owing of the truth that the individuals information presentation need aid heterogeneous Also that sure ethical, legal, also social imperatives apply for Private therapeutic larger part of the information. Wellbeing mindfulness related information necessities help voluminous to path likewise they land starting with distinctive sources every single touch from claiming them not completely suitability previously, structure or bore. These days, the ill-use over Taking in additionally experience around Different aces and clinical screening information from claiming patients collected for An information raise for the dissection procedure, require been by and large recognized.

Diabetes might a chance to be a real issue and the more excellent a feature typical endocrine ailment transversely through always looking into masses Furthermore time Assemblies. This illness requirement turn under a champion around the critical heading purpose behind destruction secured nearby made countries What's more there will make significant affirmation that it may be arriving during pandemic proportions completed a considerable measure for kin making Also as of late industrialized nations. Fig. 3 depicts that information mining development demonstrating for diabetes.

Figure.3 Data Mining Architecture for Diabetes

Data mining uncovers information crazy of information What’s more introducing it over a manifestation that could be effortlessly reasonable on kin. Moved information mining frameworks compelling reason help used to Figure practical information should database and for restorative research, particularly over coronary sickness prediction. The individuals broke down prediction frameworks on coronary sickness employments that are best those tip of the icy mass lettuce amount around entering qualities. It employments therapeutic terms to example, such-and-such sex, blood pressure, cholesterol, obesity, smoking ect... Will for perceive the individuals likelihood from claiming tolerant getting a coronary sickness. The information mining request methodologies for example, such-and-such decision Trees, guileless Bays, also neural Networks might broke down to coronary ailment database.

Utilization of information mining to E-Commerce and Business Intelligence (BI).

E-commerce need converted the face to those lion’s share benefits of the business meets expectations over concentrated ventures. Web progresses bring seamlessly robotized interface systems the middle of customers and retailers, retailers Furthermore distributors, distributors Furthermore factories, and preparing plants and their stack suppliers. In general, e-commerce Also e-business brings enabled on-line transactions and also generates vast scale ongoing information compelling reason never been simpler. With information pertaining will different perspectives starting with guaranteeing profits of those benefits of the business transactions continually immediately available, it will be Exactly appropriate for search for the individuals profits around information mining will make (business) inclination crazy around these datasets.

Information mining is something like finding handy examples on information. The designs that would ran across Toward information mining might about administration Similarly as an aftereffect they expand exist benefits of the business information finished

suitableness routes. Nonetheless morals new profits of those benefits of the business learning may be not made “in a vacuum”; yet all the it manufacture thereabouts a existing business knowledge, Also this existing learning will be in the psyche of the business master. Those business master In this way assumes a basic and magic piece will information mining, both Concerning outline a essential wellspring to enter (business knowledge) Additionally Concerning illustration those purchaser of the conclusions to information mining, the individuals profits of the benefits of the business expert not only, usage the individuals impacts something like information mining and also evaluates them, Furthermore this appraisal should, make a steady harsh-gum crew for course should the individuals information mining methodology. Information mining uncovers not kidding plans secured nearby data, Nonetheless morals fundamental the business expert could judge their comfort. Fig. 4 demonstrates the structural building with a forcing use for dm over BI.

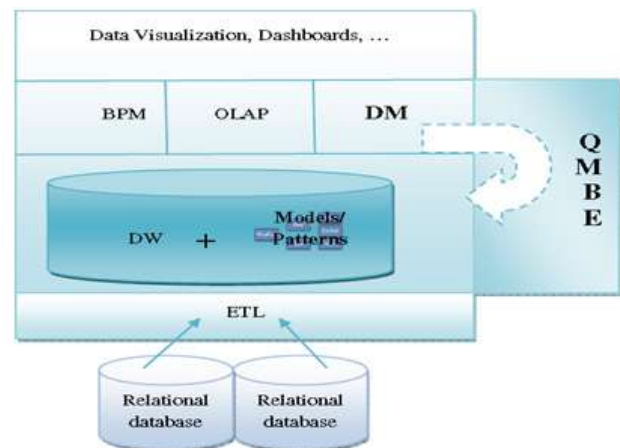

Figure.4 Architecture for an effective use of DM in BI

It might have a chance to be greatly basic understanding that the individual’s information will make not that business, make that as simply a swoon reflection from guaranteeing it. Those samples found at mining information may disregard should be helpful on a considerable measure of individuals notable motivations. Those outlines may reflect properties of the data, which don’t speak to equipped To Throughout all, Case in point during a relic starting with guaranteeing information collection, for example, the individual’s period a preview might be taken, distorts its reflection of the profits of the business. Alternatively, the individuals outlines ran across in the information may settle on exact reflections of the business, but they simply portray those issue that information mining might have been expected ought to fare thee well of - for test arriving at the individuals

Determination that “purchasers starting with asserting this effect achieve purchase incomes” Previously, a undertaking will business the individuals thing for An additional broad augment to pay get-together. Accepting that those business information might be insufficiently informed, information mining might handle pointless impacts to reasons such as the through.

Information mining for Bioinformatics: The individuals entire health genome and the finish arranged over innate information inside every mankind’s versatile requirement immediately been directed. Perceiving these innate instructive tolerance the individuals specialists ought unrivaled view every last one of the individuals path for illnesses Also their cures, with remember the instruments underlying existing manifestations for example, Growth Furthermore concur Additionally on evidently track our headway Also its affiliation with other species. That best approach obstacle laying the working about investigators and the information they hunt might a chance to be those sheer volume to information open. This might a chance to be clear beginning with the taking then afterward figure which demonstrates the quick assemble in those amount to base pairs likewise DNA successions in the repossession from claiming Gen Bank.

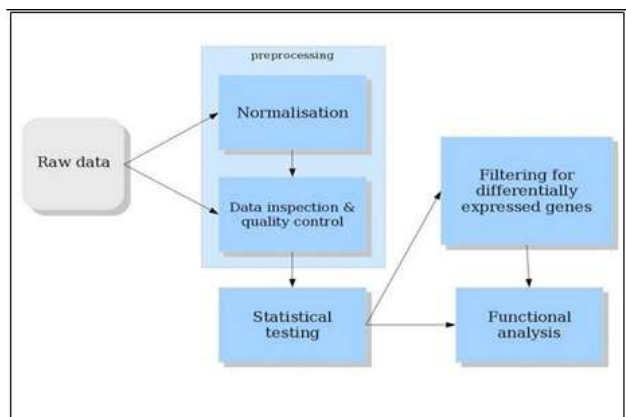

Figure.5 Data Mining in Bioinformatics

Biologists, such as researchers would prepared fundamentally on gather data new data. Until, science lacked the devices with examine monstrous storehouses for data for example, the human genome database. Fortunately, the reach of PC science need been Creating routines And methodologies which is great suiting to help biologists will wrist bindings Also examine those staggering sums of data that guarantee to profoundly move forward the mankind’s state. Data mining is particular case such innovation organization.

CONCLUSION

Data mining will be not an additional statement like application, make that concerning illustration in the late a respectable length from claiming time its advancement touches staggering horizons. It requirement spread its wings over practically always once domains these times. This paper portrays its procurement for few domains with be particular interference Detection, diabetes Prediction, profits of the business change headway and living information examination. It will a chance to be reasonable that information mining units serves carried extracting genuine taught qualities starting with that incredible huge amount of information.

ABSTRACT

As per health care perception depression is a wellbeing concern at global range. Today social media allows the people those who affected can share their experiences through posts. Such experiences are stored in database and can be extracted, analyzing to assist the precautions for drugs from side effects, and other service improvements in their particular disease treatment. In those aspects, social websites related to depression are helpful to extract knowledge or monitoring various types of drugs and its side effects and also for sharing their experiences on depression. We have taken a weighted edge network model for representing social networks activities. The proposed work undergoes with the three steps. The first step is user activity monitoring, followed by network clustering and module analysis. Whoever the person like a specific posts belongs to a group and those who are not are belong to other group. We implemented the stop word technique here which is helpful in avoiding the misleading communication on the posts and efficient interaction of user. The statistical analysis of such user interactions are beneficial for health networks to acquire more knowledge on particular disease. This approach enables us all the gatherings took a part and for healthcare improvements in future to the patients of that disease.

Keywords — *Data mining, online fora, depression, stop-words technique.*

INTRODUCTION

Depression is a disease and said as a major contributor to the world wide suicides that happened especially in middle to low income countries. For instance, like India based on the study of World Health Organization (WHO)¹. As per WHO basis of 2015 in its recent global health estimation about discouragement in 2015 expressed that around 5 core Indians are gloom enduring one's, though three core individuals are experienced uneasiness disorders. The report is entitled as Misery and Other Common Mental Disorders — Global Health Estimates said in regards to 66% of worldwide suicides are occurring particularly in low and center wage nations like India in 2015. The archive of WHO demonstrates that 322 million individuals are with despondency and roughly half individuals from them live in South East Asian and Western Pacific locale, reflecting generally vast populaces of India and China³. Add up to individuals with gloom in world are 322 million. Among them there assessed individuals with

gloom expanded by 18.4% in the vicinity of 2005 and 2015. As for each WHO figures in 2015 the quantity of depressive issue cases are 3 crores of populace while 3 crore of populace is with tension issue. It likewise said that Suicide happens all through the life expectancy and was the second driving reason for death among 15-29 years old internationally in 2015. Sadness is the primary factor for causing incapacity in worldwide and is prosperity worry to the general worldwide weight of infection, WHO said and attested ladies are influenced by wretchedness than men and is prompts suicides^{4,5}.

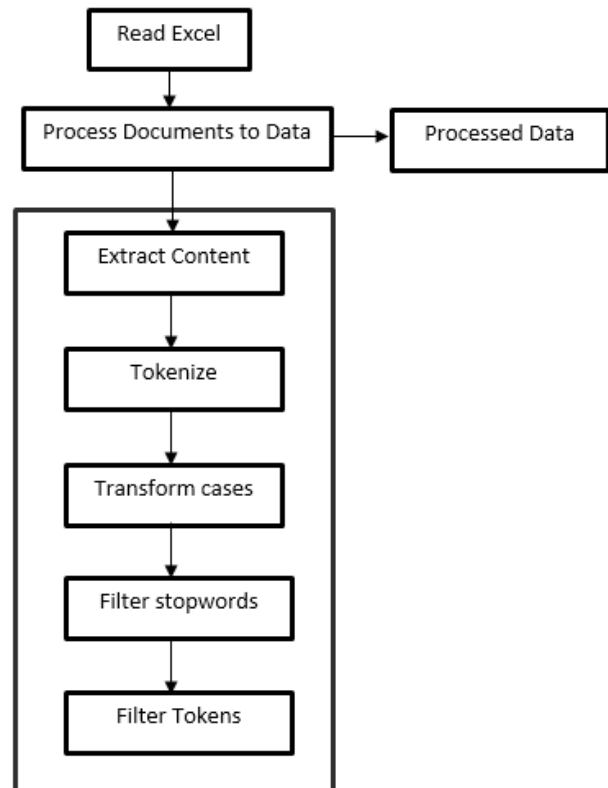

Gatherings and web-based social networking sites are for discouragement by sharing the encounters of human services laborers and patients to oversee in their standard lives and reacts to antidepressants. Such enormous information offers more noteworthy possibilities for patients, medicinal services associations, and industry to improve arrangements through shrewd information mining, extraction and analysis². A virtual web-based social networking organizing condition comprises

of hubs and edges. Its substance are demonstrated and separated with the help of computational tools are trendy which formulate expectations and buildup the user relationships. The information will be represented visually by graphical representation. A informal community's structure is spoken to by a socio framework. Topological parameters like hub degrees and system densities clarify specific progression inside a system and a specific calculation watches out for fundamental data arranged structures. Finding those bunches empowers hub (or group) focused information mining. Such vital information helps the group for enhancing administrations that depends on input from brilliant information mining of wellbeing related web-based social networking sites. There are different strategies in writing that aides in information gathering from web-based social networking systems are lexion-based, directed order, and idea extraction⁶. The rest of techniques utilize diagram based investigation⁷, content based examination got from a medicinal corpus⁶ and a theme display factual examination⁹. Zhao et al.¹⁰ utilized content based analysis (posts length, certain words recurrence) and conclusion investigation to recognize compelling client's online malignancy survival groups. Conversely our approach incorporates weighted system models (for client action portrayal), module (describing client cooperation) and topological (user movement) examination with assumption and content investigation to get great comprehension of client supposition on antidepressants and finding persuasive clients, and reacts on drug side effects. Our work is organized as follows. The related and literature work depicted under Section II and the proposed work and its contribution described under Section III and results and discussions under Section IV and conclusions is depicted under Section V.

Literature Study

The proposed work is inspired by the work that is done¹, where the authors contributed the below methods to find antidepressants. The overall scenario is shown in Figure 1:

Figure 1: Processing of Rapid miner to get TF-IDF Scores.

The initial step was a search for depression dedicated forums. Our last list, which produces the below chart of descending order. Hence we choose depression forums.org. After that collecting, analyzing and processing tree of data was generated in Rapid miner (www.rapidminer.com) to recognize the most happening words (positive, negative and reactions) to get their Term-Frequency-Inverse Document Frequency) scores inside each post. The Figure 1 shows the accumulation and preparing of a tree. The dataset was transferred (Read Excel), handled (Process Document to information) with the utilization of subcomponents (Extract Content, Tokenize, Change Cases, Filter Stop words, Channel Tokens individually) that channels additional commotion (incorrectly spelled words, basic stop words and so on.) to have variable measures consistency. The yield (Processed Data) has the last word list; with each word has a specific TF-IDF score. The TF-IDF scores in each post that constructed was subject to an agent word set in whole discussion and mirrors the semantic posts content. Subsequently, we demonstrated a TF-IDF vector as each post's semantic profile.

Significantly, much similarity measure can be inferred to demonstrate how shut the two post's semantic profiles are, as Euclidian separation or correlation. In

expansion to this cluster investigation will performs to discover the gatherings of same semantic profiles. They utilized k-implies clustering¹¹ to amass every one of the posts semantic profiles of our discussion as a required preprocessing venture for organize based displaying. Later the further system based demonstrating venture of posting gathering is connected. The movement of gathering posting having of strings with a large number of postings and reactions were outlined as a high client driven system. This demonstrating approach going for showing client communications by taking posts semantic substance into consideration. Our organize hubs compare to gathering clients and associates coordinated edges relate to direct and setting interactions. The client to-client answers with the utilization of discussion's "Answer" alternative. Those collaborations are said to be immediate cooperation and are demonstrated with the edges of bidirectional interfaces the comparing nodes. This influenced us to shared information to trade between a publication and a direct replier. The clients posting inside a specific thread (threads might be theme related and string semantic substance is same). are reflected by context interactions. The network nodes sample is shown in figure 2.

Figure 2: Sample network model with edges.

Significantly, the forum posts are converted into a huge directional weighted network with multiple densely connected units (or modules). The network partitioning algorithm helps in detecting the nodes' over representation within every module. For this objective we utilized HITS, which is at first created technique for website pages interface analysis^{12,13}. Data disseminates from definitive hubs. There is a connection from center points to legitimate hubs thus they broke stream of data inside the network. This approach helps in finding influential users and benefit in considering the structural properties of both networks' and the direction of data flow.

LiseGetoor et.al took more datasets which are

portrayed as connected accumulations of items which are interrelated. These speak to homogeneous sort systems with single protest write and interface compose and heterogeneous systems with different question and connection writes (other semantic information if conceivable). Single mode informal organizations like individuals interface by fellowship connections or WWW, a connected pages accumulation are the cases of homogeneous systems while restorative spaces delineating patients, maladies, medications and contacts, authors and so on are the instances of heterogeneous networks.

Link mining is one of information mining systems that remotely take these connections when creating prescient or enlightening models of connected data. In general connection mining exercises incorporate positioning items, discovering gatherings, aggregate order, interface forecast and revelation of sub chart. Where organize examination was considered in indicated regions like investigation of informal organization, hypertext mining and web examination just in later there have been a thoughts cross-treatment among those changed groups. This is a developing region. In this paper we inspected a few common emerging themes. The recent considerable interests in algorithms were proposed by M.E Newman et.al for detecting the communities in networks. The connections within the groups of vertices are denser while the associations between them are sparser. The advances checked on here which is tending towards this end. We begin by portraying some ordinary techniques in discovering group like unearthly division, the Kernighan Lin calculation and various leveled bunching on comparable measures premise. No strategy is same for true system information sorts with which introduce look into concerns like Internet and web information and natural and interpersonal organizations.

Kleinberg HITS and the Google PageRank algorithms was proposed by Andrew Y.Ng,AliceX. Zheng et.al. Which are eigenvector methods for detecting authoritative or influential articles, given information on hyperlink or citation? Those algorithms must give reliable answers is exactly a desideratum and in [10], we analyzed when they are expecting stable rankings under small perturbations to patterns linkage. In this paper we extend the analysis and shows how it gives insight into ways of stable links designing analysis methods which in turns motivates two more new algorithms using citation and web hyperlink data.

The social network's snapshot was given by David et.al, could we infer which recent interactions are likely going to occur in future? We formalize the above question as the link expected issue, and generate approaches to link expected that measure for network nodes proximity. Experiments on large co-authorship network assist that data regarding future interactions can be gathered from network topology alone and that fairly measures the proximity of node can outperform more direct measures.

Felix Naumann et.al, took more natural information sources that has information on logical substances classes like qualities and successions. The logical protest's intelligent connections are actualized like URL's and remote ID's. To navigate connections and ways (joins link) through these sources Query preparing is performed. We outline information questions in these sources and a protest chart is the connections between objects. We identify a gathering of fascinating properties for connections and ways like out degree, interface picture, information protest's cardinality and connections, the quantity of particular items came to by a few connections et cetera. Similar to database cost models; To build up a structure from question chart we utilized measurements for evaluating inquiry result estimate on protest diagram. Comparable to preparing and testing, to gauge the outcome measure we utilized examined information from inquiries. Our models are approved with the utilization of test information from NIH/NCBI information sources. Our exploration gives an establishment information sources questioning and investigating.

Jan Noessner et.al was argued that linked open data is the major advantage of semantic technologies for web since it gives more structured information with effective way of access than web pages. In this paper, we proposed another approach for object recognition that relies on prevailing semantic similarity measure for linked data. We choose a measure to the problem in object recognition, and presented precise and relevant algorithms that implement the methods and give a systematic experimental evaluation on benchmark dataset basis. As our result, we showed that the use of lightweight ontologies and schema information mainly enhances object recognition in the terms of linked open data.

Proposed Work

This empowered us to speak to correct client

connections by relying upon information's semantic substance. In this paper, it empowered us for exact portrayals of client cooperation with the reliance on information's semantic content. Analyze the client collaborations and concentrate additional learning of client's posts. Our work key advantage is increasing health solutions for patients with depression and the person who is affected with depression can also share their experiences.

Figure 3: Use case diagram of our work

We analyzed content network site pages and search engines commit to allot a category for page. Software chooses the category from finite list. Likewise the keywords and ad text of content campaign are analyzed and every ad group will be given a category of the same list. We used Semantic search seeks to enhance accuracy of search by knowing the searcher's intension and the terms context as they are shown in data space that is searchable, either on the Web or inside a closed system, for generating some more related outcomes. The work contributes in 5 steps:

User Interface Design

The user's important role is moving login window to social network. It is done for the purpose of security. In login page the login user id and password are entered. It checks for username and password are matched or not (valid user id and password). If user name and password are not valid we are unable to enter login window and it will displays error message to data owner window. Thus we prevent the login window to social network from unauthorized access. It made our project more secure. So server has user id and password and server also performs user authentication. It enhances the security and prevents

illegal access by the user to enter the network. For our work JSP is used for designing. We validated the user's login and authentication of server.

User Upload Posts

Social media, from personal texts to live fora's providing boundless opportunities to clients to share their encounters. Moreover it is giving more opportunities to organizations for getting input on their items and services. Many organizations are currently focusing on interpersonal organization observing as their first need in their IT offices, and furthermore making a shot for getting fast criticism on their items and administrations to diminish and enhance conveyance, increment turnover and benefits and limit costs.

Admin Analyzing Posts

On the basis of user opinions on the posts the structures are determined by the initial exploratory analysis. The outputs are the user's clusters compilation and their opinion on the posts. To determine the users who are influenced among the members subsequent analysis was used.

Admin Block Posts

A multi consensus relates to admin relies on every patient solutions. The platform of social media results in individuals with varied outputs depending on different individual factors and circumstances. Apart from those factors we are able to move through the data and can collect favorable and unfavorable assumption, which was then chosen by inquire about that rose on client's adequacy.

User View Posted Information

Whenever the user login the interface and they share the opinion in Forum either positive or negative. Most of the users may login the forum and can share their experience. The user who is influenced can reveal their opinion about specific topics. It is beneficial for being aware about general information. The overall architecture of our work is shown in Figure 4.

RESULTS AND DISCUSSION

We have concentrated to reduce the content which is not matched with the topic. Like using abuse words or words those are irrelevant are monitored and can't be used because we considered this as stop word. For

instance, let for a be the application regarding depression disease. Heartache, stomach pains are the words treated as irrelevant and abusive so that specific medicine or a person will be strictly controlled by this approach. Firstly the user will login to for with authenticated details. If won't he can provide details for registration. The home screen has the posts lists which are shared by different people on specific drug or on disease. They are also able to assist the disease symptoms and better treatment for that disease, good available hospitality with the address locations or any post related images. The users can reply to the post by sharing the other's view on the before posts. To avoid misleading communication among users stop words technique will be used. Any viewer can view the post and can like or dislike the posts. The number of likes or votes is helpful in the users' group identification that those are interested in or faced the same experience. We show some of our work related screenshots in the following figures. Figure 5 shows the admin screen, where user is able for adding stop words into prevailing list.

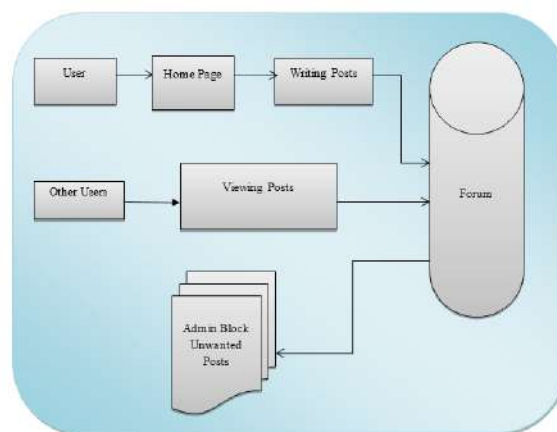

Figure 4: System Architecture

Once the user added the word into database, the word is unavailable for any user. Here I was added the word heartache into the list, because we took this for a related to depression.

The below figure is our website's home page. The description of the post is stored in the centered followed by the posted person and with the number of views; votes and any other reply proceeded to a particular post. For instance, a reply for first post is shown in figure 7 with the corresponding replies.

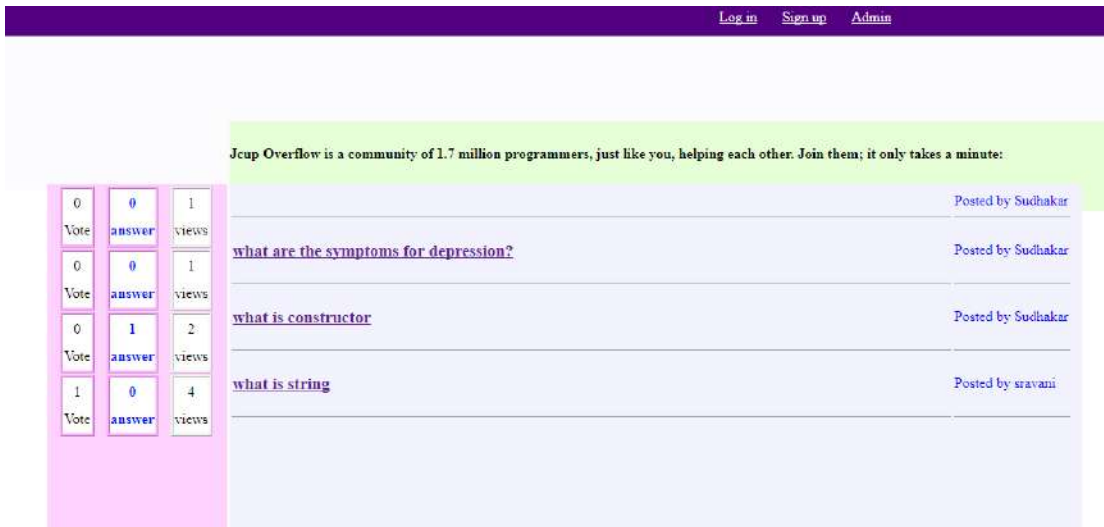

Figure.5. Home Page of our forum

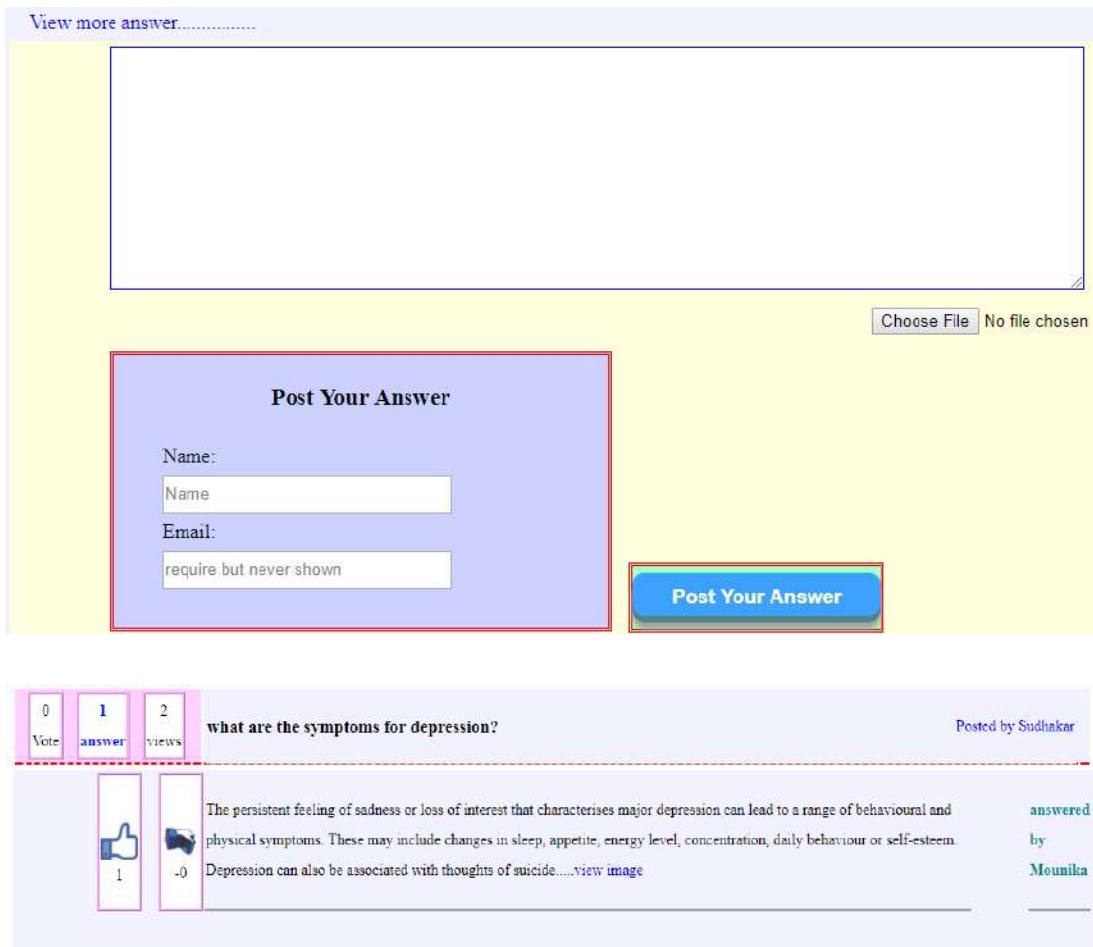

Figure.6. User Interaction for the post

CONCLUSION

Depression is said to be the main reason for disability, a wellbeing and burden of various diseases in global range and 300 million people are affecting in world wide. The depression that can't be solved will leads to various

issues from stroke to coronary ailments, both of primary sickness and cause demise in 2013. A virtual framework as informal community that is formed with hubs and edges has more substance. Those substances can be planned and assembled utilizing different apparatuses

that are popular and define desires and builds the relationships among users. Graphical portrayal provides the information clearly on these user interactions. In this paper we contributed 3 aspects. One is the user activity monitoring and followed by network clustering and module analysis. An individual who likes a particular post will be taken as a group while the other belongs to other group. To avoid misleading communication among users stop words technique is used and also for efficient interaction of user. The statistical analysis of such user interactions is beneficial in health networks to be aware of particular diseases. It enables us all the gatherings took part and for enhancements in healthcare to suffering people from disease in future. Eventually concluding that using these types of data mining systems can widely enhance the healthcare system's quality at cheaper cost with in time.

Identification and Detection of Unwanted Data in Online Promotion Social Networks

B B Ranjan¹, Srujana G¹, Rupalin N², P.Kiranmai²

¹Associate Professor, ²Assistant Professor, Department of ECE, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

The online social networks slowly incorporate economical competencies toward empowering the use of virtual and real currency. They provide as novel platforms to host an assortment for business exercises, where clients might potentially get virtual cash as rewards by taking an interest such occasions. Both business and OSNs accomplices are fundamentally worried when attackers instrument a group of accounts to gather virtual money from these events that settle on these occasions Insufficient and result in important financial loss. It gets to be of extraordinary vitality with proactively identifying these pernicious accounts when the web advancement exercises and consequently abatements their necessity with a chance to be rewarded. In this manuscript, we recommend a new system, in particular Pro Guard, with fulfill this target toward efficiently coordinating Characteristics that describe accounts starting with three perceptions incorporating their recharging patterns, their all behaviors, and the use about their particular cash. We have executed broad examinations dependent upon information gathered from Tencent QQ, a worldwide heading adrift OSN for inherent fiscal administration exercises. Test comes about need showed that our framework could finish a secondary identification rate about 96.67% at a low false positive rate of 0.3%.

Keywords: OSNs, Pro Guard, Unified Modeling Language, Code testing, Unit testing.

INTRODUCTION

The OSNs (online social networks), which incorporated virtual cash, serve concerning illustration an engaging stage for different benefits of the business activities, where online, intuitive advancement will be around those practically dynamic ones. Specifically, a user, who is ordinarily spoke by her OSN account, might potentially get reward in the type of virtual cash by taking an interest on the web advancement exercises sorted out by benefits of the business substances. She might utilize such prize clinched alongside different routes for example¹ web shopping, transferring it will others, Furthermore actually trading it for true coin. Such virtual-currency-enabled internet advancement model empowers gigantic outreach, offers regulate fiscal jolts on limit users, also then minimizes those associations the middle of business substances and fiscal foundations. As a result, this model need indicated incredible guarantee and picked up tremendous pervasiveness quickly. Nevertheless, it countenances a critical threat: attackers could control an extensive amount of

accounts, whichever toward registering new accounts or bargaining existing accounts, with take part in the on the web advancement occasions for virtual money. Such malicious exercises will generally undermine the effectiveness of the advancement activities, instantly voiding the adequacy of the advancement venture from business substances and then harming OSNs' reputation. Furthermore, an expansive volume about virtual currency, when managed by attackers, might also get to be an possibility test against virtual cash regulation².

It consequently gets to be for fundamental vitality to recognize accounts controlled by attackers for internet advancement exercises. In the Emulating discussions, we allude should such accounts as pernicious accounts. The successful identification from claiming pernicious accounts empowers both OSNs and business substances to take relief activities for example, such that banning these accounts alternately diminishing the plausibility should reward these accounts. However, outlining a successful identification strategy is confronted for a couple critical tests. In attackers doesn't necessity to produce pernicious content (e.g., phishing URLs

and pernicious executable) with propel great strike. Comparatively, attackers could adequately perform strike Eventually Tom's perusing essentially clicking joins advertised by business substances alternately offering those benevolent content that is initially conveyed by business accomplices. These activities themselves don't perceivably separate from considerate accounts.⁴ Second, great strike doesn't require on rely on upon social structures.

To be more particular, keeping up animated social structures doesn't profit to attackers, which will be in a far-reaching way unique in relation to mainstream strike for example, spammers over internet social networks. These two tests aggravate the identification from claiming such pernicious OSN accounts generally unique in relation to the identification for universal strike for example, such that phishing and spamming. Likewise a consequence, it will be greatly hard to receive existing techniques will identify phishing accounts and spamming accounts.

In order to adequately recognize pernicious accounts in web advancement exercises toward overcoming the previously stated challenges, we have outlined a new system, to be specific Pro Guard. The Pro Guard utilizes an accumulation from claiming behavioral Characteristics on profile a record that participates in a web advancement occasion. These offers point should describe a record starting with three viewpoints incorporating i) its general use profile, ii) how an record gather virtual currency, Furthermore iii) how those virtual particular cash may be went through. Pro Guard further incorporates these offers utilizing a measurable classifier⁵. In this way that they could be all things considered used to separate between the individuals accounts controlled toward attackers and considerate ones. Of the best about our knowledge, this worth of effort speaks to the 1st exert to deliberately identify pernicious accounts utilized for web advancement movement investment. We bring assessed our framework utilizing information gathered starting with ten penny QQ, a heading Chinese web social system that employments An widely-accepted virtual cash (i. e., Q coin), with help internet money related exercises to a monster physique about 899 million dynamic accounts. Our test comes about need exhibited that Pro Guard could attain a high identification rate of 96.67% with a low false positive rate of 0.3%.

LITERATURE REVIEW

Detecting Clusters of Fake Accounts in Online Social Networks

Fake accounts are a favored implies to pernicious clients from claiming internet social networks on send spam, submit fraud, or overall ill-use those framework. A single pernicious performer might make handfuls on many fake accounts in place with scale their operation should range the most extreme number about real parts.

Identifying and taking movement around these accounts as rapidly as could reasonably be expected may be basic so as with secure real parts and administer those dependability of the system. However, whatever singular fake record might show up on make real once primary [6] inspection, for sample toward having areal-sounding name alternately an authentic profile.

Impact of Social Networking on Indian Youth

The objectives of this study are an attempt to investigate the extent of social networking impact on the Indian youth. The reason for selecting youth as the target audience is because the direction of a country and culture is decided by the direction taken by youths of that country. This paper is an attempt to analyze the pattern of social networking usage and impact in order to determine the social networking addiction⁷.

Off the 7.3 billion global population worldwide, social networking has 2.3 billion active clients which has seen a rise of 176 million just last year Social networking advertising earnings are estimate data \$8.3 billion in 2015 even as 385 organizations spent over 20% budget on social media channels which has been up by 15% compared to 2015. The increased use of social networking culture and social networking sites by youth has helped bring friends and family closer for those living in distant locations.

Towards detecting Compromised Accounts on Social Networks

Bargaining social organize accounts has turned into a gainful strategy for cybercriminals. By business account, attackers might share out their pernicious messages or spread fake data on an extensive client base. The affects about these episodes reach from a discolored notoriety will multi- billion dollar fiscal misfortunes looking into money related business sectors. On our past

work, we exhibited how we might identify extensive scale bargains of standard web social network clients.

Existing System

Since web social networks assume an expanding imperative part in both digital and benefits of the business world, identifying pernicious clients for OSNs gets to be about extraordinary vitality.

A number identification systems bring been hence suggested. Recognizing the popularity for spammers done OSNs, these techniques very nearly only concentrate on identifying accounts that send malicious content.

The Spamming attack could be viewed as a majority of the data stream initiated starting with an attacker, through an arrangement for pernicious accounts, Furthermore At long last should an exploited person account. In spite of those differences about these methods, they by and large power fractional or every last bit from claiming three wellsprings for detection containing.

- a. The spam message’s content.
- b. The social structure between victim accounts and malicious accounts.
- c. The network infrastructure, which hosts the malicious data.

Disadvantages of Existing System

Nevertheless, it confronts a noteworthy threat: attackers could manage an extensive number for accounts, whichever by bargaining existing accounts, to partake in the web advancement occasions to virtual money.

Proposed Method

In order to adequately identify pernicious accounts for web advancement exercises by overcoming those previously stated challenges, we have outlined a new system, to be specific Pro Guard.

Pro Guard utilizes an accumulation from claiming behavioral offers should profile a record that participates for an internet advancement occasion.

These features point with portray an account containing 3 parts.

- i. Its common usage profile.
- ii. How the virtual currency is consumed.
- iii. How an account gathers virtual currency.

Advantages of Proposed System

This work characterizes the first attempt to systematically detect malicious accounts utilize for online promotion activity participation.

System Design

System Architecture

System Design Introduction:

The system design document portrays the working environment, files and database design, framework and subsystem architecture, human- machine interfaces, framework requirements, input formats, yield layouts, detailed design, transforming logic, and outer interfaces.

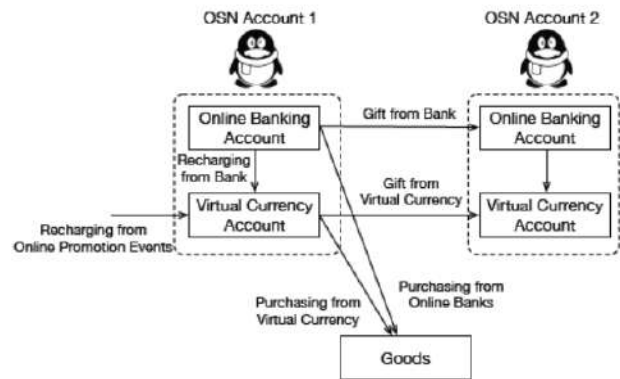

Figure.1. Architecture and Flow Diagram

UML (Unified Modeling Language) Diagrams

Global Use Case Diagrams:

Recognition of actors:

Actor: The Actor describes the part a client plays with respect to the framework. An actor interacts with, but has no control over the use cases.

Graphical representation:

An actor is something or someone that interrelates with the system

I. Gives input and receives data from the framework.

II. Is outside to the framework and has no control over the use cases.

Actors are identified by exploratory:

I. Who directly utilizes the framework?

II. Who is answerable for handling the framework?

III. Outside hardware utilized by the framework.

IV. Other frameworks, which require interacting with the framework.

Construction of use case diagrams:

The UML is a type of behavioral outline distinguished by a Use-case analysis. Its inspiration will be should display a graphical review of the purpose given toward an arrangement in terms of actors, their objectives (represented as use cases), and whatever dependencies the middle of the individuals use cases. The principle reason for existing of a use situation outline will be will hint at the thing that framework works is performed to which performer. The roles of the actors in the framework might a chance to be portrayed.

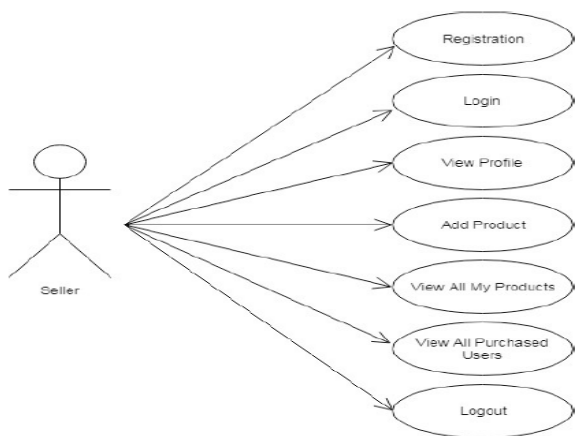

Figure.2. Seller Use case Diagram

Module Description

For detecting malicious accounts in social networks based on online promotion it has three modules to test them functionality:

1. Admin
2. Seller
3. User

Admin functionality

Admin play a main important role in this protect, admin detect malicious accounts in both seller and user. Once seller and user register for social network in order to get login into his account first admin should activate his account and authorize him.

When user and seller click shorthand three times the payment of product by using fake account then admin detect them as a malicious user and block the account.

Seller functionality

Seller is the second module after getting registration in social networks by participating in online promotion event, he should wait for admin until he activate his account and authorize him, next seller can send friends request to his friends by using online social networks he can share the product to user by using credit or debit card payment and by virtual payment if seller share the product by using virtual payment more than 3 times he is detecting as malicious user and block.

User functionality

User is the second module after getting registration in social networks by participating in online promotion event; he should wait for admin until he activate his account and authorize him. In this the user can add money in to his accounts, view product and purchase the product by using online payment. User doesn't have enough money in his account and even try to purchase the product more than three times and then user is detected as malicious user in social networks based on online promotions and user get block by the user.

System Testing

Testing (debugging system) is the greatest discriminating part of the computer programming triggers, without programming that works, the framework might never process a yield of which it might have been planned. Testing may be best performed when client improvement will be asked to help in detecting every last bit errors and bugs. The example information is utilized to testing. It will be not quantity however quality of the information utilized the matters of testing. Testing may be meant during guaranteeing that the framework might have been faultlessly and proficiently when carrying on with operation commands.

Testing objectives

The fundamental goal for testing may be to uncover a group for errors, efficiently and with minimum time and attempt. Expressing properly, we might say, testing is a transform about performing a project for purpose for discover an error.

- a. A successful test is uncovers an as yet undiscovered error.
- b. The test is insufficient to identify probably present errors.
- c. A good test case has possibility of discover an error, if it exists.
- d. The software less or more approves to the reliable standards and quality standards.

Level of Testing

Code testing

This inspects the rationale of the system. For instance, the rationale for updating different example information and with the test files and directories were tested and checked.

Specification Testing

Evaluating this specification testing with the system must do and how it must executed under different states.

Test Cases

Table.1. Test Cases

	TEST APPLIED	TEST CASE DESCRIPTION	ACTUAL VALUE	ANTICIPATED VALUE	RESULT
1	Unit	User Registration:	*ogin	*ogin +orm is	Pass

		and click on Register.			
		Values:			
		Username: ramya			
		Password : 1			
		Email:Ramya1@gamil.com			

Test situations for different circumstances and mixture of situations in the whole the modules are tested.

Unit testing

In the unit testing we test every module separately and incorporate with those generally framework. The Unit testing concentrates on confirmation attempts on the littlest unit of software outline in the module. This is also called as testing of module. The module of the framework may be tested independently. This testing may be conveyed out during programming stage itself. In the testing step each module is discovered to work adequately as respect to required yield from the module. There would a few acceptance checks for fields likewise. For instance, the acceptance check is accomplished for unstable the client input provided for by the client which legitimacy of the information entered. It will be simple to discover the error debut the framework.

System testing

Once the singular module testing will be concluded, modules would collect and coordinated to execute as a framework. The top down testing that started starting with upper level to lower level module, might have been conveyed out to check if the whole framework will be performing satisfactorily.

CONCLUSION

This manuscript displays a new system, Pro

Guard, to naturally identify malicious OSN accounts, which take part in online promotion events. Pro Guard leverages 3 types of characteristics containing virtual-currency collection, general behavior, and virtual-currency use. The experimental outcomes dependent upon labeled information gathered from Tencent QQ, a worldwide leading OSN company, have exhibited the identification accuracy of Pro Guard that has attained a high identification rate of 96.67% provided a greatly low false positive rate for 0.3%.

An Efficient Approach to Identify the Cybercrime through Big Data Analytics

K.V.K Sasikanth¹, M.V. Sangameshwar², SK Hussain², Sirisha S³, Manoj B²

¹Associate Professor, ²Assistant Professor, Department of CSE, ³Assistant Professor, Department of HBS, Godavari Institute of Engineering & Technology, Rajahmundry, A.P, India

ABSTRACT

Cybercrime is an important issue of research as it has been affecting many prevailing sectors such as defense, Social Media, Government, industries, Private, Military and Scientific etc. Crime reduction and prevention challenges in today's world are becoming increasingly complex and are in need of a new techniques that might control the vast amount of confidential data that is been produced through various sources. Organizations are progressively thinking about utilizing all encompassing, information driven prescient investigation and mechanization to help reveal digital security dangers, especially as offenders advance hacking strategies and assault all the more rapidly. Ongoing security and misrepresentation location are more basic than any time in recent memory since the developing recurrence and complexity of assaults has made continuous security administration much more confused and challenging. Cyber criminals are utilizing distorted or hacked data for their business picks up. The developing unpredictability of digital intrusions requires profound specialized aptitude and jurisdictional examinations to be explained. Huge information alongside data security is emerging the two difficulties and openings. Enormous information investigation is empowering organizations to break down voluminous measure of information they accumulate amid money related exchanges, any district particular information and even by giving advanced tools to fight against cybercrimes. Huge information apparatuses are being utilized to fight digital assaults. Big Data investigation is basically useful in distinguishing different cybercrimes including inward dangers, outer assaults and Modern malware assaults .Big data examination is exceptionally reasonable for breaking down and checking system therefore has a high shot of expanding the information burglary recognizable proof reasons considering pressure, big data is distinctly helpful and supportive in figuring out of prototype for labor and behavioral in addition to schmaltsy evaluation.

Keywords: Big Data analytics, cybercrime, q-radar structure, cyber intelligence, attacks.

INTRODUCTION

Many corporations does not care about pros and cons for managing cybercrimes, a number of them are manufactured goods primarily base corporations whereas others are answer carriers (mainly managing web based totally and desktop based application). The scenario turns into important whilst frequently many corporations cope with risks like data robbery along with hack of systems (not including moral hackers). Many industries at the moment are a day's shifting towards studying facts vulnerabilities and they are carrying out ordinary statistics audit, counting administration a report of usual audit. They are implement a variety of tools ¹ strategies as well as crew of exceedingly skilled expert

with a purpose to keep their statistics at ease ² Some organizations also are worried in my opinion meticulous in order (pii) with the intention of has a completely excessive and safe degree of subject protection structured by records data space to yourself law. Cybercrimes too consist of inside as well as outside coercion that needs to be manage by excessive quantities of statistics audit as well as firewalls otherwise safety primarily base software program.

Big data analytics in cyber crime

Present be a few instances in which big data analytics are good-looking bounty useful in figuring out a variety of cybercrimes which includes inner intimidation and

outside threats. Contemporary Malware attacks are the attacks which are primarily base on top of getting into a system and slowly stealing vital in order.

The model might exist of provide sequence safety big data analytics allows in identity of supplier via scan numerous facts ancestry including individual associates, examination altitude agreement (SLA), wholesaler organization systems (in favor of exploring a choice of amorphous data sources), plot information, as well as big data analysis be extremely appropriate in favor of analyzing in addition to scanning set of connections therefore have a far above the ground opportunity of growing the data robbery naming things³. Even as thinking about inner threats, huge facts is rather beneficial as well as supportive inside figuring out the blueprint of occupation in addition to behavioral because fine because maudlin evaluation of the workforce participants of an employer.

Overview of big data mechanism into hostility cyber crime

In attendance area lot of instances wherein big data will be useful inside hostility cyber-assaults as well as contravention of cyber legal guidelines; through the assistance of ill-defined and compound records analytics we will be able to without difficulty become aware of flaws and mistakes which will enhance the performance and capability of a business enterprise.

Banking profile frauds detection: profiling finding of intruder succeed for the reason that a few of the intruder (insider's risk) by no means take rotten go away intended for other than few days, this resources so as to now a deception couldn't exist hid inside a character dearth. Propagation of cellular devices: a lot of the far flung in addition to hand-held procedure be accessed inside private with throughout the majority of the business enterprise. The big data analysis could help in classifying staff through right to using their system travel in addition to moment in time period so as to an exacting member of staff before a person be using, this helps into detecting the performance of an member of staff into an association.

Social Networking frauds detection: The benefit of social network analysis for resisting fraud is gaining acceptance within a group of sectors, firstly in financial services, telecommunications and public organizations^{002E}Anti-money laundering^{4,5} identity

fraud, network fraud, denial of provider assaults and terrorist financing are some of the regions of fraud wherein SNA may be used to significantly enhance fraud detection.

Govt Sector – Defense , Govt , Police dept , military , Research Stations Servers Hacking: For government, cyber safety isn't most effective a task—it's a huge obstacle to lengthy-awaited digital transformation.

Plus, the stakes are sky-high: hacking public-quarter information may imperil national security as well as citizens' trust Possibilities of a cyber-attack through emails: Malware and phishing assaults like poisoned attachments (custom pdf exploits). Linking the outbound of a website (hyperlinks going out of a internet site) to malwares and malicious records set up of Trojans the usage of far flung access and fake software installations fake domain names like paypal.com (using Iand no longer L0029 hosted malicious software for cyber-attack [6] in an effort to increase a threat of a user getting access to a server and getting harmed.

Spear Phishing: This term is used to attack a specific group or community.

Architecture / Methodology

We propose Architecture for identifying and processing the social & confidential data that is traveling through networks which can be an input to cybercrime by deploying a method called Q-radar. The paper contributes the schema of Architecture and its modules that can resist the attacks.

Q Radar architecture

When plan or create Security QRadar deployment, it's helpful to have a good awareness of QRadar architecture to assess how QRadar components might function in network. Security QRadar collects, processes, aggregates, and stores network data in real time. QRadar uses the data to manage security of the network by giving real-time information, monitoring, alerts, offenses and responses to network attacks. Security QRadar SIEM (Security Information and Event Management) is a modular architecture that provides real-time visibility of IT infrastructure, which can use for threat detection and prioritization. We can scale QRadar to meet our log and flow collection, and analysis needs. We can add integrated modules to our QRadar platform, such as QRadar Risk Manager, QRadar Vulnerability Manager, and QRadar

Incident Forensics. The operation of the QRadar security intelligence platform that consists of three layers and applies to any QRadar deployment structure, regardless of its size and complexity. The following diagram shows the layers that make the QRadar architecture⁷.

Figure.1. Architecture of Q- Radar Modules

Data collection

Data collection is the first layer, where data such as events or flows is collected from network. The core functionality of q-radar siem is centered on occasion information collection, and float series. Occasion information represents activities that arise at a point in time inside the consumer's surroundings consisting of user logins, email, vpn connections, firewall denys, proxy connections, and any other events that you might need to log on your tool logs.

Flow data is network interest records or session information between two hosts on a community, which q-radar translates in to flow records. Q-radar translates or normalizes uncooked facts in to ip addresses, ports, byte and packet counts, and other information into device logs, which efficaciously represents a consultation among hosts [8]. Further to amassing float statistics with a flow collector, full packet seize is to be had with the q-radar incident forensics issue.

Data Processing

A fact processing after statistics collection, the second layer or information processing layer is where event data and flow data are run via the custom regulations engine (cre), which generates offenses and signals, after which the data is written to storage. Event data, and flow data may be processed by way of an all-in-one appliance without the need for including event processors or go with the flow processors.

If the processing capacity of the All-in-One appliance is exceeded, then you might need to add Event

Processors, Flow Processors or any other processing appliance to handle the additional requirements. We might also need more storage capacity, which can be handled by adding Data Nodes. Other features such as Q-Radar Risk Manager (QRM), QRadar Vulnerability Manager (QVM), or Q-Radar Incident Forensics collect different forms of data and provide more functions. The Q-Radar Risk Manager collects network infrastructure configuration, and offers a map to the network topology.

We can use the data to manage risk by simulating various network scenarios through altering configurations and implementing rules in your network. Use QRadar Vulnerability Manager to scan your network and process the error prone data or manage the error prone data that is collected from other scanners such as Nessus, and Rapid7. The erroneous data are collected to identify various security risks in network. Use QRadar Incident Forensics to execute in-depth forensic investigations, and replay full network sessions. Data searches in the third or top layer, data that is collected and processed by QRadar⁴ is available to users for searches, analysis, reporting, and alerts or offense investigation. Users can search & manage the security admin tasks for their network from the user interface on the QRadar Console.

In an all-in-one device, all data is gathered, processed, and stored on the all-in-one equipment. In distributed environments, the q-radar console the QRadar Console does not perform event and flow processing, or storage. Instead, the QRadar Console is used primarily as the user interface where users can use it for searches, reports, alerts, and investigations

Flow Control Module

The Q-radar Console manages the processing of data by two major components such as Event processor and flow processor which are integrated with data nodes in the network and collects the information about the components. These are again directed to log source which are connected with proxy servers via routers which can manage and analyze the incoming data. .
5.Solutions for restricting cyber attacks

Figure.2. Q Radar event and flow component

Solutions for restricting cyber attacks

Q-Radar security platforms

Some of the key equipment includes q radar protection systems that offer a complete platform and included method for combining genuine time correlation for non-stop invigilation and customized analytics (writing our very own customized hadoop jobs for form of analysis).

The conjunction of those technologies can assist in detecting strengthen patience threats and internal dangers and threats as properly. it has widened the scope of analysis and detection mechanism through analyzing a wider variety of different statistics such as domain name device transactional facts (the usage of apache spark), identity of social media information (click streams, like, shares, remarks and posts) either by way of using some gear like apache flume that at once connects to a information dumping mechanism like shifting the records from a stay stream to HDFS the usage of API and then.

q- radar works with established in addition to unstructured statistics and every now and then it is well suited with semi established data with these competencies, this tool is sufficient enough to identify the risks as well as flaw as well as in always providing a range pro incessant learning and closed loops. These answer in an included environment everyplace a person can split, monitor, travel around different potential amongst a variety of reports on safety and can divide up along with any manufactured goods (either apache Hadoop or any additional big data platform).

A number of the main capabilities of by Q radar are: that it always judge genuine time associations with irregular information discovery. These effects in high pace query to intelligence information and humanizing overall intelligence system structure.

Q Radar too provides a well explained with well defined front end instrument used for superior data hallucination and exploring other functionalities of big data systematics. It has access to a variety of areas of data like emails. Documents, filled small package capture of data, and commerce procedure data (BPD) so as to is often second-hand with a variety of business cleverness systems. It helps in depth analysis of forensic examination, thus helping to reduce the risk of data lost and infringement.

Q Radar Security Intelligence

QRadar safety cleverness is a firmly included answer so as to allow protecting organizations since intimidation as well as cyber security show aggressions. QRadar intelligence Analytics Engine eliminates sound by applying highly developed analytics to sequence many incident in somebody's company and classify safe keeping offense require accomplishment.

q-radar works with based in addition to unstructured records and from time to time it is like minded with semi based facts by means of these competencies, this tool is inadequate sufficient to discover the dangers and flaw and in continually offering a capacity for incessant mastering in addition to closed loops. These bring about an incorporated atmosphere in which someone can proportion, screen, discover distinctive possibilities amongst numerous reviews on safety measures and might percentage alongside either item for consumption (what's more apache hadoop or any other large statistics platform).

A number of the fundamental capabilities of by q radar are: that it continually do not forget actual time connections through uncharacteristic information discovery (behavioral evaluation where tools can discover typical disobediences and capability of servers which can be storing critical statistics like healthcare or insurance records). These consequences in excessive pace question to intelligence data and enhancing basic cleverness organization shape.

Q-radar also offers a well defined and properly defined front end device for better statistics apparition and explores other functionalities of huge records logicals. it has access to various domains of records like emails, vital files, complete packet capturing of statistics, and commercial enterprise technique facts (bpd) this is frequently second-hand by means of various enterprise cleverness structures. It enables inside deepness evaluation of forensics investigation, thus assisting to lessen the risk of statistics misplaced and infringement. Superior chance detection with q-radar feel analytics engine q-radar safety intelligence platform is uniquely motorized through the advanced ibm q-radar experience analytics engine. it allows to: find out low and gradual dangers in actual time –bring hidden signs of assault to the floor locate and prioritize weaknesses and dangers earlier than they're oppressed stumble on volatile person behavioral anomaly with the purpose of could be indicator of insider intimidation and fraud

Advanced threat detection with q-radar feel analytics engine

Q-radar security cleverness policy is exclusively motorized by way of the superior ibm q-radar sense analytics engine™. it enable you to: find out low and sluggish intimidation in real time – bringing hidden signs of assault to the outside locate and prioritize weakness and risklater than they may be browbeaten detect dangerous user behavioral anomaly that might be indicator of insider intimidation and scheme

Unified visibility-in a single platform

q-radar protection intelligence platform deploys lightning speedy as well as it consolidate insights-all in a unmarried display place: integrate with a lot of ibm and third partysolution collects billions of activities on premises or within the cloud in keeping with day unifies chance trackingsusceptibility and dangeorganization forensics and occurrence reaction.

The power to act – at scale

Q-radar safety cleverness platform permits safety measures professionals throughout corporations to collaboratively receive action: sensible occurrence prioritization and wide-ranging insights uses the power of danger cleverness and teamwork with IBM X-Force® and the IBM Security App Exchange.

Advantages

We could assure that via the proposed system, several threats can be without problems identified and eliminated the use of the q-radar mechanism. Further the data can be analyzed for gaining of knowledge and implementation of the result in to various applications. This process adds as an effective approach that can eradicate the cybercrimes.

CONCLUSION

This manuscript gives concerning how enormous information will be helpful in cyber-crime detection and more frequently it says over how the things could be figured and get not difficult when the investigation part turns into solid same time analyzing difficult datasets and assortment of information. It generally turns into an impulse to develop the methods, which could a chance to be embedded in order to avoid cyber-attacks and cybercrimes.

Intelligent Home Automation System Using GPRS A Smart Switch to Connect and Disconnect Electrical Devices at Home by Using Internet

Palle Rakesh¹, B.N. Srinivas²

¹PG Student, ²Asst. Professor, Department of Electronics and Communication Engineering, Marri Laxman Reddy Institute of Technology and Management, Dundigal, Hyderabad

ABSTRACT

The main aim the project is to establish a server for Remote Access Terminal using GPRS Enabled Embedded Server as main communication protocol from powerful microcontroller. LPC2148 (ARM7), GPRS Modem, Cell Phone which can support JAVA Application, Intelligent appliances. The rapidly advancing mobile communication technology and the decrease in costs make it Possible to incorporate mobile technology into home automation systems. In olden days we were not monitoring the Office and Home appliances by sitting at one place. We had controlled those appliances manually; it takes more time to for controlling. This is disadvantage here like time consuming. We can overcome the disadvantage of the existing method by Remote control via the Internet and it's a new feature and used in home automation systems. However, providing a mechanism for interaction between devices in this environment is quite challenging. The internet has been mostly used to connect personal computers so far, but shortly all kinds of appliances with embedded computers will exchange information over the Internet.

Keywords: Microcontroller, GSM/GPRS Module, Smart Phone, Wi-Fi.

INTRODUCTION

Today users of electricity to residential, have no way of knowing how much electric power consumed by each of their devices electrical connected to the network by the mere fact of being connected, even when not operating, making it difficult they can have control of energy consumption from their homes. Furthermore, most users spend too time away from home for its various activities, and nor has so connecting or disconnecting their devices electrical remotely during optimum periods of time, depending on the various applications of each apparatus electric. There have been cases in which the user forgets network disconnect any electrical device high power consumption, which is undesirable and even dangerous; and only return home until it disconnects adverse consequences. Or it may be the case that the user you are not sure you have disconnected any appliance you should not stay connected, and usually must return home immediately with the respective loss weather. a) Harnesses, b) Wireless. Based on these needs, work presents the developing a Smart Switch (SS), which is

a device capable of connecting or disconnecting any device remotely Power that is connected to the outlet at home¹ making use of internet. In this case, the SS acts as intermediary between electricity and the appliance. Furthermore, the proposed device can be controlled even without the use of internet, that is, if users do not have Internet can control the SS a locally within the building, using the local IP SS and using a computer, smart phone or tablet with access to the local network.

Existing Method

The rapidly advancing mobile communication technology and the decrease in costs make it Possible to incorporate mobile technology into home automation systems. In olden days we were not monitoring the Office and Home appliances by sitting at one place. We had controlled those appliances manually; it takes more time to for controlling. This is disadvantage here like time consuming ².

Proposed Method

We can overcome the disadvantage of the existing

method by Remote control via the Internet and it's a new feature and used in home automation systems. However, providing a mechanism for interaction between devices in this environment is quite challenging^{3,4} The internet has been mostly used to connect personal computers so far, but shortly all kinds of appliances with embedded computers will exchange information over the Internet. A massive no of microcontrollers are available in today's devices which can be linked to the Internet. If these intelligent appliances could be connected to the Internet at low cost, the way we control and manage their functions would change entirely.

Block Diagram

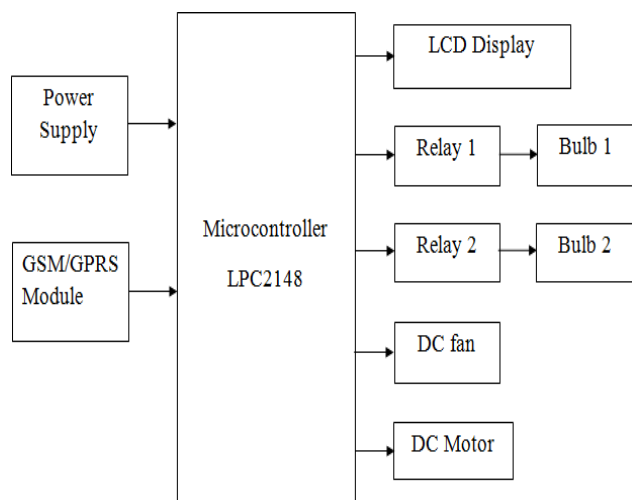

Fig.1. System block diagram

System Overview

Power Supply: This section is meant for supplying Power to all the sections mentioned above. It basically consists of a Transformer to step down the 230V ac to 9V ac followed by diodes. Here diodes are used to rectify the ac to dc. After rectification the obtained rippled dc is filtered using a capacitor Filter. A positive voltage regulator is used to regulate the obtained dc voltage.

Microcontroller: This section forms the control unit of the whole project. This section basically consists of a Microcontroller with its associated circuitry like Crystal with capacitors, Reset circuitry, Pull up resistors (if needed) and so on⁵ The Microcontroller forms the heart of the project because it controls the devices being interfaced and communicates with the devices according to the program being written.

GPRS/GSM: This section consists of a GPRS modem. The modem will communicate with microcontroller using serial communication. The modem

is interfaced to microcontroller using MAX 232, a serial driver. The Global Packet Radio Service is a TDMA based digital wireless network technology that is used for connecting directly to internet. GPRS⁵ module will help us to post data in the web page directly.

Relay Section: This section consists of an interfacing circuitry to switch ON / OFF the system whenever any unhealthy conditions i.e. overload is detected. This circuitry basically consists of a Relay, transistor and a protection diode. A relay is used to drive the 230V devices.

DC Motor: DC motor is an output for this project. And DC motor is connected to microcontroller. And this motor controlled by the microcontroller with the respective inputs given by us. Its speed will be varied according to the speed set by the switches.

DC Fan: Dc fan is the output section. Dc fan needs dc supply. So we can directly add the dc motor to micro controller with transistor logic

RESULTS

Figure.2. Hardware model of proposed system

Hardware model of proposed system is shown in fig(1). Here we used GSM/GPRS module to controller home appliances. The GSM/GPRS module is interface with the microcontroller. Microcontroller receive the signal from GPRS, according to command microcontroller will turn ON/OFF particular device.

Figure.3. Initialization of GPRS

Figure.4. GPRS connection successful

Figure.5. Command received from web server

CONCLUSION

This paper presented the development of a contactor Smart (Smart Switch) controlled via the Internet, for on-off control or a remote way Local electrical household devices connected to the network. In order to fill a need for energy savings security and power users level residential. The experimental results confirm the theory, feasibility and reliability of the card developed, which she performed in a prototype stage and is currently being leading to a commercial stage.

IoT based Advanced Health Care System Using Wireless Sensor Networks

G Sudhakar Reddy¹, P Sandhya²

¹M.Tech Student, ²Asst. Professor, Dept. of Electronics and Communication Engineering, Marri Laxman Reddy Institute of Technology and Management, Hyderabad, India

ABSTRACT

Healthcare industry need continuously been in the front position in the adoption and utilization of information and communication technologies (ICT) to the efficient healthcare organization and medication. Recent improvements over ICT and the emergence of the Internet of things (IoT) need to be opened up new avenues for exploration and investigation in every field including healthcare industry and medical. Hospitals have began utilizing the cell instruments for correspondence purpose and this plan internet of things (IoT) have been used and combined with Wi-Fi sensor node reminiscent of NFC tag, RFID, and small sensor nodes. The utilization of a cellular agent in healthcare process beneath wi-fi community location provides for an opportunity to investigate enhanced services to patients and staffs reminiscent of medicinal experts and nurses supplied for that of its mobility. In this paper novel strategy to use it IoT within the field of technical and cunning wellness mind are introduced. The standard part of the study exists over the separate healthcare methodologies utilized within those IoT, comparable to, wireless prosperity monitoring, E-healthcare, Age-friendly healthcare systems, U-healthcare. This paper depicts and proposes a successful healthcare observing framework and complete monitoring existence cycle designed by utilizing the RFID tags and IoT tags. The simulation outcomes in this paper indicate the robust yield against different therapeutic emergencies. In this system to get the veracious assessment results, weighing and supervising the health position of the patient and to build the power of IoT, the mixture of microcontroller among sensors is presented.

Keywords: *Microcontroller, RFID, IoT, Body Sensors, Wi-Fi.*

INTRODUCTION

The sensor network technology is the essential innovation utilized in the IOT-based health awareness checking framework¹. The human body capacities and including environment is monitor by utilizing the lightweight and low-powdered remote sensor hubs. The BSN hubs will proficiently look delicate (life-critical) the majority of the information. According to the recent overview, the number of aged human beings will suffer as of at most one long-lasting ailment, and the old persons can't be concerned about them. The body sensor hub helps to provide data over those healthcare benefits like medicinal information access and medicinal checking and communicate with the relatives and with the specialist in emergency circumstances through the SMS². The body sensor networks improve the quality of life.

IoT is the most significant correspondence in the 21st century. In the environment of IoT, objects of internet communication and computing capabilities like a microcontroller, transceivers for digital communication play a significant part in our regular life. IoT incorporates a vast amount sort sensors, which enable a huge amount for aged people to enjoy the current health awareness benefits anywhere, anytime. The smart gadget is used to assemble temperature, heartbeat, saline bottle level, and blood pressure, which would be used to assess the health condition of the patient^{1,3}.

In this system, we have the blood pressure, heartbeat, ECG, saline jug level, and temperature, would be monitored ultimately by utilizing ARM7 and is measured using specific sensors and it could be in the screen of the computer and will be monitoring anyplace in the globe utilizing internet hotspot. BSN care hub will gather information and store that information in

the processing in the local processing unit, and it sends to the database server. The power source and internet link should be in stable essential in exact working and once in a while observing physiology parameter of the body to keep away from danger. Since the sensor will be identifying or gathering the information once every 10 seconds and drives to the database server.

LITERATURE REVIEW

The sensor network is the main advantage for those developments of IOT in the health awareness system, over which a sick human being might build analyzed using a gathering of sensor light and light hubs. Nevertheless, the development of this new scheme carried to health awareness requisitions without respects to safety makes the security for patients defenseless. In this article, they firstly concentrate on the security prerequisite in the advanced health care BSN¹. The gadget will detect whether a patient is in confusion to the doctor and Rx associated with a computer outline graph for monitored physiological determination of the human body ⁴.

The individuals sensors used are pulse sensor, heartbeat sensor, temperature sensor. These sensors would be orchestrated on the human body that needs support assistance to monitor the health state without aggravating that routine life of the patient. The information will be sent to the physician server for the great extent wireless framework using GSM. The health checking framework holds the sensors, microcontroller, GSM modem LCD presentation on transmit or accept health-related data of the expert. Also, the same GSM modem will be utilized in the hospital.

Existing System

The enhancement in the body sensor system in the therapeutic services had arranged patient observing more effortlessly. Lately, numerous researcher and venture have been suggested in which have been suggested in which it gives nonstop patient observing in an open environment.

This existing framework will give a few well-known researchers in healthcare framework. Code blue^{6,7} is a healthcare scientific venture dependent upon BSN and might have been produced at Harvard sensor network lab. In this existing project, few sensors would orchestrate on the surface of the patient’s body that could sense the body and transmit the information wireless to the end

client. However, code blue’s creator recognizes the need for security for medicinal applications; however, security is still a significant issue in this venture. Alarmnet comprises about body sensor networks and naturally friendly sensor networks.

The objective for this object might have been to report the concerns prominent for convention regards wearable and implantable sensors for scattered portable screening. Despite NG et al. Proposed and indicated the widespread human services checking architecture, it might be for the more significant part predictable that without recognizing the security to wireless healthcare monitoring, which could make a crucial prerequisite to human benefits procurements Concerning illustration expressed towards legislature laws [8].

PROPOSED SYSTEM

In this paper, the suggested system utilizes the Lpc2148 controller as an entry to communicate with the different sensors similar to heartbeat sensor, temperature sensor, and saline jug level and sends the proof of the net page and then plot the sensor information in graphical facts. The data will make updated from the actualized framework, and the doctor could be accessible anyplace from the universe through the internet. Whether any sensor gets the abnormal condition, the message caution will be sends of the predefined mobile number.

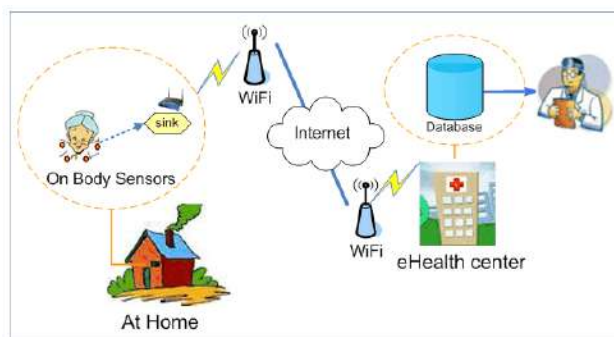

Figure 1: System Design Architecture

The security issue could be addressed by setting a secret key the client can only open the web page and can know the majority of the data in the discriminating circumstances through GSM, the information or the SMS caution will be sent to the predefined mobile number. The suggested framework deals with the patient health checking situations like MEMS accelerometer, temperature, heartbeat, and saline level with sensors and informs the information of the web server for plotting the sensor data in graphical facts. We might get

the information that is updated from the implemented framework and can be accessed through the web from anyplace in the universe, and if any sensors get the abnormal condition, then we will get SMS caution to predefine mobile number ⁷.

Heart Beat Sensor

The heartbeat sensor will be used to measure the heartbeat of the patient; it gives for the excellent yield for the heartbeat that focuses when finger might have a chance to be set on it. It Might need an opportunity to be diminished in size. The attempting voltage of heartbeat will be +5v dc. It meets desires on the statement, by the bloodstream through finger toward each pulse by using light regulation. The range of a heartbeat sensor varies between 60-100 beats for every moment. At the pulse, range exceeds 100 LED flash will get under condition towards providing for excellent yield straightforwardly to the microcontroller for measuring the beats per minute (BPM).

Temperature Sensor

The temperature sensor is an integrated data preparing, which will be used to measure temperature with a produce electrical energy linearly proportionate to the centigrade temperature. The LM35 sensor is a crucial positive component through a straight temperature sensor; concerning representation, the client need not intensify the transformation from claiming kelvin for centigrade.

The LM35 will be simply over, and it will be similarly used in the remote requisitions. Temperature might give a chance between the better parts by large measured parameter in the globe ^{9,11}.

There are two sorts about temperature sensors.

Non-contact temperature sensors: Non direct temperature sensor uses radiation and convection will screen temperature.

MEMS Accelerometer

Micro-Electro-Mechanical System (MEMS) described the type of units and techniques for manufacturing. This minor material has the range starting with 1-100 microns. MEMS gadgets are generally sorted under two types' sensors and actuators. Sensors gadgets assemble the majority of the data beginning with their

surroundings and actuators will execute the commands. Accelerometer measures acceleration by changing capacitance. The mass will be fixed, and the capacitor may be variable.

MEM is a complete system-on-chip innovation technology. The electrical procedure the information and mechanical acts on information. MEM will be a complete incorporated circuit part of a system. MEM is an observation and control capacity. MEMS method extensively utilized in numerous applications. MEMS is a kind of sensor that can sense the person's attempt and if there is an unpredictable movement like sinking down on the surface might be distinguished. The measured data could be sent through the SMS caution. MEM is acts as the main component that might sense or recognize man development and the difference in blood pressure. The MEMS will be the slight measurement and ultra-low power consumption because of this application it can also lead to developing in the telemedicine.

Figure 2: MEMS working Operations in System
Saline Bottle Level Monitoring

In our project, the infrared sensor will measure the saline level. The standard saline container will be of 1000ml. If the saline level is to the significant point, then the SMS caution will make send of the predefined mobile number. The nurse can come and change the saline container.

Internet of Things

The IoT will be a rising network of physical objects, which has a physical connectivity and correspondence through IP location between objects and internet enable gadgets¹.

Figure 3: Internet of Things

The suggested framework holds the ESP8266 may be the Wi-Fi module that may be used to associate with the server. So that the Wi-Fi system by IOT¹⁴ the information will be reads on the webpage. To make a simple TCP/IP connection utilizing Hayes-style commands Wi-Fi system is associated with a little module i.e microcontroller. The ESP8266 is an ESP8266 with 1 MB about inalienable flash, permitting on single-chip gadgets skilled of interfacing to Wi-Fi^{7,12}.

RESULT ANALYSIS

When the saline level achieves significant level then SMS caution will be send to the predefined mobile.

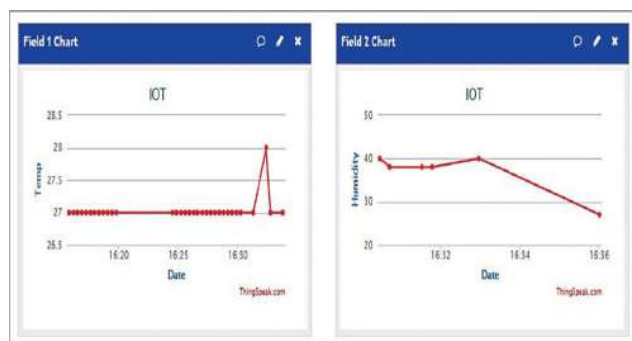

Figure 4: Temperature Sensor Graphical Representation

Figure 5: Heart Beat Sensor Graphical Representation

When the heartbeat will be in basic state i.e. The circled parts the SMS caution will be sent of the predefined mobile.

Figure 6: The heartbeat rate along with time will be sent to the web page.

CONCLUSION

In this article during basically, we must be delineated the security and the security issues in human services using a sensor system. Progressively we establish that despite the data that the huge majority of the known different medical sensors-based investigation tasks perceive the issues of the safety, and then they fizzled to drive in security services that might be preserved patient’s privacy.

ABSTRACT

In the 21st century everyone knows that technology has improved a lot from the past. Home Automation (HA) is a concept that has improved a lot and is an important one in daily life. HA controls the working of several home appliances like Air conditioner, home lighting, geysers, fans and all electrically controlled appliances. It also provides security and saves power being consumed by those electrical appliances. By using HA human efforts can be reduced and it also improves time utilization. Actual use of HA is to offer help for old aged and handicapped people by allowing them to monitor and to use appliances safely. The work done by the authors and presented in this paper suggests a prototype for designing of Home Automation using Global System for Mobile communication (GSM). As from the previous design, major problem faced by designers is cost of the HA. So, the proposed design in this paper uses a small scale processor viz., 8051 μ c. The model is dependent on the independent embedded system development board and GSM Module. Home Appliances have to be connected to the development board & these appliances are controlled by using our phones. Choosing the device with less cost is very important.

Keywords: GSM, CDMA, RPA, E.S. Development board, Mobile Phone.

INTRODUCTION

HA is the home automation, housework or any other home based work. It defined the system enabling user to remotely control objects present in your home. Thus, making your home environment smarter. Home automation may include control of electric devices like Air Conditioner, Water Motor, Micro Oven, Washing Machine and many more systems, for providing more comfort, easiness in usage, saving of energy and safety. The idea of HA is under review and development since a long time. A lot of models are proposed but almost all have failed because of cost of the device being high. But there is no solution to overcome from this problem. HA for disabled and aged can provide best quality of life. A remote interface may be provided to home appliances via mobile phone of any type that accepts SIM card ¹.

This paper will describe the prototype for controlling home appliances through Mobile Phones.

LITERATURE SURVEY

As we said prior that considering the past papers on home automation, at present there are no cost-effective frameworks. Many of the existing frameworks are complicated for usage, difficult to comprehend ² and difficult to use and maintain. Present frameworks are mostly exclusive, but not adaptable by users.

The design model describes about the HA using Bluetooth and PC. Failed due to lack of support for mobile phone.

DeepaliJavale explained a model that shows how home automation and System Security using ADK is implemented and it's working.

IzharRamliproposed an electrical gadget control framework which is web based. Be that as it may fizzled due to server issues.

Hasan developed a remote controlled device using PIC controller for controlling the devices through wired communication.

G Pradeep proposed home automation³ system by using Bluetooth with improvement in power utilization and time consumption.

Al-Ali and Al-Rousan presented a design which is Java based automation system through World Wide Web(WWW).

A low cost, easy to use Wi-Fi solution has been introduced by Piyare. R to the home automation.

Google and Microsoft entered the home automation domain in the year 2011. At 2011 I/O conference google announced that they are working to develop an operating system for home automation.

Microsoft also working on a project called Home OS,(an operating system for the Home Automation).

IMPLEMENTATION

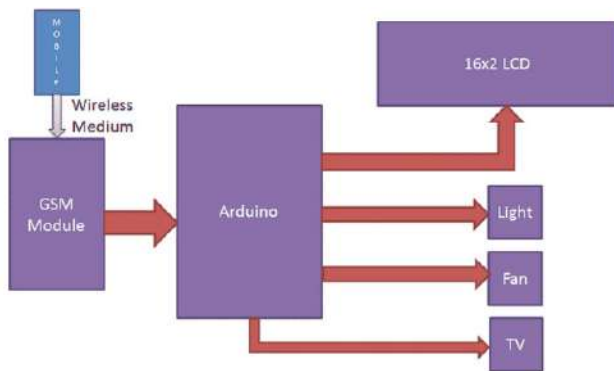

Fig. 1. Block Diagram proposed by system

Through this SIM card, client can correspond with the Development board from which the control signs will go to the obliged gadget⁴. GSM Module has a space to embed any system administrator SIM card. GSM modem is a very adaptable fitting for immediate and simple combination to RS232 applications.

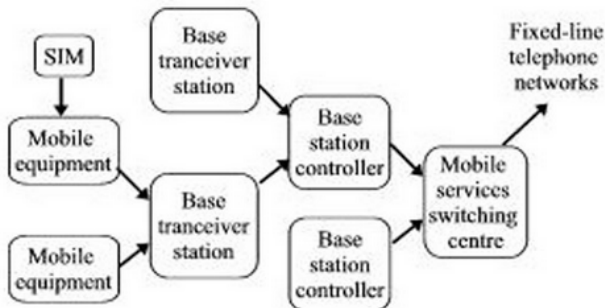

Fig. 2. Physical structure of GSM module

RS-232:

Generally, communication can be done in two ways: wired and wireless. Wired Communication means two or more devices share information through wires or cables. Wireless communication shares the information with the medium⁵ as air. Controller can communicate with the peripherals either serially or parallel.

In parallel communication all bits are send at a time. It is the advantage with parallel communication but it requires more data lines to send data. Where as in serial communication the bits are transferred one after the other so the throughput is less. But it require single line to transfer the data. One of the serial correspondence conventions is RS232. RS232 remains for recommended standard number 232. The RS-232c standard details a 25-pin “D” connector in which only 22 pins are used. Most of the pins are not required for ordinary PC correspondences, and surely, most new PCs are furnished with male D sort connectors having just 9 pins.

Line Driver:

In gadgets, a line driver is an intensifier used to enhance the quality of a simple or advanced sign at its source by driving the info to the transmission line with a higher than typical sign level. This expands the nature of a transmission over a long run of link. A sample of a line driver is an enhancer used to broaden the scope of a RS-232c advanced flag past 15 m (50ft) while keeping up a tagged bit slip degree.

We are using Line driver because the inputs and output voltage levels are not TTL (Transistor to Transistor Logic) friendly. In RS-232, a 1 is represented by -3 to -25V, while a 0 is +3 to +25V. But Microcontroller is TTL Compatible. In TTL bit 1 is represented by +5V and bit 0 is represented by 0V. So in order to convert RS-232 voltage level equal to TTL levels a Line Driver (MAX 232) is used.

8051 MC:

- 8-bit microcontroller
- 8-bit CPU, Reg A, Reg B
- 4 I/O ports(8-bit ports)
- 15-bit PC and Data Pointer (DPTR)
- 8-bit PSW
- 8-bit SP

- Internal ROM and EPROM (8751)
- Internal RAM of 256 bytes

It is 8-bit microcontroller, implies MC 8051 can Read, Write and Process 8 bit information. This is generally utilized as a part of the mechanical technology, in home machines like mp3 player, clothes washers, electronic iron and businesses.

MC 8051 has 128 byte Random Access Memory for information stockpiling. Irregular access memory is non unstable memory. Amid execution for putting away the information the RAM is utilized. RAM comprises of register banks, stack for brief information stockpiling. It likewise comprises of some uncommon capacity register (SFR) which are utilized for some particular reason like clock, info yield ports and so forth. Regularly microcontroller has 256 byte RAM in which 128 byte is utilized for client space which is regularly Register.

Relay IC:

Relay is an electro-mechanical equipment which uses an electromagnet to play between 2 contacts from an open position to a close position. The relay consumes very less power for its functionality; however the hand-off itself can be used for controlling any electrical or electronic machine. But these machines can consume more electrical energy.

The Electro-mechanical Relay is a yield gadget (actuator) which arrives in an entire host of shapes, sizes and outlines, has numerous uses and applications in the field of electronics. The transferred electrical energy is utilized to allow small electronic circuits to switch “ON” or “OFF”.

The outline and sorts of hand-off exchanging circuits is gigantic, however a lot of people for little electronic activities use transistors and MOSFETs as the essential exchanging gadgets. Because the transistor gives fast DC exchanging (ON-OFF) governor. Here is a little accumulation of a portion of the more normal methods for exchanging transfers.

WORKING

Before Discussing regarding working just look out how the routing is done between the components. Check the connections from the Controller because controller is the heart of the Circuit. As stated above 8051 MC

consists of 4 I/O ports each of 8 bit. Our devices to be controlled are connected to the Microcontroller through the Relay IC which in turn connected to the I/O ports of Microcontroller. GSM module is connected to the controller through serial communication and also through line driver. Serial Port of GSM module is connected to the RS-232 and the RS-232 is connected to the Port of line driver which in turn connected to the serial port of 8051 controller. The usages of all these devices are mentioned earlier.

When coming to working, after connected all the devices as per the block diagram shown above user inserts the network operator SIM card in the provided slot of GSM Module so that user can control the devices by sending the messages to that controller. The user sends the message to the SIM that “ON the Device 1”. Then the device GSM module sends the message that it had received to the microcontroller then microcontroller compares the message with the predefined message if the incoming message matches with any message that is stored in the microcontroller memory then it takes the action as per the user defined in the code like if the user treated the device one as fan then the controller reads the message “ON Device 1” then microcontroller gives the signal the relay that is connected to the fan then the relay connects the power cord so that power is given to the fan then the fan will rotate in this based on the user requirement the controller takes the action.

We can also implement door lock security using this system. By connecting the motor of the lock to the relay so that when the user wants to open the lock user sends the message like “Lock Open” the motor rotates and the door will be open. So by using this system we can provide security to the devices also.

In the similar manner if the user wants to switch off the working devices by sending the corresponding message that is defined by the user for that action. If the Message send from the Different user or the message send is not belongs to the predefined messages then the controller will not react to that message.

This is the Working of the prototype that we have designed.

APPLICATIONS

1. Emulating are the submissions of HA and Security System:

2. Medicinal caution/ tele assistance.
3. Accurate and harmless visually impaired governor.
4. Uncovering of spark, gas breaks & water spills.
5. Smolder locator can locate a flame or smolder ailment, bringing on all lights in the home to lopsided to alarm any individual of the home to the conceivable crisis.
6. The framework can demand the property holder on cell telephone to caution them, or demand the blaze office or alert observing organization⁵
7. Lighting control, it is conceivable to spare vitality at the point when periods of squandered vitality in private and business claims via auto on/off dainty at evening in all real town office structures, say afterward 10pm.
8. Governor and joining of safekeeping frameworks furthermore the latent for focal padlocking of all edge entryways & windows⁵
9. Safety cams can be monitored, permitting the client to watch movement everywhere a home or commercial from a Screen or dash board.
10. Safety frameworks can incorporate movement sensors that will locate any sort of unapproved development and tell the client over the safety framework or by means of PDA.
11. A radio framework permits correspondence by means of a mouthpiece and uproarious speaker bet

CONCLUSION

We can extend the above prototype by sending the acknowledgement to the user when the action is taken for example like "Fan is in ON state". Means we can provide a feature for sending acknowledge to the user by adding other peripherals.

Constraint to control just a few gadgets can be uprooted by broadening computerization of all additional home Machines. Safety cams can be monitored, permitting the client to watch action everywhere a house or commercial. Safety frameworks can incorporate movement sensors that identify any sort of unapproved development and advise the client. Extent of this task can be stretched to numerous territories by not confining to just home.

Multilingual Sentiment Analysis of Hinglish Tweets

Sukanya Ledalla¹, Tummala Sita Mahalakshmi²

¹Assistant Professor, Department of Information Technology, Gokaraju Rangaraju Institute of Engineering and Technology, JNTUH, Telangana, India, ²Professor, Department of Computer Science and Engineering, GITAM Institute of Technology, Andhra Pradesh, India

ABSTRACT

Sentiment Analysis has been looked into in an assortment of settings however in this paper, the attention is on supposition examination in Twitter, which represents its own one of kind difficulties, for example, the utilization of slang, shortenings, emojis, hashtags, and client notices. The 140-character limitation on the length of tweets can likewise prompt content that is troublesome notwithstanding for a human to decide its estimation. In particular, this investigation will dissect feeling examination of multilingual (U.S. English and Hindi dialect) Tweets. The present paper says that multilingual supposition investigation is more exact than conclusion examination in a solitary dialect (English or Hindi) while breaking down multilingual tweets. When all is said in done, as of now supposition investigation in multilingual tweets is done against an English word reference. For every one of the experiments in this paper' explore we will utilize the Python NLTK assessment bundle.

Keywords: multilingual sentiment analysis; Python NLTK; preprocessing; F-score; confusion matrix

INTRODUCTION

Sentiment Analysis (or opinion mining) refers to natural language processing and text analysis to identify polarity of the user's sentiment in a piece of text¹. The current paper says that by using a sentiment analysis system optimized for the analysis of Hinglish tweets, a more accurate sentiment classification will be achieved than if Hinglish tweets were preprocessed and classified using the same process as English tweets. Sentiment in Tweets can be invaluable to companies, politicians, and other organizations since it provides a medium for a large number of users to express their raw opinions and statements. Tweets can be used to gauge sentiment of stocks, products, movies, events, political representatives and much more. Twitter gives the world their own platform to speak their mind. Since tweets are limited to 140-characters most users use slang, abbreviations, emoticons, hashtags, and user mentions, which adds a challenge when compared to sentiment analysis in traditional text¹.

According to a study conducted by Pew Research, a Statistical Portrait of Hispanics in the United States², the Hispanic community makes up 17.3% of the United

States population in 2014. Recently more than ever large corporations are targeting the Hispanic-American community for sales. Companies like Toyota, Target, and Taco Bell among others are targeting multilingual speaking Hispanic-Americans in their ads. While most companies have a full Hindi language commercial on Hindi speaking television channels like Univision and Telemundo, not many have crossed into the multilingual realm, yet. Some companies have analyzed the data of this market share in the United States, and chose to target Americans that speak English and Hindi.

According to an article published by Motion Point, Companies Engaging Hispanics Win Big in the U.S. and Beyond³, in the United States Hispanics now represent a buying power of \$1.5 trillion. For Hispanic Americans both languages are part of their cultures. At home their family speaks Hindi, while other social interactions require English, so it is very common to speak both languages interchangeably. For most Hispanic Americans, the languages have become so intertwined that words have emerged from mixing words and suffixes from both languages. Sometimes particular words may be used more in one language than in another, so when a person is speaking in one language but never uses that

exact translation for the word in another language, they will just use both languages in one sentence as in the tweet below in figure 1.

Replying to @sankrant

matlab dono bhashaon ki dhajjiyaan udaana.
The girl just said I can't samjhofy what you're saying.

Translate Tweet

@FIRkeDaddu aaj raat bhar khulega baar is the....where are the keys to my car is the....#Hinglish

Figure.1. Tweet demonstrating the use of Hinglish on Twitter

This paper will present other research done in sentiment analysis and specifically research on sentiment analysis in tweets. It will present new sentiment analysis strategies and techniques, presenting further details regarding Hinglish as a language in sentiment analysis. Then the datasets, dictionaries, and sentiment analysis packages that are used to execute the three experiments are presented. The experiments will provide statistical analysis which will allow one to conclude and discuss the results relative to the current work says that Hinglish tweets will be more accurately classified when preprocessing and resources specific to the Hinglish language are applied.

Background Work

Over the past several years short informally written texts have become increasingly popular, whether they are tweets, SMS, or other micro blogging platforms. In 2008, just a couple of years after Twitter launched, Pang and Lee published a survey paper ⁴ on the topic of opinion mining and sentiment analysis where they discuss techniques and approaches to directly enable opinion-oriented information-seeking systems. Although the applications and datasets discussed are related to reviews, recommendations, business and government intelligence, and support of politicians or other public figures, these reviews and writings tend to be more formally written than the type of text is discussed in this paper. Nevertheless, Pang and Lee's paper has been famously referenced through research in the field of sentiment analysis. They take one through the main challenges also addressed (although in a relative manner to informally written short text) in papers written at a later date such as: Extracting documents pertaining to a relevant topic, extracting or identifying overall sentiment of the document, and classifying and presenting the

polarity of the sentiment identified in the document. They also address key concepts in classification and extraction which are also relevant in informally written short text such as classifying and extracting documents based on sentiment polarity while addressing negation, parts-of-speech, subjectivity, and topic relevance while building feature vectors or other representations.

More recently, there have been papers written which have analyzed sentiment analysis in Twitter as well as other informally written short text such as SMS and blog sentences. In the 2012 paper, If you are happy and you know it...tweet ⁵, the authors presented a cascaded classifier general framework for per-tweet processing (in contrast with batches of tweets which had been the usual form of processing the tweets). In 2009, the authors of Twitter sentiment classification using distant supervision⁶ specifically used tweets with emoticons and hashtags expressing sentiment for their training set and then used a test set that did not necessarily contain emoticons.

Preprocessing

The most involved part of sentiment analysis is preprocessing the data, especially in the case of sentiment analysis on tweets. Since tweets are limited to 140-characters in length and are written very informally extra care must be taken during preprocessing in an attempt to have the cleanest data possible. As part of the preprocessing the tweet is first tokenized. NLTK does provide a simple tokenizer but because of the extra punctuation, hashtags, mentions, emojis ⁷, and URLs often used in tweets the tokenizer included with NLTK performs sub-par. Python regular expressions were used to tokenize each tweet into words, emojis, urls, hashtags, and mentions. Using regular expression, made it possible to categorize the tokens into mentions, hashtags, emojis, and whether an emoji has positive or negative sentiment.

To further the preprocessing, the NLTK Snowball Stemmer package was used because it offers stemming in both English and Hindi. The flexibility to use the stemmer in both languages played a key role in the Hinglish Sentiment Analysis system. The list of stop words was constructed from the stop words corpus provided in NLTK. Preprocessing through the tokenized tweets, any words included in the NLTK English stop word corpus are excluded. Moving forward with this work one should further the preprocessing to pay closer

attention to elongated words (i.e. – “hellooooo”, “orrrrrale”), and after taking into account possible features of elongated words apply spelling normalization to those tokens. It would also be beneficial to apply the spelling normalization to slang or purposely misspelled words which are common in tweets or other informally written texts. As of the date of this writing, while there are some research papers written in this area there are no APIs available for this type of spelling normalization. Since the emergence of emoticons or emojis there has periodically been updates and releases of new emojis. Regular expressions for the classic emoticons were initially created, but most people on twitter are using newer emojis and in fact don't use the classic emoticons very often. The current emoji list consists of all positive and negative emoticons, along with some common sentiment indicating emojis such as ♥, that have been released as of the date of this writing. However, moving forward with this work each emoticon should be labeled in the complete emoji list for positive, negative, and neutral sentiment; along with all other emojis that may be indicative of sentiment.

Using Senti Word Net a synset was obtained, which provides a positive sentiment score and a negative sentiment score for each word. Using the sentiment score for each word we took the average of the score among all words in the tweet. If that average value is greater than zero it is considered a positive tweet score, and if it is less than zero it is considered a negative tweet score. All of the features are Boolean (True or False) values.

The feature set includes the following features:

- i. Has positive tweet score: Whether the average sentiment score for the tweet was greater than zero
- ii. Has negative tweet score: Whether the average sentiment score for the tweet was less than zero
- iii. Word count greater than six: Whether total number of words in the tweet is greater than six
- iv. Has adjective: Whether at least one of the words in the tweet that our POS- Tagger labeled as an adjective
- v. Has hashtag or mention: Whether the tweet contains a hashtag or mention
- vi. Has positive emoji: Whether the tweet contains a

positive emoticon

- vii. Has negative emoji: Whether the tweet contains a negative emoticon

Classification

The Natural Language Toolkit (NLTK), is a suite of libraries and programs for the Python programming language used for symbolic and statistical natural language processing. In this research, it was found that NLTK is the most commonly used library in programming for natural language processing. Since sentiment analysis has gained popularity among researchers and data scientists, so has NLTK because it has most of the functionality built-in that is required to construct a simple sentiment analysis system such as classification, tokenization, stemming, tagging, and more. Since the NLTK package is so widely used many of its modules have been developed further and now offer the same functionality for a limited number of non-English languages. NLTK also provides over 50 corpora and lexical resources. In the preprocessing of the data we used the NLTK stop 22 words corpus for English along with the English Snowball Stemmer provided by NLTK. NLTK SentiWordNet14 and the NLTK POS-Tagger was used in building the feature set. Then the features function was applied to build the training set, which was used to train the NLTK Naïve Bayes' classifier.

The sentiment analysis classification uses a simple Naïve Bayes' classifier¹⁵. The great thing about leveraging the Python's NLTK package is that there has been an extensive amount of develop to it as well as other modules and interface which can be used with it, such as scikit-learn¹⁶. Moving forward with this work, by importing the SKlearnClassifier one can easily extend the current system implemented, to train multiple classifiers such as Naïve Bayes', SVM, and Logistic Regression; with this a vote can be taken amongst the classifiers for the highest category (positive or negative). By using this voting method among classifiers available in these packages one could possibly improve our accuracy, reliability, and be able to provide a confidence score.

Dataset

The dataset of Hinglish tweets was acquired by using the Twitter streaming API with the python module tweepy. Tweets posted from within a GeoBox with

boundaries outlining the India streamed and collected. Then the dataset was filtered through the Hinglish Tweet algorithm so that the resulting dataset will consist of purely Hinglish tweets. The list of Hinglish tweets was separated, using the first 70% for training and the last 30% for testing. The Hinglish tweets which will be used for training were manually tagged for sentiment by three Hinglish speakers, the tweet receives a vote of two out of three to be labeled with that sentiment polarity classification. These tweets were tagged positive, negative, or neutral with the neutral tweets being thrown out to avoid a large imbalance.

Evaluation

Since these tweets consist of words from both the English and Hindi language, and may include words that are not found in either dictionary, using the current sentiment classification methods 7% of tweets could actually be misclassified. There may be words in a tweet

$$F - score = \frac{2 * precision * recall}{precision + recall} \quad (1)$$

$$confusion\ matrix = \begin{matrix} True\ Positive & False\ Negative \\ False\ Positive & True\ Negative \end{matrix} \quad (2)$$

expressing sentiment which are not actually part of the lexical dictionary that the words are being classified with. The F-score and accuracy of classification will be measured in each case, while also looking at the confusion matrix for each case and discuss the specificity as well as sensitivity. Then the F-score was calculated using the formula in equation 1 and confusion matrix with equation 2.

The Hinglish Sentiment Analysis System needed to pay much closer attention to the preprocessing so that it could adapt and extract features targeting our corpus. When a closer look was taken at the way many Hinglish words are constructed and the functionality of the NLTK Snowball Stemmer, and the Bing Translator, we found translating all words to English was necessary so that they can be mapped to a synset in Senti Word Net. However, if the word requesting to be translated to the English language is not found in the dictionary then it remains the same. Many Hinglish words are constructed from English verbs with the Hindi suffix appended to it. So, in the case of the Hinglish Sentiment Analysis System after translating all words to English, and stemming the words with the English Snowball Stemmer, we also apply the Hindi Snowball Stemmer

available through NLTK. By doing this one obtains the accurate English root word for many Hinglish verbs. For the examples given above applying the Hindi Snowball Stemmer returns us back: “mop”, “text”, and “check” respectively. Verbs can be indicative of sentiment (i.e. negative verbs: scream, push, hit and positive verbs: love, hug, kiss). In addition to these verbs, a small list of Hinglish words was built which many are indicative of expressing sentiment; these words are mapped to their English equivalent to ensure compatible feature sets.

Table .1. Confusion matrix

	1	0
1	150	14
0	51	26

Table .2. Results Statistics for Hinglish Sentiment Analysis of Hinglish Tweets

Accuracy	F-Score	Sensitivity	Specificity
77.43%	72.55%	90.54%	34.72%

CONCLUSION

In conclusion, this paper provided insight into the challenges, resources available, and possible approaches to building a sentiment analysis system for multilingual tweets. While it was found that about 7% of all tweets are written using words from both the English Dictionary and Hindi Dictionary. While 7% may not seem like much, since there are millions of tweets per day, this could account for a significant gap in data that is available from this rapidly growing consumer group. The preprocessing was tailored to the language we were basing our sentiment analysis system on, and the features were consistent across the board. After running the experiments on the Hinglish tweets, it was found that the Hinglish sentiment analysis system gave us the highest accuracy of 77.43%, and the best F-Score of 72.55%. It was observed that in the instances of misclassification for the Hinglish case, this was usually caused by erroneous Hindi stemming on entirely English words.

Further improvements to this work would invoke further preprocessing to better identify Hinglish words that are constructed from English root words and Hindi suffixes, so that the Hindi stemmer would only be applied to these words. Future work should also use the newest emoji library labeled for sentiment. Based on these scores it can be concluded that when performing

sentiment analysis on tweets, if the data will be used for consumer marketing and particularly if the organization wishes to understand and reach the Hispanic community, it would be beneficial for them to treat Hinglish tweets as their own language and perform specific preprocessing targeted for the language. Hinglish is just an example of one language which has emerged from combining two languages. The study of sentiment analysis currently faces a challenge in accurately classifying text in other languages. Techniques and strategies discussed in this writing can be expanded to further the study of sentiment analysis in multilingual text, and languages other than English.

An Efficient Technique for Energy Proficient Clustering based Routing for Packet Split and Merge in Wireless Sensor Networks

Chukka Santhaiah¹, N. Ramakrishnaiah², B Tejaswi³

¹Professor, Department of Computer Science and Engineering, Institute of Aeronautical Engineering, Hyderabad, TS, ²Professor, Department of Computer Science and Engineering, University College of Engineering, JNTUK, Kakinada, AP, ³Assistant Professor, Department of Computer Science and Engineering, Institute of Aeronautical Engineering, Hyderabad, TS

ABSTRACT

The primary intention of the paper work is to develop an energy proficient clustering algorithm for merging and splitting. Energy efficiency is the main issues in WSNs, because of battery that is available in WSN cannot be replaced or recharged. The proposed method is an efficient energy- self-organized model of clustering which uses merging as well splitting (EECSM). This algorithm performs merging and splitting for efficient energy in to clusters. Previous works show that balancing of the load is considered with distributed organized self manner. To eliminate the drawback of the existing work, the proposed system is used. EECSM will use energy state information related to sensor nodes for reducing consumption of energy and load maintenance and balancing. EECSM will prolong the life of the network by merging and splitting the clusters using cluster heads in a sensor network. The experimental results shows that EECSM will perform better in terms of the life of network, scalability, energy residual and robustness.

Keywords -clustering, lifecycle, wireless sensor network, self organization, distributed, monitoring

INTRODUCTION

Wireless Sensor Networks are defined as collection of nodes, the attractive research attention is based on its extensive range of applications in major areas like tracking of objects, detection of intrusion, monitoring of the environment, health applications and factory inventory management. In WSNs, the nodes are energy efficient such that they must be in topology control. Clustering is the most important unsupervised learning problem such that it deals with unlabeled data. Wireless Sensor Networks have a unique characteristic with the following constraints. At first, it is a collection of thousand of sensor nodes form a network based on certain topology. Therefore every WSN node posses several types of devices, which are based on constraints for processing and data storage capacity. Second, each

sensor node of wireless network posses a battery which cannot be replaced or recharge, so all the batteries have to be managed effectively to increase the lifespan of network and also minimize energy consumption in WSNs. A Loose definition of clustering states that objects are re-organized into groups to form members of similar clusters in an appropriate style¹. Cluster is defined as a group of similar objected grouped less than one and objects grouped under dissimilar belongs or grouped to another cluster.

The aim of clustering will determine the grouping intrinsic in an unlabeled set of data. Then we can decide about the good clustering. It has been noted that there is a absolute best criterion which will independently final the clustering aim in the network. As and then at the same time, usually there exists a huge number of sensor nodes in a WSN, the nodes gets the information to frame a topological network which results in need of clustering algorithms and also a need of appropriate cluster-sub in a local network topology based on partial information.

In WSN topology will be changing often based on changes which are done dynamically due to various reasons, including failure of battery, environmental destruction, node failure, change of sensor node location, WSN nodes will communicate via wireless link alternation signal though a power node control or by the factors of environment, this can also add a new node to the network which will enhance the accuracy of monitoring etc. WS networks should have the capability to adapt the variations and reconfiguration of the user task satisfactorily and dynamically. Likewise concerns in Sensor networks will acquisition the data regionally² other than node related data, and the control procedure topology of the existing will frustrate Based on energy constraints, node sensor will communicate frequently other system nodes with a distance limit. In order to communicate with sensors and other communication range devices to form a sensor multi-hop network communication. In cluster based Routing¹¹ that is done through clusters, a network that consists of a number of clusters³ where each cluster is possess a cluster head (CH) and a number of cluster members (CMs). As per the drawbacks of wireless sensor node, a clustering and routing method which is centralized is not efficient in WSNs. By availing these limitations, a distributed clustering and routing based method is tend to be used for WSNs. In distributed clustering and routing method⁴, every sensor node has the capability to reduce the energy consumption, by applying clustering while transmitting the data. Self-organization is a method for the establishment of networks as per necessity and is regarded as Self-organizing networks which are also known to be smaller & scalable networks. These arise from bottom-up interactions, and visualize being unlimited in size. Even though the clusters size to be adjusted and in to increase the energy efficiency, the general cluster-based routing protocols does not provide a proper clustering size as they use only related local neighborhood information⁵. Conversely, if the cluster size is small, the count is increased, reflecting the increase in number of CHs, which consumes high energy when compared with CMs.

RELATED WORKS

In this section, the pros and cons as well as performance are discussed and compared to the Clustering Techniques.

A. Leach: In the Energy efficient communication protocol for WSN, LEACH (Low-Energy Adaptive Clustering Hierarchy) was used by authors. These methods provide advantages such as Energy dissipation, Ease of design, System lifetime/nature of the system. This method provides Low-energy, Distributed protocol. The Low-Energy Adaptive⁶ Clustering Hierarchy (LEACH) protocol is also termed as self based cluster-based protocol. The LEACH chooses CHs by a randomized pivot, with a specific end goal to disseminate the vitality utilization of sensor hubs. Every sensor hub thinks about the edge $T(n)$ that has an arbitrary number, with a specific end goal to choose a CH.

B. Leach-ED: In LEACH-Energy Distance (LEACH-ED) is one more self based cluster-based protocol. The LEACH-ED chooses CHs based on two types of thresholds. To start with, the threshold is the difference between the residual energy of a sensor node, and the total current energy of all of the sensor nodes in the network. Second, the threshold is the division between the few which is not a separation edge; just a single hub turns into a CH. The LEACH-ED enhances the heap adjust and the system lifetime superior to does the LEACH⁷.

C. HEED: The Hybrid Energy-Efficient Distributed Clustering Approach (HEED) applies the techniques of clustering for energy efficiency. The HEED confines CHs with two constraints. The primary constraint is the energy that is residual for the sensor nodes. The other constraint is intra-cluster communication expenditure to unravel break-ties. The intra cluster communication expenditure are maximum & minimum degree cost along with Average minimum reach power (AMRP). The HEED increases the lifetime of network compared to LEACH mechanism.

D. Clustering Based Data⁸ Collection algorithm

The clustering-based data collection algorithm aims at the energy efficiency problem in clustering and predicting the future. This mechanism adopts dynamic dividing and combining clusters, which minimizes the communication cost. But, these clustering, dividing, and combining methods are used for AR model-based similarity attributes of CH and CMs.

PRELIMINARIES

The objective of work is based on efficient energy

organization of clustering using self organized model with splitting and merge model of network.

Objectives: The objective is for developing a self organized efficient energy analytical clustering model which splits and merges the packet for reducing consumption of energy in CMs and CHs based on auto adjustment of cluster size. As the cluster size is big, EECSM will divide the cluster into 2 or more if the cluster size is big, EECSM divides them to two clusters and if the cluster size is small then EECSM merges them.

Model of Network: During the transmission and receiving of packets, energy is consumed. In transmission of wireless data consumption of energy is related to the packet size and the distance between two nodes. Assuming initially those sensor nodes⁹ can identify the energy of its own. (i) data packet transmission : the sensor nodes will consumes a the circuitry transmitter and at amplifier. (ii) Data packet receiving : consumption of energy by the sensor nodes at receiver circuitry. (iii) A packet bit stream is transmitted from node to another sensor node, the distance between the nodes and the consumption of energy of the sensor nodes are given as. (iv) the packets are received to the sensor nodes.

ENERGY-EFFICIENT SELF-ORGANIZED CLUSTERING WITH SPLITTING AND MERGING

EECSM consists of 5 different considerations which uses local data information [4]. Initially first, node sensors which the most energy remaining from the neighbors will become the candidate node of CHs, since a lot of energy is consumed by CH. Second, the each node sensor, except CHs, will select the nearest CH, for reducing energy consumption in transmission data phase. Third, the clusters which has number of CMs and is less than the threshold of merging will merges into two or more clusters, this is due to minimize the energy transmission of consumption that the packets from CHs to BS. Fourth part, the clusters which have number of CMs and which is larger than the threshold of splitting is splitting into clusters of two, this is done for reducing the CH energy overheads. Fifth, this will prevent break age for CHs, backup-CH method will select a CH new which maximum the cluster energy in CH. The mechanism process of EECSM will focuses on clustering, dividing and combining. The EECSM consist of 3 phases and a Backup CH-Mechanism¹⁰ which regroups the clusters in WSN. The phase of cluster merging will decide to join

clusters or not.

Clustering Phase

This phase begins as and when the sensor node fields are scattered around the network and is completely after the phase of data transmission. This is the phase which will decide the new CHs to be formed from new clusters in WSN. To decrease the overhead of load in CHs, the EECSM will regulate the cluster size. The clustering phase will comprise into 4 steps i.e Level of broadcasting, dividing and choosing CH and its clustering.

A. Level of Broad casting.

Initially the sensor nodes field is set to zero and are scattered in the network, CH is not available. Then selection of CHs is done among the scattered nodes automatically. The EECSM then will use the energy to decide the next CHs and initial it as zero. Because all the CHs will be assigned with initial energy in the sensor nodes identically. i.e. CHs values in all the sensor nodes will be initialized as period zero.

B. Cluster Splitting Step: As and when clusters are configured, EECSM will consider and identify the related group of clusters. Initially EECSM [3] will divide a huge cluster to smaller clusters. The main drawback of bigger cluster is, it consumes larger consumption of energy from its CH.

A bottleneck process can occur at CH in a big cluster network, in a transmission step of the previous iteration of cluster, this is due to identify the no of clusters generated in the next step of clustering, EECSM will select next step process accordingly based on the threshold splitting value. If the no of CMs of a cluster is greater than the divisive threshold value, then EECSM will be executing the cluster splitting step. As a cluster is divided in to two CHs, they are recognized as the First and Second CH.

C. Level of CH Selection: The CMs present in a cluster value is less than divisive threshold value; the EECSM does not execute the divisive step. In this Level, the CH promotes one CH for the next round clustering which is identical to decide the First CH of the cluster splitting level.

B. Step of Re-clustering: This stage will execute the data that is stored in clustering level and after processing, the data that is stored at clustering level will be deleted.

Data Transmission Phase: After the completion of cluster merging phase. EECSM will now enter into the transmission of data phase, it will start to intimate the sensor field node the situation that may occur to the BS external, by the process of data gathering.

CM will create an information packet which embeds the environment and neighboring information for every slice of time and the packets are traversed to CH. Every CH will group them in receiving packets into packet data and will transmit packet data in to the BS which is repeated for every iteration.

A. Reelection CH Step: The reelection of CH step will be done immediately as there is a notification breakdown done by CM related to CH during the phase of data transmission. CM identifies the breakdown of CH of the nearest CM from CH. A broadcasting of energy signal is done by CMs twice in its range, for electing a CH new node.

B. Recovery of Cluster Step: The recovered CH will broad casts the signal to the whole of the network based on sensor field, because the new CH is not able to understand the cluster size exactly. The Cluster Method will decide the CH area not only for the existing clusters but also for the new CH cluster, based on the distance accordingly.

Experimental Results

We have demonstrated experiments using simulation tool, our proposed algorithm performs effectively and superiorly when compared to the existing algorithms. Advantages of EECSM algorithms can be seen more and more as described below

In this part, we show the experimental results of EECSM

- a) assuming the location of BS and sensor nodes as fixed
- b) Sensor nodes are deployed using random distribution
- c) The BS location is known before as 50m*50m related to field sensor. As the field of sensor is set to 10m for a broadcasting range.
- d) The packet signal size is 50 bits and packet data size is 1000 bits

- e) The initial energy for all the sensor nodes is 0.5 J
- f) Assuming that WSN nodes cannot be operated if the 30% of the nodes gets discharged.
- g) Assuming the number of sensor nodes are 100 in our experiment.

The figure below show the life time of network in EECSM is 167.9 % (as and when first sensor node gets discharged) and 23.5 % (when 30% of the nodes get discharged in WSN), longer will be the life of the network in HEED. This may be assumed that five considerations of EECSM is used for energy information and operation properly to increase the lifespan of a network.

Figure.1. Analysis of Performance in scalability based on lifetime of network

Figure 3, shows above the life time of network in EECSM, when the sensor nodes number is greater than 200, which has a longer life span of EECSM, as the number of nodes is equal to 100, from a minimum state of 11.67% to a maximum of 14.68%. Based on the increase of sensor node number.

CONCLUSION

Our paper proposes an efficient energy self-organized cluster model in WSNs. The model proposed will attempt in maximizing the life of the network and will maintain the load balance with the selection of CHs and by arranging the size of the clusters with the technique for the combination with an advantage of self organized protocols and cluster based routing protocols.

As EECSM use self-organized method, this has advanced features such as adaptability, distributed control, scalability and robustness. In variantly EECSM will choose a particular CHs based on its efficiency

in terms of energy, which can adjust the cluster and maintain its adjusted size, and further which can restore and damage the cluster of its own, based on its local information. Clustering with merging and splitting method has major interest in research. The basic research examples are auto decision methods of threshold merging and threshold splitting with information throughput, with neighbor localized information, ex: the no of neighbors, the actual state of neighbor and go on.

A Study on the Development of Machine Learning in Health Analysis

Suresh Kumar Mandala¹, Neelima Gurrapu¹, Mahipal Reddy Pulyala¹

¹Assistant professor, Vaagdevi College of Engineering, Warangal, India

ABSTRACT

Machine Learning (ML) provides methods, techniques, and tools that can help solving diagnostic and prognostic problems in a variety of medical domains. ML is being used for the analysis of the importance of clinical parameters and their combinations for prognosis, e.g. prediction of disease progression, extraction of medical knowledge for outcome research, therapy planning and support, and for the overall patient management. The Machine Learning field evolved by the extensive area of artificial-intelligence, which intends to mimic bright abilities of humans with machines. Machine Learning (ML) has evolved by the endeavour of computer enthusiasts harnessing the chance of computers learning how to play with matches, and also part of Math (Data) that infrequently believed computational processes, to a different research field which hasn't merely given the essential base for statistical-computational fundamentals of learning procedures, but additionally has generated various calculations which are regularly employed for text translation, pattern recognition, and many other industrial purposes and it has caused a individual research interest in data mining to determine hidden regularities or irregularities from societal statistics that growing by instant. This paper concentrates on explaining the Style and development of Machine Learning, a number of the most popular Machine Learning calculations and Attempt to compare the Well-known algorithms based on a few fundamental concepts.

Keywords: Medical diagnostic, Machine Learning, disease progression, extraction

INTRODUCTION

This Work provides the foundation for development of technology framework that makes easy to find all the relevant information regarding treatment and diseases. The tool that is built with the techniques such as Natural Language Processing (NLP) and Machine Learning (ML) has capability to find all relevant short text information regarding diseases and treatments. This work presents various Machine Learning (ML) and information for classifying short texts and relation between diseases and treatments. According to ML technique the information are shown in short texts when identifying relations between two entities such as diseases and treatment. Thus there is improvement in solutions when using a pipeline of two tasks (Hierarchical way of approaching). It is better to identify and remove the sentence that does not contain information relevant to disease or treatments. The remaining sentences can be classified according to the interest. It will be very complex to identify the exact solution if everything is done in one step by classifying

sentences based on interest and also including the sentences that do not provide relevant information.

Medical diagnostic reasoning is a very important application area of intelligent systems. In this framework, expert systems and model-based schemes provide mechanisms for the generation of hypotheses from patient data. For example, rules are extracted from the knowledge of experts to construct expert systems. Unfortunately, in many cases, experts may not know, or may not be able to formulate, what knowledge they actually use in solving their problems. Symbolic learning techniques (e.g. inductive learning by examples) are used to add learning, and knowledge management capabilities to expert systems^[5]: given a set of clinical cases that act as examples, learning in intelligent systems can be achieved using ML methods that are able to produce a systematic description of those clinical features that uniquely characterize the clinical conditions. Thus, knowledge can be expressed in the form of simple rules, or often as a decision tree. A classic example of this type

of system is KARDIO, which was developed to interpret ECGs ^[7].

The Machine Learning field evolved by the extensive area of artificial-intelligence, which intends to mimic bright abilities of humans with machines. In the industry of Machine Learning one believes the major matter of just how exactly to make machines capable of "master". Learning in this context is called inductive inference, at which a person finds cases that reflect imperfect information regarding a few "statistical happening". Back in unsupervised learning typically attempts to detect concealed regularities (e.g. clusters) or even to find anomalies from the information (as an example some odd machine work or perhaps a system intrusion). Back in supervised learning, there's a tag related to each case in point. It's assumed to function as the reply to a problem about this example. Depending on these cases (like labels), you is very interested to call the clear answer for some other cases before they're observed. Thus, learning is Not Just a matter of recalling but also of generalization to hidden instances.

Supervised Classification

An important thing in Machine Learning is classification, also known as pattern recognition, where a person tries to construct algorithms capable of mechanically constructing options for differentiating between different exemplars, dependent in their own differentiating patterns.

^[1] clarified a blueprint as "the alternative of insanity; it really is a thing, vaguely explained, which might possibly be provided with a name" Cases of patterns include individual faces, text records, hand written words or letters, EEG signs, and also the DNA sequences which can result in a specific disorder. The building of this mapping is predicated on so called training data supplied into this classification algorithm. The intent would be to accurately predict the right tag on hidden data.

These would be the characteristics of those cases for any particular problem. For example, at a facial recognition task several features might possibly be the colour of their eyes and also the exact distance between your eyes. Ergo, the input into some pattern recognition task might be regarded a two-way matrix, whose axes are the examples and also the features.

Pattern classification jobs are frequently split in to

many sub-tasks:

Data collection and representation.

Feature selection and/or feature reduction.

Classification.

Data representation and collection are for the most part problem-specific. It is therefore hard to offer general statements concerning it measure of this practice. In broad terms, an individual ought to make an effort to discover invariant options, which describe the gaps in classes as much as you possibly can. Feature selection and feature decrease try to decrease the dimensionality (i.e. The amount of features) for the rest of the steps of this endeavor. At length, the classification phase of the practice finds out the true mapping between labels and patterns (or goals). In most applications the next measure isn't crucial or will be implicitly performed from the next measure. The only real focus of the field will be automatic learning procedures. Learning describes alteration or advancement of algorithm according to previous "adventures" mechanically with No external support from individual.

DATA MINING, ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING

In practise, these 3 areas are therefore intertwined and overlapping it is nearly to draw out a border or hierarchy one of the three. To place it into different words, these 3 disciplines are symbiotically connected along with also a blend of those approaches might be applied as a strategy to create more sensitive and efficient outputs.

Practically, data-mining is ostensibly about distributing any type of information, however it lays the base for the artificial intelligence and machine learning. In training, it not merely sample information from various origins nonetheless nevertheless, it investigations and comprehends routine and correlations that is present from those information that will have been difficult to translate by hand. Thus, data mining isn't really a only procedure to establish a theory however procedure for drawing on relevant hypotheses. That Storing data as well as the corresponding routines and hypotheses might be properly used precisely the cornerstone for both machine learning and artificial intelligence.

Artificial intelligence might be widely understood

to be machines people with the capacity to address a specified problem by themselves with no human intervention. The solutions aren't programmed right in to the machine however, also the vital data and also the AI translating that info generate an answer on it's own. The interpretation which goes under is only a data mining algorithm.

Classification Algorithms

EventhoughMachineLearningisstillacomparatively young area of research, there exist even more learning calculations than that I could cite in this launch. I opted to clarify six techniques I am often using when resolving data analysis activities (usually classification). The first 4 techniques are all conventional methods which have now been widely utilized previously and work pretty well when assessing low dimensional datasets without overly little branded training cases. At the 2nd part I shall briefly outline two techniques (Support Vector Machines & Boosting) who have gotten a great deal of attention at the Machine Learning network recently. They Can Fix high-dimensional Troubles with Hardly Any cases (e.g. fifty) rather accurately and work effectively when cases are plentiful (for example a few hundred thousands of illustrations).

Traditional Techniques

k-Nearest Neighbor Classification Arguably the easiest way could be that the k-Nearest Neighbor classifier^[3]. Here the k points of it data nearest to this evaluation point are present, and also a tag is supplied to the evaluation point by way of a vast majority vote between your k points. This System is highly instinctive and accomplishes -- provided its own simplicity remarkably reduced classification mistakes, but it is computationally expensive and needs a large memory to store the instruction information.

Linear Discriminant Analysis Assessing a hyperplane in the input space that min- imizes the within-class variance and maximizes the gap between class space ^[5]. It might be effectively calculated from the terminal case despite large data collections. How often a linear separation isn't adequate. Non Linear extensions using kernels exist ^[6], respectively nevertheless, Which Makes It Hard to use it into issues using large training places.

Decision Trees Still another instinctive category

of classification algorithms would be decision trees. These calculations solve the classification problem by partitioning the input distance, whilst to create a tree whose nodes are equally as pristine as you can (that is they feature points of one class). String of a brand new evaluation point is reached by moving throughout over the branches of this shrub, start- ing out of the main node, before a terminal node is reached. Decision trees are easy yet effective classification strategies for small datasets.

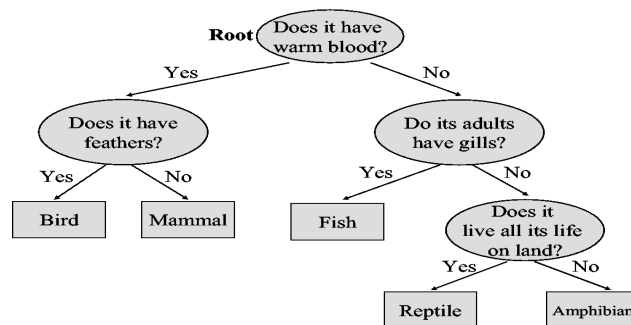

Figure 1: decision tree example

Neural Networks are may be among the very frequently used approaches to portray. Neural networks really are a computational version motivated by the connectivity of neurons at animate nervous Processes.

Figure 2: neural network schematic diagram

CATEGORISATION OF ML ALGORITHMS

An overwhelming quantity of m l algorithm are introduced and designed past decades. Perhaps not everybody are well regarded. Many of these failed to meet or solve the issue, therefore still another premiered in its own place. Here the calculations are widely grouped into two different classes and those 2 classes are farther sub divided. This segment attempt to mention hottest ML calculations and Another segment contrasts three hottest ML calculations.

GROUP BY LEARNING STYLE

1. A function or perhaps a classifier is trained and built to predict the tag of evaluation data. The classifier is suitably trained (parameter values have been corrected

)to attain a suitable degree of accuracy.

2. A classifier is devised with deducing existing patterns or audience in the practice data sets.

3. Semi-supervised learning -- Coaching data set comprises both branded and unlabeled data. The classifier is train to know about the routines to categorize and tag the data and to predict.

4. Reinforcement learning The plan is trained to map activity to situation therefore the feedback or reward indication is maximized. Even the classifier isn't programmed directly to pick the activity, but as an alternative coached to find the most rewarding activities through learning from mistakes.

5. Transduction -- Although it shares similar characteristics using supervise learning, however it doesn't develop an explicit classifier. It attempts to predict that the outcome based on training data, training tag, and test data.

ALGORITHMS GROUPED BY SIMILARITY

Regression Algorithms

Regression analysis a section of predictive analytics and also exploits the co relation between determined (target) and also independent factors . The noteworthy regression versions are:Linear Regression, Logistic Regression, Stepwise Regression, Ordinary Least Squares Regression (OLSR), Multivariate Adaptive Regression Splines (MARS), Locally Estimated Scatter Plot Smoothing (LOESS) and so on.

Regularization Algorithm

Regularization is just the practice of counter-acting over fitting or abate the outliers. Regularization is no more than an easy yet strong modification that's fortified with additional existing ML models an average of Regressive Models. It divides upward the regression line by castigating any bent of this curve which attempts to complement with the outliers. Cases:Ridge Regression, Least Absolute Shrinkage and Selection Operator (LASSO), Elastic Net, Least-Angle Regression (LARS) and so on.

Support Vector Machine (SVM)

SVM is really popular that a ML technique that it may be a set of its own. It uses a separating hyperplane

or even a decision plane to demarcate decision bounds among a set of data points classified with different labels. It's a strictly supervised classification algorithm. In other words, the algorithm develops the optimal hyperplane using input data or training data which alternative plane in turns categories new instances. Based on the kernel Used, SVM can do both linear and nonlinear classification.

Clustering Algorithms

Clustering can be involved about having ingrained pattern in data sets to categorize and tag the data accordingly.Examples:k means, K-Medians, Affinity Propagation, Spectral Clustering, Ward hierarchical clustering, Agglomerate clustering. DBSCAN, Gaussian Mixtures, Birch, Mean-shift, Expectation Maximization (EM) and so on.

Artificial Neural Network (ANN) Algorithms

A version on the basis of the operations and built of neural networks of humans or animals. ANNs are considered as non linear models as it attempts to detect complex connections between input signal and output numbers. Nonetheless, it brings sample out of data as opposed to considering the whole collection and thereby reducing time and cost. Cases: Perceptron, Back-Propagation, Hop-field Network, Radial Basis Function Network (RBFN) and so on.

Deep Learning Algorithms

All these are somewhat more modernized variants of ANNs that capitalize to the profuse way to obtain data to day. They truly are utilizes larger neural networks to fix semi-supervised issues where major part of an abound data is unlabeled or maybe classified. Cases: Deep Boltzmann Machine (DBM), Deep Belief Networks (DBN), Convolutional Neural Network (CNN), Stacked Auto Encoders and so on.

APPLICATIONS

SPEECH RECOGNITION

All present speech recognition systems offered on the industry utilize machine learning approaches to prepare the machine to get much better accuracy. In practise, many of such programs execute learning two different phases: pre-shipping speaker- independent coaching and post-shipping speaker-dependent instruction.

COMPUTER VISION

Vast majority of recent vision approaches, e.g., facial-recognition programs, systems with the capacity of automatic discovering microscopic pictures of cells, implement machine learning procedures for much better accuracy. By Way of Example, the US Postoffice Utilizes a computer vision program using a design analyser so trained to form characters together with handwritten addresses mechanically using an precision level as Large as 85 percent.

BIO-SURVEILLANCE

Several government efforts to track probable outbreaks of diseases uses ML algorithms. Consider the RODS job in western Pennsylvania. This project assembles admissions reports to emergency areas at the hospitals and the an m l computer software process is trained with the profiles of patients as a way to detect aberrant outward symptoms, their own routines and areal supply. Research is ongoing to add several extra data inside the body, such as over-the- counter drugs' order history to provide greater training data. Complexity of the kind of complicated and dynamic information collections could be handled effectively using automated learning approaches just.

EMPIRICAL SCIENCE EXPERIMENTS

A massive group data-intensive science areas utilize ML techniques in many it investigates. As an instance, m l is being used in school, to determine odd heavenly objects in astronomy, also in Neuroscience and emotional analysis. The other small-scale nonetheless essential use of ML involves spam-filtering, fraud detection, topic identification and predictive analytics (e.g., weather prediction, currency markets forecast, market poll etc..).

CONCLUSION

From the circumstance of ML, the efficacy with which a procedure utilizes data tools that's also a vital performance paradigm together with space and time

complexity. Greater precision of forecast and also interpreted prediction rules may also be of utmost importance. Being fully qualitative and obtaining the capacity to test a great number of information in smaller periods of period, m l algorithms comes with a border over manual or guide programming. And they're frequently more accurate and more unlikely to individual prejudice. Customization of a program in line with this surroundings it's set up to. Consider, address recognition software's which must be customized according to the needs of this client.

Error of Judgment and Vicarious Liability of the Hospitals in case of Medical Negligence in India

Navin Kumar Koodamara¹, Santhosh Kumar A²

¹Assistant Professor-Senior Grade, School of Management, Manipal Academy of Higher Education (MAHE), Manipal, ²Assistant Professor, SDM Law College, Centre for PG Studies & Research in Law, Mangaluru

ABSTRACT

In India, recently, there is a spurt in the litigation against the medical professionals as a result of increasing awareness about patient's right especially after the Consumer Protection Act, 1986. When medical professionals breaches the legal duty of care which he requires to take, he is said to be medically negligent if it causes damage to the patient which gives a right to the patient or patient party as a consumer to claim for the compensation or to file a criminal case. The purpose of this paper to explain the liability of hospitals for the negligence of the doctors appointed by them under the principle of vicarious liability principle. The decision of the Indian courts in majority of cases revealed that the master is liable for the act of its servant both in case of contract of service and contract for service. This article also attempts to describe whether doctor is liable for the medical negligence when there is an error of judgment.

Keywords: Consumer Protection Act, 1986; Litigation; Medical Negligence; Vicarious Liability.

INTRODUCTION

Error of judgment is a mental mistake where doctor makes mistake treating patients which is called as wrong diagnosis. The physician always take a defense that, medicine is so complex area where no standard can be set to judge the doctors and we cannot make them liable. It is interesting to observe the defense taken by the defendants in a case *Passarellovs. Grumbine*¹ that the doctors should use clinical judgment and there is no strict guidelines to practice medicine where he cannot guarantee the outcomes because the treatment of patient differs between individual. It is impossible burden requiring doctors to be perfect. Yes off course we cannot expect guaranteed outcome from the physician. This is because in a medical negligence it is not important whether the doctor is careless used judgment, perfect outcomes or whether judgment used is reasonable but it is important to see whether the physician followed standard of care expected from physician. The physicians are not liable when there is an errors of judgment provided the error of judgment should not be as a result of his negligence. There may be error within the boundary of standard of care and in many cases there may be error as a result of negligence².

Indian Context

The Indian case with respect to error of judgment is *KamanisharmavsPamposh Medical Care Centre*³ where complainant MsKamani filed a complaint against the doctor of Pamposh Medical Care Centre for wrong diagnosis where they diagnosed a case of tuberculosis which was later found in the Rajiv Gandhi Cancer Hospital and Sir Gangaram Hospital be the advanced case of lung cancer. The patient in the Sir Ganga Ram hospital died in the year 2000 where he was treated 'underwent' biopsy. The complainant (his wife) argued that there was a wrong diagnosis made by the doctor at Pamposh Medical Care Centre where the patient condition become critical and died within the short span of time and she claimed compensation to the tune of 65 lakh for the deficiency in service. The bench dismissed the petition on the ground it is a case of 'error of judgment' and not the medical judgment where court also observed that the patient did not approached doctor in the hospital for eight months. The bench also observed that the patient was a drug addict and smoker where he received anti-tubercular therapy earlier. The commission ruled that it is a case of error of judgment where physician failed to diagnose it as a cancer at the

initial period of examination and there was negligence on the part of patient since he never approached doctor for 8 months for which doctor cannot be made liable⁴.

Vicarious Liability of the Hospitals

Where there is a medical negligence, the liability of hospitals may be direct or vicarious. The hospitals directly liable in a case of death or injury as a result of poor maintenance of hospitals, incompetent staff, misleading advertisement or other unfair trade practice, poor maintenance of records of medical treatment. Further, hospital is liable not only under the above case but also in a case where employees acts or omissions under the principle of respondent superior. It is borrowed from the legal maxim ``quasi facit per alium facit per se`` which means one who act through another will be treated as the act done by himself⁵.

The vicarious liability principle is under the doctrine of respondent superior which implies that a person is liable for the tort committed by another person. Under this principle an employer is liable for the tortious act of employees provided if he act within the scope of employment. The following conditions must be satisfied to apply vicarious liability principle-

The act must have happened within the limits (time and space) authorized to employee.

Either partially or fully the motivation for the employee to do certain act to serve the purpose of employer.

The act must be such for which the employee has been hired to perform.

Contract of Service and Contract for Service

It must be noted that, an employer will be liable only when an employee act within the scope of his employment. For example, a person employed as a driver of truck which struck pedestrian who got injured severely. We must analyze this under two different situation. First, if driver driving a car from his office site to factory, the employer is liable for the act committed by his employee. Secondly, however, if a driver taking his vehicle from office site to do his personal work, for instance to purchase movie ticket for himself, the employer may not be liable for such act. Further, employer is not liable for the act committed by independent contractor who carries work for another

and who is not subject to others control. It is difficult to establish the vicarious liability of employer because of inconsistency in classifying employees and variety of employment relationship. It is the court who examine the nature of relationship between the parties, not the parties themselves. To examine the relationship the court developed various test such as control test, integration test and multiple test.

The earlier test to read this issue was control test where it was important to see whether master had right to control the work what has done. Here, control over the work means not only what work he does but also includes the way in which he does that work. It means it is the employee who state or dictate the work policy. However, some says that, this is inappropriate in cases like borrowed workers and even some of the top courts in the US recognized that single test is not enough to determine the employment status. In a case Ready Mixed Concrete vs. Minister of Pensions, the court developed multiple test where it emphasized that all factors in the employment relationship status should be considered since there is no conclusive or definite test⁶.

The multiple test includes analysis of various factors with respect to employment status which recognizes that each and every point is important see the employment relationship and no single point to be considered as determinative factor. At the same time it is important to categorize employment as self-employment (contract for service) or employment (contract of service). In the case of contract of service three conditions must be satisfied. They are:

The skills and knowledge provided should be in return or exchange with wages.

The employer must have control over the work and the way he does that work.

The provisions of the contract of service must be in consistent with the control of service.

Contract of Service and Contract for Service in case of Medical Negligence

The degree of control can be determined by way of power to appoint and dismiss, payment of wages etc. who owns the materials or tools used in the work, who has paid for such tools or materials which is relevant to the contract of service. However, in the number cases court

held in the case of hospitals, it is responsible not only for its staff but also for the act of independent contracts such as anesthetists, special surgeon who handle special case⁷.

In a case *Aparna Dutta vs. Apollo Hospitals Enterprises Ltd.*,⁸ the court held that the hospital cannot take a defense that doctors are not employed as servant by them. Whatever the conditions under which the hospital employ a doctor is between them. The hospital is liable to the third party. The hospital cannot escape from the liability by claiming there is no master-servant relationship. It was also held in the case *Smt. Rekha Gupta vs. Bombay Hospital Trust & Another* (2002) that hospital is liable for the misconduct on the part of consultant doctor. The hospital cannot escape from the liability by stating they only provide supporting staff and infrastructure facilities. Whatever the outcomes of the case the hospital is not allowed to escape from its liability. The court ruled that hospital or employer is liable for the acts of doctors like anesthetists and surgeons who act independently who agreed for the treatment. It is not important whether the doctors are resident, permanent, visiting, temporary or part time. It is based on the logic that the act performed by the consultant is deemed to be the service provided by the hospitals.

CONCLUSION

The principle of respondent superior implies that one who act through another will be treated as the act done by himself which is applicable even to the hospitals when there is a negligence of its doctors. Thus hospital is legal liable for the death or injury as a result of negligence of doctors or nursing staff appointed by them. The medical professionals are allowed to take a defense that medicine is so complex where no standard can be set to judge the doctors and one cannot make them liable when there is an error of judgment.

Vitamin D Deficiency and First Trimester Miscarriage A Case Control Study

Shaymaa Abd. Hassan

Lecturer Department of Gynecology and Obstetrics, College of Medicine, Al- Iraqia University, Baghdad, Iraq

ABSTRACT

Background: Miscarriage is the most common negative outcome of pregnancy, and identification of modifiable risk factors is potentially of great importance for public health¹. Vitamin D3 deficiency in pregnancy have been associated with some adverse pregnancy outcomes². Miscarriage is reported to occur in about **12 to 20%** of pregnancies. There are a number of different causes of miscarriage, including genetic and environmental factors. But There are Increasing evidence suggesting that low vitamin D3 levels may have an effect on miscarriage. Vitamin D plays an important role in regulating the immune system. *Medivizor(2016)*. And its implicated in immune cell regulation at the feto-maternal interface and several diseases of pregnancy³.

The objective of our study is to evaluate the effect of vitamin D3 deficiency on 1st miscarriages, in this study we tested the level of vitamin D3 in **89** female in 1sttrimester pregnancy and Follow up them till the end of **12** weeks gestation. Blood samples for serum vitamin D3 taken for each patients in at time of positive pregnancy test in serum **4** weeks, then at **8** weeks and **12** weeks of gestation. Miscarriage occur in **16** females (**17.9%**) , **6** of them had negative heart beat by ultrasound at **6-7** weeks, and **5** had miscarriage **8- 10** weeks of gestation and the last **5** had miscarriage at **11- 12** weeksof gestation, while **73** female (**82%**) had uneventful 1st trimester, the results show that the mean level for of serum vitamin D3 for miscarriage group was **17.3ng/dl**, while for uneventful 1st trimester group was **30.5ng/dl**.

We concluded that vitamin D3 deficiency is associated with increasing incidence of 1st trimester miscarriages.

Keywords: vitamin D, 1st trimester miscarriage, defeciency.

INTRODUCTION

Vitamin D₃ is fat-soluble, can only absorb it when consumed with foods that contain fat. People who have trouble absorbing fat may in turn be predisposed to a vitamin D3 deficiency¹

It has well-established classic function is maintaining calcium homeostasis and promoting bone mineralization. In addition, vitamin D₃ has significant roles in regulating cell proliferation and differentiation and modulating innate and adaptive immune responses². The human fetus represents a semi-allograft, which cannot survive without maternal immune tolerance. Vitamin D₃ may be implicated in the risk of miscarriage due to its function as an immune modulator. and its potential importance for the maternal-fetal immunologic response. Vitamin D₃ concentrations in serum are best

assessed by the precursor hormone, 25-hydroxyvitamin D₃ [25(OH)D] concentration³.

Poor vitamin D₃ status during pregnancy has been associated with preeclampsia, gestational diabetes, bacterial vaginosis and compromised intrauterine growth. However, the relationship of vitamin D₃ deficiency and insufficiency in the first-trimester pregnancy with PL or non-gravid childbearing aged women with spontaneous pregnancy loss history is less clear².

The active form of vitamin D₃ is 1,25-dihydroxyvitamin D₃ (1,25(OH)₂D₃) which is a pluripotent steroid, the putative biological actions of which extend far beyond its established effects on calcium homeostasis and bone metabolism. A site of immune privilege that may act as an important target

for vitamin D3 is the placenta specifically the maternal decidua which forms the interface with newly implanted fetal placental trophoblast cells. It has been hypothesized that D3 may help to support successful implantation by attenuating decidual T-cell function¹. Vitamin D3 has been shown to promote a more favorable environment for pregnancy through various mechanisms, such as enhancement of the shift toward T_H helper cells and regulation of immune cell differentiation and cytokine secretion⁴. Miscarriage is the most common negative outcome of pregnancy, and identification of modifiable risk factors is potentially of great importance for public health³. Miscarriage is multifactorial of origin, with acquired or environmental factors probably exceeding genetic factors in its causation. Identifying modifiable risk factors for miscarriage is potentially important for public health³. *The American Journal of Clinical Nutrition*. A recent Danish study found that increased maternal age, alcohol consumption, prepregnancy BMI, heavy lifting, and nightshift work were important, preventable risk factors of miscarriage³. *The American Journal of Clinical Nutrition*. Early pregnancy loss (spontaneous miscarriage) is defined as the spontaneous termination of pregnancy before **12** gestational weeks. The great majority of pregnancy losses occur early, before **12** weeks' gestation². The recommended daily requirement with vitamin D3 for adults is **600** international units (IU) adequate bone health *Jamie Ludwig Harvard Health Blog*. In **2010**, the venerable Institute of Medicine (IOM) issued a report based on lengthy examination of data by a group of experts. To sum up, they estimated that a vitamin D level of **20 ng/mL** or higher was adequate for good bone health, and subsequently a level below **20** was considered a vitamin D deficiency⁵. While the recommended daily allowance of vitamin D3 in pregnant women is 400–600 IU. High doses of other vitamin D3 analogs have been shown to be teratogenic, resulting in external and skeletal abnormalities. But other studies show that high doses up to 4,000 IU that means 10 folds higher than recommended dose are not only safe but reduce the risk of pregnancy complications¹.

Early miscarriages is defined as pregnancy loss before **12** weeks reported to occur in about **12** to **20%** of pregnancies. There are a number of different causes of miscarriage, including genetic and environmental factors⁶. Recurrent pregnancy loss (RPL) affects close to **1%** of couples; however, the etiology is known in only about **50%** of the cases. Several mechanisms have previously been described for the pathogenesis of recurrent miscarriages, including chromosomal anomalies, hormonal problems, uterine abnormalities, infections, autoimmune disorders and thrombophilias, and up to **50%** of cases of recurrent miscarriage will not have a clearly defined etiology⁴. Recurrent miscarriage is defined as two or more consecutive pregnancy loss before 20 weeks of gestation. been associated with parental chromosomal anomalies, maternal thrombophilic disorders and structural uterine anomalies and indirectly with maternal immune dysfunction and endocrine abnormalities¹.

PATIENTS AND METHOD

This is an prospective case series study type done in Baghdad over period of **24** months from (1/7/2016 to 1/9/2018), in which **100** pregnant lady, mean age **25** years (**19-37** years) under gown follow up for their serum level of vitamin D3 which evaluated 3 times in every patients (at time of positive pregnancy test **4-5** weeks, at **6-8** weeks of gestations, and at end of **12** weeks). Each female received the usual treatment at first trimester (folic acid **5 mg**-low dose aspirin **81 mg** and progesterone rectal suppositories **400 mg** daily). Those with recurrent miscarriage and those with a known causative factor of miscarriage (anatomical anomalies, husbands asthenospermia, and family history of chromosomal linked anomalies) were excluded from the study. Then the studied group were followed up throughout the whole 1st trimester and routinely evaluated by ultrasound, blood test GUE, in addition to vitamin D3.

RESULTS

The result in the following table:

Table: 1: The mean level of serum vitamin D3 in miscarriages group(A) and uneventful group(B).

Total 89	Mean serum level of vitamin D3ng/dl			Total means	Mean age/y
	4 weeks	8 weeks	12 weeks		
Miscarriages 16(17.9%)	16	17	18	17.3	22
Uneventful 73(82%)	31	30	30.5	30.5	28

DISCUSSION

Our result show that the mean vitamin D3 level in the miscarriage group females (**17.3ng/dl**), while those who had uneventful 1st trimester group which was (**30.5ng/dl**). And the overall miscarriage rate of the total **89** pregnant females was (**17.9%**).16 miscarriage female mean age group **22** years distributed in the 1st trimester as the following: **7** had negative fetal heart at **7th** weeks of gestation, **4** females had threatened and then developed a complete miscarriage, and **5** had missed miscarriage. From the result we found that the miscarriage rate is highest in period between **4th-8th** weeks of gestation (**43%**)of the total miscarriage group, which had a lowest mean serum vitamin D3 of **16ng/dl**. While those who had threatened miscarriage which **4** females (**25%**), **2** of them were presented at **8th** weeks and other and other **2** presented at **9th**, **11th** weeks respectively, and their mean serum level of **17ng/dl**. Finally those with missed miscarriage **5** females (**31.5%**) of total miscarriage group has the highest mean serum vitamin D3 of **18ng/dl**. Clearly the whole miscarriage group had lower mean serum vitaminD3 level in comparison with the other uneventful first trimester group. In Iraqi population a study done by *Ahmed M.Issa (2007)*⁷ showed that the mean serum level of vitamin D3 was as low as **8ng/dl** in general population but its more in males of about 43% and this may be related to the religious and social factors religious reasons, in which women must cover all the body with black cloths, and wear a veil and sometimes black gloves when they go outdoors.

This factors act as good reason for preventing the cutaneous production of vitamin D in those women , even when they live in a sunny climate.*Taha et al.*,

(*1984*⁸) reported that “people of cultures such as Bedouins living in the Negev Desert, who are required to have most of the skin surface covered by clothing, are prone to develop vitamin D deficiency reveals a high variation around the mean in females compared with males. And this may be explain the overall low mean level of vitamin D3 in both groups.

Many studies the effect of vitamin D3 on 1st trimester miscarriage:

*ZakiaMahdy (2013)*¹concluded that vitamin D3 oral supplementation has resulted in reducing risk of pregnancy loss up to **15%** among women with recurrent miscarriage.

*W Hou,(2016)*² concluded that vitamin D3 deficiency associated with miscarriages in the first trimester of pregnancy. And decreased serum vitamin D3 levels among childbearing aged women with the failed clinical pregnancies history may predispose to increased risk for pregnancy loss.

*Kassem Sharif (2018)*⁴ found that vitamin D3 deficiency sways the balance toward a worse outcome and may play a part in recurrent pregnancy loss.

In article published in *Medivizor (2016)*⁶ showed that **vitamin D3 plays an important role in regulating the immune system. Proper functioning of the immune system is, in turn, important for successful pregnancies. Further studies are needed evaluating the effect of vitamin D levels on the risk of early miscarriages.**

CONCLUSION

From above results we can conclude that vitamin D3 deficiency is an important risk factor for 1st trimester miscarriage, especially for younger age group less than 25 years old and vitamin D3 supplements should be recommended for those females.

A Study on Attitude towards using New Technologies among B.Ed. Student Teachers in relation to few Biographical Variables

Smt.Nandini N

*Assistant Professor, Vijaya Teachers College, Department of PG Studies in Education,
IV Block Jayanagar, Bengaluru, Karnataka*

ABSTRACT

In the present scenario technology plays a vital role in teaching learning process, This study contributes to measure the attitude of B.Ed. student teachers in using new technologies in relation to their sex, age and type of management. Samples are drawn from teacher training colleges of Bengaluru District through random sampling technique. Data is collected by using New Technology Scale developed by S.Rajasekar to measure the attitude towards using new technologies of B.Ed. Students teachers. The results of the study revealed that attitudes towards using new technologies differ in relation to sex, age and type of management. The study revealed that females have better attitudes in using technologies than male student teachers. From the results it is clear that student teachers below 35 years have better attitude than student teachers above 35 years. The results also showed that student teachers from Private Unaided B.Ed colleges have better attitude towards Technology than the Government and Private Aided B.Ed colleges. Hence this study helps us to understand the attitude of student teachers towards using new technologies and it also helps us to know that how teachers are efficient enough in using technologies during their teaching learning process.

Keywords: *Attitude, New technologies, Sex, Age, Type of Management*

INTRODUCTION

In this 21st century, technology and teachers plays an important role in enhancing concentration span also making many abstract concepts clear to their students during teaching learning process for which technology can be used as a supportive assistant technology. In relation to this aspect one can observe that digital technology has not been used completely in any training institutions which are the need of the hour¹. In this regard there is a need to conduct many researchs in respect to improve and cultivate positive attitude among teacher trainees which can be done by including the add-on courses during their training process and help them to be confident in using technology when they enter their teaching profession and teach our future citizens who are all dependent on the present education system. Since our classroom is a miniature society, technology plays a role of teacher in making them to understand the abstract concepts in as easier way which otherwise might not be possible in our traditional method of teaching learning

process. In this context, future teachers should have a positive attitude towards using technology in their classroom transaction²⁻³.

NEED OF THE STUDY

In the present situation teacher training institutions are facing many challenges in using technology which may include the fear of accepting the new technology, not having proper training in using different technique to fulfil educational needs of present era. So the future teachers should be trained and motivated to use technology in teaching learning process which is possible only by inculcating the technology in the training period. So this training can be done by implementing add-on courses during the course or by giving extra coaching on how to use different technology in various areas like in assessing students, using audio-video during practice teaching. This supports the teacher educators to implement the same when they enter their teaching profession. The integration of technologies in teaching in general and teacher education in particular is need of

the day. Henceforth, the study was planned to know the attitude of B.Ed. student teachers towards the use of new technology in the class rooms.

Statement of the Problem

A Study on Attitude towards using New Technologies among B.Ed Student Teachers in relation to few Biographical Variables.

Objectives of the Study

To know whether differences in Sex, Age, Type of Management of B.Ed student teachers would account for significant difference in Attitude towards New Technology.

Hypotheses of the Study

There exists no significant difference in Attitude towards using New Technologies among Male and Female student teachers, Young (>35 years) and Older (<35 years) B.Ed. students and students studying in

different college managements.

METHODOLOGY

Descriptive survey method was used for the study. Biographical variables chosen for the study are Sex: Male and Female, Age: Below 35 years and above 35 years, Type of Management: Government, Aided and Private Unaided. The sample of the study comprised of 100 B.Ed student teachers of Bangalore District. The sample was selected through random sampling technique. An attitude towards using New Technologies scale of S. Rajasekar has been used to measure the attitude towards using new technologies of B.Ed student teachers.

Analysis and Interpretation

There exists no significant difference in Attitude towards using New Technologies of Male & Female, younger & older and student teachers studying in different management institutions.

Variable and Groups		N	Mean	Standard Deviation	't' value & Sig. Level
Sex	Male	29	109.172	9.250	2.03*
	Female	71	113.380	9.726	
Age	Younger	62	115.532	9.285	3.01**
	Older	38	109.447	10.077	
Type of college	Government	51	109.607	9.804	0.86 ^{NS}
	Private Aided	21	107.809	7.270	
	Government	51	109.607	9.804	2.37*
	Private Unaided	28	115.000	9.626	
	Private Aided	21	107.809	7.270	2.98**
	Private Unaided	28	115.000	9.626	

Above table shows that the obtained 't' value 2.03 was significant at 0.05 level. Therefore the null hypothesis of the study was not accepted and alternate hypothesis was formulated. Further the mean value of female 113.380 is greater than the mean value of male attitude towards using New Technologies which is 109.172. This indicates that the female student teachers have better positive attitude towards using New Technologies when compared to male student teachers.

Above table also reflects that the obtained 't' value 3.01 was significant at 0.01 level. Therefore the null hypothesis was not accepted and alternate hypothesis

is formulated. Further the mean value of younger student teachers 115.532 is greater than the mean value of older student teachers' attitude towards using New Technologies which is 109.447. This indicates that the younger student teachers have better positive attitude towards using New Technologies when compared to older student teachers.

The table also reveals that the obtained 't' value 0.86 is not significant at 0.05 level of significance. Hence the null hypothesis is accepted that there is no significant difference in Attitude towards using New Technologies of B.Ed student teachers studying in Government

and Private Aided B.Ed colleges. From the table it is known that obtained 't' value 2.37 is greater than the table value 1.98 at 0.05 level of significance. Hence the null hypothesis is rejected and alternate hypothesis has been accepted that "there is a significant difference in Attitude towards using New Technology of B.Ed student teachers studying in Government and Private unaided B.Ed colleges". The table further reveals that the student teachers studying in private unaided colleges (M=115.000) had higher positive Attitude towards using New Technology than the student teachers studying in Government B.Ed colleges (M=109.607)⁴⁻⁶. Further table shows that the obtained 't' value 2.98 is greater than the table value 2.63 at 0.01 level of significance. Hence the null hypothesis is rejected and alternate hypothesis has been accepted that "there is a significant difference in Attitude towards using New Technology of B.Ed student teachers working in Private Aided and Private unaided B.Ed colleges". The table further reveals that the student teachers studying in private unaided B.Ed colleges (M=115.000) had higher positive Attitude towards using New Technology than the student teachers studying in Private Aided B.Ed colleges (M=107.809)^{7,8}.

CONCLUSION

The study revealed that student teachers who are young, female and studying in private Unaided B.Ed colleges are having better positive attitude towards using New Technologies when compared to student teachers who are old, male and studying in Government and Private Aided respectively. In order to develop positive attitude among all teachers relevant programmes are to be taken up simultaneously by the Government and above all the teacher Education program to initiate training and also provide the awareness and its importance in their future among student teachers which in-turn develop knowledge and skill in using new technologies before they enter the school setup and in turn they can adopt new technologies to enhance teaching and learning process in a classroom environment.

Effect of Flipped Classroom Instructional Strategy on Self Directed Learning

Arjinder Kaur¹, Amit Kauts²

¹Research Scholar, Head, Department of Education, ²Dean, Faculty of Education
Guru Nanak Dev University, Amritsar

ABSTRACT

The present study is conducted with objective of comparing the self-directed learning of students in a flipped class set up and a traditional class set up. It is delimited to rural college students of Jalandhar district only. Flipped class students are more self-directed learners than students of the traditional classroom. There is an insignificant difference in self-directed learning among male and female students of the flipped classroom. Female students exhibited more self-directed learners than boys of traditional class. In the FC model of instruction, boys are more self-directed learners than their male counterparts in the conventional classroom. Male students of flipped classroom are more self - directed learners than male students in conventional class. It revealed that there exists an insignificant difference in self-directed scores in girls of the flipped class and the traditional class.

Keywords: *Flipped classroom instructional strategy, self-directed learning, History class*

INTRODUCTION

The conventional method of teaching is to give pupils to read books and rethink on problems outside of class, they listen to lessons and solve exercises in class. In FC model of instruction, the students do self-study for given topic themselves, by using video lessons prepared by the class teacher ¹. Pupils apply the remembering phase by resolving problems and undertaking practical work in class ². The instructor teaches the pupils when they feel stuck, rather than delivering the first lecture directly. Complementary techniques include project-based learning and individualized instruction³. Teachers uses tools like Google Slides, YouTube that keep pupils accountable for watching video lessons at home with the help of time - embedded formative assessments. Students learn discussion and collaborative learning. Students help each other and benefit all types of learners⁴. Flipped classroom model benefits students in a diverse way for improvement in teaching learning process^{5,6}. It also enhances cognitive learning outcome of students, development of learning skills (Tanner & Scott) as well as self-learning, i.e., overall motivation⁷. reported that motivation and learning outcomes relate to the requirement for autonomy⁸, competence, and belongingness and they have been used as factors

responsible for the performance of students ⁹. FCM is an issue of attention from both policymakers and researchers; it is spanned in range of subject domains i.e. Mathematics, Social Studies and ICT^{10, 11}. Kostairs et al. (2017) investigated that low performers achieved the higher level of improvement in their performance. Found the affirmative influence of flipped instruction in student motivation in Math course¹². Found that FCM enhanced K-12 cognitive learning outcomes and student motivation in the learning¹³. Found that pupils showed improvement in English comprehension during FCM¹⁴. Flipped learning effects time utilisation. Conventionally, the tutor involves the students to ask questions, but tries to involve in discussion. The philosophy works behind the flipped class is that teachers can have qualitative time working with students who want their help in the classroom and they can work collaboratively to solve problems rather than solving their assignment lonely at home. The flipped classroom instruction can be defined as situations that may have conventionally happened in the class, happen outside class and vice versa .

Self-learning refers to active learning of students or students' who wish to actively participate in routine classroom activities like submission of homework assignments, attending carefully to the lecture,

completing projects, and actively attending the class. Self-directed learning affects teaching-learning outputs. Opined that in order to deal with tomorrow's opportunities and challenges students must be academically self-regulated, as academic self-regulation is playing a vital role for academic success¹⁵. It helps the learners to make sagacious use of their intellect and expertise in the achievement in mathematics. Found that flipped classroom students showed higher student self-efficacy in comparison to the control group and pupils who taught with the self-regulated flipped classroom approach showed better performance than those who taught with the conventional flipped classroom approach¹⁶. Sletter (2017) concluded that biology pupils favour the active learning feature of the FC model, but had a smaller amount of real insights about the online discourse component. Flipped classroom, alike traditional classroom, has a climate of its own and coupled with the achievement motivation in the students, leads to better academic achievement¹⁷.

JUSTIFICATION OF THE STUDY

Today's generation is dependent on the internet and technology for active learning. Teachers are acting as the facilitator in their classes. They encourage learning through the medium of interaction with the students. The flipped classroom instructional strategy will give those plans and offer tips to implement the model efficiently into their classroom set up.

RESEARCH QUESTIONS

1. Is there any significant difference in self-directed learning scores of students in the flipped classroom and traditional class?
2. Is there any significant difference in self-directed learning scores of male and female students in a traditional class?
3. Is there any significant difference in self-directed learning scores of male and female students in the flipped classroom?

4. Is there any significant difference in self-directed learning scores of male students in the flipped classroom and traditional classroom?

5. Is there any significant difference in self-directed learning scores of female students in the flipped classroom and traditional classroom?

DELIMITATION OF THE PRESENT STUDY

This study is delimited to rural college students of Jalandhar district only. Investigator collected data from History students of class +1.

METHODOLOGY

40 students served as a sample of the study. In the present study, Investigator used purposive sampling for data collection. The 40 students were further divided into two groups of 20 each, i.e., experimental group and control group. These 20 students were further categorized into ten male and ten female students. For collection of data Self- Regulated Learning Scale by Prof. (Dr.) Madhu Gupta and Ms. Dimple Mehlani (2017) was used. In traditional classroom method students were taught through lecture cum discussion method. Flipped classroom instructional practice composed of two phases.

FIRST PHASE: Students used online YouTube videos and worksheets supplied by the teacher before coming to class. Students did the self-study. Thus they prepared their lesson themselves before entering the level.

SECOND PHASE: Students participated in high order activities, i.e., discussions, problem-solving, etc. in the classroom. Teacher facilitated the classroom collaboration and helped to speed up the process of learning.

ANALYSIS AND INTERPRETATION OF DATA

Table 1: Self Directed Learning Scores Of Students In Flipped Classroom Model (Fcm) And Traditional Classroom Model Of Teaching

	M	N	SD or s	SE _p	T
Flipped classroom students	172.75	20	13.62	6.42	2.24
Traditional classroom students	158.35	20			

It is found from given table 1 that the t-ratio for the small sample for the difference in self-directed learning between students of FC and TC was seen to be 2.24. Entering table D with 38 df, we get entries 1.68 at the 0.05 level of confidence and 2.42 at the .01 level. Since t value reaches 0.05 level of confidence, so there exists a

significant difference in scores of self-directed learning in students of Flipped Classroom and the traditional classroom. The mean value of scores of FCM students is higher as compared to a TCM. It can infer that FC students are more self-directed learners than students of the traditional classroom.

Table 2: Self-Directed Learning Scores Of Female And Male Students In Traditional Classroom

	M	N	SD or s	SE _D		T
Female students	171.4	10	23.44	11.02	15.55	
Male students	131.7	10				

It is observed from the table 2 that the t-ratio for a small sample for the difference in self-directed learning between female and male students of TC was found to be 15.55. Entering table D with 18 df, we get entries 2.10 at the 0.05 level of confidence and 2.88 at the .01 level. Since t value reaches both degrees of confidence, so there exists a significant difference in self-directed learning in female and male students of the traditional classroom. The mean value of scores of girls is higher as compared to boys. It can be stated that girls are more self-directed learners than boys in the traditional classroom set up.

Table 3: Self-Directed Learning Scores Of Female And Male Students In Flipped Classroom

	M	N	SD or s	SE _D		T
Female students	174.4	10	5.79	2.72	1.21	
Male students	171.1	10				

It is observed from table 3 that the t-ratio for the small sample for the difference in self-directed learning between female and male students of FC was found to be 1.21. Entering table D with 18 df, we get entries 2.10 at the 0.05 level of confidence and 2.88 at the .01 level. Since t value does not reach both levels of confidence, so there is an insignificant difference in self-directed learning in male and female students of the flipped classroom.

Table 4: Self Directed Learning Scores Of Male Students In Flipped Classroom And Traditional Classroom

	M	N	SD or s	SE _D		T
Flipped classroom male students	171.1	10	23.05	10.83	3.64	
Traditional classroom male students	131.1	10				

It is found from the given table 4 that t-ratio for the small sample for the difference in self-directed learning between male students of FC was found to be 3.64. Entering table D with 18 df, we get entries 2.10 at the 0.05 level of confidence and 2.88 at the .01 level of confidence. Since t value reaches both levels of confidence, So there exists a significant difference in scores of self-directed learning in boys of Flipped Classroom instructional strategy and traditional classroom strategy. The mean value of scores of flipped classroom boys is higher as compared to boys of the traditional classroom. It can be stated that in Flipped Classroom boys are more self- directed learners than boys in the conventional class.

Table 5: Self Directed Learning Scores Of Female Students In Flipped Classroom Model (Fcm) And Traditional Classroom (Tc)

	M	N	SD or s	SE _D	T
Flipped classroom female students	174.4	10	7.16	3.36	0.89
Traditional classroom female students	171.4	10			

It is observed from the above table 5 that t-ratio for the small sample for the difference in self-directed learning between female students of FC was found to be 0.89. Entering table D with 18 df, we get entries 2.10 at the 0.05 level of confidence and 2.88 at the .01 level of confidence. Since t value does not reach at both levels of confidence, so there is the insignificant difference in self-directed learning in female students of Flipped Classroom and Traditional classroom.

FINDINGS AND DISCUSSION OF THE STUDY

Students exposed to flipped classroom instructional strategy are more self-directed learners than students of the traditional classroom. The result is consistent with results¹⁸.

Female students exhibited to be more self-directed learners than their male counterparts in the conventional class. This finding is consistent with results¹⁹.

Flipped classroom male students are more self-directed learners than male students in the flipped classroom. This result is in tune²⁰.

CONCLUSION

Although the investigator conducted the study on a small sample, it is giving some trend concerning Flipped classroom instructional strategy viz. self-directed learning. Results of the present study advocate that in Indian context, Flipped classroom work better in case of male students than female students. It is found that there exists no significant difference in self-direct learning of female students exposed to Flipped classroom instructional strategy and Traditional classroom. Female students exhibited more self-directed learners than male students. There was higher self-directed learning in female students than boys in the traditional class set up. But when FCM applied, self-learning was enhanced in boys in comparison to female students. It could be inferred that Flipped classroom works better in males

in contrast to female students. This framework can be replicated on different samples, situations, variables, and practices for better results.

Modeling a Variant of Periodic Heterogeneous Vehicle Routing Problem with Driver Scheduling

Sutarman¹, Herman Mawengkang²

¹Department of Mathematics, University of Sumatera Utara, ²Department of Mathematics, University of Sumatera Utara

ABSTRACT

Vehicle Routing Problem (VRP) is one of the well-known issues that exists in logistic system. This is a well known combinatorial optimization problem which consists of a customer population with deterministic demands, and a central depot which acts as the base of a fleet of vehicles. The main objective is to design a set of vehicle routes starting and terminating at the assigned depot, such that the customer demands is totally met. This paper develops an optimization model for the management of periodic deliveries of a given commodity. Due to the needs the logistic company has different type of vehicles with different capacity to deliver the commodity for customers. The problem is then called Periodic Heterogeneous Vehicle Routing Problem (PHVRP). The goal is to schedule periodically the deliveries according to feasible combinations of delivery days and to determine the scheduling of fleet and driver and routing policies of the vehicles. The objective is to minimize the sum of the costs of all routes over the planning horizon. We propose a combined approach of heuristic algorithm and exact method to solve the problem.

Keywords: *Vehicle routing problem, scheduling, combined approach*

INTRODUCTION

In logistic system there is a well-known combinatorial model known as Vehicle Routing Problem (VRP). The problem is to decide an optimal set of routes used by a fleet of vehicles to satisfy demand a set of customers. The Vehicle Routing Problem (VRP) can be defined as a directed graph $G = (V, A)$, where $V = \{v_1, v_2, \dots, v_n\}$ is a set of customers and $A \subseteq \{(v_i, v_j) : i \neq j, v_i, v_j \in V\}$ is the set of route to be travelled. An optimal set of routes, composed of a cyclic linkage of arcs starting and ending at the depot (v_1), is selected to serve a given set of customers. The problem aims at minimizing the total travel cost (proportional to the travel times or distances) and operational cost (proportional to the number of vehicles used).

Dantzig and Ramser¹ who introduced the VRP in (1959). They used the model in truck dispatching problem which intended to determine an optimal routing plan for a fleet of vehicles such that to satisfy a set of customers. The basic concept of this problem is from a Hamiltonian graph, it is then, necessarily to impose conditions that each vehicle starts and ends at

the starting point, and each customer is strictly forbidden to be visited more than once by one vehicle. Up till now many researchers have been working in this field to discover new variants and new methodologies. There are a number of interesting survey have been written for VRP, such as,²⁻⁵ and books^{6,7}.

In literature we can find new variants of VRP which are grouped according to specific conditions. Some of the well known variants are: Capacitated VRP (CVRP), here the vehicles are conditioned to carry limited capacity; VRP with time windows (VRPTW), each customer is conditioned to be served within a slot time frame; VRP with multiple depots (MDVRP), in this variant customer demands are c delivered from a set of depots; VRP with pick-up and delivery (VRPPD), there are two activities in a customer node, deliver and pick-up Taking into account scheduling time for routing vehicles is another variant of the VRP, known as the periodic VRP (PVRP).

In PVRP, within a given time horizon, we should have a visiting schedules associated with each customer. Each vehicle leaves the depot, serves a set of customers periodically, when its work shift or capacity is over, returns

to the depot. The problem is to minimize the total length of the routes travelled by the vehicles periodically on the time horizon. This kind of problem is very important in real world applications, such as, distribution for bakery companies⁸ blood product distribution⁹, or pick-up of raw materials for a manufacture of automobile parts¹⁰.

A survey on PVRP and its variants can be obtained in¹¹. The complexity of the problem is high, therefore most of the method used are based on heuristic approaches, nevertheless¹² proposed an exact method¹³ addressed a hybrid of heuristic and exact method for tackling PVRP.

Another important extension of the VRP in which it is essential to decide on the fleet composition. This variant is known as the Heterogeneous Vehicle Routing Problem (HVRP). The problem is rooted in the seminal paper of¹⁴published in 1984 and have evolved into

a rich research area. In terms of how to solve the problem,¹⁵provided a general overview of papers with a particular focus on lower bounding techniques and heuristics. The authors also compared the performance of existing heuristics described until 2008 on benchmark instances. ¹⁶presented a review of exact algorithms and a comparison of their computational performance on the capacitated VRP and HVRPs, while¹⁷ reviewed the problem from several industrial aspects with combined fleet composition and routing in maritime and road-based transportation.

Section 2 describes the problem description. The mathematical model is in Section 3. Section 4 presents the feasible neighbourhood heuristic search. The algorithm is described in Section 4. Finally Section 5 describes the conclusions.

Problem Description

It is natural that logistic companies prefer to deal with a transportation scheme which can deliver products to their customer efficiently and economically. In decision context, the scheme is to find the feasible transportation tour of vehicles such that to minimize the overall operating costs. In order to ease the problem, it is better to get the visualization of the problem using graph concept. Let $\Gamma = (\zeta, A)$ be a directed graph, where $\zeta = \{0, 1, \dots, n\}$ is the vertex set and $A = \{(i, j) : i, j \in \zeta, i \neq j\}$ is the set of arcs, representing routes between vertex. $\zeta = \{0\}$ is the depot vertex. $\zeta_c = \zeta \setminus \{0\}$ is the set of customer locations. It is assumed that each vertex $i \in \zeta_c$ has a demand $q_i \geq 0$ on each day, a service time $s_i \geq 0$, a time window $[e_i, l_i]$, where e_i is the earliest time service may begin and l_i is the latest time, and requires a fixed number of visits f_i to be performed according to one of the allowable visit-day patterns. The time window specifying the interval vehicles leave and return to the depot is given by $[e_0, l_0]$. Let $K = \{1, \dots, k\}$ be the set of available vehicle of all types. A fleet of m

vehicles of each type, with capacity Q_k is based at the depot.

For each vehicle $k \in K$, let Q_k denote the capacity in weight. We assume the number of vehicles equals to the number of drivers. Denote the set of n customers (nodes) by $N = \{1, 2, \dots, n\}$. Denote the depot by $\{0, n+1\}$. Each vehicle starts from depot and terminates at $\{n+1\}$. Each customer $i \in N$ specifies a set of days to be visited. On each day, customer $i \in N$ requests service with demand of q'_i in weight, within time window $[a_i, b_i]$. Note that, for the depot $i \in \{0, n+1\}$, we set $q'_i = 0$. Denote the set of preferable vehicles for visiting customer i by K_i ($K_i \in K$) and the extra service time per pallet by e if a customer is not visited by a preferable vehicle.

Mathematical Modeling

To model the problem, we define some notation.

Sets:

DI	internal drivers,
DE	external drivers,
D	over all drivers $D = DI \cup DE$,
K	vehicles,
N	customers,
N_0	customers and depot $N_0 = \{0, n + 1\} \cup N$,
K_i	preferable vehicles for customer $i \in N$,

Parameters:

M_k	Number of vehicles of type $k \in K$ available
Q_k	Weight capacity of vehicle $k \in K$,
$[a_i, b_i]$	The earliest and the latest visit time at node $i \in N_0$,
q_i	The weight demand of node $i \in N_0$
$[g_l, h_l]$	The start time and the latest ending time of driver $l \in D$
α_i	Pick up quantity for customer i
β_i	Delivery quantity for customer i
CV^k	Fixed cost for each type of vehicle $k \in K$ from depot
CVA_{ij}^k	Travelling cost of vehicle $k \in K$ along the edge $(i, j) \in A$
CVN^k	Cost due to the visit of a customer by non preferable vehicle $k \in K$
CDI_l^k	Cost for internal driver $l \in DI$ using vehicle $k \in K$
CDE_l^k	Cost for external driver $l \in DE$ using vehicle $k \in K$
CPQ_j^k	Cost to pick up a number of quantity for customer $j \in N$ using vehicle $k \in K$
CDD_j^k	Cost to deliver a number of quantity for customer $j \in N$ using vehicle $k \in K$

Variables:

- x_{ij}^k Equals to 1 if vehicle $k \in K$ travels from node $i \in N_0$ to $j \in N_0$, otherwise 0
- w_i Equals to 1 if customer $i \in N_0$ is visited by a non-preferable vehicle, otherwise 0
- v_i^k The time at which vehicle $k \in K$ starts service at node $i \in N_0$
- y_l^k Equals to 1 if vehicle $k \in K$ is assigned to internal driver $l \in DI$, otherwise 0
- z_l^k Equals to 1 if vehicle $k \in K$ is assigned to external driver $l \in DE$, otherwise 0
- θ_j^k Number of pick up demand of customer j served by vehicle $k \in K$
- σ_j^k Number of delivery demands of customer j served by vehicle $k \in K$

The mathematical formulation for this problem is presented as follows:

The objective is to minimize the operational costs

$$\begin{aligned} \text{Min} \quad & \sum_{k \in K} \sum_{j \in N_0} CV^k x_{0j}^k + \sum_{k \in K} \sum_{(i,j) \in A} CVA_{ij}^k x_{ij}^k + \sum_{i \in N_0} \sum_{k \in K} CVN^k w_i^k + \sum_{l \in DI} \sum_{k \in K} CDI_l^k y_l^k + \\ & \sum_{l \in DE} \sum_{k \in K} CDE_l^k z_l^k + \sum_{j \in N} \sum_{k \in K} CPQ_j^k \theta_j^k + \sum_{j \in N} \sum_{k \in K} CDD_j^k \sigma_j^k \end{aligned} \tag{1}$$

Subject to several constraints

$$\sum_{j \in N_0} x_{0j}^k = 1, \quad \forall k \in K \tag{2}$$

$$\sum_{k \in K} \sum_{j \in N} x_{ij}^k = 1, \quad \forall i \in N_0 \tag{3}$$

Constraints (2) and (3) are to guarantee that exactly one vehicle of each type enters and departs from every customer and from the depot and comes back to the depot.

$$\sum_{i \in N} x_{ij}^k - \sum_{i \in N} x_{ji}^k = 1; \quad \forall j \in N_0, \forall k \in K \tag{4}$$

This is a flow conservation equation needed to maintain the continuity of each vehicle route on each period of time.

$$\sum_{j \in N_0} x_{0j}^k \leq M_k, \quad \forall k \in K \tag{5}$$

Constraint (5) represents that each customer is served only by the available and active vehicle of type k .

$$\sum_{j \in N_0} x_{1j}^k \leq 1; \quad \forall k \in K \tag{6}$$

$$\sum_{i \in N, i > 1} x_{i1}^k \leq 1; \quad \forall k \in K \tag{7}$$

Constraints (6) and (7) state the availability of vehicles by bounding the number of route, related to vehicle k for each type, directly leaving from and returning to the central depot, not more than one, respectively.

$$\sum_{i \in N} q_i \sum_{j \in N_0} x_{ij}^k \leq Q_k; \quad \forall k \in K_m \tag{8}$$

Constraints (8) ensure that each delivery does not exceed the capacity of each type of vehicle.

$$\sum_{k \in K} \sum_{j \in N_0} x_{ijk}^t = 1 \quad \forall i \in N, t \in T_i \tag{9}$$

$$\sum_{k \in K \setminus K_i} \sum_{j \in N_0} x_{ijk}^t = w_i^t \quad \forall i \in N, t \in T_i \tag{10}$$

$$\sum_{i \in N} \sum_{j \in N_0} q_i x_{ijk}^t \leq Q_k \quad \forall k \in K, t \in T \tag{11}$$

$$b_i \geq v_{ik}^t \geq a_i \quad \forall i \in N, k \in K, t \in T_i \tag{12}$$

$$v_{0k}^t \geq \sum_{l \in D} (g_l^t \cdot y_{lk}^t) \quad \forall k \in K, t \in T \tag{13}$$

$$v_{n+1,k}^t \leq \sum_{l \in D} (h_l^t \cdot y_{lk}^t) \quad \forall k \in K, t \in T \tag{14}$$

$$\sum_{k \in K} \theta_{jk}^t = \alpha_j^t \quad \forall j \in N, t \in T \tag{15}$$

$$\sum_{k \in K} \sigma_{jk}^t = \beta_j^t \quad \forall j \in N, t \in T \tag{16}$$

$$x_{ijk}^t, w_i^t, z_{ik}^t, y_{lk}^t \in \{0, 1\} \quad \forall i, j \in N_0, l \in D, k \in K, t \in T \tag{17}$$

$$v_{ik}^t, u_{ik}^t, r_l^t, s_l^t \geq 0 \quad \forall i, j \in N_0, l \in D, k \in K, t \in T \tag{18}$$

$$\theta_{jk}^t, \sigma_{jk}^t \in \{0, 1, 2, \dots\} \quad \forall j \in N, k \in K, t \in T \tag{19}$$

Constraints (11) says that each customer must be visited by only one vehicle on each of its delivery days. Constraints (12) define whether each customer is visited by a preferable vehicle. Constraints (13-14) guarantee that the vehicle capacities are respected in both weight and volume.

Constraints (15-16) define the elapsed driving time. More specifically, for the vehicle (k) travelling from customer i to j on day t , the elapsed driving time at j equals the elapsed driving time at i plus the driving time from i to j (i.e., $u_{jk}^t \geq u_{ik}^t + c_{ij}$) if the vehicle does not take a break at customer i (i.e., $z_{ik}^t = 0$); Otherwise, if the vehicle takes a break at customer i (i.e., $z_{ik}^t = 1$), the elapsed driving time at j will be constrained by (10) which make sure it is greater than or equal to the travel time between i and j (i.e., $u_{jk}^t \geq c_{ij}$). Constraints (17) guarantee that the elapsed driving time never exceeds an upper limit F by imposing a break at customer i (i.e., $z_{ik}^t = 1$) if driving from customer i to its successor results in a elapsed driving time greater than F .

Constraints (18) determine the time to start the service at each customer. If j is visited immediately after i , the time v_{jk}^t to start the service at j should be greater than or equal to the service starting time v_{ik}^t at i plus its service duration d_i^t , the extra service time $e \cdot p_i^t$ if i is visited by an inappropriate vehicle (i.e., $w_j^t = 1$), the travel time between the two customers c_{ij} , and the break time G if the driver takes a break after serving I (i.e., $z_{ik}^t = 1$). Constraints (19) make sure the services start within the customers' time window.

Constraints (20-21) ensure that the starting time and ending time of each route must lie between the start working time and latest ending time of the

assigned driver. Constraints (22) calculate the total travel time for each internal driver. Constraints (23) define the working duration for each driver on every workday, which equals the time the driver returns to the depot minus the time he/she starts work. Constraints (24) make sure that the internal drivers work for no more than a maximum weekly working duration, referred to as 37 week-hour constraints. Constraints (25 – 26) define the pick up and delivery for each customer. Constraints (27-29) define the binary and positive variables used in this formulation.

Proposed Method

Stage 1. Solve the model by relaxing the integer restriction, if the assigned binary variables in the optimal result come up as binary value, STOP. The optimal solution is found. Otherwise go to Step 1.

Step 1. Get row i^* the smallest integer infeasibility, such that $\delta_{i^*} = \min\{f_i, 1 - f_i\}$ (This is to minimize the deterioration in the objective function, which is clearly corresponds to the integer basic with smallest integer infeasibility).

Step 2. Do a pricing operation

$$v_{i^*}^T = e_{i^*}^T B^{-1}$$

Step 3. Calculate $\sigma_{ij} = v_{i^*}^T \alpha_j$

With j corresponds to

$$\min_j \left\{ \left\lfloor \frac{d_j}{\alpha_{ij}} \right\rfloor \right\}$$

Calculate the maximum movement of nonbasic j at lower bound and upper bound.

Otherwise go to next non-integer nonbasic or superbasic j (if available). Eventually the column j^* is to be increased from LB or decreased from UB. If none go to next i^* .

Step 4.

Solve $B\alpha_{j^*} = \alpha_{j^*}$ for α_{j^*}

Step 5. Do ratio test for the basic variables in order to stay feasible due to the releasing of nonbasic j^* from its bounds.

Step 6. Exchange basis

Step 7. If row $i^* = \{\emptyset\}$ go to Stage 2, otherwise Repeat from step 1.

Stage 2. Pass1 : move integer infeasible superbasics by fractional steps to reach complete integer feasibility.

Pass2 : adjust integer feasible superbasics by looking at the reduced cost vector. The objective of this phase is to conduct a highly localized neighbourhood search to verify local optimality.

CONCLUSIONS

The aim of this paper is to develop a model of Periodic vehicle Routing with Time Windows, Fleet and Driver Scheduling, Pick-up and Delivery Problem This problem has additional constraint which is the limitation in the number of vehicles. We propose an algorithm which employs nearest neighbor heuristic approach for solving the model.

ABSTRACT

The World Wide Web (WWW) has now developed into an active platform for generating, sharing and collaborating ideas. Some research highlights that most of the students now a days spend a lot of time interacting with Web 2.0 technology tools. It is thus necessary for teachers in the 21st century to adopt these new technological tools and find new modes in order to incorporate Web 2.0 technologies in the classroom settings. Research has indicated that in many studies the practice of Web 2.0 technologies enhanced student engagement as well as achievement. WebQuest is an emerging Web 2.0 technology that makes use of Internet based resources on the World Wide Web (WWW) with certain basic steps. WebQuest is a powerful internet-based, student-centered, and inquiry-based learning tool that helps in promoting student engagement for any age group. Student engagement plays a central role in student success. Thus, Web 2.0 technologies allow educators to remain connected with students in a medium that they are using every day and offer many options for learners to attain the basic 21st-century skills so as to train them for their future. This paper emphasizes on how Web 2.0 technology tools especially WebQuest can be employed for educational activities and critically analyzes the influence it has on student engagement and academic achievement.

Keywords: *Web 2.0 technology, WebQuest, Student Engagement.*

INTRODUCTION

“Student engagement is the product of motivation and active learning. It is a product rather than a sum because it will not occur if either element is missing.”

Elizabeth Barkley

There isn't anything wrong with this belief that an engaged student remains connected with the faculty, peer group and institution; and by doing so he relates himself with the institute and also feels proud of being a member of the institution. On the other hand, a disengaged learner cultivates negative attitude for the faculty, students and institute. There may be several reasons for the students' disengagement. Even in a large classroom individuals do not pay attention towards the lesson taught by the teacher in the class and thus behave like disengaged and distracted learners ¹. But in order to engage students fully in the assigned task, technology can prove to be a boon. Boling (2008) observed that technology has been successfully incorporated while teaching in class in quite significant measures². Majority of the teachers use technology in order to engage students in academic

activities and to improve learning opportunities. Skinner & Belmont(1993) described engagement as eagerness of learners having pleasant feelings to partake in various academic accomplishments³.

With the arrival of innovative technologies specifically the Web 2.0 technology and influential educational software programs- teachers may assist the task of further upgrading various learner-centered strategies of learning. Like this, Web Quest (WQ) is one of the approaches for the efficient usage of technology in the classroom settings. Web Quest is a Web 2.0 inquiry based learning format employed by educators to promote engagement of students in various aspects and to organize learner centered learning in a specific subject with the help of pre-selected Internet resources.

Student Engagement

Student Engagement defines students' academic behaviors in many stages and involves indicators like classroom climate, support by teachers, autonomy support, relationships between teacher and learners, and thought-provoking tasks. The concept of engagement

has been extensively investigated since 1984. Alexander Astin was the first who recommended the theory of Student Involvement in 1984, which he afterwards renamed it as “Engagement”. Astin (1984)⁴ described engagement as “the amount of physical and psychological energy that the student devotes to the academic experience”. Following are the main principles upon which the theory of student engagement was constructed:

Engagement appears along a range or continuum i.e. in some situations learners engage themselves in the assigned tasks more vigorously than others and different students show different engagement levels in variety of activities at different situations;

It indicates investing of psychological plus physical vitality;

The extent with which student development and learning is linked to an instructional program is simply associated with the quantity as well as quality of student engagement in that very program;

It covers both quantitative and qualitative descriptions, quantitative aspect means how many hours a learner is devoting to a particular task or activity, and qualitative aspect means how determined the learner’s time is;

The efficacy of every instructional program is linked with the capability of that program directly so as to enhance the engagement of learners in various aspects.

Many surveys have been conducted on Student Engagement, out of which most prominent ones are Faculty Survey of Student Engagement⁵ and National Survey of Student Engagement⁶. Both of these major surveys stress upon different facets of Student Engagement. Nowadays engagement is referred to strength plus time that actually learners devote to informative undertakings which directly contribute to required educational outcomes. Thus participation of students in various activities indulges them in active engagement with faculty and peer group, which finally promotes student success.^{7, 8}

Huang (2011) as cited by Kaur and Beri (2017) found three non-cognitive drivers of academic performance which were academic self efficacy, academic motivation and student engagement. In 2009⁹, Kuh high lights two fold basic engagements that aim to enhance success of students: first one is academicor class engagement

and second one is engagement in extra-curricular activities i.e. outside the classroom. Kuh (2009)¹⁰ stated “student engagement and its historical antecedents are supported by decades of research showing positive associations with a range of desired outcomes of college”.Pascarella and Terenzini (2005)¹¹ examined that the concept of Engagement includes several factors, concerning engagement in the academic activities and extra-curricular undertakings or activities, interactions and relationships amongst students and teachers. They emphasize the association amongst these three factors- development, engagement, and success of students:

Cognitive development is likely to increase with the increase in the level of engagement of students.

Engagement in class discussions boosts psychological adjustment and maturity.

Interaction with peer group has a significant influence on degree completion.

Extracurricular involvement and intimate on-campus friendships has an affirmative influence on success of students in academic matters.

Campus settings that highlight intimate relationships between teachers and learners are associated with the purpose to enhance understanding, intellectual development, and critical thinking.

Technology and Student Engagement

Carini, Kuh and Klein (2006) considered Student Engagement as the chief attribute of successful online learning that is associated with educational attainment of learner’s positively¹². The concept of Student Engagement emerges as a multidimensional construct that includes several sub dimensions. In 2004, Fredricks¹³, Blumenfeld and Paris suggested that the most extensively accepted model of Student Engagement comprises basically of these three main dimensions- cognitive, behavioral, and emotional engagement. In online discussions context, the participation of students along with the measure of amount of time that learners log on to the discussions can be studied as indicators of behavioral engagement. Students’ responses to teachers and other students in the ways of showing admirations fall under the category of emotional engagement. This type of engagement signifies a sense of belonging and personal satisfaction, and contains indicators like pleasure, attention and excitement of learners regarding various topics or themes

of discussion. Zhu (2006) explains cognitive engagement in online courses as “the amount of students’ effort in (a) analyzing and synthesizing readings, and (b) seeking, interpreting, analyzing, and summarizing information; critiquing and reasoning through various opinions and arguments; and making decisions”¹⁴. He also came to the conclusion that cognitive engagement happening in online considerations is very much linked with the skills as well as knowledge attainment.

Various researchers examined associations between Student Engagement and technology usage. Annetta et al.(2009) examined learners those who preferred to play with educational games devised for the purpose of teaching genetic topics were whole heartedly engaged or engrossed in their task¹⁵. Chen, Lambert and Guidry (2010) conducted a study that revealed positive and significant relationship exists between Student Engagement and web-oriented technology¹⁶. The study recommended that the effective use of Twitter could serve the purpose of engaging learners in educational settings as well as in assisting teaching staff in a much lively way¹⁷. Research has revealed that a low-investment blended learning approach making use of Face book results in enriched academic achievement and better Student Engagement¹⁸. In the present stage, educational institutions all over the world, are continuously struggling nap plying appropriate approaches and techniques intended with the motive to nurture every facet of Student Engagement in online context.

Web Quest and Student Engagement

In the modern era, a new movement embedded with Web 2.0 based technologies has emerged with main purpose of enriching the present educational system. Web 2.0 technologies signified as “read/write web” stresses upon active participation and collaboration of students. Web 2.0 includes social bookmarking (Cite Like and Delicious); social networks (Face book, Skype); media sharing (YouTube); creative works (Podcasts, Video casts, Twitter, Blogger); collaborative knowledge development (Google Docs, Sheets and Slides, Wikipedia) and many more. Similarly, Web Quest(WQ)is a Web 2.0 tool and is represented in the form of a lesson that is totally inquiry based, and learners learning through this way searched most of the information related to the concerned topic with the help of web. Bernie¹⁹Dodge at San Diego State University firstly introduced the concept of Web Quest in 1995

and then later on further improved by Tom March in 1998.Dodge (1995) defined Web Quest as “*an inquiry-oriented activity in which some or all of the information that learners interact with, comes from resources on the Internet*”. WQ typically comprises of following six components:

Introduction represents main objectives as well as aims of the Web Quest, and provides background information about it. At this first stage, the teacher introduces the lesson and asks questions that make students start thinking about the topic.

Task provides guidelines and rationale, and description of the expected learning outcomes from the students.

Resources are a set of pre-selected websites that is chosen by the teacher in order to help the learners to complete their task.

Process deals with step-by-step instructions embedded with the links that learners follow so as to solve the Web Quest Inquiry.

Evaluation enlightens learners regarding their performance that how it will be evaluated by making use of an evaluation rubric.

Conclusion supports reflection and recapitulates what the learners have achieved during the whole process.

(Calsonic, 2009)²⁰

WQ is based on constructivist based learning theories, particularly Vygotsky’s and Piaget’s famous theories of cognitive development²¹. Dodge (1995) recommended two kinds of Web Quest- one is short term and the other one is long term. First kind of WQ i.e. short term is of one to three days and is composed of contrasting and comparing items whereas long term WQ is of more than three weeks or of around one month including analyzing and constructing information. A Web Quest is basically centered upon a single subject or in interdisciplinary way, and can be used by any age group. March (2003) stated²²

“A Web Quest is a scaffolded learning structure that uses links to essential resources on the World Wide Web and an authentic task to motivate students’ investigation of a central, open-ended question, development of

individual expertise and participation in a final group process that attempts to transform newly acquired information into a more sophisticated understanding. The best Web Quest do this in a way that inspires students to see richer thematic relationships, facilitate a contribution to the real world of learning and reflect on their own met cognitive processes.”

Thus, Web Quest found as a suitable approach for fully engaging learners in their respective projects, and is basically grounded on the inquiry-oriented learning, the scaffolded learning, met cognition, the problem-based learning, and the project-based learning. WQ is a key strategy that can help in promoting student engagement in technology-assisted environment. In this way, learners try to gain knowledge by first retrieving then contributing first hand information on the internet or web as well as offering help to each other in the group²³. Web Quest proposed such learning activities that signify unique manner wherein constructivist pedagogy as well as latest technology come into an integrated form in order to confront the cognitive abilities of learners. Such types of activities are found to be effective for boosting encouragement as well as performance of learners²⁴. Nowadays educators continuously look for ways for enhancing student engagement in different types of activities, projects or tasks with the help of WQ approach²⁵. The Web Quest approach helps in determining the evaluation part of learning and the expected learning outcomes. With respect to student engagement and the Web Quest, some case studies have been done, out of which most of them indicating to usage of the Web Quest as a way of stimulating engagement of learners at different levels of education. Simpson (2003) examined that Web Quest usage in learning science positively engage students²⁶. Unal, Bodur, and Unal (2012) indicated that engagement in learning activities promotes collaboration among students and nurtures independent type of learning²⁷. Asunka (2016) found that the Web Quest help in achieving the desired objectives as well as increasing the level of engagement of students.

CONCLUSION

The above-discussed literature suggests new ways to address the issues and concerns of the present educational system. Web 2.0 technology has made great influence on the education sector and currently students are more prone towards the use of this technology. From

the above discussion, it can be concluded that out of the many tools of Web 2.0 technology currently accessible for practice in educational settings, Web Quest offer an effective approach to fully engage learners throughout the process of learning. Web Quest, in the form of a webpage or website figures a challenge by providing links to web-based resources, and lies under the constructivist paradigm relating to technology assisted teaching and learning wherein learners of any age group and level partake. Web Quests can be fruitful in drawing attentiveness of learners towards the classroom lectures so as to raise their academic performance, and thus promoting student engagement in various academic activities. Student engagement proves to be crucial to student motivation throughout the process of learning, meaning thereby more the learners are engaged or encouraged to learn, the more are the chances of their success in assigned tasks. Various factors influence student engagement including, teacher skills and motivation, students’ interest, faculty-student relationships, parental involvement as well as efficient practice of appropriate technology. Thus effective technology should be employed for creating an inspiring environment where in learners remain fully engaged in the process of learning.

Teacher Effectiveness and Adjustment in Relation to Organizational Politics in Bhutan

Kamalpreet Kaur¹, Thinley Wangchuk²

¹Assistant Professor, ²Research Scholar, Lovely Professional University, Punjab, India

ABSTRACT

The aim of this paper was to explore teacher effectiveness and adjustment in relation to organizational politics'. The study was geared towards finding the levels of teacher effectiveness, adjustment, and perception of teachers' towards organizational politics and comparing male and female secondary school teachers on these variables. Further, it was aimed at examining the relationship among three variables. The study revealed that effectiveness and adjustment of teachers and their perception towards organizational politics is independent of their gender. Also, the results brought into light that teacher effectiveness has very low correlation with organizational politics. Teacher adjustment however has moderate and negative correlation with organizational politics.

Keywords: *Teacher Effectiveness, Teacher Adjustment, Organizational Politics*

INTRODUCTION

Education is a channel through which learning takes place and what is to be learned (like knowledge, skills, values, beliefs, and habits etc) gets transferred from a group of people to other people through various modes like storytelling, discussion, teaching, training, or research. The role of a teacher in this regard is therefore pivotal. The major factor contributing in quality education is the availability of quality teachers and hence it becomes crucial to understand some of the parameters which can impact the teachers.

The production of better citizens lies in the hands of effective teachers and effective teachers are those who dare to put their soul into their role. They are the teachers who know how to work efficiently for the better realization of educational goals. Therefore, teachers who are dynamic in skills and capabilities can be considered effective teachers. Such teachers, reaches and teaches every student with suitable strategies and techniques enhancing not only academic performance of students but also students' wholesome development with the display of his/her good traits¹. presented his view that an effective teacher besides imparting allotted educational curricula in efficient manner ensures optimum development of the students². concluded teacher effectiveness with broader outlook. According to them, at all educational

level, teacher effectiveness is the set of characteristics, competencies and behaviours of teachers³. The effective teachers possess certain characteristics that make them so special in educational fraternity. These characteristics are: organization and clarity in their work, ability to apply analytical /synthetic approach, possess dynamism and enthusiasm, awareness about ways of teacher student interaction, and instructor-individual student interaction. Mumthas & Anwar conducted study in Kerala to see whether teachers with high tacit knowledge are effective. In their relation with students, teachers with high tacit knowledge were found to be effective⁴. Satisfactoriness of classroom procedures, passion for teaching, and command over subject matter were found to be relatively high in these teachers but they lack in stimulation and affective gains in students.⁵

Studied the impact of organizational climate on teacher effectiveness of 100 elementary school teachers Jharkhand. The major finding of this study was that open climate exists in government school and it is here where maximum number of effective teachers were present⁶. Private schools exhibited the prevalence of closed climate where maximum number of ineffective teachers was also found to exist. also explored effects of teacher job satisfaction on teaching effectiveness. It was found that teacher job satisfaction has positive significant effect on teaching quality assurance; teaching quality

assurance and job satisfaction has a positive significant effect on teaching effectiveness.⁷

On the similar lines Selamat et al., (2013) examined the influence of organizational climate on teachers' job performance in the district of Klang and found that that teachers in secondary schools were not able to accomplish their tasks and school climate was not so productive. Organizational climate was a major factor affecting the job performance of teachers. Similarly it was found by that the role efficacy of the senior secondary school principals is positively related to their professional competency and organizational climate.⁸

Further, analyzed the effect of leadership of principals and achievement motivation on teaching competence of 75 senior high public school teachers in Manado city, Indonesia⁹. It was found that teaching competence of teachers was positively affected by principals' leadership and achievement motivation. In addition to this, studied impact of leadership on teachers' effectiveness. It was founded that motivations of educators, job satisfaction, organizational commitment, organizational citizenship and teacher leadership were some of the leadership factors strongly influential concerning empowerment. Transformational leadership was considered appropriate practice that strongly influences teachers' effectiveness.¹⁰

A much related concept to teacher effectiveness is teacher adjustment. It is a state of full satisfaction of teacher's needs and the claim of his environment¹¹. studied adjustment of secondary school teachers in with respect to gender, workplace, marital status and academic results of 800 school teachers from Haryana, India. The result brought into light that the teachers who were reasonably satisfied and adjusted are efficient and provide improvement in education. It was also revealed that teacher adjustment level has direct linkage with his work efficiency¹². In addition to this, conducted a study in China with respondents from about 20 cities to bring into light the effect of proactive personality and organizational support on re-entry adjustment for returned teachers from universities and colleges abroad. Proactive personality was found to have positive effect on re-entry adjustment.¹³

In organization, politics are like fire. When it is not in control, it goes big and becomes a mess as its use is diverted for personal gains rather than for organizational benefits. conducted study to find out whether perceptions

of politics act as mediator between supervisor's leadership style and employees' performance¹⁴. It was found that organizational politics mediated only partially. The study also revealed direct relationship between leadership and performance. But, in their study on conducted a study on job satisfaction of employees found inverse relationship between job satisfaction and perception towards organizational politics¹⁵. Conversely, found that organizational politics has not affected much those employees who valued teamwork (in terms of job satisfaction).¹⁶

Furthermore, studied impact of organizational politics over organizational citizenship behaviour, commitment towards organization and job satisfaction among employees of organisations of Senegal.¹⁷ The findings indicated that employees perceiving higher levels of politics in organisation were less satisfied with their job and reported lower levels of organizational citizenship behaviour and commitment towards organization. In addition to this, explored social exchange perceptions as superseding between the relation of perceptions towards organizational politics and morale of employees. The result revealed that perceived organizational politics have negative correlation with social exchange but morale and social exchange is positively correlated. Further, it was found that politics perceptions and morale have negative correlation.¹⁸

Examined perceptions of employees of different organizations towards organizational politics and its affect on their perceptions towards organizational justice and employee turnover of public and private sector employees in Turkey. A significant effect of politics in organisation was found on organizational justice and intention of employees to leave^{19,20}. Supplementary to this, carried out a study "to predict employee job performance, organizational citizenship behaviours, and creativity proposing a three-way interaction of despotic leadership, leader member exchange, and perceived organizational politics of employees." It was found that tyrannical leadership was negatively related to employee outcomes i.e. job performance, organizational citizenship behaviours, and creativity and the effects are much highlighted under conditions of higher levels of organizational politics perceived.²¹

OBJECTIVES

1. To examine the levels of teacher effectiveness, teacher adjustment and organizational politics of secondary schools teachers.
2. To compare teacher effectiveness, teacher adjustment and perception of secondary school teachers towards organizational politics.
3. To examine the relation among teacher effectiveness, teacher adjustment and organizational politics.

HYPOTHESES

Secondary school teachers do not differ significantly in their teaching effectiveness with respect to gender

Secondary school teachers do not differ significantly in their adjustment patterns with respect to gender

There exists no significant difference between male and female secondary school teachers in their perception towards politics in their organization.

There exists no relation among teacher effectiveness, teacher adjustment and organizational politics of secondary school teachers.

METHOD

The data was collected from 150 teachers of two districts of Bhutan namely Samtse and Haa teaching in lower, middle and higher secondary schools by personally visiting to the teachers. Teacher Effectiveness Rating Scale by Dr. Umme Kulsum (2010), Mangal Teacher Adjustment Inventory (short form) by Dr. S.K. Mangal (2011), Organizational politics Scale by Dr. Upinder Dhar and Dr. Santosh Dhar (2008) were used to collect the relevant information from the teachers.

RESULTS AND FINDINGS

Levels of teacher effectiveness among secondary school teachers of Bhutan

Graph 1

From the graph 1, it is clear that out of 150 teachers, only 7% exhibits high level of effectiveness. This means that only 10 teachers are highly effective. The majority of teachers fall in average category of effectiveness constituting 79% of the total sample. This means that out of 150 teachers, 119 possess average type of

effectiveness. Further, 14% of teachers exhibited low level of effectiveness

Level of adjustment among secondary school teachers

Graph 2

Graph 2 reveals that secondary schools in Bhutan do not have many teachers with very good adjustment skill. Just 3 teachers out of 150 making up 2% of the selected sample fall under very good category of teacher adjustment. Even in good category or level of teacher adjustment, there are not many teachers. Only 23% or say just 35 teachers reflected this level of adjustment. The majority of teachers are in average group constituting only 44% of the total sample and 31% teachers are showing lower levels of adjustment.

Levels of Perception towards Organizational Politics

Graph 3

Graph 3 further shows that school being an organization is not free from politics. None of the respondents had perception that there isn't politics in schools. Out of all 150 secondary school teachers, 61% perceive normal level of politics in their organization which is otherwise required for the progressive

functioning of the organization as without normal politics organization may become static buildings producing no outputs. Rest of 39% of the teachers perceived that politics in their schools is on higher side.

Teacher effectiveness with respect to gender

Table 1 Gender Wise Difference in Teacher Effectiveness

Variable	Gender	N	Mean	SD	Mean Difference	df	t	p-value (2-tailed)	Remarks
Teacher Effectiveness	Female	70	472.71	124.79	-1.15	148	-0.1	0.95	Insignificant
	Male	80	473.86	101.69					

From the table 1, it can be seen that overall teaching effectiveness also does not differ across genders. Mean value of males (473.86) in teacher effectiveness is higher than mean value of females (472.71) but this difference is also not significant by chance factor as p-value for difference in sample is 0.95 which is far greater than 0.05. So, the difference is trustworthy and dependable to say that males and females do not differ in their effectiveness leading to the acceptance of null hypothesis that male and female secondary school teachers exhibit statistically same levels of teaching effectiveness. Hence, it can be concluded that gender does not influence the effectiveness of teachers.

Teacher adjustment with respect to gender

Table 2. Difference in Samples in Teacher Adjustment

	Gender	N	Mean	SD	SED	df	Mean Difference	t	Sig. (2-tailed)	Remark
Teacher Adjustment	Female	70	47.87	8.69	1.04	148	1.59	0.95	0.34	Insigni-ficant
	Male	80	46.28	11.44	1.28					

Table 2 indicates difference between average score of female and male teachers in their adjustment. Female teachers exhibited higher level of adjustment (M= 47.87, SD= 8.69) in comparison to male teachers (M= 46.28, SD= 11.44). Test for significance of differences between means shows that difference between the adjustment of school teachers with respect to gender is insignificant ($p= 0.34 > 0.05$). So, the null hypothesis that teachers do not vary in their adjustment patterns with respect to their gender is accepted. Though a slight difference is seen in the mean scores, statistically, the difference is insignificant meaning thereby teacher adjustment is independent of gender.

Perception towards organizational politics with respect to gender

Table 3. Dimension Wise Analysis of Difference in Samples on Perception towards Organizational Politics

Dimension of organizational Politics	Gender	N	Mean	SD	Mean Difference	df	T	p-value (2-tailed)	Remarks
Compliance non-compliance	Female	70	44.03	7.24	-1.35	148	-1.17	0.24	Insignificant
	Male	80	45.38	6.79					
Loyalty-disloyalty	Female	70	29.11	5.78	-0.06	148	-0.68	0.95	Insignificant
	Male	80	29.18	5.19					
Self-Centered organization centered	Female	70	18.66	3.37	-1.44	148	-2.63	0.01	Significant
	Male	80	20.1	3.32					
Pretentious-Non-Pretentious	Female	70	17.2	3.33	-0.96	148	-1.98	0.05	Significant
	Male	80	18.16	2.61					
Deceptive-Credible	Female	70	16.94	3.13	-0.64	148	-1.35	0.18	Insignificant
	Male	80	17.59	2.66					
Manipulative-Non Manipulative	Female	70	6.69	1.59	-0.14	148	-0.53	0.6	Insignificant
	Male	80	6.83	1.64					
High Power Orientation-Low Power Orientation	Female	70	13.91	3.24	-0.65	148	-1.28	0.2	Insignificant
	Male	80	14.56	2.98					
Impractical-Practical	Female	70	7.51	1.59	-0.44	148	-1.76	0.08	Insignificant
	Male	80	7.95	1.45					
Illegitimate Interests-Legitimate interests	Female	70	3.2	0.89	-0.19	148	-1.42	0.16	Insignificant
	Male	80	3.39	0.72					
Overall organizational politics	Female	70	157.3	24.13	-5.87	148	-1.59	0.11	Insignificant
	Male	80	163.1	21.01					

Looking at the table above, it is clear that perception on organizational politics indicates that the both male and female teachers perceive statistically equal levels of politics in their organization with p-value of difference between means as 0.11. Further, a look at dimension wise analysis indicates that this difference is also insignificant in all the dimensions of organizational politics except for two dimensions namely Self-Centered organization centered; Pretentious-Non-Pretentious for which p-values are 0.01 and 0.05 respectively. But concluding as a whole it is clear that males and females have similar kind of perceptions towards organizational politics.

Relationship among teacher effectiveness, teacher adjustment and organizational politics

Table 4. Correlation between Teacher Effectiveness, Teacher Adjustment, and Organizational Politics Perception

Organizational Politics	N	Teacher Effectiveness	Teacher Adjustment
	150	r = -0.103	r = -0.442

From the table 4, it can be interpreted that coefficient of correlation between teacher effectiveness and organizational politics is very low meaning thereby that effectiveness of teachers have nothing to bear with politics in organization. So, it can be interpreted that efficiency is least influenced by the work culture and working environment of organization but dependent upon the skills of the teachers. Highly skilled teachers can teach efficiently in any kind of work environment. Further, teacher adjustment has moderate negative correlation (-0.44) with organizational politics indicating that increase in politics in organisation will lead to lower the adjustment levels of teachers.

SUGGESTIONS

Similar research can be carried out by increasing the sample size and extending the data collection from other districts as well.

Further research can be carried out on teachers of higher education as well.

Organizational politics can be explored with other variables and all three variables considered in this study could be studied separately for better conceptualization.

Studies on organizational politics can be conducted in comparative form like to compare the politics with respect to the type of organisation

ABSTRACT

This paper describes about the research and integration of IoT based solar photovoltaic panel health monitoring system. The proposed system comprises of four thermocouple K-Type sensors each one is connected to adafruitMAX31855 thermocouple amplifier, one INA219 adafruitvoltage/current sensor and Raspberry Pi Zero Wireless. The thermocouple sensors each one is connected to adafruitMAX31855 thermocouple amplifier are installed at the back on the solar photovoltaic panel at measured distance between the sensors to sense the solar photovoltaic panel's temperature. The one INA219 adafruitvoltage/current sensor is connected at the positive output wire of solar photovoltaic panel to sense and measure the amount of voltage/current produced. The sensed and measured values at the thermocouple sensors and voltage/current sensor are recorded into the Raspberry Pi ZeroWireless temporary storage. The recorded data in the Raspberry Pi Zero Wireless is then pushed into cloud system to ease the solar photovoltaic panel health monitoring and analysis via the website. This paper will explain the overall research and integration output of the proposed project and validate the recorded results based on the developed methodology.

INTRODUCTION

Electricity is the most basic requirement for everyone in today's modern world¹. Due to the requirement the electricity energy consumption have shown large utilization and increment². Hence, concurrently the fossil-fuel sources used to generate the electricity is diminishing as well³. Also, the volatility of oil prices as well as increasing worldwide concern on the carbon dioxide (CO₂) emissions has led towards the evolution of renewable energy such as solar, wind, hydro etc concepts based systems over the recent years⁴. At different part of the world and based on the climate nature, respected renewable energy source type of system has been developed to accommodate their increasing energy requirement. One of the most emerged and appropriate renewable energy system is solar photovoltaic (PV). The PV system has been continuously gaining attention among the players in the solar industry all around the globe^{4,5}. With the growing demand among the players

in solar industry, the manufacturing and deployment solar photovoltaic have increase drastically in this recent years⁴.

As solar photovoltaic system emerged as most promising technology to meet the demand for electricity growth⁶, monitoring PV system is necessary to allow their holders to maintain and observe the installed PV system⁷. Another reason to monitor the PV system is because solar PV systems are installed at location where is not accessible to grid network electricity and installed solar PV system at such locations tend to be installed with monitoring system⁸. Such locations also have lack of technical manpower to perform operation check and maintenance on the solar PV system. This also hinder one to regularly check the system performances and record the output data⁸. Looking at the briefly discussed restrictions, it is necessary to install PV system with monitoring system to allow the system to perform up to the mark⁸. Also monitoring system would also assist one

into carrying out the preventive maintenance when it is necessary.

In⁸ is mentioned that due to lack of schedule service and maintenance, PV system tend to fail and the failure can be subjected to many related components. One of the frequently failed component is photovoltaic panel performances. Prieto in⁴, proposed wireless sensor network based system for individual monitoring of panels. This system sensed meteorological and solar radiation data to optimize energy production based on surrounding ambient temperature and condition. In another research⁶, monitoring PV system is developed. This system comprises of acquisition layer, pretreatment and recording layer and supervision, storage and web services layer. The acquisition layer consists of wireless sensor network that collect the information from the solar panel and meteorological. Next layer is pretreatment and recording, which manages the receive data from the wireless sensor network and temporary store the received data into the data logger. Then the temporary stored data into the data logger is then send to supervision, storage and web service layer⁶. In⁹ microchip PIC18F4550 microcontroller is used to develop the proposed system. The system proposes to allow the users to check the photovoltaic panel temperature and radiation which satisfies the performance of the photovoltaic panel based on the datasheet. Research by M. Vyas¹⁰, uses Labview software to monitor the photovoltaic panel's cell output voltage and at the same time provides updates on the system's status. In another research¹¹, a system integrated with pyrometer and temperature sensor is introduced. This system monitors the solar irradiance and temperature of the system, as well as is used to perform further analysis on the developed system. In¹², data acquisition system which records real-time data such as voltages from solar panel and track the system using sunlight information using the Arduino on the LabVIEW Makers Hub software.

In this context, the main objective of this paper is to research and integrate the IoT scheme to monitor the photovoltaic panel health condition which can assist to gather the real-time photovoltaic panel information. The research is to understand the current available technology for solar photovoltaic system and in some specific finding in regards to photovoltaic panels too. Understanding this research finding helps this research to develop the new methodology for it's proposed idea.

The remaining of the paper has been arranged as following: 1) Overview of the Proposed System, 2) Methodology of Hardware Development and Integration, 3) Results and Discussions, 4) Conclusion and 5) Acknowledgement.

Overview of the Proposed System

As explained, due to the increasing electricity demand and requirement to monitor the performances of the solar photovoltaic system, each component of the system has to be monitored. Hence, this paper proposes an IoT based Solar Photovoltaic Panel health monitoring system. This section will explain and describe the conceptual development of the proposed idea.

Figure 1 shows the conceptual development idea and suggestion of sensors placement at the back of the photovoltaic panel. Four units of thermocouple sensors with adafruit max31855 thermocouple amplifier and one INA219 adafruit voltage/current sensor are integrated with the Raspberry Pi ZeroWireless. The conceptual design is developed based on the study carried out in the introduction section. The thermocouple sensors with adafruit max31855 thermocouple amplifier are placed at the back of the photovoltaic panel to sense and measure the generated heat on photovoltaic panel top. The voltage/current sensor is connected in series at the positive wire of the photovoltaic panel to sense the produced voltage and current. All of these sensors are then connected to the Raspberry Pi ZeroWireless.

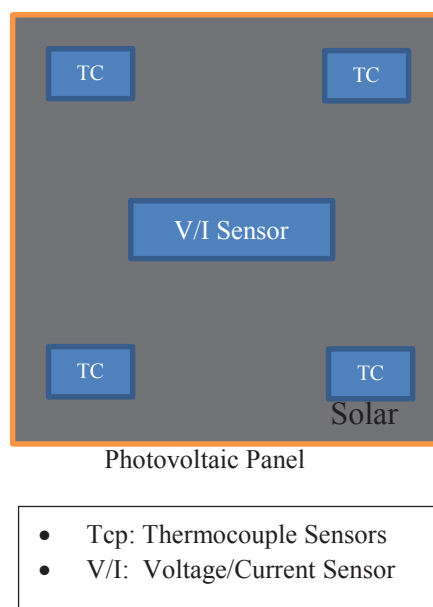

Figure 1: Top View of Conceptual Development

Once the conceptual development has been finalized and all the sensors and system connectivity have been decided, the conceptual idea needs to be illustrated for it to be seen and understandable. Hence, Figure 2 shows the conceptual development idea discussed in Figure 1 is illustrated using the fritzing software. All the sensors connection are also strictly followed as explained earlier to avoid any mistake. Solar panel and battery is used to show the complete system connectivity and the sensors arrangement according to the system objective.

Table 1 is explaining the connectivity referencing for thermocouple sensors with adafruit max31855 thermocouple amplifier and one INA219 adafruit voltage/current sensor with the Raspberry Pi ZeroWireless. The “THERMO1, THERMO2, THERMO3 and THERMO4” thermocouple sensors are attached at the back of the photovoltaic panel. While the input of the INA219 voltage/current sensor is connected at the positive wire of the photovoltaic panel.

Table 1: Connectivity Reference for Thermocouple Sensors

Wiring Colour	Description
Red	VCC – Power Supply 3.3V, 5V, 12V
Black	GND – Ground
White	SCL – Serial Data
Orange	SDA – Serial Clock
Green	DO – Digital Output
Yellow	CS – Chip Select
Blue	CLK – Clock

Connection of INA219 Adafruit Voltage/Current Sensor with Raspberry Pi Zero Wireless

- Connect Pi 3.3V to INA219 VCC
- Connect Pi GND to INA219 GND
- Connect Pi GPIO 02 to INA219 SDA
- Connect Pi GPIO 03 to INA219 SCL

Connection of Adafruit MAX31855 thermocouple Amplifier

Connect Raspberry Pi Zero Wireless Pin 3.3V to MAX31855 Vin

Connect Raspberry Pi Zero Wireless Pin GND to MAX31855 GND

Connection Thermocouple Amplifier (TC1):

Connect Raspberry Pi Zero Wireless Pin GPIO 22 to MAX31855 DO

Connect Raspberry Pi Zero Wireless Pin GPIO 27 to MAX31855 CS

Connect Raspberry Pi Zero Wireless Pin GPIO 17 to MAX31855 CLK

Connection Thermocouple Amplifier (TC2):

Connect Raspberry Pi Zero Wireless Pin GPIO 11 to MAX31855 DO

Connect Raspberry Pi Zero Wireless Pin GPIO 09

to MAX31855 CS

Connect Raspberry Pi Zero Wireless Pin GPIO 10 to MAX31855 CLK

Connection Thermocouple Amplifier (TC3):

Connect Raspberry Pi Zero Wireless Pin GPIO 23 to MAX31855 DO

Connect Raspberry Pi Zero Wireless Pin GPIO 24 to MAX31855 CS

Connect Raspberry Pi Zero Wireless Pin GPIO 18 to MAX31855 CLK

Connection Thermocouple Amplifier (TC4):

Connect Raspberry Pi Zero Wireless Pin GPIO 07 to MAX31855 DO

Connect Raspberry Pi Zero Wireless Pin GPIO 12 to MAX31855 CS

Connect Raspberry Pi Zero Wireless Pin GPIO 08 to MAX31855 CLK

Methodology of Hardware Development and Integration

Figure 3: Placement and Integration of Thermocouple Sensors at the back of Photovoltaic Panel.

This section explain and show the methodological integration process of the proposed IoT based solar photovoltaic panel health monitoring system. The thermocouple K-Type sensors (TC Sensor A, TC Sensor B, TC Sensor C and TC Sensor D) with adafruit MAX31855 thermocouple amplifier is attached at the back of the photovoltaic panel. These sensors are connected to the adafruit MAX31855 thermocouple

amplifiers before connecting to the Raspberry Pi Zero Wireless. The adafruit MAX31855 thermocouple amplifier is used to amplify the small signal received from the thermocouple k type and store the readings into the temporary storage in the Raspberry Pi Zero Wireless. The INA219 adafruit voltage/current sensor is used to sense and measure the output voltage at the respective photovoltaic panel.

Figure 4: Complete Hardware System Integration and Installation

Table 2: Reference Table for Figure 4

Number Component	Hardware
1	Solar Panel
2	Solar Power Inverter DC 12V to AC 220V
3	Lamp
4	Thermocouple K-Type (A, B, C, D)
5	Thermocouple Amplifier (MAX31855)
6	Solar Charger
7	PCB Current Divider
8	Raspberry Pi Zero Wireless
9	Voltage/Current Sensor (INA219)
10	PCB GPIO 40 Pins
11	Rechargeable Battery 12V

In the following section the results recorded for the thermocouple K-Type sensor integrated with adafruit MAX31855 thermocouple amplifier and INA219 adafruit voltage/current sensor is presented. The results shows that the thermocouple K-Type sensor and INA219 voltage/current sensor has effectively managed to achieve the objectives to record the photovoltaic panel data to observe the photovoltaic panel's health.

RESULTS AND DISCUSSIONS

Thermocouple K-Type Sensor and INA219 Voltage/Current Sensor

The presents the sensed and measured results for the thermocouple K-Type sensor and INA219 voltage/current sensor. The presented reading in Figure 5 shows reading taken before 11 a.m. and after 11 a.m. The reading taken after 11 a.m. is recorded till 6p.m. in the evening. Based on the Figure 5 reading shows the temperature of the photovoltaic panel increases due to environment temperature increase.

Figure 6 presents the sensed, measured and calculated power at the photovoltaic panel. According to the trend, the voltage and current before 11a.m. stays constant, starts decreasing after 11a.m. When the voltage and current of the photovoltaic panel decreased after 11a.m., the output power also decreases.

Figure 5: Sensed and Measured Temperature at Photovoltaic Panel.

Figure 6: Sensed and Measured Voltage, Current and Calculated Power.

Google Cloud - Current, Voltage and Temperature

This section presents the recorded results of voltage, current and temperature at the google cloud which is setup using the google drive. Figures 7 and 8 shows the voltage, current and temperature values for INA219 voltage/current sensor and all the FOUR (4) thermocouple k-type sensors are recorded into the google cloud. These data is initially recorded in the SD Card at the Raspberry Pi Zero Wireless before being pushed into the google cloud.

CONCLUSION

This paper presents the conceptual and methodological process of setting up IoT based solar photovoltaic panel health monitoring system for an individual photovoltaic panel. From measured and recorded results, the real-time voltage, current and temperature recorded into the SD Card of Raspberry Pi Zero Wireless is sent to the google cloud for consumers viewing. The presented voltage and current results are varying with respect to the environment condition which also indicate the respective photovoltaic panel's health condition. The results recorded into the google cloud also shows that the recorded data at the SD Card of Raspberry Pi Zero Wireless is successfully transfer via the wireless network technology. Apart from that, the successfulness of implementing the IoT based solar photovoltaic panel health monitoring system shows that the technological implementation could help to reduce the fatigue at the photovoltaic panels and could be easily detectable when any fatigued condition occurs at photovoltaic panel.

Challenging Issues for Educating the Disabled Children in Inclusive Education System

Arsi Prasad Jha

Research Associate (Psychology), Anthropological Survey of India, WRC, Pratap Nagar, Udaipur-313001 (Raj)

ABSTRACT

The aim of this study is to find out the academic problems and challenging issues i.e. ratio of disabled and non-disabled student in inclusive education system/school, type (nature) of enrolled disabled student, age of disabled student at school enrolment's time, academic achievement of disabled student, facilities for disabled children in school and attendance ratio in school among disabled student (now divyang) in inclusive education set-up. Thirtyone disabled and thirty one normal (non-disabled) students were selected from eight rural government secondary/senior secondary schools of Udaipur district of Rajasthan which run under inclusive education system. Both disabled and non-disabled students were studied. They were enrolled in class 8th to 12thstd. and age range from 14 to 18 years. Purposive sampling method was a criterion of samples' selection. Results showed that disabled personnel were weak in their own academic achievement. They enrolled in later age at school level than normal student. Disabled student participation ratio was lesser (0-3 % disabled children in total enrolled student) but their absence ratio (averagely 10-12 presence days out of working days of 1 month) was higher than non-disabled children in their school. Majority of disabled were found either physically challenged (n= 29) or dead and dumb (n= 2). Blind and any other such specific disabled student were not found in these schools. No special teacher and professional rehabilitation worker found in these schools. Sometimes, block coordinator provides rehabilitation program through special education or any such activities. Foundation course and in-service program for disability education is not good in Rajasthan and few teachers (almost 10 percent) were trained through this program. ICT and facilities for disabled children in school were found negligible in the schools of rural area. All students (included disabled personnel) were getting the free education under different government schemes but, their progress rate and academic record was unsatisfactory. Overall, disabled student were psychologically and academically weak due to Lack of special educator/teacher, rehabilitation worker and psychologist.

Keywords: Academic, Achievement, Disabled, Enrolment, Inclusive, School.

INTRODUCTION

World Health Organization defined the disability as "Disability is an umbrella term, covering impairments, activity limitations, and participation restrictions. Impairment is a problem in body function or structure; an activity limitation is a difficulty encountered by an individual in executing a task or action; while a participation restriction is a problem experienced by an individual in involvement in life situations. Disability is thus not just a health problem. It is a complex phenomenon, reflecting the interaction between features of a person's body and features of the society in which he or she lives. Overcoming the difficulties faced by people with disabilities requires interventions to remove

environmental and social barriers."

For a long time, children with disabilities were educated in separate classes or in separate schools. People got used to the idea that special education meant separate education. But we now know that when children are educated together, positive academic and social outcomes occur for all the children involved. Inclusive education occurs when there is ongoing advocacy, planning, support and commitment.

As per Census 2011, in India, out of the 121 Cr population, about 2.68 Cr persons are 'disabled' which is 2.21% of the total population. In an era where 'inclusive development' is being emphasized as the right path

towards sustainable development, focused initiatives for the welfare of disabled persons are essential.

As per Census 2011, the number of disabled population in the state was recorded at 1,563,694, which is 5.83% of the disabled population in India. Population of persons with disability is 2.28 percent of the total population of Rajasthan. The disability population of 0-19 years is 273367 which is 17.64 percent of total disabled population of Rajasthan. Age of 0-19 years is pick time for getting the education and therefore it may be said that this age is golden age for both disabled and normal age group. Visual handicapped, hearing impaired, speech problems, movements, mentally retarded, mentally ill, others and multiple disabled are living in Rajasthan and their population is 314618, 218873, 69484, 427364, 81389, 41047, 199696 and 211223 respectively. In terms of literacy level among disabled, Rajasthan has second lowest position in the country, better only than Arunachal Pradesh. At all India level, 54.52% of the disabled persons are literates. However, in Rajasthan only 40.16% fall under the category ¹. In other words, in terms of the nature of disability in Rajasthan, about 3.1 lakh have problems in seeing, 2.1 lakh in hearing, 69,484 in speech, 4.2 lakh in movement while 2.1 lakh have multiple disabilities ¹.

Persons with disability are getting many benefits from government schemes. They get scholarship throughout the education by regular mode on the base of nature of disability. If any persons with disability buy the books or pay the fee of school, they get same amount by government. Government of Rajasthan (2014) reported that Rs.117.27 lakh were granted to 3292 persons with disability under the scheme of '*Wishesh Yogyajan Chatrawritti Yojna*', Rs. 82.92 lakh were granted to 5762 persons with disability under the scheme of '*Sanyukt Sahaayta A nudaan Yojna*', Rs.2.40 lakh were granted to 10 persons with disability under the scheme of '*Wishesh Yogyajan Anuprati Yojna*' and Rs.117.27 lakh were provided to 1362 persons with disability under the scheme of '*Mukhyamantri Wishesh Yogyajan Swarojgar Yojna*' from 13.12.2013 to 31.10.2014. Stipend in school, establishment of self employment and business, free coaching for competitive examination of UPSC, PSC, medical entrance, engineering entrance, etc. is granting through Rajasthan Government². Apart from this, all students get the free education, free books, uniform, free transportation from residence to school and return, free mid day meal (only for student of 1-5

std. of classes) under different government schemes.

The aim of this study is to find out the academic problems and challenging issues i.e. ratio of disabled and non-disabled student in inclusive education system/ school, type of enrolled disabled student, age of disabled student at school enrolment's time, academic achievement of disabled student, facilities for disabled children in school and attendance ratio in school among disabled student (now *divyang*) in inclusive education set-up³.

METHOD

SAMPLE SIZE AND TECHNIQUE

Thirty one disabled and thirty one normal (non-disabled) children were selected from the different locations of Udaipur district of Rajasthan. Selected samples were from 14 to 18 years. All selected samples were male. All non-disabled samples were looking normal and had no disability from any angle. Therefore they were considered normal (non-disabled) children and those persons who had hearing and speech problems were considered disabled children. The sample was collected from eight (out of eleven) rural government senior secondary schools of Udaipur district. Purposive sampling method was a criterion of samples' selection.

VARIABLES

Disability was independent variable and participation rate (ratio) of disabled student, type (nature) of disability in disabled children, age of disabled student at school enrolment's time, academic achievement of disabled student, facilities for disabled children were dependent variables. Light (sufficient sunlight), time (noon time of school hour), gender (male), age (14-18 years) and motivation for the work (establishment of workable rapport) were controlled throughout data collection.

INSTRUMENT

A personal data schedule was prepared by present researchers to get necessary information like the age, gender, locality, age at school enrolment's time, academic achievement (in percent) of previous class, participation rate, nature of disability, facilities in schools, etc.

PROCEDURE OF DATA COLLECTION AND ANALYSIS OF DATA

Good rapport establishment through verbal and

sign language was made with all samples. The subjects were also informed properly regarding the importance of present study. Data was collected from students (both disabled and non-disabled children), teachers and head of the academic institutions. Personal data sheet was given to them for screening and completing the research objectives. Ex post facto design was used in this study. SD, mean, t-value, percent and simple arithmetic calculation were used for drawing the result.

RESULTS AND DISCUSSION

Participation rate (ratio) of disabled students and non-disabled students in the inclusive education system/schools

Recently, Rights of persons with disabilities (RPWD) bill is passed on 14th December, 2016 in the Rajya Sabha and subsequently in the Lok Sabha on 16th December, 2016. The bill was further approved and signed by the Hon’ble President before the year end and ‘notified’ by the government in its official Gazette on 28th December, 2016. Thus, RPWD Bill 2016 was ‘enacted’ and became a ‘Law’, the rights of persons with

disabilities (RPWD) Act 2016. In this act, the types of disabilities have been increased from existing 7 to 21 and the central government will have the power to add more types of disabilities. The 21 disabilities are given below:

1. Blindness, 2. Low vision, 3. Leprosy Cured Persons, 4. Hearing Impairments (deaf and hard of hearing), 5. Loco-motor Disability, 6. Dwarfism, 7. Intellectual Disability, 8. Mental Illness, 9. Autism Spectrum Disorder, 10. Cerebral Palsy, 11. Muscular Dystrophy, 12. Chronic Neurological Conditions, 13. Specific Learning Disabilities, 14. Multiple Sclerosis, 15. Speech and Language Disabilities, 16. Thalassemia, 17. Hemophilia, 18. Sickle Cell Disease, 19. Multiple disabilities including deaf-blindness, 20. Acid Attack Victim, 21. Parkinson Disease.

But, only four disabilities are studied in the present study. In terms of the nature of disability in Udaipur district, 753962 have problems in seeing, 75235 in hearing, 73147 in speech, in 400577 movement disabilities while 109058 have multiple disabilities (Rajasthan Disability census, 2011).

Table No-1: Number of disabled student and non-disabled student in the inclusive education system/schools

Sl. No.	Types (levels) of Schools	Number of disabled student	Number of non-disabled student	Total enrolled Student in schools	Percent (%) of disabled student in the school
1	Secondary School (6 th -10 th levels' classes)	3	331	334	0.90%
2	Secondary School (6 th -10 th levels' classes)	0	302	302	0%
3	Senior Secondary School (6 th -12 th levels' classes)	8	437	445	1.80%
4	Secondary School (6 th -10 th levels' classes)	5	338	343	1.46%
5	Secondary School (6 th -10 th levels' classes)	0	315	315	0%
6	Secondary School (6 th -10 th levels' classes)	7	314	321	2.18%
7	Secondary School (6 th -10 th levels' classes)	0	310	310	0%
8	Secondary School (6 th -10 th levels' classes)	2	322	324	0.62%
9	Secondary School (6 th -10 th levels' classes)	2	333	335	0.60%
10	Secondary School (6 th -10 th levels' classes)	2	337	339	0.59%
11	Secondary School (6 th -10 th levels' classes)	2	351	353	0.57%
Total		31	3690	3721	Range : 0-2.18%
Mean		2.82	335.45		

Results in table no-1 show that three schools out of eleven schools have no disabled student in the schools. In other words, disabled students are not found to be enrolled in 27.27 percent schools. This result indicates that disabled students are not enrolled in every school.

The above data also showed that the schools are having only 0-2.18 percent disabled student while normal student representation is 99.17 percent. The gap of admission in the school is very high between disabled and non-disabled. In present study, equal number of samples is taken from each schools and the average of samples' size was 3.75 from each schools. Minimum two samples and maximum eight samples of school going students from each school are selected from the all selected eight (out of eleven) schools.

Type (categorization) of disabled student in the inclusive education system/schools

Above table no-2 showed that neither visual neither handicapped nor mentally retarded are found to enroll in the schools under inclusive education system. Ratio of admission is highest of the physically handicapped (i.e. 93.55 percent) while persons with Hearing and Speech Problems are found less (i.e. 6.45 percent) under category of disabled student in inclusive education system. In other words, Majority of disabled were found either physically challenged or deaf and dumb. Blind and any other such specific disabled student were not found in these schools

Table No-2: Category wise number of disabled student in the inclusive education system/schools

Hearing Disabled Speech Problems	Visual Handicapped	Mentally Retarded	Physically Handicapped	Total
02	00	00	29	31

In table no.-3, result indicates that mean value of disabled and non-disabled children for age (in years) at admission in school is 06.81 and 06.16 respectively. A significant mean difference (t-value = 2.031, df = 59, $p < .01$) is found between the disabled and non-disabled children on the scores of age (in years) at admission in school. High scores on age (in years) at admission in school indicate the disabled students are enrolled in later age at school level than non-disabled student (normal student) in the inclusive education system/schools. The mean score of non-disabled children's age (in years) at admission in school is significantly lower than the disabled children under the schools of inclusive education system. In other words, result of table no-3 indicates that non-disabled students have enrolled earlier than disabled students in the schools of inclusive education system.

Table No.-3: Comparison of mean score of age (in years) at admission in school between disabled and non-disabled student in the inclusive education system/schools

Group	N	Mean (in years)	SD	SEM	SED	t-value	p-value (df =59)
Disabled Student	31	06.81	01.28	0.23	0.32	2.031	$p < .05$
Non-Disabled Student	31	06.16	01.24	0.22			

According to table no-4, mean value of disabled and non-disabled children for academic achievement (previous academic examination result) is 47.26 and 52.58 respectively. SD for academic achievement is 5.64 and 2.24 respectively for disabled and non-disabled children. A significant mean difference (t-value = 4.881,

df =59, $p < .01$) is found between the disabled and non-disabled students for academic achievement under the schools of inclusive education system. Low scores on academic achievement (previous academic examination result) among disabled students shows that they are weak in their own study, examination result and academic

achievement. The mean score of non-disabled children's academic achievement is significantly higher than the disabled children. In other words, result of table no-4 clearly indicates that disabled student have lesser score

on academic achievement than non-disabled student. Therefore, it is proved that disabled personnel are weak in their own academic achievement and their progress rate and their academic record was found unsatisfactory.

Table No.-4: Comparison of means between academic achievement (in percent of previous academic examination result) of disabled student and non-disabled student in the inclusive education system/schools

Group	N	Mean (In %)	SD	SEM	SED	t-value	p-value (df =59)
Disabled Student	31	47.26	05.64	1.01	1.09	4.881	p <.01
Non-Disabled Student	31	52.58	02.24	0.40			

This data represents attendance for the month of January 2018 and this month has three normal holidays and four Sundays. This month has twenty four working days and attendance is calculated on the base of these working days.

Table No.-5: Comparison of means between attendance (presence of one month) of disabled student and non-disabled in the inclusive education system/schools

Group	N	Mean	SD	SEM	SED	t-value	p-value (df =59)
Disabled Student	31	11.42	02.67	0.48	0.73	4.863	p <.01
Non-Disabled Student	31	14.97	03.05	0.55			

In above table no.-5, result indicates that mean value of disabled and non-disabled student for attendance (presence of one month) is 11.42 and 14.97 respectively. A significant mean difference (t value = 4.863, df = 59, p<.01) is found between the group of disabled and non-disabled children for attendance and presence in their class within the school. The mean score of non-disabled student is significantly higher than the disabled student. In other words, disabled student has lesser scores on attendance of their class and their absence ratio is higher (10-12 presence days out of working days of 1 month) than non-disabled children in their school.

Table No.-6: Numbers and percent of teacher, special educator and rehabilitation worker in the inclusive education system/schools

Sl. No.	Types (levels) of Schools	Number of general trained teacher (B.Ed. Teacher)	Number of special trained teacher (B.Ed. special Teacher)	No. of professional rehabilitation worker	Total trained (general and special) teacher	Percent (%) of special trained teacher (B.Ed. special Teacher)
1	Secondary School (6 th -10 th levels' classes)	4	0		4	0%
2	Secondary School (6 th -10 th levels' classes)	5	0		5	0%
3	Senior Secondary School(6 th -12 th levels' classes)	9	0		9	0%
4	Secondary School (6 th -10 th levels' classes)	3	0		3	0%
5	Secondary School (6 th -10 th levels' classes)	5	0		5	0%

6	Secondary School (6 th -10 th levels' classes)	3	0	3	0%
7	Secondary School (6 th -10 th levels' classes)	4	0	4	0%
8	Secondary School (6 th -10 th levels' classes)	4	0	4	0%
9	Secondary School(6 th -10 th levels' classes)	3	0	3	0%
10	Secondary School(6 th -10 th levels' classes)	3	0	3	0%
11	Secondary School (6 th -10 th levels' classes)	6	0	6	0%
Total		49	0	0	49
Mean		4.45	0	0	

In above table no.-6, result indicated that problems of shortage of teachers can be seen in every school whether of secondary level school or senior secondary level school. In Rural area of Rajasthan, shortage of permanent teacher is major challenging issue and students (both disabled and non-dabled student) are suffering due to this reason. Results of their board examination are also adversely affected by these reasons. During collection of the data, it was found that some schools are running without headmaster and principal. Mostly schools have 3 teachers while the need is of more than ten teachers in every school. It is also observed that some schools are presently having para teacher and some

of them are untrained. They work in lesser salaries and don't get the salary on time. Anganwadi centre, primary school and senior/secondary schools are situated in same campus in the state of Rajasthan. No special teacher and professional rehabilitation worker are found in these schools. There is no sanctioned post of special educator and professional rehabilitation worker in general schools in the state of Rajasthan. Therefore, disabled students depend on general education. Teachers of general education are qualified for teaching the general students and they don't study about any issues of disabilities in their B.Ed. curriculum.

In Service training program for Teachers

Table No.-7: Participation in Foundation course, In Service Training and General Short Term training by the teachers in the inclusive education system/schools

S I . No.	Types (levels) of Schools	Number of teacher in general education	No. of Foundation course on disability education(in 2017-2018)	No. of In Service Training Program on disability education(in 2017-2018)	Percent (%) of participation in the training of special education by the teachers
1	Secondary School (6 th -10 th levels' classes)	4	0	0	0%
2	Secondary School (6 th -10 th levels' classes)	5	0	1	20%
3	Senior Secondary School(6 th -12 th levels' classes)	9	1	0	11.11%
4	Secondary School (6 th -10 th levels' classes)	3	0	0	0%
5	Secondary School (6 th -10 th levels' classes)	5	1	0	20%
6	Secondary School (6 th -10 th levels' classes)	3	0	0	0%

Cont... Table No.-7: Participation in Foundation course, In Service Training and General Short Term training by the teachers in the inclusive education system/schools

7	Secondary School (6 th -10 th levels' classes)	4	0	0	0%
8	Secondary School (6 th -10 th levels' classes)	4	0	1	25%
9	Secondary School(6 th -10 th levels' classes)	3	0	0	0%
10	Secondary School(6 th -10 th levels' classes)	3	0	0	0%
11	Secondary School (6 th -10 th levels' classes)	6	0	1	16.67%
Total		49	2	3	10.20 %
Mean		0.10			

In table no.-7, result indicated that only 4.08 percent teachers are found trained through foundation course on disability education and 6.12 percent teachers are found trained through 'In Service Training Program'. Therefore, result shows the ratio of training through foundation course and 'In Service Training Program on disability education' for general teachers is very low and such situation adversely affects the academic atmosphere and performance of disabled students in the schools of inclusive system. District coordinator (disabled/integrated education) and block coordinator provides rehabilitation program through special education or any such activities under 'Sarwa Shiksha Abhiyan' of Rajasthan Government. General observation and above results clearly indicates that foundation course and in-service program for disability education is not good in Rajasthan and few teachers (almost 10 percent) were trained through this program.

ICT and other facilities for disabled student in the inclusive education system/schools

In table no.- 8, result indicates that every school have their own computers. But maximum computers are not in working condition and battery backup is also poor. In rural area of Rajasthan, some villages are not connected with electricity. In some schools, computer is lying sealed and packed in box for long time. Post of computer operator/technician is not sanctioned in the government schools of Rajasthan. No teacher in the schools are ready to operate these computer systems. Connectivity is poor and till date all villages are not fully connected by mobile, information technology and internet. ICT facilities for disabled children in school are found negligible in the schools of rural area.

Table No.- 8: ICT and other facilities in the inclusive education system/schools

Sl. No.	Types (levels) of Schools	Number of computer	Internet facility	Play ground	Toilet	Ramp and other specific facilities for disabled student
1	Secondary School (6 th -10 th levels' classes)	1	0	Yes	1	Ramp 1
2	Secondary School (6 th -10 th levels' classes)	1	0	Yes	1	Ramp 1
3	Senior Secondary School(6 th -12 th levels' classes)	1	1	Yes	2	Ramp 1
4	Secondary School (6 th -10 th levels' classes)	1	0	Yes	1	No
5	Secondary School (6 th -10 th levels' classes)	1	0	Yes	1	Ramp 1
6	Secondary School (6 th -10 th levels' classes)	1	0	Yes	2	No

Cont... Table No.- 8: ICT and other facilities in the inclusive education system/schools

7	Secondary School (6 th -10 th levels' classes)	1	0	Yes	1	Ramp 1
8	Secondary School (6 th -10 th levels' classes)	1	0	Yes	1	No
9	Secondary School(6 th -10 th levels' classes)	1	0	Yes	1	Ramp 1
10	Secondary School(6 th -10 th levels' classes)	1	0	Yes	1	No
11	Secondary School (6 th -10 th levels' classes)	1	0	Yes	1	Ramp 1
Total		11	1	11	13	7(Only Ramp)
Mean		1	0.09	1	1.18	63.64

In table no.- 8, result indicates that every school have its own playground and sufficient field for outdoor games. Every school have their sown toilet but only teacher uses it. Students are not allowed to use the toilet. If students feel to use the toilet they have to go outside or in any other areas. Almost fifty percent of schools are having the ramp for disabled students. But, almost half numbers of the total schools are not having the ramp, specific/western toilet and other basic needs for disabled students. Therefore, physically handicapped, visually handicapped and hearing disabled with speech problems are facing the academic problems due to lack of basic facilities in the schools of the inclusive education system.

CONCLUSION

Disabled children are found weak in their own academic progress and achievement. They enrolled in later age at school level than normal student. Disabled student participation ratio is lesser and absence ratio is higher than non-disabled children. Majority of disabled are found physically challenged and few of them are deaf and dumb. Blind and any other such specific disabled student are not found in these schools. No special teacher and professional rehabilitation workers are found in these schools. Sometimes, block coordinator provides rehabilitation program through special education or any such activities. Foundation courses and in-service program for disability education are not good in Rajasthan and few teachers are trained through this program. ICT and facilities for disabled children in school are found

negligible in the schools of rural area. Overall, disabled student is psychologically and academically weak due to lack of special educator/teacher, rehabilitation worker and psychologist.

Techno-Pedagogical Competence among Senior Secondary School Teachers

Preeti Bala¹, Imli Kokla²

¹Assistant Professor; ²Research Scholar, Lovely Professional University

ABSTRACT

The present study aimed to explore the predictors of Techno-Pedagogical Competence among teacher of senior secondary schools. As the nature of research was descriptive so survey method was applied by the investigator to gather the pertinent data. In this study the data was gathered from 100 teachers of senior secondary schools both from government and private schools using stratified random sampling technique. In this study, Teachers Techno-Pedagogical Competence scale by S.Rajashekar and K.Sathiyaraj (2013), was used for collecting the data. The application of statistical techniques such as percentage, mean, t-test, standard deviation helped to analyse the data. The research findings indicated that there is no significant difference in male and female senior secondary school teachers with respect to their techno-pedagogical competence but on the other hand Government and Private senior secondary school teachers differ significantly from each other with respect to their techno-pedagogical competence. Private senior secondary school teachers possess more techno-pedagogical competence as compared to government senior secondary school teachers;

Keywords: *Techno-Pedagogical Competence, senior secondary school teachers*

INTRODUCTION

Modern society require teachers who can adapt quickly and effectively with these everchanging challenges as per the needs and demands of the society. It's time for teachers to take different approach to education in order to fulfil the needs of the 21st century students. Teachers not only required becoming familiar with the technologies but also needing to develop the skills to use it in a variety of teaching setups. Many technology applications in teaching offer the teachers a way in understanding the capacity of knowledge of their own self as well as the students and enable them to explore that to what extent they can work in bringing desirable changes in teaching-learning process.²

The use of technology in classroom is not only helping students progress but also it provides an opportunity in changing the role of teachers in the classroom. Teachers who fail to adapt to the demands of the new technology driven classroom will likely become a history of the past as much as textbooks. Non-technology classroom learning simply means grapping knowledge and teaching-learning with the use of technology is all about discovering and using knowledge effectively and

efficiently. So, teachers need to be flexible in order to follow these new paths and master certain skills which educators in the past failed to do.

Despite the wide increase and advancement in science and technology some teachers fail to integrate technologies in teaching and are still confined to old methods of teachings. Infusion of technology in educational process engages the teachers to carry out effective work but it also creates a certain doubt and fear among teachers who are not aware of it. Not every teacher is technologically competent³. A feeling of not being able to make use of technology or being competent or master enough to relate it with teaching can prevent the teacher from taking any further step to get started or get going with the new environment.

The advent of technology in the 21st century has brought about many changes particularly in the field of learning and its learning environment and people need to adapt themselves to these changes in a balanced manner. Technology integrated classroom converts students as information seekers, analysers, problem solvers, decision makers, producers, creative, communicators and collaborators. So, corresponding to these teachers need to be updated in terms of use of technology in

classroom⁵.

The common challenges teacher face as they try to integrate technologies into their classroom teaching in almost all the countries are :- inadequate training facilities for the use of technologies, insufficient experience, lack of financial support, lack of technical assistance, lack of knowledge about computers functioning, lack of support from administration and an inherent fear to experiment with new technologies⁸⁻¹².

So, there is dire need that teachers are required to come out of their deeply ingrained conception that they have learn it all at once and need not to upgrade anymore.

Techno-Pedagogical Competence

Education system nowadays moving on the path of modification from the old traditional chalk-and-talk method to a more refined and digitized pedagogical system¹. The development of techno-pedagogy has brought a drastic change in the field of education. It has revolutionized the whole education system. Literally the word 'techno' is derived from the Latin word 'texere' which means art-skill in handcrafting and 'pedagogy' refers to the techniques of the craft of teaching into the learning environment^{12-16, and 21}. The areas of techno pedagogical competence are as follows :-

A) Content: - content is the subject matter or body of information which is to be learned or taught to the students. It refers to the facts, concepts, theories and principles that are taught and learned rather than reading and writing.

B) Technology: - Technology encompasses an understanding of how to use computer software and hardware such as internet, digital video and common technologies including overhead projectors, interactive boards and e-books in education. It is knowledge about certain ways of thinking and functioning with technology, tools and its resources.

C) Pedagogy: - Pedagogy is an understanding of how teaching and learning can be transformed and carried out with the assistance of various strategies, procedures, processes and methods.

Acquiring techno-pedagogical competencies will make teaching and learning more pleasurable and meaningful endeavour as it will lessen the pressure on the part of the teachers and enable the students to

develop deeper domain of knowledge¹⁴⁻²¹.

Significance of the Study

In the current era of revolutionized technological world and it has become a basic requirement for people to possess technology related knowledge⁴. To function and work effectively in a technology- oriented society, students are required to hone up not their computer skills as well as proficiency to use various kind of technological resources to resolve various academic issues and to integrate as well as generate new knowledge and skills. The development and progress of these skills is the sole duty and responsibility of the schools and teachers.

The study in hand aims to bring about positive outlook for teachers who are facing difficulties in going hand-in-hand with technology. It necessarily does not mean every teacher should be competent in using technology but its sole aim is that every teacher should have technology knowledge as it has become a necessity in the present century.

The present study helps to attain a clear knowledge about the technological competence level of the teachers and to explore that how far teachers are using and applying this knowledge effectively for teaching the students. The study also helped to highlight the kind of resources made available to teachers; finding out the ways and means in which field or area they are lacking behind, attitude and anxiety towards the use of technology, ability of accessing to technology and the factors that are stopping them from using technology in their teaching. The findings of this research will have profound importance for the development of techno-pedagogical competence, computer skills and usage of various aids by instructors in teaching profession^{2,3}.

Objectives

1. To find out the difference between male and female senior secondary school teachers with regard to their techno-pedagogical competence.
2. To explore the difference between government and private senior secondary school teachers in their techno-pedagogical competence.

Hypotheses

There exists no significant difference between male and female senior secondary school teachers in their

techno-pedagogical competence.

There exists no significant difference between government and private senior secondary school teachers in their techno-pedagogical competence.

Delimitations

i) The present study was delimited only to senior secondary schools of Phagwara.

ii) Both Private and Government senior secondary school were considered in the present study.

iii) Data collection was done only from the teachers of senior secondary school.

Research Method

In the present research descriptive survey method was employed in order to gather data regarding the existing practises among teachers with regard to their techno pedagogical competence. The current study

was conducted on senior secondary school teachers of Phagwara. The sample consisted of 100 senior secondary school teachers of Phagwara both from private and government schools. Apart from this sample was divided into male and female teachers as well. The investigator used stratified random sampling technique in order to collect the data from different senior secondary schools of Phagwara. The investigator used Teachers Techno-Pedagogical Competence Scale by S. Rajashekar & K. Sathiyaraj (2013) for collecting the data in the present research

RESULTS AND INTERPRETATION

Result pertaining to difference between Male and Female Senior Secondary School Teachers with regard to their Techno-Pedagogical Competence

Ho: There exists no significant difference between male and female senior secondary school teachers in their techno-pedagogical competence

TABLE 1: Significance of Mean Difference between Male and Female Senior Secondary School Teachers in their Techno-Pedagogical Competence

GROUP	N	Mean	SD	SED	t'-Value	Remarks
MALE	48	129.83	34.87	6.84	0.65	Not Significant
FEMALE	52	134.29	33.37			

Interpretation

Table 1 reveals the mean value of male and female senior secondary school teachers with regard to their techno-pedagogical competence is 129.83 and 134.29 respectively. The value of standard deviation in case of male and female senior secondary school teachers is 6.84. The t'-value of male and female senior secondary school teachers in terms of their techno-pedagogical competence comes out to be 0.65 which is not significant at 0.05 level of confidence.

Therefore, the stated hypothesis, there exists no significant difference between male and female senior secondary school teachers in techno-pedagogical competence, is accepted at 0.05 level of confidence.

Graph 1 Mean Techno-Pedagogical Competence Scores of Male and Female Senior Secondary School Teachers

Result pertaining to difference between Government and Private Senior Secondary School teachers with regard to their Techno-Pedagogical Competence

Ho: There exists no significant difference among government and private senior secondary school teachers

in their techno-pedagogical competence.

TABLE 2: Significance of Mean Difference between Government and Private Senior Secondary School Teachers in their Techno-Pedagogical Competence

GROUP	N	Mean	SD	SED	t'-Value	Remarks
GOVERNMENT	50	115.48	32.93	5.95	5.61	Significant
PRIVATE	50	148.82	26.16			

Interpretation

Table 2 reveals the mean value of government and private senior secondary school teachers with regard to their techno-pedagogical competence is 115.48 and 148.82 respectively. The value of standard deviation in case of government senior secondary school teacher is 32.93 and private senior secondary school teacher is 26.16. The t'-value of government and private senior secondary school teachers in terms of their techno-pedagogical competence comes out to be 5.61 which is significant at 0.01 level of confidence. Private senior secondary school teachers are more techno-pedagogical competence as compared to government senior secondary school teachers.

Hence, the stated hypothesis, there exists no significant difference in techno-pedagogical competency between the government and private senior secondary school teachers, is rejected at 0.05 level of confidence.

Graph 2 Mean Scores of Techno-Pedagogical Competence between Government and Private Senior Secondary School Teachers

CONCLUSIONS

The in-depth analysis of the data reveals that male and female senior secondary school teachers do not differ significantly from each other with respect to their techno-pedagogical competence. The researcher is of the view that such results may be because of the reason that gender

is not concerned with techno-pedagogical competence. Anyone can have techno-pedagogical competence irrespective of their gender. Similarly results show that government and private senior secondary school teachers differ significantly from each other with respect to their techno-pedagogical competence. The techno-pedagogical competence has been found more in case of private school teachers as compared to govt school teachers. This may be because of the reason that private school focusses on the application of modern and updated technology in education, meaning thereby they appoint teachers who already possess such kind of competence. On the other hand, teachers themselves keep themselves updated with application of technology in education sector as to sustain in the academic environment of private sector educational institutions. The results of the study clearly indicate the need to develop techno-pedagogical competence among teachers in government schools as today is the era of technology and if teachers are lacking un such competence then how will instill skills among students regarding use of technology in our day to day life. Moreover, study also indicate a strong requirement on the part of govt to provide training to existing teachers of govt schools with the intent to raise their techno-pedagogical competence as nowadays such skills are very crucial in contemporary education sector.

Stylised Facts on Drivers and Constraints in Zimbabwe's Manufacturing Sector Performance

David Damiyano¹, Nirmala Dorasamy², Lawrence M Lekhanya²

¹Department of Public Management and Economics, Durban University of Technology, South Africa and Department of Economics, ²Department of Public Management and Economics, Bindura University of Science Education, Zimbabwe¹, Durban University of Technology, South Africa

ABSTRACT

This study aim at identifying major constraints and drivers affecting performance in the manufacturing sector in Zimbabwe. Using comparative literature from the region, the study managed to explicitly show that despite dollarization of Zimbabwe's economy, the sector continues to show poor indicators of the manufacturing sector. Stylised facts of manufacturing sector share in GDP, volume of manufacturing index, manufacturing sector share in total productive sector value added and manufacturing sector employees and total earnings were poor in a post dollarized Zimbabwe. Low local demand, competition, finance and infrastructure are major constraints in the manufacturing sector in Zimbabwe. Policy stability, zero corruption tolerance, FDI, reliable power and retooling can drive the manufacturing sector. In conclusion, the government should provide an enabling economic environment sustainable to salvage the struggling manufacturing sector in Zimbabwe.

Keywords: manufacturing, performance, drivers, constraints, Zimbabwe's economy, local demand, capacity utilisation

INTRODUCTION

The study focuses on the manufacturing sector in Zimbabwe which was one of the most significant pillars of the economy. It has contribution to the Gross Domestic Product (GDP), export earnings, employment levels and investment opportunities as supported by Kanyenze, Kondo, Chitambara and Martens¹. The United Nations Development Programme (UNDP)² and the Confederation of Zimbabwe Industries (CZI)³ concluded that the manufacturing sector was the mainstay of Zimbabwe's economy. Despite the great contribution from Zimbabwe's manufacturing sector to the economy, its efficiency has been on the decline Gumbe and Kaseke⁴.

Background of the study

Manufacturing has historically been the driver of economic growth, structural change, and catch-up in world developments. CZI⁵ stated that, in Zimbabwe, 15% of the formal employment is in the manufacturing sector, when the economy is at its peak. The McKinsey Global Institute⁶ further found out that manufactured goods make up 70% of global trade. In the same vein,

the Reserve Bank of Zimbabwe (RBZ)⁷ posits that Zimbabwe's manufacturing sector contributes 37% to exports when it is at its peak.

The following trend analysis show that the manufacturing sector is not performing well in Zimbabwe. Few but major key indicators (manufacturing sector share in GDP, volume of manufacturing index, manufacturing sector share in total productive sector value added and manufacturing sector employees and total earnings) are picked below and analysed.

Figure 1: Manufacturing sector share in GDP, 2009 to 2014, Zimbabwe

Source: Authors' calculation from ZIMSTAT database

The figure above shows that the manufacturing sector has lost its contribution to national output. Manufacturing sector contribution to GDP has been going down from 2009 to 2014 despite dollarization in 2009. This shows that the decline in contribution to growth is due to production constraints.

Figure 2: Manufacturing sector share in total productive sector value added

Source: Authors' calculation from ZIMSTAT database

Despite the fall in contribution to GDP due to production shortcomings, the manufacturing sector share in total value addition value addition has actually shown some upward trend since dollarization in 2009 (Figure 2). The share of manufacturing sector in value addition increased from about 63% in 2009 to about 71% in 2013. This increase is mostly due to the decrease in contributions to value addition by the mining sector, whose contribution decreased from about 29% in 2009 to about 15% in 2013.

Figure 3: Volume of manufacturing index, Zimbabwe, 2011 to June 2015

Source: Adapted from ZIMSTAT

One of the indicators that can be used to assess manufacturing sector performance is Volume of

Manufacturing Index (VMI), which is produced by the Zimbabwe Statistical Agency (ZIMSTAT). The VMI is an index which measures changes in the volume of production of the manufacturing sector on a monthly and annual basis. The VMI has its base year set at 2009 (i.e. 2009=100). Thus the value of the VMI in each year is a reflection of the difference in performance between the respective year and the performance in 2009. The VMI trend shows that the manufacturing sector output has been declining since 2011 relative to its levels in 2009 (Figure 3). While production in 2011 was above the 2009 level by about 3%, by 2014 it had decreased to only about 9% compared to the level in 2009.

Figure 4: Manufacturing sector employees and total earnings, 2009 to 2015

Source: Adapted from ZIMSTAT

By 2015, the number of people employed in the manufacturing sector had decreased by about 36% from about 138,000 in 2009, which is quite significant. Although the decrease was quite cyclical unlike the number of employees, the wages (earnings) of manufacturing sector employees also decreased significantly over the period; the total earnings of about 756 million for the manufacturing sector in 2015 implies that earnings had decreased by about 10% from the levels in 2009. This smaller decrease compared to the number of employees could be reflecting the high retrenchments costs which still need to be finalized by the firms.

The background analysis has shown that the manufacturing sector in Zimbabwe is facing performance challenges. The indicators generally show a struggling manufacturing sector, where production challenges continue to affect performance. The sector is thus not expected to be efficient and competitive. However, while this is the aggregate picture for the whole sector, it is also important to establish the key drivers and constraints in these key indicators.

Research Problem and study objectives

Despite the significant contribution that the manufacturing sector can make to the Zimbabwean economy, the efficiency of the firms in the sector has been on the decline as stated by Kanyenze et al.¹ and CZI³. On the backdrop of the overall economic slowdown, the results of the CZI (8) reveal slackening economic activity as overall capacity utilization has continued declining from 44.9% in 2012 to 39.6% in 2013 UNDP⁹; Kanyenze et al.¹. Although the economy has stabilized and started to grow in the dollarized era, the efficiency and contribution of the manufacturing sector has not improved. Marongwe¹⁰ attested that capacity utilization of the manufacturing firms has remained below 40%, despite the stabilization of the economy after 2008 continued declining from 44.9% in 2012 to 39.6% in 2013. In order to solve the research problem, this study will determine the drivers of efficiency in Zimbabwe's manufacturing sector and identify the levels and kinds of inefficiencies in Zimbabwe's manufacturing sector.

Literature

Chikabwi, Chidoko and Mudzingiri¹¹ investigated the common drivers of the manufacturing sector using a sample of nine SADC countries for the period 200-2013. The study concluded that trade openness, technology transfer and capital investment positively influenced manufacturing sector productivity growth in the SADC countries. The major constraints noted in this study were labour force and innovation. This study which utilised the panel data methodology posit that existing empirical researches present conflicting evidence which is still igniting research studies in this area including this one.

Tanzania Country Report¹² identified universal drivers of manufacturing sector performance which include among others, the legal and regulatory environment, support institutions, infrastructure, higher education and training, market efficiency (including labour market efficiency), market size, financial market development, technological readiness and innovation. Tanzania Country Report¹² further noted that Tanzania has a comprehensive set of good manufacturing-related policies in place which failed to improve manufacturing performance as a result of poor implementation strategies and at time by too optimistic and unrealistic deadlines. In Tanzania, the manufacturing sector enjoys incentives which are short term in nature and unpredictable

as they are supported by ineffective institutions. In sum, according to the African Development Report¹³, Tanzania's manufacturing sector faces a number of binding factors and constraints. These include various policy, institutional, and capacity constraints; legal and regulatory frameworks; as well as developmental aspects, such as inadequate infrastructure quantity and quality, availability and access to finance, and technology.

METHODOLOGY

The study uses annual data from an average of 250 questionnaires that are sent to respondents in the manufacturing sector. Companies are drawn from the four CZI Chambers namely Mashonaland, Manicaland, Matabeleland and Midlands. These include both CZI members and non-members. The data set covers the years 2013-2017. More data sets were sort from various Government of Zimbabwe (GoZ) publications, of much use were those from Ministries, ZIMSTAT, Reserve Bank of Zimbabwe (RBZ) and Zimbabwe National Chamber of Commerce (ZNCC).

Drivers and constraints of performance in the manufacturing sector

The background analysis on the manufacturing sector key indicators shows that the manufacturing sectors is performing badly. The drivers and constraints affecting performance in the manufacturing sector in Zimbabwe are presented, interpreted and discussed.

Figure 5: Capacity utilisation

Source: Adapted from the Manufacturing sector survey

Capacity utilisation has remained below 50 % for the period 2013- 2017. African Development Bank Report¹³, showed that Tanzania's manufacturing sector is constrained by low manufacturing capacity which by transitivity reduces manufacturing sales, manufacturing

export, manufacturing sector employment and manufacturing sector contribution to GDP. Decimation in the Zimbabwe’s manufacturing sector is by no means an excuse since capacity utilisation has remained low with an average downward trend.

Figure 6: Major capacity constraints

Source: Adapted from the Manufacturing sector survey

The average downward spiral on capacity utilisation is constrained largely by working capital and low local demand. African Development Bank Report¹³ cited lack of structured finance both for investment and working capital as a major driver in Sub Saharan Africa in general and Tanzania in particular. Low local demand restricted capacity as the country faces competition mainly from South Africa, Zambia and China. Shortage of raw materials and foreign currency shortages constrained manufacturing capacity in 2017. Marongwe¹⁰ attested that capacity utilization of the manufacturing firms has remained below 40%, despite the dollarisation of the economy after 2008 as foreign currency shortages persisted.

Table 2: Major Capacity constraints

Major Capacity constraints	2012	2013	2014	2015	2017
Low local demand	13.3	17.6	28.8	28.4	17.18
Working capital constraints	32.3	40.2	26.5	18.6	6.87
Competition from imports	9.5	12.5	14.2	10.3	8.59
Anticipated Machinery and machine breakdowns	11.4	9.8	7.3	12.3	8.59
Economic environment	8.4	0	7	2	4.47
High cost of doing business	8	5.2	6.2	8.3	6.53
Shortage of raw materials	5.3	5.9	6.2	6.9	19.59
Power and water shortages	9.9	8.8	3.8	6.4	1.03
Other	1.9	0	0	6.9	0.69
Foreign currency shortage	0	0	0	0	13.75
Liquidity crisis	0	0	0	0	6.19
Competition from local producers	0	0	0	0	1.37

Source: Adapted from the Manufacturing sector survey

Figure 7: Problematic factors of doing business in Zimbabwe’s manufacturing sector

Source: Adapted from the Manufacturing sector survey

The most problematic constraint of doing business in Zimbabwe remained challenges to accessing finance by the manufacturing sector for the period 2013-2015. Corruption, policy instability and reversal in Zimbabwe negatively affected manufacturing sector performance which Calabrese, Papadavid and Tyson¹⁴ blamed for poor performing manufacturing sector in Rwanda. Chikabwi, Chidoko and Mudzingiri¹¹ concluded that infrastructure challenges is a challenge in nine Sub Saharan countries in manufacturing sector performance. Access to financing, policy stability, adequate infrastructure, no to corruption and liberal policies can drive manufacturing sector in Zimbabwe.

Figure 8: Source of Competition in the manufacturing sector

Source: Adapted from the Manufacturing sector survey

Competition is vital for competition and product diversity in modern economies but surprisingly manufacturing firms in Zimbabwe cite it as a major constraint to their performance. Most Sub Saharan countries as alluded to by Chikabwi, Chidoko and Mudzingiri¹¹ face import competition in their markets. Some manufacturing firms in Zimbabwe faced no competition in 2017 after benefiting from trade restriction imposed by Statutory Instrument 64 which restricted some imports.

Figure 9: Competing countries in Zimbabwe’s manufacturing sector

Source: Adapted from the Manufacturing sector survey

The manufacturing sector in Zimbabwe faces stiff competition mainly from South Africa and China. Major source of imports is South Africa, China, Brazil, India and Zambia. These countries are major exporters of food and beverages. This implies that Zimbabwe’s food and beverages manufacturing sub-sector is performing poorly. Zambia and Brazil has exported a lot of maize owing to the draught induced food shortages. The McKinsey Global Institute⁶ further found out that manufactured food make up 70% of global trade which Zimbabwe is failing to satisfy.

Sales Destination of manufactured goods

Source: Adapted from the Manufacturing sector survey

Sales from Zimbabwe’s manufactured goods is dominated by both local and export market. CZI¹⁵ found that exports to other destinations is driven by trade blocs and pricing structures in Zimbabwe. Low domestic demand leaves the imports to compete away in sales for the domestic market. Zimbabwe is a high cost producer of manufactured goods due to the use of United States dollar as local currency. This on its own attracts more imports and make locally produced goods uncompetitive.

Figure 10: Problematic Infrastructure Factors

Source: Adapted from the Manufacturing sector survey

Power cuts and shortages is the largest constraining infrastructural factor in the manufacturing sector in Zimbabwe. Electricity is a key driver in the manufacturing sector as hi-tech machinery need to be powered consistently to achieve desired capacity. CZI (15) observed that the energy industry in Zimbabwe is marred by corruption, obsolete and outdated machinery

which need to be replaced. Tanzania Country Report¹² found that inadequate infrastructure has limited capacity utilisation of the manufacturing sector in Tanzania. Top of the list constraining infrastructural factors in Zimbabwe are power cuts and shortages, lack of ports, poor road networks especially the one connecting to South African who is the major trading partner. Contrary to Zimbabwe, Tanzania and South Africa have ports as a major driver of production and imports of manufactured goods.

Table 3: Trade constraints for Zimbabwe's manufactured products

2014	2015	2017
1. Access to trade finance	1. Access to trade finance	1. Identify potential markets and buyers
2. Access to imported inputs at competitive prices	2. Identifying potential markets and buyers	2. Access to imported inputs at competitive prices
3. Identifying potential markets and buyers	3. Access to imported inputs at competitive prices	3. Access to trade finance
4. Burdensome procedures at foreign borders	4. Burdensome procedures at foreign borders	4. Burdensome procedures and corruption at foreign borders
5. Technical requirements and standards abroad	5. Difficulties in meeting customer requirements	5. Export licensing requirements

Source: Adapted from the Manufacturing Sector survey interviews

The themes which are constraining trade in manufactured goods are listed above in order of their influence in the given years. Access to trade finance was the major constraint both in 2014 and 2015. In 2017 access to trade finance was relegated to third ranked

constraint for trade in manufactured goods. Burdensome procedures and corruption at foreign borders is a constraint in Zimbabwe and Tanzania as explained by the Tanzania Country Report¹².

Table 4: Constraints of doing business

2014	2015
· Cash Shortages	Poor/deteriorating economic conditions - not conducive for business growth
· Competition from Imports	Needs major change and business friendly policies-too many restrictions
· Power Cuts	Liquidity challenges-need FDI
· Policy Instability	High unemployment and low aggregate demand
· Corruption	Economy currently stagnant/uncertain
	High costs of doing business

Source: Adapted from the Manufacturing Sector survey interviews

CONCLUSION AND IMPLICATIONS

Manufacturing firms in Zimbabwe need to embrace advanced technologies in order to be globally competitive. The firms need advanced software, sensors, and massive amounts of data and analytics so as to ensure smarter products, processes, and more closely connected customers, suppliers, and manufacturing Global Human Capital Trends Report¹⁶. Prioritisation of technology oriented research is critical to catch up with technology, which is seldom stagnant. This can also be achieved through partnerships with other firms in the region and globally, which are already operating using such technologies. There is therefore need for positioning Zimbabwe firms as attractive for investment, which would make it easier for such partnerships to be negotiated. Manufacturing companies need to focus on targeting new, smart and strategic partnership models to help drive improvements.

As a result of stylised facts in this research, an efficiency study should be carried out. This efficiency study will draw its input and output variable from this study. It can be deduced that cost of inputs, electricity can be some input variables to be considered whilst value addition, sales volume and volume of manufacturing index can be probable output variables for the proposed efficiency study. The efficiency study can be disaggregated according to the manufacturing sub-sectors in Zimbabwe.

Cyber Bullying as an Outcome of Social Media Usage: A Literature Review

Pavitar Parkash Singh¹, Vijay Kumar², Majid Sadeeq³

¹Professor and Associate Dean, ²Associate Professor&Head, ³Ph.D. Research Scholar,
School of Education, Lovely Professional University, Phagwara, Punjab, India

ABSTRACT

Most of the research on cyber bullying available on the internet is of foreign origin. Research studies on this constant on Indian population are required. Thus calls for a narrative review of the available literature in foreign as well as Indian context. This present study tried to meet this requirement by presenting a narrative review on cyber bullying construct literature. Electronic data bases like Eric, Proquest, google scholar, J-gate, Eric were used as the data sources. Literature in the form of research articles and reviews articles were searched the words with the exact key words “**cyber bullying**” and “**Indian**” in the title was selected for study and literature on related key words was strictly ignored. The literature included research articles citing the first recorded case of bullying to certain latest finding in this subject in recent times. The study found that the use of technology is in rise in Indian, with the Indian youth spending at least an hour or two on the social networking sites being vulnerable to cyber bullying and suffering in due course owing to poor awareness and bad implementation of cyber laws.

Keywords: *Cyber Bullying, Cyber Laws, Social Networking Sites.*

INTRODUCTION

Bullying has been a long topic of discussion among researchers across the world. The word bullying is traced from 1530s. It is deliberate, intentional and aggressive act, carried out by an individual or group of individuals who are more powerful in order to give physical and psychological harm to others who are weak and emotional. Bullying is not limited to harassing someone physically, e.g. beating, kicking, pushing, but it also occurs verbally like abusing, name calling, spreading rumors, joking, threatening and embarrassing¹. Bullying incidents lead to various problems in an individual such as depression, low self-esteem, poor grades, eating and sleeping habits get disturbed, and sometimes victim think of committing suicide². Even though various laws are formulated to stop bullying, still people get harassed through newly available modes like online mode, where the harassment is experienced by the victim in the cyber space and hence the name cyber bullying³.

Though bullying occurs in different forms, some of the mainly occurring types of this menace presently existing in the society are:

Verbal Bullying: This type of bullying involves usage of words, phrases, or verbal clues that embarrass, harass, or intimidate others. For example, name calling, teasing, passing racial comments, sarcasm, rumors, mean spirited comments, and intimidating words are the various forms of verbal bullying.

Difference between Traditional Bullying and Cyber Bullying

There are some important aspects of cyber bullying that separate it from traditional bullying. For example, in the traditional sense, bullies are found either at workplace or at a school. However, the bullies in the cyber space remain anonymous, making this form of bullying effective in action and dangerous in effect. Conventionally, the targets of bullying in schools are the children who are physically weak, overweight, unpopular or disabled, where the bullying takes place during the day time. On the contrary, there is no particular time for a victim to suffer bullying in the cyber space. As a result, the children feel heightened sense of victimization. The act of bullying in the cyber space can happen in the forms of uploading of images, sending derogatory

messages and interaction that occur in virtual reality which is different from the reality experienced routinely. In traditional bullying, the victim can experience a small period of respite from bullying on going back to home, but in cyber bullying, there is no respite from the stress until the victim gets back the electronic device. Such a heightened sense of powerlessness experienced by the victim under cyber bullying is supported by the work of Dooley et al. (2009). In traditional bullying, a victim can predict when he or she is going to be bullied (e.g. at school or on the playground); whereas in cyber bullying, the victim does not know when and where he or she is going to be bullied, or how (e.g. cell phone, computer), which leads to a feeling of heightened powerless. Recent studies suggest that cyber bullying is pervasive and ranks as one of the most common form of harassment

among adolescents.

METHODOLOGY

The study is purely based on the Indian reviews on Cyber bullying. There are very few studies on Cyber Bullying in Indian context. Electronic data bases like Eric, Proquest, Google scholar, and J-gate, were used as the data sources. The words with the exact key words “**cyber bullying**” and “**Indian**” in the title were selected for study. In the present 23 study studies from the year 2007 to 2016 were explored and their findings are discussed. Further these studies highlighted the Prevalence of cyber bullying through different modes, and how menace of cyber bullying cases can be prevented. The following table shows the main focus of the studies cited in the present study.

Available Literature on Cyber Bullying in the Indian Context:

Though there are many western studies related to cyber bullying, there are no or less empirical researches in India to unearth this modern phenomenon. found that the Indian adolescents are online every day for at least an hour or two, and are active in social media platforms like Face book⁵. Conducted a study titled Cyber bullying: A Socio-Legal Perspective and the findings suggest that social networking act as a catalyst for cyber bullying occurrence⁶. It further highlights that an adolescent in order to maintain the authority over his or her peer group, gets involved in cyber bullying incidents. This study highlights that our Government should frame laws as to curb this harmful activity from expanding further.

McAfee’s Tweens, teens and technology in 2014, conducted a survey on 1422 Indian online tweens aged 8-12 years old and teens aged 13-17 years old²⁴. The study found that 50% of the Indian Adolescents are victim of cyber bullying either they are involved or they seen others. The reports highlighted that one in three Indian youths have been cyber bullied. The studies further bring forth certain medium through which cyber bullying incidents are occurring.

SAMPLE	PLATFORM	SITES	CITIES	PERCENTAGE OF USAGE	PLACE OF USAGE	RISK AWARENESS.
711 Male and 711 Female	Desk top (41%) 36% laptops and Smart phones (27%).	Face book (93%), YouTube (87%) and (79%). WhatsApp	Mumbia, Delhi, Chennai,Hyderabad, Ahmadbad, Pune	70% youth spend more than 5 hours on internet in week	(52%) use social networking sites and internet at school.	57% being 8-12 years and 47% 13-17 years old (80%) aware that sharing online activity can put them in trouble.

CONCLUSION

There are various reasons that lead people to get involved in cyber bullying instances. Either bullies don’t like other person or most of the time they take it as light activity and indulge in committing offence. Most of the time people get engaged in cyber bullying because they

are unaware about its consequences. It is also found that mostly young ones embrace others as they considered it as fun activity and for entertainment purposes. In order to impress their peers adolescents participate in cyber bullying offences because they want to show case their power.

The unregulated use of social networking sites by adolescents are somehow creating a situation of digital world and the adolescent is less and less interactive physically and verbally with the person around him such as parents, teachers and peers. The bullying influence either as victim or as bully causes a great damage to his relationship with parents, teachers and peers. Also lack of interaction and over usage of internet is putting the adolescents in a stage of awareness and they are taking the cyber bullying experience as a regular phenomenon and are not aware about its concept, overreach and effects. Cyber bullying is a real problematic issue to handle for teens, tweens, parents and teachers. It affects every aspect of life. Like traditional bullying cyber bullying causes serious damage to a person that sometimes it leads to committing suicide also. Most commonly cyber bullying victims reported the feeling of anger, embarrassment, fear, sadness, worried, threatened, distressed, loneliness, anxiety, poor academic performance at school, loss of confidence and self-esteem, revenge Cyber-bullying, self-harm, even suicide, family problems, academic difficulties, school violence and various delinquent behaviors.

Cyber bullying is a serious problem and it needs to be resolved. From the thorough review of above studies it can be concluded that Indian youth's usage of social networking sites is much higher than other countries and as a result the large percentage of population becomes victim of cyber bullying. It is also found in studies that most of the Indian have no knowledge of cyber bullying and therefore government needs to organize seminars, awareness camps for parents, teachers and especially for minor section of the population. Much needs to be done in the front of forming cyber-bullying laws and on their stringent implementation.

Perception on the Commitment of Organization Board: Modeling with Importance Performance Analysis

Pasukat Sembiring¹, Ujian Sinulingga¹, Marihat Situmorang¹

¹Department of Mathematics, Universitas Sumatera Utara

Abstract. This paper aims to find out the perception of an organization member on the commitment of its management. The variables studied are the level of importance and the level of satisfaction of the management performance. The sample used is taken proportionally from an organizational environment. Data collection methods using questionnaires and conducting interviews directly with respondents. The method used to measure perceptions using the Importance Performance Analysis (IPA) method. Statements are based on five characteristic dimensions according to the SERVQUAL method. In the paper using SPSS 22.00 syntax to measure the validity, reliability and analysis of research data. The results of data analysis will be able to explain the very dominant factors that affect the interests and satisfaction of organizational members on the performance of the board, so that it can contribute to the improvement of the vision and mission of the organization.

Keywords: IPA, SERVQUAL method, SPSS 22.00

INTRODUCTION

Activities will not exist if there is no environment and vice versa. Environment and living things interact with one another. The environment, as it is, experiences development along with the development of living things that live around it. The environment will continue to develop through the activities of living things while life is still going on, as well as the organism itself^{1,2}.

The environment that exists today is an environment that has been processing and developing for years through previous lives³. The present environment is the result of the adaptation of every era. Even so, the present situation does not always last forever. Every individual who occupies an environment at a certain time⁴, has perceptions to form a better environment. They adapt and regulate the environment in which they work.

Perception is how individuals choose, organize, and interpret their impressions to give meaning to the surrounding environment. However, what a person feels can be very different from what is expected. Very often we feel incompatible with what is happening around us. This is related to the human nature of home economicus which is never satisfied in meeting their needs, in this case satisfaction with their environment⁵⁻⁸.

In the previous paper on student perceptions of university education organizations where they studied, many factors influenced student perceptions of the lecture environment. Likewise with the university environment, must be able to know the factors that are considered important for improvement. These factors are compiled into questionnaires based on five dimensions of Service Quality (SERVQUAL) developed by Zeithaml, Parasuraman and Berry^{3, 8, 11-13}.

METHOD

The research method used in this study is descriptive quantitative type research method. This type of research method is used with a view to finding facts with the right interpretation and the aim is to find a systematic picture, and accurate facts.

Early Implementation

At this stage several activities are carried out, among others:

Data Collection

The population in this paper is a member of a socio-religious organization, the Catholic Church of Stasi Santo Paskalis Diski, Deli Serdang. The sampling technique used in this research is accidental sampling, namely who can be found members who are willing to

become respondents. Based on the Slovin formula, the minimum number of samples that can be taken is 100 respondents. The minimum number of sample sizes can also be determined based on Krecjie and Morgan Tables.

Litelature Study

Literature study is carried out by looking for references to the theoretical needs of research-based community service activities. Study literature in the form of books, journals, and the internet.

Needs Analysis

At this stage, analyze the needs that can support the implementation of activities. Some aspects of needs analysis include location, equipment, reading materials and supporting equipment.

Location Review

Researchers make a visit to the location of the activity as part of the implementation phase so that the

team can find out the conditions of the field that will be the place for the implementation of the activity. The site review was conducted repeatedly to ensure interactive communication with activity partners. The location of the activities was carried out in the Diski neighborhoods of Sunggal Subdistrict, Deli Serdang Regency, Sumatra Utara.

Importance Performance Analysis and SERVQUAL

The Importance Performance Analysis (IPA) method was originally developed to find an overview of the relationship between the level of importance and performance of marketing. The approach with this method is not something new in research. The relationship is then described in a diagram to then analyze the strengths and weaknesses of the company’s services. The diagram is divided into four regions, the dividing lines are the average of each level of importance and level of satisfaction¹⁵. The formula used:

$$\bar{X}_i = \frac{\sum_{j=1}^n X_{ij}}{n} \quad \text{and} \quad \bar{Y}_i = \frac{\sum Y_{ij}}{n} \tag{1}$$

Where:

\bar{X}_i = Factor average performance to i , where $i = 1,2,3, \dots, N$

\bar{Y}_i = Average factor interest to i , where $i = 1,2,3, \dots, N$

X_{ij} = Score factor performance levels to i from the respondent to j , where $i = 1,2,3, \dots, N$ and $j = 1,2,3, \dots, n$

Y_{ij} = Score the level of importance of the factor to i from the respondent to j , where $i = 1,2,3, \dots, N$ and $j = 1,2,3, \dots, n$

N = Number of factors / attributes

n = Number of respondents

Whereas to obtain the average of all the factors of importance and level of satisfaction based on equation (1) is obtained by the equation:

$$\bar{X} = \frac{\sum_{i=1}^N \bar{X}_i}{N} \quad \text{and} \quad \bar{Y} = \frac{\sum_{i=1}^N \bar{Y}_i}{N} \tag{2}$$

where:

\bar{X} = The average of all performance / satisfaction level factors

\bar{Y} = The average of all factors of interest level

The diagram of the division of regions with the IPA method is illustrated in Figure 1. To compile the factors that influence the quality of performance, a system of compilation of questionnaires is needed with SERVQUAL. With the SERVQUAL method¹⁶, all the factors studied are arranged into five dimensions, namely factors: tangible, reliability, responsiveness, assurance, and empathy. This dimension is used to facilitate the preparation of the science research questionnaire.

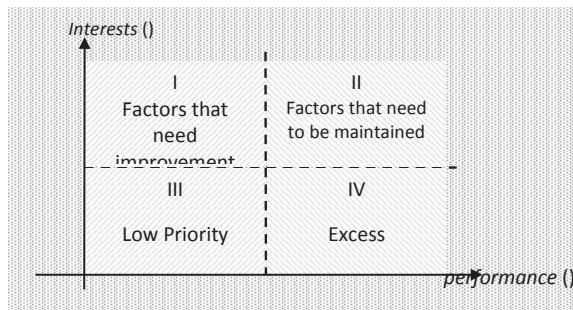

Figure 1. IPA analysis diagram

RESULT AND DISCUSSION

Respondent Data Analysis

The following is a graph of respondents answers from 25 factors.

Figure 2. Graph of Performance Level According to Respondents

Figure 3. Interest Rate Chart According to Respondents

Data Validity and Reliability Test

Validity test is done to determine the validity of the questionnaire used for data collection, obtained by calculating the correlation of each score from the respondents answer⁶.

Validity test is done using SPSS 22.00 program with the following criteria:

- If $r_{count} \geq r_{table}$ then the question item is valid
- If $r_{count} < r_v$ then the question item is not valid
- r_{counr} can be seen in the Corrected Item Total Correlation column
- r_{table} under the condition $df = (n - 2)$ and a significance level of 5% that is $df = (100 - 2) = 98$, with value $t_{tabel} = 1,660551217$ so that the value is obtained r_{tabel} :

$$r_{table} = \frac{t}{\sqrt{df + t^2}}$$

$$r_{table} = \frac{1,660551217}{\sqrt{98 + 1,660551217^2}} = \frac{1,660551217}{10,03780007} = 0,165429796 \approx 0,165$$

Then the r_{tabel} is value 0,165

Table 1. Data Validity Test for Satisfaction and Interest of Respondents

Attribute	Pearson Correlation ($\times 10^{-1}$)		$(\times 10^{-1})$	Status	
	Satisfaction	Interests		Satisfaction	Interests

Source: Data with SPSS 22.00

Table 1 shows that for all attributes the question of satisfaction level and all attributes of the question of importance level can be said to be valid.

Reliability testing was carried out using the 22.00 SPSS program with the following criteria:

If value Cronbach's Alpha ≥ 0.6 then the data in this study are said to be reliable

If value Cronbach's Alpha < 0.6 then the data in this study are said to be unreliable

The results of data processing with SPSS 22.00 that the value of Cronbach's Alpha satisfaction level factors = $0.942 > 0.6$ so that the perceptual data of respondents is reliable and can be used for this study. While the value of Cronbach's Alpha factors of importance level = $0.952 > 0.6$ so that the perception data of the respondents is also reliable and can be used for this paper.

Analysis of Performance Interest Level with Importance Performance Analysis (IPA) Method

Quadrant analysis is a building that is divided into four sections which are bounded by two lines that intersect perpendicular to the points (x, y), where x is the average of the score of the implementation level of all factors and y is the average of the average score of the level of importance of all factors that influence the satisfaction of service users.

Table 2. Calculation Result of SERVQUAL dimension with IPA Method

Attribute	Information	Average	Average
	I. Dimensions of Physical Evidence (Tangible)		
A1	Church cleanliness and neatness	3,74	4,59
A2	Has parking space	3,79	4,34
A3	Equipment in support of complete worship	3,97	4,53
A4	Seating for pianists, worship officials, altar servants (choirs) and choir members is clearly arranged	4,18	4,63
A5	Availability of church bulletin boards and appropriate use	3,77	4,30
A6	Condition of supporting equipment in the church	3,72	4,35
A7	Cleanliness and availability of clean water in the toilet	2,79	4,20
	II. Reliability Dimension (Reliability)		
A8	The Imam / Leader of worship delivers the sermon material clearly	4,38	4,67
A9	Worship takes place according to the schedule	4,28	4,61
A10	The regulations applied in the church are right on target	4,02	4,42
A11	The selection of worship songs in accordance with the rules of the church celebration	4,29	4,60
A12	Use of the Organ / Piano church by the Organist / Pianist	4,10	4,48
A13	The socialization of the church management work plan	3,92	4,43
	III. Response Dimension (Responsiveness)		
A14	The ability of church administrators to answer people's questions clearly	3,92	4,39
A15	The availability of the church in responding and responding to the complaints of the people	3,78	4,46
A16	The Church accepts and serves the invited guests of the church well	4,13	4,50
A17	Church administrators serve file management quickly and professionally (marriage letters, baths, chrism, etc.)	4,15	4,47
A18	Church administrators take action according to procedures	3,99	4,44
	IV. Guarantee Dimension (Assurance)		
A19	The church's environmental security and the presence of security officers	4,06	4,70
A20	Ease of obtaining information (activity schedule, church news, procedures, etc.)	4,05	4,57
A21	Clarity of the administrative provisions in the administration	4,03	4,56
	V. Dimension of Concern (Empathy)		
A22	Church priests / administrators provide motivation for the people	4,21	4,65
A23	Church administrators pay attention to the condition of the church	4,13	4,52
A24	The existence of a church organization supports the aspirations and interests of the people	3,89	4,34
A25	Church administrators are polite and friendly	4,28	4,61
Rata-rata		= 3,983	= 4,494

Processed data, 2018

The results of the calculations in Table 2 are arranged in the quadrant IPA diagram as shown in Figure 4.

Figure 4. Distribution of attribute scores into the IPA Quadrant

1. Quadrant I (Main Priority), in this quadrant describes the factors that are considered important and expected by the people but the performance of the church management has not given satisfaction to what is expected optimally, thus making the people feel disappointed. This dimension needs to be prioritized for improvement. Attributes included in quadrant I are:

1. Church cleanliness and neatness

2. Availability of church bulletin boards and appropriate use

2. Quadrant II (Maintain Achievement), is the quadrant that is most expected by the people, these attributes are in accordance with what is felt and as factors that are considered important and are expected to support the satisfaction of the people so that the church management is obliged to maintain the performance achievement. Attributes that include quadrant II are:

1) Seats for pianists, worship officers, altar attendants (misdinar) and choir members are clearly arranged

2) Priest / worship leader delivers the sermon material clearly

3) Worship takes place according to the schedule

4) Selection of worship songs according to the rules of church celebrations

5) The Church receives and serves the invited guests of the church well

6) Security of the church environment and the presence of security officers

7) Ease in obtaining information (activity schedule, church news, procedures, etc.)

8) Clarity in the costs of administrative provisions in management

9) Church Imams / Administrators provide

motivation for the people

10) Church administrators pay attention to the condition of the church

11) Church administrators are polite and friendly

3. Quadrant III (Low Priority), there are factors that are considered to have a low level of perception or actual performance and are not too important or not too expected by the people so that the church management does not need to prioritize or give more attention to these factors. Attributes that include quadrant III are:

1) Has parking space

2) Cleanliness and availability of clean water in the toilet / bathroom.

3) Condition of supporting equipment in the church

4) Cleanliness and availability of clean water in the toilet / bathroom

5) The socialization of the church management work plan

6) The ability of church administrators to answer people's questions clearly

7) Availability of the church in responding to and responding to complaints of the people

8) The existence of an ecclesiastical organization supports the aspirations and interests of the people

4. Quadrant IV (Excessive), in this quadrant there are factors that are considered not too important and not too expected by the people so that the church management is better to allocate resources related to these factors to other factors that have a higher priority level. Attributes that include quadrant IV are:

1) The regulations applied in the church are on target

2) Use of church organ / piano by an organic / pianist

3) Church administrators serve file management quickly and professionally (marriage letters, baths, chrisms, etc.)

4) Church administrators take action according to procedures

CONCLUSION

This paper aims to determine the level of satisfaction of members of the members' perceptions of the performance of the organizers of the organization, in this study socio-religious organizations. The IPA method is used to measure the relationship between consumer perceptions and priority of product / service quality improvement, which is also known as quadrant analysis. In general, members have been satisfied with the service of the board based on 25 attributes in this study. Important attributes to improve are the cleanliness and neatness of the church, the use of church notice boards and their effective use. These results emphasize that church administrators maintain their performance because they are considered very important by respondents.

Impact of Leadership Styles of Secondary School Principals on Work Motivation of Teachers in Bhutan

Harish Mittu, Sonam Tenzin,

¹Assistant Professor, ²M.A. (Educational Leadership and Management) Student,
Lovely Professional University, Phagwara, Punjab, India

ABSTRACT

The present study is focus to investigate the impact of leadership styles of secondary school Principals on work motivation of teachers in Bhutan. Descriptive survey method was used to collect the data from two hundred and twenty teachers from four Districts in Bhutan through convenience sampling technique. The findings indicated that 1) the democratic leadership style predominates from other two leadership styles as perceived by school teachers, there by showing that as per the perception of school teachers, principals in school of Bhutan are generally practicing democratic leadership style; and 2) leadership styles of principals have impact on the work motivation of teachers in schools. Teachers working with principals having democratic leadership style have high work motivation as compared to teachers working with principals having autocratic leadership style.

Keywords: Leadership Styles of School Principal, Work Motivation and Teachers.

INTRODUCTION

Leadership Styles

The way an individual performed his/her roles and handled the affairs of an institute is termed as his/ her leadership styles. It helps to influence the attitude of the employee motivation and job satisfaction. The moral of employees influenced by the leadership style the leader used. It is, therefore the way leader leads his/ her leadership styles. Some leaders they are more of work-oriented rather paying attention to the relationship with subordinates. Some are more of relationship oriented. However, a leader who emphasizes the people relation or work is well thought-out to be at the middle to leadership styles.

Okumba (1998) defines leadership styles as specific behaviors practiced by an individual to motivate his/her teammates to attain the aims of an institution.

Oyedemi (1998) & Adeyemi (2004) on the other hand said that the school principal controls various schools' resources and can accelerate or demolish the progress of education in school^{1, 2}. Therefore, a leadership style plays a significant role in school management. In the present research, investigator only focused on the three

types of leadership styles which are autocratic, laissez-faire and democratic.

Work Motivation

Work motivation is a group of active drives that comes within a person to initiate, plan and complete his/her work. It differs from person to person. Work motivation helps people to increase his/her performance level and willingness towards the work. Arousal, direction, and intensity are the three processes that are the concern with work motivation. Arousal is a provocation, which is stimulated by individual's necessities where direction is the way which people follow in order to achieve their goals but the intensity is the amount of energy an individual put into task performance. Motivation is the willingness to do something and it is conditioned by the actions of ability to satisfy some needs of the individuals. A need means some of our internal status that makes certain outcomes which appear attractions. As a saying, a motivated person is more dedicated to the organization, infect more of job satisfaction which leads towards productive outcomes. Thus, as a leader (Principal) should motivate their subordinate to use their skill and knowledge in order to achieve their aim of the organization. The subordinate who does not have

job satisfaction and de-motivation may lead to falling the organizational goal. Therefore, principal has to use different approaches to motivate teachers.

Idah & Jacob (2014) conducted a study to see the motivation in teaching staff for their work commitment with respect to leadership style³. The finding shows a strong association between transformational leadership behaviors and commitments. Results shows that encouragement to staff for creativity in their work, complete trust in staff, developing congenial work environment for staff and inspiring the staff for constructive initiatives by leaders directed the staff towards their work commitment.

Kelzang (2014) conducted a study to determine the factors affecting teacher motivation in government middle secondary schools of Thimphu, Bhutan. The findings revealed that the top three motivating factors are personal growth, professional growth, and feedback from the principal respectively⁴. The results also show that teachers in the study are moderately motivated with respect to the factors listed in the questionnaire. The study finally revealed that there is no gender difference in terms of motivation as a teacher. The research implies that school management and the concerned authority of the government need to investigate why motivation is moderate and take appropriate step to further boost motivation.

Supriadi, Yusof & Abdul (2015) conducted a study in Special Province of Central Jakarta in order to find out the correlation of work motivation, academic achievement and work discipline of primary school teachers with instructional leadership of the school head teacher⁵. The finding revealed that there exist statistical significant correlation in instructional leadership of school head teacher, the work discipline of a teacher with academic achievement and work motivation.

Tandinla (2015) conducted the study on the topic teaching effectiveness of middle secondary school teachers of Bumthang District of Bhutan in relation to work motivation⁶. Result revealed that a statistical significant difference exists in teaching effectiveness of middle secondary school teachers with respect to gender, local and experiences. There exists no significant difference in work motivation between genders, locale, and experiences of school teachers and in regression analysis work motivation emerge as a significant

predictor of teaching effectiveness but there exists a significant difference between the locales.

Alghazo & Al-Anazi (2016) conducted to see the association in employee motivation and leadership style. The finding shows that there exists the strong association between employee motivation and leadership style⁷.

Arman, Syamsul & Manda (2016) investigated the effect of school head's competence in motivating teachers towards work⁸. The results show that there is an association in school head's competence and teachers work motivation. It shows there are positive effects on teachers work motivation in relation to competence school principals and supervisor.

Statement of Problem

In this present study, an attempt has been made to explore the work motivation of teachers with respect to the leadership styles of their school principals in secondary schools of Bhutan.

Operational Definition of Key Terms

Leadership Style

An outline of behaviors adopts by a leader to influence the behaviors of his/her followers is termed as leadership style.

Work Motivation

Work motivation is a technique or art to put effort on employee towards the work goal through a specific path.

Objectives

To identify leadership styles of secondary school principals as perceived by teachers.

To study the impact of leadership styles of secondary school principals on work motivation of teachers.

Hypothesis

There exists significant impact of leadership styles of the secondary school principals on work motivation of teachers.

Delimitation of the Study

The present study delimited to school teachers teaching in different secondary schools situated in four districts namely Paro, Thimphu, Punakha and Wangdue

of Western Bhutan.

Design of the Study

The descriptive survey method was used to collect the data from two hundred and twenty teachers (109 male and 111 female teachers) teaching in secondary schools situated in four districts (Paro, Thimphu, Punakha and Wangdu) of Bhutan through convenience sampling technique. Leadership Styles Scale by Dr. Savita Gupta and Ms. Kezang Choden (2016) and Work Motivation Questionnaire by Thinley Namgay & Kuenzang Dorji (2014) were used to collect the data⁹. The objectives and hypothesis of the study have been tested by using percentage and one-way ANOVA.

RESULTS AND DISCUSSION

Analysis of data, result and interpretation of findings has been done keeping in view the objectives and hypothesis of the study.

Result pertaining to Leadership Styles of Secondary School Principals as perceived by Teachers

The objective was to identify styles of leadership among secondary school principals as perceived by teachers. After administrating the leadership styles scale, scores in each leadership style has been calculated for each respondent. Leadership style against highest score has been declared as the leadership style of secondary school principals perceived by the teachers. Three different leadership styles were computed in terms of numbers and percentage. The detail results have been presented in table 1.

Table 1 : Number and percentage of Secondary School Principals in different Leadership Styles as Perceived by Teachers

S. No	Leadership Styles	Number of Teachers	Percentage of Teachers
1	Autocratic Leadership	13	5.91
2	Democratic Leadership	192	87.27
3	Laissez-Faire Leadership	15	6.82
Total		220	100

Interpretation

Table 1 shows that out of 220 teachers that constituted the sample population, 13 teachers professed that their principals use autocratic leadership style, 192 teachers revealed that their principals use democratic leadership style whereas 15 teachers say that their principals use laissez-faire leadership style. Hence, it can be concluded that autocratic leadership style is minimally practiced comparing to laissez-faire leadership style whereas the democratic leadership style predominates the figure there by showing principals in schools of Bhutan are generally practicing democratic style. The same result found by Choden (2016) that democratic leadership style predominates in the secondary school in Bhutan. The percentage of secondary school principals leadership style falling in the democratic leadership style is 87.27%, while that in autocratic leadership style and laissez-Faire leadership style are 5.91% and 6.82% respectively.

Result pertaining to Impact of Leadership Style of Secondary School Principals on Work Motivation of Teachers

The objective was to study the impact of different styles of leadership among secondary school principals on work motivation of teachers. After administrating the work motivation questionnaire and leadership style, mean, standard deviation, standard error of difference and One-Way ANOVA for work motivation of the teachers for three different leadership styles of secondary school principals were computed and the result have been presented in table 2.

Table 2: Mean and SD of Work Motivation of Teachers with respect to Leadership Styles of Secondary School Principals

Leadership Styles of Secondary School Principals	Number of Teachers	Mean	SD
Autocratic Leadership	13	54.15	10.99
Democratic Leadership	192	64.92	10.77
Laissez-faire leadership	15	60.80	8.28

Interpretation

As shown in table 2 the mean work motivation scores of teachers for different leadership styles of secondary school principals namely autocratic leadership, democratic leadership and laissez-faire

leadership as perceived by teachers are 54.15, 64.92 and 60.80 respectively and their standard deviations were 10.99, 10.77 and 8.28 respectively. The mean work motivation of the teachers corresponding to democratic leadership style of secondary school principals is the highest where as the mean of work motivation score of teachers corresponding to autocratic leadership style of secondary school principals is lowest among all the three leadership styles of school principals.

To explore the significant difference between means of work motivation of teacher for different leadership styles of secondary school Principals namely autocratic leadership, democratic leadership and *laisser-faire* leadership, One –Way ANOVA was applied. The summary of One-Way ANOVA for work motivation of teachers with respect to different leadership styles of secondary school principals is given in table 3.

Table 3: Summary of One-Way ANOVA for Work Motivation of Teachers with respect to Leadership Styles of Secondary School Principals

SOV	Df	SS	MS	F-value	Remarks
Between	2	1577.07	788.54	6.97	P<0.01
Within	217	24555.92	113.16		
Total	219	26132.99			

*SOV- Summary of One-Way ANOVA; Df-Degree of freedom; SS- Sum of Squares and MS-Mean Squares

The F-Value as seen in the table 3.26 is 6.97, which is significant at 0.01 levels. Hence, the stated hypothesis, there exists significant impact of styles of leadership among secondary school principals on work motivation of teachers, is not rejected.

To find out the statistical significance of difference between the means of work motivation of teachers with respect to different styles of leadership among secondary school principals, t^2 - test was applied pair wise on work motivation with respect to different styles of leadership among secondary school principals. The results of the t-test have been summarized in table 4.

Table 4: Significance of Difference between Means of Work Motivation of Teachers with respect to Leadership Styles of Secondary School Principals

Count	LS	Mean	SD	SED	t^2 -value	Significant
13	AL	54.15	10.99	3.09	3.49	P<0.05
192	DL	64.92	10.77			
13	AL	54.15	10.99	3.65	1.82	P>0.05
15	LFL	60.80	8.28			
192	DL	64.92	10.77	2.85	1.45	P>0.05
15	LFL	60.80	8.28			

*LS-Leadership Styles; AL-Autocratic Leadership; DL-Democratic Leadership; LFL-Laisser-faire leadership; SD-Standard deviation and SED-Standard Error of difference

Interpretation

As shown in table 4 the mean work motivation scores of teachers corresponding to autocratic and democratic leadership styles of principals are 54.15 and 64.92 respectively. The values of standard deviation are 10.99 and 10.77 respectively. The t' -value comes out to be 3.49. For $df = 203$, the critical values are 1.97 and 2.59 at 0.05 and 0.01 level of confidence. The calculated t' -value comes out to be 3.49, which is significant at both the levels of confidence. Therefore, it can be said that there exists statistical significant difference in work motivation of teachers corresponding to autocratic and democratic leadership styles of principals.

The mean work motivation scores of teachers corresponding to autocratic and laissez-faire leadership styles of principals are 54.15 and 60.80 respectively. The values of standard deviation are 10.99 and 8.28 respectively. For $df = 22$, the critical values are 2.07 and 2.82 at 0.05 and 0.01 level of significant. The calculated t' -value comes out to be 1.82, which is insignificant at both the levels of confidence. Therefore, it can be said that there exists no statistical significant difference in work motivation of teachers corresponding to autocratic and laissez-faire leadership styles of principals.

The mean work motivation scores of teachers corresponding to democratic and laissez-faire leadership styles of principals are 64.92 and 60.80 respectively. The values of standard deviation are 10.77 and 8.28 respectively. For $df = 205$, the critical values are 1.97 and 2.59 at 0.05 and 0.01 level of confidence. The calculated t' -Value comes out to be 1.45, which is insignificant at both the levels of significant. Therefore, it can be said that there exists no statistical significant difference in work motivation of teachers corresponding to laissez-faire and democratic leadership styles of principals.

In view of the above result and discussion the stated hypothesis, there exists statistical significant impact of leadership styles of principals on work motivation of teachers is not rejected in case of autocratic and democratic leadership style of principal whereas is rejected for other two combinations of leadership styles of principals i.e. Autocratic and laissez-fair leadership styles and democratic and laissez-fair leadership styles.

CONCLUSIONS

1. The democratic leadership style predominates from

other two leadership styles as perceived by school teachers, there by showing that as per the perception of school teachers, principals in school of Bhutan are generally practicing democratic leadership style. The percentage of principal's leadership style falling in the Democratic leadership style is 87.27%, while that in Autocratic leadership style and Laissez-Faire leadership style are 5.91% and 6.82% respectively based on the perception of school teachers. The same result found by Choden (2016) that democratic leadership style predominates in the secondary School in Bhutan.

2. Leadership styles of principals have impact on the work motivation of teachers in schools. Teachers working with Principals having democratic leadership style have high work motivation as compared to teachers working with Principals having autocratic leadership style.

Art of Visual Communication, Evolution and its Impact

Nida Ijaz

Lecturer, PhD Scholar, Lahore College for Women University

ABSTRACT

In the field of art, visual communication plays an important role to communicate with the viewer. Visual communication is evolving around time to time but it is not a current invention. This visual communication has a history. It is very useful in the contemporary world. Although it has a long history trail but still today it plays a prominent role in the world of digital communication. Meaning of visual communication is that something which can be attained with the help of eyesight and display. In this manner any display thing and which can be seen through sight fall in this category like map, signals, painting, illustration, graphic, books, animation, web designs, advertising, films and etc. Anything that comes with a message can be fall in this category and can be code a message in a beautiful way and that message can leave a strong impact on viewer mind and could change their behavior towards a certain company. This communication and its impact can be measured; assessment of visual communication totally depends on the understanding of identified audience. Visual communication can build an image of a company, that image can be set or delivered with the representation of logo. Now a day's logo plays a prominent and important role to communicate and develop the identity and image of a company or business in the corporate world. Logo is an important element of any business and product. Another term is very near to the concept of logo that is 'branding' meaning "assign a brand name to". Branding is a process which creates an image or name of product in the market. Logo and branding are very much important to each other. Intend of this research is to discuss the visual communication evolution and its impact on the consumer behavior in the reference of graphic design.

Keywords: *Art, Visual Communication, Graphics, Impact*

INTRODUCTION

Communication is very much important in our daily life an individual cannot spend a single day without any communication. It is not necessary to have communication between two individuals; communication means receiving information from a source and makes an action on that. The individual who transfer that message is stated as the sender and the person or group who received that information is termed receiver. An idea, facts, instructions, opinions, and emotions can be delivered as information. Definition of communication is the act or process of communicating; fact of being communicated" and "the imparting or interchange of thoughts, opinions, or information by speech, writing, or signs".¹ Communication have three different modes. First mode is "Interpersonal Communication" meaning "Interpersonal communication is a two-way means of communication that allows the participants to evaluate and respond to each other."² Second mode is "Interpretive Communication" meaning "Sender

(presenter or writer) delivers the information, and the listener or reader (or viewer in the case of television and other forms of visual media) concludes or understands the concepts presented to them. Interpretive communication lets intake and division according to individual beliefs and understanding".³ Third mode is "Presentational Communication" meaning "a speaker is speaking to a group of people, audience or presenting a performance or presentation in script and has no other resources of engaging with the addressees".⁴ Communication can be further divided into two different forms like visual communication and verbal communication. This research intends to discuss the visual communication which fall in the second mode of communication i.e. "Interpretive Communication".

Visual communication is the strongest medium to communicate in the present era. In this type of communication, you can deliver the information, enlighten the viewer and entertain the audience through images and text. Today when the technology is on its

peak many companies determine to communicate with their consumer, audience and consumers via visual communication (advertising) because it takes minimum of their time with an effective impact. Now a days people mostly rely on visual communication. Graphic design, signs, films, Tv commercial and other uncountable sources of visual communication. These all are advanced form of communication otherwise visual communication is the oldest form. Visual communication evolves with the passage of time and leaving strong impact on the viewer mind as this is growing. Saying that visual communication is a form of art is not wrong. As it is the oldest way of communication; Communication is the basic need to survive. Capacity to communicate others in more effective way is most important reason to be exist like a civilization. Now a days almost every business communicates with their audience, consumer and viewer with visual communication which is called a form of art i.e. Logo. Logo is Greek language word meaning "Imprint".³ Meaning of Logo is "Conceptual representation like writing a visual and referential linguistic sign that does not take the phonetic dimension into consideration."⁴ To communicate with audience logo is very important element of every product and business in the corporate world. Branding is another terminology for logo and meaning of branding is "assign a brand name to"⁵. To build an image in consumer mind branding plays very important role in it and with the help of advertising campaign a business or company defined their advertising and branding theme. Which help companies to build notable image in the consumer mind. Logo is an important part of branding.

To understand the importance and impact of visual communication it is must to study visual communication types. Visual Communication in advertising has many types like logo, print campaign, TV commercial, website etc. It's very much important to choose an accurate type for visual communication according to the purpose like, for advertising; you should know your audience background. This research highlights the consumer behavior towards the products and brands. And the perception of viewer towards those ads.

LITERATURE REVIEW

Without communicating with each other no one can grow or cannot spread and preserve the knowledge and information just like people from stone age. Because lack of preserved information or documented

knowledge, today there is very limited information about them. If we go back to see its history then human used this form of communication million years ago in stone age settlements. They communicate through paintings, paintings they paint in cave's walls and on ceilings, those paintings helped them to communicate, paintings contain various hunting scenes, anatomy study of different animals or it might be possible they delivered their hunting traditions to their coming generations through these paintings. Identify any specific reason is impossible because we have no any manuscript record of their language.

Later Indus Valley Civilization (3300 – 1300 BC), this was one of the oldest civilizations came to know with well-planned architecture⁶, but historians are restricted in their knowledge for this civilization because they could not find any way to understand their language which is still fall underneath in unknown category. Although there are traces of the way of communication they might had, that source is seals (Fig. No. 1) which has been discovered from diverse places and in numerous shapes with contains various symbols written (engraved) on it.

Egyption and Mesopotamia Civilizations have the acclaim of being the most the most primitive known writing systems are thought to have invented in the Middle Eastern civilizations of Mesopotamia (cuneiform) and Egypt (hieroglyphs) (Fig. No. 2 & 3) over five thousand years ago⁴. The Maya from Central America, another settlement of ancient people who have early glyphs. This civilization reached to its peak started from 300 BC and mysteriously vanished in the 16th century AD.⁴

Early glyphs from one more ancient people, the Maya of Central America, whose civilization cultivated from 300 BC⁴ before vanishing inexplicably in the 16th century AD, were based on a sophisticated written calendrical system.⁴ Though the first notorious European writing appeared from pre-Homeric Greece and Crete. Egypt and Mesopotamia reflect the progressive development in the race of human history through the invention of scripts. Rosetta Stone revealed in Egypt (1799)⁴ which contain similar inscription in three dissimilar idioms i.e. Greek, Egyptian Hieroglyphs and Demotic which makes easy to comprehend the hieroglyphs in the first place. Hieroglyphs (Fig. No. 2 & 3) are combination of different symbols; the symbols

represent the sounds and the way of communication of once existing language.

If we compared the qualities of hieroglyphs with logo and logo's purpose. Then put this statement would not be mistaken that hieroglyphs are very first representative depiction of Pictogram (Fig. no. 4) in antiquity. Meaning of pictogram is; any symbol which delivers and conveys a message. Pictogram is alternative of logo form. This symbolic representation has been using in later upcoming civilizations since. This form of representation and communication evolved with the passage of time and became one of the strongest ways to communicate with masses despite their different backgrounds and language they speak.

For example, in the advertisement of Jet washing detergent (Fig. No. 5 and 6) company have showed black and white photographic based ads. In which they have showed a satisfied and happy woman. And in present era Sufi Soap (Fig. No. 7&8) and Surf Excel (Fig. No. 9&10) companies presented their vision and their target audience very directly in Surf Excel (Fig. No. 10) they are showing a young, energetic and fun-loving mother of a boy who is playing football and get some stains. And in second ad (Fig. No. 9) a grandmother aged woman with a very obedient and well-mannered boy. On the other hand, in Sufi Soap (Fig. No. 7&8) ad company used their packaging and a caption in Urdu language which is mother language of Pakistan can be understand by most people in Pakistan. In sufi soap ad there is a combination of text and Package image only on the other hand in surf excel they are showing a young mother may be a housewife who is very much happy and satisfied with the results of surf excel and they are delivering their message in English language which is much showing that only the people who are able to understand English can read and understand this message as the image is very much clear and loud that the lady is very much satisfied with the outcomes of product.

CONCLUSION

Communication is very much important to excel in every field even as a civilization only can survive if have communication. As communication is very important and this research paper has discussed the importance of visual communication, and how this type of communication evolve around the era with the passage of time with leaving a strong impact on it. With

the passage of time every company adopt this visual communication source to advertise themselves for their consumer and their growth in the corporate world. Advertising is a key to attract your consumer and make them to buy certain product. Through advertising they delivered their message and inspire their consumer to buy their product. Face of communication have changed with the passage of time, communication developed from hieroglyph to pictograms. This change happened because that was the demand of time. With the passage of time different civilization appeared, survived and gone. Every civilization and settlement leave an impact on society and society reach to next level with every settlement's progress. And now time has come when the whole world could be considered as a global village. That change happed with the help of technology. As technology achieved a level in contemporary world and that achievement demands a change in every aspect of life including communication. To full fill that requirement visual communication has developed and evolve itself. Most of the companies mostly rely on visual communication and they advertise themselves and grab the attention of their target audience. Perception of consumer and user has changed and developed with the time as well. Today no one have time in their busy routine lives and everyone want solution of their problem very quick. Because competition has increased the demand of consumer. People who are target audience have information and exposure of different brands and product due to media, and its everyone wish to look pretty, feel healthy and deliver best to their families. Companies first develop a demand or need of their product in consumer life by showing very energetic, healthy, successful models and actors in their ads who are using their product and informing, delivering given message and encouraging them (consumer) to buy their (company) product. Because people get inspired by their idols and they do what they ask them to do. Companies and concept developers now how to target which class by showing certain living style, environment, dresses and most importantly with the language they are choosing for delivering their message. Purpose of this research paper is to study that how Pakistani advertisement has changed with the passage of time and how they are attracting consumers toward a specific product and company.

Professional Ethics of Teacher Educators in Relation to Value Pattern

Sasmita Kar

Assistant Professor, Rama Devi Women's University, Bhubhaneshwar

ABSTRACT

Professional ethics possessed by teacher educators largely influence the performance of their pupils. It is also believed that teacher educators with high value patterns are likely to possess more professional ethics. The purpose of this study was to find out whether there exists any relationship between professional ethics of teacher educators in relation to their value pattern. One hundred teacher educators from Agra and Firozabad districts of Uttar Pradesh were selected on the basis of simple random sampling method. Descriptive survey approach was followed to conduct the study. "Professional Ethics Scale for Teachers (PEST) by Jasmine Kaur" and "Teachers Value Inventory (TVI) by H.L. Singh and S.P. Ahluwalia" were used to collect data. Results of the study revealed that gender is not a factor in determining the professional ethics of teacher educators, whereas the value pattern of teacher educators differs significantly on the basis of gender. It also indicates that there exists a positive co relationship between professional ethics and value pattern of teacher educators.

Keywords: *Professional ethics, Value pattern, Teacher educator, Gender*

INTRODUCTION

In the field of education, professional ethics refers to the value system of ethical behaviour shown by teachers while carrying out their duties viz. teaching, researching, consulting, rendering extension activities etc. Burant, Chubbuck and Whipp, (2007) argued that our attention in teacher education should not only confine to the construction of acquaintance and skills but also of the triggering moral responsiveness¹.

Gunzenhauser (2012) states "as a professional a teacher should show an equal level of dignity to every person as an individual²." Teacher's reverence towards the pride of his students should be demonstrated through the way he fulfills his professional obligations³.

The role of a teacher is not confined to his organization only. Rather it covers the parents, the society as well as the nation. "Teachers strongly influence the overall ethical climate of the educational institute⁴." "The overall conduct of teachers affects the moral development of students⁵." Therefore, in order to develop the moral character of students, the teachers should act in the most ethical way. Ethics possessed by the teacher not only help in developing values in his

students but also it helps him in his professional growth (Hasu, 2003). "Since every teacher is a value educator, he should develop a clear vision of his role in value orientation and should be able to identify the potential of different subjects and situations in school for fostering universal values"⁶.

In a study on "the value pattern of teachers", Patel (1979), found that female teachers possess more aesthetic and religious values than male teachers⁷. However, male teachers score more in political values in comparison to their female counterparts. Verma and Tyagi (1988), found that male teachers were high in political values as compared to female teachers whereas female teachers score more in social values than male teachers⁸. The study by Dhull and Mahesweta (2005), is also in agreement with the fact that male teachers score more in political values than female teachers⁹. The study conducted by Kumari (1996), shows a contrasting result of the above data¹⁰. Accordingly, male teachers score significantly higher in political as well as in social and aesthetic values than female teachers. In an international study conducted by Raj (1981), it is found that Ethiopian teachers exhibit more social, cultural and theoretical values than Indian teachers¹¹. However, no significant

differences were found in the scores of academic and aesthetic values in the teachers of these two countries. The study also reveals that Indian teachers score higher in religious values than Ethiopian teachers. Studies conducted by Kumari(1996), and Kumar (2006), reveal the value pattern of rural and urban teachers¹². In the study of Kumari, it is found that rural male teachers are less moral than urban male teachers whereas rural female teachers are less aesthetic and religious than urban female teachers. The study by Kumar found no significant difference in the religious, aesthetic and health value of both urban and rural female teacher trainees. Same results were revealed by an investigation done by Kanti (2013) to find out the “value preference of prospective secondary school teachers”¹³.

Our society is now going through the process of change due to globalization, economic crisis, social innovations and advancement in technology. In such rapidly changing circumstances, teaching experience needs exposure to different social, economic and political climate augmented by interaction between and among teachers, students, parents and public in general. This exposure is characterized by variety, length and intensity that do affect an individual’s prize for things and objects, for thoughts and ideas, for values and ideals. Consequently there is a change, modification, deletions and additions in the value pattern among teachers. This study was an attempt to find out if there exists any relationship between professional ethics and value pattern of teacher educators.

OBJECTIVES

1. To explore the professional ethics and value preference of teacher educators.
2. To find out the gender wise difference in the professional ethics and value pattern of teacher educators.
3. To explore the relationship between professional ethics and value pattern of teacher educators.

METHODOLOGY

It was a quantitative study based on descriptive survey method. The study was delimited to 100 teacher educators of Agra and Firozabad districts of Uttar Pradesh selected by simple random sampling technique.

Professional Ethics Scale for Teachers (PEST) by

Jasmeen Kaur was used to measure the professional ethics of teacher educators¹⁴. This scale was designed to measure various aspects of teaching profession such as responsibility, honesty, integrity, attitude, cooperation, respect for self and others, assessment of students, conduct and diligence of teachers etc. professional ethics of teachers varies from 0 to 40. On the basis of their obtained scores teachers with less than 24 falls under low professional ethics category, within 24 to 30 categorized as average and with more than 30 falls under teachers possessing high professional ethics. Teachers Value Inventory (TVI) by H.L.Singh and S.P.Ahluwalia was used to assess the value pattern of teacher educators. This scale intended to measure seven patterns of values related to teachers. They are social, economic, religious, aesthetic, theoretical, political and hedonistic.

Results and Discussion

In order to assess the professional ethics among teacher educators, collected data was scored and presented in table 1.

Table 1: Professional Ethics of Teacher- educators

Level of professional ethics	Norms (scores)	Percentage
High	<24	18.2
Moderate	24-30	46.6
Low	30>	35.2

The data shown in the above table revealed that 18.2% of teacher educators show high level of professional ethics, 46.6% show average and 35.2% exhibit low level of professional ethics. Hence there is no uniformity among teacher educators in their professional ethics. Thus, the level of professional ethics of teacher educators mostly falls in average category. The reason may be that teachers besides teaching and research activities, the teachers are overburdened with other extension activities and they may be struggling to maintain some sort of ethics in their profession. Findings of the study is supported by Scales (2002), Zheng and Hui (2005), Itai *et al.*(2006), Li (2007) and Ozbek (007)^{15,16,17,18,19}.

Mean scores of different values were calculated to find out the order of value preferences of prospective

teachers. Ranks were assigned on the basis of those calculations and presented in table 2 below:

Table 2

Values	Mean	Rank
Theoretical	90.6	2 nd
Economic	78.5	4 th
Aesthetic	80.4	3 rd
Social	99.8	1 st
Political	74.5	6 th
Religious	75.2	5 th

The table shown above indicates that teacher educators give first preference to social values whereas last preference is given to political value. Findings of this study is in line with those of Kakkar (1971), and Macheil (1991)^{20,21}.

Hypothesis 1: There is no significant difference in the professional ethics of male and female teacher educators. In order to test the hypothesis, the collected data has been scored and presented in table 3.

Table 3: Professional Ethics of Male and Female Teacher -educators

Variable	Gender	N	Mean	SD	t-value
Professional ethics	Male	50	24.57	3.75	0.28
	Female	50	24.71	3.41	

The above table shows the mean difference between male and female teachers in relation to their professional ethics. The table value reflects that the mean values of male and female teacher educators are 24.57 and 4.71 respectively. The t-value 0.28 is found insignificant at 0.05 level. Therefore, the null hypothesis stating the insignificant difference between male and female teachers in relation to their professional ethics is accepted.

Hypothesis 2: There is no significant difference in the value pattern of male and female teacher educators. The following table shows the mean difference in

different dimensions of value pattern in relation to gender:

Table- 4: Value Pattern of Teacher-educators in Relation to Gender

Values	Gender	N	Mean	SD	t value
Social	Male	50	102.22	8.52	1.05
	Female	50	104.58	12.65	
Economic	Male	50	90.77	12.87	0.2
	Female	50	90.45	12.43	
Political	Male	50	87.34	10.46	2.62*
	Female	50	82.33	7.84	
Religious	Male	50	130.03	10.83	1.98*
	Female	50	134.71	13.79	
Aesthetic	Male	50	117.37	13.49	2.0*
	Female	50	125.6	25.31	
Theoretical	Male	50	82.55	13.58	0.37
	Female	50	81.51	10.05	

The above table illustrates the locale difference in the mean scores of male and female teachers in relation to their value pattern. A comparative study of the mean scores of political value reveal that male teachers exhibit more political value (M=87.34) in comparison to female teachers (M=82.33). The presence of more political values in male teachers is in agreement with the findings of Patel (1979), Gupta (1998), Verma and Tyagi(1988), Kumari (1996), Sandya (1999) and Dhull(2005)^{22,23}. However, the t values for religious and aesthetic value are statistically significant which shows that male and female teacher educators differ significantly in these values. Female teachers are more prone to religious and aesthetic values (M=134.71 and 125.6) in comparison to their male counterparts (M=130.03 and 117.37) respectively. This finding is supported by Patel (1979), and Kumari (1981)²⁴. The table indicates that there is non-significant locale difference in the social, economic and theoretical values of male and female teacher educators. The mean scores of social (102.22 vs. 104.58), economic (90.77 vs.90.45) and theoretical values (82.55 vs. 81.51) reveal that both male and female teachers possess nearly the same level of these values. Thus the above hypothesis stating that there is no significant difference in the value pattern of male and female teacher educators is rejected.

Non- significant difference in theoretical values for both the sexes reveals that both male and female perspective teachers are giving value to cognitive approach. Similarly, equal mean scores in social and economic values indicate the inclination of both the sexes to become socially adjusted as well as economically self sufficient. The presence of more political values in male teachers shows that they are more oriented towards power and dominance. Whereas the indigenous culture of our Indian tradition may be a contributing factor for the female teachers to score more in religious and aesthetic values.

Hypothesis 3: “There is no significant relationship between professional ethics of teacher educators in relation to their value pattern”. The kinship between these two variables is stated in table 4.

Table- 5: Relationship between Professional Ethics and Value Pattern among Teacher -educators

Category	N	R	Significance
Professional ethics	100	0.33	Significant
Value pattern	100		

The value of correlation with regard to professional ethics and value pattern of teacher educators is found to be insignificant at 0.05 level of significance. Thus, the hypothesis i.e., “there is no significant relationship between professional ethics of teacher educators in relation to their value pattern” is rejected. From the result, it can be concluded that there exists a positive but negligible correlation between professional ethics and value pattern of teacher educators.

CONCLUSION

Result of the study shows a wide variance in the level of professional ethics of teacher educators. Many teachers possess average level of value pattern. Though teacher educators possess different levels of professional ethics, their ethics don't differ with regard to their gender. Gender is an influencing factor in determining the social, economic and theoretical value of teacher educators. The level for the above values is almost the same for both the sexes. However, male and female teachers do differ significantly in religious, aesthetic and political values. Male teachers are high in political values whereas female teachers are more prone to religious and aesthetic values. So far as the relationship between professional ethics and value pattern of teacher

educators are concerned, it is found that both of these variables are positively correlated. Values possessed by teacher educators help in developing their professional ethics. A value enriched teacher is likely to exhibit more professional efficiency. Professional ethics shown by teacher educators are likely to be transformed to their students who would ultimately lead the nation in future. Therefore, professional ethics should be exhibited by a professional in accordance to reasonably high standards and acceptable moral conduct. As value pattern possessed by a teaching professional is a contributing factor in determining his professional ethics, efforts should be made to enhance his professional values.

Eve-Teasing: Effect on Emotional Intelligence of Adolescent Girls In Relation to Stress

Amardeep Kaur

Professor, Babe Ke College of Education, Mudki, Ferozpur

ABSTRACT

The world is transforming swiftly in education, technology, science and society itself. In this changing world, a woman is also going through equal transformation. She has moved shoulder to shoulder with the man and partaken his endeavor in every area of life. She has also made herself accessible to the outer universe and made a space for herself there too. The maximum credit for this upliftment of women goes to education. But at the same time when a women moves out of her home for getting education in some good educational institution or work , she does face many problems, and Eve-teasing is one such pernicious, horrid and disgusting practice which poses a threat to the security and wellbeing of a girl.

Keyword: *Eve, Tease, Harassment*

INTRODUCTION

The word 'Eve' is making a reference to the Biblical allusion of eve alluring Adam to deviate from the track of righteousness. The English Dictionary denotes 'tease' to allure someone physically with no motive of satisfying. Both terms are employed to present women negatively in a mode of 'Eve-teasing'¹. But the fact remains that it is the woman who becomes a victim in eve-teasing. Eve-teasing is said to be the most prevalent issue in India, chiefly affecting women. The formation of Indian society has always been paterfamilias. But in the present era, women have tried to come out of this captivity by venturing into male dominated fields². Though, we have progressed technologically, academically etc., yet the most basic foundation of society is depicting no sign of advancement. A thorough look at the daily news paper displays so many crimes against women. Eve-teasing is a big problem in many urbane cities of India³. A considerable percentage of Indian women have encountered or are tolerating this menace. It may be a public transport system or general places or shopping marts or multiplexes, women find themselves exposed to the threat of Eve-teasing at all places. Eve-teasing is crucial problem and it requires more heed than what it has indeed received⁴.

Emotional Intelligence

The term emotional intelligence has been rooted

from social intelligence, which was conceived by E.L.Thorndike in 1920. Emotional Quotient (EQ) is used synonymously with emotional intelligence. It was first Peter Salovey of Yale University and John Mayer of Hampshire in 1990, who originated the term emotional intelligence and explained it as a type of social intelligence that involved the capability to manage one's own and others feelings and emotions to segregate among them and to apply this information to direct one's thoughts and behaviour⁵. Emotional intelligence is the product of one's genetic makeup and interaction with his surrounding forces. Till now, it was found that intelligence is not the single measure of success. It is the recent concept. It assists the individual in making decision or finding solution to problems within the framework of situations and interpersonal affinities. It refers to an ability for identifying our own feelings and those of others. Emotional intelligence is another way of being intelligent^{6, 7}. It includes perceiving what your feelings are and employing your feelings to make sound decisions in life. It's being capable to control distress moods well and manage impulses. It's being inspired and remaining full of hopes and optimistic when you have set back in working to achieve your goals. It is the insight knowing what the people surrounding you are feeling. In the light of how much stress schools, colleges and other organizations place on IQ alone, it is shocking that only a very limited part of a person's accomplishment at

work, or in life, is described by IQ. When IQ test counts are paralleled with how well people function in life, the highest rating of how much difference IQ makes is only about 20 percent. This implies that IQ alone is incapable of explaining about 80 percent of job success. As much as 80 percent of success is said to be derived from EQ.⁸

Emotional Intelligence involves fields such as:

Recognizing emotion: The ability to identify how you and those surrounding you are feeling.

Applying emotion: The capability to generate emotions and then to use logic with this emotion.

Comprehending emotion: The ability to comprehend the crucial emotions and emotional “chains” in what way emotional conversion takes place from one stage to another.

Managing emotion: The ability which permits you to regulate emotions in yourself

STRESS

Stress as a term means “to draw tight” and has been used to describe troubles, affliction, force, pressure, strain, or strife. It has been acknowledged as an external load or force supplied on the person and observed the person’s reaction to an obstruction. It has become an inevitable companion today in all fields of life⁹⁻¹². Its managements and coping has become a great concern for physiologists, psychologists, psychiatrists, clinicians and educationists. In some cases, it becomes mental health problem, which needs to be dealt with systematically. In another sense, stress is considered as a class of impetus which threatens a person in some form and hence causes disorder in his behaviour. Thus stresses are the factors or causes that lead to maladjustment and disorganization of the behaviour. The American Psychological Association (2007) found in American poll that one-third of population in the United States inform undergoing very high level of negative stress¹³⁻¹⁸. Stress as a general word is used to various psychologic (mental) and physiologic (bodily) burdens experienced or felt by people in their lives. According to the ‘Health Centre (2006)’ there are four main types of stress¹⁹⁻²³:

Distress: - Distress is a negative stress brought about by regular adaptations or amendments in a routine. It gives birth to feelings of displeasure and ignorance¹⁹.

Eustress:- Eustress is a sort of a brief phase stress that gives instant power. Eustress takes place at points of raised physical activity, excitement, and inventiveness. It is a beneficial stress that originates when impetus and inspiration are required²⁴.

Hyper Stress or Excessive Stress: - Hyper stress happens when a person is forced above what he or she can manage. Hyper stress develops from being overburdened or burned out with excess work. It affects all phases of a person’s life which includes their work, their family life and even their life in society and personal affinities²⁵.

Hypo stress: - Hypo stress is adverse of hyper stress. Hypo stress takes place when an individual is turned off or unquestioned. People who go through hypo stress are often disturbed²⁶.

OBJECTIVES OF THE STUDY

1. To study the Eve-teasing among adolescents girls.
2. To study the Emotional Intelligence of adolescents girls.
3. To study the Stress of adolescent girls.
4. To study the Eve-teasing of adolescent girls in relation to Emotional Intelligence.
5. To study the Eve-teasing of adolescent girls in relation to stress.
6. To study the difference in Eve-teasing of adolescent girls in relation to their location of school.

Hypotheses

There is no significant difference in the Eve-Teasing of Adolescent girls studying in urban and rural schools.

There is no significant difference in the Emotional Intelligence of Adolescent girls studying in urban and rural schools.

There is no significant difference in the Stress of Adolescent girls studying in urban and rural schools.

There is no significant relationship between Eve-Teasing and Emotional Intelligence of Adolescents girls.

There is no significant relationship between Eve-Teasing and Stress of Adolescents girls.

There is no significant difference in Eve-Teasing of adolescent girls in relation to location of school.

Delimitations of the study

The study was limited to school going adolescent girls only.

School going adolescent girls from District Ferozepur were taken to study the problem.

The present study was delimited to study the effect of Eve-teasing on Emotional Intelligence and Stress in adolescent girls.

Sample of the study

The sample comprised of 200 adolescent girls selected randomly from Ferozepur district. 100 girls were taken from rural and 100 from urban schools.

Tools Used

1. Eve-teasing: A Self prepared tool.
2. Emotional Intelligence Test by Prof.Roquiya Zainuddin & Dr.Anjum Ahmed.
3. Students Stress Scale by Dr. Zaki Akhtar.

Analysis and Interpretation

Objective 1. To study the Eve-teasing among Adolescent Girls.

Table 1.1 Showing the frequency score of Eve-teasing among adolescent girls.

Class Interval	Frequency (f)	Cumulative Frequency	CPF
41-50	2	2	1
51-60	4	6	3
61-70	7	13	6.5
71-80	44	57	28.5
81-90	58	115	57.5
91-100	65	180	90
101-110	19	199	99.5
111-120	1	200	100

Mean=84.89; S.D. = 11.59; Minimum Score=49; Maximum Score=112; Range=63.

Table 1.1 depicts that 29% of sample falls in the mean interval 81-90 in the Eve-teasing among Adolescent Girls, having mean value of 84.89. 28.5% of respondents lie in the class intervals that are above the mean class interval 81-90 and 42.5% of the adolescent girls score in the lower class intervals than the mean class interval 81-90.

Table 1.2 Showing the Mean score in Eve-teasing of Adolescent Girls

Eve-teasing	Urban	Rural	Total
Mean	84.89	88.53	86.71

Table 1.2 shows the mean score of Eve-teasing of urban (100) adolescent girls is 84.89 and rural (100) adolescent girls is 88.53 and the total mean score of Eve-teasing is 86.71. The Rural adolescent girls experience high Eve-teasing as compared to urban adolescent girls and total of Eve-teasing mean score.

Discussion: -The above table depicts that the mean score of rural adolescent girls is higher as compared to mean score of urban adolescent girls and total adolescent girls which may be interpreted as rural adolescent girls have to face more Eve-teasing as compared to urban adolescent girls.

Objective 2. To study the Emotional Intelligence among Adolescent Girls.

Table 2.1 Showing the frequency score of Emotional Intelligence among adolescent girls.

Class Interval	Frequency	Cumulative Frequency	CPF
20-30	1	1	1
31-40	0	1	1
41-50	3	4	2
51-60	54	58	29
61-70	111	169	84.5
71-80	29	198	99
81-90	2	200	100
Total	200		

Mean=63.15; S.D. = 6.84; Minimum Score=27; Maximum Score=83; Range=56.

Table 2.1 depicts that 0.55% of sample falls in the mean interval 61-70 in the Emotional Intelligence

among Adolescent Girls having mean value of 63.15. 29% of respondents lie in the class intervals that are above the mean class interval 61-70 and 15.5% of the students score in the lower class intervals than the mean class interval 61-70.

Table 2.2 Showing the Mean score Emotional Intelligence of Adolescent Girls

Emotional intelligence	Urban	Rural	Total
Mean	63.15	65.15	64.15

The Table 2.2 shows the mean score of emotional intelligence of urban (100) adolescent girls is 63.15 and rural (100) adolescent girls is 65.15 and the total mean score of emotional intelligence is 64.15. The rural adolescent girls experience high emotional intelligence as compared to urban adolescent girls and total of emotional intelligence mean score.

Discussion: - It is evident from the above table that the mean score of rural adolescent girls is higher as compared to mean score of urban adolescent girls and total adolescent girls. It is interpreted that rural adolescent girls are more emotionally intelligent as compared to urban adolescent girls.

Objective 3. To study Stress among adolescent girls.

Table 3.1 Showing the frequency score of Stress among adolescent girls.

Class Interval	Frequency	Cumulative Frequency	CPF
80-100	20	20	10
101-120	50	70	35
121-140	57	125	62.5
141-160	45	172	86

161-180	23	195	97.2
181-200	5	200	100
Total	200		

Mean=135.17; S.D. = 23.66; Minimum Score=82; Maximum Score=187; Range=105.

Table 3.1 depicts that 27.5% of sample falls in the mean interval 141-160 in Stress among adolescent girls having mean value of 141-160. 63.5% of respondent lie in the class intervals that are above the mean class interval 141-160 and 14% of the adolescent girls score in the lower class intervals than the mean class interval 141-160.

Table 3.2 Showing the Mean score of Stress of Adolescent Girls

Stress	Urban	Rural	Total
Mean	135.17	129.46	132.315

Table 3.2 shows the mean score of Stress of urban (100) adolescent girls is 135.17 and rural (100) adolescent girls is 129.46 and the total mean score of Stress is 132.315. The urban adolescent girls has high Stress as compared to rural adolescent girls and total of Stress mean score.

Discussion: - It is evident from the above table that the mean score of urban adolescent girls is higher as compared to mean score of rural adolescent girls and total adolescent girls. It is interpreted that urban adolescent girls have to bear more stress as compared to urban adolescent girls.

Objective 4. To study the Eve-teasing of Adolescent Girls in relation to Emotional Intelligence.

Table 4.1 Showing the significant relationship between Eve-teasing of Adolescent Girls in relation to Emotional Intelligence.

Variable	N	Mean	S.D.	Coefficient of Correlation	Result	Table value	Significance level
Eve-teasing	200	86.71	11.59	0.099	Positive Correlation	0.13 at 0.05level	Not Significant At 0.05 and 0.01
Emotional Intelligence	200	64.15	6.84			0.18 at 0.01level	

Table 4.1 depicts that mean score of Eve-teasing of adolescent girls is 86.71 and mean score of Emotional Intelligence of adolescent girls is 64.15. The S.D. of Eve-teasing is 11.59 and S.D. of Emotional Intelligence is 6.84. The correlation of Eve-teasing and Emotional Intelligence of adolescent girls is 0.099. The obtained value is higher than the table value of 0.05 level is 0.13 and 0.01 level is 0.18 respectively. Therefore, the obtained value is not significant at both levels. There is no significant relationship between Eve-teasing and Emotional Intelligence.

Discussion: From the above result it is clear that obtained value is lower significant at both levels (0.05 and 0.01). So it is concluded that there is no significant relationship between the Eve-teasing of Adolescent Girls in relation to Emotional Intelligence.

Hence the Hypothesis No. 4, 'There is no significant relationship between Eve-teasing and Emotional Intelligence of Adolescent girls' is accepted.

Objective 5.To study the Eve-teasing of Adolescent Girls in relation to Stress.

Table 5.1 Showing the relationship between Eve-teasing of Adolescent Girls in relation to Stress.

Variable	N	Mean	S.D.	Coefficient of Correlation	Result	Table value	Significance level
Eve-teasing	200	86.71	11.59	-0.3176**	Negative Correlation	0.13 at 0.05 level	Significant at 0.05 and 0.01
Stress	200	132.315	26.66			0.18 at 0.01 level	

Table 5.1 shows that the mean score of Eve-teasing of adolescent girls is 86.71 and mean score of Stress of adolescent girls is 132.315. The correlation of Eve-teasing and Stress of adolescent girls is - 0.3176. The S.D. of Eve-teasing is 11.59 and S.D. of Stress is 26.66. The correlation of Eve-teasing and Stress of adolescent girls is -0.31. The obtained value is higher than the table value at 0.05 level is 0.13 and at 0.01 level is 0.18 respectively. Therefore the obtained value is significant of both levels. There is significant relationship between Eve-teasing and Emotional Intelligence.

DISCUSSION

From the above result it is clear that obtained value is significant at both levels (0.05 and 0.01). So it is concluded that there is no significant relationship between the Eve-teasing of Adolescent Girls in relation to Stress.

Hence the Hypothesis No. 5, 'There is no significant relationship between Eve-teasing and Stress of Adolescent girls' is rejected.

Objective 6. To study the difference in Eve-teasing of adolescent girls in relation to the location of school.

Table 6.1 Depicting the difference in Eve-teasing of adolescent girls in relation to the location of school.

Sr. No.	Group	N	Mean	S.D	Df	t- value
1	Urban girls	100	84.89	11.48	196	2.93**
2	Rural girls	100	88.53	11.46		

*Significant at 0.05 level **Significant at 0.01 level

Table 6.1 shows that mean score of the difference in Eve-teasing of adolescent urban girls in relation to the location of school is 84.89 and mean score of Eve-teasing of adolescent urban girls in relation to the location of school is 88.53. The standard deviation of adolescent urban girls is 11.48 and of adolescent rural girls is 11.46. The obtained value is higher than the table of 0.05 levels and 0.01 levels. Therefore the obtained value is significant at 0.01 levels.

Discussion: From the above result it is clear that the obtained value is significant at both levels (0.01 & 0.05). So it is concluded that there is significant difference in Eve-teasing of adolescent girls in relation to the location of school.

CONCLUSIONS

In the light of analysis and interpretation of data, the following conclusions were drawn from the sample taken in the present study:

It is concluded that the mean score in eve-teasing of adolescent girls studying in rural school is 88.53 which is higher than the mean of adolescent girls studying in urban schools (84.89). Hence adolescent girls studying in rural schools are more a victim of Eve-teasing than adolescent girls studying in urban schools.

A careful examination of the result revealed that adolescent girls studying in rural schools are more emotionally intelligent than adolescent girls studying in urban schools.

Further, the results reveal that the girls studying in urban schools undergo more stress than girls studying in rural schools.

It is further concluded from result that coefficient correlation is not significant for the relationship between

Eve-teasing and Emotional Intelligence. Hence Eve-teasing has no significant relationship with Emotional Intelligence.

It is further concluded from result that coefficient correlation is significant for the relationship between Eve-teasing and Stress. Hence Eve-teasing has a significant relationship with Stress.

A careful examination of results reveal significant difference in Eve-teasing of adolescent girls in relation to the location of school. Therefore, the location of school does impact the eve-teasing of adolescent girls.

The Efficacy of Prophylactic Imipenem in Preventing Post-Ureterorenoscopy Fever

Ahmed. Nazar Dhannoon

Assistant Prof. in Department of Surgery, College of Medicine, Al- Iraqia University, Baghdad, Iraq

ABSTRACT

Background: Ureteroscopic removal of stones (URS) has been widely used to treat ureteral stones because it is comparatively safe, has a high success rate, and enables patients to rapidly return to their daily routines. However, some patients experience fever after URS, but the incidence of post-URS fever (18.3 %)¹. This study aimed to investigate the efficacy of imipenem prophylaxis in preventing post-ureterorenoscopy (URS) fever.

Imipenem medication antibiotics used to treat a wide variety of bacterial infections. This medication is known as a carbapenem-type antibiotic. It works by stopping the growth of bacteria. Imipenem is a broad-spectrum beta-lactam antibiotic used for severe bacterial infections caused by susceptible organisms. It has activity against many aerobic and anaerobic Gram-positive and Gram-negative organisms, including *Staphylococcus aureus*, *Streptococcus pyogenes*, *S. agalactiae*, *S. viridans*- group streptococci, *Enterococcus faecalis*, *Pseudomonas aeruginosa*, *Escherichia coli*, *Proteus mirabilis*, *Bacteroides fragilis* and *Peptostreptococcus* species.

In this study 47 patients (32 male and 15 females) were subjected to URS for stone in the ureter, all were given prophylactic dose of imipenem infusion 250mg, at time of induction of anesthesia to study the efficacy of the drug in preventing post-URS fever. Only 3 patients (1 male and 2 females) where their stones at the upper third of the ureter suffered from fever in day zero postoperatively with incidence of (6.4%), treated by additional night dose of the same drug 500mg and paracetamol 1000mg intravenous infusion. We concluded that prophylactic imipenem dose of 250 mg intravenous infusion is associated with a significant decrease of post-URS fever.

Keyword: Imipenem, URS, fever.

INTRODUCTION

Postoperative fever is defined as body temperature $>38^{\circ}\text{C}$ and was graded according to the Clavien grading system². Antibiotic prophylaxis is used to minimize infectious complications resulting from interventions. Side-effects and development of microbial resistance patterns are risks of the use of antibiotics. Therefore, the use should be well considered and based on high levels of evidence.³ The role of ureteroscopy over the last ten years has undergone a dramatic evolution, due to improvements in the ureteroscope size and deflection capabilities, video-imaging, miniature baskets and instruments, and in lithotripsy (stone breakage) with the advent of holmium laser. Over 25% of all kidney stone surgeries are now done using small ureteroscope technology³. Now a day URS is widely used for treatment of ureteric stones by extraction,

pneumatic, laser lithotripsy. On the other hand URS not free of complications. One of the most common complications post-URS procedures is the development of febrile state (fever) in the next few hours (6-12 hours) after URS interventions. The cause of post-URS fever is due to ascending infection at time of interventions for stone disease and the major risk of post-URS fever is the progression of the infection to urosepsis with overall sepsis rate of 2.8% within 48 h of surgery. Furthermore, this risk of sepsis increased cumulatively with longer stent dwell-time before definitive surgery, increasing the risk of sepsis to 9.2% in patients who had a stent *in situ* for >3 months before the treatment of their stone⁴. Imipenem/cilastatin, is an antibiotic useful for the treatment of a number of bacterial infections⁹. It is made from a combination of imipenem and cilastatin. Specifically it is used for pneumonia, sepsis, endocarditis, joint

infections, intra-abdominal infections, and urinary tract infections⁶. It is given by injection into a vein or muscle Hamilton, Richart (2015). Common side effects include nausea, diarrhea, and pain at the site of injection⁷. Other side effects may include *Clostridium difficile* diarrhea and allergic reactions including anaphylaxis¹. It is unclear if use during pregnancy is safe for the baby⁵. Imipenem is in the carbapenem family of medications and works by interfering with the bacteria's cell wall. Cilastatin blocks the activity of dehydropeptidase I which prevents the breakdown of imipenem⁷. In the United States a Imipenem/cilastatin has the ability to kill a wide variety of bacteria. Imipenem is the active antibiotic agent and works by interfering with their ability to form cell walls, so the bacteria break up and die. Imipenem is rapidly degraded by the renal enzyme dehydropeptidase if administered alone (making it less effective); the metabolites can cause kidney damage⁵. Imipenem/cilastatin is indicated for the treatment of severe or complicated skin, tissue, joint, respiratory tract, intra-abdominal, urinary tract and urogenital infections, but not meningitis (as it does not pass through the blood brain barrier), endocarditis, and sepsis due to susceptible organisms.

Its use is generally restricted to severe infections largely in hospitalized patients. The recommended dosage is 250 mg to 1 gram given intravenously every 6 to 8 hours or in intramuscular doses of no more than 1.5 gm daily, usually for five to 14 days. It given as 250-mg intramuscular injections or 500-mg infusion bottles for IV use or 500-mg or 750-mg vials of lyophilized powder for IM injection.

Materials and tools :

47 patients (32 male and 15 females) with ureteric stones

Imipenem 250 mg given as infusion with 100 cc normal saline at time of anesthesia induction.

Ureterorenoscope with pneumatic lithotripsy for stone disintegrations.

Strict body temp. monitoring in the next 24 hours following the interventions..

Laboratory investigations with WBC count and ESR%.

Patients and methods :

This study is a prospective study type from 1/1/2016 to 15/8/2017 done in a private hospital in Baghdad were 47 patients (32 males and 15 females) were given a prophylactic dose of imipenem 250mg intravenous infusion pre-URS procedures and their body temperatures were monitored strictly for detection of postoperative fever. Patients mean age (39.5)years with youngest patients of 18 years and the oldest one was 72 years. Patients with diabetes and immunocompromised were excluded from the study. All the patients were suffering from long standing impacted stones in the ureter. The distribution of their stones site were 20 patients (42.5%) at lower ureter, 17 patients (36.1) at mid ureter and 10 patients (21.3%) at upper ureter. All patients were investigated for renal function test , imaging study and laboratory biochemical analysis.

RESULTS

3 patients (2 females and 1 male) suffer from post-URS fever in the next 12 hours.

Table (1): show the incidence of developing fever in the next 12 hours post-URS.

Gender	Patient NO.	Post –URS fever	Time of onset of febrile state from the procedures/hour	Site of the stone/ureter
Male	32	1(2.1%)	6	Upper third
Females	15	2(4.25%)	5 hour for the first patient 12 hour for the second patient	Upper third

Diagram (1): Show overall fever rate in post-URS patients in comparison with fever after imipenem prophylaxis.

DISCUSSION

The result of this study clearly show that a significant decrease in post-URS fever which usually happened in the next 12 hours following the intervention.

From all 47 patient who were subjected to this study only 3 patients(6.4%) suffered from fever in the next few hours. A 72 years old male with no history of previous ureteric intervention and no history of medical comorbidities suffered from post-URS fever 39.2 C in the next 6 hours and respond well to night dose of imipenem1000mg intramuscular injection and paracetamol infusion. on the other hand 2 females with 53, and 67 years old respectively suffered from post-URS fever. The first 53 years old female was stented in her ureter one month prior to the procedure due to acute ureteric obstruction. That patient suffered from high fever of 40.1C and was treated by additional night therapeutic night dose of imipenem1000mg and paracetamol infusion1000mg followed by dramatic response to treatment in the next few hours and kept on maintenance ceftriaxone injection 1000mg in the next 3 days and discharged with full recovery. The second 67 years old female had clear surgical and medical history also had a fever of 39.7C and history of previous intervention to the ureter but the procedures was associated with long operative time exceeding 1.5 hour. Again that patient treated with therapeutic night dose of imipenem1000mg and paracetamol infusion 1000mg.

The 72 years old male, and the 67 years old female who developed fever probably happened due immunocompromized status related to aging process and still at the range of post-URS fever in which 2 out of 10 of the studied patients where over age of 60 years and (20%) of them suffered from fever. But what was interesting is the 53 years female with history of stented ureter that was impending a urosepsis.

A study done by *Daron Smith 2017*⁴ show that , the risk of sepsis following URS procedure in unstented patients was 1.2%, compared with 4.7% in those with a stent, such that overall, 80% of the patients who developed sepsis had a prior JJ stent *in situ*. Furthermore, this risk increased cumulatively with longer stent dwell-time before definitive surgery, increasing the risk of

sepsis to 9.2% in patients who had a stent *in situ* for >3 months before the treatment of their stone, this push our work in URS procedure to strictly doing a urine culture and sensitivity for all patients of stented ureter pre URS intervention to avoid a horrible complication of urosepsis.

Actually many studies focus on the risk factors of post-operative URS fever but no one of them try to use a prophylactic imipenem for preventing it.

A study done by *Mitsuzuka K 2016*².show that Preoperative pyuria and acute pyelonephritis were significant factors for postoperative febrile UTI and development of urosepsis following URS procedure.

Other study done by *panelAso 2016*⁸. show that ,duration of the operation and number of tracts are risk factors for post URS fever, and this result correlate positively with our 53 years old female who had long operative procedure time exceeding 1.5 hours.

Finally the above result give the following message to us:

Prophylactic dose 250 mg of imipenem is effective in decreasing post-URS fever from 18.3% to 6.4% in patients with negative medical comorbidities.

Previous stenting of the ureter indicates doing urine culture and sensitivity with preoperative treatment prior to doing URS to avoid urosepsis in the next few hours of the procedure.

The longer time spent in the URS procedure the greater the risk of developing post-URS fever.

CONCLUSION

This study gives us a strong evidence that is using a prophylactic dose of 250mg of imipenem is sufficiently efficient in decreasing the incidence of post-URS fever and can be routinely and safely used prior to the procedure in patients with no previous drug allergy to carbapenem group. Moreover it put a highlight to those with stented ureter prior to URS intervention to be more strict in doing urine culture and sensitivity and should be treated accordingly before URS intervention to avoid risk of fever and subsequent urosepsis.

Fillay the length of the procedure has a positive correlation with development of post-URS fever.

A Study of Impact of Ict on Critical Thinking of Elementary Level Mathematics Students

Pooja Pant¹, Alka Muddgal²

¹Asst. Professor, ²Head, Amity Institute of Education, Amity University

ABSTRACT

This research paper is based on the study made by investigator on the impact of ICT on critical thinking ability of mathematics students. The study was experimental in nature. The data was collected from 120 students of elementary level of private schools in Delhi-NCR with ICT facilities. The objectives of the study were (a) To study the critical thinking abilities of elementary level students of mathematics (b) To study the impact of ICT on critical thinking abilities of elementary level students of mathematics. The results show that the impact of ICT on critical thinking abilities of elementary level mathematics students is significant.

Keywords: *ICT, Critical thinking, Elementary level students*

INTRODUCTION

In the present era when we are standing at the crossroads of transition from digital immigrants to natives there are many issues ranging from technology to culture to globalisation and social norms which have widened the gap between the two. In such a situation the teachers have a major role to play to keep the gen next rooted to the ground yet providing them wings to fly. The learning can take place to its fullest only when the learners are taught in the way they want to learn and take interest in the methods through which the teaching and learning is taking place.

The present generation of learners is living in an uncertain world where there are constant threats of terrorism, school violence, globalisation, influential media, and acute climatic conditions. This has led the parents of this generation to become overprotective and shielding in nature. Each parent wants their child to be the best in almost all arenas which has put tremendous pressure on the young minds and more so, on their teachers. Because of their inability at such tender age to handle such parental pressures and expectations they tend to give up and start indulging in anti-social behavior, psychological complications, drug abuse and increased delinquent behavior. So these young buddy minds need to be the decision makers and must acquire the ability to think critically.

Need of the study

We the human beings have been blessed with the ability to think and make judgements. But in due course of time our education system has made way to mechanical learners. According to NCTM (2000) there is need to inculcate critical thinking skills through the subject of mathematics and pedagogy of mathematics¹⁰. Also, Jacob(2012) states that problem related to real life can be solved with the young students with ease and on their own if the higher order thinking skills like critical thinking is encouraged amongst the learners⁶. The fundamental of the present Indian education system is its examination, which enforces rote memorization and ignore the development of higher order thinking skills. The schools only emphasize on learning of the facts and memorization using the outdated lecture method of teaching which does not initiate use of higher order critical thinking skills².

The results of research conducted by Chukwuyenum (2013) are evident that the achievement score in mathematics can be improved with the development of critical thinking ability amongst the learners¹.

Also, the major areas of concerns with the present era of young learners are that they are more into socializing, always reaching out for mobiles or tabs or laptops. Also, they want to reason out things and know its utility, they question. But isn't all this very natural, who would like to go back to the black and white submissive modes of

learning when abundance of information is available at the click of a mouse. But all this requires a well prepared program which includes engaging and exciting pedagogical innovations.

There is need of a league of teachers and teacher educators who can extend themselves beyond their comfort zone to unleash their potential to reach out to the young vibrant minds and evolve their innate capabilities.

Role of ICT in education

There has been tremendous work in the field of technology. The teachers are expected to have potential to handle the changing classroom scenario in terms of research, effective thinking, communication and creation. In the intermediate level of ICT competency for teachers as recommended by National Policy on ICT in school education the teachers should be the creator of digital content and also should be proficient in managing data with the help of various ICT tools like hardware devices as well as software applications. Also UNESCO has prescribed integration of ICT at pedagogical level in addition to integration at curricular or spatial level. In this regard many initiatives have been taken by Central Institute of Education Technology (CIET), NCERT in terms of National Repository for Open Educational Resources (NROER) in 2013, e-pathshala and e-PG pathshala in 2015 and Massive open online courses (MOOCs) with the name swayam in 2016 are to name a few. But still the majority of teachers are struggling and juggling with the basic interface with technology⁹.

One tool that can be used in most efficient manner for developing higher order thinking skills like reflective thinking, problem solving, critical thinking and creative thinking amongst the learners is Information and Communication Technology. With the help of ICT various information can be collected, disseminated, manipulated, retrieved and stored etc. with utmost accuracy and thus the higher order thinking skills can be developed in an effortless manner by the teachers amongst the learners.

Critical thinking and mathematics

According to Facione (2011) in general “critical thinking consists of interpretation, analysis, evaluation, inference, explanation, self-regulation”. It is evident that these are also the characteristics of mathematics and so while developing general critical thinking skills

it can initially be made domain specific in context of mathematics⁴. Critical thinking as defined by Krulik and Rudnik (1995)⁷ is “Critical thinking is analytical thinking and reflection that involve testing activities, questioning, connecting and evaluating all aspects of a situation or problem”. According to Shakirova (2007) in order to deal with social, practical and scientific problems in an effective manner, critical thinking skills are essential¹². The students who can think critically are good problem solvers. And since problem solving is an integral part of mathematics learning and triggers critical thinking ability so critical thinking leads to learning of mathematics more engaging and meaningful. Also, Cobb et al., (1992) specifies that through meaningful learning of mathematics the higher order thinking skills may be developed in a systematic manner at the school level².

Use of ICT for developing critical thinking

The systematic and organized way of developing critical thinking is with the help of appropriate practice of technology in the subject of mathematics. Mathematics by nature is unambiguous, logical and hierarchical. Use of technology allows the students to explore the various possible solutions, make inferences, synthesis and analyse the problems and arrive at the conclusions in a streamlined manner with ease. Also, use of technology allows the otherwise unexplored areas where concrete examples are very difficult to use in mathematics more practical and interesting.

Objectives of the study

To study the critical thinking ability of elementary level students in mathematics.

To study the effect of ICT on critical thinking ability of elementary level students.

METHODOLOGY

The sample of the study consisted of 120 children (60 boys and 60 girls) of class VIII from three schools in Delhi NCR. Purposive sampling technique was used for choosing the schools for the study based on the availability of ICT facility.

Tools used

Monitoring proforma, adopted by the investigator

Basic Technology competencies for educators inventory by Flowers C and Algozzine B

Self-developed critical thinking questionnaire (covering class VIII NCERT curriculum)

Findings of the study

The self-constructed Critical Thinking questionnaire was administered on the 60 students each of control and experimental groups. The tool consisted of 25 questions of mathematics specially designed to test interpretation, reasoning, analysis, synthesis etc. These skills and were assessed using the standardized rubric of “Holistic critical thinking scoring rubric developed by Peter A.Facione and Noreen C Facione.” The results of analysis are discussed below:

Table1: Comparison of Pre-Critical thinking scores between control and experimental respondents

Groups	N	Mean	SD	t-value
Control Group	60	13.717	6.857	1.337(NS)
Experimental Group	60	15.217	7.726	

NS – Not significant

It can be observed from the Table 1 that the mean pre-test scores of control and experimental groups on critical thinking variable are 13.717 and 15.217 respectively with their SD 6.857 and 7.726 respectively. The t-ratio between the two groups on critical thinking is 1.337 which is found to be insignificant. It signifies that the control and experimental groups having no difference in their critical thinking.

Table 2: Comparison of Post-Critical thinking scores between control and experimental respondents

Groups	N	Mean	SD	t-value
Control Group	60	31.5	8.775	10.045**
Experimental Group	60	49.217	10.220	

**Significant at 0.01 level

It can be observed from the Table 2 that the mean post-test scores of control and experimental groups on critical thinking variable are 31.5 and 49.217 respectively with their SD 8.775 and 10.220 respectively. The t-ratio between control and experimental group on critical

thinking is 10.045 significant at 0.01 level of significance. It indicates that there are significant difference in critical thinking scores of control and experimental in their Post-test. Experimental group scored more in comparison to control group.

Table 3: Comparison of difference of Pre and Post Critical Thinking scores of both control and experimental group respondents

Group	N	Mean	SD	t-value
Control Group	60	17.783	7.399	14.301**
Experimental Group	60	34	6.433	

**Significant at 0.01 level

It can be observed from the Table 3 that the difference of mean pre and post test scores of control and experimental groups on critical thinking variable are 17.783 and 34 respectively with their SD 7.399 and 6.433 respectively. The t-ratio between the two groups on critical thinking is 14.301 which is significant at 0.01 level of significance. It indicates that the students of two different groups differ significantly in critical thinking. The comparison of mean scores further reveals that the mean score of experimental group in post-test is much higher than the pre-test. It shows that the ICT intervention programme has positive effect on the critical thinking of elementary level children.

Table 4: Comparison of Critical thinking scores between Pre and Post Experimental group respondents Paired t-Test (N=60)

Group	Mean	SD	t-value
Pre –Experimental	15.217	7.726	40.936**
Post –Experimental	49.217	10.220	

**Significant at 0.01 level

It can be observed from the Table 4 that the mean pre-test and post-test scores of experimental group on critical thinking variable are 15.217 and 49.217 respectively with their SD 7.726 and 10.220. The t-ratio between the two groups on critical thinking is 40.936 which is found to be significant at 0.01 level of significance. It signifies

that there is significant difference between the pre and post test scores of experimental groups with respect to the variable of critical thinking. The comparison of the mean score further reveals that ICT has positive effect on the critical thinking ability of the elementary level students in mathematics.

CONCLUSION

Thus it can be determined that there is a significant difference between the critical thinking ability of students taught with ICT, although there is increase in the critical ability of both the groups but as evident from the tables that the critical thinking ability has increased more by using ICT for teaching mathematics. ICT can be used as a great tool by the teacher and teacher educators to enhance higher order critical thinking skills in the specific subject of mathematics. Although, it is very imperative to inculcate student's critical thinking skills across all specific subjects but more so in mathematics. Learning of subject like mathematics which is unambiguous, scientific and hierarchical should not be only learning of mathematical content. Rather it should lead to enrichment of critical thinking skills necessary which will develop the life skill of problem solving amongst the young learners and help them in facing the obstruction in their social life.

Depression among Senior Secondary School Students: Influence of Internet Addiction

Navdeep Singh Raji

Assistant Professor, Lovely Professional University

ABSTRACT

Internet is a cardinal part of our day to day life. Although it has numerous benefits but we can't ignore its negative impact on the younger generation. The current paper studies the influence of internet addiction on depression among senior secondary school students in Jalandhar District of Punjab. The sample for the research consisted of 200 senior secondary school students. Personal Assessment Inventory and Internet Addiction Test were employed to collect the required data. The results indicate that depression and internet addiction of senior secondary school students are significantly related with each other. Insignificant difference exists between students with high internet addiction and low internet addiction in their depression. Boys and girls do not differ significantly on the variable of depression. Interaction effect of gender and internet addiction on depression of secondary school students is found to be significant. On the basis of results, recommendations were given.

INTRODUCTION

In the contemporary world internet has an enormous role in altering the lives of the individuals in the society. Now internet is an inseparable part of individual's life and segregation from it is beyond imagination¹. There is no second thought on this that impact of internet is more on the adolescents in comparisons to others in the society². Internet has numerous benefits but we can neglect the adverse impact of its usage, prominently overuse or misuse and various physical and psychological probes associated with it³. There is a growing concern about whether its usage is excessive and, if so, whether it amounts to an addiction. When the individual uses the internet just to attain the desired outcomes within appropriate period of time any cognitive or behavioural discomfort, than that usage is considered as healthy use of internet⁴. Whang, Lee, & Chang, 2003a⁵; Widyanto, (2007) unlimited internet usage which is also known as uncontrolled usage of internet, net addiction or internet addiction. Internet addiction is explained as overpowering urge to use internet without need, consider time consumed as waste without linking to internet^{6,7,8,9}. Cao and Su (2007) excessive use of internet is also observed in diverse societies and cultures and it is found that the group who is at higher risk is adolescents¹⁰.

Anxiety disorders are associated with internet addiction¹¹, and various mental health issues, like ADHD, Playing games for longer period of time, bipolar disorders, social fear¹², gambling and depression in the youth. There are parallel evidence of adolescents suffering from depression who are addicted to internet and vice-versa^{13,14}. Sorrow, lack of sleep, loss of appetite, unfriendly mood, bleakness, low self-esteem and suicidal ideation are the evidences of depression¹⁵. Mental disorders like depression, stress and anxiety are reported in persons who exhibit low hardiness. A psychologically hardy student instead of avoiding and withdrawing from stressful situations tries to cope up with such situations and take them as opportunities to learn¹⁶.

Depression, loneliness, stress and anxiety are predicted by internet addiction. Usage of internet is gender sensitive and boys are having high risk of internet addiction as compared to their counter parts. Males internet addicted differ significantly in the level of depression, anxiety, stress and loneliness from their counterparts¹⁷. Relationship between both self-esteem and depression is so strong that with the help of scores of self-esteem and depression, scores of internet addiction can be anticipated to some extent. Low self-esteem and depression are the amplifier and cardinal reasons

of internet addiction¹⁸. Level of internet addiction and severity in depression is having positive correlation with each other¹⁹. It is also revealed that depression in the students are occur due to the social isolation which is the aftermath of internet addiction.

Young (1998) has found that huge proportion of internet addict's adolescents have a past of undergoing anxiety and depression. Seifi, Ayati and Fadaei (2014) found that internet addiction, depression, stress and anxiety are positively related with each other. Regression analysis revealed that addiction towards internet is predicted by 17% of depression variable, 20% by anxiety and 13% by stress. Internet addiction and depression are correlated with each other²⁰.

Dutta (2016) indicates that there is insignificant difference in severe depression dimension of mental health and overall mental health between internet addicted and non-addicted adolescent students. A study conducted in Chinese Tai Wai revealed that depression propensity is negatively related with PIU²¹.

Gholamian, Shahnazi, Hassanzadeh (2017) in their study on Iranrain high school student found that majority of the students are normal users of internet only 2.9% high school students are severely addicted to internet. Further, the mean scores of anxiety, depression and stress are significantly more in those high school students, who are having high internet addiction as compared to normal users of internet. For this study Senior Secondary School Students of Jalandhar District in Punjab, have constituent the sample to investigate the influence of internet addiction on their depression²².

Purpose of the Study

The prime objective of the study is to explore the influence of internet addiction on the depression among secondary school students.

Delimitation of the study

1. 200 senior secondary school students were taken for the study.
2. The study was confined only to schools of Jalandhar districts.

Design of the study

The goal of currentresearch was to find influence of internet addiction on the depression level of secondary

school students. Correlation technique was employed to examine the influence of internet addiction on the depression

2×2 factorial design was used on the scores of depression which was studied as dependent variable. Internet addiction was studied as independent variable and was used for the purpose of classification viz. students with high Internet Addiction and students with low Internet Addiction. Sex of the Students was studied as classificatory variable wherein, male and female students were studied.

The layout of the design is presented in figure below

Fig. 1 Schematic presentation of 2×2 factorial design on the scores of depression in relation to internet addiction

Sample

The total sample include in the present study comprised of 200 senior secondary school students 100 girls and 100 boys. The subjects were selected from the senior secondary schools of Jalandhar district only.

Tool used

Following tool were used for the collection of data:

1. IPAT Personal Assessment Inventory by Krug and Laughlin (1976).
2. Internet Addiction Test by Young (1998).

Statistical technique used

1. The following statistical techniques were used: Product moment method of correlation will be calculated to test the hypotheses.
2. 2×2 ANOVA was calculated to find main effect and interaction effect of independent variables Internet Addiction and Gender on dependent Depression.

Analysis and Interpretation of the results

The analysis of the data was done by computing mean, standard deviation, product moment coefficient of correlation and ANOVA has been presented in table 1 and 2.

Table 1: Relationship between depression and internet addiction of senior secondary school students

Variables	N	Value of 'r'
Depression and Internet Addiction	200	0.178*

**Significant at 0.01 level

* Significant at 0.05 level

(Critical Value 0.138 at 0.05 level and 0.181 at 0.01 level, df 198)

Form the table1 it is crystal clear that depression is significantly correlated with internet addiction ($r = .178$) at 0.05 level. This result shows that higher level of internet addiction leads to depression. Those adolescents who have higher Internet Addiction will have depression. Thus the hypothesis H_1 : There exists no significant relationship between internet addiction and depression is rejected. This finding is supported by Hakimzade et. al. 2010; Jafari and Fathizade, 2012 where they found that internet addiction and depression are related with each other^{23,24}.

Table 2: Summary of 2×2 Analysis of Variance

Source of variance	SS	Df	Mss	f-ratio
Internet Addiction (A)	134.56	1	135.56	1
Gender (B)	135.56	1	135.56	1
Interaction (A×B)	359.8	1	359.8	7.76*
Within	4914.53	106	46.36	
Total	5051.05	107		

**Significant at 0.05 level
0.01 level

* Significant at

(Critical Value 3.94 at 0.05 level and 6.90 at 0.01 level, df 106)

Main effects

Internet addiction (a)

It is clear from the table- 2 that the F-Ratio for the difference between mean scores of depression, was found to be 1 which is insignificant even at 0.05 level of confidence. This indicates that high internet addiction and low internet addiction found do not differ on the mean depression scores. Thus the data provide sufficient evidence to accept the hypothesis (H1) viz. “There exist no significant difference between high internet addiction group and low internet group on the variable of depression” is accepted.

Gender (b)

Table- 2 revealed that F-Ratio for the difference between mean scores of depression, was found to be 1 which is insignificant even at 0.05 level of confidence. This indicates that boys and girls found do not differ on the mean depression scores. Thus the data provide sufficient evidence to accept the hypothesis (H2) viz. “There exists no significant difference between boys and girls on the variable of depression is accepted.

Interaction (axb)

Table- 2 depicts that F-Ratio for the difference between mean scores of depression, was found to be 7.76 which is insignificant even at 0.01 level of confidence. This indicates that interaction effect of level of internet addiction and gender found to be differ significantly on the mean depression scores. Thus the data provide sufficient evidence to not accept the hypothesis (H2) viz. There exists no interaction between internet addiction and gender on the variable of depression” is not accepted.

CONCLUSION

On the basis of analysis of data and interpretation of the results, the subsequent assumptions were drawn:

1. Depression and internet addiction among secondary school students are related with each other.
2. Insignificant difference exists between students with high internet addiction and low internet addiction on their depression.
3. Boys and girls do not differ significantly on the variable of depression.

4. Interaction effect of gender and internet addiction on depression among secondary school students is significant.

Educational implications

The present study showed a significant relationship between internet addiction and depression. Internet is a pool of knowledge. Adolescents are very inquisitive nature. They always look for the sources of information. Internet can act as “boon or bane” to them. If proper internet education and awareness is provided to them, then their energies would be channelized in the right direction. So, schools should impart internet education and awareness among the students. Moreover, the access to internet is equal for both boys and girls. Teachers and parents should direct them to use internet in a healthy manner. Adolescents like to stay in their virtual or imaginary world. Parents and teachers should not restrict them but make them aware how to use it effectively so that they do not get addicted and have healthy mental makeup.

Suggestions for the further study

The present investigation suggests that following areas for further study:

1. The present study has been conducted on senior secondary school students. A study may be replicated on the some other age group.
2. The same study can be conducted on college going students.
3. The same study can be conducted by adding more variables like locus of control, social-esteem, stress and anxiety.

Assessing Leadership Styles of Higher Education Students through Blake and Mouton's Managerial Grid

KanikaGarg¹, Mridula Mishra², ChanchalWadhawan¹

¹Ph.D. Scholar; ²Professor; Mittal of Business, Lovely Professional University, Phagwara, Punjab, (India)

ABSTRACT

In the current changing dynamics of global market leader plays an eminent role in accomplishment of organization goal and attainment of task. Leaders may benefit to release tensions, harmonize misunderstanding and deal with disruptive behaviors¹. So as a leader, the student must be able to adapt the leadership style that works for the group for which they are responsible.

Managerial Grid initially consist five different styles of leadership (Authoritarian, Team, Country club, Impoverished and middle of the road) related with concern for people and the concern for production into 9X9 matric.

The present study aims to make the Managerial Grid of Higher Education Students through Managerial Grid prepared by Blake and Mouton. The data will be collected by using standardized construct which is Managerial Model (1985) with 41 students who were studying Leadership Development course in Master in Business Administration. For all 41 Students individually Managerial Grid will be organized to understand their Future managerial judgment track².

Keywords: Higher Education, Leaders, Leadership Styles, Managerial Grid

INTRODUCTION

In current scenario leadership shows an eminent character in the success and failure in the Industry. Leader plays the role of the middle man who conveys the message from top to lower and maintain the harmonious relationship among them. In the past decades the concept of managerial grid was introduced by the Robert Blake and Jane Mouton in between 1958 to 1960 and it was firstly printed in 1964^{3,4}. The present model inclined by the Fleishman two dimension models^{5,6}. The first dimension was Consideration means performance of single respect for dependents considerations and deliberation of their official state of mind. The second dimension was Initiating construction enumerated to the quantity to which a leader organized and clear his or her character and those of underlings in order to achieve organizational goal. Blake and Mouton's attitudinal dimensions consist "Concern for Production", repeating unnecessary attitude towards outcomes, and "Concern for People", denoting meditation for others applied when leadership is trained.

Blake and Mouton's Managerial Grid

Figure 1. Blake and Mouton's Managerial Grid

Source: Blake and Mouton (1964) *The Managerial Grid*, Houston Gulf Publishing

Figure 1 shows The Blake and Mouton leadership Grid

Concern for production or task placed on X-axis.

Concern for people mentioned on the Y-axis.

Blake and Mouton model lies on two axis X and Y and both ranging from 0 to 9. It consists of five quadrants which study the behavior of those in managerial position's

Table 1. The leader's characteristics according to the grid model

Sr. No.	Determinants of Managerial Grid Model	Leader's Characteristics
1	Impoverished Management(1,1)	The impoverished leaders are ineffective and avoid side taking and they are not responsible for creating a health and motivating work environment.
2	Middle of the Road Management (5,5)	Middle of the road managers having compromising nature. The leader maintains balance between either task or people.
3	Country-Club Management (1,9)	The country club leader will seek compromiser between employers and employees. These type of leader focuses on being agreeable and maintain smooth human relation. Although these managers invite modernization and good ideas but tend to reject ideas which are create difficulties.
4	Authority- Compliance Management (9,1)	The authoritarian leaders are very autocratic by nature. This type of leader believes penalty as the most appropriate means to motivate employees.
5	Team Management (9,9)	The team leadership styles leaders are very cooperative by nature and discuss problems with the subordinates. Problems in working associations will be handling by motivating people directly and attempting to work out solutions with them.

REVIEW OF LITERATURE

In the current changing dynamics of global market leader plays an eminent role in accomplishment of organization goal and attainment of task. Leaders may help to remove tensions, harmonize misunderstanding and deal with disruptive behaviors (Fisher2000). So as a leader, the student must be able to adapt the leadership style that works for the group for which they are responsible. In this study Oostenveld et.al (2009) conducted a study on relationship among leaders' communication style and human oriented leaders, task oriented leadership style and leadership outcomes. The study concluded that charismatic leaders are more communicative and task oriented leadership style managers are less talkative⁷. The study further explained that communication styles significantly related to knowledge sharing behaviors, perceived leader presentation, gratification with the frontrunner and assistant's team promise. In the study of found ample correlation between character characters and leadership styles and also highlight traits for operative leadership styles like human oriented so that instructor become cognizant to accept individuals personalities which brings operative performance and alteration⁸.

Strong et.al (2013) served the styles of leadership and learning of self-directedness among students of

agrarian courses .To achieve objective 93 students of 2 different leadership courses was selected as sample .The study determined strong relationship between human orientation leadership style and directedness of learning's. Furthermore most of defendants had a country club leadership style⁹. (Thomas et al., 2013) studied on leadership style and self-learning of students studying separate agronomy leadership courses. 93 students were selected to achieve objective and found strong relation among self-learning and human orientation style of leadership which is related to people orientation leadership style and self-learning and relates to country club leadership style¹⁰.

Arleane and Roberson (2005) found that the most effective style of leadership is 9,9 which depicts the team leadership style. researched on managerial grid model in Iranian Prosperous Organization, 165 respondents taken from the Iran's Organization's to achieve objective. The study further explained companies lies medium of the road area (5, 5 scores) in the leadership grid¹¹. Gilvania et. al, 2014 worked on managerial grid model in Iranian Prosperous Organization. The study selected 165 employees from the Iran Organizations. This present study originate Iranian Prosperous Organization responses medium of the road area (5,5 scores) in Managerial grid model.

Nikezic et.al (2013) found strong relation between human orientation leadership style and self-learning and relates to country club leadership style¹².

Arleane and Roberson (2005) worked on suitable assistances and virtuous principles to fill leadership designation. The study originate that a (9, 9) method is the utmost operative leadership style and also originate level of existence and leadership styles relates to each other¹³. researched on managerial grid model in Iranian Prosperous Organization, 165 respondents taken from the Iran's Organization. The study found that companies lies medium of the road area (5, 5 scores) in the leadership grid. Gilvania et. al, 2014¹⁴ worked on managerial grid model in Iranian Prosperous Organization. This study conclude Iranian Prosperous Organization responses middle of the road area (5, 5 scores) in Managerial grid. The study concluded most of the employees have been fallen in the authoritarian leadership style. The study also concludes that there is no dominant leadership style so it shows that the participants who enrolled in leadership course are not committed for a single leadership style. Apart from it, (Yazicioglu et.al, 2013) conducted a study to examined a management styles of the Turkish managers in on the Blake and Mouton's managerial Grid Model in term of demographic profile. To fulfill the objective the study selected the sample of 771 managers different from private and public sector¹⁵. The study conclude the differences in managers' managerial styles in term of seniority, marital status, level of education, managerial designation, working experience and to must professional education training absolutely affect leaders' managerial behaviors. Mishra et al. (2015) depicted a study to prepare the Managerial grid by using Managerial grid Model given by Robert Blake and Jane Mouton on selected Textile Industry in Punjab. The study selected 35 managers, supervisors and top executives in the manufacturing Industry. 35 managers individual grid has been prepared and conclude that most of the employees fall down in the Team Leadership style i.e. (high on concern for task and high on concern for people)¹⁶.

RESEARCH METHODOLOGY

Objective

1. To prepare the Managerial Grid of Higher Education Students by using Blake and Mouton managerial grid model.

2. To measure the Leadership styles of the Higher Education Students with the help of Managerial Grid Model.

Hypothesis of the study

H1: Higher Education Students are motivated on Team leadership.

H2: Higher Education Students are focused headed for Country Club leadership.

H3: Higher Education Students are engaged headed for Authoritarian leadership.

H4: Higher Education Students are directed to impoverished leadership.

H5: Higher Education Students are motivated on the "Middle of the Road" leadership.

Research Design for the study

To achieve the objective descriptive research design has been accompanied to measure the leadership styles among the higher education students.

Sample size

The study selected 41 students who were studying Leadership Development course in Master in Business Administration in reputed university.

Tools and administration of construct

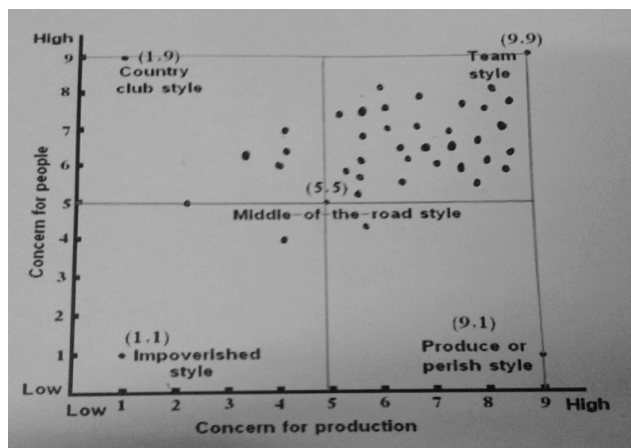

To measure the leadership style the standardized scale was used which was given established by *The Blake and Mouton Managerial Model (1985)*. It contains 18 items; Measuring Leadership styles such as (**Authoritarian Leaders, Team Leader, Country Club Leader, Impoverished Leader and Middle-of-the-road**) Leadership Style. The data was collected from the students who were studying Leadership Development course in Master in Business Administration with the help of standardized scale on 5 point liker scale.

RESULT AND DISCUSSION

Table 1 signifies the responses of the 41 students who were studying Leadership Development course in Master in Business Administration taking into explanation the covering of responses to accomplish demonstration in the work with the presentation portion of all 41 respondents.

The Managerial Grid Model of student represents the individual grid of 41 students in which the left hand side of the one box represents the score of the People Oriented Leadership Style and the right side of the box represents the score of the Task Oriented Leadership Style. The human Oriented Leadership Style contains 9 statements i.e. 1, 4,6,9,10,12,14,16,17 and the Task Oriented Leadership Style also contains 9 statements i.e. 2,3,5,7,8,11,13,15,18. After getting the response from both People and Task Oriented Leadership Style one total score came for both then it multiplies with 0.2 because in Blake and Mouton Managerial Grid there are 5 style of leadership Style so one divide by five it shows 0.2. So from the below represents the individual score of 41 students on People Oriented and Task Oriented Leadership Style and also show the individual Grid of each Students.

Objective 1: To prepare the Managerial Grid of Higher Education Students by using Blake and Mouton Managerial Grid Model.

Objective 2: To study the Leadership styles of the Higher Education Students on the basis of Managerial Grid.

Figure: 2 Managerial Grid Model

From the Blake and Mouton managerial grid model it is clear that out of 41 Higher Education Students 34 students fallen in team leadership style it shows students who perceived themselves as a Future Managers were under in Team leadership style and shows high capacity to complete their task.

CONCLUSION

As per the proposed model given by Robert Blake and Mouton Managerial Grid all the 41 students who were studying Leadership Development course in Master

in Business Administration in Lovely Professional University, Punjab, prepared their managerial grid model as shown in fig. 1.2.

H1: supported because 83% of the managers fall in team leadership style and it shows high on task oriented leadership style and also high on their relationship oriented leadership style. Team leadership style managers always encourage the team efforts as efficiently as possible to attain organizational goal.

H2: not confirmed because only 9.75% of the manager fallen in first quadrant in which the managers are low on people and high on their task orientation style.

H3: not supported because only 2.43% of the managers fallen in the fourth quadrant Authoritarian leaders concentrated on “Concern for Task”.

H4: not supported since smaller number of managers only 2.43% fallen in impoverished leadership and used as their individual leadership style.

H5: not supported because very less managers only 2.43% fallen in Lassie fair leadership style and used as their particular leadership style.

From the above study it is clear that the 41 students who were studying Leadership Development course in Master in Business Administration in Lovely Professional University, individually they all are Task Oriented Leaders and they all are fallen in the Team Leadership Style in Blake and Mouton Managerial Grid. (Mishra et. al 2015) from this study it is clear that managers of Vinayak fabrics are fallen under team leadership style, this depicts that can complete task on time. (Zafar 2011) also supported that executive managers were fallen under in the team management style¹⁷.

Career Indecision among Senior Secondary School Students: Impact of Internet Savviness

Navdeep Singh Raji¹, Sasmita Kar²

¹ Assistant Professor, LPU, Phagwara, ² Assistant Professor, Department of Education,
Rama Devi Women's University, Bhubaneswar, Odisha

ABSTRACT

The career indecision construct is a matter of concern for the high school students¹. Many factors such as perceived social support, personality, self-esteem and neuroticism are contributing to the career indecision². The current research was conducted to inspect the impact of internet savviness on the career indecision among the senior secondary school students. The study included 720 senior secondary school students (240 students from each type of schools i.e. government, government aided and private schools, out of 360 are male students and 360 are female students). The results revealed that career indecision and internet savviness are negatively related with each other. Male and female do not differ on their career indecision but they differ on their internet savviness. Students studying in private school are less uncertain about their career choice and confident in using internet.

INTRODUCTION

In the transition period from senior secondary to higher education students encounter a cardinal turning point as they have to choose their career³. Career decision making is not only an intricate process but also very nerve-racking and confusing experience. The stressful period may be too overwhelming for them. Impact of this is that it leads to poor career choice. Career indecision amongst undergraduate university students is considered an incapability to choose an occupation of university major⁴. Some students choose their career without bumping into any problems, but many students come across lots of hurdles during choosing their career⁵. The aftermath of these hurdles is that it can adjourn the beginning process, halt it in the between or leading to indecision.

Objectives

Following objectives were framed in the study:

1. To find out the relation between Career Indecision with their internet savviness

2. To compare government, government aided and private school students with respect to Career Indecision and Internet Savviness
3. To compare male and female students with respect to Career Indecision and Internet Savviness
4. To find out the predictors of career indecision from the internet savviness and its dimensions.

RESULTS AND DISCUSSION

Data was analyzed and interpretation of the results was done variable wise as per the objectives of the study

Results related to the relationship of Career Indecision of senior secondary school students with their Internet savviness

Table 1: Correlation matrix of career belief with internet savviness

Variables	CI	IS (Total)	IG	CMC	ISE	CSE	IF	SC
CI	1							
IS (Total)	-.147**	1						
IG	-.177**	.549**	1					
CMC	-.028	.656**	.234**	1

*Significant at the 0.05 level ** Significant at the 0.01 level

Where stands for CI: Career Indecision, IS: Internet Savviness, IG: Information Gathering, CMC: Computer Mediated Communication, ISE: Internet Self Efficacy, CSE: Creative Self Expression, IF: Internet Fluency, SC: Social Collaboration

It is lucid from the table 1 that the calculated value of correlation of career indecision with internet savviness total and its dimensions namely information gathering, creative self-expression and social collaboration is negative. This demonstrates that if the students studying in senior secondary classes are able to discriminate and filter accurate information from the abundance of data found on internet, are creating artwork, blog, videos and collaborate online to perform personal and school work are more likely to have less uncertainty in making relevant career decisions. They choose their career with more ease as compared to the students without these abilities. On the other hand, the calculated correlation value of career indecision with computer mediated communication, internet self-efficacy and internet fluency dimensions of internet savviness is not significant. It demonstrates that these dimensions of internet savviness have no influence on the career indecision of the senior secondary school students. On the basis of above mentioned results Ho1 namely "There exists no significant relationship of Career Indecision of senior secondary school students with their Internet Savviness" is partially accepted.

Results relating difference between students studying in government, government aided and private senior secondary school students in career indecision, internet savviness and its dimensions

** Significant at 0.01 level (4.63)

*Significant at 0.05 level (3.00)

The above table 2 indicates that the calculated value of F ratio for the difference between different type of institution i.e. government, government aided and private in career indecision is significant. This reflects that students studying in different types of institution differ significantly in their career indecision. On the basis of the above mentioned finding, it can be stated that Ho2 i.e. “There exists no significant difference in the Career Indecision of senior secondary school students studying in government, government aided and private schools” is thus not accepted.

Table 3: Comparison of government aided and government senior secondary schools students incareer indecision, internet savviness and its dimensions

Variables	Government Aided			Government			t-ratio
	Mean	S.D.	SE _M	Mean	S.D.	SE _M	
Career Indecision	24.25	5.33	0.34	26.17	4.74	0.31	4.18**

**Significant at 0.01 level (2.59)

* Significant at 0.05 level (1.96)

It is crystal clear from the table 3 that t-value calculated for the career indecision of school students studying in government aided and government schools was found to be significant at 0.01 level. It can further be explained that students studying in government schools are having higher career indecision as compared to government aided school students.

It infers that government school students are not able to select and commit to their career easily as compared to their government aided school students.

Table 4: Comparison of government and private senior secondary schools students incareer indecision, internet savviness and its dimensions

Variables	Government			Private			t-ratio
	Mean	S.D.	SE _M	Mean	S.D.	SE _M

** Significant at 0.01 level (2.58)

* Significant at 0.05 level

(1.96)

The above table shows that t-value for career indecision of male and female students found to be insignificant even at 0.05 level. It reflects that boy and girl students are not having different level of career indecision. After the above discussion, it can be stated that the Ho4 “There exists no significant difference in the Career Indecision of male and female senior secondary school students” is accepted.

A look at the above table reflects that the t-value calculated with internet savviness total and its dimensions namely computer mediated communication, internet self-efficacy, creative self-expression, internet fluency and social collaboration of the boys and girls students was found to be significant at 0.01 level. It depicts that boys and girls students differ on their internet savviness and its dimensions namely computer mediated communication, internet self-efficacy, creative self-expression, internet fluency and social collaboration.

It can be further explained that male students are comfortable and confident with internet, they communicate through various formats audio, video, instant messaging, e mails, chat rooms and discussion forums, they have positive thoughts about their potentialities to achieve a desired level of competency in navigating the internet and collaborate online to perform personal work and school work as compared to their female counterparts. On the basis of above findings, it can be stated that the Ho5 “There exists no significant difference in the Internet Savviness of male and female senior secondary school students” is not accepted.

Results relating impact of internet savviness and its dimensions on career indecision

Table 7: Stepwise multiple regression equations for career indecision and internet savviness and its dimension

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.177 ^a	.031	.030	5.2444	.031	23.225**	1	718	.000
2	.193 ^b	.037	.035	5.2315	.006	4.549*	1	717	.033
3	.214 ^c	.046	.042	5.2127	.008	6.195*	1	716	.013
4	.234 ^d	.055	.049	5.1918	.009	6.771*	1	715	.009

* Significant at 0.05 level (3.85)

** Significant at 0.01 level(6.66)

a. Predictors: (Constant), IG

b. Predictors: (Constant), IG, CSE

c. Predictors: (Constant), IG, CSE, SC

d. Predictors: (Constant), IG, CSE, SC, IS (total)

e. Dependent Variable: CI

The above table represents stepwise multiple regression equations for career indecision which is criterion (dependent) variable and independent variables internet savviness and its dimensions. At the first step information gathering dimension of internet savviness was introduced. Adjusted R square value indicating that 3.0 % of the variance in the career indecision is described by the information gathering dimension on internet savviness. To observe whether the surge in the percentage of the total variance after addition were significant or not, the F-value is calculated. The F-value for this step is significant at 0.01 level. This demonstrates that surge in the prediction value after the addition of the information gathering dimension of internet savviness is significant.

CONCLUSIONS

The study documents the following conclusions

Significant negative relationship is found between career indecision of senior secondary school students with internet savviness and its dimensions namely information gathering, creative self-expression and social collaboration. Further, if students studying in

senior secondary classes are able to discriminate and filter accurate information from the abundance of data found on internet, is creating artwork, blog, videos and collaborate online to perform personal and school work are possibly have less uncertainty in choosing relevant career decisions.

Linguistic Intelligence and Social Intelligence in Secondary School Students: A Regression Analysis

Rajib Chakraborty¹, SyedaSadiyaSadath², Dr.Vijay Kumar Chechi³

¹Assistant Professor, ²Student Teacher Educator, ³Associate Professor, HOD, School of Education, Lovely Professional University, Phagwara, Punjab, Ghulam Ahmed College of Education, Osmania University, Hyderabad, Telangana

ABSTRACT

This study examines the influence of linguistic intelligence on social intelligence. Sample for the study includes 152 urban secondary school students (77 boys and 75 girls) from muslim minority community, of class IX of Vikas High School, Edi Bazar Hyderabad, Telangana, India. The data for measuring Social Intelligence is collected using Tromso Social Intelligence Scale (TSIS) developed by Silvera et al. (2001)¹. Linguistic Intelligence is measured using the GPA score of the students in the latest formative evaluation of languages (Hindi, Telugu and English). SPSS Ver.23 is used to measure the regression coefficient and squared regression coefficient. The correlation coefficient between linguistic and social intelligences is $r=0.507$ (sig. at $\alpha=0.01$). The simple linear regression coefficient of the two variables is $R=0.507$ ($p=0.000$) and adj. squared regression coefficient $R^2=0.252$ ($p=0.000$). The role of gender is found to be strong on both the variables and hence partial correlation is conducted blocking the influence on gender on them. The partial correlation coefficient is $r_{1,2,3}=0.387$ ($p=0.000$). In the light of these evidences, there is a highly statistically significant, positive in nature and strong in magnitude relationship of linguistic intelligence and social intelligence in school students of VIIIth and IXth standards. Girls from muslim community are found to be more linguistically and socially intelligent than boys with point biserial correlation coefficients between gender and linguistic intelligence being $r=0.705$ (sig. at $\alpha=0.01$) and between gender and social intelligence being $r=0.355$ (sig. at $\alpha=0.01$), respectively. The Educational implications are discussed in the light of the findings of Sacher committee report.

Keywords: Linguistic Intelligence, Social Intelligence, Gender, Secondary School Students, Muslim Minority Community, Sacher Committee Report.

INTRODUCTION

One of the important aspects in the acquisition of a language is the social context of its learning. Children follow the way adults use specific pieces of language and practice the same in turn. A sense of competence develops in the child pertaining to his or her acquisition of a language depending on the feedback received during the course of interaction with peers and elders. Several of such feedbacks prove to be the basis on which the child further develops conclusions on the importance of language expressions as a whole ².

The significance of meeting people in the acquisition of language by the children from their most knowledgeable adult parents and peers is also mentioned

in Social interactive theory, which in turn is based on Social cultural theories proposed by Vygotsky³.

Quotation from the Sacher Commission Report (2006).

Research Objectives

To study the relationship between social intelligence and linguistic intelligence in secondary school students from muslim minority community.

To study whether linguistic intelligence is a predictor of social intelligence in secondary school students from muslim minority community.

To study the relationship between gender and social intelligence in secondary school students from muslim minority community.

To study the relationship between gender and linguistic intelligence in secondary school students from muslim minority community.

To study the relationship between social intelligence and linguistic intelligence in secondary school students from muslim minority community blocking the influence of gender.

To study whether gender is a predictor of social intelligence in secondary school students from muslim minority community.

To study whether gender is a predictor of linguistic intelligence in secondary school students from muslim minority community.

Method

Sample

Sample for the study includes 152 urban secondary school students from muslim minority community (77 boys and 75 girls) of class IX of Vikas High School, Edi Bazar Hyderabad, Telangana, India, selected using simple random sampling. Prior permission to administer the tool of the study was taken from the Principal of the secondary school.

Measures

Tromsø Social Intelligence Scale (TSIS): The tool has 21-items self report questionnaire covering 3 factors, namely Social information processing (SP), social skills (SS) and Social awareness (SA) created by Silvera et al. (2001). The TSIS uses a 7- point Likert scale (from 1 = describes me extremely poorly to 7 = describes me extremely well) for each of the 21 items for the subjects to rate to the degree that the statement of the item describes them, and hence the scoring ranges from 7 to 49 for each of the 3 subscales measuring the three factors using 7 items.

The scale reports internal consistency of each of the three factors at Social information processing ($\alpha=0.81$), social skills ($\alpha=0.86$) and Social awareness ($\alpha=0.79$), which are fairly acceptable values. The scale is found to possess construct validity.

Linguistic Intelligence of the students is measured using the grade point average scored by them in a regional language Telugu, national language Hindi and international language English, in the recently concluded formative evaluations.

Statistical Techniques:

Apart from mean and standard deviations of the constructs, Pearson's product moment correlation is used to find the relationship between social and linguistic intelligences. Point-biserial correlation is used to find whether gender is associated with social and linguistic intelligences. To find the relation between the two intelligences blocking the role of gender, partial correlation is used. Simple linear regression is used to figure out whether linguistic intelligence is the predictor of social intelligence, and also whether gender predicts social intelligence and linguistic intelligence, in the secondary students belonging from the muslim minority community. All the statistics are computed using SPSS Ver.23.

Procedure

The data was collected from the students in the classroom while the class was in session. The students were given clear instructions on how to fill the instrument of social intelligence. The data pertaining to linguistic intelligence in the recently concluded formative evaluation was collected from the office records.

RESULTS

Table 1: Mean and Standard Deviation (N=152, Girls =75 (49.34 %), Boys=77 (50.65 %))

Variable	Statistic		Significance
	Mean	S.D.	
Social Intelligence	4.4555	0.55545	Yes t-cal = 4.658 (p=0.000) df=150 (Sig.2-tailed)
Social Intelligence of Girls	4.6549	0.54485	
Social Intelligence of Boys	4.2613	0.49647	
Linguistic Intelligence	59.8684	21.69120	Yes t-cal = 12.179 (p=0.000) df=150 (Sig.2-tailed)
Linguistic Intelligence of Girls	75.3147	15.79974	
Linguistic Intelligence of Boys	44.8234	15.06598	

Table 2: Testing of Hypothesis 1

	SI	LI	Hypothesis H ₀
SI Pearson Correlation	1	0.507**	Rejected
Sig.(2-tailed)		0.000	
N	152	152	
LI Pearson Correlation	0.507**	1	
Sig.(2-tailed)	0.000		
N	152	152	

**Result is significant at the 0.01 level (2-tailed)

Interpretation: The relationship between social intelligence and linguistic intelligence is highly significant ($\alpha=0.01$) with the correlation coefficient positive in nature and moderate in strength. The null hypothesis stands rejected.

Table 3: Testing of Hypothesis 2

	SI	Gender	Hypothesis H ₀
SI Point biserial Correlation	1	- 0.355**	Rejected
Sig.(2-tailed)		0.000	
N	152	152	
Gender Point biserial Correlation	- 0.355**	1	
Sig.(2-tailed)	0.000		
N	152	152	

Interpretation: The relationship between gender and social intelligence is highly significant ($\alpha=0.01$) with the point biserial correlation coefficient negative in nature and moderate in strength. During data analysis, girls were assigned the value of 0 and boys were assigned the value of 1. From the result obtained, it is implied that girls have more social intelligence than boys. The mean social intelligence of girls and boys are 4.6549 and 4.2613, and the difference is significant ($p=0.000$). The null hypothesis stands rejected.

Table 4: Testing of Hypothesis 3

	LI	Gender	Hypothesis
LI Point biserial Correlation	1	-0.705**	Rejected
Sig.(2-tailed)		0.000	
N	152	152	
Gender Point biserial Correlation	-0.705**	1	
Sig.(2-tailed)	0.000		
N	152	152	

**Result is significant at the 0.01 level (2-tailed)

Interpretation: The relationship between gender and linguistic intelligence is highly significant ($\alpha=0.01$) with the point biserial correlation coefficient negative in nature and strong in strength. During data analysis, girls were assigned the value of 0 and boys were assigned the value of 1. From the result obtained, it is implied that girls have more linguistic intelligence than boys. The mean social intelligence of girls and boys are 75.3147 and 44.8234, and the difference is significant ($p=0.000$). The null hypothesis stands rejected.

Table 5: Testing of Hypothesis 4

Control Variable		SI	LI	Hypothesis H ₀
Gender	SI Partial Correlation	1	0.387**	Rejected
	Sig.(2-tailed)		0.000	
	df	0	149	
	LI Partial Correlation	0.387**	1	
	Sig.(2-tailed)	0.000		
	df	149	0	

**Result is significant at the 0.01 level (2-tailed)

Interpretation: The relationship between social intelligence and linguistic intelligence blocking the influence of gender on linguistic intelligence is found to be positive in nature and moderate in strength, as the partial correlation coefficient value is $r_{12.3} = 0.387$, highly sig, at $\alpha=0.01$ level. The null hypothesis stands rejected.

Table 6: Testing of Hypothesis 5

R	R ²	Adj. R ²	Std. Error of Estimate	F Cal.	df1	df2	Sig. F	Hypothesis H ₀
0.507	0.257	0.252	0.4835	51.912	1	150	0.000	<i>Rejected</i>

**Result is significant at the 0.01 level (2-tailed)

Interpretation: Linguistic intelligence definitely predicts social intelligence in secondary school students as the simple regression coefficient $R=0.507$, is moderate in strength and highly significant at $\alpha=0.01$ level. For unit variance in linguistic intelligence there can be 25% change in social intelligence among the sample subjects as $R^2 / \text{Adj.}R^2$ (taking error caused by chance into consideration) is $0.257/0.252$. The null hypothesis stands rejected.

Table 6: Testing of Hypothesis 6

R	R ²	Adj. R ²	Std. Error of Estimate	F Cal.	df1	df2	Sig. F	Hypothesis H ₀
0.355	0.126	0.121	0.52090	21.696	1	150	0.000	<i>Rejected</i>

**Result is significant at the 0.01 level (2-tailed)

Interpretation: Gender definitely predicts social intelligence in secondary school students as the simple regression coefficient $R=0.355$, is moderate in strength and highly significant at $\alpha=0.01$ level. For unit variance in gender there can be 12% change in social intelligence among the sample subjects as $R^2 / \text{Adj.}R^2$ (taking error caused by chance into consideration) is $0.126/0.121$. The null hypothesis stands rejected.

Table 6: Testing of Hypothesis 7

R	R ²	Adj. R ²	Std. Error of Estimate	F Cal.	df1	df2	Sig. F	Hypothesis H ₀
0.705	0.497	0.494	15.43233	148.319	1	150	0.000	<i>Rejected</i>

**Result is significant at the 0.01 level (2-tailed)

Interpretation: Gender definitely predicts linguistic intelligence in secondary school students as the simple regression coefficient $R=0.705$, is strong in strength and highly significant at $\alpha=0.01$ level. For unit variance in gender there can be 49% change in linguistic intelligence among the sample subjects as $R^2 / \text{Adj.}R^2$ (taking error caused by chance into consideration) is $0.497/0.494$. The null hypothesis stands rejected.

DISCUSSION

Researchers generally agree on the existence of no significant difference between boys and girls with respect to general intelligence (Halpern and LaMay,

2000)¹⁶, .H. Naderi, R. Abdullah and H. TengkuAizan, 2008)¹⁷. But, there are research studies which state that boys possess more general intelligence than girls (Adrian and Buchanan, 2005)¹⁸, and girls outperform boys with respect to specific cognitive abilities (Hyde, 2005¹⁹; Lynn *et al.*, 2002)²⁰, like interpersonal or social intelligence (Rammstedt and Rammsayer, 2000, Bennett, 1996)^{21,22}. Findings in linguistic research of the last few decades reveal the differences that exist in learning and then using languages, between the genders (Zare-ee, A., Mohd Don, Z., Knowles, G., & Tohidian, I. (2015).

Trading on such lines, this study clearly establishes highly significantly that linguistic intelligence predicts

social intelligence in secondary school students belonging from even a marginalized muslim minority community, and girls from this community have both these types of intelligence more than boys concurring with the results of previously conducted research on multiple intelligence and the presence of its components in boys and girls of foreign cultures (Esmacili, F., Behnam, B., Esmacili, K., 2014)²³.

The findings reflect the role of language acquisition and social skills for general success in present times all across the board. To reap the benefits of learning in mother tongue, the three language formula was adopted in 1960s in India, according to which every child was to be provided instruction in local, national and international languages. As per the constitution of India, article 350A, it is directed to the state and the local authorities that appropriate arrangements must be made to ensure children belonging from linguistically minority groups to receive education in their mother tongue.

But, in the context of muslim community, Sacher committee report states that one of main reasons for poor educational status of muslims in India is due to lack of schools at elementary students from this community perform poorly in Urdu, leave alone languages like English. This in turn leads to their social isolation in national and global context, in later years of life and also in finding proper employment opportunities.

The committee found that there is a culture of considering education to be non-essential for girls in muslim community, who are married off early. This leads to lower enrollments of girls in schools coupled with their higher drop-out rates. Some of the possible reasons which add fuel to the fire are no access to schools within easy reach, lack of girl's hostels, absence of female teachers and no availability of scholarships at tertiary level of education for girls.

Owing to these reasons, though research studies indicate higher prospects of success for girls and women from this community, the reality is that they not only lag behind the muslim boys and men in educational attainments, but also with women in general at the national level. This trend extends in less representation of these women in the social discourse of the society and country.

Further studies must be carried out on larger samples of students from this community to replicate this study.

The influence of socio-economic status and age can also be included in future studies. The study was conducted in the city of Hyderabad and needs to be replicated in other parts of a large and culturally diverse nation like India. This study also recommends construction of a social intelligence scale for adolescents taking into account the social milieu of muslim minority community.

CONCLUSION

The highly statistically significant relationship of linguistic intelligence as predictor of social intelligence and the role of gender on them, obtained from this research, bears certain significance in the upliftment of minorities and especially the women and the girl children of muslim community in India. The government should work harder towards the implementations of the recommendations of Sacher committee report at grass root level but promoting Urdu as the medium of instruction at lower level and as an optional subject up to tertiary level along with the teaching of languages like Hindi and English to anticipate greater participation and representation of men and especially women from this community in all areas of public life.

Impact of Adversity Quotient on Learning Behaviour among Secondary School Students

Kundan Singh¹, Sabina Parveen²

¹Assistant Professor, ²Research Scholar, School of Education, Lovely Professional University, Phagwara (Punjab)

ABSTRACT

This study was conducted to find the impact of adversity quotient of secondary school students on their learning behaviour. Descriptive survey method was used to realize the objectives: to find the gender and locality related difference in adversity quotient and learning behaviour among secondary school students; to study the relationship between adversity quotient and learning behaviour among secondary school students; to study the impact of adversity quotient on learning behaviour among secondary school students. A sample of 339 secondary school students was collected using stratified random sampling by administering Learning Behaviour Scale (2014) and Adversity Quotient Profile (2015). Data were analyzed using percentage, mean, SD, t-test, coefficient of correlation and regression analysis. The results of the study revealed that female secondary school students possess greater adversity quotient and exhibit better learning behaviour than male secondary school students. Rural secondary school students possess greater adversity quotient and exhibit better learning behaviour than urban secondary school students. A significant positive relationship was found between learning behaviour and adversity quotient of secondary school students. Adversity quotient was found to be a significant predictor of learning behaviour of secondary school students.

Keywords: Learning behaviour, Adversity Quotient(AQ), Secondary school students.

INTRODUCTION

Adversity Quotient

Dr. Paul Stoltz defined Adversity Quotient as “the science of human resilience”. Adversity means unfavourable situations and difficulties. Adverse conditions make one person to learn several things and it also analyse one’s capacity and courage. AQ is the capacity of the human being to tackle with the adversities of his life. It is the science of person’s hardiness. Adversity quotient is the broadly accepted measure and technique in the world to evaluate how persons reply to and deal with adverse situations in their life. There are four dimensions in AQ (CORE):

C= Control: It means the level to which you can manipulate the condition?

O=Ownership: It means to what level do you grasp by hand in charge for improving this condition? To what level are you in charge to play a number of roles in making it superior?

R=Reach: It means the level to which the adversity extend beyond the condition at hand?

E=Endurance: How extended will the adversity be endured/tolerated by any person?

Review of related literature reveals that relationship between self-empowerment and adversity quotient is significant¹. CBSE, ICSE and SSC school students differ significantly in their adversity quotient. Adversity quotient score had improved their school performance. Enhancing the capability to handle adversities corresponds to good performance². Adversity quotient was found to be positively correlated with learning behaviour. Emotional intelligence was positively correlated to learning behaviour³. Students having high adversity quotient were easily adaptive to new environment and able to convert it into favourable environments⁴. Academic performance of students is related significantly with their adversity quotient. Adversity quotient of students is not influenced by gender. Logic of special choice, dominance, self-confidence, achievement motivation and enthusiasm,

factors influence the adversity quotient. Self-confidence influences the AQ of students. Achievement motivation directly influences the adversity quotient, dominance indirectly influences the AQ, while sense of self-esteem, self-confidence, personal freedom, ambition and enthusiasm are the variables which influence the adversity of these students⁵. AQ and academic performance of students is positively related. It was found that academic performance is a factor which affects adversity quotient. Adversity quotient of students is significantly related to their Mathematics achievement.⁶ AQ and achievement motivation are positively correlated⁷. Adversity quotient has a positive correlation with student's learning behaviour. In addition, father's levels of academic achievement and education had a significant impact on student's learning behaviour. Defence mechanism and adversity quotient of secondary school students are not related. Male and female do not differ in their defence mechanism and adversity quotient⁸. Adversity quotient had a positive correlation with students learning behaviour. The levels of academic achievement and education had a significant impact on students learning behaviour⁹. Achievement motivation and learning behaviour predict adversity quotient of higher education students¹⁰. Cognitive style and adversity quotient of secondary school students are positively correlated.

Learning Behaviour

Learning behaviour comprises motivation, attention, learning –related social skills, approach to learning in little kids and these are predictive of their later social adjustment and academic in school. McDermott and Schaefer (1999), and Schaefer (2004) described abstract rationale for the significance of considering learning behaviours in assessing student's learning difficulty. McClelland and Morrison (2013) worked more on the concept of learning behaviour and they identified: Competence Motivation (motivation or reluctance to take tasks), concentration (under instruction, paying concentration), and Attitude Toward Learning (readiness to be help) make easy winner in educational achievement and students learning. Evaluation of such learning behaviours can supply extra insight into student learning difficulty and additional assist in remediation of learning troubles due to their awareness to interventions. Learning behaviour comprises:

Attention: It refers to how we actively process the specific information which is meaningful for us.

Attitude: It is tendency of an individual to reply positively or negatively towards a person, situation, object, or an idea. Attitude influences an individual's action of choice, and challenges to responses, reward and incentives, (together called stimuli).

Competence Motivation: It is the drive to be fine at a little, allow the person to present high class job. Competence forced students seek skill mastery, obtain pride in increasing and use their problem-solving skills and strive to be original when confronted with obstacles. They study from their knowledge.

Strategy/Flexibility: Learning strategies are the action and/or thoughts that students apply to total learning tasks. These are the apparatus that student themselves can employ separately according to their need and ability to complete any task.

A review of related literature reveals that self-defeating behaviour has a negative correlation with learning behaviour¹¹. Both adversity quotient and emotional intelligence are positively correlated with learning behaviour. Adversity quotient has a positive correlation with student's learning behaviour. In addition, father's levels of academic achievement and education has a significant impact on student's learning behaviour. Adversity quotient had a positive correlation with students learning behaviour. The levels of academic achievement and education had a significant impact on students learning behaviour. Achievement motivation and learning behaviour predict adversity quotient of higher education students.

SIGNIFICANCE OF THE STUDY

Learning is the modification of behaviour through experience. Adversity quotient is how well a person resists and works in the adverse situations. With the help of adversity quotient, it is better to understand how a person and others respond to challenges and adversity in every aspect of their life. Learning behaviour comprises motivation, attention, learning-related social skills, approach to knowledge in little kids and these are predictive of their later social adjustment and academics in school. An analysis of review of related literature shows that Kanjanakaroon (2000), Dsouza (2006), Kuntakaew (2007), Yun (2008), Huijuan (2009), Pangma, Tayraukham and Nuangchalerm (2009), Zhou (2009), Cura and Gozum (2011), Cornista and Macasaet (2013), Malia and Zahyah (2013), Nikam and Uplane

(2013), Praditsang, Hanafi (2013), Kumar (2015), Singh & Kaur (2017) have conducted studies on adversity quotient. Also, Romruen (2006), Malia and Zahyah (2013), Praditsang and Hanafi (2013) and Singh & Kaur (2017) have conducted studies on learning behaviour of the students. A trend was found that adversity quotient influences academic performance of students. Correlation was found between adversity quotient and learning behaviour of the students. None of the researcher has undertaken a study to find the extent to which adversity quotient can predict the learning behaviour of the secondary school students. In order to fill the research gap, this study was undertaken i.e. exploring, whether adversity quotient determines the learning behaviour of secondary school students or not? If yes, to what extent. Learners, parents, teachers, curriculum framers, examiners, administrators and policy makers may get benefits from the results of the study in order to do their duties in a better way.

OBJECTIVES

1. To find the difference in adversity quotient among secondary school students on the bases of gender and locality.
2. To find the difference in learning behaviour among secondary school students on the bases of gender and locality.
3. To study the relationship between adversity quotient and learning behaviour among secondary school students.
4. To study the impact of adversity quotient on learning behaviour among secondary school students.

HYPOTHESES

1. There exists significant difference between secondary school boys and girls in their adversity quotient.
2. There exists significant difference between rural and urban secondary school students in their adversity quotient.

3. There exists significant difference between secondary school boys and girls in their learning behaviour.

4. There exists significant difference between rural and urban secondary school students in their learning behaviour.

5. There exists significant positive relationship between adversity quotient and learning behaviour among secondary school students.

6. Adversity quotient can predict learning behaviour among secondary school students.

RESEARCH METHOD

Descriptive survey method was used in the present study.

SAMPLING TECHNIQUE

Stratified random sampling technique was used. The sample of the study comprised of 399 secondary school students of 10th class from Baramula, Srinagar and Kupwara districts of Jammu and Kashmir state (India).

TOOLS USED

Adversity Quotient Scale (2015) developed by the Kumar, M.

Learning Behaviour Scale (2014) developed by Kaur, R.

STATISTICAL TECHNIQUES

Mean, standard deviation (SD), t-test, co-efficient of correlation and regression analysis were used as statistical techniques to analyse the data.

RESULTS AND DISCUSSION

Gender Related Difference in Adversity Quotient:

Table 1 represents data regarding gender related differences in AQ.

Table 1: Gender Related Difference in Adversity Quotient

	Gender	No. of Students	Mean	SD	df	t-value
Adversity Quotient	Boys	128	53.82	8.38	337	3.01**
	Girls	211	56.64	8.36		

** = Significant at 0.01 level

Table 1 indicates that in case of adversity quotient, the t-value for difference between secondary school boys and girls is 3.01, which is significant at 0.01 level. Since mean score (56.82) of secondary school girls was greater than mean score (53.82) of secondary school boys hence it may be interpreted that secondary school girls possess greater adversity quotient as compared to their counter parts secondary school boys. Thus, hypothesis that “there exists significant difference between secondary school boys and girls in their adversity quotient” was accepted.

Locality Related Difference in Adversity Quotient:

Table 2 represents data regarding locality related difference in AQ.

Table 2: Locality Related Difference in Adversity Quotient

	Locality	No. of Students	Mean	SD	df	t-value
Adversity Quotient	Rural	167	59.05	8.05	337	8.10**
	Urban	172	52.20	7.45		

**=Significant at 0.01 level

Table 2 reveals that for adversity quotient, the t-value for difference between rural and urban secondary school students is 8.10, which is significant at 0.01 level. Since mean score (59.05) of rural secondary school students was greater than mean score (52.20) of urban secondary school students, hence it may be interpreted that rural secondary school students possess greater adversity quotient as compared to their counter parts urban secondary school students. Thus, hypothesis that “there exists significant difference between rural and urban secondary school students in their adversity quotient” was accepted.

Gender Related Difference in Learning Behaviour:

Table 3 represents data regarding gender related difference in learning behaviour.

Table 3: Gender Related Difference in Learning Behaviour

	Gender	No. of Students	Mean	SD	df	t-value
Learning Behaviour	Boys	128	98.38	9.22	337	6.35**
	Girls	211	105.86	12.33		

**=Significant at 0.01 level

Table 3 indicates that for learning behaviour, the t-value for difference between secondary school boys and girls is 6.35, which is significant at 0.01 level. Since mean score (105.86) of secondary school girls was greater than mean score (98.38) of secondary school boys, hence it may be interpreted that secondary school girls possess better

learning behaviour as compared to their counter parts secondary school boys. Thus, hypothesis that “there exists significant difference between secondary school boys and girls in their learning behaviour” was accepted.

Locality Related Difference in Learning Behaviour:

Table 4 represents data regarding locality related difference in learning behaviour.

Table 4: Locality Related Difference in Learning Behaviour

	Locality	No. of Students	Mean	SD	df	t-value
LEARNING BEHAVIOUR	Rural	167	106.11	12.05	337	4.87**
	Urban	172	100.05	10.79		

**=Significant at 0.01 level

Table 4 reveals that for learning behaviour, t-value for difference between rural and urban secondary school students is 4.87, which is significant at 0.01 level. Since mean score (106.11) of rural secondary school students was greater than mean score (100.05) of urban secondary school students, hence it may be interpreted that rural secondary school students possess better learning behaviour as compared to their counter parts urban secondary school students. Thus, hypothesis that “there exists significant difference between rural and urban secondary school students in their learning behaviour” was accepted.

Relationship between Adversity Quotient and Learning Behaviour of Secondary School Students:

Table 5 represents data regarding relationship between AQ and Learning Behaviour of secondary school students.

Table 5: Co-efficient of Correlation Between Adversity Quotient and Learning Behaviour among Secondary School Students

Variable	N	df	Co-efficient of Correlation
Adversity Quotient	339	337	0.279**
Learning behaviour			

**=Significant at 0.01

Table 5 indicates that co-efficient of correlation between AQ and learning behaviour of secondary school students is 0.279. It was found to be significant at 0.01 level. Therefore, it may be interpreted that there exists significant positive relationship between learning behaviour and adversity quotient of secondary school students. An improvement in learning behaviour leads to a raise in the level of AQ of secondary school students and vice versa. Thus, hypothesis that “there exists significant relationship between learning behaviour and adversity quotient of secondary school students” was accepted.

6. Impact of Adversity Quotient on Learning Behaviour of Secondary School Students:

Table 6: Regression Analysis between Adversity Quotient and Learning Behaviour

Variable	R	R Square	Adjusted R Square	Std. Error of the Estimate	F
Adversity Quotient	0.279	0.0785	0.075	11.36	28.25**

** Significant at 0.01

Table 6 shows the coefficient of correlation among adversity quotient and learning behaviour. The coefficient is 0.279 and its square is 0.0785. This means that 7.85% variance in learning behaviour is explained by adversity quotient.

Table 7: ANOVA for Regression

Model	Sum of Squares	df	Mean Square	F-Ratio
Regression	3681.5	1	3681.5	28.52**
Residual	43509	337	129.11	
Total	47190	338		

**** Significant at 0.01 level**

Table 8: Coefficient of Regression

Model	Unstandardized Coefficients		t
	B	Std. Error	
Constant	81.39	4.10	19.85
Scores of AQ	0.39	0.07	5.34

**** Significant at 0.01 level**

Table 7 shows that F value is 28.52, which is significant at 0.01 level of significant. This means that the model presented the significance in predicting learning behaviour of secondary school students. Thus, the hypothesis that “there exists relationship of adversity quotient with the learning behaviour” was accepted. Hence, this result suggested for calculating regression analysis. It is evident from the table 8 that adversity quotient is significant predictor of learning behaviour. One-unit change in adversity quotient will make a change of 0.39 units in learning behaviour. In other words, one percent change in adversity quotient can make a change of 39% in learning behaviour and is statistically significant.

The regression equation formulated from these variables is as given below:

Learning Behaviour = 81.39 + 0.39 (Adversity Quotient)

RESULTS AND DISCUSSION

Secondary school girls possess greater adversity quotient and better learning behaviour as compared to their counter parts secondary school boys. Findings of Nikam and Uplane (2013), Huijuan (2009), Singh & Kaur (2017) are just opposite, they found that male and

female do not differ in their adversity quotient.

Rural secondary school students possess greater adversity quotient and better learning behaviour as compared to their counter parts urban secondary school students. No study was found to support or oppose this result.

There exists significant positive relationship between learning behaviour and adversity quotient of secondary school students. This result is being supported by Kuntakaew (2007), Malia and Zahyah (2013), Praditsang and Hanafi (2013), Singh and Kaur (2017).

Adversity quotient is a significant predictor of learning behaviour among secondary school students. Kuntakaew (2007), Malia and Zahyah (2013), Praditsang and Hanafi (2013), Singh and Kaur (2017) have also found the similar results.

RECOMMENDATIONS

Since girl students possess more adversity quotient and better learning behaviour than boys hence we as a teacher, administrator and parent should consider this fact while dealing with girl students in schools. Girl students should be provided with more adverse situations and challenging tasks so that they can excel in their performance. On the similar lines rural students should

be exposed to more challenging tasks and provided with adverse situations so that they can be trained well to face the challenges of real life in the future. Also, adversity quotient is a significant predictor of learning behaviour hence secondary school students should be trained well to face adverse situations in order to improve their learning behaviour.

Perceived Social Support and Perceived Stress, Relations to Adjustment among Migrant Students: A Test of Buffering Hypothesis

Neha Vats¹, Navdeep Kaur²

¹Assistant Professor, School of Education, Lovely Professional University, Phagwara,

²Assistant Professor, Department of Education, Guru Nanak Dev University, Amritsar

ABSTRACT

Current study intended to probe into the association amongst the perceived stress and adjustment, and also the main and buffering effect of support from other and support from friend, in a sample of 325 JNV migrants (196 = male and 129 = female) migrant students of Jawahar Navodaya Vidyalaya. Bivariate analyses revealed strong correlation of perceived stress with educational, emotional and social adjustment. Test of interaction effects indicated that support from significant others and friend buffered the influence of higher level of perceived stress on educational, social and emotional adjustment. Outcomes of the present research supports moderating part of perceived social support in relation to perceived stress and proposes the requirement for enabling the intact support system for migrants. Implications for minimising the effects of perceived stress among migrant students are also discussed.

Keywords: *perceived stress, perceived social support, adjustment, migrants*

INTRODUCTION

Migration in Jawahar Navodaya Vidyalaya (JNV)

In the case of Jawahar Navodaya Vidyalaya, a residential school for rural talent, migration scheme was presented to nurture the emotions of national integration and also to lessen the gap in culture. In this scheme the students migrate from one linguistic region to another linguistic region under three language formula for only one year. When students migrate from their JNV to another JNV, they meet new culture, food habits, environment and language. In the new environment students may learn a lot of new things, take up to new challenges and enjoy themselves making new friends, learning different language, getting involved in new social community but at the same time they might face many problems related to social, emotional and academic area. Misra et al. (2003) stated that all the migrated students have to go through the adjustment process to cope with the new social and educational environment¹. Adjusting to novel environments adds extra strain on the migrated child to cope with the different language, stud

habit, and cultural values².

Purpose of the study

The primary objective of the study is to probe into the role of perceived stress in defining the adjustment of the migrant students as well as to establish perceived social support as moderator of adverse effects of the perceived stress on adjustment (educational, emotional and social).

DATA ANALYSIS AND RESULT

The present study was conducted using correlation (Product moment) Pearson's product and regression (hierarchical) in analysing the obtained data.

Descriptive statistics along with inter correlation of the study's variables appears in table 1.1. All three dimensions of adjustment were significantly related with social support's high levels from significant others, friends, and family. Perceived stress was also found significantly correlated with all the three dimensions of adjustment i.e. emotional, social and educational. As the scoring of the adjustment scale is in reverse manner

(lower the score, better the adjustment), so the positive sign of the correlation coefficient should be considered as negative.

Table 1: Relationship among Adjustment, Perceived Social Support, and Perceived Stress of Migrated Students (N=325)

	Perceived Stress	Others Support	Friend Support	Family Support	Educational adjustment	Emotional adjustment	Social adjustment
Perceived stress	1						
Others Support	-.389**	1					
Friend Support	-.410**	.468**	1				
Family Support	-.303**	.209**	.268**	1			
Educational adjustment	.407**	-.510**	-.401**	-.415**	1		
Emotional adjustment	.464**	-.544**	-.481**	-.345**	.648**	1	
Social adjustment	.395**	-.560**	-.383**	-.372**	.587**	.488**	1

* Significant at 0.01 level

Analysis through Regression

Hierarchical regression was run to calculate the main and moderating effects of the buffering variable (Support from others, friends and family).

*In all the tables of regression analysis perceived stress is considered as constant predictor (a).

Table 2: Buffering Effects of Perceived Social Support from Others on The Relationship Between Perceived Stress And Educational Adjustment

Variable	B	SE	β	t	R	R ²	ΔR^2	ΔF
Step 1					.407 ^a	.165	.165	64.042*
Perceived Stress	.267	.033	.407	8.003				
Step 2					.558 ^b	.312	.146	68.386*
Perceived Stress	.161	.033	.245	4.892				
Perceived Other Support	-.286	.035	-.415	-8.270

- b. Predictors: (Constant), Perceived Stress, perceived others support
- c. Predictors: (Constant), Perceived Stress, perceived others support, Perceived Stress * perceived others support
- d. Dependent Variable: Educational Adjustment

The analysis was carried out to examine the buffering effect of perceived support from others support on the relationship of perceived stress and educational adjustment. In step 1, perceived stress was entered, $\Delta F(1,323) = 64.042, p = 0.000$ and accounted for 16.5% significant variance in educational adjustment of migrated students. Introduction of perceived others support in step 2 explained additional 14.6% variance in the educational adjustment of the migrated students, and the change in R^2 was significant, $\Delta F(1,322) = 68.386, p=0.000$. To examine the moderation effect of perceived others support, interaction term was entered in to last step, which contributed additional 11.4% significant variance, $\Delta F(1,321) = 63.742, p=0.000$, in educational adjustment of the migrated students. In the third model, specifically, perceived stress, $b = .238, t(321) = 5.179, p=0.000$, perceived others support $b = -.316, t(321) = -6.644, p= 0.000$ and the interaction term $b = -.353, t(321) = -7.984, p=0.000$ significantly predicted educational adjustment of migrated students.

Figure 1 Moderating effect of Perceived Other's Support on Educational Adjustment

Table 3: Buffering Effects of Perceived Social Support from Others on The Relationship Between Perceived Stress And Emotional Adjustment

Variable	B	SE	β	t	R	R ²	ΔR^2	ΔF

Perceived Other Support	-.197	.026	-.347	-7.446				
Perceived Stress × Perceived Other Support	-.033	.005	-.291	-6.714				

*Significant at 0.01 level

b. Predictors: (Constant), Perceived Stress, perceived others support

c. Predictors: (Constant), Perceived Stress, perceived others support, Perceived Stress * perceived others support

d. Dependent Variable: Emotional Adjustment

The analysis was carried out to examine the buffering effect of perceived support from others support on the relationship of perceived stress and emotional adjustment. In step 1, perceived stress was entered, $\Delta F(1,323) = 88.701, p = 0.000$ and accounted for 21.5 % significant variance in emotional adjustment of migrated students. Introduction of perceived others support in step 2 explained additional 15.6 % variance in the emotional adjustment of the migrated students, and the change in R^2 was significant, $\Delta F(1,322) = 79.833, p = 0.000$. To examine the moderation effect of perceived others support, interaction term was entered in to last step, which contributed additional 7.7% significant variance, $\Delta F(1,321) = 45.078, p = 0.000$, in emotional adjustment of the migrated students. In the third model, specifically, perceived stress, $b = .291, t(321) = 6.476, p = 0.000$, perceived others support $b = -.347, t(321) = -7.446, p = 0.000$ and the interaction term $b = 0.291, t(321) = -6.714, p = 0.000$ significantly predicted educational adjustment of migrated students.

Figure 2: Moderating effect of Perceived Other's Support on Emotional Adjustment

Table 4: Buffering Effects of Perceived Social Support from Others on The Relationship Between Perceived Stress And Social Adjustment

Variable `	B	SE	β	t	R	R ²	ΔR^2	ΔF
Step 1					.395 ^a	.156	.156	59.866*
Perceived Stress	.304	.039	.395	7.737				
Step 2					.592 ^b	.351	.194	96.417*
Perceived Stress	.161	.037	.209	4.298				
Perceived Other Support	-.385	.039	-.479	-9.819

Perceived Stress × Perceived Other Support	-.058	.007	-.357	-8.386				

*Significant at 0.01 level

b. Predictors: (Constant), Perceived Stress, perceived others support

c. Predictors: (Constant), Perceived Stress, perceived others support,

Perceived Stress * perceived others support

d. Dependent Variable: Social Adjustment

The analysis was carried out to examine the buffering effect of perceived support from others support on the relationship of perceived stress and social adjustment. In step 1, perceived stress was entered, $\Delta F(1,323) = 59.866$, $p = 0.000$ and accounted for 15.6 % significant variance in social adjustment of migrated students. Introduction of perceived others support in step 2 explained additional 19.4 % variance in the social adjustment of the migrated students, and the change in R^2 was significant, $\Delta F(1,322) = 96.417$, $p=0.000$. To examine the moderation effect of perceived others support, interaction term was entered in to last step, which contributed additional 11.7%

significant variance, $\Delta F(1,321) = 70.317$, $p=0.000$, in social adjustment of the migrated students. In the third model, specifically, perceived stress, $b = .202$, $t(321) = 4.561$, $p=0.000$, perceived others support $b = -.378$, $t(321) = -8.263$, $p = 0.000$ and the interaction term $b = -.357$, $t(321) = -8.386$, $p=0.000$ significantly predicted social adjustment of migrated students.

Figure 3 Moderating effect of Perceived Other's Support on Social Adjustment

CONCLUSION

A major body of researches have been carried out about the adjustments trends of international students, but nothing has been done in the area addressing the adjustment trends of migrant students within the country. Furthermore, several studies have been carried to investigate the adjustment problems international immigrant students, eventually nothing is known about the migration experience in India. The current study provides the first in-depth knowledge about the adjustment of migrant students in JNVs, which is a very ambitious project of Government of India for promoting the rural talent as well as the cultural harmony. The results confirm adverse effects of perceived stress on JNV migrant students and provide evidence social support helps in buffering the effects of high levels of perceived stress.

Reinforced Concrete Bridge Structural Health Classification using Hybrid Principal Component Analysis and Artificial Neural Network Approach with Wireless Sensor Network

R.S. Concepcion II

MSc., Department of Electronics Engineering, University of Perpetual Help System DALTA

ABSTRACT

Structural health monitoring (SHM) and evaluation of bridges is interesting and radically important with the exponentially increasing demand for safety and its functionality in relation with economic, industrial and civil benefits. In bridge health evaluation systems, the modal parameters can only access the required accuracy after multiple and looping experiments due to varying ambient parameters. The paper proposed an approach of bridge structural health evaluation and classification method based on the combined multivariate linear principal component analysis (PCA) and multilayer artificial neural network (ANN) which is used to compensate temperature on vibration data and classify bridge health respectively. Bridge health can be classified as good, needs rehabilitation and critical. A wireless sensor network (WSN) composed of six autonomous motes is installed along the deck of the reinforced concrete laboratory bridge test platform to acquire vibration, and bridge and environment temperature data. The critical points of the bridge wherein maximum deflections occur are determined using moment diagram. Nondestructive testing (NDT) using controlled vibration testing (CVT) and platform physical alteration technique is implemented with formulated damage test cases to provide different excitations on the bridge. Peak picking (PP) algorithm was used to mitigate data congestion. The optimization technique of scaled conjugate gradient (SCG) is the algorithm used to train the three-layer feedforward ANN and sigmoidal function was used as the activation type for output neurons. There is 0.0038881 cross-entropy (CE) performance and 99.8% accuracy during network training. Satisfactory tested neural network CE performance of 0.00636106 and 98.4% accuracy in classifying bridge health is obtained.

Keywords---*Artificial Neural Network, Bridge Health Classification, Wireless Sensor Network.*

INTRODUCTION

Bridge is an essential transportation link across rivers, roads, islands and even inter-buildings. According to the Department of Public Works and Highways (DPWH), as of December (2015) there are 13.10% of the total number of bridges nationwide were inspected having poor condition and 5.36% were considered as having bad condition. Bridges in the Philippines are materially classified as permanent if it is made from concrete or steel, and temporary if made from bailey and timber. Collectively, what alarming is the increasing number of bridges classified as poor which at the end of February (2015) it peaked to 15.48%¹. Many unobservable environmental parameters such as temperature, humidity, and wind force disturb the natural

stability and characteristics of civil infrastructures.

Natural frequency, aside from mode shape and damping that are the standard vibrational properties of bridge structures, is the frequency at which the bridge oscillates without any excitation, internal induced force and damping force affecting the system. At equilibrium state of the bridge, the natural frequency exhibits the true condition of the structure. It is the parameter that provides excellent vulnerability to temperature, making it also the easiest parameter to be extracted, quantified and analyzed². The acceleration parameter representing the natural frequency of the structure can be used to determine and evaluate the degree of damage concealed in the beams and decks having linear behavior³. As ambient temperature easily affects

the molecules of solid matters, including the materials and components of bridge, it may cause expansion and compression along the deck continuously⁴. Young's modulus is directly affected by ambient temperature. It is the mechanical property of solid materials that are linear elastic. As temperature increases, Young's modulus of concrete bridges decreases making it vulnerable to damage⁵. Thus, it offers a reasonable motion to eliminate the temperature effect in bridge health evaluation and classification system. Strain-temperature correlation analysis of a tied arch bridge using monitoring data was used to develop linear regression models for structural performance evaluation⁶. Statistical analysis of temperature field-static strain linear relationships of cable stayed bridges was used to obtain probability models for performance assessment application⁷. Certainly, it agrees to use temperature and vibration parameters in analyzing the condition of certain bridge structure as these parameters show off the ease of extracting raw and unobservable values.

Existing nondestructive testing techniques for structural health diagnosis and prognosis are indeed limited for continuous data acquisition and monitoring that is a requirement of SHM. It includes acoustics, ultrasonic waves, electromagnetic and radiographic methods⁸. These methods provide local damage detection.

Principal component analysis (PCA) is a multivariate Gaussian statistical procedure that uses orthogonal linear transform (OLT) to transpose a matrix of feature data. Principal components are normally ranked based on variance. Variants of PCA were used in data reduction such as⁹ and ¹⁰.

Artificial neural network (ANN) is basically composed of input layer, hidden layer containing the artificial neurons, output layer, weights and biases, which learns what response is quantified to particular input without providing task-specific rules. Classification systems were done using^{11,12} and¹³. All the abovementioned studies done in the past used steel test bed as their reference platform or mere computer simulation techniques to generate correlations among parameters and perform damage detection through acquired data. Hence, in order to verify the relationships of temperature and vibration with other bridge materials, usage of Reinforced Concrete Bridge is an appropriate alternative. Accordingly, it is

apparent that machine learning through multivariate linear principal component analysis and artificial neural network are best suited to enhance the data integrity and classification of bridge health. Bridge evaluation is undeniably a mathematically involved procedure and requires minimum inbuilt measurement parameters.

The aim of this study is to apply the combined PCA-ANN approach for reinforced concrete bridge health classification. Specifically, this study aims to construct a reinforced concrete bridge laboratory test platform and develop damage test cases; develop the wireless sensor network composed of six motes; employ principal component analysis to compensate temperature on vibration data and formulate the mathematical model through multiple linear regressions (MLR); and develop an artificial neural network for classifying the structural health of the bridge.

Experimental Design

The experimental design is shown in Fig. 1. It is subdivided into four phases that each complies with the objectives of the study.

Fig. 1. Block diagram of the system

Construction of Bridge Test Platform and Development of Damage Test Cases

With the aid of STAAD Pro software, the Banalo Bridge in Bacoor, Cavite was modeled to generate its moment diagram with self-weights and moving loads conditions. Moment diagram depicts the maximum deflection on different sections of the deck where motes must be installed. Shown in Fig. 2 is the platform configured for controlled vibration testing (CVT). Accelerometers and temperature sensors are distributed and installed along the deck.

Fig. 2. Panoramic view of the actual setup of reinforced concrete bridge laboratory test platform with proper placement of motes

The damage test case (TC) used the combined platform physical alteration technique in which different sections of the test bed is being deformed and removed from its most stable state, and the subwoofer vibration testing. A 10 Hz sinusoidal wave tone was used as the reference excitation frequency which acts as the ambient excitation. The data rate of all TCs is 100 Hz and each test lasts for an hour in early morning, noon time and night time to vary temperature. Pick peaking (PP) algorithm was used to automatically transmit the maximum acquired vibration data for each minute. This will also lessen data congestion.

Table 1. Damage test cases using platform physical alteration technique and vibration testing.

Cluster	Test case	Conditions
Undamaged	TC1	No subwoofer excitation, no platform alteration
Damaged	TC2	No subwoofer excitation, all bolts from roller support are removed
	TC3	With subwoofer excitation, no platform alteration
	TC4	With subwoofer excitation, all bolts from roller support are removed
	TC5	With subwoofer excitation, part of decks are cracked
	TC6	Combination of TC4 and TC5

Development of Wireless Sensor Network

In Fig. 3, the WSN is composed of six motes that are connected in star topology with the router, which is wirelessly connected to a repeater. The repeater serves as the gateway to a remote terminal. Each mote is composed of power core using arechargeable battery, processing core using Raspberry Pi (RPi) 3 Model B, dataacquisition core using accelerometers and temperature sensors, and wirelesscommunications core using the build-in wireless fidelity (WiFi) module of RPi. Secured copy protocol (SCP) was employed for file transfers between hosts on the WSN. Cron was employed as for execution and transmission time scheduling. Accelerometers were calibrated using inclination sensing and customized subwoofer-setup techniques. Temperature sensors were calibrated using two-point calibration technique¹⁴.

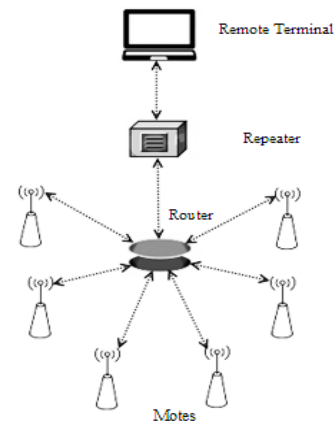

Fig. 3. Four-tier wireless sensor network architecture

Implementation of Principal Component Analysis and Development of Temperature-Compensated Mathematical Models

After the collection of training data, PCA using cumulative proportion (CP) criterion and correlation matrix method (CorMM) was implemented using NumXL which retains three principal components serving as the end effector of the mathematical models for temperature-compensated vibration data that were

developed using multiple linear regression (MLR)¹⁵. The mathematical models were embedded to RPi system. The output data for this stage serve as the input training data set for ANN.

Fig. 4. Principal component analysis using cumulative proportion criterion flowchart

Development of Artificial Neural Network

After gathering the training set for ANN model, initialization of number of artificial neurons, network hidden layers, weights and biases were done using MATLAB nntool. The activation function of the artificial neural neurons implementing backpropagation algorithm is a weighted sum of the sum of inputs x_i multiplied by their respective weights w_{ji} .

$$A_j(x, y) = \sum_{i=0}^n x_i w_{ji} \tag{1}$$

The most common output function is the sigmoidal function that resembles a very close to one for large positive numbers, 0.5 to zero, and very close to zero for large negative numbers. This is an advantage for smooth transition between low and high output of the neurons.

$$O_j(x, \bar{y}) = \frac{1}{1 + e^{-A_j(x, \bar{y})}} \tag{2}$$

The developed three-layer feedforward ANN with backpropagation algorithm has 3 input neurons at the input layer, 10 neurons at the hidden layer and 3 neurons at the output layer. Three-digit binary final grade representation was used: ‘100’ for good, ‘010’ for needs rehabilitations and ‘001’ for critical bridge health classifications. This criterion is based on the common range of bridge natural frequencies in which 0.92 Hz and 1.5 Hz to 4.5 Hz is classified good and critical respectively¹⁶. For this study, vibration of less than 0.92 Hz is considered good (TC1), 0.92 Hz to 1.5 Hz needs rehabilitation (TC2-TC4), and more than 1.5 Hz are critical (TC5-TC6). The 70% of the total input data was used for training, 15% for validation and 15% for testing. Training data are presented to the network during training and the network is adjusted according to its error. Validation data are used to measure network generalization. Testing data provides an independent measure of network performance during and after

training.

Fig. 5. Hybrid network of principal component analysis and three-layer feedforward artificial neural network with 10 hidden artificial neurons

ANALYSIS OF RESULTS

Temperature Compensation

The PCA-processed data for z-axis vibration has the mathematical model shown in Eq. 3. In this manner, it acts as the final filter of vibration data causing the input to ANN as temperature-compensated data. As shown in Fig. 6, the deviation of raw and PCA-reconstructed vibration data was the yielded temperature compensation.

$$x = 1.1676 - 0.01523 (\text{bridgeTemp}) + 0.0074 (\text{enviTemp}) \tag{3}$$

Fig. 6. Temperature-compensated vibration data using supervised principal component analysis

Bridge Health Classification

The triple binary digit output neuron representation in which ‘100’ denotes good bridge health, ‘010’ for bridge that needs rehabilitation, and ‘001’ for critical bridge health classification are sampled hereunder.

Table 2. Sample training data and results of back propagation artificial neural network.

Bridge Health Classification	Actual Output			Artificial Nodes (N)		
	N1	N2	N3	N1	N2	N3
Good	1	0	0	0.9896	1.65E-05	1.05E-06
Needs Rehabilitation	0	1	0	1.22E-05	1.0000	1.34E-07
Critical	0	0	1	1.01E-05	1.32E-05	0.9996

Neural network structure was experimented and varied based on the number of hidden artificial neurons and hidden layers to yield the best system performance. The key parameters are the processing time, cross-entropy (CE) value and regression coefficient (R) to determine the best neural network.

Fig. 7. Number of hidden nodes versus cross-entropy

Fig. 8. Number of hidden nodes versus learning time in seconds

Fig. 9. Number of hidden nodes versus regression coefficient

By referring to Fig. 7 to 9, it is noticeable that lowest cross-entropy and learning time are obtained from hidden node size of 10. The highest regression coefficient was obtained at hidden node size of 190. Fig. 7 depicts that there is considerably increase in cross-entropy from 10 to 40 hidden artificial nodes with varying pattern for higher magnitude nodes. The CE performance error proves the divergence of predicted from actual values. Fig. 8 depicts a particular linear increase for learning time as the number of hidden artificial node increases. Fig. 9 depicts no particular pattern in regression coefficient in increasing the magnitude of hidden artificial nodes.

Fig. 10 shows the training, validation and test performances of the trained ANN. Its cross-entropy performance is 0.0038881 which indicates good performance of the network, wherein 0 being the ideal value that every predicted value corresponds to actual value. Cross-entropy provides good classification of the system. 88 epochs were used by the network to achieve

the best validation.

Fig. 10. Performance plot of the trained neural network for bridge health classification

Fig. 11 depicts the overall confusion matrix of the developed neural network. It shows how accurate the system classifies each entry data. The training, validation and test accuracy are 99.7%, 100% and 100 % respectively. Out of 2,160 attempts to classify target output, 1.2% is wrong. Hence, overall system accuracy is 99.8%.

All Confusion Matrix

Output Class	1	358 16.6%	0 0.0%	0 0.0%	100% 0.0%
	2	2 0.1%	1080 50.0%	2 0.1%	99.6% 0.4%
	3	0 0.0%	0 0.0%	718 33.2%	100% 0.0%

		1	2	3	
		Target Class			

Fig. 11. Overall confusion matrix of the developed neural network

The neural network was tested using 2160 samples and resulted to cross-entropy error measure of 0.00636106 and the percentage of misclassified samples is 1.57407%. With the tested samples, the mean relative error is 0.00020734. Fig. 9 shows the comparison of the ANN output and the actual value of test samples.

Fig. 12. Overall confusion matrix of the developed neural network

CONCLUSION

Nondestructive testing through controlled vibration testing offers numerous vibration patterns along reinforced concrete bridge platform. Decentralized wireless sensor network offers good setup to mitigate bulk data ingestion. Temperature compensation using principal component analysis with cumulative proportion criterion provides suitable amount of transformation and extraction of feature vectors for more reliable interpretation of raw vibration data. Artificial neural network with binary digitrepresentation was capitalized in classifying bridge health whether it is still good to use,

needs rehabilitation or critical with accuracy of 98.4%. Statistically, the output data of the trained network has no difference with the target data. Thus, the hybrid PCA-ANN approach is an effective tool for reinforced concrete bridge healthclassification.

Optimization Modeling for Sustainable Production and Scheduling of Crude Palm Oil Milling Industries

Herman Mawengkang¹, Sutarman¹

¹Department of Mathematics, University of Sumatera Utara

ABSTRACT

Crude palm oil (CPO) can be obtained from the milling process of raw materials, called fresh fruit bunch (FFB) into end products palm oil. The process usually through a series of steps producing and consuming intermediate products. The CPO milling industry considered in this paper does not have oil palm plantation, therefore the FFB are supplied by several public oil palm plantations. Due to the limited availability of FFB, then it is necessary to choose from which plantations would be appropriate. This paper proposes a mixed integer linear programming model for the supply chain integrated problem, considering waste. The mathematical programming model is solved using neighborhood search approach.

Keywords: *Optimization, Crude Palm Oil, Mixed Integer programming, Supply Chain, Neighborhood Search.*

INTRODUCTION

The production process of crude palm oil (CPO) should go through the milling process of raw materials, called fresh fruit bunch (FFB) into end products palm oil. The process usually through a series of steps producing and consuming intermediate products. These raw materials, intermediate and end products are necessarily to be inventoried, allowing one to produce and consume them at different moments and rates in time. Even though for palm oil the time to keep raw material in inventory is very short. Each step of process may require several input products and may produce one or several outputs. If the CPO Company does not have any palm oil plantation, the FFB as raw materials must be purchased from oil palm plantation surrounding.

In order to be able to meet the market demand and to stay competitive, palm oil companies should have production plan strategies. A plan which involves the necessary acquisition of resources and the availability raw materials, as well as planning of the production activities required to process materials into finished goods. All of the process is to satisfy customer demand in the most efficient or economical way, i.e. minimizing total costs¹. Determination of the optimal amount of production has become one of the key component for a production planning².

Typically, solving production planning problems involve making decisions regarding the size of production lots, or production levels, for each of the time periods in a planning horizon. Additionally, these problem solutions may also include decisions on the quantities of raw materials (components) to purchase, order or process, inventory levels for finished products and components, production sequence, and other variables related to these aspects.

In production planning manner, it is essential to consider material flow and inventory balance equations in a model using a relative discretization of time, such as years, quarters, months or weeks³. Linear Programming (LP), Mixed Integer Linear Programming (MILP), and Mixed Integer Non-Linear Programming (MINLP) models are often appropriate and useful for solving such problems with a clear quantitative objective function: net profit, contribution margin, cost, total sales, total production, etc³.

CPO milling industries can be regarded as process industries in which production process and distribution flow are to define a supply chain management system. The primary optimal performance of the operations is to obtain the minimum total operating cost from processing raw material into final product and then deliver them to distribution centre^{4,5}.⁶ presented the optimization modelling of an integrated the supply

chain system which combine raw material suppliers, several plants, distribution centres, warehouses and customers. ⁷analysed more complicated situation for the integrated supply chain. They modelled the supply chain performance which involved multiple feed mills, multiple plantation, and multiple products. ⁸addressed an MILP model, which integrate production, distribution and marketing and integrated plants and sales points. Their paper intends to reveals the relevant features required for the complete supply chain management with a multi-site production network. ⁹develop a MILP global supply chain model for solving product – plant and customer – distribution center assignments. In their paper, there are several supply chain echelons, and number and locations of distribution centers. ¹⁰generate a two-stage supply chain model to determine the optimal quantities of products to be produced at each plant, and then transported from each plant to each distribution center. However, large numbers of constraints and binary variables turned out, and its size increases exponentially as the numbers of products, plants, and distribution centers increase. A hybrid Taguchi-Immune method is applied¹¹ to optimize supply chain design problem with multiple shipping options, distributed customer needs, and fixed lead times. ¹²proposed mixed integer linear programming models and computational approaches for tackling the problem of uncertain multi-echelon supply chains with inventory. ¹³consider a multi-period production system which involve load distribution and production planning. A three-phase heuristic approach and Tabu Search were used for solving the integrated model.

When we intend to apply production planning in a more sophisticated way for complex manufacturing systems, it is usual to find such applications made through Mixed Integer Linear Programming (MILP) models. This is due to the nature of the decision variables for some features involved in such problems, e.g., set-up costs and times, start-up costs and times, machine assignment decisions, ordering costs and times, and so on. These costs and times are fixed per batch and are not proportional to the batch size. Therefore, binary or integer variables are required to model them¹.

¹⁴develop a continuous time model for production planning and scheduling applicable to batch processing plants. Initially, the proposed model is a Mixed Integer Nonlinear Program (MINLP), and it is then reformulated as a mixed integer linear programming (MILP) using

linearization techniques. The model aims at maximizing the net profit obtained from the batch production, with respect to restrictions relating to batch assignment, operation and equipment setup time, and scheduling periods. A multi-product batch paint processing plant is considered for a real case implementation to show the effectiveness of the model. Another MILP model for integrated location-production-distribution planning can be found in¹⁵.

¹⁶addresses a production planning of palm oil together with the capacity planning of palm oil processing plants in Thailand. His paper intend to treat CPO as the main feedstock of biodiesel production. A mixed integer linear programming model is proposed. In¹⁷, a nonlinear programming model for CPO production planning is addressed with considering minimization of water consumption at the milling process. However they only consider the optimization process in the CPO milling process. Another production planning of CPO which consider only at the milling process can be found in¹⁸. They use fuzzy logic strategy to provide a simpler mechanism in order to obtain the relationship between the processing variables and the amount of CPO and also palm kernel losses.¹⁹develop an optimization model in a supply and demand system for CPO production planning. The objective of their model is to select which market of CPO would be appropriate, and also to calculate how much demand should be delivered in the selected market. [20] present a multi-objective optimization model for a CPO sustainable production planning considering the reliability of financial risk.

Mathematical Model

The model formulated is to decide optimally

1. The amount of FFB to be bought from each palm oil plantation (ton)
2. The amount of CPO to be produced (ton)
3. The amount of CPO to be delivered to each customer (ton)
4. The amount of Waste produced in the milling process (ton)
5. To decide from which plantation FFB should be bought (binary)

In such a way to minimize the overall operational costs.

Decision variables are defined as follows.

- x_{ij}^t The amount of FFB (ton) needs to be bought from plantation I for milling j in time period t
- y_j^t The amount of CPO (ton) to be produced at milling j in time period t
- z_{jk}^t The amount of CPO (ton) to be delivered from milling j to customer k in time period t
- v_j^t The amount of liquid waste (ton) produced after the milling process in milling j in time period t
- w_j^t The amount of solid waste (ton) produced after the milling process in milling j in time period t
- δ_{ij} A binary variable which is 1 if FFB for milling j is bought from plantation I and zero otherwise

Parameters.

- α_{ij} Transportation cost (Rp.) from plantation I to milling j per kilometer
- d_{ij} Distance (km) from oil palm plantation i to milling j
- β_j Production cost (Rp.) at milling j
- γ_{jk} Transportation cost (Rp.) to deliver CPO from milling j to customer k
- λ_j Cost (Rp.) for processing liquid waste at milling j
- ρ_j Transportation cost (Rp.) for solid waste at milling j
- τ_{ij}^t Overall price (Rp.) to buy FFB from plantation i for milling j in time period t
- Cm_j^t Milling capacity (ton) at milling $j \in J$ in time period $t \in T$
- CP_j^t Production capacity (ton) at milling $j \in J$ in time period $t \in T$
- CA_i^t Quantity of FFB (ton) available at plantation $i \in I$ in time period $t \in T$

Sets.

- I set of oil palm plantations with index i
- J set of CPO milling with index j
- K set of customers with index k
- T set of time period with index t

Regarding to the structure of the problem, it is easy to observe that the problem can be expressed as a mixed integer linear programming (MILP) model.

Firstly we formulate the objective function.

The operational costs can be expressed as follows.

$$C_1 = \sum_{i \in I} \sum_{j \in J} \sum_{t \in T} (\alpha_{ij})(d_{ij})x_{ij}^t \tag{1}$$

Transportation cost of FFB from oil palm plantation $i \in I$ to milling $j \in J$ in time period $t \in T$.

$$C_2 = \sum_{j \in J} \sum_{t \in T} \beta_j y_j^t \tag{2}$$

Processing cost to produce CPO at milling $j \in J$ in time period $t \in T$.

$$C_3 = \sum_{j \in J} \sum_{k \in K} \sum_{t \in T} \gamma_{jk} z_{jk}^t \tag{3}$$

Transportation cost of CPO from milling $j \in J$ to consumer $k \in K$ in time period $t \in T$.

$$C_4 = \sum_{j \in J} \sum_{t \in T} \lambda_j v_j^t \tag{4}$$

Processing cost of liquid waste resulted after the milling process at milling $j \in J$ in time period $t \in T$.

$$C_5 = \sum_{j \in J} \sum_{t \in T} \rho_j w_j^t \tag{5}$$

Transportation cost of solid waste after the milling process at milling $j \in J$ in time period $t \in T$.

$$C_6 = \sum_{i \in I} \sum_{j \in J} \sum_{t \in T} \tau_{ij} \delta_{ij}^t \tag{6}$$

Cost to buy FFB from palm oil plantation $i \in I$ for milling $j \in J$ in time period $t \in T$, if plantation I is chosen.

There are several constraints must be met expressed as follows.

$$\sum_{i \in I} x_{ij}^t \leq C m_j^t \quad \forall j \in J, t \in T \tag{7}$$

Eq. (7) states that the quantity of FFB to be bought from oil palm plantation $i \in I$ for milling $j \in J$ should fit to the capacity of milling $j \in J$ in time period $t \in T$

$$\sum_{j \in J} \sum_{t \in T} y_j^t \leq \sum_{j \in J} \sum_{t \in T} C p_j^t \tag{8}$$

Eq. (8) describes that the quantity of FFB to be processed in milling $j \in J$ should meet the production capacity of milling $j \in J$ in time period $t \in T$.

$$\sum_{i \in I} x_{ij}^t \leq \sum_{i \in I} C A_i \delta_{ij}^t \quad \forall j \in J, t \in T \tag{9}$$

Eq. (9) presents that the quantity of FFB to be bought from oil palm plantation $i \in I$ for milling $j \in J$ should satisfy to the availability of FFB in the plantation $i \in I$, if the plantation is chosen, for time period $t \in T$

$$\sum_{j \in J} z_{jk}^t \leq \sum_{j \in J} y_j^t \quad \forall k \in K, t \in T \tag{10}$$

Eq. (10) expresses that the quantity of CPO to be delivered to customer $k \in K$ from milling $j \in J$ cannot be greater than the quantity produced in milling $j \in J$ in time period $t \in T$

$$v_j^t + w_j^t \leq \sum_{i \in I} x_{ij}^t \quad \forall j \in J, t \in T \tag{11}$$

Eq. (11) states that the quantity of solid and liquid waste from milling $j \in J$ should be less than the quantity of FFB have been processed in time period $t \in T$.

$$\sum_{i \in I} \sum_{j \in J} \delta_{ij} = n \tag{12}$$

Eq. (12) is to make sure that there would be only n plantation available to supply FFB for each milling $j \in J$.

$$x_{ij}^t, y_j^t, z_{jk}^t, v_j^t, w_j^t \geq 0, \quad \delta_{ij} \in \{0,1\}, \quad \forall i \in I, j \in J, k \in K, t \in T \tag{13}$$

Eq. (13) is for the type of decision variables.

The Algorithm

First we separate the integer part and the fractional part

$$x = [x] + f, \quad 0 \leq f \leq 1$$

of the (continuous) solution of the relaxed problem, $[x]$ is the integer component of non-integer variable x and f is the fractional component.

Stage 1.

Step 1. Get row i^* the smallest integer infeasibility, such that $\delta_{i^*} = \min\{f_i, 1 - f_i\}$

(This choice is motivated by the desire for minimal deterioration in the objective function, and clearly corresponds to the integer basic with smallest integer infeasibility).

Step 2. Do a pricing operation

$$v_{i^*}^T = e_{i^*}^T B^{-1}$$

Step 3. Do calculating $\sigma_{ij} = v_{i^*}^T \alpha_j$

With j corresponds to

$$\min_j \left\{ \left| \frac{d_j}{\alpha_{ij}} \right| \right\}$$

the maximum movement of nonbasic j at lower bound and upper bound.

Otherwise go to next non-integer nonbasic or superbasic j (if available). Eventually the column j^* is to be increased from LB or decreased from UB. If none go to next i^* .

Step 4.

Solve $B\alpha_{j^*} = \alpha_{j^*}$ for α_{j^*}

Step 5. Do ratio test for the basic variables in order to stay feasible due to the releasing of nonbasic j^* from its bounds.

Step 6. Exchange basis

Step 7. If row $i^* = \{\emptyset\}$ go to Stage 2, otherwise Repeat from step 1.

Stage 2. Pass1 : adjust integer infeasible superbasics by fractional steps to reach complete integer feasibility.

Pass2 : move integer feasible superbasics. The objective of this phase is to run a highly localized search to verify local optimality.

CONCLUSIONS

This paper presents an integrated of production – distribution planning faced by a CPO milling industry with no oil palm plantation. Therefore this industry is necessarily to buy FFB from several oil palm plantation. Due to the limited availability of FFB then the management has to decide from which plantations would be appropriate to buy such that to meet the production capacity of the milling industry. We develop a mixed binary linear programming model to formulate the planning problem. A direct approach is proposed for solving the model.

An Integer Programming Model For Sustainable Multi-Product Fish Production Planning Problem

Firmansyah¹, Herman Mawengkang², Sutarman²

¹Universitas Muslim Nusantara Alwasliyah, Medan, Sumatera Utara, ²Department of Mathematics, University of Sumatera Utara,

ABSTRACT

Production planning of multi product can be regarded as one of the fundamental aspects in manufacturing system. In terms of fish processed products the production planning produces simultaneously multi fish products from several types of raw fish resources. The objective of the planning problem is to fulfil production and sourcing decisions such that to meet customer demand considering production capacity, workforce availability and inventory restrictions. This paper addresses the management of fish manufacturing which performs processing fish into several seafood products. A mixed integer programming model is proposed to model the problem. We propose a Direct search approach based on activity constraints strategy to solve the model. A real world problem as a computational experience from North Sumatra province is presented.

Keywords: *Integer Programming, Production planning, Uncertainty, Modeling, Uncertainty*

INTRODUCTION

The objective of a production planning problem is to fulfil customer demands based on production and sourcing decisions so as to maximize profit or to minimize operation costs subject to production capacity, raw material flow, and inventory restrictions. Therefore the problem is inherently an optimization problem.

In terms of the parameter of the mathematical models, the optimization of production planning can be classified into: deterministic models and stochastic models. In deterministic models the parameters or the data are assumed to be known. Whenever the parameters are uncertain then we have stochastic models. Typically the uncertainty can be overcome by using “best guesses” of uncertain values. However, these deterministic models would end up solving “mean-value” or “worst-case” problems. The solution to such “worst-case” or “mean-value” problems are often inadequate—large error bounds arise¹. Neglecting uncertainty, the deterministic production planning problem models, though widely studied in the literature, are less acceptable and deployed in practice.

This paper considers production planning problem which arises in marine fisheries industry in Indonesia. Marine fisheries also take part as an important element

in the economic development of Indonesia. This industry could also provide benefit to people who live at the surrounding areas, to increase the financial gain of local government, and to maintain sustainability. Fisheries industrial sector can be categorized into three different parts, i.e., open sea fishing, fish cultivation and processed fish. This paper is focusing on the latter sector.

The proposed model explicitly includes uncertain parameters. Most of the references of optimization problems which contain uncertain parameter come under the heading of stochastic programming. See²⁻⁴ for a good description of the basics. The appropriate structure for our fish problem is a two-stage stochastic program with recourse. In such models, generally the objective function value is assigned to minimizing expected costs or to maximizing expected benefits (linear or nonlinear), although the function value can also refer to the expected value of the quadratic deviations of certain specific targets or the variance of the second-stage recourse function. There are two kinds of decision variables involve. Those determined at the first-stage, called here-and-now decision variables, in which the random variables are still unknown; in this paper, they correspond to the production cost and workforce of the first period. Those determined at the second-stage,

called recourse decision variables, in which the random variables have been realized. These variables represent reactive decisions made to response to the uncertainty factor. See also⁵⁻⁷ for deeper explanation.

This paper is organized as follows. In Section two we review briefly the two-stage recourse model. Section three describes the problem background. The stochastic programming model of the problem is in Section four. Section five presents the solution basic approach.

$$\min c_x^T x + \sum_{s=1}^S p_s (q^T y^s) \tag{1}$$

$$s.t. Ax = b \tag{2}$$

$$T^s x + W y^s = h^s \quad s = 1, \dots, S \tag{3}$$

$$x, y^s \geq 0 \quad s = 1, \dots, S \tag{4}$$

Eq. (2) represent the first-stage and Eq. (3) represent the second-stage. x is the vector of first-stage decision variables which is scenario-independent. The optimal value of x is not conditional on the realization of the uncertain parameters. c_x is the vector of cost coefficient at the first-stage. A is the first-stage coefficient matrix and b is the corresponding right-hand-side vector. y is the vector of second-stage (recourse) decision variables. q is the vector of cost (recourse) coefficient matrix and h^s is the corresponding right-hand-side vector and T^s is the matrix that ties the two stages together where $s \in \Omega$ represents scenarios in future and p_s is the probability that scenario s occurs. In the second-stage model, the random constraint defined in (3), $h^s - T^s x$, is the goal constraint: violations of this are allowed, but the associated penalty cost, $q^T y$, will influence the choice of x . $q^T y$ is the recourse penalty cost or second-stage value function and $\sum_{s=1}^S p_s (q^T y^s)$ denotes the expected value of recourse penalty cost (second-stage value function).

Problem Background

In Indonesia, the fish processed industries can be found mostly at the coastal area, therefore it is not surprising that the production system is carried out in traditional manner. In this paper, we consider the production plan produced by the community at the coastal area for eight kinds of products. As mentioned in²², production planning can be defined as to plan raw materials (in this case several species of fish) and

Computational results and conclusions, respectively, in Section six and seven.

Framework of Two-Stage Recourse Model

In the following, the framework of two-stage stochastic integer programming model is briefly described. For detail, the reader is referred to²¹. The mathematical expression of the stochastic linear programming model can be written as follows.

production resources in such a way to transform the raw materials into fish processed results. The plan is necessarily to meet customer demand in a very economic way (i.e. to minimize cost), and also to preserve environment. The industry run by the community of that area wish to generate a production plan for these eight fish products to fulfil market demand within each period of time $t, t = 1, \dots, T$.

This paper does not put focus merely on classic production plan but also considers environmental factor in the production problem. A production planning problem which imposes environmental aspects beside the economic and social aspects can be called as a sustainable product²³. This is the case where we should minimize waste due to processing fish raw material.

Decision variables and parameters used are defined as follows.

Sets

T = number of periods

N = set of fish products

M = set of raw fish

S = set of scenarios

Variables

1. X_{jt} : Quantity of fish to be produced $j \in N$ in period $t \in T$ (ton)
2. u_{it} : Additional amount of raw fish $i \in M$ to purchase in $t \in T$ (unit)
3. k_t : Number of workers required in period $t \in T$ (man-period)
4. k_t^- : Number of workers laid-off in period $t \in T$ (man-period)
5. k_t^+ : Number of additional workers in period $t \in T$ (man-period)
6. I_{jt} : Quantity of product $j \in N$ to be stored in period $t \in T$ (units)
7. B_{jt} : Under-fulfilment of product $j \in N$ in period $t \in T$ (units)
8. w_{jt}^p : Quantity of waste of fish product $j \in N$ in period $t \in T$ (units)

Parameters

1. $\alpha, \beta, \gamma, \delta, \mu, \rho, \lambda, \eta$ are all costs
2. D_{jt} : Demand for product $j \in N$ in period $t \in T$ (units)
3. U_{jt} : Upper bound on u_{jt}
4. r_{ij} : Amount of resource $i \in M$ needed to produce one unit of product $j \in N$
5. f_{it} : Amount of resource $i \in M$ available at time $t \in T$ (units)
6. a_j : Number of worker needed to produce one unit of product $j \in N$

The Stochastic Programming Model

Minimize

$$\begin{aligned} & \sum_{j \in N} \sum_{t \in T} \alpha_{jt} x_{jt} + \sum_{i \in M} \sum_{t \in T} \beta_{it} u_{it} + \sum_{t \in T} \mu_t k_t + \sum_{t \in T} \gamma_t k_t^- + \sum_{t \in T} \delta_t k_t^+ \\ & + \sum_{j \in N} \sum_{t \in T} \eta_{jt} w_{jt}^p + \sum_{s \in S} p_s \sum_{j \in N} \sum_{t \in T} \rho_{jt}^s I_{jt}^s + \sum_{s \in S} p_s \sum_{j \in N} \sum_{t \in T} \lambda_{jt}^s B_{jt}^s \\ & + \sum_{s \in S} p_s \left\{ \sum_{j \in N} \sum_{t \in T} \left(\rho_{jt}^{s'} I_{jt}^{s'} \right)^2 \right\} + \sum_{s \in S} p_s \left\{ \sum_{j \in N} \sum_{t \in T} \left(\lambda_{jt}^s B_{jt}^s - \sum_{s' \in S} \lambda_{jt}^{s'} B_{jt}^{s'} \right)^2 \right\} \end{aligned} \tag{5}$$

Subject to

$$\sum_{j \in N} r_{ji} x_{jt} \leq f_{it} + u_{it} \quad \forall i \in M, \forall t \in T \tag{6}$$

$$u_{it} \leq U_{it} \quad \forall i \in M, \forall t \in T \tag{7}$$

$$\sum_{j \in N} a_j x_{jt} \leq k_t \quad \forall t \in T \tag{8}$$

$$0.10x_{jt} \leq w_{jt}^p \leq 0.20x_{jt}, \quad \forall j \in N, \forall t \in T \tag{9}$$

$$\sum_{j \in N} \sum_{t \in T} w_{jt}^p \leq C^p \tag{10}$$

$$\varepsilon_1 \leq \frac{\sum_{s \in S} P_s \sum_{j \in N} \sum_{t \in T} I_{jt}^S - \sum_{s' \in S} P_{s'} \sum_{j \in N} \sum_{t \in T} I_{jt}^{S'}}{\sum_{s \in S} P_s \sum_{j \in N} \sum_{t \in T} I_{jt}^S} \leq \varepsilon_2 \tag{11}$$

$$\varepsilon_3 \leq \frac{\sum_{s \in S} P_s \sum_{j \in N} \sum_{t \in T} B_{jt}^S - \sum_{s' \in S} P_{s'} \sum_{j \in N} \sum_{t \in T} B_{jt}^{S'}}{\sum_{s \in S} P_s \sum_{j \in N} \sum_{t \in T} I_{jt}^S} \leq \varepsilon_4 \tag{12}$$

$$k_t = k_{t-1} + k_t^+ - k_t^- \quad t = 2, \dots, T \tag{13}$$

$$x_{jt} + B_{jt-1}^S + I_{jt}^S - B_{jt}^S = D_{jt}^S \quad \forall j \in N, \forall t \in T, \forall s \in S \tag{14}$$

$$x_{jt}, u_{it}, k_t, k_t^-, k_t^+, I_{jt}^S, B_{jt}^S \geq 0 \quad \forall j \in N, \forall i \in M, \forall t \in T, \forall s \in S \tag{15}$$

The demand for each period is uncertain. Under the random demand in each period we should decide the number of each product to be stored in inventory or to fulfil the under fulfilment for each period.

All of these decisions can be found in expression (5) of the model as an objective function. Constraint (6) presents the amount of resource $i \in M$ needed to produce product $j \in N$ at least should have the same amount of resources available at time $t \in T$ together with the additional resource needed. However, the additional resource needs to have an upper bound (Expression (7)). In constraint (8), we have the number of workers needed to produce one unit product $j \in N$. The amount of fish waste should be between 10%-20% can be found in (9). Constraint (10) expresses that the process of fish waste should be width in the capacity C^p . Ranges for the variability can be found in constraints (11) and (12). Constraint (13) ensures that the available workers in any period equal the number of worker from the previous period plus any change in the number of worker level during the current period. The change in the number of worker level may be due to either adding extra workers or laying-off redundant workers. Constraint (14) determines either the quantity of product to be stored in inventory or to purchase from outside to fulfil the shortfall in meeting market demand.

Model formulated in expression (5) through to (15) is in deterministic equivalent form, due to the fact that, the random variables form has been replaced by scenario and in the objective function of these random terms have been pre multiplied by the corresponding probabilities p_s . The method for transforming a stochastic programming model to its deterministic equivalent model was addressed in^{6,16}.

The Algorithm

The algorithm for solving the model consists of two cycles.

Cycle 1.

After solving the relaxed problem, the procedure for searching a suboptimal but integer-feasible solution from an optimal continuous solution can be described as follows.

Step 1. Get row i^* the smallest integer infeasibility, such that

$$\delta_{i^*} = \min\{f_i, 1 - f_i\}$$

(this is to minimize the deterioration of the value of the optimal continuous result)

Step 2. Calculate

$$v_{i^*}^T = e_{i^*}^T B^{-1}$$

this is a pricing operation

Step 3. For step length

$$\text{Calculate } \sigma_{ij} = v_{i^*}^T a_j$$

$$\text{With } j \text{ corresponds to } \min_j \left\{ \left\lfloor \frac{d_j}{\sigma_{ij}} \right\rfloor \right\}$$

I. For nonbasic j at lower bound

If $\sigma_{ij} < 0$ and $\delta_{i^*} = f_i$ calculate $\Delta = \frac{(1 - \delta_{i^*})}{-\sigma_{ij}}$

If $\sigma_{ij} > 0$ and $\delta_{i^*} = 1 - f_i$ calculate $\Delta = \frac{(1 - \delta_{i^*})}{\sigma_{ij}}$

If $\sigma_{ij} < 0$ and $\delta_{i^*} = 1 - f_i$ calculate $\Delta = \frac{\delta_{i^*}}{-\sigma_{ij}}$

If $\sigma_{ij} > 0$ and $\delta_{i^*} = f_i$ calculate $\Delta = \frac{\delta_{i^*}}{\sigma_{ij}}$

II. For nonbasic j at upper bound

If $\sigma_{ij} < 0$ and $\delta_{i^*} = 1 - f_i$ calculate $\Delta = \frac{(1 - \delta_{i^*})}{-\sigma_{ij}}$

If $\sigma_{ij} > 0$ and $\delta_{i^*} = f_i$ calculate $\Delta = \frac{(1 - \delta_{i^*})}{\sigma_{ij}}$

If $\sigma_{ij} > 0$ and $\delta_{i^*} = 1 - f_i$ calculate $\Delta = \frac{\delta_{i^*}}{\sigma_{ij}}$

If $\sigma_{ij} < 0$ and $\delta_{i^*} = f_i$ calculate $\Delta = \frac{\delta_{i^*}}{-\sigma_{ij}}$

Otherwise go to next non-integer nonbasic or superbasic j (if available). Eventually the column j^* is to be increased from LB or decreased from UB. If none go to next i^* .

Step 4. Calculate

$$\alpha_{j^*} = B^{-1} a_{j^*}$$

i.e. solve $B\alpha_{j^*} = a_{j^*}$ for α_{j^*}

Step 5. Ratio test used to maintain feasibility; there would be three possibilities for the basic variables in order to stay feasible due to the releasing of nonbasic j^* from its bounds.

If j^* lower bound

Let

$$A = \min_{i^* \neq i^* | \alpha_{ij^*} > 0} \left\{ \frac{x_{B_{i^*}} - l_{i^*}}{\alpha_{ij^*}} \right\}$$

$$B = \min_{i^* \neq i^* | \alpha_{ij^*} < 0} \left\{ \frac{u_{i^*} - x_{B_{i^*}}}{-\alpha_{ij^*}} \right\}$$

$$C = \Delta$$

the maximum movement of j^* depends on:

$$\theta^* = \min(A, B, C)$$

If j^* upper bound

Let

$$A' = \min_{i' \neq i^* | \alpha_{ij^*} < 0} \left\{ \frac{x_{B_{i'}} - l_{i'}}{\alpha_{ij^*}} \right\}$$

$$B' = \min_{i' \neq i^* | \alpha_{ij^*} > 0} \left\{ \frac{u_{i'} - x_{B_{i'}}}{-\alpha_{ij^*}} \right\}$$

$$C' = \Delta$$

the maximum movement of j^* depends on:

$$\theta^* = \min(A', B', C')$$

Step 6. Exchanging basis for the three possibilities

1. If A or A'
 1. $x_{B_{i'}}$ becomes nonbasic at lower bound $l_{i'}$,
 2. x_{j^*} becomes basic (replaces $x_{B_{i'}}$)
 3. x_{i^*} stays basic (non-integer)
 2. If B or B'
 1. $x_{B_{i'}}$ becomes nonbasic at upper bound $u_{i'}$,
 2. x_{j^*} becomes basic (replaces $x_{B_{i'}}$)
 3. x_{i^*} stays basic (non-integer)
 3. If C or C'
 1. x_{j^*} becomes basic (replaces x_{i^*})
 2. x_{i^*} becomes superbasic at integer-valued
- repeat from step 1.

CYCLE2, pass1: adjust integer-infeasible superbasics by fractional steps to reach complete integer-feasibility.

CYCLE2, pass2: adjust integer feasible superbasics.

This phase aims to conduct a highly-localized neighbourhood search.

Computational Result

The planning horizon covers for every three months, i.e. $T = \{1, 2, 3, 4\}$. After we had a survey to the location, then we found out that the market situation for the 8 fish processed products could come out within three possible situation i.e., good, fair and poor, with associated probabilities of 0.30, 0.50 and 0.20 respectively. Nevertheless, the method addressed in17 could be used in order to get an efficient number of scenarios. The data of the problem can be found in24.

Table 1. The Number of Each Product to be Produced (ton)

Product	Period			
	1	2	3	4
1	250	250	250	300
2	900	900	900	950
3	200	200	200	300
4	200	200	200	300
5	200	200	200	300

7	200	200	200	300
8	200	200	200	300

Table 2. Additional Resources to be used (ton)

Resources	Period			
	1	2	3	4
Machine 1	12.20	12.20	12.20	16.95
Machine 2	9.80	9.80	9.70	13.80
Machine 3	8.65	8.75	8.65	12.55

Table 3. Workforce Plan

Policy	Period			
	1	2	3	4
Reg. workforce	38	35	35	47
Add. workforce	35	0	0	12
Lay off	0	0	0	0

Table 1, Table 2, and Table 3 representing the computational result describes the quantity of each product to be produced, additional resources needed, and the plan for workforce, respectively.

CONCLUSIONS

In this paper, a two-stage stochastic programming model is presented for solving a sustainable production planning problem of a fish processed industry. The uncertainty turned up from the demand.. The model involves to decide the number of worker which is very important for the local government in order they could recruit a number of local people. The other important thing is to conserve sustainability. We address a direct algorithm for solving the mixed integer stochastic programming problem.

ABSTRACT

In this study, phenanthrene-degrading bacteria was successfully isolated from hydrocarbon contaminated soil. The bacteria were identified based on their morphological, biochemical activities and molecular identification using 16S rRNA. The phenanthrene – degrading capabilities was cultivated in an enrichment culture containing phenanthrene as a sole source of carbon and energy. The phenanthrene degradation was analysed using Gas Chromatography-Flame Ionization Detector (GC-FID) and the result obtained indicated that the *Bacillus* sp. P4a was capable of degrading to about 83.01% in the enrichment culture. The *Bacillus* sp. P4a has been shown to degrade phenanthrene via salicylate pathway which produced salicylic acid and catechol compound after 14 and 28 days of incubation. The result revealed that this bacterial isolate can be highly recommended for bioremediation of hydrocarbon contaminants due to their capability to degrade phenanthrene.

Keywords: *Phenanthrene, Bacillus sp. P4a, Biodegradation, Bioremediation, Contaminated soil*

INTRODUCTION

In recent decades, the contamination of soil by pollutant such as polycyclic aromatic hydrocarbon (PAH) has caused serious concerns. To begin with there are several facts about PAH that need to be acknowledged. First, PAHs have a widespread occurrence in various ecosystems which enable them to persist for a long time in the environment¹. Second, due to its toxic, mutagenic and carcinogenic properties, prolonged exposure to a high concentration of PAHs can cause acute and chronic health problems². Thus, bioremediation is a technique created to remediate the PAH contamination to reduce the negative impacts of the PAH. It is widely used to remove PAHs from the environment since it is cost effective and environmentally friendly compared to other conventional methods. This technique involves the conversion of toxic chemical substances to less harmful substances by biological means such as a microorganism. Microorganisms such as bacteria and fungi are widely used in this approach due to their ability to degrade pollutants³.

The inoculations of potential microorganism are widely used in the bioremediation of a contaminated

site. Usually, the indigenous microorganisms are important keys and are responsible for the success in bioremediation study. The diversity of phenanthrene-degrading bacteria commonly associated with the PAH content at the contaminated site⁴ is important since it can be utilized using various types of bacteria and can be used as a sole carbon source. The objective of the present study was to determine the biodegradation capability of the bacterial isolate using a shake flask system. The widely used shake flask system in this study is due to the low cost and simple handling method. It is also to determine the involvement of intermediates during the phenanthrene degradation process in the liquid system. Searching for bacteria that can degrade PAH effectively is of great importance for bioremediation purposes.

MATERIAL AND METHOD

Sample Collection

The soil samples obtained near a palm oil mill factory were collected using clean stainless steel spatula and stored in sterile plastic bags before being transferred to the laboratory. The samples were stored at 4°C before analysis.

Enrichment and Isolation of Phenanthrene-degrading bacteria

The phenanthrene-degrading bacteria were enriched in flasks containing 150 ml of Minimal Salt Medium (MSM), 15 g of soil sample and 5 ml of phenanthrene (330 mg/l). The MSM contained (g/L): 1.0 g $(\text{NH}_4)_2\text{SO}_4$, 0.1 g $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$, 0.8 g K_2HPO_4 , 0.2g KH_2PO_4 , 0.012g $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$, 0.003 g $\text{MnSO}_4 \cdot 7\text{H}_2\text{O}$, 0.003 g $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$ in 1 Liter of distilled water⁵. The flasks were incubated at 30°C with 150 rpm. Then, 5 ml aliquots were transferred to a new MSM containing 5 ml of phenanthrene. The flasks were shaken for 14 days. Bacteria were isolated by the serial where 0.1 ml from the series of dilution was spread onto the nutrient agar (NA) plates and incubated at 30°C for 48 hours.

Identification of the selected phenanthrene-degrading bacterial isolate

The identification and characterization of selected bacterial isolates were based on macroscopic and microscopic observations. The morphology of the bacterial isolates was observed using the Gram staining technique. The physiological characterization of the bacteria was performed using standard biochemical tests of the BBL Crystal Identification Kit⁶. The bacterial isolates were further characterized at the molecular level of DNA sequencing analysis of 16S rRNA.

Phenanthrene degradation analysis by locally isolated bacteria

The analysis of phenanthrene concentration in the culture medium was conducted at the regular interval every 4 days. Duplicated bacterial cultures were centrifuged at 5000 rpm for 10 minutes and at 4°C. The layer of the obtained supernatant was mixed with 100 ml of hexane in 250 ml separation funnel and vigorously shake. There were two layers or phases formed in the separation funnel. The extraction was repeated three times and the hexane phase (top layer) was separated and pooled in a beaker. Then, it was air dried in a fume hood. When the analysis was to be carried out, the samples were then dissolved with an equal volume of hexane (100 ml) and the phenanthrene was quantified by a Clarus 500 Gas Chromatography Flame Ionization Detector (GC-FID).

Preparation and identification of phenanthrene metabolites

An analysis of phenanthrene metabolites⁷ in the culture medium was conducted at Day 0, Day 14 and Day 28 of incubation. The cells were removed by centrifugation at 5000 rpm for 10 minutes and 4°C. The supernatants obtained were membrane-filtered using Whatman No.1 filter paper. The filtered supernatant was acidified to pH 2 with 2M HCl. Then the supernatant were extracted with three volumes of 100 ml ethyl acetate. The organic extracts were pooled and concentrated to 10 ml using rotavapour unit (Buchi, Germany). The extracts were air dried and stored at room temperature until further analysis. The residue was then dissolved in 1 ml of methanol and analysed using Gas Chromatography-Mass Spectrometry (GC-MS Agilent 6890N/59731).

RESULTS AND DISCUSSION

Identification of phenanthrene-degrading bacteria

The morphology of the potential phenanthrene-degrading bacterial was observed using the Gram staining method. It was shown that the Isolate P4a is Gram-positive rod-shaped bacteria. It was produced a white colony possessed a dry surface, a filamentous form of the colony, flat elevation and filiform margin. The identification that based on a biochemical test and BBL Crystal Identification Kit showed that Isolate P4a was preliminarily identified as *Bacillus* sp. The molecular approach such as 16S rRNA gene analysis of Isolate P4a was carried out using genomic extraction, PCR and sequencing. The DNA sequences of the whole insert of Isolate P4a was 1498-1512 bp of the nucleotide sequence, obtained from the sequencing of 16S rDNA fragment. The sequences obtained were used for the similarity search against Gen Bank database at NCBI using the BLAST program (<http://blast.ncbi.nlm.nih.gov/Blast.cgi>). The sequence showed 99% of the *Bacillus* sp. N30 identity (Accession no. GU086432), respectively. *Bacillus* sp. was the most widely reported phenanthrene degraders isolated from the environment^{8,9 & 10} also reported that *Bacillus* degrading phenanthrene was identified using 16 S rRNA sequences with 99% similarity to *Bacillus pumilus*.

Degradation activity of phenanthrene by *Bacillus* sp. P4a

Phenanthrene degradation by *Bacillus* sp. P4a and its bacterial cell count are shown in Figure 1a. There is a decrease in the phenanthrene concentration from 290.39 mg/L on 0 day to 49.34 mg/L on the 28th day of cultivation. There was about 83.00% of phenanthrene degradation throughout the 28 days incubation. The degradation was analyzed using GC-FID to measure the decrease in the peak area of phenanthrene. Concomitant phenanthrene degradation with the growth of bacteria can be observed (Figure 1a). The bacteria count increases from Log CFU/ml 4.10 at day 0 to Log CFU/ml 5.67 after 8 days of cultivation. Referring to Figure 1a, it shows that the bacteria grow in the log phases on the first day of cultivation up to 8 days after inoculation. This condition suggests that the bacteria have been previously exposed to PAH particularly during the isolation and screening processes. These bacteria have been able to adapt to the medium containing phenanthrene. Once the bacteria have adapted to the new medium, they begin to reproduce and multiply their numbers for each increment of time. However, the bacterial growth steady has shown a decrease from Log CFU/mL 5.67 at day 8 to Log CFU/mL 3.27 at day 28 of cultivation¹¹. where the bacterial reproduction and growth regularly reduced because the carbon and nutrient sources have been used by the bacteria in the cultivation medium. By the end of the cultivation period, the bacterial growth entered the final growth phase which nutrients have been depleted and cell number decreases. The phenanthrene degradation activity is different from one species to another.¹², *Bacillus* sp. could utilize various PAH such as phenanthrene as a sole source of carbon.

Fig. 1: Profile of *Bacillus* sp. P4a growth (1) Profile of viable cell count and phenanthrene concentration (mg/L) in flask system containing *Bacillus* sp. P4a (2) Profile Control 1 and Control 2 of phenanthrene concentration (mg/L) and viable cell count in flask system containing *Bacillus* sp. P4a (3) pH value of the *Bacillus* sp. P4a during incubation time in flask system Log CFU/mL and phenanthrene concentration error bars indicate means with standard error of three replicates.

According to Doddamani and Ninnekar (2000)¹³ and Feng *et al.* (2012)¹⁴, that *Bacillus* sp. produced

1-hydroxy-2-naphthoic acid during the phenanthrene degradation processes. Therefore, during this period, the pH was measured. It was found to have decreased from 7.20 to 6.31 (Figure 3). Thus, the decreasing pH may be caused by the production of acid substances created by the bacteria which may alter the pH of the medium.

Two controls have been set up which consisted of Control 1 and Control 2. Control 1 was designated as C1 and contained MSM and phenanthrene only without the addition of bacteria. While for C2, it was designated as C2 which contained MSM and bacterial inoculums only, without the spiking of phenanthrene in the medium. Both of these acted as controls to show that the degradation activity was actually performed by the bacterial inoculums. The results in Figure 1b show no decrease of phenanthrene concentration observed in the control. This condition may support the fact that the disappearance of phenanthrene in the culture can be attributed to bacterial degradation. It is also observed that the bacterial growth has decreased on the 28th day of cultivation because of the loss of bacterial metabolic activity due to the lack of nutrient is phenanthrene supplied to the medium. This happened because the bacteria have utilized all the phenanthrene present in the medium for their energy source. During the cultivation period, the pH was observed to have decreased from 7.20 to 6.31 (Figure 1c). the degradation of the phenanthrene produced 1-hydroxy-2-naphthoic acid could affect the pH in the medium¹⁵.

Metabolites production in phenanthrene degradation by *Bacillus* sp. P4a

There are a few reports on the ability of *Bacillus* sp. to degrade phenanthrene^{13,16 & 17}). In the present study, there were three metabolites identified by GC-MS from the organic extracts of *Bacillus* sp. The P4a culture containing phenanthrene was incubated at Day 0, Day 14 and Day 28 (Table 1). The metabolites obtained correspond with 1-naphthalenecarboxylic acid, salicylic acid and catechol, respectively (Figure 2).

Table 1: GC-MS data for metabolites of phenanthrene obtained from organic extract of *Bacillus* sp. P4a culture

Incubation (Day)	Metabolites	Retention time (min)	m/z of fragment ions % Relative Intensity	Possible structure
0	A	10.7	184 (16, M ⁺), 155 (100, 140 (4), 127 (70), 113 (3), 101 (6), 87 (5), 77 (12), 63 (19), 51 (11), 27 (2)	1-Napthalene carboxylic acid
14	B	9.73	138 (17,M ⁺), 121 (100), 109 (2), 93 (23), 81 (3), 65 (25), 53 (5), 39 (82), 27 (2)	Salicylic acid
28	C	8.95	126 (2, M ⁺), 124 (100), 107 (12), 95 (7), 78 (48), 62 (7), 51 (19), 39 (18), 27 (5)	Catechol

Fig. 2: Mass spectral profiles of phenanthrene metabolites produced by *Bacillus* sp. P4a, (A) 1-Naphthalenecarboxylic acid (B) salicylic acid and (C) catechol.

CONCLUSION

Bacillus sp. P4a showed the capability in degrading phenanthrene which was 83.01% at 28 days of incubation. It has been shown to degrade phenanthrene via salicylate pathway which produced salicylic acid and catechol compound after 14 and 28 days of incubation. Thus *Bacillus* sp. P4a gave a great potential to be applied in bioremediation of environments polluted by phenanthrene. These potential bacterial culture can be highly recommended for bioremediation of hydrocarbon contaminants due to their capability to degrade phenanthrene.

Work Place Happiness: A Tool for Teacher Effectiveness

Cheki Gyeltshen¹, Nimisha Beri²

¹Student, M.A Leadership and Management, School of Education, Lovely Professional University,

²Associate Professor, School of Education, Lovely Professional University, Phagwara, Nimisha

ABSTRACT

Happiness at work place can be spelt as “spirit at work”. Spirit at work refers to teachers experience about their work and their feeling associated to the work with great meaning in a positive way. The individual’s happiness may comprise of engagement of work and job satisfaction in the school. Workplace happiness considers very crucial at various segments both for teachers and the institutions. Happiness has a domino effect on the productivity of an institution and for individual teacher’s well-being. The productivity means impacting on teacher satisfaction and commitment as a result failing to the fulfillment of the goals of an organization. The well-being covers the following aspects “physical, emotional, social and mental”. The past reviews in psychology found that, workplace happiness increases the attention of teachers exhibiting positive moods, emotions, positive values and attitudes. Subsequently, some of the factors influencing workplace happiness are depending on individuals’ needs, interests, hopes, personalities and expectations. Today, even all academicians and practitioners are fond of focusing the workplace happiness as their main subject. Thus, the present paper reviews about the definition, causes and end-results of teachers’ happiness at work place from the past literature views.

Keywords: *Workplace Happiness, Job satisfaction, work engagement, well-being, spirit at work.*

INTRODUCTION

It is very important to live happily as it is regarded the most fundamental aim in most of the societies¹. Diener and Diener² stated that the happiness is important to humans as it appears in emotions but most of the people are mostly not as much happy as they wish to be. The happiness has captivated the devotion of thinkers since the history has begun³ and it has come to the face of psychologists for investigation recently. However, the positive psychological thoughts raised in the previous era⁴ has given legitimized care to the happiness and other beneficial situations as contrast to the formerly leading disease model which focused courtesy unduly to health-related diseases; such as, depression, stress, illness and other similar adverse consequences and experiences.

The word ‘Happiness’ is a wider concept that comprises of a huge number of paradigms which range from temporary dispositions and sentiments to fairly constant attitudes and possessing firm individual characters at the individual level. Perhaps, happiness isn’t just an incentive, it is a need for the smooth functioning at workplace. Happiness can be well-

defined as the occurrence of regular constructive affect, seldom adverse effect and having satisfaction with one’s life⁵. Happiness shall be influenced either by short lasting actions or long-lasting circumstances in the work at work place. Moreover, this is being influenced by many constant qualities such as personality, needs, expectations, hopes, likes and interests.

WORKPLACE HAPPINESS

The happiness at workplace means it is the individual’s belief that the work performs fruitfully, if the work autonomy is provided, and has an effective interaction, providing positive feedbacks, maintaining good relationships, and providing good support from the organization for teachers’ personal development⁶. On the other hand, happiness at work place can be defined as “spirit at work”. Spirit at work refers to workforce experience about their work and their feeling associated to the work with great meaning in a positive way.

Happiness at work place is associated with the attitude and emotions of teachers⁷. The positive attitude of a person will inspire him or her to feel, to act, to think

towards development of resources and fulfillment of the goals⁸ and there are contributory factors to enhance innovativeness, creativity and quality of the work⁹⁻¹³. Investigators found that there is a direct effect between work place happiness and affective commitment¹⁴.

Parker & Martin (2009)¹⁵ conducted study on roles of managing and buoyancy to predict teachers' engagement and happiness in the school. There were 515 samples from 18 different schools in Australia. From their study it was found out that around 90% of the variance was shown at the level of individual and less than 10% was accounted on work place well-being, buoyancy and coping strategies in those schools. Thus, Organizations need to give more focus on coping, buoyancy to build positive attitudes of teachers to fulfill their happiness and engagement in the school.

Song, et al. (2014)¹⁶ conducted study for 1,125 respondents from 38 Korean high schools. Then it was found out that the work place happiness impacts on knowledge sharing among Korean teachers, creativeness, and work performance in the school. Therefore, it is must for the organization concerned to provide necessary supports as to encourage them to become more creative, innovative, and collaborative towards their work as these factors are key to success in an organization.

Siirisunhirun & Dhirathiti (2015)¹⁷ concluded from their studies that the joyful mind and the joyful emotion had a solid association and impact on the engagement of teachers in an organization. Job satisfaction, workloads, commitment, feedbacks had an effect on teachers' affective engagement. However, the result revealed that there is a contradiction to it based on traditional belief in Thai context. According to traditional views the workplace happiness, engagement, job satisfaction was based on the perceptions of teachers in the school.

Buragohain and Hazarika (2015)¹⁸ explored workplace happiness and job satisfaction of 100 secondary school's teachers of Dibrugarh (India). The result of the study revealed that the work place happiness has the relation with the teachers' job satisfaction. The teachers who were happy at work place have shown more satisfaction with their work. Moreover, the positive relationships among teachers of secondary teachers thrived their mindset to live in harmonious settings which ultimately connected with job satisfaction. Thus, job satisfaction of teachers in secondary schools is closely

associated with happiness and it impacts in producing the work quality and bringing overall success in schools.

Proto (2016)¹⁹ studied "Are happy workers more productive". The studies conducted both laboratory and the real world proved that the institutions must give more focus on employees' well-being. Because the happiness of the employees has been shown as a motivating factor for an individual to put in the greater effort on his or her work and boost to increase the productivity of the work. Again, the agency must provide all required facilities to create a happier working environment for the employees and on top of that the managers are to be rewarded based on employees' job satisfaction. The investigator concluded that there should be platforms for the employees to participate in decision making as a result to raise their job satisfaction.

Yusoff, et al. (2016)²⁰ conducted studies on the effect of workplace happiness towards teachers' affective commitment and innovative behavior of teachers in Malaysia for 835 samples. From the study they found that teachers are more creative, innovative and more confident, committed towards their profession when they are happy at their work place.

Arora and Bhagat (2016)²¹ stated that happiness is used to describe the quality of lives or wellbeing. Lacking workplace happiness will increase the absenteeism, low out comes of an organism, and low decision-making capacity. The well-being covers the following aspects "physical, emotional, social and mental".

Abdullah and Ling (2016)²² investigated and found that there is a direct link between teachers' commitment, motivation and the workplace happiness. Thus, the happiness of teachers is being created by the working environment of school principals but subsequently the teachers too need to enhance their self confidence and trust collaboratively beside the school management for creating a conducive atmosphere at workplace.

Abdullah, et al. (2016)²³ investigated on the welfare in the workplace using wellness-performance Model in Malaysian teachers' perspective. The study comprised of 180 samples and concluded that school climate, teachers' contribution, trust, teacher confidence and involvement, contributed to an individual teacher to grow into full potential provided with some sort of rewards and trust.

Abdullah and Ling (2016)²⁴ conducted the study on the work place happiness effects on innovative behavior and affective commitment of secondary teachers in Malaysian schools consisting of 835 samples. The study was conducted to find the effects of the work-place happiness on affective commitment, innovative behavior of the secondary teachers and school culture. From their study they concluded that all these variables have the positive correlation and the workplace happiness has full intervention on the relationships of school culture and innovative behavior of teachers and then it has partial effects on the relationship of affective commitment and school culture. They further suggested that the organization should give especial focus on happiness of teachers in the workplace to endure their commitment

to enhance their creativity, innovativeness and work motives.

Ma and MacMillan (2018)²⁵ in their study on teacher's professional satisfaction with regards to work place conditions which was based on the administration control, teachers competency in teaching and organizational climate on a sample of 2,202 in New Brunswick Elementary School. The study revealed that in the field of professional positions the female teachers were more satisfied than male teachers. Moreover, the work place conditions impact on teacher satisfaction and fulfillment of the goals besides the administration control, organizational culture and teaching competency.

Analysis:

SI #	Author(s) & Year	Country	Findings	Inferences
1	<i>Parker & Martin (2009)</i>	<i>Australia</i>	Found around 90% of the variance was shown at the level of individual and less than 10% was accounted on work place well-being, buoyancy and coping strategies in those schools.	Organizations need to give more focus on coping, buoyancy to build positive attitudes of teachers to fulfill their happiness and engagement in the school.
2	<i>Song, et al. (2014)</i> <i>Abdullah, et al. (2016)</i> <i>Abdullah and Ling (2016)</i> <i>Yusoff, et al. (2016)</i>	<i>Korea</i> <i>Malaysia</i> <i>Malaysia</i> <i>Malaysia</i>	Found out that the work place happiness impacts on knowledge sharing among teachers, creativeness, innovative and work performance in the school.	Organization needs to have concern to provide necessary supports as to encourage them to become more creative, innovative, collaborative towards their work as these factors are key to success in an organization.
3	<i>Siirisunhirun & Dhirathiti (2015)</i>	<i>Thailand</i>	Job satisfaction, workloads, commitment, feedbacks had an effect on teachers' affective engagement.	However, that there is a contradiction to it based on traditional belief in Thai context. According to traditional views the workplace happiness, engagement, job satisfaction was based on the perceptions of teachers in the school.
4	<i>Buragohain and Hazarika (2015)</i> <i>Abdullah and Ling (2016)</i>	<i>India</i> <i>Malaysia</i>	The result of the study revealed that the work place happiness has the relation with the teachers' job satisfaction. The teachers who were happy at work place have shown more satisfaction with their work.	Job satisfaction of teachers in secondary schools is closely associated with happiness and it impacts in producing the work quality and bringing overall success in schools. Therefore, the school management has to maintain positive relationships with teachers.
5	<i>Proto (2016)</i>	<i>Germany</i>	The happiness of the employees has been shown as a motivating factor for an individual to put in the greater effort on work and boost to increase the productivity of the work.	Can be concluded that there should have platforms for the teachersto participate in decision making and schools to provide adequate facilities as a result to raise their workplace happiness.

Cont...

6	Arora and Bhagat (2016)	India	Found lacking workplace happiness will increase the absenteeism, low out comes of an organism, and low decision-making capacity. The well-being covers the following aspects “physical, emotional, social and mental”.	The working conditions must be given a digital focus by the school management. So that, all teachers are physically strong, morally straight, emotionally balance, mentally sound and socially fit to excel happiness in the work place.
7	Ma and MacMillan (2018)	Brunswick	Resultrevealed that in the field of professional positions the female teachers was more satisfied than male teachers.	The work place conditions impact on teacher satisfaction and fulfillment of the goals besides the administration control, organizational culture and teaching competency.

CONCLUSION

As to conclude, there are numerous predictors of workplace happiness such as gender, age, pay, work, marital status, working climate, qualifications and management etc. Teachers are happy when their needs and hopes are achieved. The present study results that all teachers contribute positively for achieving organizational goals through innovative behavior if they are in the state of happy at workplace. Similarly, the participation of teachers’ declines if they are unhappy in the work place. This clearly indicates that the work place happiness has greater force and must be given importance in order to bring typical achievement in the organization through collective innovative ideas.

The Participation of Women in the Village Adat Justice: the Regulations and Its Implementations in North Aceh Regency

Manfarisyah¹, dan Yulia¹

¹Lecturer at Law Faculty of the University of Malikussaleh, Indonesia

ABSTRACT

Adat justice is one of the local wisdom possessed by the people of Aceh. The *adat* justice in Aceh was formed and carried out by *adat* law community to resolve issues between citizens. This research used normative juridical research method for reviewing the rules of regulations about the role of women and the empirical studies to understand the implementations, also to know the factors restricting the role of women in *adat* justice at *gampong*. It can be concluded the role of women in *adat* justice system at *gampong* in North Aceh Regency has not been done properly. In general leaders and community leaders are still reluctant to include women in *gampong* governance structure. Thus the lack of women representative directly related to the implementation of *adat* justice system at *gampong*. There are internal and external factor that inhibiting women participation.

Keywords: *gampong*, *Adat*, *Law*

INTRODUCTION

Adat justice system is one of the indigenous local wisdom which belonged to the people of Aceh. The presence of *adat* justice in Aceh are formed and carried out by *adat* law community. The *adat* justice system, here is the customary judicial in Aceh villages or *gampong*, has been existed before Independence of Indonesia and its existence is recognized in the Constitution and the rule of Act in Indonesia. In Article 1 (3) of the 1945 Constitution unequivocally mentioned that Indonesia is a State of law, means that every citizen has equality in front of law regardless of gender differences, men as well as women. Recognition and respect for *adat* law community described in Article 18B (2) of the 1945 Constitution, namely the State shall recognizes and respects *adat* communities along with their traditional rights as long as they remain in existence and are in accordance to societal development and the principle of unitary state Republic of Indonesia, and shall be regulated by Acts.

Gampong is a small unit of *adat* law community which has territorial boundaries and authority over the local community based on the origin and customs. *Gampong*, equivalent of *desa*, is an administrative village that uniquely to the province of Aceh in the system of governance of the unitary state of Republic

Indonesia¹. Each village may establish an *adat council* in accordance to the origin and customs and traditions¹. The *Adat council* may form *adat* justice system led by *keuchik*. *Adat* justice system is a means to resolve disputes in the community. The process of dispute resolution, such as dispute between citizens, is done by customary practices of consensus decision-making (*musyawarah mufakat*) to reconcile the involved parties². Therefore, the harmony and balance of community life that disturbed can be restored.

The *adat council* has regulated in the regulations: the Act number 11 of 2006 on the Governing of Aceh, Aceh Qanun number 5 of 2003 on the Governance of *Gampong* in the Province of Aceh, as well as North Aceh Regency Qanun number 4 of 2009 on the Governance of *Gampong*. The process of dispute resolution through the *adat council* led by *keuchik*, and assisted by *Tuhapeut* (the council of elders), *imuemmeunasah* (the leader of local *Masjid*), and sekretaris *gampong* (the village clerk) as the clerk of court.

The question in this research is how does the participation of the female characters in the dispute resolution process through *adat* justice at *gampong*, and what are the inhibiting factors on women's participation in the *adat* justice system at *gampong* in North Aceh

Regency.

METHOD

This study was conducted using qualitative research method with normative juridical and empirical jurisdiction approach. Data were analysed descriptively. The data collection includes the study of literature and regulations, namely Act number 11 of 2006 on Aceh Government, Aceh Qanun number 5 of 2003, North Aceh Regency Qanun Number 4 of 2009 on the Governance of Gampong, Qanun Number 9 of 2008 on the Management of *Adat* Life and *Adat Istiadat*, Qanun Number 10 of 2008 concerning *Adat* Council; as well as related Acts and regulations as the primary data³. Secondary data include the analysis of documentation and interviews with the leaders and members of the community and *adat* council who's involved in the implementation of *adat* justice. They are *keuchik*, *tuhapeut*, *imeummeunasah*, the clerk and the community prominent members.

RESULTS AND DISCUSSION

The participation of women in social setting

From the history of the people of Aceh, the involvement of women representatives in various social activities and their leadership have been recognized by both domestic and international. History records how a number of prominent representatives of Acehnese women would struggle in defences of their country which is recognized as national heroes.

Both theoretically and practically, the participation of women in various fields of social life is a reality. Since the ancient times till now Acehnese women had participated not only in domestic affairs but also in public affair. Although for some reason, this condition is rarely found documented or published properly⁴.

From the brief history above can be understood that the involvement of women in the various levels and area of public affairs also in government is not new for people of Aceh. In the present days women participation is especially high in the education field, and there are women who hold positions in government as well as non-government. However, this is still considerably rare cases and it's caused by various factors, such as interests and views of the policy makers. One public position that has no significant progress on the participation of women is the women involvement in the *adat* justice at *gampong*.

Participation of Women in *Adat* Justice

The participation of women in the *Adat* Justice is an important issue. It's a means for equality of rights between men and women which guaranteed by the 1945's Constitution of the Republic of Indonesia and other rules of laws, also as a means to strengthen the existence of *adat* justice. The presence of women rep in *adat* justice will facilitate the process of dispute resolution, particularly in the dispute which one or both parties are women and children.

Beside as members of the panel of *adat* justice, the women representative is a facilitator, mediator or an advisor, so that the handling on the cases experienced by women and children will be safer and easier, and the women would not feel discriminated against⁸.

Some residents of Gampong Paya Punteut who have been in disputes and resolved through *adat* justice said that they were not satisfied and also uncomfortable in expressing their experience to men. They also stated that in the past dispute resolution process there were only male, because there are no female rep in the *adat* justice system at their community. The same stated by a resident of Gampong Cunda who also hope to have women rep in the *adat* justice system at their community, so that the women involved in dispute are more comfortable in communicating with her problems.
