Currently women's participation in *adat* justice in Aceh, especially in the area of this research held, is very alarming. It is hardly found a representative of women who is involved structurally as a member of *tuhapeut* in the village. Stated by Mr. Muntasir, as *keuchik* well as a native of Meunasah Keh in Nibong Sub-district, there are no women included as *tuhapeut gampong* yet. Various administrative villages in North Aceh Regency said to be in similar situation. Stated by Mr. Muzakir A. Talib that some *villages* around him, namely *Gampong Rawalteek*, *Gampong Matang Drien*, and *Gampong Biram*, the existence of women as an element *tuhapeut gampong* also unheard. Similarly, in neighbor city Lhokseumawe it's rarely found to have women involved in *adat* justice. The opportunity for participation of women as judges in *adat* justice will be open, if she is elected and sit as member of *tuhapeut*.

The statements above show the recognition of the rights of women in political also in *adat* institutions that exist in society. The participation of women in various

fields already has a strong legal basis in Aceh and Indonesia.

Factors Inhibiting Participation of Women

Importance of women's participation in the process of settling disputes through *adat* justice system at *gampong*, should be fully supported by all parties. However, its implementation is not easy because it is due to various inhibiting factors which impede the inclusion of women as board members of *adat* justice. Those factors can be divided into two categories:

Internal Factors

Among internal barriers experienced by women in Aceh are the false perception and old mindset that women are incompetent and unfit to be involved in public matters. The presumption became a shackle for women at *gampong* in order to exist not only in the public space but also in *adat* justice system.

Women are not prepared to participate in the dispute resolution process of *adat* justice. Several prominent women stated that they have never been involved whenever legal proceedings of *adat* justice held at their villages, so it never occurred to prepare their self or the next generations to be involved in the assembly of *adat* justice. In general, they do not know that Acts require the representation of women in *tuhapeut* and are a means to participate in the implementation of *adat* justice.

There are no women involved in *tuhapeut* in their community, yet. So most women are not motivated to learn about social studies and dispute resolution that became one of the tasks of *tuhapeut* with *keuchik* and *imeum*.

Various rules of law as mentioned above have been set on the representation of women in political parties, government, as well as in *adat* justice in the provinces. In reality the implementation will require understanding and a genuine desire of all parties, namely the leaders of *gampong*, religious leaders, and the communities in realizing the mandate of the Act. The most important party in this case is the women, they have to prepared in order to truly representation in various fields can help people, especially women. Thus, all parties will recognize the presence of women in the village government and the participation on *adat* justice in the dispute resolution process.

External Factors

In addition to internal factors, there are a number of external factors that are causal interplay with internal factors, as an example, among others:

Mindset of some religious leaders and community leaders who think women logical capability is lower than men, is a quitter and giving up easily. Some assume men have superior ability to think than women, has a firmness and commitment, better physical strength and courage. Another reason said to be women must to obtain permission from the husband to able to join *tuhapeut* and the husband is not necessarily permit. These are hardly have strong basis as women are actively involved in various other social activities in their communities, whether in day or night.

Religious factor is also often used to justify that the woman must not sitting together in a conference room with a man who is not *mahram* which is not good in view of the Islamic religion. But in fact, the chief of village often requires the assistance of women, usually wife of *keuchik* or *Imeum* the women rep from PendidikanKesejahteraanKeluarga (PKK) or other female members. If necessary the women will be called in a meeting or proceedings of *adat* justice, yet they were never formally included in the governance structure of *gampong* or named as one of the *tuhapeut* member as stipulated in *QanunGampong*. The same thing is also found in the Sub-district Nibong that no women were included in the elements of *tuhapeut* and *adat* justice structurally. When women rep is needed to approach to the women or children involved in the dispute, the wife of *keuchik* and the wife of *imeum* or other female will be summoned.

The similar findings also came from western area of North Aceh Regency. TeungkuSyafie, the *Imuem* of West Reuleut, that women are not included in *adat* justice, including in the settlement of disputes about women's issues that involve women / children or male, are all completed by the men. Different statement are delivered by Adnan Hasan some *gampong* has written names of women member of *tuhapeut*, such as *GampongReuletTimu*.

Keuchik Bluka Teba said that the head of village know on the existence of regulations requiring the participation of women in the structure of *tuhapeut*. There are several reasons to have not been involved women in the structure

of *tuhapeut*, such as it is difficult to have women members because their meeting often held at night and women are not proficient in giving opinions, especially in terms of dispute resolution. Beside *tuhapeut*, “women are not often excluded in other important meetings such decision-making meetings related to the development of the village.” AinulMardhiah said.

Based on the above can be explained briefly that the participation of women in *adat* justice has not been done as it should be due to various factors mentioned above. The mindset of religious leaders and community leaders such as the above cannot be justified and does not have a strong foundation, or it can be said is a fallacy. For example, the Prophet Muhammad’s wife Aisha is a teacher and teaches men. Whether in past and present, many female Islamic scholars have women and men disciples. Thus there is no reason for leaders, *adat* leaders and religious leaders for not including women in structure of *tuhapeut* and in the implementation of *adat* justice.

To change those mindset it ought to correct their understanding on the limitations that should and should not be violated by men and women according to Act. Particularly in *adat* justice, the necessary adherence and compliance of *adat* and community leaders is needed to improve the engagement of women rep in the peace building process in present and the upcoming future.

The concluding remarks of Preamble to CEDAW emphasized on the need of changes in traditional roles and participations of men and women in society and in the family to achieve equality⁵. The traditional roles based on the inferiority or superiority of one gender is a man-made, construct of society. Thus, it can be changed also by people who are committed to achieving an equitable and prosperous society. This change of view can only be realized if the stakeholders (legislative, judicial, executive and the entire community) feel obliged to take steps to delete the old mindset and tradition detrimental to participation and position of women in the family and society, towards the fair and prosperous society⁵.

For the balance and benefit for all, there are several matters that must be considered before women actively participate in public spaces. Woman working at home and outside the home as an effort to carry out *the good and prohibiting unjust injunction* that had been ordered in Islam. Therefore, the perspective is used to accept

the participation of women in politics is solely for message *amrumba’rufwabilnahyu ‘anilmunkar*. In a public activity, both women and men should go by the principle of *fastabighulkhairat* (or competing in goodness). This means Islam encourages Muslims to reach the level of knowledge and high skills, so women can contribute better to the people. Every Muslim man should provide the opportunity for his wife to take part *sindakwah* as a Muslim. It said that Prophet Muhammad (PBH) ask men to not prohibit wives who ask for permission to go to the mosque to worship. The participation of women in the public sphere must in balance with household duties as wives, mothers, and educators for their children, so that harmony in the family is maintained. Muslims also should keep *adab* (Islamic manner code) and maintaining *iffah* (pride) as a Muslim to remain noble⁴.

Thus, it is inappropriate when women should be inhibited in doing good for the nation and the country, because women are also part of the citizens who have rights and obligations to the state and nation. As creatures of Allah, the women are also assigned as a *khalifah* on earth. There is no discrimination, because in the end that distinguishes a person with another is their *taqwa* to the Creator of Universe.

CONCLUSION

Based on description above can be concluded that the participation of women in *adat* justice *the village* in the city of Lhokseumawe and North Aceh Regency has not been done properly as mandated by *Qanuns* and Act of Aceh Government. In general, leaders and community leaders are still reluctant to include female characters in the governance structure of *gampong*, so the women rep directly involved in the implementation of *adat* justice system at *gampongis* very little or none. The inhibiting factors are: **internal factors** the level preparedness of women as member of *tuhapeutor* as facilitator in *adat* justice system is little to none; **external factors** that mindset of community leaders, *adat* and religious leaders who brought up the religion as a reason for not including women in *tuhapeut* structure and on the *adat* justice system at *gampong*.

The Influence of Economic Growth Per Capita and the Average Length of Schooling on the Human Development Index in West Java

Andria Zulfa¹ Rita Meutia²

¹Faculty Economy and Business, Universitas, Malikussaleh, ²Lecturer in Accounting Department Universitas, Malikussaleh

ABSTRACT

Although the province of West Java has a relatively high GRDP, it has not fully paid attention to the development of human resources. This is indicated by the low average length of schooling in each district / city. There are still nineteen districts / cities in the province of West Java that have an average length of schooling under 9 years. Both of these, both GRDP and school averages, are assumed to have implications for the HDI. To determine the interrelationship between these variables, a study was conducted in West Java. The study was conducted to determine the effect of per capita GRDP level and school length average number on the Human Development Index. To achieve this goal, an analysis of GRDP and HDI is used with the equations of Egbulonu and Nwokoro. The results $GRDP = -2.825150 + 0.369888AGRO + 0.917197IND + 0.079170MYS$ and $HDI = -101.0269 + 9.76691PDRB + 0.728485MYS$

These results show α of -101.0269, which means that if the independent variable GDP per capita and the average length of school time (MYS) is zero, the dependent variable Human Development Index (HDI) will be negative -101.0269. This means that without the GRDP per capita (community income) and the average length of school in the community, human development will not be possible. Furthermore, the PDRB coefficient is 9.766914, which means that if there is a change in GDP per capita increase of 1% (assuming other variables are constant), the Human Development Index (HDI) figure will increase by 9,766914 index points.

Keywords: human resource development, GRDP, average length of schooling, HDI

INTRODUCTION

Indicators of the success of development in the field of education and health can be seen from the figures of the Human Development Index (HDI). The Human Development Index is a composite index that focuses on three basic dimensions of human development: living a long and healthy life, the ability to study, and the ability to achieve a decent standard of living¹. National HDI is 69.55 while each province ranges from: 57.25-78.99². The highest HDI is the Jakarta Special Capital Region (DKI) province with the lowest and Papua Province, while the West Java province is 69.55. This figure shows the conditions that are still lagging behind because the province has a relatively high Gross Regional Domestic Product (GRDP). The value of GRDP at the

2010 constant price of West Java Province in 2015 was Rp. 25,840,540.00. Since West Java province has the largest population among other provinces in Indonesia, the development of its human resources requires great attention.

One of the problems in the development of human resources in West Java is the low average length of schooling for residents of West Java. During the period of 2004 to 2015 the average length of schooling in West Java was still under 9 years of age, which had not fulfilled the 9-year compulsory education requirement set by the government². Of the 26 districts and cities, only 26.92% or seven districts / cities whose average length of schooling is over 9 years: Cimahi is 10.78 years, Depok is 10.71 years, Bekasi is 10.71 years, Bandung

is 10.52 years, Bogor is 10.20 years old, Cirebon is 9.76 years, and Sukabumi is 9.08 years. Meanwhile, 73.07% or nineteen other districts and cities still have an average length of schooling under 9 years. Therefore, it is assumed that regions with high HDI rates have a high average number of years of schooling. In other words, economic growth is closely related to the development of the quality of human resources in an area.

Economic growth is one indicator of the success of economic development of a country. In general, economic growth is defined as an increase in the ability of the economy to produce goods and services³. Economic growth shows the extent to which economic activity generates additional income in a given period⁴. With economic growth, it is expected that people's income, as owners of factors of production, will increase. Economic growth is defined as an increase in Gross National Product (GNP) which is greater or smaller than the level of population growth and changes in economic structure⁵. Developing a theory of economic growth means giving immaterial weight such as enjoyment, satisfaction, happiness, a sense of security and peace to the community⁶. An economy can be considered as developing if long-term per capita income tends to increase⁷. In other words, economic growth refers more to quantitative changes and can be measured based on data on Gross Domestic Product (GDP) or income, or the final market value of the final goods and services produced from an economy over a period of time. Economic growth in this period can be viewed from the level of community welfare. The level of welfare of the population can be measured by an increase in GDP per capita. The level of welfare of the population will be achieved if the per capita GRDP increases faster than population growth⁸. The purpose of this study was to determine the effect of per capita GRDP level and school length average number on the Human Development Index in West Java.

MATERIALS AND METHOD

The analysis was carried out using regression techniques using the Index of Agricultural Output, the index of the industrial sector production, the interest rate, and the exchange rate level, as the independent variable, and the Real GDP number as the dependent variable⁹. Furthermore, an empirical study of the two-way relationship between human development and regional economic performance in Indonesia is carried

out¹⁰. Based on the two techniques, the following equation is used:

1) To calculate GRDP, the equation is:

$$GRDP_t = \alpha_0 + \alpha_1(AGRO_t) + \alpha_2(IND_t) + \alpha_3(IPM_t) + e_t \dots\dots (1)$$

2) To calculate the HDI, the equation is:

$$HDI_t = \beta_0 + \beta_1(GRDP_t) + \beta_2(MYS_t) + v_t \dots\dots (2)$$

GRDP is regional per capita Gross Regional Domestic Product to year t, IND_t is the Value of Industry Contribution in regional GDP to year to year in Rupiah, AGRO_t is the Value of Agricultural Contribution in regional GDP to year to year in Rupiah, MYS_t is Average the average length of regional school to year t, HDI_t is the Human Development Index area to year t, α_i and β_i are the parameters of regression $i = 1, 2, 3, \dots, n$, e_{it} and v_{it} are errors / confounding variable, whereas $i =$ area i ($i = 1, 2, 3, \dots, 26$) and $t =$ year to t ($t = 2010-2015$). In using equations (1) and (2) the ratio of oil and gas to GRDP is not taken into account, taking into account the contribution of the agricultural sector in GRDP and the value of the contribution of the industrial sector in GRDP. While for the average variable the length of women's school is replaced by the average length of school variables in each district / city in West Java. In the calculation of the HDI, the education level component is measured from two indicators, namely: literacy rate (Lit) and the average length of schooling (Mean Years of Schooling). Literacy rates are the percentage of educators aged 15 years and over who can read and write in Latin letters or other letters. Average length of school, which is the average number of years spent by people aged 15 years and over at all levels of formal education that has been undertaken or is undergoing. This indicator is calculated from the highest education variable that is completed and the level of education being completed and the level of education that is being occupied. The average length of school (MYS) is analyzed using the equation:

$$MYS = \text{highest conversion year} + \text{class ever occupied} - 1 \dots\dots (3)$$

RESULTS AND DISCUSSION

The lowest PDRB value of the regency / city of West Java province tends to have the value of the contribution of the agricultural sector and the value of the contribution of the small industrial sector, shown in Figure 1 below.

Figure 1. Development of GRDP per capita Regency / City in West Java

On the basis of Constant Prices in 2010 (Rupiah)

Based on Figure 1 above the districts/cities that have the highest rate of per capita GRDP are Bekasi District of Rp. 61,149,708.00. If Bekasi Regency is connected with the influence of the value of the industrial sector’s contribution to GDP per capita, Bekasi Regency is proven to be the Regency with the largest contribution of the

industrial sector in the GRDP. While the regencies/cities that have the smallest average GDP per capita figure are Banjar City, which is Rp. 3,565,733. From the figure, it appears that there is an imbalance and inequality in the level of GDP per capita in districts / cities in West Java. Furthermore, the development of the average length of schooling for each district / city in West Java in the period 2010-2015 is shown in Figure 2 below.

Figure 2. Development of the average length of school in the province of West Java

Based on Figure 1 above, it can be seen that out of 26 regencies / cities there were only 6 (23.07%) districts/ cities with an average of 9 years of schooling, namely Cirebon City (9.39 years), Depok City (10.39 years)

, Cimahi City (10.56 years), Bekasi City (10.45%), Bandung City (10.40%), and Bogor Regency (9.74 years). Meanwhile, 20 (76.93%) other districts / cities still have an average length of schooling under 9 years.

Cimahi City is an area that has the highest average school length of 10.56 years and Indramayu Regency is the region with the lowest average school length of 5.19 years. But the average number of years of schooling in districts / cities in West Java Province from 2010 to 2015 has never reached 12 years, this shows that the province of West Java is still left behind in terms of improving the quality of public education.

Description of the variable Value of Agricultural Contribution in GRDP, Value of Industry Contribution in GRDP, Average value for each population aged more than 15 years in formal education, Human Development Index, and economic growth (GDP per capita). The results of the analysis of each variable based on the minimum value, maximum value, mean and standard deviation are shown in Table 1 below.

Table 1. Results of descriptive analysis of each variable

	N	Minimum	Maximum	Mean	Std. Deviation
AGRO	156	32437.00	11197706.63	3484002.07	2966092.055
IND	156	242072.07	161947397.05	17826066.2	31752678.71
PDRB	156	3166183	69895470.78	21126395.2	17363408.02
MYS	156	4.93	10.78	7.7740	1.53229
IPM	156	58.58	79.67	67.8244	5.21767
Valid N (listwise)	156				

Based on Table 1 above, It can be found that the minimum value, maximum value, average and standard deviation of each research variable from 2010 to 2015. Variables in agricultural contribution in GRDP have a minimum value of Rp. 32,437,000,000; maximum value of Rp. 11,197,706,630,000; an average of Rp3,484,002,070,000 and a standard deviation of Rp. 9,966,092,050,000. Variable of industrial contribution in GRDP has a minimum value of Rp242,072,070,000; maximum value of Rp161,947,397,050,000; an average of Rp. 17,826,066,200,000, - and a standard deviation of Rp. 31,752,678,710,000. - The average value variable

for each population over the age of 15 years in taking formal education (years) has a minimum value of 4.93 years; maximum value of 10.78 years; an average of 7.77 years and a standard deviation of 1.53 years. The Human Development Index variable has a minimum value of 58.58; maximum value of 79.67; an average of 67.82 and a standard deviation of 5.22, and the variable of economic growth (GDP per capita) has a minimum value of Rp3,166,183, -; maximum value of Rp69,895,470.78; an average of Rp21,126,395.20 and a standard deviation of Rp. 17,363,408.02. Furthermore, to find out the GRDP in West Java province, equation (1) is used, the results of the analysis are shown in Table 2 below.

Table 2. The results of the analysis of partial influence on GRDP

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-2.825150	1.302437	-2.169127	0.0318
AGRO?	0.369888	0.110378	3.351095	0.0010
IND?	0.917197	0.061589	14.89216	0.0000
MYS?	0.079170	0.023991	3.299994	0.0012

Based on Table 2 above, the panel data regression equation with the Fixed Effect model obtained GRDP as follows:

$$GRDP = -2.825150 + 0.369888 AGRO + 0.917197 IND + 0.079170 MYS$$

Furthermore, the results of the HDI analysis using equation (2) are shown in Table 3 below.

Table 3. The results of the analysis of partial influence on the HDI

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-101.0269	6.348597	-15.91327	0.0000
PDRB?	9.766914	0.482967	20.22274	0.0000
MYS?	0.728485	0.256516	2.839922	0.0052

Based on the data in Table 3, the form of panel data regression equation with the Fixed Effect model is as follows:

$$\text{HDI} = -101.0269 + 9.766914\text{PDRB} + 0.728485\text{MYS}$$

The tcount value of the GDP variable is 20.22274, with p-value of 0.0000 and the direction of its influence is positive, so that it can be concluded that partially the GDP variable has a significant effect on the HDI with a positive direction of influence. Furthermore, the value of t count MYS variable of 2.839922, with a p-value of 0.0052 and the direction of its influence is positive, so it can be concluded that partially the MYS variable has a significant effect on the HDI with a positive direction of influence.

The results of the analysis using equation (2) show α equal to -101.0269. If the independent variable per capita GRDP and Average School Length (MYS) is zero, the dependent variable Human Development Index (HDI) will be negative -101.0269. This means that without the GRDP per capita (community income) and the average length of school in the community, human development will not be possible. PDRB per capita variable and average length of school have a significant effect on the level of HDI. GRDP coefficient is 9.766914 which means that if there is a change in GDP per capita increase of 1% (assuming other variables are constant), then the number of Human Development Index (HDI) will increase by 9,766914 index points. This is consistent with the results of Brata's research (2002) that the increase in GDP per capita will significantly increase the Human Development Index. Furthermore, the MYS coefficient is 0.728485 which means that if there is a change in the

increase in Average School Length (MYS) by 1 year (assuming other variables are constant), then the Human Development Index (HDI) number will increase by 0.728485 index points. This is consistent with the results of the study that the increase in the average length of female schooling by one year will increase the Human Development Index number by 17.9 index points¹⁰. The effect of increasing the average length of schooling for the Human Development Index is greater than the increase in the average length of schooling in general (without gender classification).

CONCLUSION

Based on the results of research and discussion on Causality of Economic Growth and the Human Development Index in West Java for the period 2010 to 2015, the researchers concluded that Economic Growth (GRDP per capita) and Average School Length have positive and significant effects on the Human Development Index in West Java Province in 2010 to 2015. Referring to the results of the study, the West Java regional government needs to guarantee the 12-year compulsory education funding in order to encourage an increase in the average length of school population in the province of West Java.

The Optimal Level of Production Factors to be Applied of Maize Farming at Kuta Makmur District North Aceh Regency

M Benbuleuen

Faculty of Agriculture, Universitas Malikussaleh, Lhokseumawe

ABSTRACT

This research was conducted based on the idea that farmers of maize did not ever orient to apply the production factors at the optimum level on their farm. The research carried out in Kuta Makmur District North Aceh Regency Aceh Province. The purpose of this study was to determine the level of input application and to determine the optimum level of maize production factor to be applied in maize farming in Kuta Makmur District, North Aceh Regency. Cobb Douglas production function for maize that obtained by this research is as follow:

$$Y = 0.3253X_1^{10.263} X_2^{20.261} X_3^{30.229} X_4^{40.103} X_5^{50.196} X_6^{60.002} e^U$$

Where: size of land is X_1 , quantity of seed is X_2 , quantity of Urea is X_3 , quantity of SP-36 is X_4 , quantity of KCl is X_5 , and quantity of labor is X_6 . The effect of those input on the level of maize production simultaneously highly significant, it was showed by the high value of $F_{calculated}$ and R^2 , otherwise the effect of independent variable of inputs partially still significant for X_1 , X_2 and X_3 , but for X_4 , X_5 and X_6 could not affect the level of maize production significantly. All level of inputs application are situated in reasonable region where the increasing of inputs less than 1% due to addition of input addition of input at 1%. Except labor and all the other application of inputs should be increased for the optimal reason. In addition to quantity of labor application specially should be reduced. The following are quantity of input should be applied in the related of optimization reason: Optimal size of land is 7.9 Ha, Seed 48.33 kg/Ha, Urea 402.80 kg/Ha, SP-36 284.60 kg/Ha, labor 39 mandays.

Keywords: *Maize, Feed industry, Livestock*

INTRODUCTION

The highest maize consumption so far is for food and feed industry. Usually maize uptake for industrial needs is an indication of the better level of economic life of the community, so the level of animal protein consumption will also increase. Increased consumption of animal protein ultimately Has a direct impact on the development of the livestock industry, especially poultry farming.

In connection with the above problems, it is necessary to conduct research to determine the level of input application and to determine the optimum combination of its application in smallholder maize farming in Kuta Makmur District, North Aceh Regency.

RESEARCH METHODOLOGY

This research took place from April 2018 to Jun 2018. This research was conducted in Kuta Makmur District, North Aceh Regency. The study was conducted in this area, this area is a center of maize production in North Aceh Regency. In relation to determining the optimum level of fertilizer application. The population in this study was the farmer who planted maize in the November 2017 planting season. Sampling was done in a simple random sampling, by interviewing 93 maize farmers in the study area.'

In order to analyze the level of input applied and the optimum level of input applied, the Cobb Douglass production function is applicationd, namely:

$Y = A X_1 X_2 X_3 X_4 X_5 X_6 \epsilon U$
(Ferguson,1975)

Y = Maize production produced by farmer (ton);

X_1 = Land area (Ha);

X_2 = Number of seed (kg);

X_3 = Number of Urea fertilizer (kg);

X_4 = Number of fertilizer of SP-36 (kg);

X_5 = Number of Kcl (kg);

X_6 = Number of labor (Mandays);

$\beta_1, \beta_2, \dots, \beta_6$ = Coeffisien of input (production elasticity);

e = Logarithm natural ($e = 2,718\dots$)

The model in the above equation is estimated by using the SPSS program (Version 25)

Analysis of level of input application

The level of input application through Cobb Douglass production functions analysis for maize farming in the study area. Analysis of Cobb Douglass production function for maize farming carried out in the study area is based on production data and input application data from farmers in the November 2017 planting season. Variables included in the analysis of this production function are six. The average application of inputs application in this analysis are: land area (X_1) = 1.22 Ha, maize seeds (X_2) = 30.72 kg, Urea fertilizer (X_3) = 247.95 kg, SP-36 fertilizer (X_4) = 153.53 kg, muriate of potash fertilizer (KCl) (X_5) = 88.85 kg, and labor (X_6) = 126.22 mandays. The results of the regression analysis of the maize production function can be seen in Table 1 below.

Table 1. Estimation of Production Function of Cobb Douglass of Maize Farming in the Study Area

Input Variable	Coeffisien (Elasticity)	Standard Error	T _{calculated}	Sig	VIF
NLX1	0.263	0.083	3.166	0.003	9.736
NLX2	0.261	0.134	1.945	0.057	22.727
NLX3	0.229	0.134	1.710	0.094	23.127
NLX4	0.103	0.099	1.042	0.302	14.728
NLX5	0.196	0.123	1.270	0.210	22.75
NLX6	0.002	0.060	0.310	0.975	5.560
Constant = 0.3253					
R ² = 0.96					

- Notes
- *** = Significant at 99%
 - ** = Significant at 95%
 - * = Significant at 90%
 - NS = None Significant.
 - NL = Natural Logaritms

Based on the results of the Cobb Douglass production function above, the Cobb Douglass production function for maize farming in Kuta Makmur Sub-District can be formulated as follows:

$$Y = 0.3253X_1^{0.263} X_2^{0.261} X_3^{0.229} X_4^{0.103} X_5^{0.196} X_6^{0.002} eU^{1,2}$$

In the case of knowing whether the regression analysis of the production functions Has fulfilled the provisions of the good production function model (goodness of fit), it is examined from the significance of F calculated and R2 values. From the results of the analysis presented in Table 2, the calculated F value is 224,611. This F calculated is greater than the value of F table at a 99% confidence level. This means that all the independent variables analyzed (land area, number of seeds, amount of Urea fertilizer, amount of SP-36 fertilizer, amount of KCl fertilizer, and number of workers) together Have a very significant effect on the dependent variable (level of production corn). Besides that, the influence of the variables together on the level

of production can also be assessed from the R² value. From the analysis R² = 0.96 means that the level of corn production can be explained by the variable land area, number of seeds, amount of Urea fertilizer, amount of SP-36 fertilizer, amount of KCl fertilizer and amount of

labor use by 96%. While the other 4% was caused by factors that were not included in the model. From the description above shows that the calculated F value is very real and the R² value is very high, meaning that the production function model used is appropriate³.

Table 2. Analysis of Variants of Production Function of Maize Farming in the Research Area

No.	Source	Sum of Squares	df	Mean Square	F _{calculated}	Significant Level
1	Regression	44.238	6	7.373	224.611	0.0000
2	Residual	1.641	50	0.0328		
3	Total	45.880	56			

In order to test or to detect of classic assumption violation is about the presence or absence of multicollinearity, autocorrelation and heterocedasticity, tests are carried out. In the case of knowing whether there is multicollinearity is by seeing the value of VIF (Variant Inflating Factor). Based on the VIF tabel (Table 1), there is no multicollinearity of the inputs production of land and labor becaapplication the production inputs Have a VIF tabel that is smaller than 10, whereas in other production inputs namely seeds, Urea, SP-36, and KCl there are multicollinearity it has a VIF tabel that is greater than 10.

VIF tables between 1 to 10, indicate the lower the multicollinearity, whereas if the VIF tabel is greater than 10 indicates the value of multicollinearity is increasingly serious.

Table 3. Production Elasticity, Average Production, Marginal Product, Marginal Production Value, Marginal Production Value Ratio with Input Prices

Input Factor (X)	Production Elasticity (PE _x)	Average Product (AP _x)	Marginal Product (MP _x)	Marginal Product Value (MPV _x)	Price of Product (P _y)	MPV _{xi} P _y Ratio
X ₁	0.263	8.30	2.2000	5.500.000	27.000	203.70
X ₂	0.261	0.30	0.0800	200.000	10.000	0.05
X ₃	0.229	0.04	0.0090	22.500	1.200	18.75
X ₄	0.103	0.10	0.0100	25.000	1.700	14.10
X ₅	0.156	0.10	0.0200	50.000	1.700	29.41
X ₆	0.002	0.10	0.0002	500	12.500	0.04

The autocorrelation check was application by using Durbin Watson test, and from the results of the calculations showed that there was no autocorrelation.

In order to test or to detect of heteroscedasticity is application by Park's test by regressing X_i to e_{i2}, where X_i is the independent variable while e_i is an error term. The calculation results show there is no heterocedasticity. In seeing the extent to which the influence of the independent variable (production input application) on the level of production can be interpreted through the value of the elasticity coefficient.

Furthermore, in analyzing the optimization of the application of production inputs is done by entering the unit price of production inputs application (Table 3).¹⁻⁴.

Notes:

AP = Average Product Px4
= Price of SP-36

PM = Marginal Product Px5
= Price of KCl

VMP = Value of Marginal Product
Px6 = Labor rate

Px1 = Land rent

Px2 = Seed price

Px3 = Urea price

Partially the production factor of the land area and the number of seeds application Had a very significant effect on the increase in production respectively at the significant level of 1%, 5%, and 10%, but the production inputs of SP-36, KCl and Labor did not Have real effect

The optimum level of input applied

Furthermore, partially the production inputs that affect the increase in maize production in the study area during the November 2017 planting season are interpreted as follows:

Land Area (X1)

The partial test results on the regression coefficients of the production input show that the value of $t_{calculated}$ is greater than t_{table} at 99% confidence level, which means that the effect is very significant on the increase in maize production.

The elasticity coefficient of the variable is 0.263, meaning that each 1% increase in seed will increase production by 0.263%. In terms of technical efficiency, the application of the body is still at a rational stage. The average production from the production input (PRxi) is 8.3 tons per Ha, thus the marginal production of the production input (PMx1) is 2.2, so every additional 1 Ha will be added an additional production to 2.2 tons.

To determine the level of optimization of the application of production factor of land area, it is compared with the marginal production value (MPVxi) by leasing land (Hxi). From the calculation results obtained $MPVxi = Rp.5,500,000$, while $Hxi = Rp27,000$, then $MPVxi / Hxi = 203.7$, meaning the level of land application was not reached optimum or not efficient so

its application needs to be increased or added. In order for the ratio between $MPVx1$ and $Hx1$ to be equal to 1, the farmer must expand his maize farming land to 7.9 Ha.

Optimal number of seeds must be cultivated by farmers if they want to get maximum profits. This optimal number of seed can still be reduced again by improving cultivation technology.⁵

Seed (X2)

The partial test results on the regression coefficients of variable seeds showed that $t_{calculated}$ was greater than t_{table} at 95% confidence level, which means that the number of seeds application Have a very significant effect on increasing maize production.

The elasticity coefficient of the seed variable is 0.261, meaning that each addition of 1% seed will increase production by 0.261%. In terms of technical efficiency the application of seeds is still in a rational stage. The average production of the seed variable (PRx2) is 0.3 tons per 1 kg of seeds, thus the marginal production of the production input (PMx2) is 0.08 tons, so each addition of 1 kg of seeds will be added an additional production of 0.08 tons.

To determine the optimization level of the application of variable seeds, it is compared with the marginal production value (MPVx2) with the price of the seed (Hx2). From the calculation results obtained $MPVx2 = Rp200,000$, while $Hx2 = Rp10,000$, then $MPVx2 / Hx2 = 20$, meaning the level of seed application was not reached optimum or not efficient so that its application needs to be increased or added. In order for the ratio between $MPVx2$ and $Hx2$ to be equal to 1, the farmer must increase the amount of maize seeds to 402.80 kg of seeds per Ha. optimal seeds must be cultivated by farmers if they want to get maximum profits. This optimal seed rate can still be reduced again by improving cultivation technology⁶.

Urea Fertilizer (X3)

The partial test results on the variable urea regression coefficient shows that $t_{calculated}$ is greater than the T_{tabel} at the 90% confidence level which is used to significantly affect corn production. Production elasticity of the Urea fertilizer production factor is 0.229 which means that each addition of Urea fertilizer production

factor of 1% will increase production by 0.229%, in terms of technical efficiency, the use of Urea fertilizer is in the rational stage (area II). The average production factor for Urea fertilizer production (PRx3) is 0.04 tons per one kg of urea, thus the marginal production (PMx3) is 0.009 tons. Because the price of Urea fertilizer in the November 2017 planting season is Rp. 1,200.00 / kg and the price of corn is Rp. 2,500,000 / ton, then $NPx3 / Hx3 = 18.75$. The steps are in terms of the level of optimization (economic efficiency)

The use of urea fertilizer still needs to be improved because the level of use is still not optimal, so that the ratio between MPVx3 and Hx3 is equal to 1, then farmers must use urea up to 402.80 kg / Ha (Dwiratna N.P,Sophia,2016)

SP-36 Fertilizer (X4)

The reason that can be given why the addition of P Has an unreal effect on increasing corn production is because at a low pH, P will be bound by Al. The production elasticity of the SP-36 fertilizer production factor is 0.103 which means that each additional factor of 1% SP-36 fertilizer production will increase the production of corn by 0.103%. From a technical perspective the use of this production factor is in the rational stage (area II). The average production for SP-36 fertilizer production (PRx4) = 0.01 tons. From the calculation results obtained $MPVx4 / Hx4 = 14.71$. In terms of economic efficiency the use of fertilizers still needs to be improved. In order for the ratio between MPVx4 and Hx4 to be equal to 1, the farmer must use SP-36 fertilizer to 284.60 kg/Ha⁷.

KCI Fertilizer (X5)

The production elasticity of the KCL fertilizer production factor is 0.156 which means that every additional factor of KCI fertilizer production is 1% will increase production by 0.156%. in terms of technical application of this production factor is in the rational stage (area II). The average production for KCI fertilizer (PRx5) is 0.1 tons per kg of KCI fertilizer. Marginal production is 0.02 tons. From the results of the calculation that $MPVx5 / Hx5 = 29.41$. Thus in terms of economic efficiency the application of KCI fertilizer production factors is still not optimal or in other words its application still needs to be improved. In order for the ratio between MPVx5 and Hx5 to be equal to 1, farmers must application KCI fertilizer up to 284.60 kg / Ha.⁷

Labor (X6)

Factor production elasticity of labor production is equal to 0.002, meaning that with the addition of labor application of 1% will increase production by 0.002%. From a technical perspective, the application of this production factor is in the rational stage (area II). The average product due to the application of this production factor (PRx6) is 0.1 tons per HOK, the marginal product (PMx6) is 0.0002 tons. The results of the calculation of $MPVx6 / Hx6 = 0.04$, meaning that the addition of the acceptance value is lower than the value of adding one HOK of labor, in this case it is necessary to reduce the workforce until the optimal level of application is achieved. In order for the ratio between MPVx6 and Hx6 to be equal to 1, the farmer must applied the labor of 38.70 HOK / Ha.

CONCLUSION

In terms of land area, so that farmers can get the maximum profit then he must expand his farm to 7.9 Ha. Thus at the level of existing technology, farmers will achieve maximum profits if he can expand his farm to 7.9 Ha. In the future, the optimal area of land can be even smaller through technological improvements can increase productivity, if there is no increase in factor prices, the optimal land area can also be smaller if there is an increase in the price of the production factor.

Of the five other types of allocation of production factors analyzed: maize seeds, urea fertilizer, SP-36 fertilizer, KCI fertilizer and labor are also at an optimum level. Therefore, the addition of the application of these production factors can be continued until a state is reached the additional marginal production value of each production factor application is the same as the price of the production factor. In this case the seeds to be applied are 48.33 kg / Ha, Urea Fertilizers 402.80 kg / Ha, SP-36 Fertilizers 284.60 kg / Ha, KCI fertilizers 284.60 kg / Ha and labor 38.70 HOK / Ha.

ABSTRACT

Integrated Administration Procedure (Patent) tends to increase the quality of service and bring services closer to the people seen of the aspect of time and service costs. The study was carried out in Purwosari Sub-District Pasuruan Regency in order to analyze the service steps for the integrated administrative sub-district, significant infrastructure, and the value of service to the community. To achieve this goal, an explanatory research conducted to the 3,250 population with the 97 people as the sample. The results show that there was a significant influence between integrated administrative sub-district on service quality, with $t = 0.315$. It had a direct influence on the public fulfillment and service quality, with $t = 0.218$ and $t = 0.387$ respectively. Furthermore, a significant influence was obtained between infrastructure and service qualities with $t = 0.236$ and $t = 0.492$ respectively. However, there is an indirect effect between integrated administration service procedures and infrastructure facilities on public fulfillment, with $t = 0.155$ and $t = 0.190$, respectively. This shows that the higher the quality of service caused by better infrastructure, the it tends to increase public fulfillment.

Keywords: *service, administration, facilities, infrastructure, satisfaction*

INTRODUCTION

Organization is the place where a group of people gather and work collaboratively in a structured way to seek for certain goals or targets set together. It is divided into two groups: private and public sectors of organization¹. Public organization is an organization that tends to produce services for the community regardless of distinguishing their status and position. Public organization is oriented to the public concentration, not profit oriented as the final goal².

In case of the dynamics development of regional governance in achieving good governance, which pays attention on the needs and necessities of the people in public services, Minister of Home Affairs Regulation No. 4 of 2010 issued the Guidelines for Implementing District Integrated Administration on January 15, 2010. Regarding the Guidelines for Implementing District Integrated Administration, issued by the Minister of Home Affairs, is to give the regional government, in

this case the regent or mayor, the chance to optimize the responsibility of the sub-district to build access and increase the service quality, and bring services to the people in city.

The range of integrated-administrative sub-district involves the licensed and non-licensed services sector. The objective of organizing integrated-administrative sub-district is to have the Subdistrict as a community service center, and become a center of facility for integrated-service offices or agencies in the district or city³. Integrated- administrative sub-district has the target to increase quality and bring services closer to the community. Integrated administrative sub-district is a simple innovation but provides great benefits⁴. In addition to facilitate the public obtain the services, it also increases the view and legitimacy of the local government to the community.

Referring to the PAN Decree No. 25 of 2004 concerning Public fulfillment Index, 14 things associated with the activities and facilities performed by service

employees, as well as service steps, appropriateness of requirements, clarity, discipline, responsibility, and ability of employees, the speed of service. equality of facility, courtesy of employees, equality and inevitability of charges, fixed-schedule, comfortable environment, and safety of services. The study aimed to investigate the advantages of the variables, including the effects on the public fulfilment. The research is restricted to procedures for services, infrastructure, public fulfilment and the quality of District Integrated Services/integrated

administrative sub-district (Case study of Purwosari District Office Pasuruan Regency).

Theoretical Review

District Integrated Administration Services is the enactment of public services in the sub-district, whose management process starts with the application to the publication of the document, carried out in one place⁵. The difference in conventional service with Patents is as shown in Table 1.

Table 1. Differences in Conventional Services with integrated administrative sub-district

Aspect	Conventional Service	integrated administrative sub-district
Citizens Participation	There is not citizen participation Citizens only accept the public service process as is.	Citizens can access service information in such a way that it is easier to provide input for service improvement Citizens can submit a complaint if the service they receive did not meet the standard that has been determined.
Availability of information	There is not information about the cost and time requirements in such a way that citizens tend to spend more, in the hope that they will finish quickly. Information is usually conveyed directly by sub-district employees to residents, who are taking care of services. the head of the sub-district has difficulty controlling the service costs received by his employees. this can trap the head of the district with the charge of “illegal levies”. There is not database system regarding these services.	Information is available about the type of service, time, costs and procedures for obtaining services; There is socialization about the implementation of public services. Acceptance of service fees could be monitored directly because payments are recorded transparently and accountably. Providing certainty to the district head in carrying out public services
Database	There is not database system regarding services	Equipped with a service database, which is managed and updated continuously

Source: Primary Data processed by researchers, 2017

Furthermore, the infrastructure in question is the ability of agencies to be able to implement or guarantee the procurement and management of adequate funds, provision, maintenance of facilities and infrastructure, and a good information system to support the quality of service to the community. Satisfaction is considered as a person’s feeling that comes with the contrast between his impress with a real product quality and the likely product performance⁶. Further explained that consumer satisfaction is “customer’s of a product or service in terms of whether that product or service has met their needs an expectation”⁶. Indicators in public fulfilment are: overall satisfaction level, conformity of service with community expectations, level of public fulfilment during relationships with institutions⁷. Based on the theories that have been proposed, a conceptual framework could be proposed, as presented in Figure 1.

Figure 1. Conceptual Framework for Patents, Infrastructure

Research Methodology

This research is a descriptive study through a survey approach, with a population of 3,250 people. A total of 97 respondents were taken as a sample of the total population. Questionnaires in the form of direct written information are used for data collection. Variable measurement uses a Likert scale, with scoring on this scale starting from number 1 to number 5, with scoring: Very good (score 5), Good (score 4), Fair (score 3), Bad (score 2), Very Bad (score 1).

Path analysis model is used to analyze the pattern of relationships between variables with the aim of knowing the direct and indirect effects of a set of independent variables on the dependent variable. Path analysis model is a causal relationship pattern. Therefore, the formulation of the research problem within the framework of path analysis only revolves around whether the independent variables (X1, X2, ..., Xk) affect the Y variable, or how much direct causal influence, indirect causal, total causal or simultaneous set of independent variables (X1, X2, ..., Xk) affect the variable Y ⁸.

RESULTS AND DISCUSSION

Data Analysis Results

The results of data analysis related to direct and indirect effects are presented in Table 2 below.

Tabel 2. Pengaruh langsung (Direct) dan tidak langsung (Indirect)

Eksogen	Mediasi	Endogen	Koefisien		
			Direct	Indirect	Total
District administration integrated service procedure	-	Service quality	0.315*	-	0.315
Infrastructure	-	Service quality	0.387*	-	0.387
District administration integrated service procedure	Service quality	Public fulfillment	0.218*	0.155* (0,315x0,492)	0.373
Infrastructure	Service quality	Public fulfillment	0.236*	0.190* (0,387x0,492)	0.426
Service quality	-	Public fulfillment	0.492*	-	0.492

Source: Primary Data Processed by researchers in 2017

Description: * (significant)

Based on Table 2, it could be seen that: The direct influence coefficient of the integrated administrative administration procedure on the service quality is 0.315*. This shows that the procedure for the service of integrated administration of sub-districts has a positive and significant effect on the quality of service. Then, the direct effect coefficient of the integrated administration procedure for the sub-district administration on public fulfillment is 0.218*. This shows that the procedures for the integrated administration services of sub-districts have a positive and significant effect on public fulfillment. Furthermore, the coefficient of direct effect of infrastructure on service quality is 0.387*. This shows that infrastructure has a positive and significant effect on service quality. The direct effect coefficient of facilities - infrastructure on public fulfillment (X2) is 0.236*. This shows that infrastructure has a positive and significant effect on public fulfillment. Then, the direct effect coefficient of service quality on public fulfillment is 0.492*. This shows that service quality has a positive and

significant effect on public fulfillment. Furthermore, the indirect coefficient of influence of sub-district integrated administration service procedures on public fulfillment through service quality is 0.155*. This shows that the procedure for the service of integrated administration of sub-districts has a positive and significant effect on public fulfillment through quality of service. The indirect effect coefficient of infrastructure on public fulfillment through service quality is 0.190*. This shows that infrastructure means a positive and significant impact on public fulfillment through quality of service.

Partial Analysis

Partial analysis is used to test whether or not there is a partial effect of exogenous variables on endogenous variables. The testing criteria state that if the probability value < level of significant (alpha = α) is stated there is a partial effect of exogenous variables on endogenous variables. Testing hypotheses could be known through the summary in the following table.

Table 3. Results of partial analysis

Exogen	Endogen	Koef.	T statistics	Prob/sig.
District administration integrated service procedure	Service quality	0.315	2.994	0.003
Infrastructure	Service quality	0.387	3.684	0.000
District administration integrated service procedure	Public fulfillment	0.218	2.658	0.009
Infrastructure	Public fulfillment	0.236	2.814	0.005
Service quality	Public fulfillment	0.492	6.491	0.000

Source: Primary Data Processed, 2017

The effect of integrated administrative procedures for sub-districts on service quality results in a statistical value of 2.994 with a probability/sig of 0.003. The test results show that the probability < alpha (5%). This means that there is a significant influence on the procedures for integrated administration services of sub-districts on the quality of services.

The effect of infrastructure on service quality results in t statistics of 3.684 with a probability of 0.000. The test results show that the probability < alpha (5%). This means that there is a significant influence of facilities - infrastructure on service quality.

The influence of integrated administrative procedures for sub-district administration on public fulfillment results

in t statistics of 2.658 with a probability of 0.009. The test results show that the probability < alpha (5%). This means that there is a significant influence on integrated administrative procedures for sub-district administration on public fulfillment.

The effect of infrastructure facilities procedures on public fulfillment results in t statistics of 2.814 with a probability of 0.009. The test results show that the probability < alpha (5%). This means that there is a significant effect of infrastructure on public fulfillment.

The effect of service quality on public fulfillment results in y statistics of 6.491 with a probability of 0.000. The test results show that the probability < alpha (5%).

This means that there is a direct significant influence on the quality of service to public fulfillment.

Furthermore, the influence of integrated administrative service procedures for sub-district and infrastructure facilities on public fulfillment through service quality is known that there is a significant influence on integrated administrative service procedures, sub-district and infrastructure facilities on service quality, and there is a significant influence on service quality to public fulfillment. Because both pathways are significant, it could be stated that there is a significant influence on

the procedures of integrated administration services for sub-districts and facilities for public fulfillment through service quality. Thus, the quality of service is able to mediate the effect of integrated administrative service procedures for sub-districts and infrastructure on public fulfillment.

Path diagram conversion into the measurement model is intended to convert the diagram model into an empirical data-based measurement model, which is used to determine the effect of exogenous variables on endogenous variables directly or indirectly.

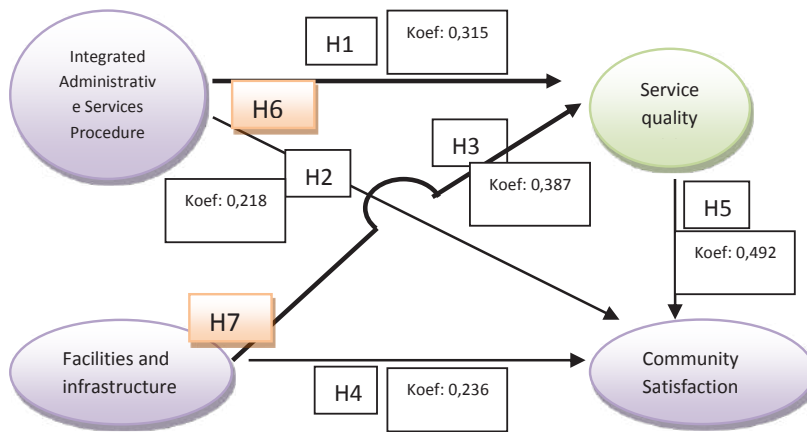

Figure 3. Model Construction

Source: Hair (2013); and primary data is processed (2017)

The empirical model produced is as follows: Model 1 : $Z = 0.315X_1 + 0.387X_2$ dan Model 2: $Y = 0.218X_1 + 0.236X_2 + 0.492Z$

Exogenous variables that most influence the endogenous variables could be known through the highest total effect. Variables that have the greatest total effect on service quality are infrastructure with a total effect of 0.387. Thus, facilities are the most influential variables, or have the most dominant influence on service quality. Variables that have the greatest total effect on public fulfillment are service quality with a total effect of 0.492. Thus service quality is the most influential variable or has the most dominant influence on public fulfillment.

CONCLUSION

Based on the results of the study obtained conclusions as follows: Head of the Office Purwosari District always needs to improve the Quality of Service

to the community, especially related to the fulfillment of integrated administrative service procedures, infrastructure facilities, in order to increase public fulfillment. This could be done by providing clarity of procedures and speed and accuracy of procedures for integrated administration services to the public, especially to improve professionalism in carrying out their duties and functions. This is an effort to help Purwosari District in providing the best service to the community.

The Role of Women in Food Security (Case Study of Rice Farmers in Blang Pala Village, Banda Baro District, Aceh Utara Regency)

N Shamadiyah¹, P.P.P.A, Nasution²

¹*Agribusiness Departement, Faculty of Agriculture, Malikussaleh University, Aceh Utara,*

²*Anthropology Departement, Faculty of Social and Political Sciences, Malikussaleh University, Aceh Utara*

ABSTRACT

The rice farming community is a producer of staple foods. They not only produce food, but also are responsible for food needs for all members of their families and society. This study aims to describe how the distribution of roles between women and men in agricultural activities (on farm and off farm) to fill household food security in the rice farming community in Blang Pala Village, Banda Baro District, Aceh Utara District, Aceh Province. The study have been done by in-depth interviews with ethnoscience as an approach. The informants were determined based on several minimum requirements: full enculturation, direct involvement of informants with their cultural atmosphere, different cultural backgrounds with researchers, and time availability. The result shows that women have a very important contribution to food security of their families and effort of providing food at the household level. The allocation of roles between husband and wife in agriculture is based on family deliberation, but still those who make decisions are male (husband). This is due to the people of Aceh adhering to Islamic law. In agricultural activities, men play a part in heavy work. Whereas women play a role in work that is considered light. This pattern refers to habits that have become a hereditary culture. Since childhood they have seen how parents share roles in the family, so this also becomes a reference or basis for them to share the roles between men and women in agricultural activities.

Keywords: *Food Security, Agriculture, Farmers, Women, Family*

INTRODUCTION

Agriculture in Indonesia is still the biggest source of livelihood for the community. Most of the land area in Indonesia is utilized for the agricultural sector. Agricultural development aims to increase farmers' income and living standards, growth of employment and business opportunities, improve nutrition and household food security, and decrease poverty in rural areas. All of this is related to the roles, duties and functions of women in rural areas. Even though, the agricultural sector and major employment opportunities do not absorb too many female workers. Based on household income it can be generated by husbands and wives (multiple livelihood patterns), women have job opportunities that can generate income for their households, as an effort to reduce poverty in rural areas. Role and position are two important aspects of social relations in society. Role is a

dynamic aspect of status, when someone has carried out an obligation according to his status, he has a role. Status is often synchronized into a position, which indicates a person's social position in society. In other words, position provides a person with a role as a pattern of interaction among community members in socializing ¹.

Economic allocation is a measurement of the benefits of the labor of household members that are needed for the existence of households to fill the consumption (needs) of goods and services. Economic allocation relates to the allocation of solidarity among household members (men, women, adults, children) in the functioning or non-functioning of their respective roles in obtaining household income and expenditure. Law No.7 / 1996 on Food, defines food security as a condition of food fulfillment for every household, as reflected by the availability of adequate food, both

quantity and quality, safe, equitable, and affordable. The definition of food security includes the macro aspect, namely the availability of adequate food; and also the micro aspect, namely the fulfillment of food needs of every household to lead a healthy and active life². Therefore, the farmer's income will be increase with for the ability of farmers to fulfill the needs of family food which is a basic need that must be fulfill and it can't be replaced with the other needs. But the basic need is not for food only, but they non-food needs such as housing, clothing, education, and health³.

RELATED RESEARCH

Women have a very important role in the effort to consume food at the household level given that in the hands of women or a mother, food is planned, processed and prepared for their families. The size of the budget in planning, processing, preparing and serving foods is also the basis for a woman (housewife) in an effort to improve the quality of food consumed by her family⁴.

The income of farmer women will contribute to household income which will directly affect household food consumption. The income of farm women shows a significant influence on food consumption at the household level with a positive relationship. It is mean, an increase in the income of farmer women will significantly increase the diversity of food in households level⁵.

Man working time allocation is concentrated on farming activities. Women working time allocations was focused on domestic activities. It means that the gender working time allocation shows different patterns between woman and man. Women have contributed more income from non-farm activities compared to man contributions. The factors that are considered to affect the food security level at the farmer's household were gender based on income from non-farm activities, family size, and on-farm income⁶.

PROPOSED METHOD

Ethnoscience is based on a number of interrelated assumptions. One of the assumptions is that the interaction of the human environment in a community or society is different from a community or other community group, and this is strongly influenced by mind, knowledge, and language that are regulated in their culture. Furthermore, that community groups

or a community with different cultures will see and understand their world differently as a result of various social aspects, history, culture, environmental conditions and experience. This approach departs from the main assumption of effective experiences that are cultural because of the same life experience, and generally can be 'seen' or 'perceived' differently by people with different cultural backgrounds⁷.

RESEARCH METHODOLOGY

This research is a socio-cultural study with ethnics as its approach. The data obtained and used in this study is a type of qualitative data, consist of statements about the content, nature, characteristics, and circumstances of something, or statements about various relationships between people with something else. Something that can be a physical objects, patterns of behavior, ideas, values, norms, and also like the physical environment, conversation, as well as events that occur in a community group⁷. Various data elements (emic view) are collected and processed to obtain a descriptive series of "The Role of Women in Food Security" in the rice farming community in Blang Pala Village (Gampong), Banda Baro District, Aceh Utara Regency, Aceh Province.

Data collected according to the research focus in words, actions, situations, documentation and observed events. Collecting this data / information, the researcher as well as an instrument is carried out with documentation and interview activities (in-depth interview). Therefore, the researcher will record, and use the support of recording devices, and observe the behavior of the informant.

RESULTS AND DISCUSSIONS

Blang Pala Village is an agrarian rural area, with the large population in farming, while other livelihoods are from the utilization of processed agricultural and plantation products. The agricultural sector is a main source of livelihood for the community of Blang Pala Village. Farming is important to preservation of nature and other creatures. With the activities in the agricultural sector, people get food which is a basic need for the sustainability of their lives. Rice farming activities in Blang Pala Village include the following activities:

Soil Processing (*Ceumacah*). Soil processing is very important for rice plants and needs more attention. Soil processing is intended to manage and utilize nutrients

needed for rice plants. The processing system can be done in the traditional way by using plows and hoes or trampled and with tractor technology.

Irrigation. Irrigation support the farming with surface water and ground water. The method and rules for irrigating rice fields in Blang Pala Village are usually done 10 days after planting when the paddy plants have looked green, which was 3 stems to be 5-8 stems. Soil management can be done by entering water into the fields until the water is stagnant and making the soil soft. Sometimes people also have to wait for their irrigation water to irrigate their fields. Not infrequently people use rainwater to flooded in their fields.

Nurseries. Nurseries are important in crop cultivation. In rice cultivation, superior variation is preferred to be resistant to pests and diseases, if plants that are affected by disease are usually carried out by refining, and this planting is needed to achieve optimal results.

Rice Planting (*Seumula*). The next stage is the stage of planting rice seeds into rice fields that have been prepared. The steps taken in planting rice seedlings that are planted seeds must be young and have two or three leaves. Enter the rice into the planting hole can be done in a single or double way. One hole for one plant is a maximum of two plants. Furthermore, the process of planting rice seeds is good when the land under conditions that are not inundated by the depth of seedling planting between 1-15 cm and the good method of rice cultivation must be parallel and neat. Usually, these women farmers have a unique thing to help each other in the process of planting rice. This term is called *Meurop*. For example, today a number of women farmers doing rice fields without payment are only provided with lunch by the owners of the rice fields, another time when other women farmers would work their fields, the owners of the rice fields and other women farmers also helped. But there are also female farm laborers who are paid 40,000 IDR/ day. *Meurop* is usually done if the owner of the capital or farm does not have enough money for the rice planting process.

Eradication of Pests and Diseases. Controlling pest and disease are usually done by farmers by using pesticides or burning the hole where the mouse is hiding so the mouse runs away and does not return. Various efforts were made to anticipate the arrival of pests such

as snails, mice, caterpillars/ rods and others.

Harvest (*Keumekoh*). Harvesting is the cutting of rice yields. For farmers in Aceh only recognize 2 seasons a year, that is *Treun U Blang* Season (Fall Season) and *Luah Blang* Season (Season when Empty Rice Fields). In this empty rice field, some people let their cows to eat postharvest haystacks and children also played kite. The harvest season is also known as *Keumekoh* season, people cut rice in a slightly squat position using *sadeup* (rice cutter).

Woman farmers of Blang Pala Village usually use *Sadeup* in cutting rice with a forward movement. After being cut, the rice is stacked using a base so losing of the crop is not much. Furthermore, rice was transported (*inibai*) by men. Then the rice is brought to the threshing machine and dried. After dry rice is immediately taken to the milling machine. After all processes are complete, the rice is stored in a 50 kg or 35 kg sack. Then it is stored in a safe place so is not to be flooded or rainy. Moreover, the women farmers of Blang Pala Village separate rice that will be stored at home for daily life and for sale. Women farmers in Blang Pala Village also have to set aside money from the sale for the farming capital and money for other necessities of life.

The division of roles between husbands and wives in agriculture in informants is mostly based on family deliberations, but still those who make decisions are male (husband). This is due to the people of Aceh adhering to Islamic law. In the teachings of male Muslims who are leaders (priests) in making decisions about their families. In agricultural activities, men have more roles in heavy work such as land processing, plant maintenance (pesticide fertilization and spraying), and harvesting. Whereas women play a role in work that is considered light and not too difficult, such as planting, pulling grass or weeds, and eradicating rice pests such as snails.

In addition to working in the fields, women also still have to work at home such as caring for children, taking care of the house, and cooking, so that this is the basis for the division of roles in agriculture. If a woman is given heavy work in the rice field, it can result in a lack of attention to the child and not having enough time to take care of the house and cooking. Another thing according to the informant, in Islam teaches men who are more obliged to make a living for their families,

but women are allowed to help in accordance with their capacity and abilities. But there are times when women also help when the harvest arrives. This pattern of role sharing refers to unwritten habits that have become a culture of hereditary farming communities in the Blang Pala Village. All respondents said there were no written rules on this matter but they had seen from a young age how the previous generation and especially parents shared the same role in the family, so that this also became their reference or basis in acting to divide the roles between men and women in agricultural activities. This division of roles also applies to boys and girls in the family, directly they learn from parents what men should do and what should be done by women. This activity became a kind of internalization that was internalized in the children in the family.

Local wisdom is a blend of knowledge and technology that develops in society. Local wisdom can be passed down from generation to generation through the learning process. In the seven elements of culture, the technological and equipment elements are in seventh order, which means the system can be easily changed according to the conditions of society and the changes that occur. Local wisdom is culturally relevant. Culture is an idea for every human behavior in life and can become a habit for that society⁷. Local wisdom is part of the culture so that this culture becomes a habit that can be learned in a society. When the culture is still beneficial to society then the culture will continue to be used. This rules has been passed down from generation to generation through the learning process. Although this rules is still traditional but people feel not yet need more modern technology, because is enough to fulfill the needs of their life⁸.

CONCLUSION

From the results of the study can be drawn, women have a very important contribution to food security of their families and effort of providing food at the household level. The allocation of roles between husband and wife in agriculture is based on family deliberation, but still those who make decisions are male (husband). This is due to the people of Aceh adhering to Islamic law. In agricultural activities, men play a part in heavy work. Whereas women play a role in work that is considered light. This pattern refers to habits that have become a hereditary culture. Since childhood they have seen how parents share roles in the family, so this also becomes a

reference or basis for them to share the roles between men and women in agricultural activities.

Erosion Prediction and Soil Conservation Planning in Krueng Seulimum Watershed Aceh Province, Indonesia

H Akbar¹, K Murti Laksono², N Sinukaban², S Arsyad²

¹*Agroecotechnology Study Program, Faculty of Agriculture, University of Malikussaleh,*

²*Department of Soil and Land Resources, Faculty of Agriculture, Bogor Agricultural University*

ABSTRACT

The conversion of forests into agricultural land and the application of agro-technology on land without considering the capability and suitability of land will result breakdowns on Krueng Seulimum Watershed. This will obviously lead to high attrition, low land productivity in the upstream, sedimentation, and high fluctuation in the downstream. This study is aimed to: 1) predict the amount of erosion on every watershed land unit in Krueng Seulimum Watershed and 2) determine the appropriate agro technology (soil and water conservation techniques) for cocoa farms to suppress erosion ($\text{erosion} \leq \text{ETol}$). The method used in this study is a survey method with the following steps: 1) the preparation phase, 2) a preliminary survey, 3) a primary survey and 4) data analyses and result presentation. The prediction was performed on each land unit (LU) and the cocoa-based farming systems (Cocoa, Cocoa + Areca nut, and Cocoa + Banana) using USLE. The results show that the greatest erosion prediction occurred on the shrub and dry land farming use. The predictive erosion values of the land use for shrub, dry land agriculture, grazing and secondary forest ranged from 30.71 - 292.98 tons ha⁻¹ year⁻¹ (ETol 31.50 - 40.96 tons ha⁻¹ year⁻¹), 27.60 - 118.19 tons ha⁻¹ year⁻¹ (ETol 39.11-40.96 tons ha⁻¹ year⁻¹), 9.92 tons ha⁻¹ year⁻¹ - 62.98 tons ha⁻¹ year⁻¹ (ETol 22.16 - 24.20 tons ha⁻¹ year⁻¹), and 1.31 - 6.94 tons ha⁻¹ year⁻¹ (ETol 23.98 - 29.28 tons ha⁻¹ year⁻¹), respectively. The agro technologies for soil and water conservation that should be implemented on agricultural dry land (cocoa, cocoa + areca nut, and cocoa + banana) are the provision of a complete fertilizer (7% slope), bunds terracing + grass planting to amplify the terrace (14% slope) and bund terracing + grass planting to amplify the terrace + mulching 6 tons ha⁻¹ (21% slope). The forest land use is recommended to remain as forest, while the shrub land use is recommended for cocoa farming.

Keywords: *Erosion, land use, watershed, agro-technology*

INTRODUCTION

Land use changes along the watershed have been increasing due to the construction activities and a high population growth rate. It is proven that the changes of land use from forest into other land uses have created negative impacts. To make it worse, when a particular land is urgently needed, the conversion of forest cannot be avoided.

In Aceh province, until 2009, there had been approximately 266,000 hectares of forest severely damaged due to illegal logging¹. According to Walhi Aceh (2012)² the loss of forests in Aceh province is now at about 23,124.41 hectares year⁻¹ from the total forest area of 3.3 million hectares due to illegal logging and forest conversion.

The deforestation has also threatened the sustainability of the 47 watersheds and sub-watersheds in Aceh. In efforts to save the watersheds in Indonesia, the Ministry of Forestry has set 108 watersheds as the top priority to be managed in the next 5 years (2010 to 2014), while Krueng Aceh is one of the 16 watersheds located in Sumatra which is categorized into critical watershed groups in Indonesia and the top priority in handling (BPDAS Aceh, 2009).

Krueng Seulimum (25,444.35 ha) which is one of the sub-watershed of Krueng Aceh watershed has experienced an extensive conversion of forests into agricultural land. In 1977 the forest area in Krueng Seulimum watershed was 16,179.0 ha (70.86%), in 1987 it declined to 11,129.10 ha (48.75%) and in 2002

it decreased until 9,032.40 ha (39.56%)³. In 2011, the remained forest area in Krueng Seulimum watershed was 7,000.01 ha (27.51%)⁴.

This study aims to: 1) predict the amount of erosion on every land unit in Krueng Seulimum watershed and 2) determine the appropriate agro technology (soil and water conservation techniques) for cocoa-based farming to suppress erosion (erosion ≤ ETol).

RESEARCH METHOD

Venue and time

This research was conducted in Krueng Seulimum watershed which is administratively located in the sub-districts of Seulimum and Lembah Seulawah in Aceh Besar regency, Aceh province from January to August 2011.

Materials and Equipment

The materials used are maps of soil types,

topographic maps, earth maps, land use maps, rainfall data, demographic data, and certain chemicals for laboratory analyses. Equipments used in the research are equipments for survey, equipments for analyzing soil characteristics in the field and laboratory, stationery, working maps, GPS, GIS software, a digital camera, and a computer.

Research Method

This study used a survey method consisting of four phases, namely: the preparation, preliminary survey, main survey, and data analyses as well as result presentation.

Erosion Prediction

Erosion prediction on a piece of land is a method to estimate the rate of erosion that will occur on the land used within a land use. The measurement of erosion was performed on each land unit by using the Universal Soil Loss Equation (USLE)⁵:

$$A = R \times K \times L \times S \times C \times P \dots\dots\dots (1)$$

Where: A = the amount of erosion (tons ha-1 year-1), R = rainfall erosivity index, K = soil erodibility factor, L = slope length factor (m), S = slope factor (%), C = crop management factor and P = conservation treatment factor.

Rainfall Erosivity (R)

Rainfall erosivity is the amount of rainfall erosion index unit which is the product of the kinetic energy (E) with the maximum rainfall intensity for 30 minutes (I30) annually. As the daily rainfall data from the automatic measuring tool were unavailable, the value of rainfall erosivity (R) was calculated based on the Lenvain equation⁶:

$$EI30 = 2.21 (CHm) 1.36\dots\dots\dots (2)$$

Where: EI30 = the maximum rainfall intensity in 30 minutes, and (CHm) = monthly rainfall

Thus, the amount of rainfall erosivity factor (R) is the sum of the values of monthly rainfall erosion index and is calculated by the following equation:

$$R = \sum_{i=1}^{12} (EI30) I \dots\dots\dots (3)$$

in which R is the rainfall erosivity factor.

Soil Erodibility (K)

Soil erodibility value was calculated using the formula of Wischmeier and Smith (1978)¹¹:

$$100K = \{1.292 (2.1 M 1.44 (10^{-4}) (12 - a) + 3.25 (b - 2) + 2.5 (c - 3))\} \dots\dots (4)$$

where:

- K = soil erodibility,
- M = soil texture grade (% silt + % dust) (100 - % clay),
- a = percentage of organic matter,
- b = the soil structure code, and
- c = permeability code of the soil profile.

Length and Slope Factors (LS).

Length and slope factors can also be calculated directly with the following equation:

$$LS = \sqrt{X(0.0138 + 0.00965S + 0.00138S^2)} \dots\dots\dots(5)$$

Where:

X = the length of the slope (m) and S = the slope (%).

Plant Factor and Management (C)

The value of C factor is the ratio between the land losses due to erosion in an area unit (tons ha-1) in the land cultivated with a certain management system and the land loss from the standard plot in adjacent places.

Conservation Treatment Factor (P)

The value of P factor is the ratio between the land losses due to erosion in an area unit (tons ha-1) in the land using a specific soil conservation technique and the land loss from the standard plot in adjacent places.

Tolerable Erosion (ETol)

Tolerable erosion (ETol) was calculated based on the equation proposed by Wood and Dent (1983)⁷. Tolerable erosion also take into account the minimum soil depth, soil formation rate, equivalent depth, and land resource life in the following equation:

$$ETol = \frac{B - D_{min}}{UGT} + LPT \dots\dots\dots(6)$$

Where:

- ETol = tolerable erosion (mm year-1),
- DE = equivalent depth {effective soil depth (mm) x soil depth factor based on sub-soil order},
- Dmin = minimum soil depth (mm),
- UGT = soil age, and
- LPT = soil formation rate.

RESULTS AND DISCUSSION

Land Use

Land use in Krueng Seulum watershed is currently dominated by secondary forest land use for an area of 7,001.01 ha, followed by scrub area of 5,988.15 ha, dry land farming area of 5,631.19 ha, pasture area of 5,033.27 ha, rice field area of 1,455.15 ha, and residential area of 335.58 ha. In detail, from the total area of Krueng Seulum watershed (25,444.35 ha), the land use for dry land farming commonly found is the cocoa-based farming without soil and water conservation treatments (Table 1).

Table 1. Land use in Krueng Seulum watershed

No	Types of Land Use	Area	
		Ha	%
1	Settlement	335.58	1.32
2	Rice field	1,455.15	5.72
3	Grazing lands	5,033.27	19.78
4	Scrub lands	5,988.15	23.53
5	Dry Land Agriculture	5,631.19	22.13
6	Secondary Forest	7,001.01	27.51
	Total	25,444.35	100.00

Sources:⁴, Field Analysis (2012).

Erosion Prediction

Erosion Prediction in Krueng Seulum watershed was analyzed on each land unit (LU) with multiple parameter values using the USLE. The calculation and observation results indicated that the parameter value of every sample point in each land unit showed significantly varied erosion values

Sufficiently high agricultural production can continuously be maintained if erosion on each land unit is smaller than the tolerable erosion (ETol), and if erosion is greater than ETol, the land productivity will immediately decline, so that high production can only

be maintained for just a few years and eventually the agricultural land becomes unproductive or even a critical land.

On the basis of the differences of the mixed planting density and cover crop characteristics, the erosion prediction value is determined by the value of C (the level of plant management) namely the value of C factor for in which the values for cocoa monoculture (C) , cocoa + banana (CB) and cocoa + areca nut (CA) are 0.206, 0.119 and 0.114 respectively, while the value of P (without soil conservation treatment) is 1.0 to obtain the erosion prediction value on the type of cocoa-based mixed farming (Table 3 and Figure 1).

Table 2. The Summary of the Predictive Erosion Condition Existing in Krueng Seulum watershed

LU	Land Use Type	Area (Ha)	Value CP	Erosion (A) (tons ha ⁻¹ year ⁻¹)	Total Erosion (tons year ⁻¹)
1	Grazing Land	847.68	0.100	29.65	25,137.16
2	Scrub Land	972.13	0.300	87.98	85,524.70
3	Dry Land Agriculture (CA)	889.54	0.300	105.30	93,670.51
4	Secondary Forest	398.79	0.005	1.51	603.87

14	Grazing Land	546.47	0.100	62.98	34,418.03
15	Scrub Land	267.87	0.300	190.63	51,064.94
16	Dry Land Agriculture (CB)	295.94	0.300	118.19	34,977.93
17	Secondary Forest	1,559.24	0.005	2.64	4,118.27
18	Secondary Forest	285.84	0.005	4.49	1,284.05
19	Scrub Land	192.59	0.300	292.98	56,424.77
20	Secondary Forest	550.12	0.005	4.87	2,677.19
21	Secondary Forest	498.09	0.005	3.68	1,833.17
22	Secondary Forest	876.06	0.005	6.94	6,078.12
Total Erosion					731,110.19

Table 3. Prediction of erosion on each type of cocoa-based mixed farming in Krueng Seulimum watershed

Slope (%)	Farming Types	CP Value	Erosion (ton ha ⁻¹ year ⁻¹)	ETol (ton ha ⁻¹ year ⁻¹)
7	Cocoa Monoculture (C)	0.206	33.41	39.11
	Cocoa + Banana (CB)	0.119	19.30	39.11
	Cocoa + Areca nut (CA)	0.114	18.49	39.11
14	Cocoa Monoculture (C)	0.206	98.27	39.78
	Cocoa + Banana (CB)	0.119	56.77	39.78
	Cocoa + Areca nut (CA)	0.114	54.38	39.78
21	Cocoa Monoculture (C)	0.206	135.89	40.96
	Cocoa + Banana (CB)	0.119	78.50	40.96
	Cocoa + Areca nut (CA)	0.114	75.20	40.96

Table 3 shows that the erosion prediction values of cocoa-based mixed farming on slopes of 14% and 21% are still above the ETol values. Therefore, to achieve sustainable cocoa-based farming in Krueng Seulimum watershed, it is crucial to implement agro technologies.

The agro technologies that can be applied at both sites are fertilizing and soil and water conservation. Complete fertilization was conducted for C, CA, and CB to increase production, so that the desired farm income can be achieved.

Figure 1. Erosion Prediction on various types of cocoa-based farming and land slopes.

To achieve high productivity in line with the genetic potential, fertilization is a major determinant especially on the balance dose and fertilizer type, but not on a high level dose (Thong and Ng, 1978)⁸.

The suggested agro technologies for soil and water conservation applied on cocoa monoculture (C), Cocoa+Banana (CB) and Cocoa+Areca nut (CA) are fertilization, bund terracing with terrace strengthening plants (slope 14%) and bund terracing with terrace

strengthening plants added with 6 tons of mulching ha⁻¹ year⁻¹ (slope 21%) so that the erosion obtained is less than or equal to ETol (erosion ≤ ETol). Bund terracing on slopes of 14% was able to reduce the erosion from

98.27 to 39.36 tons ha⁻¹ year⁻¹ (C), 54.38 to 27.91 tons ha⁻¹ year⁻¹ (CA) and from 56.77 to 38.64 tons ha⁻¹ year⁻¹ (CB) (Table 4).

Table 4. Erosion on the cocoa-based farming after the application of agro-technologies in Krueng Seulimum watershed

Slope (%)	Farming Types	CP Value	Erosion (tons ha ⁻¹ year ⁻¹)	
				ETol
7	Cocoa Monoculture	0.206	33.41	39.11
	Cocoa and Banana	0.119	19.30	39.11
	Cocoa and Areca nut	0.114	18.49	39.11
14	Cocoa Monoculture	0.103	39.36	39.78
	Cocoa and Banana	0.060	38.64	39.78
	Cocoa and Areca nut	0.057	27.91	39.78
21	Cocoa Monoculture	0.031	16.33	40.96
	Cocoa and Banana	0.018	16.03	40.96
	Cocoa and Areca nut	0.017	11.58	40.96

Bund terracing (P = 0.5) with 6 tons mulching ha⁻¹ year⁻¹ (P = 0.3) on a 21% slope can reduce the erosion from 135.89 to 16.33 tons ha⁻¹ year⁻¹ (C), from 75.20 to 11.58 tons ha⁻¹ year⁻¹ (CA) and from 78.50 to 16.03 tons ha⁻¹ year⁻¹ (CB) (Table 4).

Bund terracing with grass planting for terrace strengthening can technically be done in the research location. The purpose of this planting is to make terrace not easily slide by rainwater collision or runoff. *Setaria spacelata* grass species can be grown as terrace amplifier plant because this grass has low, tied and spread growth, as well as dense fibrous roots so that it can reduce runoff, and filter soil particles carried by runoff, and reduce erosion, while other uses of *Setaria spacelata* grass is as a provider of feed ingredients for cattle. Bund terracing plus mulching of 6 tons ha⁻¹ year⁻¹ on slope of 21% can protect the soil surface from direct blows of rain droplets so that it can reduce the occurrence of splash erosion in addition to reduce the rate and volume of surface runoff (Suwardjo, 1981)⁹. Abdurachman and Sutono (2002)¹¹ also added that the role of mulch in suppressing the erosion rate is determined by the mulch material, percentage of ground cover, mulch layer thickness and mulch resistance to decomposition.

CONCLUSIONS

The highest predictive erosion values of several

land uses in Krueng Seulimum watershed occur in scrub land use (30.71 - 292.98 tons ha⁻¹ year⁻¹) and in dry land agriculture (27.60 - 118.19 tons ha⁻¹ year⁻¹). The erosion prediction values on pasture and forest land uses ranged from 9.92 - 62.98 tons ha⁻¹ year⁻¹ and 1.26 - 6.94 tons ha⁻¹ year⁻¹. The suggested agro technology for soil and water conservation at the 14% slope is bund terracing + grass planting for terrace strengthening that can reduce the erosion prediction rate to be lower than that of the ETol (39.78 tons ha⁻¹ year⁻¹) that is 39.36 tons ha⁻¹ year⁻¹ for the cocoa monoculture, 27.91 tons ha⁻¹ year⁻¹ for cocoa + areca nut, and 38.64 tons ha⁻¹ year⁻¹ for cocoa + banana farming, while the suggested agro technology for soil and water conservation at the 21 % slope is bund terracing + grass planting for terrace strengthening + the provision of 6 tons mulching ha⁻¹ year⁻¹ that can also reduce the erosion prediction rate to be lower than that of the ETol (40.96 tons ha⁻¹ year⁻¹) that is 16.33 tons ha⁻¹ year⁻¹ for the cocoa monoculture, 11.58 tons ha⁻¹ year⁻¹ for cocoa + areca nut, and 16.03 tons ha⁻¹ year⁻¹ for cocoa + banana farming.

Creative Economic Strategy Base on Local Wisdom- An Effort in Increasing Global Competitiveness in Malang Raya

Ana Sopanah¹, Syamsul Bahri¹, Mohammad Ghozali²

¹ Accounting Department of Widyagama University of Malang, ² Law Department of Darussalam Gontor University of Ponorogo

ABSTRACT

The current study aimed to update the data and identify the creative economic characteristics in Malang Raya. Objects of the research were all actors and drivers of the creative economy in Malang Raya, which composed of 16 sub-sectors. The research method used was the analysis of SWOT and IFAS-EFAS. The population and sample were MSMEs engaged in the Creative Economy in Malang Raya. Other studies results showed that the number of Creative Economy actors in Malang were 2,191 sub-sectors. Of the 16 sub-sectors of creative economy, craft, fashion, and culinary were the most potential sub-sectors to be developed whose the average number of workers was about 1-4 people. Based on IFAS and EFAS analysis, the Creative Economy strategy position in Malang Raya was in Stable Growth Strategy that is a growth required to be pursued in stages based on the priority scale.

Keywords: *Creative Economy, MSMEs, Competitiveness, Local wisdom*

INTRODUCTION

The change on the map of global economy has put creativity into the basic capital in facing global challenges. In globalization context, competitiveness is the key to success and survival¹. Creative Economy Agency (*Bekraf*) noted that it had a contribution of 8.6% to Indonesia's Gross Domestic Product (GDP) in which in 2014 was IDR 784.82 trillion to be IDR 852 trillion in 2015. Departing from this point, Creative Economy has found its existence and has been developing. Meanwhile, John Howkins in his book 'the Creative Economy: How People Make Money' firstly introduced the term of 'creative economy'. He defined Creative Economy as "economic activities in a society who spends most of times to produce ideas, not only do routine and repetitive things. The points stressed in the realm of

Creative Economy are the ideas, talents and creativity as vital elements²". The Trade Ministry of the Republic of Indonesia (2008) formulated Creative Economy as effort sustainably developing the economy through creativities by utilizing renewable resource reserves under a competitive economic climate³.

Related Researches

According to the Report of Creative Economy in 2010 issued by the United Nations Conference on Trade and Development (UNCTAD), Creative Economy is a concept that continues to grow based on the creative assets that have the potential to generate economical growth and progress. In general, in the world there has been an economic shift, from the Agricultural Economy era to the development of Creative Economy.

Figure 1. Economic Era Shift

Wroblewski (2014) stated that creative industries are defined as industries that come from the utilization of individual creativity, skills, and talents to create prosperity and employment by producing and empowering individual's creativity and creative power. The Creative Economy Development has been mandated through Presidential Instruction No. 6 of 2009. Indonesian President instructed 27 leaders of Ministries and Agencies as well as all leaders of governors, regents/mayors of Indonesia. Government supported Creative Economy Development policy in 2009-2015, namely the development of economic activities based on individual's creativity, skills, and talents to create individual's creativity and creative power which have economic value and influence Indonesian people welfare⁴.

A study on the Creative Economy Development has been carried out by Yuslinaini and Nasir (2017)⁵ who concluded that in increasing the competitiveness of Creative Industry, Aceh Besar Regency Government had carried out several programs for instance business assistance through entrepreneurial management training and provision of revolving funds. Meanwhile, Sumartik's research (2016) concluded that government role is very important in addition to strengthen the companion institutions of MSMEs and increase the capacity building. A research has been conducted by Utami (2014) on the Creative Economy Development in Bandung City showed that there were 15 tourism clusters potential for creative industries in Bandung City. The strategy implemented for the sake of development was to observe the readiness of region, such as the accessibility from and within the region with all its physical and non-physical facilities and supporting infrastructure.

Research Methodology

The population and sample of the present study

were MSMEs engaged in the Creative Economy in Malang Raya. It used a mixed approach which combine the quantitative and qualitative approaches. Techniques of data collection used were, a) Literature Study, b) Observation, c) Questionnaire, and d) Focus Group Discussion. Data analysis techniques used were SWOT and IFAS-EFAS analysis. SWOT analysis was used to interpret the potentials of Creative Economy in Malang Raya. The four SWOT factors consist of Strength, Weakness, Opportunity, and Threat, each of which would be analyzed based on the components of each factor for further assessment determining the research objects position on the SWOT quadrants. These analyses aimed to find out the basic strategies of problem solving that can be applied qualitatively.

IFAS (Internal Factor Analysis Summary) analysis is a summary or formulation of internal strategic factors in the framework of Strength and Weakness, while EFAS (External Factor Analysis Summary) is summary or formulation of external strategic factors in the framework of Opportunity and Threat. After all SWOT, IFAS, and EFAS analysis were carried out, the Creative Economy Development strategy was developed improving the competitiveness.

RESULTS AND DISCUSSION

According to the data, Malang City had the greatest number of Creative Economy actors compared to Malang Regency and Batu City. About 50% of total number of Creative Economy actors performed their business in Malang City. This condition was very possible to influence other regions which tried to continue developing the potentials of Creative Economy in their own regions, so that the Creative Economy growth and development can be maximized properly. The following chart is showing the number of Creative Economy.

Figure 2: Number of Creative Economy

Figure 3: Creative Economy Sub-sectors in Malang Raya

In connection with the characteristics of the Creative Economy in Malang Raya, the researchers did assessment on some indicators including number of sub-sectors, workers, and marketing area. According to the figures above, it may be explained that culinary sub-sector was the most superior and desirable. The culinary development that was diverse made it always be an

alternative choice of people to start their business.

The following graph is showing the Creative Economy of each sub-sector in Malang Raya. The data processed show that in Malang City and Malang Regency, the most desirable sub-sectors after culinary were craft and fashion sub-sectors.

Figure 4: Creative Economy Sub-sectors in Malang City Whereas in Batu City, the most desirable sub-sectors after culinary were craft and communication design sub-sectors.

Of the 16 sub-sectors managed by the Creative Economy Agency (Bekraf), the three sub-sectors are culinary, fashion, and craft contributed to the Gross Domestic Product (GDP) of the Creative Economy by 41.69%, 18.15%, and 15.70%, respectively. According to national data, the Creative Economy actors had averagely 1-4 employees. This condition reflects that the Creative Economy actors, in general, also had the same conditions, namely those in Malang had only, on average, 1-4 employees.

Figure 6: Creative Economy Sub-sectors in Batu City

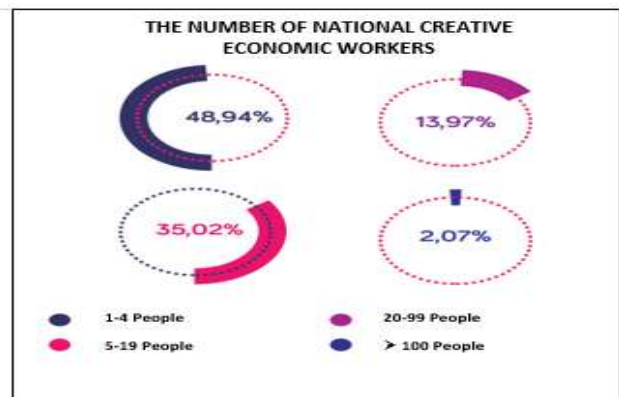

Figure 7: Numbers of Creative Economy Workers, Malang Raya and in Nationally

It is known that Malang was not much different from Indonesia as a whole in number of workers, that is, each company engaged in Creative Economy sub-sectors had 1-4 workers. Meanwhile, based on marketing characteristics in Malang Raya, it appears that both local

and regional markets are still superior. It shows that the creative economy in Malang particularly still required to be improved to be able competing in the global market. The following charts showing marketing area of Creative Economy actors in Malang Raya.

Figure 8: Creative Economy Marketing Area, Nationally and in Malang Raya

RESULTS OF SWOT ANALYSIS

The results of SWOT analysis related to the Creative Economy sub-sectors in Malang Raya showed that the craft, fashion, and culinary sub-sectors were the most potential sub-sectors to be developed. These three sub-sectors should be explored further creating a development model in accordance with local wisdom in Malang Raya. Craft sub-sector in Malang had a great potential to be developed. It, including ceramics, pottery, wood, furniture, and rattan, became into the spotlight of many researches given that it could be set as a trademark of Malang City. Ceramics from Dinoyo, for example, have long been known to have good quality amid other competitive products from other regions, especially China. In addition, what were no less interesting were *Topeng Malang* (Malang Masks), wooden furniture, and rattans which were produced into household furniture, as well as crafts which used recycled materials which were also increasingly in demand and growing rapidly in Malang City. Meanwhile, the fashion sub-sector also experienced significant growth. This potential has been getting bigger along with the proliferation

of online marketing media (internet). In addition, the development of the fashion industry, especially clothing in Malang, is very rapid in the last 10 years. The actors of the clothing and distribution industries continue to emerge in Malang, especially in Malang City which is very famous for its nickname as the city of education. Naturally, Malang City becomes a paradise and trend center for fashion enthusiasts. Finally, the culinary sub-sector had a number of creative economic actors and was most interested in because it was often visited by domestic and foreign tourists. Food business opportunity has been one of other familiar business opportunities and has become a very profitable business opportunity in Malang. The most prominent is the emergence of cafes in Malang Raya.

RESULTS OF IFAS ANALYSIS

This analysis was carried out on a current condition and situation faced by the Creative Economy actors in Malang Raya in carrying out their main activities. Following is the data from IFAS analysis.

Table .2 Internal Factors Analysis Summary (IFAS)

Question	Rating	Weight	Score
1. Strategic planning that is not too expensive and complicated	3.3	0.14	0.46
2. Low labor costs	2.8	0.12	0.33
3. The position of the company leader who comes from family members	3.15	0.13	0.42
4. Low competitiveness	2.65	0.11	0.30
5. Low skills and technology mastery	2.8	0.12	0.33
6. Low funding capacity	3.3	0.14	0.46
7. Management that is still done in traditional manner	2.9	0.12	0.35
8. Low production capacity	2.8	0.12	0.33
Total	23.7	1.00	2.98

Source: Processed data, 2018

Based on the results of the internal environmental analysis as shown in the table above, it can be seen that the total weighted value of IFAS is 2.98. This indicates that Creative Economy actors in Malang City were in a position that is good enough to further develop their business, but it can not rule out the possibility for them to remain alert to the existing weaknesses. Based on the results of the external environmental analysis as presented in the table above, it can be seen that from the multiplication of weights and ratings, the total weighted value is 3.75 for the EFAS Matrix. It depicts that Creative Economy actors in Malang City were in a very good position to further develop their business, but it can not rule out the possibility for them to remain alert to the existing weaknesses. According to the results of IFAS and EFAS analysis, strategies that can be developed for the three Creative Economy sub-sectors (craft, fashion, and culinary) to improve their competitiveness include: (1) improving human resources through training, workshops and work practices, (2) improve product branding through multimedia and social media, (3) making market center and trade center, (4) facilitation of IPR for business people, (5) facilitation of partnerships and collaboration between sectors, (6) facilitation of capital access, financing matchmaking, (7) facilitation of technology modernization, (8) making product standardization and competency certification for HR, and (9) improving competitive creative business climate

Strategic Position of Creative Economy Actors in Malang Raya

After analyzing both internal and external environment, the next step was to move the score into the IFAS-EFAS matrix. The total weighted value for IFAS is 2.98, while the EFAS score is 3.75, so that the position of the Creative Economy actors in Malang Raya in the IFAS/EFAS matrix is located at Quadrant I, at point B. At that point, the suitable strategy is Stable Growth Strategy. For more details, please look at the picture. Stable Growth Strategy is a growth that needs to be carried out in stages according to priority scale.

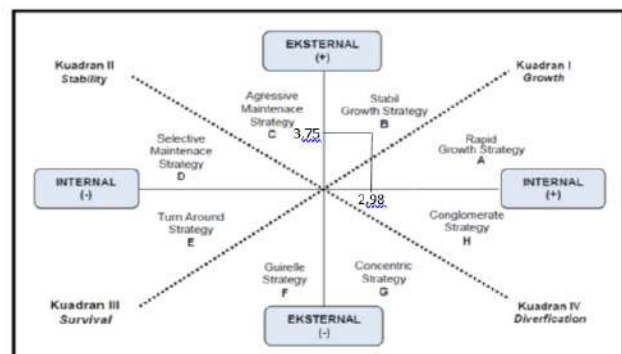

Figure 9. Position of Creative Economy Actors in Malang Raya

Based on the FGD results, it can be concluded that out of 16 creative economy sub-sectors, there are three sub-sectors that have the largest contribution in GDP, namely Craft, Fashion and Culinary. For these three sub-sectors, a strategy would be created and then the development model would be made in accordance with local wisdom in the following year. In general, the results of the FGD also concluded that the Creative Economy that will be developed in Malang Raya should be in accordance with the locality of Malang City, for

example crafts which become the hallmark of Malang is the craft of masks and batik with mask motifs. Mask is a product based on local wisdom in Malang.

CONCLUSION

Based on the discussion that has been described, it can be concluded as follows:

1. The number of MSMEs in Malang was 2,191 which were engaged in the creative economy and were distributed into 16 sub-sectors.
2. The characteristics of the Creative Economy in Malang Raya were assessed based on indicators, namely number of Creative Economy sub-sectors, number of workers, and marketing area, which show that the most potential Creative Economy sub-sectors in Malang were the craft, fashion and culinary sub-sectors whose average number of workers was 1-4 people. In addition, most of products of the creative economic sub-sectors in Malang Raya were in local markets.
3. Based on IFAS and EFAS analyses, the position of Creative Economy strategy in Malang Raya was in the Stable Growth Strategy, a growth that needed to be carried out in stages according to priority scale.
4. Strategies to increase competitiveness include: 1) Improving Human Resources through training, workshops and work practices, 2) Improve product branding through multimedia and social media, 3) Making market center and trade center, 4) Facilitation of IPR for business people, 5) Facilitation of partnerships and collaboration between sectors, 6) Facilitation of capital access, financing matchmaking, 7) Facilitation of technology modernization, 8) Making product standardization and competency certification for HR, and 9) Improving competitive creative business climate.
5. In general, the results of the FGD also concluded that the Creative Economy that would be developed in Malang should be in accordance with the locality of Malang.

The Effect of Firm Decision Making of Risk Preference Concerning to Debt to the Firm Performance in Indonesian Stock Exchange

Yohanes Indrayono

Department of Accounting, University of Pakuan, Bogor Indonesia

ABSTRACT

How firm should act risk averse or risk taking of achieving its objective to maximize stockholder wealth is still puzzle. Firms with high financial performance may act risk averse, but underperforming firms act risk taking concerning to debt. This study proposes new approach of calculating firm risk preference concerning debt use variance of firm financial performance growth and firm leverage growth and also investigates how the effect of risk preference by the firms to the profitability i.e. earning per share (EPS). This study analyses 52 firms as sample with significance book value and the most active trading stocks of Indonesian Stock Exchange during 2007 to 2016. The result is firms with good financial performance and still act risk averse will gain increasing financial performance of earning per share (EPS). This study contributes new approach of calculating firm risk preference concerning debt use variance of firm financial performance growth and firm leverage growth. Also, it suggests that firms should always act risk averse concerning debt.

Keywords: *Risk averse, book value (BV) growth, debt to equity ratio (DER) growth, earning per share (EPS) growth*

INTRODUCTION

Firm objective should be to maximize stockholder wealth by maximize the fundamental price of the firm's common stock (equity), not just the current market price¹. There are several number of equity valuation approaches. Equity valuation methods by direct method use sales to calculate present value of future cash flows and there are also methods based on the dividend growth model or classic fundamental analysis. indirect methods are intended to rank stocks using price-earnings ratios or return-on-equity ratios combined with book-to-price ratios. Equity price-to-book value (PBV) or market-to-book ratio defined as stock price divided by stock book value². Firms that have a high market-to-book ratio tend to have lower leverage³.

When firm performance is higher than expected, firms and their managers would be risk averse⁴. A firm with better profitability, book value, and capability to pay debt has bigger chance to get or additional dent from external resources. The firm with better financial performance may have alternatives sources of debts because more external parties will offer loans, so that the firm may chose the most competitive sources

which are the less interest and the longer debt payment period. As a result, the firm may able to minimize the cost of debt and this will make the chance to get more profit will be easier. For firm with better firm financial performance should use the opportunity to expand its business, to increase profit, and to increase firm wealth value optimally. On the other hand, when firms are underperforming and threatened by bankruptcy they would be more inclined to risk taking⁵. Firms search for solutions to underperformance by using idle and potential resources⁶. The firm with poor profitability, decreasing book value, and the lowering capability to pay its debt, is difficult to get new or additional debts. The firm with poor financial performance have very limited chance to get alternative of lender which can be selected the debt with the least requirements. Because of the higher risk of not performing loans of the lender to give the loan to firm is higher so the cost of debt is higher and the more requirements. The bigger cost of debt will disturb the expected profitability of the business expansion. Therefore, firm with poor financial performance not to expand its business by acquiring new or additional debt, but they implement survive strategy by operating efficiency or other way to reduce the cost to make loss

reduction or to increase profit.

What decisions firms make when investing, and whether firms follow different decision making protocols according to industry type, following the behavioral theory of the firm⁷. McKinsey (2010) who studied of 1,000 large investment companies revealed that when companies act by reducing their bias influence during their decision making, they will get significant profit increase. However people have no ability to recognize themselves of their behavior bias when they make decision, they may realize that they make mistakes when unexpected losses or negative things have occurred. This study proposes new approach of calculating firm risk preference concerning debt by variance of firm financial performance growth and firm leverage growth and also investigates how: firm performance may be affected by book value (BV) and price to book value (PBV), and firm performance may be affected by firm risk preference of decision making under uncertainty concerning to debt. To identify how firm act risk averse or risk taking about firm leverage, this study uses the book value growth as firm performance and debt to equity growth as firm risk preference.

Theoretical Review

According to the Pecking Order Theory, firms may be financially constrained due to the information asymmetry between managers/owners and investors, and so firms adopt a hierarchy in selecting sources of finance. In the first place, firms use retained profits; if it is necessary to turn to external finance, firms use debt with little or no risk, which usually corresponds to short-term debt; and in the last place, firms will select external equity. The more profitable is the firm, the greater is its capacity to accumulate retained profits, and so there is less need to turn to external finance.

Trade-Off Theory claims that firms have an incentive to turn to debt as the generation of annual profits allows benefiting from the debt tax shields. According to static tradeoff theory, firms should continue to use debt until the marginal benefit of using debt is completely offset by its marginal cost. The benefit of using debt includes interest deduction from taxable income and alleviation of free cash flow problem arising from the agency relation between managers and stockholders. The cost of using debt includes increasing the chance of financial distress and possibly causing asset substitution

and underinvestment problem arising from the agency relation between stockholders and bondholders.⁸

Empirical studies find profitable firms were more conservative in debt use⁹ documents evidence that corporate leverage is generally below the optimal level as predicted by the static trade-off theory¹⁰. The profitable firms exhibit even more debt conservatism. The findings are called “under-leverage puzzle” because they directly contradict the static trade-off theory. The pecking order theory cannot explain the findings either because these debt conservative firms are not as conservative in issuing new equity. In their effort to explain the under-leverage puzzle, argue that firms’ market timing behavior is responsible for the observed negative correlation between leverage and profitability¹¹. A positive earnings shock lifts stock price and creates an opportunity to issuing over-valued stock, which in turn brings down the leverage. This market timing explanation is not satisfactory because it violates efficient market hypothesis.

Explain the relationship between leverage and profitability in a dynamic tradeoff model¹². They argue that more profitable firms invest more and need more financial flexibility for future investment opportunities. Therefore, they use less debt to conserve borrowing capacity. This explanation is convincing because it is derived from maximization of a firm’s objective function within the constraints realistically present in our business world. This explanation is also supported by empirical evidence that more profitable firms tend to invest more and firms with more investment opportunities tend to maintain a low leverage. While dynamic tradeoff represents one piece of the debt conservatism puzzle, it falls short of solving it completely. This is evident from empirical studies regressing leverage against profitability and a set of other proposed determinants: including current and expected investment in the set does not reverse the sign of the estimated slope on profitability; even though these variables are significantly negative and do reduce the magnitude and statistic significance of the negative slope on profitability.

Book price can be decomposed into an enterprise book-to-price (that potentially reflects operating risk) and a financial leverage component (that reflects financing risk), with differences between the book value and the price of equity attributable only to the operating component. With this accounting for net debt, the book-

to-price ratio for net debt is unity and the standard measure of “market” leverage – net debt relative to the market value of equity – is economic leverage, but only if the market prices risk appropriately¹³. study of CEO risk aversion to be more pronounced in firms with high leverage or high default probability, find that the CEOs of these firms reduce firm risk, even in the presence of strong risk-taking incentives.¹⁴

Data and Method

This study uses 52 firms as sample during period of 2007 until 2016 listed in Bursa Efek Indonesia (Jakarta Stock Exchange) which are have significance book value and the most active trading stocks. The firm act risk averse when it did not add debt to expand its business although its financial performance increased. The firm act risk taking when its add debt to expand its business although its financial performance decreased. This study use firm financial performance indicators: book value (BV), price to book value (PBV), and earning per share (EPS).

Debt to equity ratio is used as the indicator of firm leverage. The risk preference of firm management in decision making under uncertainty concerning debt calculated as follows:

$$Riskaverse = \frac{B_n - B_{n-1}}{B_{n-1}} - \frac{DER_n - DER_{n-1}}{DER_{n-1}} > 0 \quad \dots\dots (1)$$

$$Risktaking = \frac{B_n - B_{n-1}}{B_{n-1}} - \frac{DER_n - DER_{n-1}}{DER_{n-1}} < 0 \quad \dots\dots (2)$$

With PBV = Stock Price/(Total Assets – Total Liabilities) per share, DER = Total Debt/Total Equities, PBV_{tn} is price to book value in the accounting period that ending on year tn, PBV_{tn-1} is price to book value in the accounting period that ending on year tn-1, DER_{tn} is debt to equity ratio in the accounting period that ending on year tn and DER_{tn-1} is debt to equity ratio in the accounting period that ending on year tn-1.

The decision making concerning debt of the firm performance be analyzed by growth of firm earning per share (EPS growth) which be calculated:

$$\frac{EPS_{n+1} - EPS_n}{EPS_n} = EPSGrowth \quad \dots\dots (3)$$

With EPS Growth is percentage of increase/decrease of earning per share of year tn+1 compare to year tn.

RESULTS AND ANALYSES

From table 1 we find that: book value (BV) is not correlate to price to book value (PBV), book value (BV) is not correlate to debt to equity ratio (DER), book value (BV) is not correlate to price to earning ratio (PER), price to book value (PBV) is not correlate to price to earning ratio (PER), price to book value (PBV) is not correlate to debt to equity ratio (DER), book value (BV) correlate to earning per share (EPS), and price to book value (PBV) correlate to earning per share (EPS).

Table 1: Pearson correlation

		EPS	BV	PER	PBV	DER
EPS	Pearson Correlation	1	.788**	-0.053	.321**	0.017
	Sig. (2-tailed)		0	0.228	0	0.703
	N	520	520	520	520	520
BV	Pearson Correlation	.788**	1	-0.062	-0.037	0.003

	Sig. (2-tailed)	0.703	0.94	0.628	0.018	
	N	520	520	520	520	520
** Correlation is significant at the 0.01 level (2-tailed).						
* Correlation is significant at the 0.05 level (2-tailed).						

The effect of book value (BV) and price to book value (PBV) to the earning per share (EPS)

With 95% confidence level, from Table 3, R Square 0.74 means that 74% of firm performance are influenced by book value and price to book value and the rest of 26% are influenced by other factors. $F = 751.25$ and significance at 0.0000 less than alpha 0.05. It means that dependent variable firm earning per share (EPS) growth are affected by book value (BV) and price to book value (PBV) growth. Book value (BV) and price to book value (PBV) growth have positive effect on EPS Growth at significance 0.000 at constant = -90.418 and $b_1 = 0.181$

and $b_2 = 22.933$. This study reveals that earning per share (EPS) increase when book value (BV) and price to book value (PBV) increase.

With 95% confidence level, from Table 3, R Square 0.40 means that 40% of firm performance are influenced by risk preference by firm managements and the rest of 60% are influenced by other factors. With $F = 314.77$ and significance at 0.0000 less than alpha 0.05, it means that dependent variable firm EPS growth are affected by how risk preference by management concerning debt. Risk averse have positive effect on EPS Growth at significance 0.0000 at constant = - 0.1990 and $b = 3.0130$.

The effect of firm decision making concerning to debt to the earning per share (EPS)

Table 2. BV growth and PBV growth

Dependent variable	n		Unstandardized coefficients B	t	Sig.	R Square	F	Sig.
EPS Growth	519	Constant	-90.418	-5.049	0.000	0.744	751.25	0.000
		BV Growth	0.181	35.978	0.000			
		PBV Growth	22.933	15.735	0.000			
Confident level at 95%								

The study reveals that: firm with additional debt by less percentage than the additional performance (risk averse) will increase its earning per share, and firm with additional debt by more percentage than the additional performance (risk taking) will decrease its earning per share.

Table 3. Risk averse

Dependent variable	n		Unstandardized coefficients B	t	Sig.	R Square	F	Sig.
EPS Growth	467	Constant	-0.1990	-0.69	0.000	0.4030	314.77	0.000
		Risk averse	3.0130	17.74	0.000			
Confident level at 95%								

Interpretation

This study finds that book value (BV) and price to book value (PBV) affects earning per share (EPS). Logically we can conclude that because of two variables have significance effect to the other variable, the two variables (BV and PBV) may have correlation. We may also conclude because BV is part of PBV, which is PBV is counted by dividing stock price by book value (BV), so that BV should have correlation to PBV. But that

commonly correlation between book value (BV) and price to book value (PBV) is not occur, we predict that stock prices are the cause.

In Indonesian Stock Exchange, the stock indices are increase significantly during year 2011 (after financial crisis) until 2016 because of the large proportion amount of foreign fund entry to stock market. The stock prices have increased significantly moved beyond its fundamental value which is stock book value. This study

indicates that firm with good financial performance and still act risk averse will gain increasing its financial performance. Contrary, the firm with less financial performance and act risk taking will suffer decreasing financial performance. The firm performance is calculated by how much growth of its book value (BV) and the firm risk taking is calculate by how much growth of its debt to equity ratio (DER). When firm have positive variance of book value (BV) growth compare to the debt to equity ratio (DER) growth, it means that the firm is risk averse. Other firm which have negative variance of book value (BV) growth compare to the debt to equity ratio (DER) growth, it means that the firm is risk taking. The more positive variance of book value (BV) growth compare to the debt to equity ratio (DER) growth is the more profitable firm which reflect on increasing its profitability earning per share (EPS).

ABSTRACT

This study aims to (1) determine the proportion of food cost to total household expenditure of farmers in Padang according to income groups, (2) determine the level of consumption of food (energy and protein) household farmers in Padang based on income level and (3) analyze conditions of household food security of farmers in Padang according to the income group. This research using survey method, whereas the data used includes primary and secondary data. Secondary data was obtained from the results of publications and information related to food security, while primary data was obtained through direct interviews with household members of farmers. The number of research samples was 60 households. Data analysis was done by disaggregation of household groups into low, medium and high groupings.

The results showed that the characteristics of household farmers in the low, medium and high groups are not significantly different. Whereas in the average proportion of food cost to total expenditure has decreased, where in the level of low income to the proportion of food cost was 64%, medium was 62% and high was 61%. The level of consumption of food (energy and protein) at home based on the low, medium and high income level are dominant in good conditions, such as 70.83%, 62.50% and 100%. The condition of household food security in the high income level group was better where there are no more households with the condition of food insecure and insufficient households. According to Engel's Law, are the higher income of a person (household), then the percentage of cost on food will be smaller as evidenced in this study.

Keywords: Food Security, Farmer's Household, Engel's Law, Disaggregation

INTRODUCTION

Food Security is divided into four levels are national, regional, household or family food security and individual food security¹. Although nationally, it has good for household food security, but it does not guarantee regional food security even households or individuals. This happens because household's level has different availability and access to food in each region. Household food security is related to the ability of households access to food adequately to fill the needs of all family members².

Household food security is reflected in several indicators, including: (1) the level of damage to crops, livestock and fisheries, (2) decreased food production, (3) the level of food availability in households, (4) the

proportion of food cost to total expenditure, (5) fluctuations in the prices of main foods commonly consumed by households, (6) changes in social life, such as migration, selling / mortgaging assets, (7) the state of food consumption of eating habits, quantity and quality of food, and (8) nutritional status³

The consumption pattern, especially household food consumption, is one of the determinants in health and intelligence levels and household productivity. Consumption and cost data can be used for a research on the application of economic law. According to Ernest Engel, in⁴ known as Engel's Law that if tastes are not different the percentage of cost on food will decrease with increasing income. Therefore, the composition of household expenditure can be used as a measurement to assess the level of welfare of the population, the

lower percentage of cost on food on total expenditure, level of the economy of the population is much better. However, increasing of food cost, it will decreasing the prosperous of the household concerned. In conditions of limited income, the fulfillment of food needs will take precedence, so in low income groups, a large part of their income will be used to buy a food.

Research Methodology

Research Location and Time

This research was conducted in 2 sub-districts of Padang City. Determination of the location of this study was carried out by purposive sampling, and the determination of the research location that was carried out purposively.

Population and Sample

The population used in this study is all farm households in 2 selected sub-districts in Padang City. The distribution of samples based on their kelurahan can be seen in the following Table 1.1:

Table 1. Distribution of Sample in 2 selected sub-districts

Sub-districts	Sub-subdistricts	Amount of Farmer Group	Distribution of Sample (%)	Amount of Sample each Sub-subdistricts
Koto Tengah	Total	67	46,85	28
	LubukMinturun Sungai Lareh	42	62,69	18

Data Analysis and Processing Methods

Processing Method

The data obtained were analyzed by qualitatively and quantitatively. Qualitative analysis is used to see an overview of household characteristics of farmers / respondents based on income level and several other related things will be described descriptively. Whereas quantitative analysis is presented in the tabulation form to simplify data into a form that is easy to read in this study.

Data Analysis

Analysis of Farmer Household Income with the Household Farmer Expenditure Approach

To find out the total amount of farmer’s household expenditure can be known by calculating food and non-food expense. The formula used is:

$$TP = P_p + P_n$$

Where:

TP : Total expenditure offarmer’s household (IDR/ Month)

P_p : Food Expense (IDR/Month)

P_n : Non-food Expense (IDR/Month)

Proportion of Food Cost on Total Household Farmer Expenditures

The proportion of food expense on total household expenditure of farmers can be calculated by the following formula:

$$PF = x 100\%$$

Dimana:

PF : Proportion of food expense (%)

P_p : Food Expense (IDR/Year)

TP : Total Expense (IDR/Year)⁵

Level of Farmer Household Food Consumption (Energy and Protein Consumption)

Consumption of farmer’s household food can be seen from the quantity and quality of food consumption. Food quality reflects the ingredients of nutrients needed to body contained in food, while the quantity of food reflects the amount of each nutrient in a food. To achieve a good nutritional state, the quality and quantity must be fulfilled.

Farmer Household Food Security Analysis

The grouping of households using these two indicators can be seen in Table 2. There are four levels of food security, like: food-resistant households, food-vulnerable households, food deficiency households and food insecure households.

Table 2 Measurement of the degree of household food security

No	Energy Consumption Level	Proportion of Food Expense	
		Low (< 60% total expense)	High (≥ 60% total expense)
1	Sufficient (> 80% energy sufficiency)	Food-resistant	Food-vulnerable
2	Deficiency (≤ 80% energy sufficiency)	Food deficiency	Food insecure

RESULT AND DISCUSSION

Characteristics of Households Farmer Based on Income Level

Household Characteristics of respondent farmers covering the identity data of respondents and household members of respondent farmers. These data include age,

education level of household and housewife, number of household members, farming experience and the area of land owned.

Age

Farmer household characteristics seen from the age of farmers who are divided by income level can be seen in Table 1.3 below

Table 3: Farmer household characteristics seen from the age of farmers based on income level

Age Characteristics (Year)	Level of Income						Total	%
	Low	%	Medium	%	High	%		
29 – 44	13	54,17	5	20,83	3	25	21	35,00
45 – 60	9	37,50	14	58,34	8	66,67	31	51,67
≥ 61	2	8,33	5	20,83	1	8,33	8	13,33
Total	24	100	24	100	12	100	60	

Source: Research Result, 2013

Education

Formal education affects to a person’s knowledge and perception. The average education of farmers as a whole is 9 years, or the level of junior high school. This means that the level of education of farmers is still low. The low level of education of farmers caused by several things, including limited cost, the environment, and the lack of facilities when they should go to school. Farmer households are generally low-income families, so they sometimes prefer to only complete 9-year education

or junior high school, then they work to fulfill their needs. The environment is also as an influential factor. Someone who lives in an educated environment will be more motivated to get a higher education like people in their environment, and also.

Number of Household Members

From the data obtained in the research location the number of respondent household members can be seen in Table 4 below.

Table 4. Characteristics of the Number of Respondent Household Members in Padang City Based on Income Level

CharacteristicsJART (person)	Income Level					
	Low	%	Medium	%	High	%
2 – 3	5	20,83	2	8,33	3	25,00
4 – 5	13	54,17	13	54,17	7	58,33
≥6	6	25,00	9	37,50	2	16,67
Total	24	100	24	100	12	100

Source: Research Result`, 2013

Farming Experince

Based from the experience of farming, it can be seen that generally the respondent farmers have experience in farming between 1-17 years there are 38 people or 63.33%.

Land Area

Details about the farm land area of the respondent farmers are in general the average respondent farmer has an area of 0.1-0.5 hectares 73.33% or as many as

44 people, while the farmer respondents who have an area of more than or equal 0.6 hectares only 16 people or 26.67%.

Proportion of Food expense on Total Household Expenditures of Farmers in Padang City Based on Income Level

The proportion of food consumption expense is the percentage of food expense compared to the total expenditure. The following can be seen in Table 5 the proportion of farmer’s household expenditure

Table 5 Proportion of Food expense on Total Household Expenditures of Farmers in Padang City Based on Income Level(%)

Household Expenditures of Farmers	Income Level					
	Low	%	Medium	%	High	%
Food	1.126.825	64	1.723.008	62	2.379.950	61
Non Food	629.083	36	1.071.354	38	1.509.375	39
Total	1.755.908	100	2.794.363	100	3.889.325	100

Source: Research Result, 2013

Food Consumption Level

Food consumption is a number of food and beverages eaten / drunk by the population / individual in order to fill their physical needs. Energy and protein consumption can be used to measure food quantity. In Table 6 the following is the average energy consumption and protein of the respondent's household and the level of nutritional sufficiency

Table 6 Average of Energy and Protein Consumption and Nutrition Consumption Level (TKG) Farmer Households in Padang City Based on Income Level (Kapita / Day)

Information	Income Level					
	Low		Medium		High	
	Energy (kkal)	Protein (gram)	Energy (kkal)	Protein (gram)	Energy (kkal)	Protein (gram)
Consumption	2.096,01	45,36	2.031,82	46,65	2.029,20	47,94
AKG Recommended	2.000,00	52,00	2.000,00	52,00	2.000,00	52,00

Household Food Security

Distribution of farmer household food security can be seen in Table 7 below

Table 7 Distribution of Food Security of Farmer Households in Padang City Based on Income Level (%)

Information	Income Level						Household Total	%
	Low		Medium		High			
	HH	%	HH	%	HH	%		
Food-resistant	8	33,33	8	33,33	6	50,00	22	36,67
Food-vulnerable	15	62,50	16	66,67	6	50,00	37	61,67
Food deficiency	0	0,00	0	0,00	0	0,00	0	0,00
Food insecure	1	4,17	0	0,00	0	0,00	1	1,66
Total	24	100,00	24	100,00	12	100,00	60	100,00

Source: Research Result, 2013

Based on the data above, it can be known the status of household farmer food security. Households with food vulnerable status have the largest distribution with a percentage of 61.67% of all farmer households. The second, households with food security status with a percentage of 36.67%, household food insecurity has a percentage of 1.66% and households food deficiency with a percentage of 0%. In other words there were no households that are in food insecure. From the information it can be seen that the majority of respondents have a proportion of food expense > 60% of total expenditure, and a sufficient level of energy consumption (> 80% of energy sufficiency).

CONCLUSION AND RECOMMENDATION

Conclusion

Based on the results of the study on the analysis of the relationship between the proportion of food expense and consumption on household farmer food security in Padang City, the following conclusions can be obtained:

Characteristics of household farmers in Padang City based on income level are : low income level, household farmer characteristics in terms of age between 29-44 years at 54.17%, education of average high school graduates at 37.50% and housewife. The average of junior high school is 41.67%, the average number of household members is between 4-5 people at 54.17%, the average farming experience between 1-17 years is 70.84% with the average land area owned 0.1-0.5 Ha as much as 79.17%. Medium income level, household farmer characteristics seen in terms of age between 45-60 years at 58.34%, education of farmers on average Elementary School / SR and Junior High School (SLTP) graduates at 33.33% and average housewife at junior high school at 41, 67%, the average number of household members is between 4-5 people at 54.17%, the average farming experience between 1-17 years is 54.17% with an average land area of 0.1-0.5 Ha as much as 66.67%. High income level, household farmer characteristics viewed from age in terms of 45-60 years of 66.67%, education of the average farmers in elementary / SR and junior high schools at 41.67% and average housewife of high school graduates at 41, 67%, the average number of household members is between 4-5 people at 58.33%, the average farming experience between 1-17 years is 66.67% with an average land area of 0.1-0.5 Ha as much

as 75%.

The size of the average proportion of food and non-food expenses of farm households based on income level are: low income level , the average proportion of food and non-food expenses is 64% and 36%. Medium income level , the average proportion of food and non-food expenses is 62% and 38%. High income level, the average proportion of food and non-food expenses is 61% and 39%.

The level of consumption of food (energy and protein) of household farmers based on income level are: in the low income strata for energy sufficiency in general it is good where 17 households or 70.83% and for protein sufficiency in general good category as many as 5 households or 20.83 % seen from $TKG \geq 100\%$ AKG. In household levels, the average energy sufficiency is in good category where 15 households or 62.50% and moderate protein sufficiency was 20 households or 83.34% seen from $TKG > 100\%$ AKG. In the high income level for energy sufficiency was 12 or 100% of households with good status seen from $TKG > 100\%$ RDA and for protein sufficiency was 11 or 91.67% of households with medium status seen from $TKG 80-99\%$ RDA.

The conditions of farm household food security based on income level are : low and medium income level in general are food vulnerable at 62.50% and 66.67% of farmer's households. The high income level is generally food resistance by 50%, vulnerable to 50% food.

RECOMMENDATION

Recommendation that researchers can submit are:

The proportion of large food expense in farmer households means that households have a low level of welfare, therefore there is a need for an effort to increase income to achieve household food.

The number of households with food vulnerable status means that households have fulfilled their energy needs, but with a high proportion of food. Therefore, to reduce the proportion of household food can be done by increasing household income. Increased income can be done, among others, through productive farm business training by the government, for example housewives, so that it will be expected to become employment

opportunities for housewives and can increase the income for their households.

It is expected that there will be research on other food security, for example in terms of availability and distribution.

ABSTRACT

This study aims to describe the transformation process of GAM's Free Aceh Movement from armed movements to political movements after the signing of the Peace MoU between GAM and the Government of Indonesia, and to investigate the strategies and challenges of GAM through the Aceh Party (PA) in carrying out the Aceh peace vision and mission to prosper the people of Aceh. This research was conducted using a qualitative approach and analyzed interpretatively on the data collected through interviews, observation, and documentation. This study found that the transformation of GAM into PA has colored politics in Aceh where the presence of local political parties that can attract the attention of the Acehnese so far has dominated the victory both in the executive and legislative ranks. Many GAM figures occupy strategic positions in the Aceh government. The PA strategy is political empowerment from grassroots to elites at the provincial level by appointing charismatic fighters, representative political recruitment between young and old groups, as well as the right political education methods in the community to attract PA victory. However, in the 4-period political journey of PA in realizing the mandate of peace, has experienced several challenges. Internal conflicts both horizontally and vertically have colored the political dynamics of PA. The right political education is expected to realize the expectations of the people of Aceh in accordance with the mandate of the Helsinki Peace MoU.

Keywords: GAM, PA, Aceh Peace

INTRODUCTION

The prolonged conflict that occurred in Aceh was a bloody conflict that lasted more than 30 years. The post-independence conflict of the Republic of Indonesia began with Tengku Muhammad Daud Beureueh's rebellion to the proclamation of the Free Aceh Movement (GAM) led by Hasan Tiro on December 4, 1976, and ended in the signing of the Memorandum of Understanding between the Government of the Republic of Indonesia and the Free Aceh Movement (GAM) on 15 August 2005 in Helsinki-Finland.

The MoU above provides an opportunity for GAM to participate in the political process in Aceh through the establishment of local political parties. This means that GAM has gone through a process of transformation from an armed movement to a political movement. GAM for

more than 30 years has succeeded in influencing the people of Aceh, especially in rural areas. So that during the conflict, fighting for the ideology of GAM's struggle to separate itself from the Indonesian government was increasing (Stange & Patock, 2010)¹.

THEORETICAL FRAMEWORK

Some research results and theories underlying the writing of this article include:

Understanding of politics:

Politics

Misunderstanding or understanding in a narrow scope about politics will obscure political objectives and all activities that are related to politics, including political education. Etymologically politics comes from

Greek, precisely from the word “policy” which means city state. The political understanding of the experts among them was raised by Laswell & Kaplan (1950)² who gave a classic understanding that “politics as who gets, what, when, and how.”

Furthermore, according to Miriam Budiardjo (2008)³ politics is a variety of activities in a social system that involves the process of determining and implementing goals. Here are some perspectives or approaches to politics³:

1. Moral Perspective / approach (good / bad): Politics of something noble because it is an attempt to achieve a good and just social order. Politics in bad form is the struggle for power, property and throne.

2. Conflict Approach: Politics is an activity to obtain and maintain interests (material and non-material). In an effort to find and maintain interests, conflicts, conflicts (physical and non-physical) arise.

3. Functional approach: Politics is the activity of formulating and implementing general policies (concerning the allocation of importance values formulated in public policy).

4. Discourse analysis approach: Politics is an activity to discuss situations from a political phenomenon, for example, the process of selecting ministers.

Various political definitions put forward by experts with various similarities and differences in understanding. Usually differences arise from attitudes that only emphasize certain political aspects or tendencies to see the point of view of the originator himself. In the past few decades, politics was identified only by activities controlling the state. But in its development politics encompasses all political decisions and various political problems in achieving noble goals, namely people’s welfare. For example, a community group that has been made aware of the effects of pollution from factories around the settlements that have caused citizen poisoning, will trigger political problems involving company owners, the government, and the community.

In Kartono (2009)⁴, the definition of politics is more dynamic and operationally functional, namely:

1. All decisions and implementation of future community development efforts.

2. Decision concerning self-fate.

3. Dynamic activities and processes of human behavior with an emphasis on political aspects of social problems.

4. Activities to uphold or change existing social conditions by using power.

5. All efforts and struggles of individuals and groups by using various tools, ways and alternatives of behavior to achieve one goal in accordance with the ideas of individuals and groups in an integral authority system in the territory of the country.

Political Party

Political parties are generally regarded as a manifestation of a political system that is modern or that is in the process of modernizing itself. So in the new countries the party has become a political institution that can be found.

According to Budiardjo & Anwar (1998)⁵ political parties are an organized group whose members have the same orientation, values and ideals, the aim of this group is to gain political power and win political position, and implement their policies. While according to Carl J Frieddrich in Budiardjo & Anwar (1998: 160)⁵, a political party is a group of people who are organized in a stable manner with the aim of seizing or maintaining control over the government for the leadership of their party and based on this control gives the party members fair and material use. But this is not a reason for R. Soltau defines a political party that is a group of citizens who are more or less organized, who act as a political entity and by utilizing their power to vote with the aim of controlling the government and explaining their general policies.

Aceh Conflict

The conflict between Aceh and the central government is multi-dimensional and rooted, meaning that the current conflict relationship cannot be separated from the conflict that occurred before the consolidation of Aceh. Darul Islam Government / Indonesian Islamic Army (DI / TII), revival of Free Aceh (AM), Aceh as Military Operations Area (DOM), Free Aceh Movement (GAM), Implementation of Martial Law, Civil Emergency and memorandum of understanding (MoU) between government RI and GAM are coordination lines that are not interrupted from the Aceh conflict.

MoU Helsinki

The Helsinki MOU according to the Ministry of Communication and Information of the Republic of Indonesia is a memorandum of understanding or agreement between Indonesia and the Free Aceh Movement (GAM) which was signed jointly in Helsinki Finland. The Government of the Republic of Indonesia and the Free Aceh Movement (GAM) affirmed their commitment to resolve the Aceh conflict in a peaceful, comprehensive and sustainable manner for all⁶. Furthermore, the parties to the conflict are determined to build mutual trust because they believe that only with a peaceful settlement of the conflict will it be possible to rebuild Aceh.

Aceh Party (PA)

The Aceh Party (PA), formerly known as the Free Aceh Movement Party (GAM), was once transformed into the Independent Aceh Movement Party. PA is one of the local political parties in the province of Aceh, Indonesia (Wikipedia: 2018). The party first participated in the 2009 Indonesian Legislative General Election and the Aceh provincial parliamentary elections, chaired by Tengku H. Muzakir Manaf, with the attorney Kamaruddin Abubakar. In the 2009 elections, the Aceh Party won a majority of votes in the province of Aceh with 47% of the seats available but in the 2014 election it was only able to win 26 seats from 81 seats.

The vision of PA is to build a positive image in political life within the framework of the Unitary Republic of Indonesia. As well as implementing party mechanisms in accordance with existing rules, and upholding the Helsinki MoU.

Political Education

Political education in English is called political forming, the word forming refers to the desire to form political people. Political education is one form of adult education⁴. This education is not intended only to form political intellectuals that are isolated from the surrounding community, but rather to emphasize individual relations with other individuals, and individuals with society in their environment, in a political context related to socio-economic-cultural aspects, in the midst of emerging conflict situations because of various kinds of differences or plurality in society. Next we review some definitions of political

education according to experts.

According to Rusadi Kantaprawira⁹ (2004: 55) political education is to increase people's knowledge so that they can participate optimally in their political systems. In accordance with people's sovereignty or democracy, the people must be able to carry out the duties of participation. Meanwhile, according to Almond & Powell (1975)⁷, political education is a part of political socialization that specifically forms political values, which shows how each society should participate in its political system.

Method

The research approach uses qualitative approaches that describe or describe problems by looking at phenomena and problems through the actual description. The data collection techniques used interview with elements of the Aceh Transition Commission (KPA), the TNI, the Community, the Government, former GAM, and Aceh Party Candidates. Furthermore, the researchers also observed the phenomenon of the change in the Free Aceh Movement to become a political movement. The third step is to study the documents related to the research, including the Law, Perpres, and also journals about GAM's struggle.

DISCUSSION

The Process of GAM Transformation

GAM's actual transformation has begun in stages, but it always fails and leads to gunfire. But the tragedy of the December 26, 2004 earthquake and tsunami brought about a tremendous disaster but also brought extraordinary goodness. The peace that the people of Aceh craved, finally realized with all the consequences. Disputed weapons turn into arguments, the wilderness becomes the negotiating table, emotional physical change becomes rational, and selfishness becomes humanist. The transformations that occur are 2 types of segments:

GAM Transformation in Society

GAM transformation into the community was a peace process in the Helsinki MoU after the GAM signed it, requiring GAM to reintegrate into the community. After GAM was dissolved they returned to ordinary people who could live safely without being hunted by fear like during a conflict. Many of the former GAM members,

when they returned to the community, returned to their old professions that had been abandoned, for example as farmers, fishermen, builders, traders, and also taught at dayah.

Even though in the Helsinki MoU agreement it was stated that former GAM and conflict victims must be given adequate services, but most of them did not expect the government too much. They just hope that they can live in peace and harmony.

GAM Transformation in Political Movement

Changes to political movements need to be done with smart steps and a natural approach, therefore, the need for involvement of charismatic figures in the community are needed. They can bring simple political methods that can be accepted by the Acehnese who are mostly apathetic about the situation of peace.

Political movements have been carried out and have been relatively successful which is marked by the end of the physical war, followed by the formation of local political parties in Aceh, including the Aceh Party. The following is the opinion of one of the figures of PA on political development in Aceh. According to him the development of GAM in politics has experienced rapid development because political management has changed verbally and no longer on the issue of Aceh independence, but has developed on the issue of autonomy, regional development and community empowerment. Aceh's political movements highlight more peace and development in areas affected by conflict.

Political Strategy of PA

GAM transformation from an armed movement to a political movement requires a strategy in its implementation. Among the strategies that exist is to avoid throwing issues = issues with indications of thuggery and field intimidation, on the contrary, the following strategies of PA as one of the mandates of GAM:

Comply with Vision and Mission

The establishment of this party is a commitment of peace agreement between RI and GAM which is also a tangible manifestation of armed political transformation towards civilized democratic politics. The substance of the agreement provides some authority for Aceh which is explained in Law No. 11 of 2001 concerning

the Government of Aceh as the basis for running the government. But the substance is incomplete, so the PA Law is formulated as well as its implementation as aspired, namely Self Government. For this reason the PA formulates the Vision and Mission as follows:

Vision: Build a positive image of political life within the framework of the Unitary Republic of Indonesia and implement the party mechanism in accordance with the rules of the Unitary Republic of Indonesia by upholding the Helsinki memorandum of understanding signed on August 15, 2005 between the Indonesian government and the Free Aceh Movement.

Mission: Transform and / or develop a vision to think the Acehnese people from the image of the revolution to the image of party development in terms of transparency for the prosperity of the people of Aceh, especially and the Indonesian people in general.

Formulating PA Winning Steps

The followings are steps that has been formulated based on the interviewed with elements of party members, party leaders, party sympathizers, and common members of society.

At least there are 4 steps:

1. The mass base of PA is very real and heterogeneous in social status so the PA must do political empowerment from grassroots to elite. PA candidates are recruited with the sikureung team system. This system is known conventionally as PA politics. It was said that PA conveyed its political vision and mission through appropriate political education within the party and the general public, both through training of cadres and party sympathizers and also through social media to the general public.

2. PA must have a strong political engine that can work effectively and quickly without a complicated bureaucracy. The political machine is not only in the political structure, but also involves, KPA, youth, women, intellectuals and also elements of the ulama.

3. Creating a positive political atmosphere that shows the political power that is considered capable of bringing political and economic change in Aceh.

4. Creating Positive Political Culture by giving a model to society that PA is the right party controlling

Aceh. The models are elite of PA, cadres and sympathizers.

CONCLUSION AND RECOMMENDATIONS

Changing the direction of GAM's movement to politics shows that the existence of the struggle still exists and continues to grow because as long as it still does not provide justice for the people of Aceh in the economy and welfare. But the challenge ahead is that representatives of the people must explore the science of legacy and become legislators who are concerned with the people. So the task and responsibility of GAM in this case PA is able to absorb the aspirations of the people and accommodate the interests of the people.

Some recommendations are:

1. To the board members both DPRA / DPRK from PA do not forget the promises that have been given to the people

2. The management of the PA and the Council of PA cannot prioritize the interests of the group alone, but think of the interests of the people who have entrusted to represent the aspirations of the people.

3. To the regional leaders from PA for the welfare of all Acehnese people regardless of class and party.

4. Political education will be the recommended choice in spreading the PA's vision and mission.

ABSTRACT

Coffee is one of the strategic and important commodities in Indonesia. In Aceh Province, coffee is one of the local superior commodities. Coffee production is a driving force in the economy of Aceh, particularly in the Gayo highlands. With no large private or state-owned plantations, this \$150 million export industry is built on a foundation of smallholder farmers managing small plots that average less than 1.5 hectares with few inputs. With high international demand for the high body, the coffee receives high export prices and an efficient value chain with high levels of competition for coffee at various points along the process delivers a large proportion of that to the farmers. This study takes an in-depth look at the Arabica Gayo coffee organic sector, particularly focused on the current state of the coffee value chain and its implications for the competitive advantage of Arabica Gayo coffee organic which is originated from Indonesia.

Keywords: *Arabica gayo coffee organic, value chain, farmer field school, and competitive advantage.*

INTRODUCTION

Indonesia is one of the largest coffee exporting countries in the world^{1,2}, and the Aceh province is the biggest producer of Arabica Gayo coffee organic³⁻⁵. Coffee production is a driving force in the economy of Aceh, particularly in the Gayo highlands. With no large private or state-owned plantations, this is \$150 million popular export commodity to several countries like Europe Union, USA, and Japan⁶ and built on a foundation of smallholder farmers managing small plots that average less than 1.5 hectares with few inputs and basically haven't economically income⁷.

The global coffee market is quite problematic for growers. Global coffee prices have been subject to wild fluctuations, with resulting issues for smallholder farmers reliant on this crop for their income⁸. These problems are caused by unfair trade^{9,10}, various constraints on production, processing and marketing so supply chain sustainability of arabica Gayo coffee organic is very hard to the realization^{7,11}. These days, the emergence of new paradigms and approaches of extension are shifting towards to the empowerment of farmers¹². Farmer Field

School (FFS) is one of the models and approaches widely used¹³.

The research objective are to analyse the competitive advantage of arabika Gayo coffee organic which is originated from Aceh province, Indonesia. Besides, to identify factors influencing knowledge, attitude and practice on coffee management practices among FFS participants.

Related Research

The theory of 'comparative advantage' says that any trade is better than no trade and that if everyone concentrates on the one thing that they are best at, and sells this on the market then everyone will benefit^{14,15}. However other studies show an increasing gap between poor and rich in the developing countries¹⁶. Competitive advantage generally goes to the stronger economy, not the weaker¹⁴.

Figure 1: Conceptual framework

Clearly there is a need for an expanded research program on alternative extension model in developing countries, and yet research on extension is chronically under-funded¹⁷. The FFS approach is generally considered to build on the critical theoretical framework of ‘knowledge and human interest’.

Several studies of global value chains in the coffee and other agricultural commodities^{18, 19, 20} have highlighted the shifting nature of corporate control due to weakened state regulation and disintegration of international conventions²¹ and increased the power of large corporate roasters within their supply chains²².

Proposed Method

Structural Equation Modeling

This study uses quantitative research by blending three research methods, namely, exploratory research, descriptive research, and causal research²³. Likewise; the multivariate technique such as structural equation modeling is deployed in this study for data analysis²⁴.

System Dynamic Approach

In sustainability perspective of Arabica Gayo coffee organic, the main activities were to mapping supply chain structure which is including all actors and activities¹⁴. The output from the first step would be used as input to system dynamic approach^{14, 25}.

Research Methodology

The study has employed a descriptive research design. As far as sampling is concerned, based on the pilot learning of coffee FFSs, from Aceh Tengah and Bener Meriah district. Totally 302 respondents were selected based on the simple random sampling method²³. Data were analyzed using different quantitative and qualitative statistical procedures and methods.

RESULTS AND DISCUSSIONS

A sample of 302 participants (45.36% male, and 54.64% female) participated in the study. Age range was from 25 to 35 years old. Results suggested that individuals had a high knowledge and experience with the product category (i.e. organic coffees). The mean value for product knowledge is five on a Likert scale of seven points and the size of individual coffee fields varied between 0.5 and 10 ha; less than 1% of the members had more than 5 ha of coffee.

Knowledge and Human Interest

The theoretical model proposed in this research (see Figure 1) suggests the use of structural equations modeling. The results of the SEM model demonstrates that all of the goodness-of-fit indexes were within the recommended ranges. Thus, the result of testing the structural research model was acceptable²⁶.

Table 1. Comparisons of goodness-of-fit indices of SEM models

GOF Indices	Criterion Guidelines	SEM Results
Chi-square (χ^2)		
Chi-square		209.415
Degree of freedom		92
Probability	p>.05	.000
Absolute fit measures		
GFI	>.80	.871
RMSEA	<.10	.087
RMR	<.05	.026
SRMR	<.05	.044
Normed chi-square	<3	2.415
Incremental fit measures		
NFI	>.90	.914
CFI	>.90	.923
Parsimony fit measurement		
AGFI	>.80	.825
PNFI	>.50	.743

Based on this model, the relationships between the constructs as reflected in the hypotheses statements are shown in Table 2.

Table 2. Testing the hypotheses of the structural research model

Hypothesized Path	Std. Estimate	Critical Ratio	Hypothesis
H1: Psychology -> Attitude	0.797	16.756***	Supported
H2: Psychology -> Practice	0.606	9.564***	Supported
H3: Communication -> Attitude	-0.260	-2.709 (ns)	Not Supported
H4: Communication -> Practice	0.477	5.182***	Supported
H5: Psychology -> Knowledge	0.984	9.514***	Supported
H6: Communication -> Knowledge	0.691	11.103***	Supported
H7: Attitude -> Knowledge	0.082	1.293 (ns)	Not Supported
H8: Practice -> Knowledge	0.339	5.673***	Supported

***significant at $p < 0.01$, ns: not significant

Table 2 shows that the standardised estimate (β) of the path between psychology and attitude (0.797), psychology and practise (0.606), communication and practice (0.477), psychology and knowledge (0.984), communication and knowledge (0.691), and practice and knowledge (0.339) were significant. Therefore, Hypothesis 1, 2, 4, 5, 6, and 8 were supported. Hypothesis 3 and 7 was not supported as the p-value was not significant.

Supply Chain Structure

The value chain for Arabica Gayo Coffee Organic is difficult to generalize, as farmers, collectors, and aggregators play a broad range of roles simultaneously. Figure 2 provides a generalized picture of the flow. Core actors handle the coffee, while supporting actors provide services to core actors.

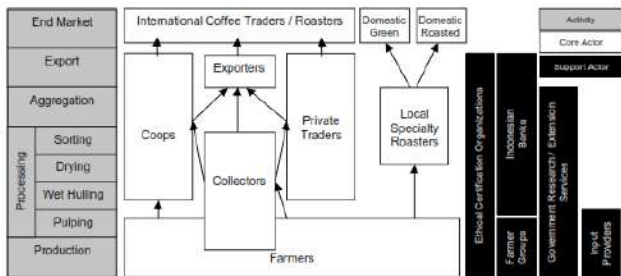

Figure 2: Arabica gayo coffee organic value chain

In this research, basic problems on arabica Gayo coffee organic supply chain structure was the gap of quality specification and benefit among each actor⁷. The business activities in the Gayo highlandshave existed in a long time, but until now it has not given better livelihood for farmers, although several certifications have been implemented, for instance, the fair-trade,

organic,geographic indicationand rain-forest.

This occurred due to the unfair trade conducted by the buyers⁹, so necessary a real effort to solve that problem by fair benefit distribution for each actor.

Most of the farmers work in a very isolated way reducing their chances to be more competitive. Social organizations try to organize them to get them certified, this statement is supported by¹⁰ while they state that most buyers collude to keep farmers isolated and hence get better prices. The Fairtrade Foundation state that the certification is needed because the little knowledge that farmers have of the market and this leaves them in disadvantage²⁷.

CONCLUSION

This research concluded that farmer’s psychology, communication, and practice in coffee management practices were the most important independent variables which had significant influence on the knowledge of Farmer Field School (FFS) members. basic problems on arabica Gayo coffee organic supply chain structure was the gap of benefit among each actor and quality specification. Most of the farmers work in a very isolated way reducing their chances to be more competitive.

One of the strengths of any research is to recognize its limitations. The first limitation relates to sampling. Thus, the sample used in this study does not represent the population of the Indonesian coffee organic. The second limitation relates to the variables contained within the research model. The study focuses on coffee industry in Indonesia area.This research could be replicated in other developing countries to find out the structure

of competitive advantage in different geographic areas. Conducting such studies could enhance the representativeness of the results in developing countries.

An Analysis of Culture Value in Adat Bak Poe Teumeureuhom, Hukom Bak Syiah Kuala, qanun Bak Putro Phang, Reusam Bak Binatara

Khalsiah¹, R Candrasari¹, N Fadhillah¹, R Praza¹, N Desiariawati¹

¹Lecturer, Universitas Malikussaleh, Indonesia

ABSTRACT

The cultural unity is in the language, religion and customs of Aceh. Acehnese communicate using Acehnese language, there also containing the meaning of proverb which has cultural value. *Nariet Maja* is a word or proverb in Acehnese life. *Hadih maja* contains a philosophical element which is used as advice or explanation and warning as a guide in life. In this study the researcher would like to analyze cultural value in *Hadih maja*. The majority of Aceh's tribe is Muslim. The study is conducted to find out two objectives to point out the system of community life in Aceh based on customary and religious law and to analyze the cultural value of Aceh Community. The significance of this research is expected the culture value in *hadih maja* is clear; for example it can pointed out *hadih maja* "Adat Bak Poe Teumeureuhon" is meaningful. This study will focus on analyzing of cultural value in *hadih maja* "adat bak po teumeureuhon, hukom bak syiahkuala, qanun bak putoe phang, reusam bak bintangara" through cultural view in Aceh. The technique of data collection used in this study was document review. It states that document review is "of collecting data by reviewing existing documents". The result show that Acehnese Adat is closely related to religion as the customary law comes from the *Shari'a* and *Shari'ah* from the books of Allah. Experience of Islamic law will be smoother, if the custom and the role of indigenous institutions are improved. The community as a unity of human life interacts and behaves to obey a system of certain customs that are continuous, where every member of the community acts and behaves according to what has been outlined and set forth in the system of values and norms owned by society.

Keywprds: *Islamic law, Religion, Aceh Community.*

INTRODUCTION

One of the tribes that has many culture is Aceh. Aceh is the name of an indigenous tribe that inhabits in coastal areas and some of them life in parts of the villages of Aceh province. The majority of Aceh's tribe is Muslim. Actually, the descendant of Acehnese consists of various tribes and nation. The binding of Acehnese cultural unity is in the language, religion and customs of Aceh. Acehnese communicate using Acehnese language. In the Acehnese language, there also is containing the meaning of proverb which has cultural value. *Nariet Maja* is a word or proverb in Acehnese life. *Hadih maja* contains a philosophical element which is used as advice or explanation and warning as a guide in life.

According¹ Culture is one of the concept which is generally used for art, literature, philosophy and music

Nowadays culture is also address the values of attitude which is expressed as the form of art, stories and songs. According to Hofstede (1986)² there are two different kinds of culture: strong and weak. The value is agreed with and embedded in society, among organization, around the community which is rooted in a habit of life, belief, symbols which has certain characteristics that can be distinguished from one to another as a reference of behavior and responses of what are happening or will happen next. Indonesian is a nation that has many culture values because of the diversity of tribes in Indonesia. The variety of tribes in Indonesia makes a distinctive culture of each region. In this study the researcher would like to analyze cultural value in *Hadih maja* "Adat Bak Poe Teumeureuhon, Hukom Bak Syiah Kuala, Kanun Bak Putroe Phang, Reusam Bak Binatara".

Based on the research background, the research question on this study can be formulated. How is the system of community life in Aceh based on customary law and religious law? How to analyze the cultural value of Aceh Community is the culture in Aceh?

Research Objective concerning with the research problem, the study is conducted to find out two objectives below: To point out the system of community life in Aceh based on customary and religious law To analyze the cultural value of Aceh Community. The significance of this research is expected as below: If culture value in hadih maja is clear, It can pointed out this hadih maja Adat Bak Poe Teumeureuhon, Hukom Bak Syiah Kuala, Kanun Bak Putroe Phang, Reusam Bak Binatara” has meaningfull. Research Scope This study will focus on analyzing of cultural value in hadih maja” adat bak po teumeureuhon, hukom bak syiahkuala, qanun bak putoe phang, reusam bak bintangara” through cultural view in Aceh.

An Overview of Culture

Etymologically, in this case culture (adat) comes from Arabic meaning “custom”, so in etymology adat can be defined as a repetitive act and become a fixed and respected habit, habits become custom. Adat is a habit that grows and is formed from a society or region that is considered to have naili and upheld and in obedient community supporters.

According to Usman (2003)³ Which in his writing states that “adat” comes from the Arabic language which is the plural of “adah” which means the way or the habit. As has been explained that adat is a cultural idea that contains the values of culture, norms, customs and laws that are commonly done by a region. Well, usually when this custom is not adhered to it will be either written or direct sanctions given to the behavior that violates it. However Harjito Notopura “ Wulansari (2010)⁴ Customary law is an unwritten law, customary law with a characteristic that is the guideline of people’s life in organizing the justice and welfare of the community and is familial.

Empirical Method

The research method used in this study is descriptive qualitative. Qualitative method produces data in the form of information descriptively⁶. The data generated in qualitative research is usually expressed in prose

or written form Polkinghorne (2005)⁷ Based on the explanation above, then in this study the author intends to describe.

Technique of Data Analysis

The technique of data collection used in this study was document review. It states that document review is “a way of collecting data by reviewing existing documents”. This study also used triangulation technique i.e. the technique of checking the data validity by exploiting something else beyond that data, for data checking purposes or as a comparison of data. In qualitative research, the research instrument is the book in the library and technique of data analysis used in this study is interactive analysis.

Research instrument

Data and Sample The subject in this study is the cultural value of hadih maja“Adat Bak Poetroe Teumeureuhon, Hukom Bak Syiah Kuala, Kanun Bak Putroe Phang, Reusam Bak Binatara” with the culture value in Aceh. The subject focus on culture in Aceh. The setting of the subject is in Balai Bahasa Aceh, Banda Aceh⁸.

4 Empirical Result and Discussion

Theological construct in the hadih maja From the above definition it is clear that the hadih maja is actually a manifestation of the embodiment of local values of the Acehnese people related to the value of the substance of religiosity, which in this context is the teachings of Islam. The mention of “people’s trust” in Aboe Bakar’s definition indicates that the hadih maja are deeply rooted in the daily life of the Acehnese. The mention of “the belief of the people, also indicates that hadih maja has emerged long before Islam entered Aceh. This does not mean that Islam does not affect the content of wisdom in the hadih maja. Hadih maja is also an open and growing literature, therefore when Islam comes,

the substance of his teachings also includes a series of content of hadih maja. In Aceh appears an adage that customs and religions such as substances with their properties cannot be separated.

In this sense the customs concerning attitudes and behavior of someone followed by others in a long process of time, this shows the extent of understanding the customs. Each community or nation and state have

their own customs, one with the other must not be the same. Customs can reflect the spirit of a society or nation and is a personality of a society or nation. The degree of civilization, the way of life that a person can not eliminate the behavior or customs that live and take root in society.

Community System In Aceh

The behavior of citizens should not pass from customs that have long existed in a region, should not violate the provisions of customs that have been set. There must be manners towards others, respect for others. Because humans always interact or interpersonal relationships. The process of continuous interaction gives rise to certain patterns called way or usage, ie A uniform or customary way of beating whiting a social group⁹.

Customs have very strong ties in Aceh society, citizens support the existence of customs as long as they do not challenge with religion, Customs that do not violate the norms in Aceh. The Aceh community also organizes village administration to avoid disputes in Aceh society, Acehnese people also follow customs that have existed so far and will continue for generations. Soepomo says that between the customary legal system and the western legal system there is a fundamental difference¹⁰ this is because each system has a different background (although it is possible that there are equations, the pressure on the difference is mainly due to because western law is limited by continental European law alone, whereas there is also an Anglo-Saxon legal system which is a western legal system).

Customs in the Acehnese are very diverse and vary widely, such as peasant custom and others. The custom can be done originally not to challenge the Islamic religion and the Islamic law or the Islamic syari'at in Aceh. the custom in the Aceh has existed from their ancestors from generation to generation and until now is still in the life of Aceh society. Aceh society is included as a region that takes care of its customs, the proof of Aceh society is very identifiable with its custom and the strongest of customary customs in Aceh.

Aceh Society Based On Religious Law

Australia has experienced a massive loss of its indigenous language. It has been reported in The 2001 Australian State of the Environment Technical paper

tha Islamic legal values cannot be separated from the principles of its adoption, as well as the objectives of Islamic law itself. One of the principles in question is the use of norms as one of the considerations in establishing the law. As a habit in society, custom or 'uruf' becomes one of the social needs that is difficult to be abandoned andlounced. Implicitly implied by several verses of the law in al-quran, among others in the letter of al-Baqarah: 233: Meaning: and it is the obligation of fathers to feed and dress the mothers in a modest manner. Islamic law can be developed and applied in accordance with the tradition (adat) that has been running, the nature of Al-Quran and As-Sunnah only provide the basic principles and character of Islamic law universality.t:

The Culture of Aceh

Culture is a set of values and social beliefs that grow and are rooted in the life of society in Aceh. Customs are behavioral or behavioral practices that are further recognized, acknowledged and appreciated, but are also respected by most citizens. The customs have contributed greatly to the survival of society. The general function of custom is to realize a harmonious life in the life of society, so that in the language of hadih maja quoted earlier, "no tabeue and hana bateue" then what is called the customary institution? Technically this is answered by qanun aceh about aceh institutions, qanun no.9 year 2008 states that customary institution is one of customary community organization which in form by a society of customary law of course have certain region and own its own property, and barhak have authority to organize and manage and resolve matters relating to aceh customs.

Qanun adat institutions are derivatives of the law no.11 of 2006 on aceh government detailing clearly there are thirteen institutions in Aceh society that is:

1. The customary assembly of Aceh
2. Imeum mukim or other names.
3. Imeum chik or any other name.
4. Keuchik or another name.
5. Tuha peut or another name.
6. Tuha lapan or another name,
7. Imeum meunasah or any other name
8. Keujreun-blang or other names.
9. Panglima laot or other name.

10. Pawang Glee/ uteun or another name.
11. Petua seuneubok or any other name.
12. Haria peukan or other names, and
13. Syahbanda or any other name

The function of the above institutions is as a vehicle for public participation in governance, development, community development, and social settlement.

Discussion And Implication

The customary law is the law established by a person or group of persons in the form of rewards, assignments, or sanctions imposed on those who violate custom. The Acehese Adat is closely related to religion as the customary law comes from the Shari'a and Shari'ah from the books of Allah. Experience of Islamic law will be more smooth, if the custom and the role of indigenous institutions are improved. of Hadih Maja

Hadih maja as a 'proverb or phrase' is an oral cultural product in Aceh society may reflect the pattern of life or characteristics of Acehese society. Because, initially hadih maja is born based on one's intelligence in memaknai life experience and the wisdom-specific groups or individuals who abstracted from everyday life in a long time. Subsequently, certain phrases were created as a means of projection of 'forecasts of things to come', the endorsement of cultural institutions, education, and other functions as described above. In the life of the Acehese, hadih maja placed as a source of value and upheld its existence.

Aboe Bakar, an Acehese historian mentioned that hadih maja is a utterance originating from an ancestor that is not related to religion, but has something to do with the people's trust which can be taken to assure the serenity of life or to prevent the occurrence of disasters, such as custom at a ceremony, rules of abstinence, sayings about morals and others.

One of the most famous Acehese culturists, Ali Hasjmy, mentioned that hadih maja is a word or sentence of wisdom. While another historian, Ali, defines the hadih maja as the advice and advice of ancestors containing moral values and religious education. The elements of adat including the hadih Maja also facilitate the understanding of religious understanding in the community.

Practical Implication

Through the above rules, Islamic law can be described at the local conditions of each region. Furthermore, in the field of trade and economics, the fiqhiyah rules provide the breadth to create various transactions or cooperation, for example by the rule: The scholars classify custom ('uruf) into two kinds:

Al-'uruf Al-sahih, the correct custom, repeatedly done, accepted by the masses, not contrary to religion, in order to be manners and ancestral culture. For example give a gift to a parent or acquaintance within a certain time, halal bi halal during the feast, giving a reward or achievement prize.

Al-'uruf Al-fasit, which is a misguided custom that is practiced in a place and even its implementation, but contrary to religion, state law, and polite. For example gambling to celebrate events, as well as serving illegal drinks.

Limitation and Resulting Implication for the Future Research.

The community as a unity of human life interacts and behaves to obey a system of certain customs that are continuous, where every member of the community acts and behaves according to what has been outlined and set forth in the system of values and norms owned by society.

linguistic norms, Exonormative English, target norm the 'native speaker' and the teachers can be monolingual.' While the latter is said to 'celebrates and supports diversity, multilingual and multi-dialectical, "International": a cross-national linguistic common core, English as lingua franca, local linguistic norms, regional and national, endonormative Englishes, target norm the good ESL user, bilingual and bicultural teachers.' Therefore, by adopting this World English paradigm, it is expected to contribute a more supportive condition to the local language preservation.

Storytelling to Narrate the Heart Through Historical Tourism to Internalize the Values of Local Wisdom

Bachtiar Akob

History Departement, Education Sciences and Teaching Faculty, Samudra University

ABSTRACT

This study examine the strategy of applying the storytelling method to narrate the heart through historical tourism visits to internalize the values of local wisdom in high school students in Langsa and the values of local wisdom as to what can be internalized in high school students. This study was designed qualitatively. Subjects in this study were three high school students in Langsa, while the objects were six historical tourist. Data collection techniques are carried out through: in-depth interviewing, direct observation, and documentation. Data analysis techniques include: collection, presentation, reduction, and verification/ drawing conclusions. Based on the results of the study, it was concluded that the strategy of applying storytelling method to narrate the heart through historical tourism visits to internalize the values of local wisdom in high school students in Langsa City in six stages, namely: 1) debriefing. 2) Visit to historical attractions. 3) Making storytelling scripts 4) Storytelling exercises. 5) Practice storytelling. 6) Evaluation and reflection. The storytelling is done by three techniques, namely: indirect monomyth, sparklines, and start false. The values of local wisdom that can be internalized in students are detailed in six historical tourist attractions, namely: Bambu Runcing's Park, Balee Juang, Tomb of Ampon Cik Banta Beurdan, Buddha Langsa Monastery, Langsa's Monument, and Rumoh Aceh.

Keywords: *Storytelling, Narrate the Heart, History Tourism, and Local Wisdom.*

INTRODUCTION

History teaching can basically be used as a medium to internalize the values of local wisdom. History is basically a way of creating wisdom¹. History, like the one launched by the Ministry of Education in Thailand since 2011, is the foundation for the formation of local wisdom². Indonesia is no exception as a diverse country. In another study, history is seen as a subject that aims to establish value and moral education. In the end, the teaching of history will lead to the development of the character of students in accordance with Pancasila³. History becomes a space for dialogue between past events and their development into the future⁴.

Historical teaching patterns can basically be done with a variety of paradigms. The teaching of history in high schools is done with a critical approach. Students are directed not only to receive historical stories textually, but also to think about curiosity about the process of occurrence of these events. Thus, the curiosity of high school tends to be higher and develop rapidly⁵. The

curiosity of high school students is the first step to direct them to understand an event. This understanding is directed as a capital for the formation of mental attitudes that are worthy of local wisdom.

Each region basically has a monumental event which is reflected in the form of historical relics. Culturally, local culture has the potential and the role of a counter culture for the domination of global culture which is posted as something cannot be avoided⁶. Each tourist area has a certain image, namely mental maps of a person against a destination which contains beliefs, impressions, and perceptions⁷. One area that has historical tourism is Langsa City. As a small city that was formed in 2001, Langsa City has its own unique and interesting aspects of its historical heritage. There are eight historical attractions that can be visited by high school students in Langsa City, namely: Bambu Runcing Park, Balee Juang, Tomb of Ampon Chik Banta Beurdan, Budha Monastery, Rumoh Aceh, and Langsa City Monument.

Serious efforts from the High School in Langsa to promote the mandatory tour program for historical tourism, will greatly play a role in internalizing the values of local wisdom from every historical event. One of them is the task and responsibility of the history teacher as the main stakeholder in history subjects. Teachers can act creatively and innovatively in packaging historical tourism visits so as not to appear boring. One of the interesting historical tour visits is through storytelling. In this method, students who have made historical tourism visits in Langsa City are required to retell the historical interesting things contained in historical buildings in Langsa City.

Related Research

Josette Frank in Asfandiyar (2007: 98)¹¹ explained that storytelling turned out to be an effective way to develop cognitive aspects (knowledge), affective (feelings), social, and conative aspects (appreciation) of children. Eck (2006: 22)⁸ also confirmed the existence of mental imagination in storytelling. This imagination is created from the relationship between: story, voice, gesture, and listener. Imagination created will form a separate learning experience between narrators and listeners. Denning (2004: 120)¹² defines stories as a narrative as one method of recapitulating past experiences by matching a verbal sequence of clauses to the sequence of events and at a minimum a sequence of two clauses which are temporally ordered. In another study, Denning (2005: 94)¹² explained that narrative or story in its broadest sense is anything told or recounted; more narrowly, and more usually, something told or recounted in the form of a causally linked set of events; account; tale; [sic] the telling of a happening or connected series of happenings, whether true or fictitious. “

Storytelling-based teaching is not only about preparation that must be done by students. Teachers are also required to plan storytelling activities. This planning is mainly done if the storytelling material is based on the environment. Heo (2004: 78)¹³ explains that there are four steps that must be done by the teacher, including: object recognition, designing learning interactions, conceptualizing stories, and making reflection of stories. In addition, there is also an emphasis on the importance of transforming the learning experience through deep reflection. According to Morgan and Dennehy (1997: 24)¹⁴, there are five components to construct an interesting story, namely as follows: determine the

setting that involves: place, time, character, and listeners who are able to build mental relationships; build interesting stories and grow the attention of listeners; build climax in storytelling; build story characters that include: behavior, curiosity, and ability to convey; and draw conclusions from the story.

In practice, the storytelling method is able to foster personal and educational / intellectual values in a person. Personal Value according to MacDonald & Read (1995: 35)¹⁵ can be seen from the ability of: a) providing pleasure and enjoyment, b) developing imagination, c) providing experiences that can truly be lived, d) developing a view towards human behavior, and e) presenting universal experiences. The educational value can be seen from the ability to: a) develop language skills, b) develop reading skills, c) develop sensitivity to stories, d) improve writing skills, e) foster social aspects, f) help develop emotional aspects, g) foster development aspects of creativity, and h) help develop cognitive aspects.

In connection with historical tourism aspects, Adi, et.al (2017: 2)¹⁶ means that historical tourism is a travel activity that aims to visit historical heritage sites. Historical tourism is very synonymous with cultural tourism. This is because, history is basically a part of the cultural side of a society. Cultural history-based tourism potential is one of the assets that has the potential to be developed by each region.

Historical tourism tends to sell characteristics that are typical of the shape and function of buildings, so that this problem poses a threat of degradation of physical values and functions that have a serious impact on the continuity of interest in tourist visits. In line with this statement, Suwantoro (2013: 22)¹⁷ writes that cultural history-based tourism is one of the potentials of each region because basically every region has a unique cultural history so that it becomes a different characteristic compared to other regions.

In connection with aspects of local wisdom, Mungmachon (2012: 3) explains that local wisdom is a way that teaches people to live in balance with nature and the environment¹⁸. Wisdom, both concretely and abstractly, becomes an important part that creates a human life experience. Wisdom is also a symbol of human strength in navigating life. Furthermore, according to Mungmachon¹⁸, “*local wisdom is basic knowledge gained from living in balance with nature. It is*

related to culture in the community which is accumulated and passed on. This wisdom can be both abstract and concrete, but the important characteristics are that it comes from experiences or truth gained from life. The wisdom from real experiences integrates the body, the spirit and the environment. It emphasizes respect for elders and their life experiences." Local wisdom is also interpreted as a view of life and science as well as various life strategies that are tangible activities carried out by local communities in answering various problems in meeting their needs¹⁹. In line with this statement, Rahyono (2012: 15) explains that local wisdom is also human intelligence possessed by certain ethnic groups obtained through community experience²⁰.

Local wisdom is also a form of knowledge, belief, understanding, or insight as well as customs or ethics that guide human behavior in life in the ecological community (Keraf, 2002: 23). Traditional communities in Indonesia have local wisdom to deal with natural disasters, such as earthquakes, floods, tsunamis, landslides and others. However technological developments in dealing with disasters, of course must be adapted to local wisdom, reading cues from our environment, animals and nature.

In people's lives, local wisdom is part of a culture that cannot be separated from the language of the community itself. The inheritance of local wisdom is usually carried out from generation to generation through word of mouth. Local wisdom is usually contained in folklore, proverbs, songs, and folk games. As a legacy of human life, the function of local wisdom becomes very important. It functions as knowledge found by local people through a collection of experiences and understanding of the culture and natural conditions of a place.

The position of local wisdom is very important, so that Law No. 32 of 2009 formulates it as noble values that apply to the system of community life which aims to protect and manage the environment sustainably. Local wisdom is an explicit knowledge that emerges from a long period and evolves together with the community and the environment in the area based on what has been experienced. This long evolution then forms a pattern called culture⁴. Therefore, local wisdom always intersects with the concept of nation building.

RESEARCH METHODOLOGY

This research was carried out in a qualitative

descriptive manner. Subjects in this study are historical heritage places in Langsa City. While the object of this study is high school students in Langsa City. The types of data used include: 1) Informants or sources consisting of: 1) High School History Teachers in Langsa City and High School Students in Langsa City. 2) Various historical attractions in Langsa City. 3) Text in the form of: archives, books, and other relevant records. Collection techniques include: in-depth interviewing, direct observation, and documentation. Data analysis techniques include: collection, reduction, presentation, and conclusion drawing.

RESULTS AND DISCUSSIONS

Strategy for Implementing the Storytelling Method to Narrate Heart Speech

The implementation of tourism trips is divided into two stages, namely: 1) Senior High School 3 Langsa and 2) Senior High School Cut Nyak Dien. Researchers invited students from Senior High School 3 Langsa to visit the following historical attractions: Bambu Runcing Park, Balee Juang, and Ampon Chik Banta Beurdan Tomb. At the first location, students are directed by researchers to observe the forms and historical symbols in the Bambu Runcing park. After that, students then make a brief note about historically interesting things in the Bambu Runcing Park building. The second location is Langsa City Juang Balee building. As is the case in Bambu Runcing Park, students also observe the shape and symbol of the Balee Juang building. In addition, because this place is used as a museum, students are also directed to observe a number of historical objects in the Balee Juang building. In addition, students are also directed to make notes about interesting things encountered, both related to the physical aspects of the Balee Juang building and the historical objects in it.

The third location is the Ampon Chik Banta Beurdan Tomb. Students are directed by the researcher to observe interesting things related to the tomb. In this place, students feel they don't find anything interesting. On the contrary, they feel disappointed because the condition of the tomb that looks unkempt. As an explanation, see the following picture. After making a tour, the students were given a month to make a storytelling script and present it by telling stories. Script writing and storytelling exercises are carried out with the help of mentoring teachers and

researchers. Students from Senior High School 3 Langsa making a storytelling script is done by referring to the method that has been chosen or determined by the researcher. The method used is Indirect monomyth (tells the story of heroism).

In indirect monomyth, students are directed to tell stories of heroism based on historical tourism aspects visited. Why is the indirect monomyth method and not direct monomyth chosen? Because in direct monomyth, students must communicate directly with historical witnesses or figures who are considered heroes. The same conditions also apply in understanding the heroic aspects of Balee Juang and the Tomb of Ampon Chik Banta Beurdan. Both places no longer leave historical witnesses who can be interviewed. Thus, researchers then take another alternative by taking the historical side based on the hero mentality. Students are no longer concerned about who, but what is the description of the mental attitude of a hero who struggles to maintain the independence of the Indonesian people. In addition, students were also directed to understand how long Ampon Chik Banta Beurdan struggled in establishing the Langsa village.

In order to facilitate students' understanding, they are directed to be able to take stories about: figures who are known/understood or heroic aspects based on historical attractions visited. Storytelling focuses on the psychological side or mentality of a hero who can inspire or inspire life. The spirit was then linked to the local wisdom that was embraced by the people of Aceh. The practice of storytelling was held on June 25, 2018 at Samudra University Hall. The students seemed enthusiastic about bringing stories made based on their interest in the theme.

The implementation of the tour for the Senior High School of Cut Nyak Dien was carried out by following the tourist route: Budha Monastery, Langsa City Monument, and Rumoh Aceh. At each location, students are directed by the researcher to observe the existing forms and historical symbols. After that, students then make a brief note about historically interesting things.

The location of the first visit was Budha Monastery. Students not only ask questions and discuss the historical aspects of monastery development, but also the values of wisdom that can be taken from the phenomenon of multiculturalism. In this case, students also think that

Langsa who is part of the Aceh region that applies Islamic Shari'a, in fact, is also able to live peacefully with adherents of other religions.

The second location is Langsa City Monument. As is done in Buddhist monasteries, students also observe the shapes and symbols found in the Elang Monument. Students are directed to observe the iconic animal-shaped monument. Students are also directed to make notes about interesting things found, both related to the physical aspects of Tugu Elang and the writings and paintings with the theme of Acehnese dances, heroes, and war that decorate the walls of the monument. The third location is Rumoh Aceh. As is the case in Buddhist monasteries and the Elang monument, students also observe the shapes and symbols found in Rumoh Aceh known as Rumoh Aceh Tengku Iman.

After making a tour, the students were given a month to make a storytelling script and present it by telling stories. Script writing and storytelling exercises are carried out with the help of mentoring teachers and researchers. For Senior High School of Cut Nyak Dien, the making of storytelling script is done by referring to the method that has been chosen or determined by the researcher. The method used is first, sparklines. Second, the start false technique. In making a story script that will be delivered in storytelling, researchers play an active role to guide and direct students. This is done so that students can make story scripts that are delivered by sparklines and start false.

The practice of storytelling was held on June 25, 2018 at Samudra University Hall. The students seemed enthusiastic about bringing stories made based on their interest in the theme. Sparklines and false start techniques provide alternative creative stories. This is because students are in direct contact with the aspects of contemporary and everyday life in the student environment. Thus, they will be easier to develop the story, without having to be very attached to the memory of the past. However, entering the past does require special techniques and a short amount of time. Because the past can be immersed in aspects of deep understanding, both factually against events and philosophically toward meaning.

Forms of Local Wisdom Values that can be Internalized in High School Students

One aspect of local wisdom found in Bambu Runcing Park is the internalization of the sentence *udeep syaree matee syahed*. Understanding the meaning of *udeep syaree matee syahed* has emerged in Aceh since the war against the Dutch. Almost all Acehnese fighters echoed this sentence as a form of resistance to Dutch colonizers. At Balee Juang, the value of local wisdom lies in the shape of the door which symbolizes the door of Aceh. This symbol is actually a historical proof that the Balee Juang building was made with a compromise of architectural values. That is, the Dutch see that Aceh has a high appeal to the beauty of art.

The value of local wisdom on Ampon Cik Banta Beurdan's tomb lies in the pilgrimage tradition which is also taught in Islam. The concept of pilgrimage, especially to the graves of pious people or scholars, teaches the human mentality to take the energy of the struggle of the deceased figures. Besides that, the pilgrimage is also a reminder that humans in time, will return to the Almighty. At Budha Monastery, the value of local wisdom that can be taken is the importance of mutual respect and respect for religious differences.

The value of local wisdom contained in Langsa's monument is included in the sentence, "*Customary Bak Po Teumeureuhom/Bak Syiah Kuala Law/Qanun Bak Putroe Phang / Reusam Bak Lakseumana*." Should have modeled Sultan Iskandar Muda as the leader of a fair and prosperous Aceh Darussalam kingdom. *Bak Syiah Kuala's* law symbolizes the application of law that should prioritize the principles of justice, honesty and religion. *Qanun Bak Putroe Phang implies* the need for an Islamic law that protects people's lives. *Reusam Bak Lakseumana* symbolizes the need for strong regional strength.

The value of local wisdom from Rumoh Aceh that can be internalized to students is about the concept of making a house that can be studied physically, spiritually, and culturally. Rumoh Aceh is a historical reality of a building that shows a mature architectural concept. In the present aspect, rumoh aceh is actually a symbol that the building that is made with careful thought will give birth to permanence. For example, Aceh rumoh is an example of earthquake and tsunami resistant buildings that have been taught by Aceh's predecessors. Rumoh Aceh is not only built physically as a place to live, but spiritually implies the meaning of majesty in the religion of Islam and local culture.

CONCLUSION

The strategy of applying storytelling method based on heart speech based on historical tourism visits to internalize the values of local wisdom in high school students in Langsa City is carried out in six stages, namely: 1) debriefing conducted by researchers assisted by supervising teachers from each school. This activity was carried out twice. 2) Field visits, namely inviting students to visit historical attractions that have been determined, namely: Taman Bambu Runcing, Tombs of Ampon Chik Banta Beurdan, Balee Juang Building, City of Langsa Temple, Rumoh Aceh, and Tugu Kota Langsa. 3) Guidance in the making of storytelling scripts carried out by researchers and tutors. 4) Storytelling exercises guided by researchers and mentor teachers. 5) Storytelling practices carried out by students. 6) Evaluation and reflection conducted by students, researchers, and mentor teachers. Evaluation and reflection is done to provide students with an understanding of the aspects of local wisdom gained after exploring and retelling historical stories based on the tourist attractions visited. The values of local wisdom that can be internalized in students are detailed in six historical tourist attractions, namely: Bambu Runcing Park, Balee Juang, Tomb of Ampon Cik Banta Beurdan, Budha Monastery, Tugu Langsa, and Rumoh Aceh.

Analysis of Productivity Measurement Using Marvien.e Mundel Method in Zakat Board of Lhokseumawe City

Anwar ST. MT.M.Ag. IPU¹, Ardiansyah Nasution¹

¹Department of Industrial Engineering, Faculty of Engineering, Malikussaleh University, Aceh-Indonesia

ABSTRACT

The term productivity is increasingly being talked as an social and public issues. However, there are so many people do not realize the meaning of the term, it is also about knowing how is it the importance of productivity. Meanwhile, productivity can be interpreted as a compound of production and activity, where production power as the cause and productivity measure the yield of the production power. If the size of production success is only viewed from the side of the output, then the productivity is viewed from two sides at once, namely: the input side and the output side. Basically mundel model is a measurement based on the concepts of industrial management and engineering science. This model requires that the company to be measured has a standard time for operation. The Marvin E Mundel method calculates the total productivity of each measurement period, by comparing the Partial Output value with the Partial Input value. While the output and input variables that will be examined in the Baitul Mal Kota Lhokseumawe are: Output in the form of the amount of public receipt (zakat payment to the community) while input is in the form of work equipment (asset value), material (zakat input), labor cost (base salary employees), energy costs (electricity costs, generators) and equipment maintenance costs and number of working days.

Keywords: *Productivity. Marvin E.Mundel*

INTRODUCTION

Zakat is a potential source of funds that can be utilized as an effort to realize people's welfare. Implementation of zakat worship involves a number of activities related to the management of property since the collection, distribution, supervision, administration, and accountability of zakat property. Therefore the implementation of such zakat worship requires a good management so as to enhance the role and function of zakat in realizing prosperity and social justice.

Management of zakat is planning, organizing, directing, implementing and supervising the collection, distribution, utilization and accountability of zakat property so that the zakat property can be handed over to those who have the right to receive it with the rules specified in syara' so that it can be achieved the main mission of zakat is to alleviate poverty.

However, the management and good supervision will be obtained by the productivity work of zakat institutions, especially those in the city of Lhokseumawe

Aceh province, whether the performance of institutions with resources existing in Baitul Mal of Lhokseumawe city has achieved good performance or not. So in this study the author discusses the performance productivity of Baitul Mal in Lhokseumawe city using Marvin E.Mundel method.

LITERATURE REVIEW

Productivity

Definition of Productivity

According to Sinungan (1997: 12)¹ in general productivity is defined as the relationship between the real and physical (goods or services) with the actual input. Productivity is essentially human desire and effort to always improve quality in all fields. Productivity can not be separated from the quality, technology, output ratio, and other things of operations management.

Benefits of Productivity Measurement

Measurement of productivity has benefits for a

company is as follows²

A company can assess the efficient use of resources in producing goods and services.

Productivity measures are useful for resource planning, both for short and long term.

Measuring business productivity level can be used to compile returns the economic and non economic goals of the company.

The results of future productivity level measurements can be re-modified based on current productivity level measurement information.

Strategies for increasing productivity can be determined on the basis of differences between planned productivity levels and productivity levels measured.

Measurement of productivity can be used to compare the performance of management in the same company, both in the industrial sector and in the national sector.

The productivity values generated from these measurements can be used in enterprise profit planning level.

Based on the above exposure it can be seen that by measuring productivity will provide excellent benefits for those who make productivity measurements, not only the company can benefit but also other parties.

Zakat

Definition of Zakat

Zakat is the fourth pillar of Islam that is obliged to every people of the season who are considered capable of issuing it, because by issuing treasures to zakat we can clean the treasure to return to the essence of holiness. Zakat according to language can mean the name '(fertility), thaharah (holiness), barakah (blessing) and can also mean tazkiyah tathier (sanctify). Zakat according to the language (etymology) comes from the word zaka which means to grow, bless, clean, and develop, while the meaning of zakat by terminology is a certain amount of property required by Allah SWT to be given to those who are entitled to receive zakat (Muzakki)³.

Hafidhuddin (2002)⁴ explains that zakat is a part of property with certain requirements based on Al-Qur'an

and Hadith, which Allah obliges to its owner, to be handed over to persons or parties entitled to receive it.

Instruction and Law of Zakat

Zakat is one of the laws of the pillars of Islam. Therefore, it is the principal that makes upright of Islam because of its existence. On the contrary Islam will be defective when one is substantially lost. Therefore, its very basic existence became al-Quran and al-Hadist as the basis of Islam which discussed it a lot. One of the commandments listed in Q.S At-Taubah (9): 103) is:

Meaning : Take zakat from their property to clean it up, purify them and pray for them. Your prayers are indeed nurturing their souls. Allah is ever more merciful.

This verse is about Abi Lubabah's request to the Prophet. He said, O Messenger, our treasures are many, take and give it to other people in Allah name and ask forgiveness for us. Apostle replied, sorry yes Lubabah, I was not ordered by Allah swt. To take the treasure of anyone. When this verse goes down, it orders the Apostle to take the treasure of Lubabah as zakat. Thus the explanation of imam as sayuti in Lubabun Nuqul fi Asbabin Nuzul.

Besides the al-Quran, Hadith as the second hand also mentions how important the zakat, even it is the foundation of the establishment of Islam. Rasulullah Saw. That said: "Islam is affirmed in five cases, First Testify that there is no god but Allah, and that muhammad is the messenger of Allah swt. The two set up the five daily prayers, the three paid the zakat, the fourth went on pilgrimage to the Baitullah, the five fasted in the month of Ramadan.

From the description, explains that the zakat is the five pillars of Islam and one of the most crucial pillars. The Jumhur Ulama also agreed that the zakat of law is obliged ain (fardhu'ain) for every Muslim if it has fulfilled the conditions that have been determined by Islamic law⁵.

Zakat Management Institution

a. Institution Structure of Amil Zakat

1) Amil Zakat Institution consist of Advisory Council, Supervisory Commission and Implementing Agency.

2) The Advisory Council as referred to in

paragraph (1) includes the elements of chair, secretary and members.

3) The supervisory commission referred to in paragraph (1) includes the elements of the chairman, secretary and members.

4) The implementing agency as referred to in paragraph (1) includes the elements of chair, secretary, financial section, collection section, distribution section, and utilization

5) Members of the Board of Amil Zakat consist of elements of society and government elements.

Research Method

Research Field and Time

The research was conducted at Baitul Mal of Lhokseumawe city, it is located in Islamic Bureau Building center of Lhokseumawe city. The time of the research was conducted on 23 February 2018 which started with preparation of research proposal until the writing of research report is completed.

Research Instrument

Instruments used in the research, among others are the data collection from the secondary and primary sources.

The number of depreciation for equipment is obtained by using straight line method of depreciation.

$$\text{Depreciation} = \frac{\text{Beginningvalue} - \text{Endingvalue}}{\text{Equipmentusefullife}} = \frac{\text{Rp}221.850.000 - \text{Rp}17.100.000}{10} = \text{Rp. } 4.475.000 / \text{year}$$

Selanjutnya melakukan perhitungan biaya depresiasi peralatan dan fasilitas perjam.

$$\text{Depreciation per hour} = \frac{4.475.000}{5.396} = \text{Rp. } 753,87 / \text{hour}$$

Definition of Variable Operationalization

- a. Data of Working Hour
- b. Data of Depreciation Cost for Machine and Equipment
- c. Data of Material Cost/Zakat Input
- d. Data of Labor Cost
- e. Data of Energy Cost
- f. Data of Maintenance Cost
- g. Data of Price Index
- h. Number of Disbursement of Zakat by Lhokseumawe Zakat Board January 2015 Until December 2016.

RESEARCH RESULT AND DISCUSSION

Calculation of Deflator Cost

Regarding to data gathered from the prior research conducted on the baitul mall lhokseumawe city is found that the value of assets in 2015 is Rp. 221,850,000. While the book value of 2017 is Rp. 177.100.000, with estimated useful life is 10 Years.

Table 1: Depreciation per hour is used for calculating the input partial of monthly depreciation in a period

Month	Period (Rp)		
	2015	2016	2017
Jan	132.681,12	120.619,20	132.681,12
Feb	114.588,24	114.588,24	120.619,20
Mar	132.681,12	126.650,16	132.681,12
Apr	126.650,16	126.650,16	120.619,20
May	114.588,24	126.650,16	120.619,20
Jun	126.650,16	132.681,12	102.526,32
Jul	114.588,24	108.557,28	126.650,16
Aug	120.619,20	132.681,12	132.681,12
Sep	126.650,16	126.650,16	114.588,24
Oct	132.681,12	126.650,16	132.681,12
Nov	126.650,16	132.681,12	132.681,12
Dec	126.650,16	126.650,16	108.557,28

Depreciation = (Available hour x Equipment depreciation per hour)

$$= 176 \times 753,87 = \text{Rp. } 132.681,12$$

Deflator Calculation

Deflator Calculation for Depreciation Cost

$$\text{Deflator February 2015} = \frac{1.HFeb15 - 1.HJan15}{1.HJan15} = \frac{104,28 - 103,9}{103,9} = 0,0036$$

Figure 2 calculation of deflator on the material, labor, energy and maintenance

Period 15	Price Index	Deflator	Period 16	Price Index	Deflator	Period 17	Price Index	Deflator
Jan	103,9	0	Jan	105,74	0	January	110,96	0
Feb	104,28	0,0036	Feb	105,79	0,0005	February	110,94	0,0002
Mar	104,85	0,0054	Mar	106,12	0,0031	March	111,34	0,0036
Apr	105,31	0,0044	Apr	106,12	0	April	111,55	0,0019
May	105,38	0,0007	May	106,06	0,0006	May	111,55	0
Jun	105,91	0,0050	Jun	106,59	0,0050	Jun	111,56	0,0001
Jul	105,84	0,0007	Jul	106,58	0,0001	July	111,59	0,0003
Aug	105,84	0	Aug	106,75	0,0016	August	111,44	0,0013
Sep	105,84	0	Sep	106,9	0,0014	September	111,54	0,0009
Oct	105,97	0,0012	Oct	107,15	0,0023	October	111,53	0,0001
Nov	105,79	0,0017	Nov	107,15	0	November	111,74	0,0019
Dec	106,04	0,0024	Dec	107,15	0	December	111,69	0,0004

Examples of calculations above the value of depreciation for February 2015, then it can be used for the calculation of constant prices of materials, labor, energy, maintenance.

Constant Price Calculation

The constant price will be calculated using the formula as follows:

$$\frac{\text{Priceint@ecurrentperiod} \times 100}{100 + \text{Deflator}} = \frac{\text{Rp. } 132.681,12 \times 100}{100 + 0,0037} = \text{Rp. } 132.681$$

Figure 3 The Calculation of Constant Price Depreciation (RIP1).

Month	Constant price of Depreciation Cost (Rp)		
	2015	2016	2017
January	132.681	120.619	132.681
February	114.584	114.588	120.619
March	132.674	126.646	132.676
April	126.645	126.65	120.617
May	114.587	126.649	120.619
Jun	126.644	132.674	102.526
July	114.587	108.557	126.65
August	120.619	132.679	132.679
September	126.65	126.648	114.587
October	132.679	126.647	132.681
November	126.648	132.681	132.679
December	126.647	126.65	108.557

Calculation Resources of Input Partial (RIP Total) For example, the total RIP calculation for January 2018 is as follows:

$$\text{RIP Total} = \text{RIP1} + \text{RIP2} + \text{RIP3} + \text{RIP4} + \text{RIP5} = \text{Rp. } 132.681 + \text{Rp. } 663.990.542 + \text{Rp. } 6.937.982 + \text{Rp. } 7.396.627 + \text{Rp. } 3.543.014 = \text{Rp. } 682.000.846$$

Figure 4 Calculation Resources of Input Partial (RIP Total)

Month	Resources Input Partial in Total (Rp)		
	2015	2016	2017
January	682.000.846	602.674.794	348.388.003
Febuary	320.331.398	609.225.074	374.013.971

CONCLUSION AND SUGGESTION

Conclusion

Regarding to the calculations and analysis of productivity measurement results using Marvin.E Mundel method on Baitul Mal of Lhokseumawe city, it can be concluded that the productivity of Baitul Mal Lhokseumawe city increased and decreased productivity, the lowest productivity decrease occurred in November 2015 of 24.4% and increased in the following month by 198.8% in December 2015. The highest increase in productivity in June 2016 was 275, 1% from the previous month amounted to 30.6%.

Suggestion

Some people is not willing to pay zakat, it is better for zakat management institution to promote and socialization how important paying zakat for poverty eradication and improve work productivity from society

The Effect of Islamic Work Ethic and Motivation through the Organizational Citizenship Behaviour and Employee Performance at Bank Aceh Syariah

Y Dharma¹, A Ikhsan²

¹Islamic State University of North Sumatera Medan, Indonesia

ABSTRACT

This study aims to determine how much influence the Islamic work ethic and motivation through organizational citizenship behaviour (OCB) and its impact on the employee performance of Bank Aceh Syariah. The data used is the data by distributing questionnaires to 168 employees of Bank Aceh Syariah. To analyze the data, the statistical analysis used two-track equipment and processed with the help of the application program analysis moment of structural (AMOS). The variables measured include Islamic work ethic (IWE), work motivation effect toward organizational citizenship behaviour (OCB) and employee performance of Bank Aceh Syariah. Based on the analysis of statistical test is Islamic work ethic (IWE) and work motivation affect the employee performance at mediated organizational citizenship behaviour (OCB). The result organizational citizenship behavior (OCB) variable effect of full mediated on Islamic work ethic (IWE) and work motivation toward employee performance of Bank Aceh Syariah.

Keywords: *Islamic Work Ethic Motivation, Organizational Citizenship Behaviour (OCB) and Employees Performance.*

INTRODUCTION

PT. Bank Aceh Syariah is a public bank owned by the Aceh government with funding activities, providing loans to the community (lending) and providing service delivery services, currently the role of Bank Aceh as a financial intermediary institution also serves as an agency of trust, as an agent of development and an agency of services, which participates in the framework of economic development of Acehese society in general.

In the banking industry, Employees Performance plays an important role in improving organizational performance, where motivation is the degree to which an individual wants and strives to carry out a task or job well and a willingness to put a high level of effort toward an organizational goal, conditioned by ability that effort to meet an individual need. The Organizational Citizenship Behaviour (OCB) element of a person performs a certain act because it is driven by his instinct, the desire to achieve satisfaction or perhaps the need of life is very urgent Robbin¹. According to Dharma² motivation is a set or set of behaviors that provide a basis for someone to act in a way directed to a specific goal (specific goal directed way).

On the other hand, organizational social behavior is often referred to as the organization citizenship behavior (OCB), which is the attitude of Bank Aceh Syariah employees who are very famous in the organization with the main dimension of altruism (eg, helping when unhealthy partners), seriousness (eg, overtime to complete the work, for example, willingly representing the company for a joint program, and a sportive attitude (eg, contributing to the failure of teamwork). According to Luthans (2011)³, Organizational Social Behavior (OCB) is covering personality and attitudes, is the behavior of organizational members / prosocial, or in short OCB (Organizational Citizenship Behavior).

According to Bangun and⁴ performance (performance) is the result of work achieved by someone based on job requirements (job requirement). A job has certain requirements to be done in achieving a goal that is also called a standard job (job standard) so the standard of work is the high expected of a particular job to be completed properly by employees in the organization. Bank Aceh Syariah Lhokseumawe has several benchmarks in evaluating its employees among others by evaluating the quantity of work in each work

unit as well as paying the quality of work produced by each employee, then employee work is very important to do because Bank Aceh Sharia is a public trust agency, other cooperation between bank employees need to be maintained and continue to be fostered to achieve the vision and mission of the organization of Bank Aceh Syaria. Based on the phenomenon and background of the problem then the authors want to examine “The Influence of islamic work ethic, Work Motivation To Employee Performance With Organization Citizenship Behaviour as Intervening Variable At Bank Aceh Sharia. The formulation of research problems can be formulated as follows:

1. How is the influence of islamic work ethic to organization citizenship behaviour at PT. Bank Aceh Syariah ?
2. How is the influence of motivation to organization citizenship behaviour at PT. Bank Aceh Syariah?
3. How is the influence of islamic work ethic to employee performance at PT. Bank Aceh Syariah ?
4. How is the influence of motivation to employee performance at PT. Bank Aceh Syariah?
5. How is the influence of organization citizenship behaviour to employee performance at PT. Bank Aceh Syariah

RESULTS AND DISCUSSION

Measurement Model Analysis Results

Ferdinand¹³ convergent validity part of the measurement model within SEM and is usually referred to as measurement model while the covariance-based SEM-called confirmatory factor analysis (CFA) in Ferdinand,¹³. There are two criteria to assess whether the measurement model is eligible to construct reflective convergent validity, namely (1) loading factor should be above mimimim > 0,50 or ideal >0.70 and (2) P_{value} a significant <0.05 in the study of these requirements have all been fulfilled,¹⁴. Then to test validity Contract can be seen at confirmatory factor analysis (CFA) in Figure 2 and Table 1 below are as follows:

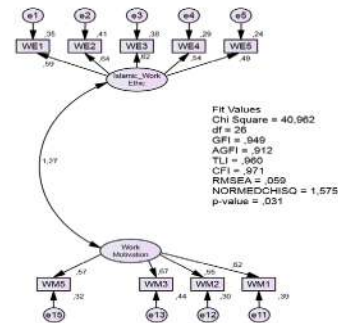

Figure 1. Confirmatory Factor Analysis Exogen Contract

CONCLUSION

Based on the results of research and discussion, it can be concluded as follows: variables Islamic work ethic, work motivation and organizational citizenship behaviour simultaneously and partially have a significant effect on employee performance at Bank Aceh Syariah.

H₁ There is a positive and significant effect of Islamic work ethic on job satisfaction at the organization citizenship behaviour at Bank Aceh Sharia.

Based on Table 4, the known value of P-value between Islamic work ethic (IWE) on organization citizenship behaviour (OCB) was 0.000, which is smaller than the significance level of 0.05. These results can be concluded that the Islamic work ethic (IWE) variable significantly influences the organization citizenship behaviour (OCB) of the Bank Aceh Sharia. Based on the results of path coefficient value of the Islamic work ethic (IWE) on organization citizenship behaviour (OCB) is 0.389 positive coefficient path meaning the Islamic work ethic (IWE) on organization citizenship behaviour has a positive effect on the Bank Aceh Sharia. Hypothesis 1 in this research is the influence of Islamic work ethic

(IWE) on organization citizenship behaviour (OCB) on Bank Aceh Sharia is accepted. Worth mentioning that the research results are consistent with studies conducted by Ali⁵ and Ali⁶, the research results show that the Islamic work ethic (IWE) characteristic has an effect on the organization citizenship behaviour (OCB).

H₂ There is a positive and significant effect of work motivation on organization citizenship behaviour at Bank Aceh Sharia.

Based on Table 4, the known value of P-value between work motivation on organization citizenship behaviour (OCB) was 0.000, which is smaller than the significance level of 0.05. These results can be concluded that the work motivation variable significantly influences the organization citizenship behaviour (OCB) of the Bank Aceh Sharia. Based on the results of path coefficient value of the work motivation on organization citizenship behaviour (OCB) is 0.634 positive coefficient path meaning the work motivation on organization citizenship behaviour (OCB) has a positive effect on the Bank Aceh Sharia. Hypothesis 2 in this research is the influence of work motivation on organization citizenship behaviour (OCB) on Bank Aceh Sharia is accepted. Worth mentioning that the research results are consistent with

studies conducted Dharma¹⁵ and Organ¹⁶, the research results show that the work motivation characteristic has effect on the organization citizenship behaviour (OCB).

H₃ There is a positive and significant effect of the islamic work ethic on employee performance at Bank Aceh Sharia.

Based on Table 4, the known value of P-value between islamic work ethic (IWE) on employee performance was 0.002, which is smaller than the significance level of 0.05. These results can be concluded that the islamic work ethic (IWE) variable significantly influences the employee performance of the Bank Aceh Sharia. Based on the results of path coefficient value of the islamic work ethic (IWE) on employee performance is 0.139 positive coefficient path meaning the islamic work ethic (IWE) on employee performance has a positive effect on the Bank Aceh Sharia. Hypothesis 3 in this research is the influence of islamic work ethic (IWE) on employee performance on Bank Aceh Sharia accepted. Worth mentioning that the research results are consistent with studies conducted Ali⁵ and¹⁷ Ali and organ⁸, the research results show that the islamic work ethic (IWE) characteristic has effect on the employee performance.

H₄ There is a positive and significant effect of the work motivation on employee performance at Bank Aceh Sharia.

Based on Table 4, the known value of P-value between work motivation on employee performance was 0.000, which is smaller than the significance level of 0.05. These results can be concluded that the work motivation variable significantly influences the employee performance of the Bank Aceh Sharia. Based on the results of path coefficient value of work motivation on employee performance is 0.486 positive coefficient path meaning the work motivation on employee performance has a positive effect on the Bank Aceh Sharia. Hypothesis 2 in this research is the influence of work motivation on employee performance on Bank Aceh Sharia accepted. Worth mentioning that the research results are consistent with studies conducted Dharma¹⁵ and organ⁸ and Robbin¹ and Luthans³, the research results show that the work motivation characteristic has effect on the employee performance.

H₅ There is a positive and significant effect of the organization citizenship behaviour on employee performance at Bank Aceh Sharia.

Based on Table 4, the known value of P-value between organization citizenship behaviour (OCB) on employee performance was 0.029, which is smaller than the significance level of 0.05. These results can be concluded that the organization citizenship behaviour (OCB) variable significantly influences the employee performance of the Bank Aceh Sharia. Based on the results of path coefficient value of the organization citizenship behaviour (OCB) on employee performance is 0.353 positive coefficient path meaning the organization citizenship behaviour (OCB) on employee performance has a positive effect on the Bank Aceh Sharia. Hypothesis 5 in this research is the influence of organization citizenship behaviour (OCB) on employee performance on Bank Aceh Sharia accepted. Worth mentioning that the research results are consistent with studies conducted Dharma¹⁵, Organ¹⁶ and Luthans³ and Yunina¹⁸, the research results show that the organization citizenship behaviour (OCB) characteristic has effect on the employee performance.

Development of a Creative Economy Model as an Alternative in Poverty Alleviation

Anwar Puteh¹, Em. Yusuf Iis¹, Azhar Hasan¹, Aiyub Yahya¹, Nurul Mawaddah²

¹Lecturer at the Faculty of Economics and Business, University of Malikussaleh Lhokseumawe-Aceh-Indonesia,

²Lecturer of Politeknik Negeri Lhokseumawe-Aceh-Indonesia

ABSTRACT

This study aims to build a creative economic model to be applied in poverty alleviation. This model is built based on four stages, namely the determination of creative economic vision, problem identification, application of the Triple Helix concept and Identification of performance indicators. This model is supported by People, the five main pillars (industry, technology, resources, institutions, financial intermediary institutions), and is organized by three main actors, namely intellectuals (creative oriented and entrepreneurship curriculum, press freedom and academic, innovative research multidisciplinary, educational and training institutions, research and development institutions), business elements (entrepreneurship, business coaching & mentoring, financing schemes, marketing and business matching, creative communities), and government (incentives, awards for creative people and conservation, a conducive business climate, educational direction).

Keywords: Poverty, Creative Economy and The Triple Helix

BACKGROUND

Poverty is a problem faced by every country. Poverty has a very broad impact on various aspects of people's lives and disrupts the economic growth of a region. Subsidies become an important slogan for countries that adhere to the welfare state system. The assumption that subsidies act as tangible evidence of the government's responsibility in the welfare of its people. Without realizing the provision of subsidies, such as providing direct cash assistance to the community has resulted in the emergence of a lazy attitude some people to try, lack of motivation to move and a sense of indulgence. The community is given assistance without conditions for repayment which has an impact on indulgence and the attitude of waiting for similar assistance at the next opportunity. It's easy for people to get help so they feel like trying and struggling with hard work to fade.

Starting in 2015 the Indonesian government has provided village financial assistance and each village can obtain Rp. 1 billion per year. If the village does not have a pattern and attitude of independence in managing these funds, it will have an impact on the increasing number of people who depend on government assistance. Therefore, in order to anticipate these impacts, there needs to be a

creative economic model design. The design is used as a guide for the community to manage village assistance funds that can add value. Creative economic design can be a guide for people to produce creative products that can be traded widely. Thus, it will increase business opportunities and ultimately will increase income and community welfare.

Theoretical Study

Basic Concept of Creative Economy

Howkins (2001)¹ first introduced the term creative economy in his book *The Creative Economy: How People Make Money from Ideas*. Creative economy is a concept in a new economic era that intensifies information and creativity by relying on ideas and knowledge from human resources as the main factors of production. This concept will usually be supported by the existence of a creative industry that becomes its embodiment. Over time, economic development reached the level of the creative economy after some time before, the world was faced with the concept of information economy in which information became the main thing in economic development. The creative economy cannot be separated from the creative industry.

Broadly speaking, the creative industry is divided into two, namely (1) creative products directly to customers, such as film, music, games, media and performances, (2) Creative Services to other industries, such as design, advertising, architecture and others. (Simatupang, 2012). There are 4 components of the creative industry (intellectual capital), namely technology, business, art and culture.

The creative economic benefits include (1) economic contribution, such as increasing Gross Domestic Product, creating jobs and increasing exports, (2) Social impacts, such as improving quality of life, equal distribution of welfare, and increasing social tolerance, (3) The emergence of innovation and creativity, for example the emergence of ideas and ideas and the creation of value, (4) renewable resources, for example knowledge-based businesses, green community, (5) the creation of a business climate, for example the creation of business fields, impacting the development of other sectors, impacting marketing efforts, (6) The development of national image and identity, such as increasing tourism, national icons, building culture, cultural heritage and local values.

Creative Economy Model

There are several models of creative economic development, one of which is the Triple Helix approach introduced by Etzkowitz and Leydersdorff (2000)². This model emphasizes the role and close relationship between three actors, namely government, industry and universities (academics) or known ABG. Universities (academics) can become innovation leaders in a knowledge-based economy, while NIS (National Innovation System) emphasizes the importance of the role of companies in innovation. Regulating ABG relations in Triple Helix is the result of communication and expectations at the network level². The relationship that appears in the Triple Helix, generally starts from problem solving efforts and produces strategies when facing problems in innovation, not determined by a particular pattern. Through this interaction process, there will be changes in actors and the roles they play². Thus, the triple helix pattern of innovation is dynamic as time changes.

This model was later developed by Pangestu (2008)³. He explained that the success of developing creative industries must be supported by (1) People (people) as

the main foundation of individuals or creative human resources. Then it must be supported by (2) the five main pillars, namely (1) industry (a collection of companies engaged in creative economy), (2) technology (Enabler to realize individual creativity in the form of real work), (3) resources (Input other than individual creativity and knowledge needed in creative processes, such as natural resources and land, (4) institutions (social order such as norms, values, and laws, including industry associations, professional associations and other creative communities, and (5) financial intermediary institutions (financial intermediary institution). Furthermore, it must be accommodated by (3) Three main umbrella (actors), namely (1) intellectual circles (Creative and Entrepreneurship-oriented curriculum, press freedom and academic, multidisciplinary innovative research, education and training institutions, research and development institutions), (2) elements of business (Entrepreneurship, business coaching & mentoring, financing schemes, marketing and business matching, creative community) and (3) government tah (incentives, appreciation of creative and conservation people, conducive business climate, educational direction).

Strategies for Creative Economy Development

The creative economic development strategy as presented by Simatupang (2012) consists of several stages, namely (1) Identification of the problem, is an activity to identify the problem of what is being faced and the gaps that occur. (2) The maturation of the creative industry is the activity of awareness and understanding of the need for a creative economy, commitment to capacity building and empowerment in the capitalization of creativity. (3) creating creative economic ecosystems such as creative products, creative businesses and creative people.

Concept of Creative Economy Development

The concept of creative economic development as stated by Simatupang (2012) explains that it is fitting that the creative economy must be a joint and comprehensive effort from various levels with the ultimate goal of the creative economy able to penetrate the international market. The creative economy at the city level must be supported by adequate capacity and resources as well as creative or inter-city products. The creative economy at the city level must be able to penetrate the provincial level and so on in stages.

Creative economy is a business activity that must always innovate, through business and innovation, entrepreneurial talents will grow. Entrepreneurs can develop creative workers and trained creative communities. Creative workers consist of skilled individuals, while creative communities can be in the form of developing creative markets.

Empowerment of the Creative Economy

For the sustainability of creative economic development, it is necessary to empower the creative economic activities. The creative economy empowerment model needs to take several steps, namely (1) preparing talented people (2) developing talent search mechanisms, (3) developing mechanisms for the development of creative workers, and (4) developing mechanisms for developing creative entrepreneurs.

Poverty

Poverty can be absolute poverty or relative poverty. Poverty can also be interpreted narrowly or broadly. But the point is that poverty is an unsatisfactory condition or an undesirable condition that has indicators that cause powerlessness. According to Bapenas (2002)⁴ as quoted by Yudhoyono and Harniati (2004) poverty is a situation or condition experienced by a person or group of people who are unable to carry out their lives to a level considered humane.

The main factor of poverty in Indonesia according to BPS (2004)⁵ in Sahdan (2005)⁶ are: (1) limited adequacy and quality of food; (2) limited access and low quality of health services; (3) limited access and low education services; (4) limited employment and business opportunities; (5) weak protection of business assets, and wage differences; (6) limited housing and sanitation services; (7) limited access to clean water; (8) lack of certainty of ownership and ownership of land; (9) deteriorating environmental conditions and natural resources, as well as limited public access to natural resources; (10) weak guarantee of security; (11) weak participation; (12) the size of the population burden caused by the size of the family burden; (13) poor governance causes inefficiency and ineffectiveness in public services, widespread corruption and low social security for the community.

One of the roles of government in alleviating poverty is in 2002 the government formed the KPK

(poverty reduction committee) with Presidential Decree No. 124 of 2002 in the form of reducing poverty by: (1) Increasing the income of the poor so that the poor have opportunities, management capabilities and protection to obtain better results, in various economic, socio-cultural, political, legal and security activities; (2) Reducing the expenditure of the poor in accessing basic needs such as health, education, health, and infrastructure that facilitate and support socio-economic activities.

The government in tackling poverty in Indonesia holds a BLT program. The BLT program is one of the Oil Fuel Subsidy Reduction Compensation Programs (PKPS-BBM). The program is intended by the government to help the poor after an increase in fuel prices which results in an increase in living costs. Residents belonging to poor families are considered eligible to receive Rp. 1.2 million in cash per family per year (Rp. 100,000 per month) and Subsidies were first used in England in the 10-11 century under the rule of King Charles II. However, subsidies only developed or expanded in the 20th century. From now on subsidy programs have become a method commonly used by the government in its financial budget⁷. According to Dartanto (2006)⁷ some of the basic principles in the application of subsidies include:

A useful assistance provided by the government to groups or individuals who are usually in the form of cash payments or tax deductions.

Given with the intention to reduce some of the burden and focus on the benefits or benefits for the community.

Subsidies obtained from taxes. So, the tax money collected by the government will return to the people through the provision of subsidies.

Research Methods

This research is a library research which is the collection of data and information in the form of scientific references or theories related to the concept of creative economy which aims to create a creative economic model. The method used is a qualitative method.

Research Results

Creative Economy Model

The Creative Economy Model of Lhokseumawe

City basically consists of 4 stages, namely the stage of determining the creative economic vision, (2) Problem Identification, (3) Application of the Triple Helix

Concept (4) Identification of performance indicators. This model is shown in Figure 1.

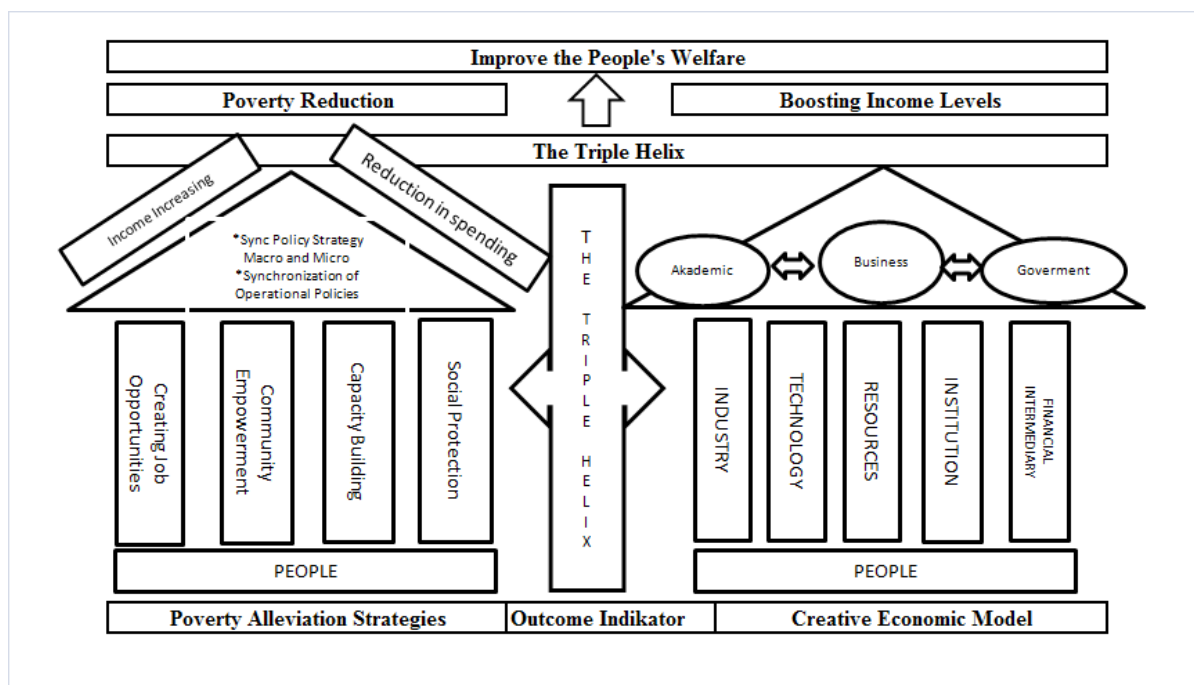

Figure 1' Creative Economy Model of Lhokseumawe City

Figure 1 explains that in order to build a creative economy in the city of Lhokseumawe several stages are passed, namely:

(1) Determination of the Vision and Mission of the Creative Economy

This stage is very important, namely setting the vision, mission, goals, objectives and strategies for achieving the goals.

(2) Analysis of problems and identities

Problem analysis is a step to identify the problems being faced related to the development of the creative economy, including the quality and quantity of human resources, conducive climate, financing institutions. In addition, it is also necessary to identify facilities and infrastructure availability, city or village identity, creative capital policies, creative communities, creative workers, creative entrepreneurs and creative education.

(3) Application of the Triple Helix Concept

The success of developing the creative industry

according to The Triple Helix concept is to be supported by (1) People as the main foundation of individuals or creative human resources. Then it must be supported by (2) the five main pillars, namely (1) industry (a collection of companies engaged in the creative economy), (2) technology (Enabler to realize individual creativity in the form of real work), (3) resources (Input other than creativity and individual knowledge needed in creative processes, such as natural resources and land), (4) institutions (social order such as norms, values, and laws, including industry associations, professional associations and other creative communities, and (5) financial intermediary institutions (financial intermediary institution). Furthermore, it must be accommodated by (3) Three main umbrella (actors), namely (1) intellectual circles (Creative and Entrepreneurship-oriented curriculum, press freedom and academic, multidisciplinary innovative research, education and training institutions, research and development institutions), (2) elements of business (Entrepreneurship, business coaching & mentoring, financing schemes, marketing and business matching, creative community) and (3) government tah (incentives, appreciation of

creative and conservation people, conducive business climate, educational direction).

(4) Identification of Achievement Indicators

Identification of performance indicators is the activity of seeing the impact of the implementation of the creative economy. Performance indicators can be in the form of; (1) The growth of a national scale industry, (2) the development of a provincial scale industry, (3) the development of a Regency / City scale industry, (4) the development of digital creative, (5) the development of creative communities, (6) publication of creative industries in the media.

CONCLUSION

Lhokseumawe city still has villages that are vulnerable to poverty. Lhokseumawe City also has creative talents that are very potential in the development of creative economy. The Creative Economy Model of Lhokseumawe City basically consists of 4 stages, namely the stage of determining the creative economic vision, (2) Problem Identification, (3) Application of the Triple Helix Concept (4) Identification of performance indicators.

Effect of Highway Network Connectivity on Regional Development in the North Zone of Aceh

H Fithra¹, Sirojuzilam², S M Saleh³, Erlina⁴

¹ Doctoral Program of Regional Planning, University of Sumatera Utara, Medan, Indonesia, ² Doctoral Program of Regional Planning, University of Sumatera Utara, Medan, Indonesia, ³ Department of Civil Engineering, University of Syiah Kuala, Banda Aceh, Indonesia, ⁴ Doctoral Program of Regional Planning, University of Sumatera Utara, Medan, Indonesia

ABSTRACT

The geographical area of the province of Aceh which is bordered by the oceans and only has land connection with the province of North Sumatra has made Aceh depends greatly on this neighboring province. In fact, The north zone of aceh covering Lhokseumawe City, North Aceh Regency and Bireuen Regency crossed by Sea Lane of Communication (Sloc), the Malacca Strait has geo-economic advantages. This study aims to analyze and assess the correlation between Highway Network Connectivity with Regional Development of the zone. This research was done by conducting field surveys, interviews, questionnaires and data analysis on the The north zone of aceh, covering Lhokseumawe, North Aceh, Bireuen, Bener Meriah and Central Aceh districts. The analysis was done by using Structural Equation Modeling / SEM. Regression Weight results show that the relationship between Highway Network Connectivity variable and Region Development is 0.546. This study concludes that the Highway Network Connectivity has the strongest or most significant relation to Regional Development activities, therefore it can be suggested for the Aceh provincial, district and municipal governments in the zone to make highway network policies to be oriented towards the development of new economic zones and supporting the implementation of Special Economic Zones of Arun Lhokseumawe.

Keywords: Sloc, Aceh, Arun Lhokseumawe.

INTRODUCTION

Aceh is one of the provinces in Indonesia which has special autonomy status in 2001 through Law No. 18 of year 2001 on Special Autonomy for the Province of Nanggroe Aceh Darussalam. Currently, Aceh is highly dependent on the province of North Sumatra. Not only in the aspect of connecting transportation through the highway network, but also almost in all aspects of economy. This can be seen from the fact that Aceh plays a role more as a consumer rather than a producer. Food, clothing, housing, and industrial needs are still imported from Medan by trucks. Aceh as an agricultural and fishery area also sends the products by trucks¹.

Therefore the movement of goods in Aceh is dominated by highway mode (up to 95%), while the rest transported by using sea and air transportation due to the lack of availability of infrastructure and facilities and

the weakness of the system and regulation which made the movement of goods through highway considered as more efficient option².

Aceh to date has a national highway length of about 1,803,354 km consisting of 538,251 km of arterial highway, and 1,265,103 km of primary collector highway. The 640,5 km of westbound highway, the 469.98 km of central highway and 532.2 km of eastern route and 161.7 km of the cross diagonal and non cross. Stability of highways in Aceh is quite high at 94.62%. Therefore, connectivity becomes a key element of development strategy in Aceh. In addition to the highway, other infrastructure projects should be further developed to improve connectivity between regencies in Aceh.

To support the future economic growth in Aceh, especially in The north zone of aceh, one of the indispensable factors is good highway network

connectivity in order to accelerate the development of the region. The highway network connectivity located in Aceh's North Zone is divided into 3 main groups: (1) Highway connection of KruengGeukueh - Sp. KKA - Jamuan - Sp. TigaRedelong - Takengon, (2) KruengGeukueh - Bireuen - Takengon, (3) KruengGeukueh - Lhokseumawe - Lhoksukon - Pantan Labu.

General Description of the North Zone of Aceh

In developing the transportation system in the Aceh region (Figure 1), based on its geographical location and strategic development plan of Aceh region, several working zones (Transportation Authority) were set as can be seen below

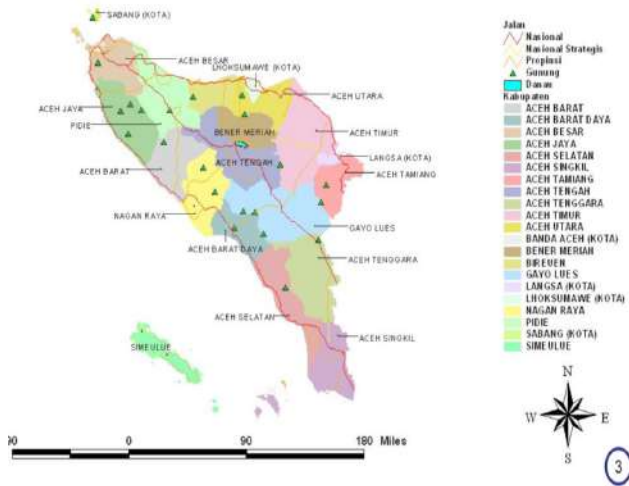

Figure 1. Map of Aceh

1. Central Zone, consisting of SabangMunicipality, Aceh BesarRegency, PidieRegency, Pidie Jaya Regency and Banda Aceh Municipality;
2. North Zone, consisting of Aceh UtaraRegency, LhoksumaweMunicipality, BireuenRegency, BenerMeriah Regency and AcehTengah Regency;
3. East Zone, consisting of Aceh Timur Regency, LangsaMunicipality and Aceh Tamiang Regency;
4. West Zone, consisting of Aceh Barat Regency, Nagan Raya Regency and Aceh Jaya Regency;
5. South - Southwest Zone, consisting of Aceh Selatan Regency, Aceh Barat Daya Regency, Simeulue Regency, GayoLues Regency, Aceh Tenggara Regency, Subulussalam Municipality and Singkil Regency.

Based on the purpose of this study, the highway network for the development of the area in the north zone of aceh will be centred at KruengGeukueh Port to support the ArunLhokseumawe Special Economic Zone.

METHODOLOGY

This study analyzed the existing highway network connectivity in the north zone of aceh, covering Lhokseumawe, Aceh Utara, Bireuen, Bener Meriah and Aceh Tengah regency by taking into consideration several aspects including performance of structurepavement, geometric design of the highway, highwaymaintenance, traffic volume, traffic flow, and supporting infrastructure.

The development of the area that occurs with existing highway network connectivity and transportation of goods isbased on the aspect of economic growth, human resources improvement, management of land use and environmental harmonization. This regional development approach is used in order to find out the connection between the two variables. Figure 2 below is a conceptual framework of research.

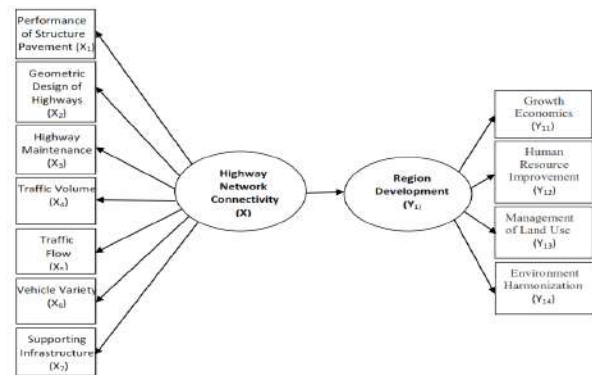

Figure 2. Conceptual research framework

Source : Researcher

Research Design

This research is explanatory research in design, that is conducted by explaining the symptoms caused by an object of researchand aims to explain causal relation to know if there is relationshipbetween highway network connectivity and development area in the north zone of Aceh³.

Futhermore, this research used a combination of quantitative and qualitative method. Quantitative method is used when the problem investigatedis more common with large scope and complex level of variation.

With a quantitative approach, this study is a causaleffect study, in which research is conducted to the facts to prove empirically⁴ that Performance of Structure Pavement, Geometric Design of Highways, Highway Maintenance, Traffic Volume, Traffic Flow, and Supporting Infrastructure, Supply and demand are predictors forhighwaynetworkconnectivity in The north zone of aceh. While the aspect of economic growth, human resources improvement, management of land use and environmental harmonization are predictors for regionaldevelopment.

Sample and Population

The population in this studywas business people in the field of goods transportation by using the trucks, and in the field of construction. In addition, entrepreneurs, traders, and truck driversin the area of Lhokseumawe, North Aceh, Bireuen, Bener Meriah and Aceh Tengah were also involved. The population used for this study was the population of the north zone of aceh in 2015(1,547,832 people)⁷⁻¹². The following are tabulated samples selected from each municipality and district in the the north zone of aceh:

Table 1. Population and sample

No.	Regency/ municipality	Population	Sample
1	Lhokseumawe	191,407	37
2	Aceh Utara	583,892	113
3	Bireuen	435,300	89
4	Bener Meriah	136,821	27
5	Aceh Tengah	200,412	39
Total		1, 547,832	300

Research Indicators and Variables

This research involved 2 (two) variables -Highway Network Connectivity (X) as exogenous latent variable (independent variable not directly measured) and Regional Development (Y1) as endogenous latent variable (dependent variable not directly measured) .

Highway Network Connectivity Variable (X)

Chourmain (2008)³ defines conceptual variable a as brief, clear and decisive definition of research variable. The Highway Network is a major infrastructure system that is part of a land transportation network system. The highwaynetwork is also called a milestone for regional economy, because it can increase economic growth and reduce regional disparities. The existence of the highway network will create inter-regional connectivity. The term connectivity is used to describe the connection and density between links (highways) on the highway network. Connectivity is the key to success in the north zone of aceh to build a good system with three important dimensions: poverty reduction, regional development and increased competitiveness.

Regional Development Variable (Y1)

Regional development is defined operatively as an effort to spur socio-economic development in connection to spatial and regional arrangements, reduce inter-regional disparities and preserve the environment of a region that emphasizes on strengthening endogenous factors of the region (economic growth, human capital improvement, , environmental protection) as a driver of the region’s competitiveness.

Analysis and Results

Analysis of Respondents’ Response against Highway Network Connectivity Variable

Responses of respondents to highway network connectivity variable measured from six (6) indicators, namely: Stability of Highway Structure; Highway Trajectory; HighwayMaintenance; Traffic Volume; The Supporting Infrastructure and Supply and Demandwhich are shown in table 2. Below.

Table 2. Analysis of respondents’ responses against highway network connectivity variable

No	Indicator	Category										F	Mode	Mean score
		STS		TS		R		S		SS				
		F	%	F	%	F	%	F	%	F	%			
1	Stability of highway structure	9	3.0	84	28.0	79	26.3	110	36.7	18	60	300	4	3.15
2	Highway trajectory	0	0	6	2.0	164	54.7	130	43.3	0	0	300	3	3.41
3	Highway maintenance	0	0	16	5.3	170	56.7	114	38.0	0	0	300	3	3.33
4	Traffic volume	1	3.0	57	19.0	185	61.7	57	19.0	0	0	300	3	2.99
5	Supporting infrastructure	14	4.7	145	48.3	105	35.0	36	12.0	0	0	300	2	2.54
6	Supply and demand	1	3.0	7	2.3	35	11.7	105	35.0	152	50.7	300	5	4.33
Total of Mean Score														3,29

CFA Confirmatory Analysis of Highway Network Connectivity Variable

An analysis of the confirmatory factor in the latent variable of highway network connectivity was carried out to be able to confirm all indicators that make up the latent construct of highway network connectivity. Figure 3 shows the results of confirmatorial data analysis of highway network connectivity.

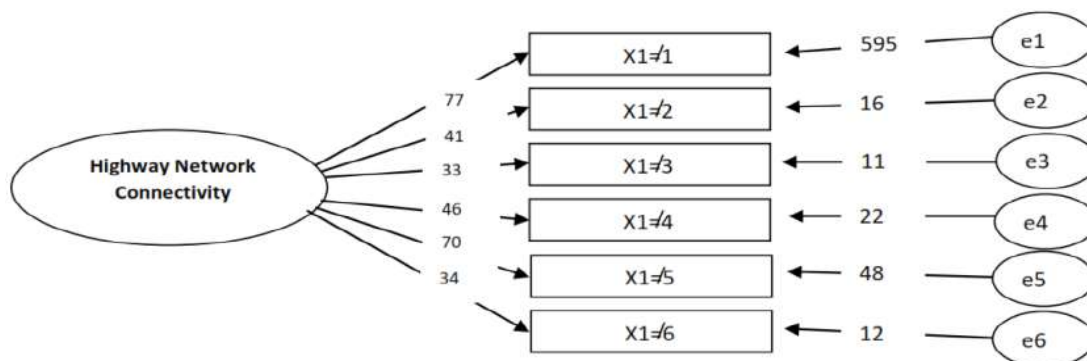

Figure 3. Confirmatory analysis network connectivity variable

It is found out from CFA analysis result that CFA model for highway network connectivity considered fit. All indicators were declared valid and trusted to measure highway network connectivity variable. The highway structure stability indicator is the largest loading factor and subsequent supporting infrastructure. Output result of CFA analysis of connectivity of the highway network variable is shown in table 4.

Table 4. Output of CFA analysis of connectivity of the highway network variable
Standardized Regression Weights : (Group number 1 - Default model)

			Estimate
x1#1	←---	Highway_network_connectivity	0.768
x1#2	←---	Highway_network_connectivity	0.406
x1#3	←---	Highway_network_connectivity	0.334
x1#4	←---	Highway_network_connectivity	0.465
x1#5	←---	Highway_network_connectivity	0.696
x1#6	←---	Highway_network_connectivity	0.344

Source: (Analysis)

CFA of Regional Development Variable

The analysis of the confirmatory factor in the latent variable of Region Development was done to confirm all the indicators that make up the latent construction of Regional Development. The results of CFA analysis can determine whether or not the CFA model for Regional Development fit^{5,6} Figure 4 below shows the results of data processing, the results of Confirmatory analysis of Regional Development.

Figure 4. Analysis of regional development confirmatory

Based on the results of CFA analysis, it is known that CFA model for the development of the region is considered fit. All indicators were declared valid and were believed to measure the variable of Regional Development. The Economic Growth Indicator is the greatest loading factor value and subsequent Environmental Protection. Results of Output of The CFA Analysis of Region Development Variable are shown in table 5.

Table 5. Output of the CFA analysis of region development variable
Standardized Regression Weights : (Group number 1 - Default model)

			Estimate
y1#1	←---	Regional_development	0.882
y1#2	←---	Regional_development	0.695
y1#3	←---	Regional_development	0.712
y1#4	←---	Regional_development	0.835

Source: (Analysis)

There are four indicators that were declared entirely capable of measuring regional development variable because it has a value loading factor of > 0.30 ie Y1.1 (economic growth) with the value of (0.882); Y1.2 (Human Resource Improvement) with the value of 0.695; Y1.3 (improvement of land use) with the value of (0.712); Y1.4 (environmental protection) with the value of 0.835. Therefore, all variable-building factors would be used in the next full SEM processing.

Result of Feasibility Analysis of Research Model

Analysis of research model was done using the criteria of Goodness of Fit (GoF), which is summarized in table 6 below. Results obtained were according to desired criteria. GoF model has been fulfilled in its entirety, and it is concluded the model is fit with the data used.

Table 6. Index of modification of SEM model after modification

Goodness of Fit Index	Cut-off Value	Analysis Results	Evaluation Model
χ^2 - Chi - square	Expected to be low (df=116)	532,862	Good
Probability	$\geq 0,05$	0,01	Marginal
RMSEA	$\leq 0,08$	0,014	Good
GFI	$\geq 0,90$	0,889	Marginal
AGFI	$\geq 0,90$	0,861	Good
TLI	$\geq 0,90$	0,884	Marginal
CFI	$\geq 0,90$	0,915	Good

Source: (Analysis)

The table above shows that the criteria for assessing the feasibility of SEM model consisting of χ^2 - Chi-square, probability, RMSEA, GFI, AGFI, TLI and CFI generally indicate that the model is fit with the data because in general, it is considered meeting GOF criteria and next it can be continued on the next data processing.

Furthermore, the calculation of the coefficient of influence through regression weight was done which would be used as the basis for answering hypotheses in this study. The results of data processing are shown in table 7.

Table 7. Regression weight

Relation between variables		Estimate	P	Result
Highway Network Connectivity	Region Development	0.546	0.014	Significant

Source: (Analysis)

Based on the results of regression weight, it can be seen the results of the significance of the influence of each variable that impact on the development of the region in the North Aceh Zone. Highway Network connectivity has also proved to have a significant effect on the success of the Region Development in the The north zone of aceh. Data on the regression weight table shows that the significance value obtained is p (0.014) and it fit the criteria that is at the standard of $p < 0.05$. This means that Highway Network Connectivity has a very strong relationship and significantly influences the activities and success of the Region Development in the The north zone of aceh. Highway Network connectivity has a role or contributes to the success of the Region Development activity (0.546). So the Highway Network Connectivity has a significant effect on the development of the region seen from economic growth, human resource development, land use improvement and environmental protection.

CONCLUSIONS

Based on the field data analysis and discussion of results, it can be concluded that:

The variable of highway network constancy (X) is formed from the highway structure consistency indicator (X1), highwayway condition (X2), highway maintenance (X3), traffic volume (X4), supporting infrastructure (X5) and supporting infrastructure (X6) indicators that are proven to be valid and reliable in measuring their influence on regional development;

Yield variables (Y1) formed from indicators of economic growth (Y11), improvement of human resources (Y12), improvement of land use (Y13) and environmental protection (Y14) are proven valid and reliable indicators in measuring their relation to highway network connectivity and transportation of goods;

Highway network connectivity has also proved to have a significant effect on the success of Regional Development in the The north zone of aceh.

Recommendation

Based on the discussion of results and conclusions of this study, some suggestions may be given as recommendations:

The results of this study may serve as a reference for Aceh provincial and district/municipality governments in The north zone of aceh in making highway network policy, territorial development and transportation of goods;

The results of this study can also be meaningful inputs for the Aceh government, the Lhokseumawe city government and the North Aceh district government in formulating the policy of the Special Economic Zone of ArunLhokseumawe, especially in preparing the development of a new economic region.

The Existence of Keujruen Blang in the Management of Water Resources as Local Wisdom in Rice Farming in Sawang Sub-District

Yulia¹, Manfarisyah¹, Sulaiman¹

¹Malikussaleh University, Lhokseumawe, Aceh

ABSTRACT

Keujreun Blang is a customary institution that functions and is authorized to manage paddy farming. This customary institution is in accordance with the mandate of Article 98 paragraphs (1) and (4) of Law Number 11 of 2006 concerning the Government of Aceh (UUPA) and strengthened in Qanun Number 10 of 2008 concerning Customary Institutions. In carrying out the emergency task, it has not been supported by Governor Regulation No. 45 of (2015) concerning the Role of Keujreun Blang in Irrigation Management. This study aims to analyze the management of water resources by Keujruen Blang as a local wisdom of the people of Aceh in Rice Farming. This study is a legal research with an empirical juridical approach in obtaining data in Sawang District, North Aceh. The results of the study that, the Keujruen Blang has done, namely: First, coordinating farmers to cultivate rice fields to conduct irrigation cooperation from upstream to downstream, and for those who are not sanctioned; Secondly, to urge the public not to dispose of waste in irrigation; Third, keep the irrigation from being shallow and dirty; and Fourth, arranging the distribution of water to each rice field based on the schedule; Fifth, keep irrigation channels from being damaged or leaking. Therefore, their togetherness in maintaining and cleaning the waterways to get abundant rice yields under coordination of Keujreun Blang is a local wisdom in Aceh society. The existence of Keujruen Blang in managing of water resources paddy agriculture for farmers in Aceh is not due, but also to preserve the culture of the Aceh society in maintaining communal water resources.

Keyword: *keujruen blang, water resources, local wisdom, Sawang*

INTRODUCTION

Customary institutions in Aceh have been reaffirmed by Law No. 11 of (2006) concerning the Government of Aceh (UUPA), including the customary institutions of Keujruen Blang. This has been affirmed in Article 98 of UUPA, that customary institutions function and act as a vehicle for public participation in the administration of the Aceh Government in the fields of security, peace, harmony and public order. Customary institutions in Aceh are one of the local wisdoms in Aceh society^{1,2}.

Customary institutions are part of customary law. The existence of customary law has also been recognized and affirmed in the constitution of the Indonesian state³. Customary law is a law that is laden with certain values in society⁴, including in Aceh society. The existence of customary institutions is also in carrying out values

including values in the management of water resources by intelligence as a customary institution. The existence of intelligence is not confirmed in Qanun Number 10 of 2008 concerning Customary Institutions (Qanun of Customary Institutions at the level of Regional Regulations). Article 1 paragraph 22 of the Qanun of Customary Institutions states that the keujreun blang is the person who leads and regulates activities in the field of rice cultivation.

Keujruen is one of the customary institutions in the traditional institutions' Qanun, namely the Majelis Adat Aceh, Imum Mukim, Imum Chik, Keuchik, Tuha Peut, Tuha Lapan, Imum Meunasah, Keujruen Blang, Panglima Laot, Pawang Glee, Peutua Seuneubok, Haria Peukan, Syahbanda and customary institutions are called by other names, but have the same functions and objectives as customary institutions stated in Article 2

paragraph (2) of the Qanun of Customary Institutions. That is, the weakness is part of the customary institution which has a role in the administration, development, community development, especially rice farmers and the settlement of social problems is affirmed in Article 2 paragraph (1) of the Qanun of Customary Institutions.

Related Research

Research related to this, there has been a study by Andrian Wira Syah Putra et al with the title *Peran Kejreun Blang Terhadap Perilaku Petani Dalam Pengelolaan Air Pertanian Di Nanggroe Aceh Darussalam*. In this study concluded that the Acehnese people still desperately need the existence of customary institutions in the implementation of rice farming activities including in the management of water resources in Aceh Province. The behavior of farmers in carrying out normal conditions does not affect the capacity of agricultural water management⁸.

Rusli Yusuf has also studied *Keujruen Blang Dan Pemberdayaan Perkumpulan Petani Pemakai Air Irigasi (Suatu Penelitian Aspek Sosiobudaya)*. This study concludes that the existence of technical irrigation and chaos is unbearable, in the order of Aceh's cultural values and at the level of government policy united in the Water User Farmers Association (P3A) can be accepted by most of the rice farming community. The role of intelligence is not quite dominant in empowering farmers in the implementation of agricultural activities⁹.

Abubakar et al, Also conducted research on *Peran Lembaga Adat Keujreun Blang Dalam Peningkatan Kesejahteraan Petani Sawah Di Kabupaten Bireuen*. In the study concluded that Bireuen District theoretically has empowered the Keujruen Blang of customary institutions which are also called Water User Farmers Association (P3AI). The farmers are grouped in these containers to suit the rice farmer associations nationally, although this association can reduce the meaning of customary institutions¹⁰.

Edy Juanda has conducted a study on *Peranan lembaga adat Keujruen Blang dan manfaatnya bagi keberdayaan masyarakat tani dalam pengelolaan pertanian sawah (Studi kasus di desa Keude Linteung Kecamatan Seunagan Timur Kabupaten Aceh Darussalam)*. In this study, it was concluded that the role carried out in coordinating cooperation with the farming community was less effective in overcoming the problem

of decreasing mutual cooperation. Keujruen Blang is not only carrying out routine tasks that are pragmatic, so as not to touch the subject of declining mutual cooperation, namely: the non-optimal service provided by the wind is not enough in the availability of agricultural water and weak institutional values are weak¹¹.

Research Methodology

This research is a legal research using an empirical juridical approach. The focus of the location of the study was on 4 (four) Village, namely Blang Teurakan Village, Jurong Village, Babah Krueng Village and Lancok Village. Primary data collection was carried out through structured interviews with respondents (kejreun blang) and informants (community and village heads) who were determined by purposive sampling, through observation, and Focus Group Discussion with the continuity of the Sawang District. Conclusion of secondary data by visiting libraries and internet media. The collected data is verified and categorized in a simple taxonomic process involving several issues in water resources management. Then the data is reduced and conclusions are drawn.

RESULT AND DISCUSSION

The existence of Keujruen Blang as a Customary Institution

In Sawang Subdistrict, Keujruen Blang was blunted as one of the customary institutions was chosen and appointed in the village community meeting. Keujruen Blang who is chosen is a person who is experienced in paddy fields and can communicate well with the community and be responsible. However, there are also appointments made in the village of Lancok appointed directly by the Geuchik (Village leader) after asking for their willingness in advance. This appointment was made after the Geuchik (Village leader) considered the experience of farming and communicating in the community. In carrying out their duties, they are not responsible to the Geuchik (Village leader).

Keujruen Blang will not be dismissed on the grounds that he died, filing an application to stop at his own accord, neglecting his duties as a fraud and committing a disgraceful act that is contrary to the Shari'a and customs. As such, the working period is not a specific period of time. In Blang Teurakan and Jurong villages, the work period is not more than 5 (five) years and the previous job has been resigned because he is

old. In Babah Krueng and Lancok Village, the period of work is not within 2 (two) years and the previous months have died. So, it can be seen that the existence of intelligence is not as a customary institution that has been determined democratically with local wisdom and meets certain requirements.

Keujruen Blang Duties and Authorities

Article 25 of the Customary Institution Qanun affirms the task of emergency, namely: (a) determining and coordinating procedures for going down to the fields, (b) regulating the distribution of water to farmers' fields, (c) assisting the government in agriculture, (d) coordinating festivities or ceremonies other matters relating to adat in paddy farming, (e) giving reprimands and sanctions to farmers who violate 'meugoe' (paddy) customary rules or not carrying out other obligations in the customary paddy farming system, and (f) resolving disputes among farmers related to the implementation of rice farming.

Management of Water Resources by Keujruen Blang

Water resources are very important for human life, nowadays drought and water crisis are important discussions in the international world¹². Water needs for human life are increasing, but people's access to water is decreasing both because the amount of water discharge is reduced due to the disappearance of the forest as a barn, as well as increasing population growth¹³. Therefore, it is necessary to regulate the water resources available for human life, including rice fields that support food availability.

In Aceh society, the management of water resources in paddy farming is carried out by uniqueness as a customary institution. Keujruen Blang has no obligation to utilize irrigation as the main irrigation of rice fields in Sawang Sub-District, which includes supervising, regulating and implementing water irrigation to farmers' fields, periodically inspecting water channels including drainage channels to prevent water theft.

The main irrigation in Sawang Sub-District is drained from the Sawang River and flows to another sub-district, managed by a Keujruen Blang Chik who is mandated by Article 4 Number (2) Regulation of the Governor of Aceh Number 45 of 2015 concerning the Role of Keujreun Blang in Irrigation Management (2015

Pergub Aceh as implementing regulation) the task is honest that, Keujreun Blang Chik should responsible for coordinating water management, maintaining irrigation networks and enforcing custom in the area of rice fields in the Sub-district area. Furthermore, in Article 4 paragraph 3 the Aceh Governor Regulation of (2015), the Keujruen Blang Chik has functions, namely: (a) coordination of the distribution of water between regions of the Keujruen Blang, (b) the implementation discussion of Keujruen Blang at the level of the mukim region; (c) supervision of the implementation of customary practices, (d) supervision of the implementation of the tasks of the windbreaker, (e) enforcement of customary practices, (f) facilitating the relations of rice farmers with relevant agencies, (g) custom socialization to the community, and (h) dispute resolution water utilization among rice farmers.

Village waterways (Lueng) are managed by Keujruen Blang Muda in Blang Teurakan Village, Jurong and Babah Krueng Village. Keujruen Blang Muda is coordinating smallholder farmers to clear the canals from the village waterways (Lueng) to the small waterways that flow into the farmers' fields. This cleaning activity is carried out by dividing the plots of water that must be cleared by tenants. Meanwhile, the Keujruen Blang Muda of village of Lancok coordinated sharecropping farmers in the provision of water for irrigating rice fields with boreholes. They deliberated in the availability of water machine equipment so that water could flow into the waterways so that it reached the farmers' fields. Then, honesty does not make a schedule for the distribution of water for each water channel. This is in accordance with Article 5 number (2) of the (2015) Aceh Governor Regulation, the role of Keujruen Blang Muda has functions, namely: (a) regulation of the distribution of water to farmers, (b) supervision of water availability for farmers, (c) supervision of channels and use of water by farmers, (d) settlement of disputes over water utilization among farmers, (e) supervision of the implementation of custom in the use of water, and (f) implementation and enforcement of customary practices.

In addition, they work together to clean water lines so that water can flow smoothly into the rice fields. This activity was carried out after a feast, it was believed that after reading the prayers in festivity, the field activities would go smoothly and get abundant harvests. Thus, in this situation, intelligence is a water manager for farmers working on rice fields. Keujreun Blang as a customary

institution has a strategic task in paddy farming. Just as in Aceh, in Klaten, Central Java in irrigation management also involves stakeholders and farmers ¹⁴.

On the other hand, the availability of abundant water does not reflect the adequacy of water in paddy farming¹⁵. For example, the harvest of farmers does not require water, but abundant water causes crop damage. In the season the water is planted a little so the rice that has been planted becomes dry. This situation is experienced by people in other parts of Indonesia, who have difficulty in fulfilling their lives⁸, including for agriculture. Therefore, Indonesia needs effective water management⁶. Water management by windfall is also influenced by strong cooperation among smallholders so that maximum water management can be carried out ⁹.

In Sawang Sub-District, during the dry season there is also a lack of water, where the discharge of river water becomes low so it cannot continue to flow into irrigation and village drains. Then the team did not coordinate the cultivator farmers to raise the water debit by making a stone dam together. When the dam's water does not flow again, it is done by using a water machine.

Procurement of water machines is requested by the district officials and from the collection of funds at the level of farmers who use the water resource. Usually the collection of funds to farmers is paid with the harvest so that the funds need to be bailed out first by capable parties. Likewise, if there is irrigation that is damaged, the accident does not coordinate irrigation repairs jointly by farmers who take water from the irrigation.

Keujruen Blang as a customary institution in carrying out its duties does not get a salary, but they will get the right after the harvest, that is the farmers will give rice called "Bruek umeng" ¹. The results of "Bruek umeng" that are collected give part for unrestricted money and some for saving "Meunasah" (savings for muslim places of worship in the village), which will be managed for the purposes of Meunasah (Muslim places of worship in the village). This is their togetherness in safeguarding and cleaning the waterways to get abundant rice yields under the coordination of windiness is a local wisdom in Aceh society. The existence of irregularities in managing paddy agriculture water resources for farmers in Aceh is not due to the task mandated in the qanun, but also to preserve the culture of the Acehnese in maintaining communal water sources. Therefore, the existence of Keujruen Blang as the customary institutions in

managing water resources as local wisdom in Aceh society.

CONCLUSION

Keujruen Blang, who is in Sawang Sub-District, has carried out the task by coordinating the cultivator farmers to cooperate in cleaning irrigation from upstream to downstream, and those who do not participate will be subject to sanctions. Keujruen Blang did not forbid people from dumping garbage into irrigation and did not close irrigation without permission. Then the weather does not check irrigation so that it is not shallow and damaged and regulates the distribution of water to prevent theft. In carrying out their duties, the month is not given a salary but will be given a harvest every time. Therefore, the existence of Keujruen Blang as a customary institution in the management of water resources is a local wisdom in the Aceh society.

The Influence of Transformational Leadership and Organization Commitment on the Job Satisfaction and the Employees Performance of City Council Secretaries in Bireuen District

Marbawi¹, Apridar¹, Yulius Dharma¹

¹Faculty of Economics and Business Universitas Mailikussaleh Lhokseumawe, Indonesia

ABSTRACT

This study aims to determine how much influence the transformational leadership and organization commitment through job satisfaction and impact on the employee performance of City Council Secretaries Of Bireuen District. The data used is the data by distributing questionnaires to 70 civil servants Bireuen. To data analyze, the statistical analysis used two-track equipment and processed with the help of the application program Statistical Package for Social Science (SPSS). The variables measured include transformational leadership, organization commitment, job satisfaction effect to ward employee performance of City Council Secretaries. The result the analysis of statistical test is transformational leadership and organization commitmen affect the employee performance at mediated job satisfaction. The result job satisfaction variable effect of full mediated on transformational leadership and organization commitment toward employee performance of City Council Secretaries in Bireuen District.

Keywords: *Transformational Leadership, Organization Commitment, Job Satisfaction and Employees Performance.*

INTRODUCTION

The success the employee performance at City Council secretariat of Bireuen District lies on empowering human resources, in order to improve the employee performance. Different Characteristics among individual employees of City Council secretariat of Bireuen District should be able to synergize with the transformational leadership style, so that institutaion leaders are able to organization commitment the employees to achieve organizational performance. The concept of employee performance applied to City Council secretariat in Bireuen District would provide guidance for secretariat on DPRK employees about important things to be done to improve job satisfaction and employee performance in secretariat DPRK Bireuen District.

The purpose of this research was to know and analyze the effect of transformational leadership and organizational commitment on job satisfaction and the, the effect of transformational leadership, organizational

commitment and job satisfaction to ward employee performance of City Council Secretariat.

Theoretical Background

Transformational Leadership

Transformational Leadership style is developed in the context of the organization, where transformational leadership cares to the improved performance, and develops followers to the maximum potential Avolio¹; Bass & Avolio¹, in Northouse². Burns³ suggested that transformational leaders are a process in which leaders and subordinates lift each other to the degree of morality and motivation higher."Leaders and followers raise one another to higher levels of morality and motivation", where leaders are trying to change the followers' consciousness on ideals and moral values such as equality, justice, peace, as well as humanitarian and instead is based emotions, such as fear, jealousy, or hatred.

Organization Commitment

Organizational commitment is an important employee behavior in city council secretariat Bireuen which to assess employee propensity to survive city council institutions as an employee who are loyal to the organization. According to the opinion of Luthans⁵, organizational commitment is an feelings of identification and loyalty to organization and the ongoing process in which members of the organization express their attention to the organization and its sustainable success and progress.

Job Satisfaction

Job satisfaction of secretariat DPRK employee can feel his job whether fun or not fun to do, in an organization of city council secretariat in doing its functions and serving the community especially in the field of financial services, employee satisfaction in performing everyday tasks are indispensable. There are some of definition the job satisfaction, according to Robbins⁴, job satisfaction is a positive feeling about the work as a result of evaluation of the characteristics. Luthans⁵ defines job satisfaction as a result of employee perceptions of how well their work delivers what is important.

Performance

Bernadin explain that performance⁷ provides limitations on the performance as a “record of outcome produced on a specified job function or activity during, a specified time period”. Then, the appraisal of performance is” a way of measuring the contributions of individuals to their organization”. Bernadin⁷ proposed six criteria for measuring the performance of employees, namely is Quality, Quantity, Timeliness, Cost-Effectiveness, Need for Supervision and Interpersonal Impact.

Research Method

Location And Time

The subjects in this study were employees of City Council Secretaries in Bireuen District, the location was done in DPRK of Bireuen District at Malhayati St. No. 1, Bireuen.

Types And Sources of Data

The type of data in this research is quantitative data. The data used in this study are primary data from the respondents' perception of the variables used. Any form

of communication with the respondents in this study used questionnaires submitted directly to the respondent⁸.

Population

Populations a combination of all the elements that have a series of similar characteristics which include the benefit of the research problem. Target population in employees of City Council Secretaries in Bireuen District was 70 employees, who are on of Secretariat DPRK of Bireuen District, with a total population of 70 people.

Samples

The amount of samples taken off in Bireuen District by total population, based on the total population of City Council Secretaries in Bireuen District were 70 employees, who are on of City Council Secretaries in Bireuen District, with a total population of 70 people.

Data Collection Techniques

Data collection method used in this research is by using questionnaire instrument, which is a set of written questions to elicit information from respondents. In this study a questionnaire sheet, there are two types of statements / questions: (1) statements relating to the measurement of the variables; (2) questions relating to the respondent data Sekaran⁹.

Data Analysis Techniques

Inferential statistic is a method related to sample analysis to draw conclusions about the characteristics of the population. After collecting the data and information in the field, then to manage data and information, the writer used the path analysis in the model and hypothesis testing uses the SPSS program for data analysis, Ghazali¹⁰.

RESULTS AND DISCUSSION

A total of 70 copies of questionnaire were analyzed and a research model in this study was used for understanding correlation between different variables. The result of hypothesis validation in this study, reality and validity of instrument had to be verified first. To compare with the independent and similar factors studied in previous studies and examine the variable validity of subjective measurement tool this research used SPSS 19.0, Ghazali¹⁰

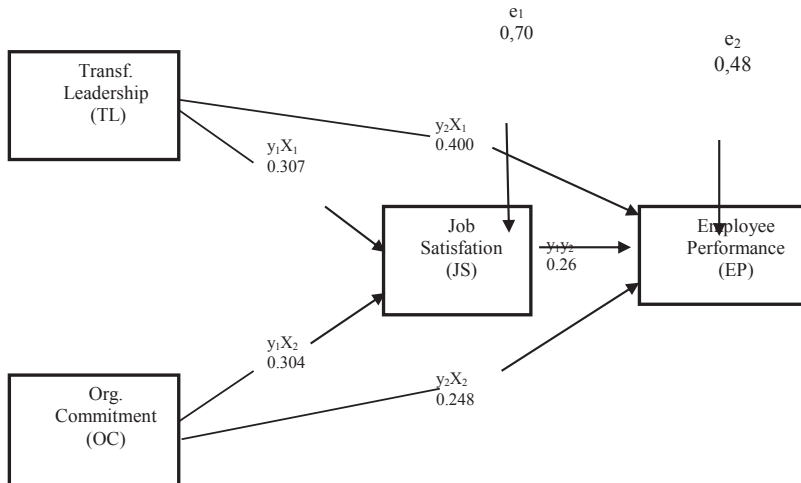

Figure 1 : Path Analysis Model

The path analysis model for this study can be seen in figure 1 above the results of calculation with path analysis shows the transformational leadership and organization commitment significantly influence on job satisfaction and employee performance (direct and indirect) at employee of City Council Secretaries in Bireuen District.

Effect Transformational Leadership to Job Satisfaction

Transformational leadership factor significantly influence on the job satisfaction. It can be seen from the results of path coefficient value 0.307 with a significance value of 0.016. These results prove that transformational leadership is one of the implementation of leadership

which has significant influence on the job satisfaction at City Council Secretariat in Bireuen District.

Effect organization Commitment to Job Satisfaction

Organization commitment factor significantly influence on the job satisfaction. It can be seen from the results of path coefficient value 0.304 with a significance value of 0.019. These results prove that organization commitment is one of the implementation of commitment of organization which have significant influence on the job satisfaction at City Council Secretariat in Bireuen District.

Effect transformational leadership to employee performance

Transformational leadership factor significantly influence on the employee performance. It can be seen from the results of path coefficient value 0.400 with a significance value of 0.001. These results prove that transformational leadership is one of the implementation of leadership which has significant influence on the employee performance at City Council Secretariat in Bireuen District.

Effect organization Commitment to employee performance

Organization commitment factor significantly influence on the employee performance. It can be seen from the results of path coefficient value 0.248 with a significance value of 0.028. These results prove that Organization commitment is one of the implementation of commitment which has significant influence on the employee performance at employee of City Council Secretariat in Bireuen District.

Effect Job Satisfaction to employee performance

Job satisfaction factor significantly influence on the employee performance. It can be seen from the results of path coefficient value 0.216 with a significance value of 0.037. These results prove that job satisfaction is one of the implementation of employee satisfaction which have significant influence on the employee performance at City Council Secretariat in Bireuen District.

CONCLUSION

Base on the results of research and discussion, it can be concluded as follow variable transformational leadership, organizational commitment, job satisfaction

simultaneously and partial have significance effect on employee performance of City Council Secretariat in Bireuen District.

H₁ There is a positive and significant effect of the transformational leadership on job satisfaction at the employee performance of Secretariat DPRK Of Bireuen District.

Based on Table 1, the known value of coefficient between transformational leadership on job satisfaction was 0.307, which is smaller than the significance level of 0.018. These results can be concluded that the transformational leadership variable significantly influences the job satisfaction of the employee performance of City Council Secretariat of Bireuen District. Based on the results of path coefficient value of the transformational leadership on job satisfaction is 0.307 positive coefficient path meaning the transformational leadership on job satisfaction has a positive effect on City Council Secretariat of Bireuen District. **Hypothesis 1** in this research is the influence of transformational leadership on job satisfaction on City Council Secretariat of Bireuen District **accepted**. Worth mentioning that the research results are consistent with studies conducted¹¹, the research results show that the transformational leadership has effect on the job satisfaction, Lumbanraja¹².

H₂ **There is a positive and significant effect of the organization commitment on job satisfaction at the employee performance of Secretariat DPRK Of Bireuen District.**

Based on Table 1, the known value of coefficient between organizational commitment on job satisfaction was 0.304, which is smaller than the significance level of 0.019. These results can be concluded that the organization commitment variable significantly influences the job satisfaction of the employee performance of City Council Secretariat of Bireuen District. Based on the results of path coefficient value of the organizational commitment on job satisfaction is 0.304 positive coefficient path meaning the organizational commitment on job satisfaction has a positive effect on the City Council Secretariat of Bireuen District. **Hypothesis 2** in this research is the influence of organizational commitment on job satisfaction on City Council Secretariat in Bireuen District Lhokseumawe **accepted**. Worth mentioning that the research results are

consistent with studies conducted¹¹, the research results show that the organizational commitment has effect on the job satisfaction, Yunina¹⁹.

H₃ There is a positive and significant effect of the transformational leadership on employee performance at Secretariat DPRK of Bireuen District.

Based on Table 1, the known value of coefficient between transformational leadership on employee performance was 0.400, which is smaller than the significance level of 0.001. These results can be concluded that the transformational leadership variable significantly influences the employee performance of the employee performance at City Council Secretariat of Bireuen District. Based on the results of path coefficient value of the transformational leadership on employee performance is 0.400 positive coefficient path meaning the transformational leadership on employee performance has a positive effect on City Council Secretariat of Bireuen District. **Hypothesis 3** in this research is the influence of transformational leadership on employee performance on City Council Secretariat of Bireuen District **accepted**. Worth mentioning that the research results are consistent with studies conducted¹¹ and ¹³, the research results show that the transformational leadership has effect on the employee performance, Siahaan ^{14, 18}.

H₄ There is a positive and significant effect of the organization commitment on employee performance at Secretariat DPRK Of Bireuen District.

Based on Table 1, the known value of coefficient between organizational commitment on employee performance was 0.248, which is smaller than the significance level of 0.028. These results can be concluded that the organization commitment variable significantly influences the employee performance of the employee performance at City Council Secretariat of Bireuen District. Based on the results of path coefficient value of the organizational commitment on employee performance is 0.248 positive coefficient path meaning the organizational commitment on employee performance has a positive effect on the City Council Secretariat of Bireuen District. **Hypothesis 4** in this research is the influence of organizational commitment on employee performance on City Council Secretariat of Bireuen District Lhokseumawe **accepted**. Worth mentioning that the research results are consistent with

studies conducted¹⁵, the research results show that the organizational commitment has effect on the employee performance¹⁶.

H₅ There is a positive and significant effect of the job satisfaction on employee performance at Secretariat DPRK Of Bireuen District.

Based on Table 1, the known value of coefficient between job satisfaction on employee performance was 0.216, which is smaller than the significance level of 0.037. These results can be concluded that the job satisfaction variable significantly influences the employee performance of the employee performance of City Council Secretariat of Bireuen District. Based on the results of path coefficient value of the job satisfaction on employee performance 0.216 positive coefficient path meaning the job satisfaction on employee performance has a positive effect on the City Council Secretariat of Bireuen District. **Hypothesis 5** in this research is the influence of job satisfaction on employee performance on City Council Secretariat of Bireuen District Lhokseumawe **accepted**. Worth mentioning that the research results are consistent with studies conducted¹¹, the research results show that the job satisfaction has effect on the employee performance⁴ and ¹⁷.

ABSTRACT

The amount of concentration and distribution length of air pollutant discharged from industrial area has consequences for fluctuations in ambient air. The objective of the research was to figure out the alteration of ambient air in Cilegon city. To achieve this objective, the research was conducted by analyzing the emission and circulation of SO₂ and dust pollutants emitted from the industrial estate. Hence, the researchers analyzed the distribution of industrial pollutants using Screen3 software whereas the distribution used is Lagrangian model. To validate the change of ambient air in Cilegon city, the measurement completed on 18 samples points. The results confirm that the amount of concentration of SO₂ pollutants had an impact on the change of ambient air in Taman Sari Village, Pulomerak District. Meanwhile, the impact of dust pollution changes the ambient air in Kotabumi village, the district of Purwakarta and Gerem Village in Grogol District.

Keywords: industrial area, concentration and distribution, SO₂ and dust pollutant, lagrangian model, impact on the change of ambient air

INTRODUCTION

Cilegon city has an industrial zone consisted of three zones, namely: Ciwandan, Krakatau Steel (KS) and Pulomerak. The amount of large and medium industries in the three regions, 81 industries¹. Meanwhile, the fuel usage varied according to the type of production². The Industry of Cilegon city there are five kinds of fuel consumed: coal, residue, diesel fuel, High Speed Diesel (HSD), Pyrolysis Fuel Oil (PFO) and Marine Fuel Oil (MFO)³. The variety of fuel consumption has consequences for various types of pollutants discharged⁴. Based on the results of the air emissions test, the type of air pollutant discharged from the industrial zone of Cilegon consists of: nitrogen dioxide (NO₂), particles/dust, sulfur dioxide (SO₂), carbon monoxide (CO), hydrocarbon (HC), and lead (Pb). The emission concentrations emitted vary be subject to the fuel volume used. The larger the fuel volume consumed, the larger the concentration of pollutants discharged⁵. The fuel volume used in Cilegon varies between 0.00237 to 255,000 kg/hour. The fuel volume sequence was used

as follows: HSD 2.37x10⁻³ kg/hour, diesel fuel 1.00x10³ kg/hour, PFO 3.72x10³ kg/hour, MFO 3.76x10³ kg/hour, and 80x10³ kg/hour residue. Fuel with large volume mainly coal with usage volume (170-255)x10³ kg/hour. The fuel was also used by the steam power plant industry located in Pulomerak zone³. The amount of brick fuel volume used has consequences on the amount of SO₂ and dust pollutants emitted from the industry⁶. SO₂ pollutants and dust emitted from the industrial zone of Cilegon dispersion beyond the industrial zone. This is as the implication of the height of the chimney used⁷.

RESEARCH METHODS

To know the emission and distribution length of air pollutant from industrial zone is done by modeling through several stages. The first stage was analyzing the type of pollutants and emission discharge of each source. The second stage was an analysis of the dispersion of air pollutants from each stack using Screen3 software. The third stage was analyzing the amount of air pollutant concentration in each region using Lagrangian model. Lagrangian model examines the flow model in particle

concept¹⁷. Emission discharge was calculated by using the general formula as follows:

Furthermore, to know the ambient air in Cilegon city, the researchers conducted by measurement. Meanwhile, to control the changes in ambient air, the comparison of ambient air measurement results in a quarterly period. Ambient air measurements were performed at 18 samples points using high volume sampling and paper tape sampling methods. The high capacity sampler method is used to measure the suspended concentration in ambient air by weighing the particulate matter retained on the filter surface by calculating the volume of inhaled air. The sample was used for both qualitative and quantitative analyzes of compounds present in particle form. The sampling was completed for 24 hours with air flow rate of 1.70 m³/

min. Furthermore, the paper tape sampling method was based on the measurement of light transmission due to precipitation (soiling) or darkening of the previously clean filter. The measurements were done by separating big particles from the atmosphere by the expanse and speed of certain airflow. To figure out the tendency of ambient air change measurement result done by using regression equation.

RESULT AND DISCUSSIONS

Emission and Dispersion Pollution of SO₂ and Dust

To figure out the pollutant discharge emitted from the industry, equation (1) was used. The results of the analysis with these equations were shown in Table 1.

Table 1. Air pollutant emissions from industrial zone in Cilegon city

No	Company	Type of fuel	Number of fuel 10 ³ (kg/h)	Element of content		Efficiency		Emission

The screen3 software used the following inputs such as; pollutant emission, temperature, wind speed and height of stack. The output of the software will be obtained the distance of air pollutant distribution in various atmospheric stability. Therefore, it was conducted the measurement of wind velocity and temperature zone. Wind speeds in industrial estates range from 0.2 to 4.0 m/s with temperatures ranging from 21.0 to 34.4°C. Average wind speed and ambient temperature in Cilegon industrial zone are: 2.5 m/s and 30°C, the result of model ruuning under those conditions, for SO₂ and dust pollutants are shown in Table 2 below.

Table 2. Distances of air pollutants with screen3

Atmospheric stability	KS zone			Ciwandan zone			Pulomerak zone		
	Concentration ($\mu\text{g}/\text{m}^3$)		Space of distance (m)	Concentration ($\mu\text{g}/\text{m}^3$)		Space of distance (m)	Concentration ($\mu\text{g}/\text{m}^3$)		Space of distance (m)
	SO ₂	Dust		SO ₂	Dust		SO ₂	Dust	
A	54.33	27.18	1000	49.52	9.89	1000	592.40	33.32	1155
B	53.38	26.70	1387	47.12	9.42	1377	237.20	13.34	4320
C	40.69	20.35	2595	36.21	7.24	2566	148.90	8.37	9876
D	16.19	8.10	8632	14.62	2.92	8356	4.82	0.27	18800
E	9.16	4.58	10371	11.99	2.40	8707	1.07	0.06	18800

Based on Table 2 above, the results of Screen3 SO₂ pollutant software and dust on various atmospheric stability with the same wind and temperature speeds showed the amount of concentration and spacing of different distances. Turner’s atmospheric stability consists of: highly unstable (A), medium unstable (B), slightly unstable (C), neutral (D), somewhat stable (E), and stable (F) [19]. Based on the results of the analysis, the atmospheric stability in Cilegon city in the morning, noon, afternoon and evening has variations between A-E. This phenomenon shows that the air condition in Cilegon city is between steady stable until quite stable. The distance distribution between atmospheric stability

E and A, SO₂ and dust pollutants in each zone varies. The ratio of the distribution of SO₂ and dust pollutants in the KS Zone between the stability of E and A is 10.37, in the KS zone of 8.71, while in the Pulomerak zone of 16.28. Meanwhile, the concentration of pollutants emitted is getting smaller. The amount of pollutant emitted from Pulomerak zone due to a very high stack used, so emissions dispersion beyond the industrial zone. To know the distribution of contaminants SO₂ and the dust that spread in Cilegon city used equation (4). The result of running the program using the equation, the distribution of pollutants in Cilegon city is shown in Figure 1.

Figure 1. Distribution of pollutants SO₂ and dust in Cilegon city

Based on Figure 1, it shows that the concentration of SO₂ and dust spread in Cilegon city emitted from the industrial estate, with an average wind speed of 2.5 m/s with wind direction from West to East. The analysis results showed that with wind velocity 2.5 m/s SO₂ and dust spread from Tamansari village towards Suralaya Village, Pulomerak district. Then from the village of Kotasari, Grogol district SO₂ spread to the village of Kotabumi

village of Purwakarta district. The concentration of SO₂ ranged from 21.843 to 24.573 µg/m³ whereas in Pulomerak subdistrict spread from Tamansari Village to Suralaya Village ranged from 40.228 to 45.256 µg/m³. While dust pollutants, concentrations in the same place between 97 to 277 µg/m³ and 259 to 629 µg/m³, the second distribution of pollutants, is shown in Figure 2.

Figure 2. Dispersion of SO₂ and dust in Cilegon city

The measurement of Ambient air

Measurements of air pollutant concentrations were carried out over five periods in November (2015) and then July and November (2016) and July and August (2017). Monitoring was conducted at 18 sample points spread throughout the Cilegon city. Monitoring the concentration of SO₂ and dust pollutants at each sample point, the monitoring results were shown in Table 3.

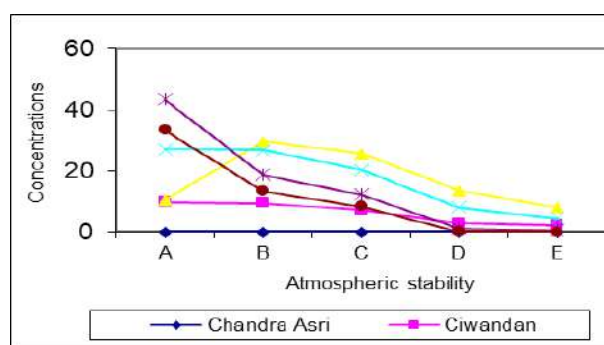

Based on the table, it is generally seen that the concentration of SO₂ and dust at each sample point has increased. Measurements were made at 18 samples points in a quarterly period, in this research, it was conducted four times for the measurement. The measurement results at the sample point, the concentration range of SO₂ between 3.45 to 55.75 µg/m³ while the dust concentration between 37 to 518 µg/m³. Changes in

ambient air, as a result of SO₂ pollutants occurred in Taman Sari village, Pulomerak district, while the change of ambient air, as a result of dust pollutants occurred in the Village of Kotabumi, district of Purwakarta and Gerem Village, Grogol district.

The amount of coal fuel volume and the height of the chimney used has implications for the concentration and distribution lengths of SO₂ and dust emitted. The concentration of SO₂ and dust is inversely proportional to the spreading distance emitted. The farther the emission distance the less concentrated pollutants emitted. Another thing related to the distribution of air pollutants is the stability of the atmosphere. Cilegon city has A-E stability, SO₂ and dust concentration changes in each atmospheric stability shown in Figure 3 below.

Table 3. The result of measurement of ambient air in Cilegon city

concentration SO₂

(b) dust concentration

Figure 3. Relationship between concentration SO₂ and dust with atmosphere stability

Furthermore, the distance of the pollutant distribution is inversely proportional to the concentration, the highest concentration in stability A while at stability E is small concentration. Meanwhile, the farthest distance occurs at the stability of E while the closest distance

occurs to the stability of A, as shown in Figure 4. The large amount of SO₂ pollutants and dust emitted from the industry had implications for changes in ambient air outside industrial zones.

Pollutant SO₂

(b) Dust pollutant

Figure 4. Relationship between distribution distance of SO₂ with atmosphere stability

CONCLUSIONS

The concentration of SO₂ and dust contaminants emitted from the industry spread to the outside of the industrial estate due to the changes in ambient air in some zones of Cilegon city. The results showed that SO₂ concentration had an impact on ambient air change in Taman Sari Village, Pulomerak district. Meanwhile, the impact of increased concentration of dust pollutants occurred air changes in the Village of Kotabumi, Purwakarta district and Gerem Village, Grogol District.

Uterine Inversion After Normal Delivery; A Case Report

Rajuddin¹, Afifi²

¹Staff of Obstetrics and Gynecology Medicine Faculty of Syiah Kuala University/ Zainoel Abidin Hospital Banda Aceh, ²Resident of Obstetrics and Gynecology Medicine Faculty of Syiah Kuala University/ Zainoel Abidin Hospital Banda Aceh

ABSTRACT

Uterine inversion is a rare case in Obstetrics and Gynecology field, but the incident can be a life threatening event. The incident was obtained 1 in 20,000 of normal deliveries. We present a case of woman with postpartum hemorrhage after delivery in obstetric clinic with active bleeding. On the vaginal toucher examination, there was a palpable lump and during massage, the uterus was difficult to assess. Postpartum hemorrhage is one of the biggest causes of maternal death until this date. One of the rarest causes of postpartum hemorrhage is uterine inversion, a rare and life threatening case in which the uterus is rotated partially or completely. This is a case about a woman, 29 years, with postpartum hemorrhage with loss of consciousness et causa hypovolemic shock since 2 hours before hospital admission. The patient has just given birth of her third child, with birth weight of 3500 grams. In the third stages of delivery, the placenta was not born immediately and the uterus is protruding into the vaginal cavity with active bleeding.

Keywords: Uterine inversion, Obstetrics, Gynecology

INTRODUCTION

Uterine inversion is a rare case in Obstetrics and Gynecology field, but the incident can be a life threatening event. The incident was obtained 1 in 20,000 of normal deliveries. We are presenting a case of a woman with postpartum hemorrhage after giving delivery on a midwife clinic with active bleeding. On the vaginal toucher examination, there was a palpable lump and during massage, the uterus was difficult to assess.^{1,2}

When inversion occurs, the adnexa and ligament are pulled into the fundus of the uterus and become more stretched. This can cause an extreme pain and lead into neurological shock. As the uterus is inverted and trapped inside the cervix, it causes progressive edema and congestion due to impaired venous and lymphatic drainage. Edema and congestion will increase the constancy of the inverse segment, making reduction more difficult. Impaired venous drainage will cause a lot of bleeding³.

The cause of acute uterine inversion is usually due to an error of the third stage of labor, with traction on the umbilical cord and fundal pressure before the placenta was separated. Another factor is the use of magnesium

sulfate during labor, manual release of the placenta after vaginal delivery or Caesarean section before the placenta is incompletely separated, increased abdominal pressure as coughing and sneezing or pushing, short umbilical cord and abnormalities of connective tissue⁴.

Case

A woman, 29 years old, came from a clinic with postpartum hemorrhage since 2 hours before hospital admission. Patient with decrease of consciousness and pale face, along with active bleeding from birth canal et causa uterine inversion. The patient has just given birth of her third child, with birth weight of 3500 grams. In the third stages of delivery, the placenta was not born immediately and the uterus is protruding into the vaginal cavity with active bleeding. The clinic where patients giving birth refers the patients directly into a type B hospitals, but because there is no availability of equipment, then the patient is referred to Zainoel Abidin General Hospital.

On physical examination obtained somnolen consciousness with GCS of 10, blood pressure 70/50 mmHg, heart rate 140 beat/minute, respiratory rate 38 breath/minute. Left and right conjunctiva was anemic,

whereas heart and lungs sound no abnormalities were found.

On obstetric examination, uterus fundus was difficult to assess, and on inspection there was active bleeding from birth canal, on vaginal toucher the uterus was protruding into vaginal cavity with active bleeding.

On laboratories examination, Hemoglobin is 4,8 g/dL and hematocrit 15%, thrombocyte 303.000/ mm³ and leucocyte 32.800/ mm³, MCV, MCH, MCHC is 76, 25, 33 simultaneously. It was concluded with Hypochromic Microcytic Anemia etcausa Bleeding with reactive leukocytosis.

The patient then had uterus reposition and continued with bimanual compression with administration of uterotonic (oxytocin 40 IU, Methergin 2 ampules, Misoprostol 600 mcq per rectal). However, the contraction was not adequate and so the patient were

decided for Laparotomy Hysterectomy.

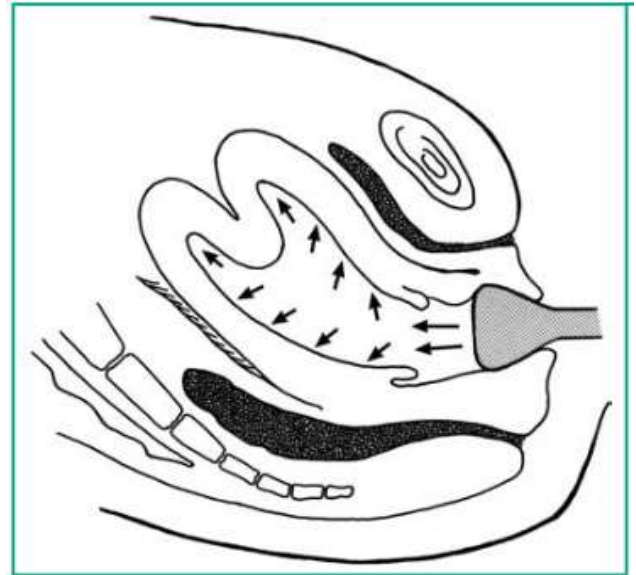

Fig 1: Cardiac Arrest Due to Uterine Inversion During Caesarean Section. Int J ObstetAnesth. 2009¹¹

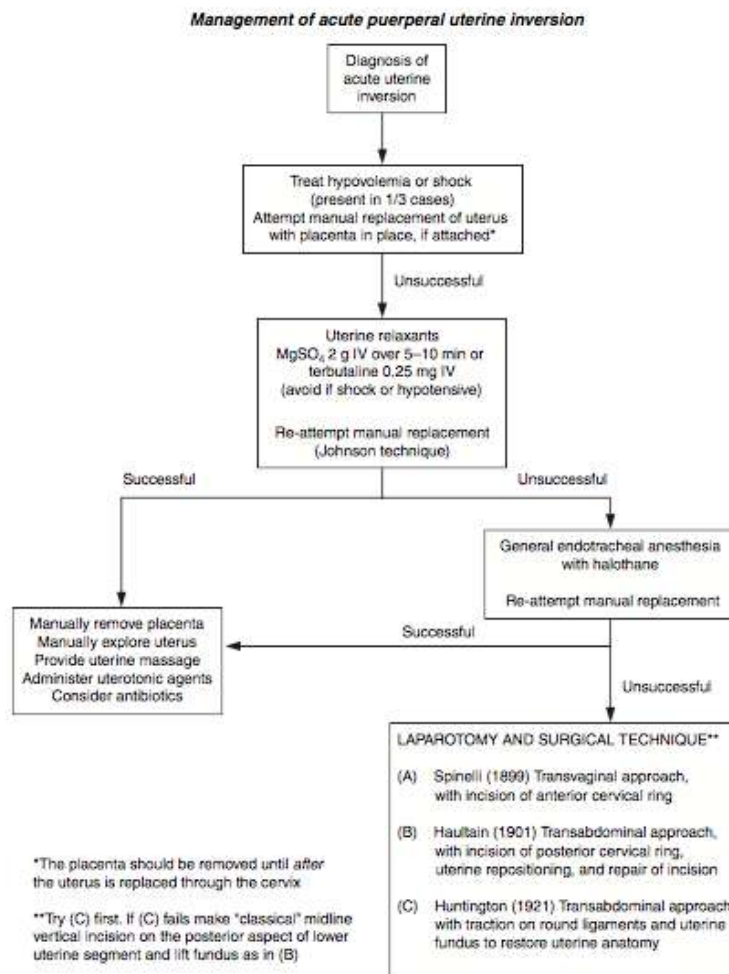

Fig 2 Uterine Inversion Algorithm. Picture taken from Clinical Protocols in Obstetrics and Gynecology¹⁵.

DISCUSSION

Uterine inversion is defined with fundus discharge into the uterine cavity. Uterine inversion divided into 4 degrees. 1st degree the fundus is rotated but does not reach the introitus. 2nd degree fundus rotates into vaginal introitus. 3rd degree fundus rotates and appears in the vaginal introitus, and 4th degree fundus rotates completely.^{3,5} Uterine inversion divided according to the distance of onset and delivery: acute inversion occurs 24 hours after delivery; subacute inversion occurs 24 hours to 1 month after delivery; and chronic inversion occurs >1 month after delivery⁶. Uterine Inversion symptoms characterized with abdominal pain, bleeding from the birth canal, along with decrease of hemodynamics².

Mismanagement of the third stage was recognized as the main cause of uterine inversion, although 50% of the case had no identifiable cause⁷. The most common factor seems to be the traction strength of placenta implantation at fundus with non adequate contraction of the uterus.

The application of uterine relaxation can be helpful such as β Sympathomimetic agents, Magnesium sulfate or low dose nitroglycerin^{8,9,10}.

After improving general condition and administer of antibiotic to prevent sepsis, manual reposition or hydrostatic method can be used as an option, if the manual treatment fails, repositioning can be done abdominally¹.

Hydrostatic method with silastic cup. Image taken from Cardiac Arrest Due to Uterine Inversion During Caesarean Section. *Int J ObstetAnesth*. 2009¹¹.

There is several ways of abdominal management of uterine inversion, Johnson's maneuver, where the operator insert two-third of the forearm into the vagina and spread the arms to lift the uterus above umbilical level to create tension and the fundus back to its normal position. If the uterus does not respond, addition of tocolytic can be considered.

Another alternative of uterine inversion is surgical methods, Huntingdon Technique, using 2 Allis forceps, uterus is pulled out and returned to its normal position.

Another surgical methods is the Haultain Technique, incisions is made in the posterior cervix with a longitudinal incision and with finger inserted into the

uterine incision area, the uterus is returned to its normal shape, incision closed with interrupted suturing³. The Matsubara-Yano suture technique is useful for deep hemostasis on postpartum hemorrhage, and it also can be used for prophylactic actions of uterine inversion recurrence¹².

Controversial occurs when removing the placenta. Uterine inversion with placenta left off during vaginal delivery will result in considerable blood loss. On the other hand, the presence of placenta will complicate the process of returning uterus position^{13,14}.

Uterine inversion can returned to its normal position with a sufficient team along with anesthetic and obstetric consultants within 45 minutes².

CONCLUSION

Uterine inversion can be managed properly, if it is known and managed immediately. The key of uterine inversion management is teamwork. In addition of uterine inversion risk factors, the process of placenta birth should be cared with cautions. Experts in labors process must paid more attention to assist when emergencies occur.

Prospect of Minapolitan Area Development in Aceh Timur Regency

Mawardati¹, Jamilah¹

¹*Agribusiness Departement, Faculty of Agriculture, Malikussaleh University, Aceh Utara,*

ABSTRACT

The study aims to determine the prospects for developing minapolitan area in Aceh Timur Regency. The method used in this study is survey method. The determination of the regency was carried out purposively, Aceh Timur Regency as an area of fisheries and cultivation minapolitan based on the decision of the Minister of Maritime Affairs and Fisheries of the Republic of Indonesia Number 35 / KEPMEN-KP / 2013. The results showed that the development of the minapolitan area in Aceh Timur Regency has potential to be developed based on the position of fisheries is on the international sea area, in the Indonesia-Thailand-Malaysia Cooperation Growth Triangle Area (IMT-GT) and the territorial waters including Fisheries Development Area I (FDA I) Andaman Sea-Malacca Strait, as well as fishery potential and fishery resources both in terms of fisheries area, infrastructure availability, fish resources, fisheries human resources, fishing facilities, availability of cultivated land, markets, processing, institutions, and the opening of fishery product export market opportunities. Integration of government, banking and private institutions was expected to be able to solving the problems of fisheries and fishermen, empowerment of fishermen and fish farmers, and encourage the development of integrated fisheries agroindustry in the minapolitan area.

Keywords: *fisheries development, fisheries resources, poverty*

INTRODUCTION

Minapolitan is a concept of maritime and fisheries development based on regional economic management with the driving force of the marine and fisheries sector. Minapolitan program begin in 2009 and it is a realization of the blue revolution program promoted by the Ministry of Fisheries and Maritime Affairs Republic of Indonesia to change the land mindset to maritime, by emphasizing the use of superior and competitive local resources. Development of the minapolitan area includes production, processing and marketing of fisheries and marine products. Through the minapolitan program, it is expected to increase various fisheries and coastal communities. The problem are: (1) the area inhabited by fishermen is generally isolated, (2) access to roads, markets and communication networks is not available, (3) knowledge and skills are very low so that they do not master capture fisheries technology and cultivation, and anticipatory thinking skills are low, (4) low ability to handle and process fisheries and marine products, (5) limited facilities and infrastructure, and (6) do not have venture capital. ¹

Aceh Timur Regency has 1,683.5 km² of marine waters, 46.4 km of coastline, and a fisheries strategic position in the Indonesia-Thailand-Malaysia cooperation growth triangle (IMT-GT) and marine waters including Fisheries Development Area I (FDA I) Andaman Malacca Strait. The fishing facilities and infrastructure owned by Unit 1 of the Nusantara Fisheries Port (PPN) in Idi Port Fish Landing (PPI) in Kuala Idi Cut and Kuala Bagok plus traditional port spread, and 43.4 km of national roads. Productive ponds have traditionally cultivated cover an area of 3,787 hectares and a freshwater pond of 2.6 hectares, non-productive ponds (idle) of 2,272.2 hectares and a pool of 3.9 hectares. Based on the fisheries potency and fisheries resources, Aceh Timur Regency is designated as a minapolitan area based on the Decree of the Minister of Maritime Affairs and Fisheries of the Republic of Indonesia Number: 35 / KEPMEN-KP / 2013, dated: 2 July 2013 Minapolitan Aquaculture.

The Minapolitan area in Aceh Timur Regency consists of 6 Sub-districts, 15 Mukim and 110 Villages with a total area of 755.47 km², 53 villages of which are

coastal villages covering an area of 137.66 km² (18.22%) which become the Core and Supporting Regions, while the villages non-coastal areas become buffer zones plus coastal villages that are not included in the Minapolitan development area of East Aceh Regency. The coastal area of the Minapolitan Region is formed from the limit of 4 nautical miles (1 mil sea = 1.85 km) from the coast and coastal sub-district boundaries.

Related Research

The poverty trap that hit fishermen's life was caused by complex factors. These factors are not only related to fluctuations in fish seasons, limited human resources, capital and access, fish trade networks that are exploitative of fishermen as producers, but also due to the negative impacts of fisheries modernization that encourage excessive drainage of marine resources³.

Proposed Method

The determination of the location of the research was carried out purposively, is the Aceh Timur Regency as an area of capture fisheries minapolitan based on the decision of the Minister of Maritime Affairs and Fisheries of the Republic of Indonesia Number 35 / KEPMEN-KP / 2013.

Research Methodology

The study used a survey method (survey method) with a qualitative and quantitative descriptive approach.

RESULTS AND DISCUSSIONS

Fisheries Resources

Aceh Regency Timur is a center for fisheries production and development in Aceh Province. Fish Resources (SDI) are relatively abundant, with superior commodities of various types of pelagic and demersal fish, such as komo cobs, layang deles, madidihang, skipjack tuna, lisung, cotton, albacora, black pomfret, machetes and other types of non-fish such as crustaceans (crustaceans) with hard skin or soft skin such as squid, cuttlefish and others. In 2014, fish production for fishing reached 16,620.61 tons increasing to 27,474.29 tons in 2016 with a production value of Rp. 599,565,982.30. Of these values, Idi Rayeuk Subdistrict is the highest contributor to the fisheries sector, namely fish production reaching 23,738.11 tons and a production value of Rp. 511,395,991⁴.

Ownership of fisheries resources and strategic location of fisheries in the Indonesia-Thailand-Malaysia Cooperation Growth Triangle Area (IMT-GT) is a potential for fisheries development and regional economic growth. To support the development of fishing, the regency has 1 unit of Coastal Fisheries Port (PPP) in Idi Rayeuk District; 5 units of Fish Auction Places (TPI) and traditional ports scattered in several sub-districts, such as Simpang Ulim, Julok, Darul Aman, Kuala Bugak Peureulak, and Rantau Selamat Districts; 1 unit of Beach Seed Hall in Alue Bu Village, Peureulak Barat District; and many traditional hatcheries. Fishing facilities in the 61 outboard motor fleets and 1,253 motorized fleets. The type of fishing equipment that is in the Idi Fishing Port is mostly in fishing rods and purse seines. The utilize of technology can also indicate the ethics of fisheries managers in utilizing fish resources. The use of inappropriate technology can trigger environmental damage or can lead to social conflicts between fish resource users. Some criteria for environmentally friendly fishing technology are high selectivity, non-destructive to habitat, do not endanger fishermen, produce good quality fish, products do not endanger the health of consumers, fish catches that are minimized, have a minimum impact on biodiversity diversity, do not catch species protected or endangered, and socially acceptable⁵.

Market and Marketing

The existence of markets and banks is very crucial, especially in the areas of fisheries production centers. In Aceh Timur Regency, in the Minapolitan development area, there are several market locations that spread in almost every sub-district as shown in Table 1. Most markets are concentrated in Idi Rayeuk District. This will make it easier for fishermen to market fish and get the raw materials needed to go fishing. Until now, coastal communities do not have microfinance institutions at the level of fishermen to facilitate access to capital loans. Microfinance institutions are able to provide credit services on a large enough scale without collateral, without strict rules and intensity of mentoring is higher than commercial credit patterns⁶. Microfinance institutions implement various systems in an effort to empower people. The system applied has its own advantages in order to help alleviate poverty⁷.

In order to support the marketing of fishery products, Aceh Timur Regency has provided 1,797.4 Km of road

network consisting of 112 Km of state roads, 116.8 Km of provincial roads and 1,568.60 Km of district roads.

Table 1 Marketing and Banking Facilities in the Minapolitan Area of Aceh Timur Regency, 2017

Amenities	Districts					
	Darul Aman	Peureulak Barat	Peudawa	Idi Rayeuk	Idi Timur	Peureulak
Traditional market	0	17	8	4	0	
Permanent Market	1	5	2	19	0	2
Store	50	97	34	277	31	165
Stalls	30	91	50	146	37	46
Cooperative	4	0	5	6	2	4
Bank	0	0	0	1	0	1

Abundant fish resources and open international market opportunities provide export opportunities for fishery products. Marketing of fish is mostly carried out outside East Aceh District, even some of which are exported to Malaysia. However, the amount of fish exported and the export value has not been accurately recorded. The marketing of fish in the Aceh Timur District reached 6,749,713 kg or around 40% of the total fresh fish marketed in 2015, which was 16,874,282 kg. Marketing outside the district ranges from 60% of the total fresh fish marketed to Medan and Padang cities and exported to Malaysia. Only a small portion of fresh fish is processed into wooden fish (drying), salted fish, shrimp paste, and shredded fish. Until now there is no fast food fish processing (canned fish) agro-industry.

Fish Processing Facilities

Generally in the coastal community, their daily life other than fishing, fishermen also do fish processing, because not all catches can be absorbed directly by the market. Fish processing activities are generally carried out during a decline in fish prices due to abundant fish production. The fish processing is in the form of salted fish, wooden fish, abonikan, terasi / belacan, and making pindangikan presto. Making salted fish is a process of processing or preserving fish by using salt so that the fish does not rot quickly and can be consumed for a long time. Fish processing units are scattered in several sub-districts as shown in Table 2.

Table 2: Fish Processing Unit (UPI) in East Aceh District

Districts	Location of Fish Processing Unit	type
Darul Aman	Seuneubok Baro	Fish salting
	Blang Geulumpang	Salting fish & fish shrimps
Idi Rayeuk	Ketapang mameh	Salting fish & shredded fish
	Calok Geulima	Salting fish & making shrimp paste / belacan
	Kuala Peudawa Puntong	Fish salting
Idi Timur	Matang Rayeuk PP	Fish salting
Peudawa	Kuala Peudawa	Fish salting
	Kampung Keudee	Fish salting

Going forward, as part of the Minapolitan development area, Idi Rayeuk District is expected not only to rely on the economy from selling fresh fish but will gradually be directed to the development of fish-based agroindustry to produce processed fish, increase added value and create jobs for the community. The existence of the fish processing industry certainly requires a large and continuous supply of fish that can be achieved by facilitating large vessels to be able to lean on the Nusantara Fisheries Port (PPN) Idi.

Institutional

The dominant institution in managing the minapolitan area is the East Aceh Regency government organization. Besides stakeholders from the East Aceh District Government officials need to also include existing institutions in the community, in this case that are closely related to the fisheries sector such as the HukomLaot Institution / East Aceh Commander from District level to Lhok (District) level and professional

groups such as Groups Mainstay Farmers and Fishermen, as well as Fishermen Association of Indonesia as partners in program implementation.

The dominant institutions in managing the minapolitan area involve the government, the private sector and the community as shown in Figure 1. Specifically, the government plays regulatory and development functions simultaneously ⁸. The local government acts as the regulator or facilitator in building and managing facilities in the Minapolitan area, such as the fish processing industry, ice block industry, shipyards. In its implementation it is left to the public or private parties; while the government regulates policies regarding location and provisions relating to public interests. However, for the provision of basic needs that are not economically efficient, it must remain the responsibility of the regional government, for example. fishing housing, fish culinary center, fish seed hall, health center and others.

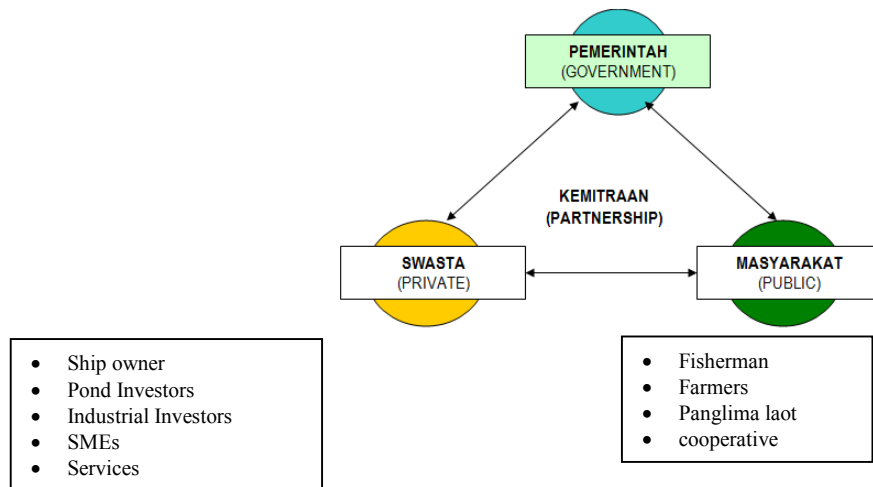

Figure 1: The partnership pattern for the Management of the Minapolitan Area, Aceh Timur Regency

Infrastructure Development in Minapolitan Areas

Infrastructure development is an indicator that can be used as a benchmark for developing a region. This condition is quite visible in East Aceh District since it was established as a minapolitan area. The center of fishing production and trade that can be used as the main driver of the economy in the Minapolitan area is the fishing port or fish landing site. In the Minapolitan

Development Area of Aceh Timur Regency as a support of fishing in Aceh Timur Regency, has several facilities to serve loading and unloading of fishing goods and products, a fairly representative port is in the Nusantara Fisheries Port (PPN) Idi located in the Geumpang Village, Idi District Rayeuk. Some infrastructure that has been built in the Minapolitan Area as shown in Table 3.

In the development of the Minapolitan area infrastructure, the priority programs are the development

of road and drainage networks, electricity networks, public facilities and means of transportation. Development in the Minapolitan area is seriously carried out by the local government for the improvement of people's lives and the development of the pre-planned Minapolitan area.

Table 3: Infrastructure Development in Minapolitan Areas

No.	Infrastructure development	Location	Benefit	Implication to the community
1	Beach Seed Center	Peureulak Barat Districts	Availability of Shrimp Seeds	Qualified Seed Availability is fulfilled
2	Production Road	All Sub-Districts Minapolitan area	distribution and transportation smoothly	Saprodi Distribution Activity and Harvest Results went smoothly
3	Production Bridge	All Sub-Districts Minapolitan area	distribution and transportation smoothly	Saprodi Distribution Activity and Harvest Results went smoothly
4	Pond Channels	All Sub-Districts Minapolitan area	Water distribution smoothly	Fulfillment of water needs for cultivation activities
5	Ice Factory	Idi Rayeuk Districts	Availability of Ice Needs at the Port	Fulfillment of ice needs for post-harvest / catch of fishermen
6	Cool Storage	Idi Rayeuk Districts	availability of Fish Storage	Stable Fish Sales Cost is stable
7	Dermaga	All Sub-Districts Minapolitan area	Availability of Boat / Boat Ropes	The loading and unloading process runs smoothly
8	PPI/TPI	All Sub-Districts Minapolitan area	Availability of an auction place	Availability of Transaction Points for Products and Other Supporting Needs
9	Fisherman's Hall	All Sub-Districts Minapolitan area	Availability of meeting places for farmers and fishermen	Ease in making decisions
10	Main Transit Building	All Sub-Districts Minapolitan area	Availability of Temporary Parent Shelter	A quality parent is accommodated
11	SPBN	Idi Rayeuk Districts	Availability of Fuel Needs	Fulfilled Supply of fuel for raw materials
12	Hatchery	All Sub-Districts Minapolitan area	Availability of Shrimp Seeds	Fulfillment of Seed Availability
13	Gudang Garam	Darul Aman Districts	Availability of salt storage infrastructure	Salt marketing runs smoothly and processing raw materials are fulfilled
14	Concrete Plate Titi	All Sub-Districts Minapolitan area	Easy distribution and transportation	The smoothness of Saprodi Distribution Activities and Harvesting Results

Contribution of Fisheries Subsector to Regional Economy

The development or dynamics of the fisheries sector can be seen from the contribution of the fisheries subsector to the GRDP of Aceh Timur Regency. If in the area / unit analyzed by the fisheries sector, it is relatively contributing to a larger economy (as seen from the contribution to GRDP), the stakeholders' attention to the sustainability of capture fisheries will be even

higher. GRDP data in Aceh Timur Regency shows that the agricultural sector still dominates the economy of the Aceh Timur Regency.

Although the use of these resources has shown significant contribution to the region, some people, especially fishermen, have not enjoyed it well. The potential of large fishery resources indicated has not been used optimally. This can be seen from the high rate of poverty of fishermen in the coastal areas of Aceh

which is reflected in the unhealthy housing environment, limited health facilities and lack of educational facilities.

CONCLUSIONS

The development of the minapolitan area in Aceh Timur Regency has the potential to be developed based on the position of fisheries on the international sea, namely in the Indonesia-Thailand-Malaysia Cooperation Growth Triangle Area (IMT-GT) and the marine waters including in the Fisheries Development Area I (WPP I) Malacca-Sea Strait Andaman, as well as fisheries potential and fishery resources both in terms of the area of fisheries, availability of infrastructure, fish resources, fisheries human resources, fishing facilities, availability of cultivated land, markets, processing, institutions, and open market opportunities for fishery product exports.

Integration of government, banking and private institutions is expected to be able to overcome the problems of fisheries and fishermen, empower fishermen and fish farmers, and encourage the development of integrated fisheries agroindustry in the minapolitan area.

Credibility-Profit Chain in Indonesian Islamic Banking Industry

Naufal Bachri

Department of Management Science, Universitas Malikussaleh

ABSTRACT

The purpose of this research is to examine the influence of credibility toward satisfaction, customer loyalty and Islamic banks performance. It is also to know whether the satisfaction and customer loyalty mediates the effects of credibility toward performance of Islamic banks in Indonesia. The sample of this research is 269 respondents that taken using purposive sampling technique. The data analysis method is Structural Equation Modelling (SEM) using AMOS. The results showed that the credibility of Indonesian Islamic banks influenced significantly toward the satisfaction and customer loyalty. The customer satisfaction influences significantly toward the customer loyalty. The satisfaction and loyalty influence significantly toward the performance. Moreover, the satisfaction and loyalty can mediate the effect of credibility toward the performance. Unfortunately, the credibility has not direct effect on the performance. However, the credibility is the key driver for increasing perception of customer and profitability.

Keywords: *credibility, customer satisfaction, customer loyalty, Islamic bank performance*

INTRODUCTION

This study is based on the concept of the service-profit chain (SPC). It is developed by Heskett *et al.* (1994)¹. SPC is an integrated framework for understanding behaviours and perceptions of employee and customer in generating profits for the corporate. This study is also called a model of integrated corporate performance. Several studies have revised and developed this model. Anderson & Mittal (2000)² examine the attribute performance can create the customer satisfaction and retention and also can increase the profitability of the corporate. This study is known as the Satisfaction-Profit Chain concept. Some studies related to satisfaction are also reviewed by Xu & Geodegebuure (2005)³. They only see the relationship of satisfaction between employees and customers. In addition, Walker *et al.* (2006)⁴ do not only use satisfaction but also use the variable of internal service quality, customer value and the customer loyalty in the SPC model. The variables used by Walker *et al.* (2006)⁴ are the important factors in increasing the growth of the company.

SPC is viewed from a public point of view by Davis (2006)⁵. This study uses the ethical and organizational values in achieving organizational goals. This concept

is known as Public-Profit Chain. Furthermore, Zigarmi *et al.* (2009)⁶ explain that maintaining the quality of culture, managing quality, and setting initiative as corporate leadership strategy can ensure the effectiveness and productive behavior of employees that affect the effectiveness of the corporate. This study is known as a Leadership-Profit Chain concept. In addition, technology information system plays an important role in the SPC model of a competitive performance^{7,8}. All of the studies above do not consider the credibility as an important element in improving the integrated corporate performance model. Credibility is a major factor that can change the customer behavior and attitudes and can improve the corporate performance^{9,10}. Based on the previous studies, there are insufficient shreds of evidence to explain the affecting factors of the corporate performance which can be seen from the aspects of corporate credibility and the customer behavior.

LITERATURE REVIEW

Service-Profit Chain

Service-Profit Chain is a concept that looks at the perception of employees and customers for the profit of corporate in a long time. The profits and growth of the corporate are caused by customer loyalty. Customer

loyalty is the output of direct satisfaction. Satisfaction is largely effected by the value of services provided to consumers. The perceived value is affected by satisfaction and loyal employees. Satisfaction of employee results from services of high-quality and policies that allow employees to deliver results to the customers.

Performance

Performance is a measure of success that has been achieved by a corporate measured every time period¹². Stoner *et al.* (1995)¹³, firm performance is a measure of how well the organization does its work. Performance measures can be defined as an assessment of organizational behavior and a parameter used to quantify the efficiency and effectiveness of past actions¹⁴.

In addition, Venkatraman & Ramannujam (1986)¹⁵ classify two corporate performance, financial performance, and non-financial or operational performance. Operational performance is a company performance that is seen from a market perspective about the corporate activities. Ahmad *et al.* (2011)¹⁶ classify several indicators to measure company performance such as product quality, market share, internal process coordination, personal rotation, and profit. Wheelen & Hunger (2006)¹⁷, corporate performance can be measured by indicators of sales volume, market share, and profitability. Denison *et al.* (2017)¹⁸ explain that the corporate performance can be seen from the profitability, main corporate achievement, growth, innovation, and the rate of return on assets.

METHODOLOGY

In analyzing the relationship between credibility and Islamic bank performance, this research takes 269 customers of Islamic bank as the respondent taken by using purposive sampling technique. Purposive sampling

technique refers to the technique of collecting samples that appropriate with the purpose of the research based on certain characteristics such as their minimum age is 18 years old, have been the customer at least for one year, and have more than three times banking transactions within the last three months. The data collection is conducted by distributing the structured questionnaires during the period October to November 2017.

To measure credibility, we adopt and adapt the work of Oliver *et al.* (1997)³⁴ and Keller & Aaker (1998)²⁴ which has three dimensions, i.e. reliability, expertise, and attractiveness. These dimensions are measured in twenty indicators. Customer satisfaction has seven indicators. We adopt and adapt the study of Saad (2012)³³. Meanwhile, to measure customer loyalty, we adopt and adapt the work of Oliver *et al.*, (1997)³⁴. Customer loyalty has four dimensions, i.e. cognitive loyalty, affective loyalty, conative loyalty, and actions loyalty. These dimensions are quantified in eight indicators. We use the study of Ahmad *et al.*, (2011)¹⁶. to measure Islamic bank performance we use five indicators. The measurement scales, this study uses five-points Likert, ranging from 1 (strongly disagree) to 5 (strongly agree).

Result and Discussion

Demography

Table 1 show the respondent descriptive statistic in this research. A total of 280 questionnaires are distributed to customers but there are only 269 samples that can be used (96.1 percent of response level). In the case of genders, men are more dominant than women which are by 62.1 percent. The most dominant age is 41 until 50 years old which is by 31.6 percent. The most dominant professions are entrepreneurs and lecturer/teacher around 29.4 percent and 19.3 percent, respectively.

Table 1: Respondents Demography

Characteristics	Frequency	Percentage	Cumulative percentage
Gender			
Men	167	62.1	62.1
Women	102	37.9	100
Age (years old)			
18-20	23	8.6	8.6
21-30	44	16.3	24.9
31-40	66	24.5	49.4

Cont... Table 1: Respondents Demography

41-50	85	31.6	81.0
More than 50	51	19.0	100
Occupations			
Civil Servant/ Government	27	10.0	10.0
Private workers	39	14.5	24.5
Lecturers/ teachers	52	19.3	43.8
Police/ Indonesian Army	11	4.1	47.9
Entrepreneurs	79	29.4	77.3
University Students/ students	44	16.4	93.7
Others	17	6.3	100

RESULTS

The normality of research data can be examined by seeing the value of the critical ratio for skew and kurtosis. All values in the critical ratio for skew and kurtosis are in the range between 2.580 and + 2.580³⁶. It means that the data have distributed normally. In this research, there is no outlier data. However, normality and outlier tests have fulfilled the requirement of SEM

AMOS. The measurement model test is analyzed to know the accuracy of all combined constructs. Based on the Goodness of Fit Test criteria, it consists of the value of Goodness of Fit Index, Adjusted Goodness of Fit Test, Tucker-Lewis Index, Comparative Fit Index, Root Mean Square Error of Approximation, CMIN, and P-Value ³⁶. The measurement model indices reveal that the proposed model is fit and parsimony. It can be seen in Table 2.

Table 2: Goodness of Fit Test for Measurement Model

Criteria	Cut Off	Results	Conclusion
Chi-Square	-	95.275	Good
The Degree of Freedom	-	104	Good
The Goodness of Fit Index (GFI)	≥ 0.90	0.961	Good
Adjusted Goodness of Fit Index (AGFI)	≥ 0.90	0.942	Good
Tucker Lewis Index (TLI)	≥ 0.95	1.006	Good
Comparative Fit Index (CFI)	≥ 0.95	1.000	Good
Root Mean Square Error of Approximation (RMSEA)	≤ 0.08	0.000	Good
CMIN	≤ 2.00	0.916	Good
P-Value	≥ 0.05	0.718	Good

Thus, all variables can be measured in the proposed model. The results can be viewed in Figure 2.

Fig. 2, Estimation of Relationships
 Note: ***Prob.<0.01; **Prob.<0.05; *Prob.<0.10

DISCUSSION

In this study, the result of the first hypothesis test shows that credibility has no effect on the Islamic bank performance ($\beta = -0.49$, Prob. > 0.10). This result is contrary to the work of Cretu & Brodie (2009)³⁷ and Alam *et al.* (2012)³⁸ in which corporate credibility affects directly on the corporate performance. We argue that the Indonesian Islamic banks are more focused on the profit orientation than the customer orientation. Islamic banks implement a network expansion strategy to other regions so that they cannot focus on the existing customer services. Meanwhile, the key to the success of a service company is the focus on customers.

The result of the second hypothesis test reveals that credibility affects significantly on the customer satisfaction ($\beta = 0.74$, Prob. < 0.01). This finding is in line with the studies of Goldsmith *et al.* (2000)²⁰; Ghorban & Tahernejad (2012)³⁹; Ballentine (2006)²². The credible company increases the customer satisfaction. The customer measures positively the Islamic bank credibility and they are satisfied with the service and product of Islamic bank. The satisfied customer will maintain to continue to use the product²⁴. In prior finding, satisfaction is a strong desire to maintain a valuable relationship⁴⁰. The bank which has the expertise, reliability, and attractiveness can strengthen the trust of the customer on the bank. Furthermore, the high trustworthiness can maintain the valuable relationship.

The third hypothesis test reveals that credibility affects significantly on the customer loyalty ($\beta = 0.23$, Prob. < 0.05). This result is in line with the works of Kemp & Bui (2011)⁴⁰; Sallam (2014)³⁵; Matthews (2012)⁴¹. The credible Islamic bank will continue to conduct transactions in the long term and do anything for the bank. It is because the customer has the sense of caring. Therefore, the bank will feel proud and confident in the competition if it has loyal customers. Cretu & Brodie (2009)³⁷ argue that customer loyalty is the results of a highly credible bank. Furthermore, the customer will always loyal to the bank in long-term, convey positive information to others and recommend the others to use the product.

The fourth hypothesis test reveals that the customer satisfaction affects significantly on the customer loyalty. This result is in line with the study conducted by Akarapanich (2006)⁴². Customer satisfaction is predictor

variable for customer loyalty. If the customer is satisfied with the product or service provided, this will lead to the customer loyalty so that the customer makes a repeat purchase in the future. Customer satisfaction will reduce price elasticity, prevent competitors from attracting customers because they are reluctant to move and reduce costs and in the next transactions⁴³.

The fifth hypothesis reveals that customer satisfaction is significantly on the Islamic bank performance ($\beta = 0.40$, Prob. < 0.01). This is in line with the works of Keisidou *et al.* (2013)²⁹; Matthews (2012)⁴¹. Customer satisfaction can affect the company performance. Satisfaction as the ability of the organization to provide service performance that exceeds the customer expectations. Wills (2009)²⁹ added that customer satisfaction is the key to future business success in the long run. To build and gain the reputation of a corporation will take a long time and large investments are needed in a series of business activities to make the customers happy.

The sixth hypothesis test reveals that the customer loyalty affects significantly on the Islamic bank performance ($\beta = 0.29$, Prob. < 0.05). This result is in line with the works of Heskett *et al.* (1994)¹; Spiteri & Dion (2004)⁴⁴. Faithful customers will do word of mouth so that this condition can reduce some marketing costs and attract new customers, and finally the corporate makes profits.

The final hypothesis testing demonstrates that customer satisfaction is a mediator variable. The indirect effect of credibility on Islamic bank performance is 0.30 (0.74×0.40). This indirect effect is greater than the direct one, i.e. 0.05. Likewise, customer loyalty is a mediator variable. The indirect effect of credibility on the Islamic bank performance is 0.07 (0.23×0.29). This indirect effect is greater than the direct one, i.e. 0.05. In the context of Islamic bank industry, Islamic bank performance is not affected directly by credibility. Banks must carry out customer-oriented strategies and redevelop employee competencies regarding Islamic products.

Research Implication

The results of the study can provide an impact. It implies that to build the credible corporate, the bank should upgrade a set of employee programs to increase expertise and trustworthiness. The bank also should design products to attract the potential and innovative

customers. Moreover, the bank also leads to the employee to orientate for the customer. Besides, the results of this study have implications for the development of integrated corporate performance theories. By adding credibility to the SPC model, it can increase knowledge in the field of banking marketing. Credibility can affect the performance of Islamic banking through customer satisfaction and loyalty. The development of this theory is called Credibility-Profit Chain.

CONCLUSION

This paper examines the relationship between credibility and corporate performance in Islamic banking. By using customer satisfaction and customer loyalty as the mediator variables, this study confirms that credibility does not affect directly on the Islamic bank performance. Credibility affects positively and significantly on the customer satisfaction and customer loyalty. Customer satisfaction affects positively and significantly on the customer loyalty and Islamic bank performance. Customer loyalty affects positively and significantly on the Islamic bank performance. Meanwhile, the indirect effect of credibility on the Islamic bank performance through satisfaction and loyalty is higher than its direct effect of credibility on the customer satisfaction and loyalty. We argue that the Islamic bank in Indonesia is more profit-oriented than social orientation. Ayub (2007)⁴⁵, claims that the main purpose of Islamic banks is social.

An Analysis of the Potentiality (Loan Repayment Capacity) of Unorganised Sector Employees on the basis of Ratio Analysis Related to their Disposable and Discretionary Income

Sharad Mittal

Research Scholar, SGT University, Gurgaon

ABSTRACT

The purpose of this study is twofold: 1. to ascertain the potentiality of the unorganised sector employees for the repayment of the EMI of housing loan. 2. to calculate the disposable and discretionary income of the unorganised sector employees. The current paper studies the influence of various factors related to household monthly expenses on the discretionary income. The study was conducted on the unorganised sector employees working in NCR, Delhi. MHFIs face problems while deciding the potentiality of the unorganised sector employees for the repayment of the EMI of housing loan. The present study focus on the issue faced by MHFIs and attempted to solve it by proposing most logical and pragmatic solutions of ascertaining the potentiality of the unorganised sector employees for the repayment of the EMI of housing loan. This study is helpful for both the MHFIs and the unorganised sector employees also. Ratio analysis was used for ascertaining the potentiality on the basis of disposable and discretionary income of the unorganised sector employees.

Keywords: *Micro housing finance, Potentiality, unorganised sector employees, disposable and discretionary income.*

INTRODUCTION

1.1 Context

Now a days the basic necessities of life – food, clothing, and shelter – are increasingly becoming a luxury and unaffordable, however luxury items such as televisions, mobile phones, refrigerators, etc. are becoming affordable...! We are often amazed at the progress our country has made when we see an auto rickshaw driver with a mobile phone; however we fail to notice that he is still living in a slum-like dwelling. Shelter is the basic human need, and owning a house can raise the productivity, social acceptability and efficiency of the family members who are staying in that.

It is understandable that economic growth leads to rise in income but this has led to even faster rise in property prices leaving it unaffordable for majority of population. Affordable housing is expected to have a positive impact by improving basic quality of life. Problems like traffic congestion, air quality, commute times, etc. can be resolved by providing proper housing facilities to the weaker sections of the society.

As housing requires huge capital that too for long term, hence the growth of this sector was real slow till now. Though it has always been remained as one of the most important economic factor, as apart from providing shelter, it raises an environment conduct for good health and sanitation, creating more employment across various industries like cement, steel, brick, and daily wage labourers. Shelter along with food and clothing, is one of the most important factor which has an intense influence on the socio-economic and physio and psychological development of human kind. Housing is not only a consumption good but also a productive investment.

1.2 Justification of the Research

The Indian housing finance sector has come a long way from its earlier phase of government domination to an increasingly market oriented system in the present times¹. In the 1990s, the process of liberalization of the financial sector provided much needed impetus to the housing finance sector with the entry of private financial institutions and banks, and propelled the system into a

higher growth trajectory. Infusion of competition and supportive regulatory changes enabled the development of a more market driven sector. The market orientation has improved the accessibility and affordability of housing, making possible the dream of home-ownership of many a households to come true. Lower lending rates, stable property prices, rising personal incomes, and fiscal incentives for owner occupied homes have contributed to the increase in the demand for housing finance. The sharp growth of the housing finance sector, particularly in a short span of one decade, also raises concerns regarding financial stability of the system in the context of macro economic and global economic developments. Although the Indian financial sector has reasonably withstood the repercussions of the recent global financial crisis, there is a need for a cautious and prudent approach on the part of the financial institutions².

LITERATURE REVIEW

In general, poor needs a wide range of financial services not just loans⁴ that are convenient, flexible, and reasonable interest rate. Depending on their circumstances, poor people need, not only credit, but also savings, cash transfers, and insurance. Microfinance is a powerful instrument against poverty⁵. The microfinance is the key factor for reducing poverty and generating self-employment among the poor. Microfinance is the provision of a broad range of financial products and services. It includes the products like life insurance, live-stock insurance, bank accounts, payment services, financial advisory services, micro-leasing, micro-insurance, money-transfer to assist the very or exceptionally poor in expanding or establishing their businesses, non-life insurance products, saving products, credit products, insurance products and remittance products. Therefore, microfinance is defined as financial products and services provided to poor and low income clients so as to help them raise their income, thereby improving their standard of living.

Successful microfinance can be defined by three main characteristics: sustainability, outreach, and impact⁶. Sustainability refers to the ability of a program to continue over time, preferably without ongoing subsidies. Outreach refers to the number of clients reached and targeting of the poor. Impact refers to the ability of a program to assist poor households and individuals to move out and remain out of poverty, and is the ultimate objective of microfinance provision. The

basic features of microfinance are as follows:

1. Microfinance plays a vital role in rural and urban village (slums) finance.
2. The borrowers are from the low income group.
3. Loans are of small amount – micro loans.
4. It is short duration loans with frequency of repayment.
5. Loans are offered without collaterals and are generally taken for income generation purpose. 6. It is not profit oriented rather more service-oriented.
7. It motivates to take hold of the self-employment opportunities.
8. The two main mechanisms for the delivery of financial services to such clients are: (a) relationship-based banking for individual entrepreneurs and small businesses; and (b) group-based models, where several entrepreneurs come together to apply for loans and other services as a group.
9. It deals in multiple services such as loans, savings, insurance, transfer services, micro credit loans etc.
10. It is not profit oriented rather more service-oriented.
11. It is one of the most effective and necessary Poverty Alleviation Strategies.
12. It is basically supply to the poor households and small entrepreneurs.

RESEARCH METHODOLOGY

This heading defines the research design, research objectives, population samples, data collection procedures and the techniques of data analysis to ascertain the potentiality of the unorganised sector employees for the repayment of the EMI of housing loan and to calculate the disposable and discretionary income of the unorganised sector employees. The current paper studies the influence of various factors related to household monthly expenses on the discretionary income. The study was conducted on the unorganised sector employees working in NCR, Delhi. Ratio analysis was used for ascertaining the potentiality on the basis of disposable and discretionary income of the unorganised sector employees. This research is exploratory in nature.

A survey was designed to measure the potentiality of the unorganised sector employees. To collect information / data for the research purpose we have used **convenient sampling**. The target population, to which we would like to draw inferences, comprises the unorganised sector employees working in NCR, Delhi. The survey was conducted of the unorganised sector employees to collect the data. The total Sample size was of 500 unorganised sector employees. For the analysis of the data, IBM SPSS STATISTICS 21 version software has been used to perform Ratio Analysis and chi square analysis.

3.1 Research Questions

- What is the demographic profile and socio-economic status of the respondents?
- How can the researcher analyse the potentiality (loan repayment capacity) of unorganised sector employees on the basis of ratio analysis related to their disposable and discretionary income?

3.2. Research Hypotheses & Objectives

Following research hypotheses & research objectives are developed to address the research problem.

3.3.1. Research Objectives

Research Objective: To analyse the potentiality (loan repayment capacity) of unorganised sector employees on the basis of ratio analysis related to their disposable and discretionary income.

4. DATA ANALYSIS, INTERPRETATION & FINDINGS

4.1 Demographic Analysis

Frequency analysis was done to study the demographic profile of the respondents. Following are the findings of the analysis-

Findings: It was found that there were total 500 respondents out of which, 91.6% respondents were Males and 8.4% respondents were Females.

Findings: It was found that out of total 500 respondents, 16.6% respondents belong to the age group of 20 to 30 years, 67.4% respondents belong to the age group of 31-40 years and 16.0% respondents belong to the age group of 41-50 years.

Findings: It was found that out of total 500

respondents, 9.0% respondents were single, 84.6% respondents were married and 6.4% respondents belonged to other marital status.

Findings: It was found that out of total 500 respondents, 5.4% respondents were illiterate, 13.2% respondents had a middle school certificate, 13.8% respondents had a high school certificate, 36.2% respondents were intermediate, 13.2% respondents were graduate or post graduate and 18.2% had done a professional course.

Findings: It was found that out of total 500 respondents, 11.6% respondents had agriculture as an occupation, 18.0% respondents had business as an occupation, 39.8% respondents were skilled labours, 21.8 were unskilled labour and 8.8% respondents had a regular service.

Findings: It was found that out of total 500 respondents, 20.0% respondents had a monthly income less than 10000, 35.0% respondents had a monthly income between 10001 to 15000 and 45.0% respondents had a monthly income between 15001 to 20000.

Findings: It was found that out of total 500 respondents, 6.0% respondents had a house hold monthly income of less than 10000, 8.6% respondents had a house hold monthly income between 10001 to 15000, 30.4% respondents had a house hold monthly income between 15001 to 20000, 29.0% respondents had a house hold monthly income between 20001 to 25000, 19.4% respondents had a house hold monthly income between 25001 to 30000 and 6.6% respondents had a house hold monthly income between 30001 to 35000.

Findings: It was found that out of total 500 respondents, 6.0% respondents rarely saved, 86.2% respondents occasionally saved and 7.8% respondents regularly saved.

Findings: It was found that out of total 500 respondents, 71.8% respondents had discretionary monthly income of less than 5001, 15.2% respondents had discretionary monthly income between 10001 to 15000, 10.6% respondents had discretionary monthly income between 10001 to 15000, and 2.4% respondents had discretionary monthly income between 15001 to 20000.

Findings: It was found that out of total 500 respondents, 6.4% respondents wanted a loan amount of

less than 2 lac, 34.4% respondents wanted a loan amount between 2 to 4 lac, 33.6% respondents wanted a loan amount between 4 to 6 lac, 10.6% respondents wanted a loan amount between 6 to 8 lac, 6.2% respondents wanted a loan amount between 8 to 10 lac and 8.8% respondents wanted a loan amount Above 10 lac.

Following two amounts of loan were most wanted by the respondents-

Rs. 400000/-

Rs. 600000/-

Hence, the most prevalent average amounts of the expected housing loan were- **Rs. 4,00,000/- and Rs. 6,00,000/-**.

So, both the average amounts of loan were considered for the further Ration Analysis.

Findings: It was found that out of total 500 respondents, 40.8% respondents wanted loan for 5y to 9y tenure, 44.2% respondents wanted loan for 10y to 14y tenure & 15.0% respondents wanted loan for 15y to 20y tenure.

It was found that most of the respondents had chosen two categories-

5 years - 9 years

10 years -15 years

Finally, **10 years** was taken as **average tenure of loan** for further analysis.

- **Findings:** It was found that out of total 500 respondents, 14.0% respondents lived in a nuclear family and 86.0% respondents lived in a joint family.
- **Findings:** It was found that out of total 500 respondents, 18.2% respondents had 1 dependent in their family, 60.0% respondents had 2 dependents in their family, 60.0% respondents had 2 dependents in their family, 21.0% respondents had 3 dependents in their family and 0.8% respondents had 4 dependents in their family.
- **Findings:** It was found that out of total 500 respondents, 9.2% respondents had 1 earning member in their family and 90.8% respondents

had 2 earning members in their family.

- **Findings:** It was found that out of total 500 respondents, 89.6% respondents lived in a pucca house and 10.4% respondents lived in a semi pucca house.
- **Findings:** It was found that out of total 500 respondents, 30.6% respondents lived in a parental house, 59.4% respondents lived in a rented house and 10.0% respondents lived in a house given by government.

From the results of above analysis, it can be said that Research Objective is fulfilled.

4.2 Ratio Analysis: Potentiality of loan Repayment Capacity

Ratio Analysis is a form of **Financial Analysis** that is used to obtain a quick indication of a financial performance in several key areas.

This section will address the following research questions-

- How to calculate **household monthly income** of the 500 respondents?
- How to calculate **household monthly expenses** of the 500 respondents?
- How to calculate **disposable monthly income** of the 500 respondents?
- How to calculate **discretionary monthly income** of the 500 respondents?
- How to calculate **average interest rate**?
- How to calculate **average amount of the loan**?
- How to calculate **average tenure of the loan**?
- How to calculate **average EMI**?
- How to measure **potentiality of repayment of the housing loan EMI by the Unorganised Sector Employees**?
- How to perform different **Ratio Analyses for ascertaining the potentiality of repayment of the housing loan EMI**?

4.2.1 Calculation of Disposable Income

Disposable income, also known as disposable personal income (DPI), is the amount of money that households have available for spending and saving after income taxes have been accounted for.

Many economists use disposable income as a starting point to calculate metrics such as **discretionary income**, personal savings rates, marginal propensity to consume (MPC) and marginal propensity to save (MPS).

Disposable income minus all payments for necessities, such as mortgage, health insurance, food and transportation, equals **discretionary income**. This portion of disposable income can be spent on what the income earner chooses or, alternatively, it can be saved.

The present research is about calculating disposable income of the unorganised sector employees who have no proof of their income. They are not tax payers, neither do they get salary through the bank or cheque, nor they have any proof of their employment such as salary slips, appointment letter etc.

This research is an attempt to calculate their disposable income for the purpose of Micro Housing Financial Services or small housing loans. Researcher collected the data of 500 respondents (unorganised sector employees) through schedules. Following information was sought to calculate their disposable income and to check their potentiality of repayment of the housing loan EMI.

- Demographic information
- Monthly Income
- Household Monthly Income
- Saving Pattern
- Applicant's average Monthly Savings
- Household Average Monthly Savings
- Expected size of affordable house
- Amount of loan
- Tenure of the loan
- Ability to repay Loan/EMI on time
- Details of the Assets:
- Household Monthly Expenses
- Other behavioural Dimensions

Step-1

First of all **Household Monthly Income** was calculated. As the respondents are **not tax payers**, so, there is no question of **deducting taxes from the income** and getting **Disposable Income**.

So whatever **household income** is mentioned by them was considered as the **household disposable income** of the respondents.

Secondly, all the expenses were calculated for all the 500 respondents by adding the amount of following **Household Monthly Expenses-**

- Food & Grocery
- Education
- Electricity & Water
- Mobile Conveyance
- Medicine
- Clothing
- Rent
- Cable / Entertainment

Thirdly, **Household Monthly Savings** were deducted from **Household Monthly Expenses**. And finally, **household monthly expenses** were also deducted in order to get **Discretionary Income**.

$\text{Household Income} - \text{Household Savings} - \text{Total Expenses} = \text{Difference (Discretionary Income)}$

Step-2

4.2.2 EMI Calculation

An **Equated Monthly Installment (EMI)** is a fixed **payment** amount made by a borrower to a lender at a specified date each calendar month. Equated monthly installments are used to **pay** off both interest and principal each month so that over a specified number of years, the loan is **paid** off in full.

CONCLUSION

The conclusion of present research study can solve this issue. In order to ascertain the potentiality of the unorganised sector employees researcher applied ratio analysis.

Firstly, **Ratio Analysis-1: EMI (6L) /HMI Ratio (R1)** was calculated for the EMI- Rs.9681/- and the amount of loan was 6 Lacs. **EMI (6 lacs) /Household Monthly Income Ratio** was calculated to ascertain the **potentiality** of repayment of housing loan **EMI** by unorganised sector employees (respondents). It was found that out of total number of 500 respondents, 214 (42.8%) respondents are **Non-potential** and 286 (57.2%) respondents were **Potential**.

Secondly, **Ratio Analysis-2: EMI (6L) / Discretionary Income Ratio (R2)** was calculated for the EMI-Rs.9681/- amount of loan was-6 Lacs. **EMI/ Discretionary Income Ratio (R2)** was calculated to ascertain the **potentiality** of repayment of housing loan **EMI** by unorganised sector employees (respondents). It was found that out of total number of 500 respondents, 445 (89.0%) respondents are **Non-potential** and 55 (11.0%) respondents were **Potential**.

Here, Potential means respondents **will be able to repay** the housing loan EMI; and **Non-Potential** means respondents **will not be able to repay** the housing loan EMI.

The result of the aforementioned ratio analysis show that if potentiality of unorganised sector employees is calculated on the monthly income ratio there are 57.2% potential prospects for the MHFIs; but if the potentiality of unorganised sector employees is calculated on the Discretionary Income Ratio there are very less potential prospects for the MHFIs.

Customers' Attitude Towards Shopping Malls: : Does Gender Matter?

Bhavik U. Swadia¹, Jaimin Patel¹

¹Assistant Professor, FOC, GLS University

ABSTRACT

The retailing sector in India is continuously grown in the past decade. The organized retail industry in India is expected to grow at 30 to 35% on annual basis. Today most of the organized retailing shopping is much more than just purchasing it is an experience itself. Shopping malls are one of those formats which have started coming up in large numbers. Shopping malls offered number of advantages against the traditional markets. The customer are attracted in shopping mall because of various reason some are pleasant ambience, safety from extreme weather conditions, convenience because of escalators and lifts, shopping comfort, watching movies at the same place, wide choice of shops, various of food alternative through food courts etc. However, the rush to be there in the mall boom has not gone well with all the malls. As the number of malls in the same place was going up because of this some of the malls started struggling to survive. The development of Indian organized retail market is mainly due to the change in consumer buying behavior. Change in consumer behavior relates various aspects like income, lifestyle, demographic etc. Now the consumer wants to shop at a place where he can get food, entertainment, shopping under the one roof.

Keywords: *Shopping Mall, Window Shopping, Retail Marketing, Shopaholism*

INTRODUCTION

Retailing India is a largest industry accounting for a 10% of GDP and around 70% of employment. Indian retail sector is highly grow as compare to other developed as well as developing country. Basically retail industry distributed into groups organized and unorganized. Shopping generally refers to act of buying but some time it is done as reactional activity like window shopping and drowsing. Retail come from French word "RETAILERS" which refers to Cutting off my hands Clip and Divide" its relates to tailoring. The concept of shopping mall is not new in India. The number of shopping malls in India is growing. It is a truth that the arrival of shopping malls in a city promises to change the shopping and recreation activities of the consumers. Therefore, many corporates are investing a large amount of money to design and develop malls in terms of providing the benefits of shopping and the access of customers' to different global brands. At present, there is a nace to nack competition among the shopping malls has gone beyond bound with time to time. Because of this, the developers and stakeholders of shopping malls as well as the retailers need to understand

the consumer's attitude towards shopping malls. Today, the developers of shopping malls are introducing new strategies in order to develop a new style in a shopping mall. They are adding up restaurants, food court, cinema halls and game zones to attract the different customers having different tastes and choices.

LITERATURE REVIEW

Archana C. N. & Dhiman K. (2017), this study was based on a quantitative analysis. For the purpose of data collection Survey method was implemented. The data collected from three popular shopping malls of Bhavnagar, they were (1) Himalaya Shopping Mall (2) K-Mart and (3) ABM Mall. The sample size of this study was 100 and there is equal representation of gender i.e., 50 male respondents and 50 female respondents. For the purpose of study Purposive random sampling method has been adopted that means purposively three malls are selected in Bhavnagar, and then randomly picked the respondents who visit malls for the survey. As the study is on overall purchasing behavior of shopping mall customers in Bhavnagar, the questions were not addressed targeting any mall and they are not compared

with each other. The study finds that there are no differences between men and women in their shopping experiences. This is a good sign for the role of women. But, there is a slight variation in opinions in case of purpose of visit, where men agreed that they were visit malls often for entertainment, but women agreed that they were visit for entertainment occasionally¹.

D. Elangoyan & R. Sangeetha (2017), the main objective of the study is to find the level of awareness of customers towards the shopping malls in Coimbatore city and to find out the consumer preferences towards various factors of the shopping mall. The type of this research study was Descriptive Research. This study is carried out with two data collection methodology i.e primary data and secondary data. The primary data was collected by using 100 questionnaire. The major source of secondary data was collected from internet, library and the books and journals. They have used non-probabilistic convenience sampling method Analysis for survey with the Secondary data. The study find out that there is no difference between reasons for purchasing in shopping malls and personal profile of the customer and there is no relationship between Perception towards shopping malls and personal profile of the Customers².

Amit M. & Deepika J. (2016), this study will help in developing the mall patronage or attractiveness measures. Data was collected and finally analysis is done using exploratory factor analysis. The attributes were measured on a five point Likert scale. For the purpose of the study they were selected a total of five hundred active shoppers of shopping malls from the major cities of Punjab and Chandigarh (these were two relatively prosperous regions in India with a significant emerging mall culture). They had used a structured questionnaire to administered the respondents through the 'mall-intercept survey technique'. And from them two hundred and forty questionnaires were finally received for further use leading to a success rate of forty eight percent. Research had been conducted to understand Indian Shoppers' mall patronage behavior based on their evaluation of mall attractiveness attributes. To achieve this objective, the sixteen attributes were outlined. They were first classified into two broad clusters of mall attributes each consisting of eight attributes each. These clusters were first Shopping Mall Product Attributes and second Shopping Mall Service Attributes. The findings of this research indicates that the more different markets, geographical contexts may seem, the more similar

customers would behave in the long run.

Afreen C., Muhammad I.A. & Sigma I. (2012), this study may be a descriptive study wherever quantitative knowledge are collected to research the customers' perspective towards shopping mall. So as to form the report additional meaningful and respectable, 2 sources of information and data are used. Each primary and secondary information sources were used to generate the report. Field survey was dealt to gather primary information for conducting the study. The first information had been collected on twelve variables that are known once reviewing the various literatures. The variables are convenience, quality of product, availability of product, store selection, entertainment, parking facility, interior design, place to socialize, price, employee's behavior. The secondary sources are websites and journals. To conduct the analysis, individuals of various occupations of Dhaka town were surveyed. The 3 activity teams are students, housewives and service holders. During this study, seven purpose Likert Scale technique has been used. Here, the structured form has been went to collect knowledge from the respondent. The sector work was personally done. To conduct the research: target population was outlined because the shoppers of Bashundhara town looking Mall; the patrons aged on top of fifteen were qualified as sample unit for the study and one hundred respondents are surveyed. The respondents within the sample were chosen through judgmental sampling technique and knowledge were collected using mall intercept methodology³.

Vipul P. & Mahindra A. (2009), the objective of the study is to find out Consumers' Motivations to shop in Shopping Malls based on Indian customers. For this purpose they used mall intercept survey method. Data were collected in last week of February, 2007 from different shopping malls located in Ahmedabad city of Gujarat, India. The population for the study were consisted of active mall shoppers. The authors used structured questionnaire which was developed to measure the customers' shopping motivations in the shopping malls. The questionnaire consisted of questions concerning shopping motivations, and demographic information of respondents etc. Total forty seven items were developed to measure the shopping motivations⁴. Some of the items were adopted from various previous studies, and some were developed by the researchers. All of these were five point Likert-type scales in which respondents were questioned to indicate their

level of agreement whether they agree or not. Finally, the questionnaire also consisted questions to solicit demographic information of the respondents such as gender, age, education and marital status of the respondents etc. the study find out that the consumers not only went for shopping in a shopping mall, but for fun also they went on shopping mall. This study may help the shopping malls to know their consumer and help them to craft the marketing strategy as per the demand of the customers.

RESEARCH OBJECTIVE:

The objective of this study is to find out role of gender on consumers’ buying behavior in select shopping malls in Ahmedabad.

1. To compare the buying capacity of male and female consumers at selected shopping malls in Ahmedabad.
2. To study gender differences in shopping experience at selected malls in Ahmedabad city, Gujarat.

RESEARCH METHODOLOGY

Population: All persons visiting Ahmedabad One Mall for shopping were the target population for this study.

Sample Size: The study was undertaken on 350 consumers of Ahmedabad One Mall in Ahmedabad, Gujarat.

Data Collection Producer: From Ahmedabad One mall, 350 customers were selected using Simple Random Sampling. Researcher had visited mall personally for the purpose of the Survey. Customers who had given concern to participate in the survey were selected for the study. In selection procedure, there was no restriction of age, income and gender etc. of the customers. The questionnaire was handed over to randomly selected customer and got back filled questionnaire.

Data Collection Tool: The questionnaire consisted of closed-ended questions that included a 5-point Likert scale. Where 5 for highly satisfied and 1 for highly dissatisfaction. To collect data from the customers of shopping malls Pre-Tested questionnaire was developed. We had carried out Cronbach’s Alpha to check internal reliability.

Data Analysis: Once the questionnaires were completed, it was coded, and analysis is done in SPSS. Descriptive statistics were calculated to summarize nominal and categorical data using frequency and percentage whereas continuous data were summarized using mean, SD.

Table No. 1 Respondent Profile

Characteristics	Frequency (N=350)	Percentage
Gender:		
Females	168	48
Males	182	52
Age:		
15 – 25 years	72	20.6
26 – 35 years	101	28.9
36 – 45 years	75	21.4
46 – 55 years	58	16.6
Above 56 years	44	12.5
Educational Qualification		
10th Pass	27	7.9
12th pass	128	36.6
Diploma	94	26.9
Graduate	48	13.6
Post Graduate	53	15
Sector in which employed		
Private sector	158	45.14
Public sector	114	32.6
Self employed	63	18
Other	15	4.28

Table No. 2 Association of frequency of visit with Gender

Particulars	Female(168)	Percentage	Male(167)	Percentage	Total	Percentage
Daily	24	14.28	20	10.98	44	12.57
Once in a week	87	51.78	91	50	178	50.86
Every Two Weeks	25	14.88	26	14.28	51	14.57
Once in a Month	20	11.9	35	19.23	55	15.71
Rarely	12	7.14	10	5.49	22	6.29

This above table presents the findings and discussion of the findings. Continuous data are summarized in form of mean as well as SD throughout this discussion. Table 1 presents the profile of the respondents. It is clear from Table 1, that 48% of the respondents are female. The mean age of the respondents was 37.17 years. The majority of the respondent's (36.6%) had 12th pass and 26.9% a diploma. Of the respondents, 45.14% were employed in the private sector and 32.6% in the public sector. It is clear from Table 2, that 12.57% of the respondents visited the mall daily whereas 50.86% visited it once a week. The proportion of male respondents who were visiting malls daily is low as compared to female respondents. There is no statistically significant association between frequency of visiting mall and gender of respondents (chi-square value = 8.641, p-value = 0.071).

CONCLUSION

This study finds out that the existence of significant gender differences of customer shopping behavior amongst the mall shoppers. Understanding the aspect of the gender differences from the shopping experience of mall shoppers provides mall managers with rich information of approaching different customer segment with appropriate strategies. The findings of this study provide helps in understanding the impact of gender difference in shopping mall experience. The study finds out that there is gender difference (Male / Female) in shopping behavior in Alpha One Mall, Ahmedabad, Gujarat. Average time spent by female is high as compared to male which also affect their average money spent at shopping mall. The study finds out that the average visit of the females in shopping mall is higher in comparison to male visit the mall.

Computer Vision Syndrome in Visual Display Terminal users (VDT)

Mohammad Nooruz Zaman¹, Varsha Singh²

¹Assistant Professor (PhD). M.Optom, ²Assistant Professor, Chitkara School of Health Science, Chitkara University

ABSTRACT

Introduction : The digital screen has become a part of the everyday life at present which is a common item now-a-days in offices, colleges, universities and home This has led to an increase in number of patients complaining of ocular symptoms.

Objective: To assess Computer Vision Syndrome in Visual Display Terminal users (VDT)

Material and method: In a cross sectional, questionnaire survey study, data was collected to identify the impact of digital screen on Visual Display Terminal users. Sample was selected by simple random sampling and Data was appropriately analyzed using spss version 21.

Result : A total of 144 subjects with mean age of 27.73 ± 4.88 years old (range 18–35 years). Of all these 94 (65.28%) were having CVS where mean score of CVS was 7.50 ± 5.86 . Out of that 65.95% of male and 34.04% of female were having CVS. 34 subjects were using Visual Display Terminal for 4-6 hours per day, 63 subjects were using Visual Display Terminal for 7-10 hour per day and 47 subjects were using Visual Display Terminals for more than 10 hours per day. According to pearson correlation coefficient there was no significant association between computer vision syndrome with number of hours working on computer per day(+0.048;p=0.567)

Conclusion : The present study revealed 65.28% of the subjects were affected with Visual Display Terminals.

Keywords: *Computer Vision syndrome, Visual Display Terminal, digital screen*

INTRODUCTION

Today in the era of information and technology, computer and mobile phones have become pervasive around the globe. Already nearly half of the working population uses computer or any visual display terminal for their job and recreation¹. In almost all offices, colleges, universities and homes, the video display terminals (VDTs) are becoming a common item of use. Millions of people including children, college students are using computers for prolonged hours. A video display terminal (VDT) is also known as computer screen. According to the American Optometric Association “Computer Vision Syndrome” (CVS), is as a complex of eye and vision problems related to the activities which stress the near vision and which are experienced in relation to or during the use of computers².

Computer Vision Syndrome (CVS) is a condition in which a person experience one or more of eye symptoms and/or headache and back pain as a result of prolonged working on a computer³. Bankers, account section workers, professional computer workers, excessive near work by mobile, laptop or tab users are commonly affected by CVS.

CVS encompasses a group of visual symptoms which crop up from the extended viewing of the Video Display Terminal (VDT), when the demands of the task exceed the abilities of the viewer. Symptoms of CVS includes; dry and irritated eyes, eye strain/fatigue, blurred vision, red eyes, burning eyes, excessive tearing, double vision, headache, light/ glare sensitivity, slowness in changing focus and changes in colour perception⁴. If you spend more than 2 hours daily in front of computer you have 90% chance to develop computer vision syndrome.

Computer Vision Syndrome (CVS) is the number one occupational hazard of the 21st century⁵

It is estimated that nearly 60 million people suffer from CVS globally and that a million new cases occur each year⁶. Prevalence of CVS ranges between 64 and 90% among computers users.⁷. The prevalence of symptoms of CVS (one or more) was found to be 89.9%^{8,9}.

Studies among students have shown prevalence of CVS among engineering students was 81.9% and 78.6% among medical students¹⁰. Prevalence of CVS among university staff in Malaysia was 68.1%¹¹. Prevalence of CVS among keyboard users was 59.5%. Prevalence of Computer Vision Syndrome among Information Technology Professionals Working in Chennai was 69.3% (moderate, 62% and high, 7.3%)^{12,1}. Another study showed that 50% to 90% of computer users experience the symptoms of CVS⁵.

Visual mechanism on VDT screen

The focusing systems of human eyes are not meant for electronically generated characters on the VDT. It responds perfectly to the images that have well defined edges with good background contrast. (eg: solid black letters on white background). VDT letters are made up of small dots or pixels. Each pixel is bright at its center and with decreasing brightness towards its outer edge.

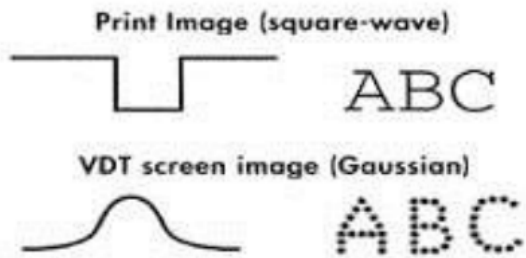

Fig. 1 Print image and VDT screen image

The human eyes find it very difficult to focus on the pixel characters. The eyes focus on the plane of the computer screen but cannot sustain that focus. Then it will relax on to a focus behind the screen. This point is called the resting point of accommodation (RPA) or dark focus. RPA is different from person to person but it is somewhat away than the normal working distance to the computer. Therefore the eyes are constantly relaxing to RPA and straining to refocus on to the screen constantly.

The constant changing of focusing by the ciliary body creates fatigue to the eye and causes accommodative symptoms pertaining to CVS.

Pathogenesis of computer vision syndrome (CVS)
^{13, 14}

Images on computer screens contrast is not sharp, edges of characters are not well-defined and eyes will have difficulty on focusing

Eyes will drift to the resting point of accommodation (RPA)

strain on ciliary muscles of the eye

Leads to Fatigue, tired eyes

Cause Dry eyes due to less blinking (<5, N=15/min)

Change in repeated head posture /wrong posture to maintain the focus

This leads to strain on the neck muscles and cervical spine

And then neck and back pain

VDT has led to an increase in number of patients complaining of ocular symptoms related to computer use. It certainly has improved the quality of the work and efficiency, but altogether has also led to ocular problems^{13, 14}.

METHODOLOGY

The overall research design parameters of the study are

- 1) Study design: Cross-sectional study
- 2) Study population: VDT (Test, T) with CVS

3) Study duration: 6 months. The present study is a cross sectional study conducted for a period of 6 months from January to June' 2018 at IT professional of Punjab.

Patient data collection: Patient Sampling was done considering various inclusion/exclusion criteria.

Inclusion criteria: VDT users with best corrected visual acuity were eligible for the present study and those who use VDT more than 2 hours⁸.

Exclusion criteria: Patients with the following factors and characteristics are ineligible to be included for the present^{15,16}, **1)** Age above 35 years, **2)** Subjects with any ocular disease, **3)** Subjects undergone refractive surgery, **4)** History of contact lens wear, **5)** History of Diabetes Mellitus, **6)** Connective tissue disease, **7)** Hepatitis C infection, **8)** Postmenopausal estrogens therapy, **9)** History of medications like lubricating eye drop, vitamin A therapy, antihistamine, antihypertensive agents, antipsychotic agents, antidepressants, antileprosy agents, sedatives and hypnotics, antimalarial agents, antiviral, anti-rheumatic gents/analgesics use, **10)** Radiation therapy, **11)** Hematopoietic stem cell transplantation.

Prior permission/consent was taken from the organisation and human subjects. Questionnaire was explained to the subjects before giving the questionnaire. Detail ocular and medical history was taken^{15,16}.

Patient Score calculation and classification: Vision and refraction was assessed for VDT

To assess the extent of computer usage and collect data of preliminary symptoms of the population under study, CVS-Questionnaire (CVS-Q) was used for VDT users to calculate the CVS score for comparison and grouping of the population as VDT and non-VDT users.

Sample design and sample size

Simple random sampling will be done on VDT and non VDT users to include 140 subjects

(male and female) in each group. Sample size will be calculated using the following general

Formula:

$ME = z \sqrt{p(1 - p)/n}$ whereas,

n (sample size) = $p(1 - p)z^2/ME^2$

$p = 0.899$ (prevalence of dry eye in VDT users)⁸

$z = z$ score, 1.96 for 95% confidence interval

ME = desired margin of error assuming margin of error (ME) to be 5%, its significance level is 0.05 (for 95% confidence interval.) Therefore, $n = 0.899 (1 - 0.899) 1.96^2 / 0.05^2$

$0.899 \times 0.101 \times 1.96 \times 1.96 / 0.05 \times 0.05 = 140$ patients.

RESULTS

A total of 144 subjects participated in the study; 42 (29.16 %) were female and 102 (70.83 %) were male. The mean age was 27.73 ± 4.88 years old (range 18–35 years) and mean age of male was 28.80 years and female was 25.11 years. The prevalence of computer vision syndrome (CVS) found in this study was 94 (65.28%) where mean CVS score was 7.50 ± 5.86 CVS score in male and female were $8.96 (\pm 4.20)$ and $12.63 (\pm 6.71)$ respectively. There was no significant changes in CVS score in between male and female ($p = 0.07$)

A negative correlation co-efficient value (-0.174) and ($p = 0.0037$) was found in between Computer Vision Syndrome and age of the VDT users.

According to pearson correlation coefficient there was no significant association between computer vision syndrome with number of hours working on computer per day ($+0.048; p = 0.567$)

Table 3 reveals association between CVS number and number of working hours per day where 34 subjects were using computer 4-6hours per day, 63 subjects were using computer for 7-10hour per day and 47 subjects were using computer for more than 10 hours per day.

Table 1: Impact of digital screen on Visual Display Terminal users

	Number	Percentage
Total number of CVS	94	65.28
Male	62	43.05
Female	32	22.23

Table 2: Association between CVS and age in years

Age in years	CVS
15-20	8±6.67
21-25	10.40±7.69
26-30	6.65±4.75
31-35	6±4.17

Table 3: Association between CVS and number of working hours per day

No. Of working hours per day	No. Of CVS	Mean CVS score with sd
4-6 hrs	34	7.88±7.79
7-10hrs	63	7.04±4.76
>10hrs	47	8.85±8.01

DISCUSSION

The prevalence of computer vision syndrome (cvs) found in this study was 65.28%

The findings of the study was supported by Seshadhri Arumugam et al and Rahman, Z.A. and Sanip, S., 2011^{1,11}.

In our study, more than 4 hours continuous use of computer was significantly associated with occurrence of CVS. Muttiand Zandic (1996)¹⁷ reported more pronounced visual symptoms in people spending 6-9 hours daily at a computer, while Stella et al (2007) observed the same in people using computer more than 8 hours daily¹⁸.

In our study there was no significant association between computer vision syndrome with number of hours working on computer per day(+0.048;p=0.567) which is supported by Seshadhri Arumugam et al study there was no significant association between the incidence of Computer Vision Syndrome and total number of hours of working on computer¹.

Spending long time on the computer screen without pause also can lead to problem of shifting focus on screen, documents and keyboard. The constant process of drifting and refocusing on fuzzy pixel of texts on the screen can leave eyes strained and fatigued¹⁹.

Computer work place illumination, screen contrast, duration of work on compute, viewing distances and angles, specific work related task, pressure and interest, screen reflection, image quality, and work place ergonomics were found to have significant role in manifesting symptoms in VDT users¹⁸.The level of the computer screen can be at or above or below the eye level of computer user. A higher proportion of subjects who had their computer screen at or above the eye level reported asthenopia^{20, 21, 22}.

CONCLUSION

Computer Vision Syndrome is a common ocular problem but the symptoms often been ignored and neglected by the computer users. If the problem persisted it may reduce job satisfaction and performance. Looking at far objects in-between work, viewing the monitor below the eye level, massage of eyes, and use of eye drops helped in reducing the symptoms.

Enhanced Improvement in Dynamic Behavior of Hybrid Active Power Filter using PI Controllers and Fuzzy Logic

N. Madhuri¹, P.Chandra Sekhar¹, M.Suryakalavathi²

¹Associate Professor, Department of EEE, Mahatma Gandhi Institute of Technology, ²Professor, Department of EEE, JNTU College of Engineering, Hyderabad, Telangana, India

ABSTRACT

This paper shows a fuzzy-logic, PI managed shunt active power filter used to compensate to get symphonious writhing in three-phase techniques. The Hybrid Vehicle power filter makes use of a more fundamental procedure for its quote of this benchmark settlement present in gentle of Rapid Fourier change. The exhibited Hybrid Power filter may work-in well-balanced, loading requirements. Exceptional filters may perhaps not need sufficient functionality in speedy varied states. Be as it could, automobile trained active electricity filter presents far better results for symphonious minimization, also THD progress. The suggested auto tempered hybrid power filter retains up the THD very well inside of IEEE-519 standards. The suggested strategy is widely Tri-ED with enhanced unique behavior of hybrid power filter making use of fuzzy-logic, PI controls. The outcome are seen to become somewhat satisfactory to medium Distortions, also enhance high quality. The Nitty-gritty reproductions have been finished on MATLAB surroundings to accept the operation.

Index Terms : Proportional-Integral (PI) control, Hybrid Active Power Filter (HAPF), Fuzzy Logic Controller (FLC), THD, load compensation, power quality (PQ), power factor, voltage-source inverter (VSI).

INTRODUCTION

With the improvement of power electronic devices and these related control advances, increasingly power electronic gear has been introduced in power framework arrange. In any case, numerous power electronic buyers, for example, circular segment heaters and rectifiers, as a result of these unique activity attributes, would cause genuine voltage change, harmonic current contamination, low power factor (PF), less qualitated power and so forth. Hence, a considerable measure of authorities have offered consideration regarding enhancing such power quality issues. Power quality conditioners, for example, static var compensators (SVCs) and active power filters (APFs), which locally relieve the harmonic current, can successfully improve voltage quality and PF and stifle harmonic contamination¹

Albeit passive power filters (PPFs) can smother restricted trademark recurrence harmonic current, this dynamic filtering performance isn't adequate to keep away from that the harmonic current from passive power filter causes series- parallel reverberation between the filter and the framework. As of late, APFs have been

created rapidly in light of this great filtering performance, yet the confinements of limit and voltage level of power electronic devices keep APFs from applying in medium-high-voltage systems. Hybrid APFs (HAPFs) join the benefits of APFs and PPFs and are appropriate to be prepared in medium-high-voltage framework.

The expanded seriousness of power quality issues and different issues related with the passive filters, for example, substantial size and weight, higher cost, settled compensation, and reverberation issues with loads and systems have required an emphasis on a power electronic arrangement, that is, active power filters (APF) as appeared in Fig.1. As of late, numerous distributions have likewise showed up on the harmonics concealment utilizing active power filters. Determination of a control strategy and appropriate topology of harmonic concealment, most appropriate to specific conditions, requires that points of interest, impediments and confinements of these devices, which show an exceptionally wide scope of properties.

The control methodology for a hybrid active power filter produces the reference current, that must be given by the power filter to remunerate reactive power and harmonic streams requested by the load ⁴⁻⁶ This includes an arrangement of ebbs and flows in the phase area, which will be followed creating the changing signs connected to the electronic converter by methods for the fitting shut circle exchanging control strategy, for example, hysteresis or bum control. A few techniques including double prompt genuine and reactive power hypothesis have been proposed for extricating the harmonic content ²⁻⁵.

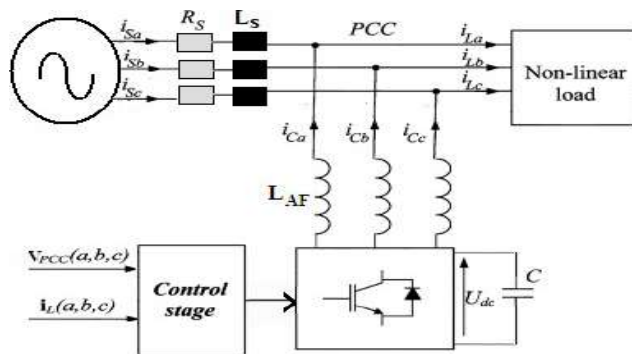

Fig.1. Shunt current compensation in active filter, a basic principle

All these techniques function admirably under enduring state, balanced and Sinusoidal conditions of supply voltage. Among every one of the techniques exhibited in the writing, the double prompt active and reactive power (P-Q) hypothesis is a standout amongst the most widely recognized and likely it is the best method⁴.

As of late, to evade the inborn bothersome attributes of ordinary control approaches, Fuzzy Logic Controller (FLC) is being produced. FLC offers a semantic way to deal with create control calculations for any framework. It maps the information yield relationship in view of human mastery and consequently, does not require a precise scientific model of the framework and can deal with the nonlinearities that are for the most part hard to demonstrate ². This therefore makes the FLC tolerant to parameter variation and more precise and vigorous.

DESIGN OF APF

Principle of APF

An APF, which is schematically depicted in Fig. 2, contains two-level Voltage Source Converter (VSC), a dc vitality stockpiling device, a coupling transformer associated in shunt to the dispersion arrange through

a coupling transformer. The VSC changes over the dc voltage over the capacity device into an arrangement of three-phase air conditioning yield voltages⁷. Appropriate modification of the phase and greatness of the APF yield voltages permits successful control of active and reactive power trades between the APF and the air conditioner framework. Such arrangement enables the device to ingest or create controllable active and reactive power⁸.

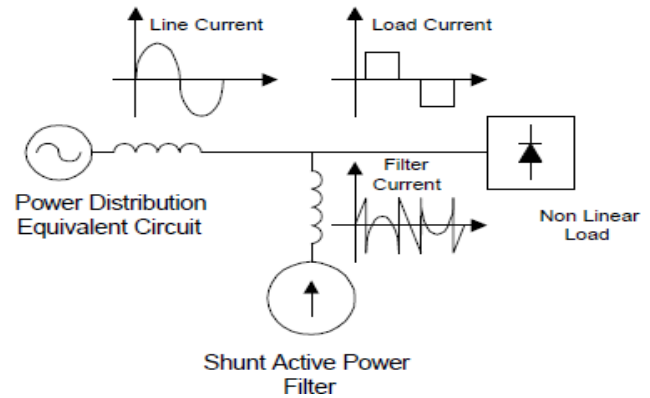

Fig. 2. APF Schematic Diagram

The VSC associated in shunt with the air conditioner framework gives a topology which can be utilized for up to three very unmistakable purposes:

1. Compensation of reactive power and Voltage direction
2. Power factor correction
3. Current harmonics elimination.

Here, such device is utilized to give ceaseless voltage direction utilizing an in a roundabout way controlled converter ⁹. As appeared in Fig. 3 the shunt infused current I_{sh} revises the voltage list by modifying the voltage drop over the framework impedance Z_{th} . The shunt infused current I_{sh} can be composed as,

$$I_{sh} = I_L - I_S = I_L - (V_{th} - V_L) / Z_{th} \quad (1)$$

$$I_{sh} / \eta = I_L / \theta \quad (2)$$

It might be said that the adequacy of the APF in redressing voltage hang relies upon the estimation of Z_{th} or blame level of the load transport. At the point when the shunt infused current I_{sh} is kept in quadrature with V_L , the coveted voltage remedy can be accomplished without infusing any active power into the framework. Then again, when the estimation of I_{sh} is limited, a similar voltage remedy can be accomplished with least evident power infusion into the framework ¹⁰.

Principle of HAPF

Fig. 3. HAPF Schematic Diagram

At the point when this gear is associated in arrangement to the air conditioner source impedance it is conceivable to improve the compensation qualities of the passive filters in parallel connection¹². This topology is appeared in Fig. 3, where the active filter is spoken to by a controlled source, where is the voltage that the inverter should produce to accomplish the goal of the proposed control calculation.

FUZZY LOGICCONTROLLER

Fuzzy Logic Controller is a procedure to encapsulate human-like reasoning into a control framework. FLC can be intended to copy human deductive reasoning, that is, the procedure individuals use to derive conclusions from what they know. In an engine control framework, the function of FLC is to change over linguistic control rules into control system in light of heuristic data or master learning. FLC has a settled arrangement of control rules, generally got from master’s information. The membership function (MF) of the related info and yield linguistic variables is for the most part predefined on a typical universe of talk. For the fruitful plan of FLC’s appropriate determination of information and yield scaling factors (picks up) or tuning of the other controller parameters are urgent employments, which as a rule are done through experimentation to accomplish the most ideal control performance. The structure of FLC is appeared in Fig.4. The structure indicates four functions, every one emerged by block.

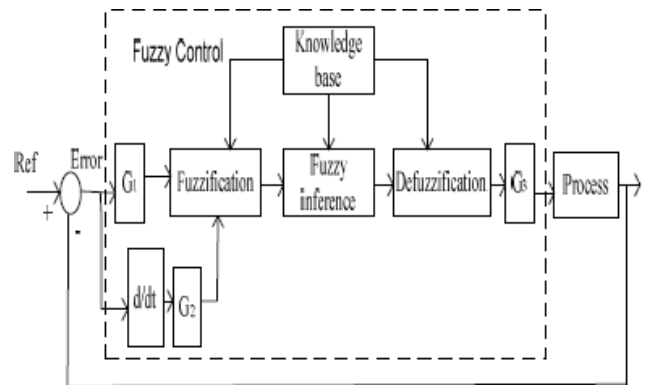

Fig.4. Structure of fuzzy controller

- Membership functions are characterized inside the standardized range (- 1, 1), and related with each name: NB (Negative Big), NM (Negative Medium), NS (Negative Small), ZE (Zero), PS (Positive Small), PM (Positive Medium), and PB (Positive Big). Seven MFs are decided for e(pu) and ce(pu) signs and seven for yield. Every one of the MFs are symmetrical for positive and negative estimations of the variables. Accordingly, most extreme 7x7 = 49 standards can be framed as in Fig.6.
- The membership functions for the sources of info (error and change of error) and yield of fuzzy control for hybrid active power filter are appeared in Fig.5.
- A learning base (an arrangement of If-Then standards), which contains the meaning of the fuzzy subsets, their membership functions, their universe talk and the entire of the tenets of derivation to accomplish great control
- An surmising instrument (likewise called an “induction motor” or “fuzzy derivation” module), which is heart of a fuzzy control, groups the limit of fake the human choices and copies the master’s basic leadership in translating and applying learning about how best to control the plant.
- A de-fuzzification interface, which changes over the finishes of the surmising instrument into genuine contributions for the procedure

A. Fuzzy Logic Membership Functions:

Fuzzy controllers don’t require a correct numerical model. Rather, they are planned in view of general information of the plant. Fuzzy controllers are intended to adjust to varying working focuses. The single yield variable (u) is unflinching state flag of the converter, only error free reaction is straightforwardly sustained to the

framework.

B. Fuzzy Logic Rules

The target of this exposition is to control the yield voltage of the converter. The error and change of error of the yield voltage will be the contributions of fuzzy logic controller. These 2 inputs are isolated into seven groups; NL: Negative Large, NM: Negative Medium, NS: Negative Small, ZO: Zero Area, PS: Positive small, PM: Positive Medium and PL: Positive

Large and its parameter ¹⁰. These fuzzy control rules for error and change of error can be alluded that is appeared as underneath:

$\Delta e \backslash e$	NL	NM	NS	EZ	PS	PM	PL
NL	NL	NL	NL	NL	NM	NS	EZ
NM	NL	NL	NL	NM	NS	EZ	PS
NS	NL	NL	NM	NS	EZ	PS	PM
EZ	NL	NM	NS	EZ	PS	PM	PL
PS	NM	NS	EZ	PS	PM	PL	PL
PM	NS	EZ	PS	PM	PL	PL	PL
PL	NL	NM	NS	EZ	PS	PM	PL

Fig. 5. Membership functions for Input, Change in input, Output.

Fig. 6. Rules for fuzzy logic controller

MATLAB/ SIMULINK MODELING AND SIMULATION RESULTS

Effects of Short Circuit Fault Currents on Power System

Short circuit fault current depends on the power circuit voltage and configuration, method of neutral connections (solidly grounded, resistance grounded, reactance grounded and ungrounded), presence of the regulating devices (such as shunt reactor, series reactor, shunt and series capacitors and FACT devices), and the speed of disconnection of the faulted circuit section. Different types of short circuit currents can affect the

power system in different manners. It is known that, the flow of short circuit currents incident to the occurrence of inter phase short circuits near the generating units frequently results in substantial disturbance to normal operation of the power system.

Simulation results are presented in this section using MATLAB/SIMULINK for Fuzzy based Fault Tolerant control of a four leg Active Power Filter. Initially, we studied Fuzzy based Fault Tolerant Active Power Filter in the presence of open circuit fault/short circuit fault and also line to ground fault and computed total harmonic distortion. Subsequently, we studied the comparison of Fuzzy based Fault Tolerant Active Power Filter with traditional Fault Tolerant Active Power Filter in the presence of fault and also in the absence of fault.

The simulation results are obtained for Fuzzy Based Fault Tolerant Active Power Filter in the presence of open circuit/short circuit fault and line to ground fault

Fig.7. Open circuit analysis for 400V reference

- Sometimes the short circuit takes the form of the arc that may cause considerable damage to the elements of the power system. For example an arc on an overhead transmission lines if not cleared quickly will burn the conductors causing it to break resulting in long time interruption of the supply

Fig.8 Before compensation and after compensation

- Unsymmetrical short circuit faults (such as line to ground, phase to phase, double phase to ground) introduce unbalance in the symmetrical circuits of the power system
- Stability of the power system may be adversely affected and can even lead to complete shutdown or cascade tripping of the power system
- Damage to other apparatus in the power system due to short circuit currents may be caused due to the over-heating and also due to abnormal mechanical stresses or forces set up by the fault
- A reduction in the voltage in power system due to faults will be sometimes be so large that the relays having pressure coils tends to fail

Fig.9 Short circuit analysis

- Due to short circuits in the power system, there may be considerable reduction in the voltage on the healthy feeders connected to the system having fault. This may result in drawing of abnormal high currents by the motors or the operation of no load coils of the motors. In the latter case there will be considerable loss in the industrial output due to the outage of the motors and other drives
- Sometimes in an interconnected systems, when a fault develops it is followed by a fall in voltage and frequency. This may result in loads such as motors which normally take the power from the supply will start to feed or deliver the power to the fault locations. During the faults, induction motors and synchronous motors feed the fault.

CONCLUSION

The target of this paper is to analyze the time determination performance between conventional controller and artificial intelligence controller (FLC)

controlling the dc interface voltage. A VSI topology for HAPF remunerating air conditioning balanced nonlinear loads and a dc load provided by the dc connection of the compensator is introduced. The proposed Fuzzy based Fault Tolerant control scheme offers continuous operation and gives superior Total Harmonic Distortion in contrast with PI based Fault Tolerant shunt Active Power Filters A control calculation for conventional pi controller and fuzzy logic controller constituted by a hybrid active power filter, this topology we built up an arrangement active power filter and a passive filter associated in parallel with the load is examined. At long last Matlab/Simulink based model is created and reproduction comes about are introduced.

Amrita School of Arts and Sciences, Kochi, Amrita Vishwa Vidyapeetham, India

ABSTRACT

The financial frauds are increasing at an alarming rate. The stake holders have lost a huge amount of money through these financial frauds. India is no way different. Even though it has a huge potential to grow the increasing financial frauds and white-collar crimes are a hindrance to it. To put an end to it we require a tool called forensic accounting. Forensic accounting is an integration of accounting, auditing and investigation. They keep on looking at the possibility of exposing frauds. They are meant for identifying the transactions which are not authentic and gathering evidence against the same which can be provided as a proof in the court of law. Forensic accounting is at an infant stage. And through our study we would like through analyse the extent to which forensic accounting act as a detection tool in reducing white collar crimes. And this study would throw light on the stakeholders who are still unaware of this concept and thus their chance of getting cheated become reduced. And there by a reduction in financial frauds and white-collar crimes.

Keywords: *Forensic Accounting, White Collar Crimes, Financial Frauds, External Auditor, Prevention Tool*

INTRODUCTION

India is a developing country which has a huge potential to grow further into a developed one. However, a hindrance to its growth is the increasing crimes which include financial frauds and corruption. According to Global Economic Crime Survey in 2018 about 49% of the organisation has experienced fraud globally. This marks the importance of a tool which helps in bringing an end to these white collar crimes and this is done through forensic accounting. Forensic accounting is an integration of accounting, auditing and investigation. They keep on looking at the possibility of exposing frauds. They are meant for identifying transactions which are not authentic and gathering evidence against the same which can be provided as a proof in the court of law.

LITERATURE REVIEW

Dr. Partap Singh, Mr. Joginder Grewal, Mr. Virender Singh (2015) done a study on **“Forensic Accounting As A Fraud And Corruption Detection Tool: An Empirical Study”** their major findings were the concept of forensic accounting is new and the people needed to be made more aware of the same. The forensic

accounting is not used for investigating the fraud in majority organization. However, forensic accounting is a strong tool for detecting fraud. It helps in having a good control over the internal control system and also on the external audit. A point to be noted is that forensic accounting does not cover the risk factor involved fully¹.

Ifath Shaheen, Pranathi, Asra Sultana, Amathun Noor (2014) done a study on **“Forensic Accounting And Fraud Examination In India”** and their major findings were the forensic accounting is the concept and certain corporate experience should be shared to make all understand about the new concept. However since it is in the stage of developing it has a huge future. It is used for investigation rather than of prevention. If forensic accounting is made compulsory then the financial scams would be reduced. For this, the government should bring in the laws and the RBI also makes the banks that it is compulsory to do forensic accounting. The chartered accountants also should be given a proper training and exposure to do forensic accounting².

Dr. Mahua Biswas, Kiran G. Hiremath, Shalini R (2013) done a study on **“Forensic Accounting In Indian Perspective”** and their major findings were the

forensic accounting is used as a investigation tool not as a preventive tool. It should be changed as it can be used for prevention also. Certain laws must be brought in by the regulatory authorities to make the forensic accounting compulsory. And RBI also should make laws to make compulsory for banks³.

Dr. Manas Chakrabarti (2014) done a study on **“Problems And Prospects Of Forensic Accounting Profession In India”** and his major findings were the financial scams and the failure of corporate communication structure made the corporate world to realize the importance of skilled professionals who can recognize the frauds and malpractices done. Forensic accounting is something which can be easily reliable by the stakeholders. But however in India we lack the forensic accounting skills. The forensic accounting should be made compulsory to reduce the scams.

Dr. Ruchita Verma, Ms. Urvi Singh (2017) done a study on **“Barriers In The Implementation Of Forensic Accounting In India: An Analysis Of Academicians’ Perception”** and their major findings were more than half of the academicians were aware of forensic accounting. The corruption, lack of proper training to the professionals and due to the weak judiciary was some of the reasons which act as a barrier in application of forensic accounting. The awareness can also be increased by certain online classes, programs on various Medias etc.

Prof. Shimoli Dhami (2015) done a study on **“Forensic Accounting: Signaling Practicing Accountants To Improve Skillset And Forming Regulatory Body For Forensic Accountants In India”** and their major findings were forensic accounting is an interesting area and it is beneficial to both society and the investigator. The persons with skill and courage can only succeed in this process. In order to have accuracy and transparency in the transaction check lists can be prepared.

Mr. Harish Jagdish Sharma (2017) done a study on **“Forensic Accounting And Its Application In Selected Industries Of Mumbai: An Analytical Study”** and his major findings were forensic accounting helps in preventing frauds rather than in auditing. The techniques of forensic accounting are as such that it helps in examining fraud. Occupational fraud can be reduced to a large extent and various computer techniques helps

in preventing the frauds.

Dr. Anita Sharma (2014) done a study on **“Frauds In India And Forensic Accounting”** and her major findings were the increasing number of financial frauds and white collar crimes have shaken our economy and caused a huge financial loss to our economy. To prevent this forensic accounting is introduced. It has various tools to meet this objective.

Dr. Sudhir Yadav and Dr. Sushama Yadav (2013) done a study on **“Forensic Accounting A New Dynamic Approach To Investigate Fraud Cases”** and their major findings were our law do not have the expertise to uncover these financial frauds. Since the white collar crimes and financial frauds are increasing the demand for forensic accountants are also increasing. The forensic accountants also need to have imminent knowledge in accounting, finance, law and also investigative and research skills then only they can find these financial frauds.

Dr. CA Kishore S. Peshori (2015) done a study on **“Forensic Accounting A Multidimensional Approach To Investigating Frauds And Scams”** and his major findings were forensic accounting should be used as a prevention tool rather than investigation tool. Forensic auditing must be made compulsory in all financial and corporate sector to reduce the financial scams. However SEBI and RBI have took a few steps to prevent fraud using the forensic accounting.

STATEMENT OF PROBLEM

Increasing white collar crimes are hindrance to the growth of our economy. Auditing cannot reveal the frauds. So in order to reduce the rate of increasing white collar crimes forensic accounting can be used. But however there is a lack of knowledge related to forensic accounting. So through our study conducted among professionals, students of finance we would like to analyse the extent to which the forensic accounting act as a detection tool in recognising frauds and the level of knowledge of this new concept among the professionals.

NEED AND IMPORTANCE OF STUDY

Forensic accounting is at an infant stage. Many of the stakeholders are still unaware about this concept even after the increasing rate of white collar crimes like Harshad Mehta scam, Satyam computers scam, 2G spectrum scam, Nirav modi scam. So by the study

conducted the concept of forensic accounting become familiarised among stake holders. Moreover, the chances of them getting cheated will be less. With the reducing rate of financial frauds and white collar crimes the stock market would not fall apart rather emerge as stronger and this in turn would boost the growth of our economy.

OBJECTIVES OF THE STUDY

- To understand the concept of forensic accounting.
- To evaluate the relevance and effectiveness of forensic accounting as a fraud and crime detection tool in India.
- To understand various Forensic Accounting techniques in fraud and crime detection.
- To analyze the role of forensic accounting in reducing the fraud cases.
- To examine the difference between Forensic Accountants and External Auditors.

HYPOTHESES OF THE STUDY

Ho: There is no significant reduction in Fraud cases in the Public Sector by using Forensic accounting.

Ho: There is no significant difference between Traditional External Auditors and Professional Forensic Accountants.

RESEARCH METHODOLOGY

The data is collected from primary as well as secondary sources. A sample size of 50 respondents have been set for collecting primary data. Data from primary source is collected using questionnaire. The primary data is collected from the professional chartered accountants, professionals, professors in finance and students of finance. The secondary data is collected from books, journals and various websites. The statistical tool which is used for analysis is ANOVA.

ANALYSIS AND INTERPRETATION

TABLE 1 GENDER OF THE RESPONDENTS

	Frequency	Percent
MALE	23	46.0
FEMALE	27	54.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1 showing the gender of respondents it is clear that that out of the 50 respondents (54%) are female and (46%) are male.

TABLE 1.1 AGE OF THE RESPONDENTS

	Frequency	Percent
20-30 Years	38	76.0
30-40 Years	10	20.0
50 & Above	2	4.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.1 showing the age of the respondents it can be seen that out of 50 respondents (76%) are between 20–30 years (20%) are between 30-40 years and (4%) of respondents are 50 and above.

TABLE 1.2 EDUCATIONAL QUALIFICATIONS OF THE RESPONDENTS

	Frequency	Percent
Higher Secondary	4	8.0
Graduate	18	36.0
Post Graduate	15	30.0
Professional	13	26.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.2 showing the educational qualifications of the respondents it is clear that that out of the 50 respondents (36%) are graduate (30%) are post graduate (26%) are professional and (8%) of the respondents are higher secondary.

TABLE 1.3 ANNUAL INCOME OF THE RESPONDENTS

	Frequency	Percent
Below 50000	25	50.0
50000-200000	6	12.0
200000-500000	12	24.0
Above 500000	7	14.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.3 showing the annual income of the respondents it can be seen that out of 50 respondents (50%) are below 50000 (24%) are 200000-500000 (14%) are above 500000 and (12%) of respondents are between 50000-200000.

TABLE 1.4 AWARENESS ABOUT FORENSIC ACCOUNTING

	Frequency	Percent
YES	41	82.0
NO	9	18.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.4 showing the awareness about forensic accounting among respondents it is clear that that out of the 50 respondents (82%) are aware about forensic accounting and (18%) are unaware about forensic accounting.

TABLE 1.5 UNDERSTANDING THE CONCEPT OF FORENSIC ACCOUNTING

	Frequency	Percent
YES	37	74.0
NO	13	26.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.5 showing the understanding of the concept of forensic accounting among respondents

it can be seen that out of the 50 respondents (74%) understand the concept of forensic accounting and (26%) do not understand the concept of forensic accounting.

TABLE 1.6 SERVICES OF FORENSIC ACCOUNTANT REQUIRED IN INDIA

NEUTRAL	8	16.0
AGREE	25	50.0
STRONGLY AGREE	17	34.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.6 showing the services of forensic accountant required in India or not it is clear that out of the 50 respondents (50%) agree to it (34%) strongly agree to it and (16%) are neutral regarding the forensic accountants' service requirement in India.

TABLE 1.7 SERVICES OF FORENSIC ACCOUNTANT NEEDED MORE IN PUBLIC SECTOR

	Frequency	Percent
NEUTRAL	6	12.0
AGREE	20	40.0
STRONGLY AGREE	24	48.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.7 showing the services of forensic accountant required more in public sector or not it is seen that out of the 50 respondents (48%) strongly agree to it (40%) agree to it and (12%) are neutral regarding the services of forensic accountants are needed more in public sector.

TABLE 1.8 FORENSIC ACCOUNTING HELP IN DETECTING AND PREVENTING FRAUD IN PUBLIC SECTOR

	Frequency	Percent
NEUTRAL	7	14.0
AGREE	24	48.0
STRONGLY AGREE	19	38.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.8 showing the forensic accounting help in detecting and preventing fraud in public sector or not it is clear that out of the 50 respondents (48%) agree to it (38%) strongly agree to it and (14%) are neutral regarding the forensic accounting help in detecting and preventing fraud in public sector.

TABLE 1.9 SERVICES OF FORENSIC ACCOUNTANT DIFFERES TO TRADITIONAL EXTERNAL AUDITOR

	Frequency	Percent
NEUTRAL	9	18.0
AGREE	28	56.0
STRONGLY AGREE	13	26.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.9 showing the services of the forensic accountant differs to traditional external auditor or not it is seen that out of the 50 respondents (56%) agree to it (26%) strongly agree to it and (18%) are neutral regarding the services of forensic accountant differs to traditional external auditor.

TABLE 1.10 SERVICES OF A FORENSIC

TABLE 2 ANOVA

FORENSIC ACCOUNTING HELP IN DETECTING AND PREVENTING FRAUD IN PUBLIC SECTOR

	Sum of squares	Df	Mean Square	F	Sig.
Between Groups	9.421	2	4.711	16.162	.000
Within Groups	13.699	47	.291		
Total	23.120	49			

SOURCE: PRIMARY DATA

From the above table 2 it is clear that f value is (16.162) significant at (p < 0.05). So hence we reject the null hypothesis and accept the alternate hypothesis that there is significant reduction in

ACCOUNTANT PREFERABLE OVER THE SERVICES OF A TRADITIONAL EXTERNAL AUDITOR

	Frequency	Percent
STRONGLY DISAGREE	2	4.0
DISAGREE	7	14.0
NEUTRAL	17	34.0
AGREE	15	30.0
STRONGLY AGREE	9	18.0
Total	50	100.0

SOURCE: PRIMARY DATA

From the above table 1.10 showing the services of the forensic accountant preferable over the services of traditional external auditor or not it is clear that out of the 50 respondents (34%) are neutral to it (30%) agree to it (18%) strongly agree to it (14%) disagree to it and (4%) strongly disagree regarding the services of forensic accountant preferable over the services of a traditional external auditor.

TESTING HYPOTHESES

a)Ho: There is no significant reduction in Fraud cases in the Public Sector by using Forensic accounting.

fraud cases in the public sector by using forensic accounting.

b)Ho: There is no significant difference between Traditional External Auditors and Professional Forensic Accountants.

TABLE 2.1 ANOVA

SERVICES OF FORENSIC ACCOUNTANT DIFFERES TO TRADITIONAL EXTERNAL AUDITOR

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	8.299	4	2.075	6.977	.000
Within Groups	13.381	45	.297		
Total	21.680	49			

SOURCE: PRIMARY DATA

From the above table 2.1 it can be seen that the f value is (6.977) significant at (p < 0.05). So hence we reject the null hypothesis and accept the alternate hypothesis that there is significant difference between traditional external auditor and professional forensic accountant

FINDINGS AND SUGGESTIONS

- Majority of the respondents are female.
- Most of the respondents belong to the age group of 20-30 years.
- Majority of the respondents are graduate.
- A huge number of the respondents have their annual income less than 50000.
- Majority of the respondents are aware about forensic accounting.
- Most of the respondents understand the concept of forensic accounting.
- Majority agree to it that the services of forensic accountant are required in India.
- A huge number of respondents strongly agree that services of forensic accountant are needed more in public sector.
- Most of them agree that forensic accounting help in detecting and preventing fraud in public sector.
- More than half of the respondents agree that services of forensic accountant differ to the services of traditional external auditor.
- Majority of the respondents are neutral regarding the services of forensic accountant preferable over

the services of traditional external auditor.

- There is significant reduction in fraud cases in the public sector by using forensic accounting.
- There is significant difference between traditional external auditor and professional forensic accountant.
- Forensic accounting should be made compulsory to prevent frauds.
- SEBI and RBI should incorporate a separate cell for forensic accounting to prevent corporate crimes.
- Seminars and classes should be conducted to polish the skills of existing forensic accountants and making others aware about this and learning this.
- Government should take initiative in providing a specialised education for forensic accounting.

CONCLUSION

Forensic accounting is an integration of accounting, auditing and investigation. Since the white-collar crimes are increasing the forensic accounting needed to be made compulsory. Even though it is at infant stage it can be developed and it has a huge potential ahead. In future it can be even used as a prevention tool rather than a detection tool. And thus, help in the growth of the Indian economy.

Analysis of the Impact of Perda Implementation Number 2 of 2014 on the Development of Prostitution in Jambi City

Anismar¹, Burlian Senjaya¹, Teuku Muzaffarsyah¹, Dida Helena¹

¹Lecturer at Universitas Malikussaleh

ABSTRACT

Articles from the results of this study describe the impact of the application of Regional Regulation No. 2 of 2014 concerning the eradication of prostitution in the city of Jambi, the implementation of the regulation directly closes the places of prostitution (*Payo Segandung and Langit Biru*) in the city of Jambi. By using a qualitative descriptive research design, this study illustrates the positive impact and negative impact of the enactment of local regulations by closing the place of prostitution in the city of Jambi. The positive impact of the enactment of regional regulations can be seen from the increasingly reduced intensity of prostitution practices in the city of Jambi and the increasingly strong identity of the city of Jambi as a Malay land that closely cultivates eastern cultures and customs. However, the negative impact is also felt by the health service which previously could control the spread of HIV-AIDS contagion before the closure of the localization in the city of Jambi, then the economic impact was also felt by the people who depend on living in the place of localization.

Keywords: Prostitution, Regional Regulation No. 2 of 2014.

INTRODUCTION

Democracy in the era of Regional Autonomy, in the last decade many have been colored by the proliferation of legislative processes that have resulted in sharing the provisions of laws and regulations and public policies. The initial idea of autonomy was to build democracy with the main characteristics for the entire community, including it, to improve the community environment that had been neglected. Regional autonomy is a form of policy that gives authority to regions within certain limits that allow people to be more independent and more developed, so that the community becomes more prosperous.

DISCUSSION

a. Development of the Prostitution World in Jambi City

There is not too much literature available regarding the development of prostitution or commercial sex in Indonesia. In a country that is very broad and very varied in its cultural background, it is difficult to determine when and from which historical study of prostitution in Indonesia began. Nonetheless, there have

been various important and interesting studies that have taken the history of pre-colonialism in Java to the era of colonialism in the same region, especially Java, Bali and Sumatra as references. ⁴The history of prostitution in Indonesia, like many other places, is full of unfair treatment and violence.

b. Analysis of Factors that Underlie the Emergence of Regional Regulation NO. 2 of 2014

Prostitution or prostitution always leads the thoughts and images of people about sexuality that is taboo or humiliated. This is because it is morally considered to be contrary to the values of religion and morality. Departing from the argument, the regional regulation prohibiting prostitution and immoral acts was born in the city of Jambi. Not much different from the Prostitution Prohibition Regulations in several regions and cities that have been promulgated in advance, that one of the main factors for the formation of a Regional Regulation is to make the area a peaceful, religious, respect for human rights as a support for the movement to make an area of morality.

In the analysis carried out by the author specifically there are several factors that cause the birth of

Regional Regulation No. 2 of 2014 in the midst of the community and became the legal basis for prohibiting the practice of prostitution and immoral acts in Jambi City. **First**, the Strengthening of the Criminal Network Organizing the Sex Industry in the City of Jambi. Based on Indonesian norms and culture, the practice of prostitution is considered a disgraceful thing, but in reality there are certain regions that are accustomed to accepting the reality that citizens are sex workers, there are even prostitutes who are supported by their families or husbands to make money this way. strengthening the criminal network that organizes the sex industry in cities in Indonesia, including the City of Jambi. In addition to the blue shoots and sky there are many places in Jambi City that offer sex tours or provide sex services. Such as those who pretend to be beauty salons, massage venues, or karaoke entertainment places, which are directly backed by well-organized groups of thugs.

Second, Increased sex tourism carried out by teenagers in Jambi City. Based on the information the author obtained in the field today many adolescents and educated people who do sex tourism places where prostitution in the city of Jambi, based on the results of the author's interview with Kastpol PP Jambi City he revealed that in the conduct of raids in prostitution places and places of koroke and massage parlors often meet teenagers and students in these places. **Third, Efforts to Reverse the Identity of Jambi City.** Besides the thick Islamic nuances Jambi is known as Malay land which upholds the values of tradition and culture, it was these two important factors that were reflected in the Jambi saying that Syara Babunyi Adat Mengato, between religious and customs provisions must go hand in hand as a guide for life and life for society in the Malay land of Jambi. Of course a very anomalous thing, when on land that upholds the norms of customs thrives on the practices of prostitution which is very clearly contrary to the local identity of the Jambi people who are known as religious communities who uphold all the norms of existing customs.

In order to restore the identity of the city of Jambi, the regulation was implemented, based on the results of interviews with the Legislation Board of the Jambi City DPRD, he said that the most important thing is that this regulation is expected to restore the social identity of Jambi City as a religious community that upholds the norms of customs. which exists.

Fourth, Efforts to Protect Women from Immoral Actions. The commissioner of the National Women's Commission said the country was in an emergency situation of violence against women. The reason is that the rate of violence against women continues to increase from year to year. Komnas Perempuan data in 2014 showed that there were 293,220 cases of violence against women. This number increased compared to 279,688 cases in 2013.

The birth of regional regulation number 2 of 2014 concerning the eradication of prostitution and immoral acts has become a protection effort, over the increasing cases of sexual violence against women, cases of sexual violence against women that occurred in the city of Jambi. This is based on the interview with the author of the Jambi City DPRD Legislative Council, he confirmed that the regional regulation No. 2 of 2014 as an effort to procure women in the city of Jambi against the possibilities of immoral acts experienced by women in Jambi City.

c. Analysis of the impact of enactment of local regulations With closure of localization

The enactment of Perda No 2 of 2014 with the closure of the lokalasai of Payo Segadung and Langit Biru, has had its own impact on the social life of the people in Jambi City. In the analysis and study that the authors carried out in the field based on the results of interviews and observations, there was a positive impact and the negative impact of the implementation of Regional Regulation No. 2 of 2014 with the closure of the two localizations.

1. Positive Impact

Both localization thrived along with the change of generation of people in Jambi City, and during that time the anxiety felt by parents in keeping their children from falling into such immoral places, anxiety is not only felt by parents but also felt by wives who are always wary and frightened if their husbands fall into the lust to enjoy sex in places of prostitution until they forget their obligations as family members for their wife's children at home.

The birth of Regional Regulation No. 2 of 2014 with the noble aim of providing benefits to the community, where prostitution is one of the causes of poverty for the birth of poor public morality, this regulation is more

specifically aimed at safeguarding the morality of future generations and more importantly maintaining the integrity of family life in the middle middle of Jambi City community.

As for the positive impact that has been felt by the community with the birth of the regulation which affected the closure of localization in the city of Jambi, nowadays the public is increasingly convinced that the morality of the next generation and social life is more secure, certainly not bring more concern for parents of their children and anxiety for wives against their husbands.

Then the positive impact can be seen also in terms of social and cultural, in a society can occur as a result of an influence and the process that is happening. Where changes that occur must have a positive and negative impact or bring progress or decline. The Jambi City community in particular and the Jambi Province in general with all its existence in the globalization era at this time still uphold the values of customs that play a role both in life with fellow groups, and even those outside the group.

Positive impact in terms of health, adverse effects on contagion or contracting several genital related diseases very quickly, such as gonorrhoea, syphilis, and also other diseases such as HIV / AIDS.

2. Negative Impact

Localization of shoots and blue sky before being closed can be said to be an open prostitution area, meaning that before the enactment of the regional regulation there is no binding legal sanction for sex tourism lovers in the two neighborhoods. However, when this regulation was effective on January 16 2015, it was almost certain that the practice of prostitution was closed. So that it can be said that one of the negative impacts of the enactment of this regional regulation will be increasingly widespread closed prostitution (via online and closed prostitution networks) whose numbers are difficult to detect.

The next negative impact is that it is very possible to expand new cases of sexually transmitted diseases (STI / HIV AIDS) because this program intervention can no longer be carried out after the enactment of the law.

Based on information from the Jambi City health office that before the local regulation was enacted they

always carried out routine controls and socialization of sexually transmitted diseases (STI/HIV AIDS), in addition to routine control and socialization of the health department also to provide free condoms to CSWs in the two localizations, but after the enactment of the regional regulation the control and socialization of the spread of venereal disease cannot be done anymore given the existence of sex workers who cannot be detected after the closure of the two localizations.

Then the next negative impact is related to the economic problems of the community, especially the people who depend on the two lokalisis. Based on the results of the interviews that the authors conducted with the people who opened businesses (food stalls, grocery stores) in the localization area, most of them hailed since the closure of the localization automatically ate their income and there was even one resident who closed his business because of the imbalance between the intakes as well expenditures due to loneliness. Complaints were also conveyed by motorcycle taxi services that hung out every day in the localization area, due to the closure of the localization, and their motorcycle taxi revenue was also reduced.

Some of the negative impacts must also be considered by the Jambi City government to find solutions and solutions, so that the Perda No. 2 of 2014 concerning Eradication of Prostitution and Asus Actions brings disability to the community and more importantly minimizes the occurrence of resistance in the midst of society.

CONCLUSION

From the description above this article concludes that there is a positive and negative impact on the implementation of local regulation No. 2 of 2014 on the development of prostitution in the City of Jambi. The positive impact of the enactment of regional regulations can be seen from the increasingly reduced intensity of prostitution practices in the city of Jambi and the increasingly strong identity of the city of Jambi as a Malay land that closely cultivates eastern cultures and customs. However, the negative impact is also felt by the health service which previously can control the spread of HIV AIDS infectious diseases cannot control again after the closure of the localization in the city of Jambi, then the economic impact is also felt by the people who depend on the place of localization.

So that in the future it is expected. (1). The City Government must further strengthen the existence of local regulations to achieve the long-term goal of realizing the city of Jambi that is free of prostitution, because it is possible that the practice of closed prostitution via online has begun to penetrate the city of Jambi along with technological developments, so that the author of this regulation must continue to be evaluated to cover crime. closed prostitution crime. (2) with the closure of the localization, the health office is hired to intervene in the prevention of HIV / AIDS, so that in the future NGOs are expected to work together with community organizations to regularly advocate to the local government to provide 'discretion' to AIDS prevention in particular to ensure access to health services for they are both for prevention and treatment. (3) The city government is expected to be able to maximize the ex-localiation that has been closed, in order to be used as productive places that run in the field of community economic development as well as fostering the character and mentality of the community, this also aims to eliminate negative stigma ex localization.

The Reflection on the Implementation of Pre-Marriage Course in Aceh

Jamaluddin¹, Faisal¹, Nanda Amalia¹

¹Faculty of Law, Universitas Malikussaleh, Indonesia

ABSTRACT

The increasing divorce rates in Aceh shows that couples are unprepared to deal with various issues arose in the household. These issues are dominated by the economic and violent issues within the household. It can be prevented, if both bride and bridegroom to be are equipped with special guidance on fostering harmonious relationships before they start the marriage. In Indonesia, based on the Regulation of the Director General of Islamic Community Guidance, the Guidelines for Implementation of Pre-Marriage Courses has been set to improve understanding and knowledge of family life aiming for the sakinnah family and to reduce the number of disputes, divorce and domestic violence. This study employed library and field research and the data was analyzed using sociological juridical approach. The field research conducted in the districts of East Aceh, North Aceh and Aceh Besar. It is aimed to describe the practice of pre marriage course conducted by the Office of Religious Affairs (ORA) and to explore the acceptance and response of the bride and groom to be related to the implementation of the pre-marriage course. The study found that the implementation of the course has been implemented not only refers to the Regulation of the Director General of Islamic Community Guidance but also in accordance with the mandate of Qanun Aceh Number 8 Year 2014. However, the implementation of the pre-marriage course is not in line with the expectations aspired in the rules. There are several technical constraints faced by the ORA including the unavailability of fund allocation, the lack of instructor and the rejection of participants to follow the entire course sessions for various reasons. This study recommends the Government of Aceh to immediately enact the Aceh Qanun on Family Law and to provide special arrangements for strengthening of pre-marriage course in order to create a harmonious Acehnese society.

Keywords: Family Law, Pre-Marriage Course, Sakinnahmawaddahwarahmah Family (harmonious).

INTRODUCTION

The study of the implementation of the course for future bride and groom conducted in Aceh is inspired by previous research that have demonstrated the weak position of women in law, especially in solving various household problem. This is due to the fact that married couples are unprepared for the marriage life as a result of the lack of training and guidance provided by the families of bride and groom or facilitated by the state through pre-marriage course for future bride and groom.

Studies related to women's position and protection have been conducted in various contexts by previous researchers. Some studies are conducted in term of the juridical context of women's protection¹, the aspect of law enforcement officials² as well as non-judicial

aspects such as the effort to improve women's protection perspective by law enforcement officials and the studies of the country policies related to women's perspectives². These studies show that the Indonesian legal system is not capable to provide justice and legal protection for women, both for women as perpetrators of crime and as victims of violence.

Some studies related to women and their rights in families and communities were also found³. In the local context of Aceh, there are various studies addressing women in various aspects such as violence, education, economy and the double burden of women³. In addition, there is a study discussing gender awareness of law enforcement officials in dealing with cases related to both women as perpetrators of crime and as crime victims⁴.

ACEH REFLECTIONS OF THE IMPLEMENTATION OF PRE-MARRIAGE COURSE IN ACEH

Taking into account the polemic of the divorce law and problems in the household resulting in the *sakinah*, *mawaddah* and *warahmah* families being hard to achieve, this study has also reviewed other studies concerning the importance of studying the law, in particular the Regulation of the Director General of Islamic Supervision No. DJ.II / 491 Year 2009 which is updated with the Regulation of the Director General of Islamic Supervisory no. DJ.II / 542 of 2013 on the guidance of pre-marriage courses conducted by researchers in several regions in Indonesia. Some of these studies, among others, are conducted by Mahmudin.²³ His study concluded that: 1) pre-marriage course is the process of behavioral and attitude transformation in the smallest group or social unit in society to the future bride and groom. 2) Preparation for marriage needs to be done so that those who will be married are ready, both in terms of mental and material, especially in running the functions of family. 3) A quality marriage is a condition in which it is able to create happiness, conformity and stability of marriage. While the quality of marriage itself is influenced by various factors such as optimal family composition, family life cycle, socio-economic feasibility and suitability of roles, social and personal factors of the couple and prenuptial conditions. 4) Building the *sakinah mawaddah warahmah* family requires a long process and great sacrifices. 5) The *sakinah* family is a family that all family members feel the love, security, tranquility, protection, happiness, blessing, and honor as well as being appreciated, trusted and blessed by Allah SWT.

The pre-marriage course for the future bride and groom in Aceh has been conducted by KUA in several sub-districts. Upon the completion of the course, KUA will provide a certificate as evidence that the future bride and groom have participated in the course. This is stated by the head of KUA of Muara Dua district mentioning the role of KUA in providing *sakinah* family service started from course for future bride and groom before the wedding and certificate is given after the course. The course takes approximately four hours. The material presented includes the forty-four problems aiming to keep the households as a solid foundation, are gradually presented.

Similarly, the head of KUA Kecamatan Pidie⁵⁵ also reported that the pre-marriage courses has been implemented and the certificate of graduation is given. However, due to the time constraint the materials presented are not sufficient. Furthermore, the Head of KUA stated that the three hours of pre-marriage course in KUA is not enough. Ideally, the course is conducted over a three-day period addressing the problematic discussion of the law as many of the future bride and groom have lack of understanding of marital law problems such as the terms and *rukun*. In addition, medical understanding is also needed, including reproduction, and health, and therefore there are some doctors who handle it. Therefore, the head of KUA collaborates with the Ministry of Religious Affairs and Ministry of Health. KUA also gives provides a useful pocket book discussing religious materials, reproductive health, family planning issues (family planning) for the future bride and groom.

The Chairman of the Consultative Assembly of Clerics (*Majelis Permusyawaratan Ulama*) (MPU) Pidie⁵⁶, also explaining the importance of pre-marriage course, briefing to the future bride and groom to continue their marriage and so forth. The pre-marriage course explains the topic related to the responsibilities of husbands and wives, the rights and duties of husbands and wives, and the shared responsibilities. In addition, there is an explanation of the transfer of rights and obligations after the *ijabqabul* (wedding vows) and the change of status that is previously under the responsibility of the father shifting the responsibility to the husband. Furthermore, there is also an explanation related to the factors causing the destruction in the household, for example livelihoods, egoism and the third parties interference. Therefore, guidance is needed to anticipate all possibilities and to maintain harmonious household.

Based on field research conducted, this study found that pre-marriage courses conducted in Aceh through the Office of Religious Affairs are ineffective as the duration of the course is very short. This course is conducted as merely to fulfill a task of BP4. This is in contrast with Malaysia, pre-marriage course is implemented within 3 (three) months. Today's couples are no longer based on *taaruf* rather based on the lust so that marriage and its attributes are no longer sacred, for example, hugging is common in the courtship, and therefore the hugs after marriage are no longer sacred⁵⁷. In addition, the ineffectivity of the pre-marriage courses is also caused budget issues. Cost allocation for KUA is only sufficient

for daily activities, including electricity, and Wi-Fi. As for the activities related to marriage, wakaf, and socialization they are carried out free of charge.

This condition will increasingly place the pre-marriage course to not being able to provide strength for the future bride and groom to be stronger in facing the married life. Not to mention the view of the neighbors concerning the future bride and groom who marry at a young age. These raise the debate about the importance and effectiveness of the implementation of pre-marriage in Aceh and therefore further study to examine to what extent the pre-marriage courses have been conducted is needed. In addition, to obtain the legal force and a strong position of BP4 as part of the Aceh government's activities so that there is a need to formalize the sharia law conducted by BP4.

The materials for the future bride and groom has already been arranged through the Regulation of Director General of Islamic Community Guidance No. DJ.II / 542 of 2013 concerning Guideline of Preparation of Pre-Marriage Course. In the regulation, the Pre-marriage Course Material is divided into three groups, namely: 1) Basic group; 2) Core Group and 3) Supporting Groups. In addition to the materials that have been regulated through the Director General of Islamic Community Guidance No. DJ.II / 542 of 2013, additional materials taught by the MPU are also required for the future bride and groom. These additional materials will reinforce the future brides and groom to understand the fiqh of munakahat (marriage law). The couple to be married are the bride and groom who have completed the course and are given a certificate as a proof of the completion.^{58, 7}

The implementation of the pre-marriage course in Aceh requires strengthening in term of the legal side and funding. Legal strengthening is required for the implementation of the pre-marriage course to be included in the pre-marriage course qanun (Islamic law) in Aceh³¹. This is in line with Article 16 Paragraph (2) of Law Number 11 Year 2006 regarding the Law of Aceh Government stating the mandatory matters that is the authority of the Aceh Government concerning the implementation of Aceh's privileges including the implementation of religious life as the implementation of shari'ah Islam for its adherents in Aceh while maintaining the harmony of interfaith society. Similarly in Article 2 paragraph (2) Qanun Number 8 of 2014 concerning the Principles of Islamic Sharia, it is stated

that the implementation of Sharia Islamic Law as referred to in paragraph (1), letter b, includes ahwal al-syakhshiyah (family law). This family law needs to regulate pre-marriage course for the prospective bride and groom. The pre-marriage course for prospective bride and groom should be included in qanun of family law and arrangement should be refined through the Aceh Governor Regulation which in turn will be applied throughout Aceh.

CONCLUSION

This study concludes that the reflection on the implementation of pre-marriage courses in Aceh has been implemented as required by the Regulation of the Director General of Islamic Community Guidance No. DJ.II / 542 of 2013, however, it is not optimum due to time constraint, and therefore the materials provided are not fully absorbed. In addition, other materials related to local wisdoms in term of the implementation of Islamic Sharia in Aceh are needed. These local contexts are required as additional contents to discover the philosophical, juridical, and sociological aspects of Acehnese society with the strong Islamic Shari'a. These local materials can be presented by scholars from the MPU Aceh, as well as from the ulemas (tengku) of the Islamic boarding school or *dayah*. Furthermore, it is necessary for the pre-marriage course to be included in the Qanun of Family Law in Aceh and then reinforced by the Governor Regulation as implementation rules.

An Efficiency Analysis in the Zimbabwean Metal Manufacturing Sector

David Damiyano¹, Nirmala Dorasamy², Lawrence M Lekhanya³

¹Department of Public Management and Economics, ²Department of Economics, Bindura University of Science Education, Zimbabwe, ³Department of Public Management and Economics, Durban University of Technology, South Africa

ABSTRACT

The study analysed the efficiency of the metal manufacturing sector in Zimbabwe. The background to this study is the decimation of the sector given its contribution to vital economic indicators like employment, Gross Domestic Product (GDP) and export. A non-parametric methodology, Data Enveloping Analysis (DEA) was used to measure efficiency in the metal sector and estimating the drivers and barriers to efficiency using STATA econometric software. Data on metal manufacturing inputs; cost of raw material (CM), energy (E), water and sewages (WS) and cost of services (S) were transformed into multiple outputs; sales (SLS), value added (VA) and gross value of production (GVP). Using an input oriented constant returns to scale (CRS) model, in the Metals sub-sector of the manufacturing sector, 38% of the Decision Making Unit (DMUs) are efficient and 62% are inefficient. At least 52% of the DMUs are operating above the average efficiency of 68%, whereas 48% of the DMUs are struggling below the average efficiency level. Under an input oriented variable returns to scale (VRS) model, in the Metals sub-sector of the manufacturing sector, 57% of the DMUs are efficient and 43% are inefficient. At least 62% of the DMUs are operating above the average efficiency of 86%, whereas 38% of the DMUs are struggling below the average efficiency level. The study's literature confirms that small to medium metal manufacturing firms have increased, which are mainly informal and thus pose a threat to government when it comes to instituting efficiency policies.

Keywords: *manufacturing; efficiency; metal; data enveloping analysis*

INTRODUCTION

This study will investigate the efficiency levels in the metals manufacturing sector in Zimbabwe in the post dollarized era. Efficiency analysis is important in Zimbabwe in the vain to rescue the decimation in the manufacturing sector in general and the metals manufacturing sub-sector in particular. The Data Enveloping Analysis (DEA) methodology which will be employed in this study has strong interpretive power on the drivers and barriers of efficiency in the metals manufacturing sub-sector. The study results will provide leverage for government policy as well as strategic planning for other key stakeholders that include mining houses, investors, financiers, suppliers, labour and communities.

BACKGROUND OF THE METALS MANUFACTURING SECTOR

Metal production is energy intensive. However, sophisticated energy management systems ensure the efficient use and recovery of energy throughout the steelmaking process for re-use, wherever possible. The World Steel Association Fact Sheet on Energy Use in the Industry (2016: 1) found that energy is one of the major cost drivers of steel production, comprising 20% to 40% of the total cost in some countries¹. Thus, improvements in energy efficiency result in reduced production costs and thereby, improved efficiency. The energy efficiency of steelmaking facilities vary depending on production route; type of iron ore and coal used; the steel product mix; operation control technology; and material efficiency. Therefore, these are the widely agreed drivers of efficiency in the metal industry.

3. Drivers and barriers in the metals manufacturing sector

The metals manufacturing sector is driven by many input variables and also incentivized by many outputs.

Capacity utilization in the mining sector is a driver of efficiency in the metals manufacturing sector. According to the State of Mining Industry Report (2016: 7), average capacity utilisation for the mining sector increased from 60% in 2015, to 64% in 2016. Platinum sector continues to operate at full capacity, while gold recorded an increase to 79%, from 77% in 2015. Chamber of Mines (2016: 11) survey identified capital constraints, constraints in electricity supply, high cost of electricity, low feedstock and low commodity prices, as the major challenges in initiating value addition in the Zimbabwe’s mining sector. The four major cost drivers in metals manufacturing are wages, stores and supplies, power and royalty. Stores and consumables at 36 % of the total costs constitute the biggest chunk of the total costs, followed by wages (32%), power (15%) and royalty (5%) (State of Mining Industry Report 2015: 21).

Figure 3.1: Reasons for low capacity utilisation

Source: Adapted from State of Mining Industry Report 2015 and 2016

In 2015 mining survey, respondents mentioned capital constraints, power shortages and high power tariffs as major barriers to efficiency in the mining sector which subsequently constrain metal manufacturing sector in Zimbabwe. All respondents in the survey for State of Mining Industry Report (2016) pointed capital shortages as the major constrain undermining capacity utilisation, coupled with high cost structure and ageing equipment.

LITERATURE REVIEW

The literature guides the study methodology.

Barriers and drivers in metals manufacturing sectors are traced in order to review other country’s efficiency conditions.

Terziovski (2010) study attempted to explain innovation practices in Australia and how they can affect efficiency and subsequently performance. The study aimed at explaining the drivers of efficiency in 600 manufacturing small to medium enterprises (SMEs) in Australia in the fabricated metal products, basic metal products or tooling and machinery industries. The major drivers of efficiency from a simple regression model of this study are presented below:

Table 4.1: Drivers of efficiency

Driver of efficiency	Size of impact
Innovation strategy	37.9%
Formal structure	42.3%
Customer and supplier relationship	-1.1%
Innovation culture	4.8%
Technological capabilities	-1.09%

Source: Adapted from Terziovski (2010)

Table 4.1 shows that an innovation strategy positively drives the efficiency of manufacturing SMEs by 32.9%, followed by the form of the structure with 42.3%. It was found that if these manufacturing SMEs were to formalise their firm structures, efficiency will improve. The above drivers were found to have about 61.6% influence on efficiency, leaving 48.4% of the efficiency being influenced by other drivers not captured in this study. Erkoç (2012: 28) suggested that X-efficiency is largely caused by inadequate motivation, incomplete contracts, asymmetric information, agency problems and attendant monitoring difficulties. A conclusion can be reached that in this study, X-efficiency was measured using a simple OLS regression analysis.

In their study, which was initiated by the Swedish Foundry Association, Rohdin, Thollander and Solding (2007: 673), utilised respondents from Swedish foundries who discussed major driving forces for energy efficiency within the sector. Partly based on the results from the workshop and a previous study of the non-energy-intensive industry, and partly based on the scientific theory on the subject, it can be concluded that this will help firms better solve their efficiency barriers. In order

to enhance efficiency in Swedish metal manufacturing, the following were the drivers of energy efficiencies in their order of influence:

- Long term strategy
- Management ambition
- Environmental company profile
- Environmental management system and
- Third party financing.

The foundry sector in Sweden found that energy was a major driver in this metal manufacturing industry.

Goriwondo, Mhlanga and Mutsambwa (2013) studied Agility for sustainability in Zimbabwe, using manufacturing Companies in Bulawayo as a case. They opined that agility as a driver of efficiency in manufacturing is critical for competitiveness. Audits were carried out on a spectrum that covers textiles, beverages, pharmaceuticals, foundry and rubber manufacturing, including household and industrial chemicals³.

METHODOLOGY

The methodology applied in the research involves the use of an empirical measure of efficiency of DMU in the metal manufacturing entities while using a non-parametric method for the estimation of a production frontier referred to as the DEA or balanced benchmarking. This method is based on the theory of production and makes efforts to depict a production frontier, which can be considered to as the best practice-frontier⁴. Mathematical formulations of the DEA and its orientations, definition of variables and model specification are covered in this study, with special recognition to Zimbabwe.

As a result of massive closure of manufacturing firms in Zimbabwe in recent times, the targeted population therefore contained metals manufacturing firms which have managed to operate for the past decade. This will enable benchmarking efficiency DMUs and analysis on efficiency drivers and barriers. The sample data from ZIMSTAT was representative of the metal sector considered and therefore large enough to provide valid results according to how the DEA methodology operates.

RESULTS PRESENTATION

The results presented under this section are a synthesis of DEA methodology from STATA software. DEA is a mathematical methodology which analyses efficiency by coming up with a composite efficiency score. The efficiency score is determined by the rate at which the existing metal manufacturing DMU's technology transforms inputs to outputs. In this study, the input variables are cost of raw materials (CM); energy (E); water and sewage (WS); and cost of services (S) and the output variables are sales (SLS); value-added (VA); and gross value of production (GVP).

Charnes, Cooper and Rhodes' (CCR) (1978) derives a CRS curve from a DMU which is considered to optimize the ratio of output to input (maximum average productivity). Two sets of econometric results for the metals manufacturing sector will be presented and interpreted in line with the three areas of efficiency: 1) orientation, 2) returns to scale and 3) stages of efficiency. The separate sets are for CRS and VRS in all the ten sub-sectors under Stage 1. In terms of efficiency orientation, the results are for input minimisation efficiency since the same results apply to the output maximisation from the Duality Theory. The slack analysis was done to show the drivers and barriers to efficiency in each manufacturing sub-sector, as well as the level of improvement necessary for the sector to become efficient.

6.1. CCR Metals Input-Orientation, Returns to Scale and Stage 1

The following results are based on the assumption that the DMUs exhibit constant returns to scale and attempt to minimise inputs to attain efficiency in Stage 1 and the objective is to: Measure efficiency in Zimbabwe's metal manufacturing sector using production plans of the efficient scores.

6.1.1 CCR Metals efficiency score analysis

This will analyse the efficiency levels of DMUs in the metals manufacturing sector in Zimbabwe.

CONCLUSIONS AND IMPLICATIONS

Under CRS, in the Metals sub-sector of the manufacturing sector, 38% of the DMUs are efficient and 62% are inefficient. At least 52% of the DMUs are operating above the average efficiency of 68%, whereas 48% of the DMUs are struggling below the average efficiency level. Overall analysis shows that **input variable CM** is the major driver of efficiency in the **Metals** manufacturing sub-sector. Output variable **VA** is the major barrier to efficiency in the **Metals** manufacturing sub-sector.

Low Cost Child Abduction Prevention with RFID Technology

A.Kamaraj,¹ C.KalyanaSunadaram¹, G.Shobana¹

¹Asst. Prof., Department of ECE, MepcoSchlenk Engineering College, Sivakasi, Tamilnadu

ABSTRACT

An ever-green problem over thousand years is the Child abduction around the world. The kidnapping of child in the society happens for the new-born babies to 15 years child. There are many methods, technologies;equipment etc. developed over the years. But, everything is having its own pitfalls. In this paper, we are addressing the prevention technique for infant abduction of new-born babies in the Hospital scenario. Here, an active anti-allergic RFID (Radio Frequency Identification) tag is attached with the new-born baby and mother. Among them one is acting as a master tag and other is slave tag. The mother tag and the baby tag's status are continuously sensed by an active RFID reader. The coverage range of the designated Active RFID system is around 100m. So, when the infant is moving far away from the mother or if it is separated for a long time then the reader fails to get the status of the baby tag and the corresponding control signals alert the hospital management and the mother. The Mother and Baby tag have the same Tag ID which helps during mother baby matching. So, this two added features effectively prevents and informs the child abduction well in advance at very cheaper cost in a very safer manner. Thus, RFID based method could be adopted in all the hospitals to prevent the Child abduction at low cost.

Keywords: *Child abduction, RFID tag, Transceiver.*

INTRODUCTION

In India the Child abduction from 1965 to till now is around 350 as per NCMEC (National Center for Missing and Exploited Children) ¹. The statistics says that, more than 40% of the child missing happens in the hospitals and healthcare centers ². There are various reasons behind this act of child kidnapping. The most common reasons are,

A female who is incapable of becoming pregnant (burning desire for motherhood) ¹

Illegal adoption (Woman usually 17-33 and unable to have a child)

The new-born child has been sold for money (\$2,500 to \$850,000) ²

There were many methodologies suggested in the literatures to prevent and identify the kidnapping before or after the event has been occurred. The existing methods discusses about, Footprints of infant at birth, HD closure picture of baby, a unique band number for baby/mother, physical identification of child ². Moreover, certain types of electronic products are being incorporated in the

normal life style. They are, parking lot controller, child controller in elevators, alarm sounds, etc... ³. But, they are still inefficient in terms of, the environment, cost, lacking in real-time prevention. It is expected to prevent the abduction in the initial step itself.

In order to avoid missing, swapping or kidnapping, a biometric recognition based methodology is suggested. Here, the foot prints of the newborn are taken in to account to prevent the above said occurrences. It needs preprocessing and other computational devices in the field itself ⁴. An automatic system of newborn babies' identification system using palm print of child is developed and it is tested in hospitals ⁵. Another automatic child identification methodology using ear images of the newborn is developed with ICA and PCA ⁶. Recently, the image processing based face recognition system has been proposed using domain specific learning with the base work of ⁷⁻⁸.

A cost-efficient kidnapping prevention system using RFID tags being proposed; and the radiation effect of RFID tag when it is immersed in the water are studied in ⁹. Infant living condition monitoring system able to measure sleep posture, breathing rate, and CO₂ level and

send the information to the remote server is developed to avoid sudden death at hospitals ¹⁰.

Apart from the above researches, there are patents are being filed regarding Safety Sleeping Pod for the infant¹¹, wearable alarm in ornament to prevent child kidnapping [12] and an IOT based smart wrist band ¹².

On summary, there are three categories of Child abduction prevention systems. They are,

A stand-alone image processing and wireless based information and identification system

RFID tag based identification system

Patents proposing smart devices

Drawbacks or limitations of the previous methods

The image processing based identification system would not be suitable to prevent the child kidnapping and also it is relying on the computer, algorithms and analysis programs. It makes this methodology costlier and in-effective for implementation. In RFID based systems, there is a possibility of prevention of kidnapping and making alert at the same instant. It means the method could be deployed in hospitals, homes and malls wherever we have closure contact of the baby and mother is needed.

PROPOSED METHOD

In the proposed method, the RFID tag is placed on the mother’s wrist and baby’s ankle with the same Tag identification number. The active RFID reader placed on the maternity ward keeps on receiving the status from both the Tags. If any deviation occurs, it immediately alerts the mother and the hospital Staffs for the next action to be taken. This methodology, gives alertness at almost zero time and very cheaper.

Functional Representation of the proposed method

There are two RFID tags namely Mother and Baby tag. The Mother RFID tag is connected to wrist of the Mother and the Baby tag is connected to the ankle of the new-born as shown in Fig.1. The RFID used in this work is having the attribute of far field coupling (FFC); means it could able to make communication up to 100 meters (more than 300 feet). This distance is sufficient to have proper communication between the mother and

baby within the hospital environment.

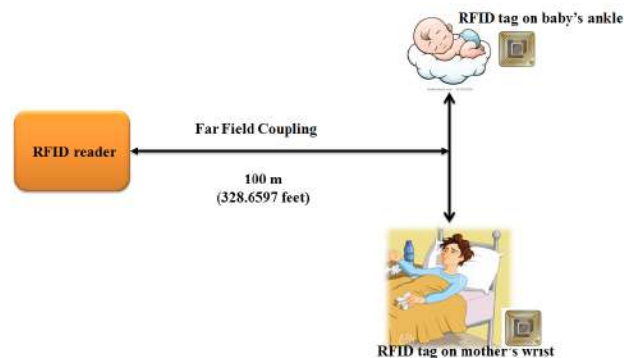

Fig.1: Representation of RFID Tag in Baby and Mother Functional components of the proposed method

The RFID used here are active type, which has internal power source for its operation. The internal architecture of the tag used is shown in Fig.2. It has transmitter module, receiver module (transceiver as combined), control logic (actions to be taken for the received data) and memory. It has an in-built antenna for data transmission and reception.

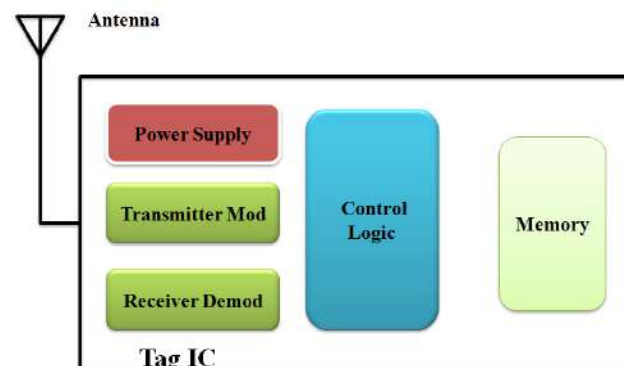

Fig. 2: Internal architecture of RFID Tag

Each tag is having its own unique identification number; which is shown in Fig. 3. In that, the header defines the EPC format to be used, the EPC manager field specifies the product manufacturer, object class defines the types of product and the serial number is a unique identification number of the RFID tag. The totally it has 96 bits in its data format.

Header	EPC Manager	Object Class	Serial Number
01	12345ABC	00012E	000123ABC
(8 bit)	(28 bit)	(24 bit)	(36 bit)

Fig. 3: EPC Code of RFID Tag

One more special feature of the tag is that, it has an embedded portion of an IR (Infra-Red) detector. So, when the tag is removed from the infant by the kidnapper, it makes or sends alarm signal to the reader. The internal tag is shown in Fig.4.

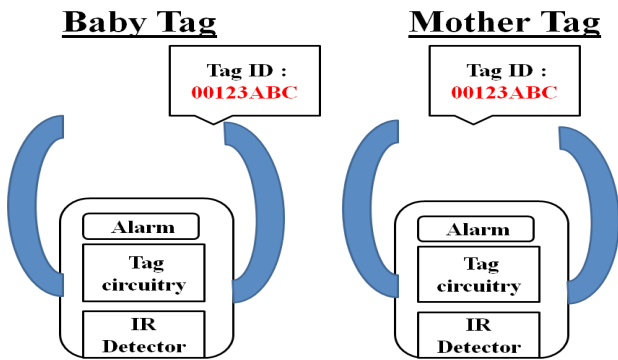

Fig.4. Structure of RFID tag

The reader which accesses the information from the tags is placed on the hospital environment. Each reader consists of a transceiver, microprocessor, communication interface and memory. The microprocessor does the processing of received baby's tag, mother's tag information and decides the actions to be performed on the information. The internal architecture of the RFID reader is shown in Fig.5.

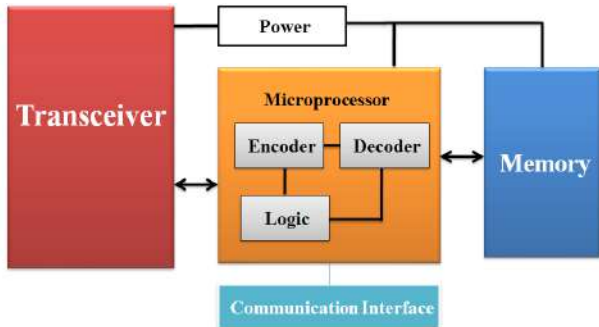

Fig.5. Internal architecture of the RFID reader

Working methodology

The functional setup unit of this work consists of majorly 3 components, two active RFID tags, one RFID reader and Communication protocols. There are three ways of communication possible in the new-born baby safety setup. They are,

Mother Tag and Child Tag communication (Direct)

Mother Tag and Child Tag communication through RFID reader (Indirect)

Mother / Child Tag communication to reader alone

In the direct communication, whenever the child is present very close to the mother (in bed, in mother lap etc...); the proximity is very good, so the tag to tag communication is effective and low power consumption. In mother's tag, simple subtractor control logic does the

matching of mother and new-born as shown in Fig.6. If there is a mismatch or no information corresponding control signals are sent to the server unit via reader.

Fig.6. Control Logic

The indirect communication is needed when the child is taken to the clean room by the hospital staff, general medical checkup etc... During these scenarios, the mother tag sends request to the reader for its unique baby tag details. The processor searches for the concerned baby tag details in the last updated information from server or it directly looks for the nearness of the baby tag. Once the reader gets the updated recent information it updates the mother tag with the same. Hence, the real time update of the tag details of consistently available to both the ends.

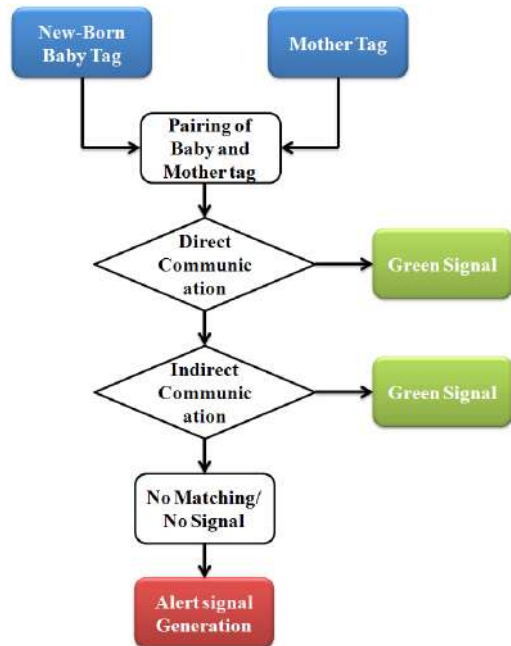

Fig.7. Flow Diagram of Child kidnapping prevention

The third scenario comes into the effect, when the negative scenario occurs in the hospital. When first communication fails, then the mother's tag informs same to the reader via control signals. Then the reader tries for the indirect communication method; if that also fails, then the reader informs the same to the centralized server as shown in Fig.8 for emergency actions to be taken by the hospital management. The entire communication

pattern and flow of the work is shown in Fig. 7.

Fig.8. RFID architecture on the data management

Since the response time of the above discussed process of RFID tags are in terms of milli/micro seconds; the theft detection and prevention is practically possible with less time in cheap.

RESULTS AND DISCUSSION

The functional unit completely relies on the working of RFID tag. There are many child kidnapping happens around the hospital scenario. The existing methods²⁻⁸ is

depending on the higher end technology for the child kidnapping detection. They are not capable of preventing the kidnapping before it happens. Moreover the hospital management has to spent more money. In the proposed system the child prevention is possible in real time and the cost of implementation also very much affordable.

There are some wearable devices supporting to provide the child details globally and provides child safety too⁹⁻¹². But, they¹¹⁻¹² are applicable to the home environment, not for the hospital scenario. The proposed system could be employed in home as well as in hospital environment. The functional, methodology, application and cost comparison of the existing and proposed methodology is shown in Table 1. From the table, it is evident that, the proposed method is better in terms of cost, real-time support in prevention and simple in operation. Thus it could be applied to the hospital environment for the new-born baby management.

Table 1: Comparison of Existing with the Proposed Method

S.No.	Existing method	Technology	Prevention / Detection	Real-time support	Home / Hospital	Cost
1.	[2]	Foot Print + Image Processing	Detection	No	Hospital	Very High
2.	[3]	E-Gadget	Prevention	Yes	Anywhere	High
3.	[4]	Foot Print + Image Processing	Detection	No	Hospital	Very High
4.	[5]	Palm Print + Image processing	Detection	No	Hospital	Very High
5.	[6]	Ear images	Detection	No	Hospital	Very High
6.	[7, 8]	Face image	Detection	No	Hospital	Very High
7.	[9,10]	RFID	Prevention	Yes	Home	High
8.	[11-12]	RFID	Prevention	Yes	Home	Low
9.	Proposed	RFID	Prevention	Yes	Home / Hospital	Low

Precautions to be taken by hospital management, Staff / Parents

Parents:

Asking ID cards to the hospital staffs

Be suspicious of the visitors

Learn the hospital protocols

Hospital Management:

Installing CCTV, Check points, login in hospital environment

Equipping with necessary technological

developments

Alarm systems wherever possible

Staff:

Educating the mother and visitors

Provide the tags to the mother and baby

Periodically checking the functioning of all the security systems

CONCLUSION

Child abduction is an ever-green problem in the hospitals, apartment regions and public places. Here, we have addressed the new-born baby abduction and prevention methodology using RFID tags. The tag chosen for this work is supporting up to 100m communication. There are three ways of communications between mother tag, baby tag and reader. This increases the effectiveness of the proposed system. Also, the tags are having direct communication which makes the system works faster. The special feature of the proposed system is; it is a prevention method rather than detection, provides real time support. The comparison of the existing methods and the proposed method shows the evidence that, it is a preventive method, cost effective, faster response, to be adapted in the hospital scenario for the new-born babies. Also, guidelines for the hospital management, faculty and parents are provided.

The Nursing Image of College Students

Jeong In Lee¹, Mi Lim Im²

¹Professor, Department of Nursing Science, Daejeon Institute of Science and Technology, Daejeon, Korea;

²Professor, Department of Nursing Science, Baekseok University, Cheonan, Korea

ABSTRACT

This study is a descriptive research conducted to investigate the degree of influence of several influencing factors on the image of the nurse among college students.

This study is a descriptive research to investigate the degree of influence of influencing factors on the image of the nurse among college students.

The subjects of this study were a total of 551 college students living in metropolitan areas, and they were selected by convenience sampling. The collected data were analyzed using the SPSS/PC program. The significance level α of the statistical test was set at .05 and a two-sided test was performed.

The mean score for the image of the nurse of subjects was 3.70 points on a 5-point scale. The score for the image of the nurse according to the general characteristics of subjects was higher in college students with religion, in first-year students than second-year or third-year students, in third-year students than second-year students, and in nursing students than those majoring in other fields. As a result of the stepwise regression analysis to identify the factors influencing the image of the nurse of subjects, the school year, school system, and media affecting the image were identified as the variables which have a statistically significant effect on the image of the nurse perceived by the subjects.

This study is a descriptive research to investigate the degree of influence on the image of nursing among college students. The mean score for the nurse image of the subjects was slightly lower than that of nursing students. In order for nursing to be properly recognized as a profession, an active and systematic nursing strategy is needed to build a positive image of the nurse among the subjects.

Keywords: *nursing Image, The Image of the Nurse, Self-Esteem, Factors Affecting the Image, General Characteristics*

INTRODUCTION

The role and work of nurses has also expanded and specialized in the recent rapidly changing health care sector, as the demand for targeted medical care has increased. Also, the image of nurses and nursing is changing positively due to the ease of employment and job security.

An image is defined as the sum of beliefs, attitudes, and impressions an individual or group has about a particular object¹. Therefore, different images can be formed about the same entity according to the individuals' past, experience, information, attitude, belief, etc.² and the effects are very large.

The image of a nurse has long been a dependent, unfriendly, difficult profession for doctors, and has been recognized as a peripheral in hospitals, so the professional functions and social roles of nurses are not properly recognized. These negative images of nurses can easily promote conflict among the general public as well as health care policy decision making by communicating incorrect knowledge in the setting of nurses and role understanding, thus hampering the activities of many nurses³.

The image of the nurse has been changing with the times. The public image of the nurse was classified into an angel of compassion from 1854 to 1919, a secretary from 1920 to 1929, a heroine from 1940 to 1945, a mother from 1946 to 1965, a sexual object from 1966 to 1982, and an expert from 1983 onwards. According to the recent analyses of the image of the nurse on the Internet in 2001 and 2004, nurses were portrayed as intellectual and highly educated people in about 70% of websites, and were depicted as respectable, responsible, competent, and trusted professionals in 60% of websites⁴.

In a survey of 22 occupations conducted by a polling agency in the United States in 2017, 82% of Americans surveyed said the most honest and ethical job was the nurse. The nurse has been ranked first with the exception of one year since the survey of Americans' most trusted jobs was begun in 1999⁵. Recently, the public's perceptions of the image of nurses have become positive, but the image of the nurse may be different according to individuals or survey participants.

Nurses are professional workers who play a pivotal role in promoting the health of patients based on their professional expertise, and they occupy an important position in the organization of medical institutions. However, despite nurses' efforts, the general public does not fully understand the role and status of nursing, and the public perception of nurses is also negatively distorted to a great extent⁶.

Given the fact that the image of a profession has a major influence on the development of the profession⁶, research on images is inevitably required for the development of the nursing profession. The purpose of this study was to investigate and understand the influence on the image of the nurse perceived by college students who express their values without hesitation or inhibition in order to provide basic data to establish measures for enhancing the desirable image of the nurse in the future.

METHOD

Study Design: This study is a descriptive research to investigate the degree of influence of influencing factors on the image of the nurse among college students.

Study Subjects and Procedure: The subjects of this study were a total of 551 college students living in metropolitan areas, and they were selected by

convenience sampling. The sample size was determined to be 110 people or more as a result of calculating it by applying the significance level of .05, the effect size of .3, and the statistical power of .95 using the G Power 3.1 program. In this study, a total of 560 questionnaires were completed, but a total of 551 copies were used in the analysis excluding those with missing data.

The data collection of this study was conducted from October to December, 2016, and we explained the purpose and contents of the research to the subjects and informed them that they could withdraw from participation at any time during the data collection process. Data were collected from the participants who voluntarily agreed to participate in the study and signed the informed consent.

Research Instruments: To measure the nurse image, the assessment tool for the image of nurse developed by Lee et al.⁷ and modified and supplemented by Jang⁸ was used. The tool consists of a total of 29 questions about qualifications, roles, social participation, interpersonal relationships, etc. The nurse image was measured on a Likert 5-point scale, and a higher score indicates a more positive nurse image. Cronbach's α was .95 in the study by Jang, and was .94 in this study.

Statistical Analysis: The collected data were analyzed using the SPSS/PC program (SPSS, Inc., Chicago, IL). The significance level α of the statistical test was set at .05 and a two-sided test was performed. The specific statistical analysis method is as follows.

- For the general characteristics of subjects and the level of the nurse image, the real numbers, percentage, mean, standard deviation, and minimum and maximum values were calculated.
- The nurse image according to general characteristics of subjects was analyzed by the t-test and ANOVA, and for the variables which had statistically significant effects, the post-hoc Scheffe test was performed.
- The image of the nurse and general characteristics were analyzed by stepwise multiple regression to identify the factors influencing the image of the nurse perceived by subjects. For the regression analysis, the multi-collinearity test between independent variables and residual analysis were performed, and it was confirmed that the assumptions of the regression model were satisfied.

Experimental Analysis: The results obtained from this study were as follows ;

1. The Image of the Nurse and Level of Self-Esteem: The mean score for the image of the nurse among subjects was 3.70 points on a 5-point scale (Table 1).

2. The Image of the Nurse according to General Characteristics of Subjects: The scores for the image of the nurse according to the general characteristics of subjects were higher in college students with religion ($t=2.18, p=.03$), in first-year students than second-year or third-year students, in second-year students than third-year students ($t=2.89, p=.02$), and in nursing students than

students majoring in other disciplines ($t=5.86, p<.001$).

3. Factors Affecting the Image of the Nurse: Table 3 shows the results of the stepwise regression analysis to identify the factors affecting the nurse image of the subjects. As a result, the F value for the goodness of fit of the regression model was 2.829, which was statistically significant ($p<.001$). The R^2 value was .156, indicating that the explanatory power of the nurse image was 15.6%. The variables which had statistically significant effects on the nurse image were found to be the school-year ($\beta=-.279, p<.001$), the school system ($\beta=.185, p<0.5$), and the media affecting the image ($\beta=-.143, p<0.5$).

Independent variables:

CONCLUSION

The purpose of this study was to investigate the degree of influence of influencing factors on the image of the nurse among college students.

The mean score for the image of the nurse among subjects was 3.70 points on a 5-point scale. The score of the nurse image according to the general characteristics of subjects was higher in college students with religion than those without it, in first-year students compared to second-year and third year students, in third-year students than second-year students, and in nursing students than students majoring in other disciplines.

In the study of nursing students by Seong, Yeom, & Do⁹, the score for the nurse image was 3.85 points, which is consistent with the result of this study that the score for the image of the nurse was higher in nursing students than in general college students. These results show that nursing students who have entered college to become nurses have a more positive image of nurses. This finding is also consistent with the study results of Seo¹⁰, which reported that nursing students had more positive images about nurses than other college students.

As a result of the stepwise regression analysis to identify the factors influencing the nurse image of subjects, the school year, school system, and media influencing the image were found to be the variables which had a statistically significant effect on the level of the nurse image among subjects.

In a study of the general public¹¹, the 30-39 age group and the group of higher educated people were found to have the most negative image of the nurse. In Kang et al.¹², the occupation group of teachers showed a more positive perception of nurses than any other occupation group. Waters¹³ reported that those showing the highest level of support for nurses were patients receiving the care of nurses or their guardians.

In addition, mass media may have a decisive impact on the formation of the image of the nurse. So far, the nurse has been frequently portrayed and viewed as a good and kind person, a self-sacrificing hero, or a sexual object rather than as a person who has professional expertise and voluntarily performs nursing care^{14, 15, 16}. In the United States, as the nurse has been perceived as an occupation socially recognized as a profession¹⁷ and ¹⁸, in recent years, the nurse has begun to be represented as a socially recognized profession through the media¹⁹. As social media and the Internet are now very important media in modern society, it is necessary to investigate how the image of the nurse is changing in mass media and make efforts to improve the image of the nurse through these media.

When the image of a nurse who is late for work is positive, the nurse becomes more involved in the organization and can be satisfied with her job. These results not only increase the efficiency of nursing, but also contribute to the competitiveness of hospitals^{20, 21, 22}.

As the role of nursing care is expanding these days, it is becoming more important to establish a desirable

image of the nurse because it not only helps to reduce nurses' own conflicts while performing nursing care but also enables them to provide better nursing care to patients. In particular, because college students in their twenties are an age group who expresses their thoughts assertively and is particularly sensitive to the mass media, and thus are important for the formation of the nurse image, it is necessary to continuously investigate and understand how they feel and communicate about the nurse image.

A positive image of a nurse's nurse will be an important factor in successfully overcoming the practical problems that are given to them. Given the fact that an image of a profession has an important impact on the development of that profession, research on the image is essentially a requirement for the development of a nursing profession.

Data Analysis on the Application of Advanced Information System to Relieve Knee Osteoarthritis in Korean Adults

Seong-Ran Lee

Department of Medical Information, Kongju National University, Kongjudaehak-ro, Gongju-si, Chungnam, Korea

ABSTRACT

Background/Objectives: Osteoarthritis is an inflammation of the joints caused by various bacteria. There search is to verify the mediation of advanced information system to relieve knee osteoarthritis.

Method/Statistical analysis: The data was carried out through preparation and face to face survey from February 5th to April 27th, 2018. The Basic information from respondents was analyzed the comparison between experimental and control group by using the Chi-square test. Factors related to physical symptoms and treatment procedure were analyzed by t-test. Pre and post-system conditions in osteoarthritis patients were analyzed by t-test.

Findings: There are three main points from these findings. 1) 30.8% of the experimental group was lower than 35.4% of control group for the age of 60 to 69. 2) 44.6% of the experimental group was significantly higher than 32.3% of the control group in the family history of osteoarthritis. 3) For leg pain, it has decreased significantly since the arbitration of the information system ($t=2.41$, $p=.035$). 4) Physical acupuncture increased significantly post-arbitration than pre-arbitration ($t=-5.27$, $p=.001$). 5) The adaptability of the system was higher pre-arbitration than post-arbitration ($t=-4.31$, $p=.016$). 6) The accessibility of the system has been significantly higher after application ($t=-7.54$, $p=.000$). 7) The experimental group has steadily increased than the control group since the 10 days. 8) The system worked better for osteoarthritis patients after the arbitration than pre-system arbitration. But after 25 days, the effects tend to decrease.

Improvements/Applications: This system has been confirmed to be effective in relieving pain of osteoarthritis. It is expected to help for the treatment of osteoarthritis in the future

Keywords: Osteoarthritis, Acupuncture, Adaptability, Accessibility, Treatment

INTRODUCTION

Osteoarthritis is an inflammation of the joints caused by various bacteria such as tuberculosis and bacteria. The joint is the part of the body that connects the bone to the bone, which enables the muscles to exercise. Osteoarthritis can only be called arthritis if it comes with pain, swelling or a feeling of heat^[1,2]. Osteoarthritis patients are severely uncomfortable with osteoarthritis. It's hard to climb, get off, and walk any staircase. It's hard to get up after sitting down. The pain is severe at night as well as during the day. It is necessary to control the pain of osteoarthritis patients^[3,4],

The most common and early complaints are localized pain in the joint area where osteoarthritis occurs. Pain can worsen in the initial movement of the joint, but continues to develop as the disease progresses. As the elderly population increases, osteoarthritis patients are

rapidly increasing. Osteoarthritis is the number one cause of disability in the United States. Osteoarthritis is the most common chronic condition in adults over 45 and more than 20 percent suffer from osteoarthritis [Figure 1]. Knee osteoarthritis is a disease that affects more than 271 million people. As blood circulation fails, joint pain and inflammation can occur even with minor shocks. Women have thinner cartilage than men, which can cause degenerative osteoarthritis [Figure 2]. Women have wider pelvis than men, but when walking, the gap between the two feet is narrow, and the weight on the knees is concentrated. In Korea, the proportion of serious patients in need of treatment is three to four times higher than that of women^[5,6].

The x-ray reportedly showed that half of women aged 70 were suffering from osteoarthritis. It was assumed that the reason was due to hormonal changes after menopause and prolonged squatting, but the

exact cause was not found. Women’s knees were 30 percent heavier than men’s, with arthritis rate 3.2 times higher six years later. Osteoarthritis has degenerative osteoarthritis caused by worn joints. On the other hand, there is rheumatism arthritis caused by white blood cells attacking normal joints. Having anti-contact antibodies means that the immune system tends to irritate the patient’s own body. Although they are found in various areas of the body, they usually occur on the knees. Knee joints are the largest joints in the body and are prone to injury. Also, knee joints are the first things you bump into during an exercise or an automobile accident^[7,8].

Walking carries two to eight times the weight of the knee joint. The deterioration of cartilage in the middle age causes degenerative changes. A repeated weight shock is applied to the cartilage in the joints without major trauma^[9]. In winter, when the weather gets cold and cold, the symptoms of osteoarthritis get worse and we suffer from pain [Figure 3]. Organisms such as joints, muscles, ligaments, and blood vessels in our bodies have features that are sensitive to the weather and temperature. When the temperature drops in winter, the muscles, blood vessels, ligaments, and joints of the body become constricted and stiff. Therefore, the research analyzes data on the mediation of the latest system to relieve Osteoarthritis¹³.

Figure 1: Distribution of osteoarthritis by age

Figure 2: Distribution of osteoarthritis by gender

SURVEY RESEARCH

Framework of a system: This paper indicates the outline of the framework of the latest system for the reduction of osteoarthritis [Figure 4]. Firstly, system design steps to reduce osteoarthritis. Secondly, strategy for the Protection of Arthritis. Thirdly, intervention in the system for mitigation of osteoarthritis. Fourthly, measuring the effectiveness of osteoarthritis pain relief. Fifthly, data analysis on osteoarthritis pain. Sixthly, setting priorities for osteoarthritis pain relief. Seventhly, feedback for reducing osteoarthritis pain. Eighthly, a Proposal of the effects of the contents to reduce osteoarthritis pain. Ninthly, an analysis of the latest systems for reducing osteoarthritis pain [Figure 5].

Figure 3: Distribution by year of osteoarthritis incidence

MATERIALS AND METHOD

The data was carried out through face to face and preparation survey from February 5th to April 27th, 2018. This research was drawn from two parts. The experimental group categorized 65 people for arbitration and 65 for control group for which arbitration was not applied. The Basic information from respondents was analyzed the comparison between experimental and control group by using the Chi-square test. Symptoms and treatment procedure before and after system application were analyzed by t-test. Pre and post-system conditions in osteoarthritis patients were analyzed by t-test.

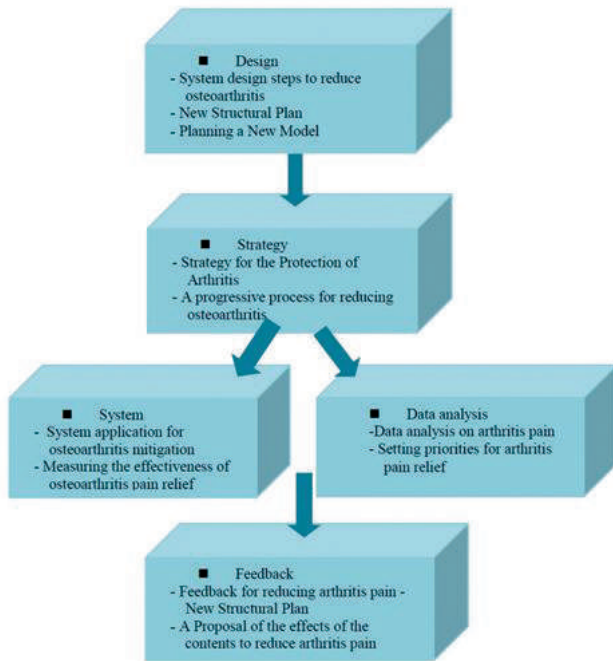

Figure 5: A new methodology to relieve knee osteoarthritis

RESULTS AND DISCUSSION

Basic information from respondents: The basic information from respondents indicates in Table 1. For marital status, 24.6% of the experimental group was lower than 29.2% of the control group in the unmarried state. On the other hand, 75.4% of the experimental group was higher than 70.8% of the control group in the married state. 30.8% of the experimental group was lower than 35.4% of control group for the age of 60 to 69. For educational level, 41.5% of the experimental group who graduated from high school was found to be higher than 35.4% of the control group. For family history of osteoarthritis, 44.6% of the experimental group with family history of osteoarthritis was significantly higher than 32.3% of the control group with it ($X^2=2.59, p<.05$).

Symptoms and treatment procedure: Pre and post-arbitration of symptoms and treatment procedure reveal in Table 2. From the results obtained, for leg pain, it has decreased significantly since the arbitration of the information system ($t=2.41, p=.035$). The finding was similar with the previous studies on the chronic diseases^[9,10]. Based on the results obtained by the study, it found that this analyzed a new data for reducing the leg pain in osteoarthritis patients. On the other hand, physical acupressure increased significantly post-arbitration than pre-arbitration ($t=-5.27, p=.001$). Cholesterol level was significantly lower an average score of 25.62 point safter system application than an average score of 30.70 points before system application ($t=4.57, p=.028$).

Table 2: Symptoms and treatment procedure before and after system application

Variable	Before	After	t	P
	Mean ± S.D	Mean ± S.D		
Leg pain	34.95 ± 1.84	28.74 ± 3.72	2.41	.035
Edema	33.47 ± 0.93	21.19 ± 0.76	1.46	.017
Fever	29.13 ± 2.51	23.63 ± 1.94	3.82	.394
Blood pressure	32.53 ± 1.47	30.74 ± 0.53	0.71	.514
Cholesterol	30.70 ± 0.63	25.62 ± 2.18	4.57	.028
Wt. control	27.25 ± 1.95	24.19 ± 3.51	6.91	.395
DM	23.82 ± 0.72	22.73 ± 0.46	1.36	.592
Stretching	19.42 ± 3.26	33.57 ± 1.72	-3.19	.000
Physical acupressure	15.38 ± 1.54	20.19 ± 0.47	-5.27	.001
Walking	21.44 ± 0.72	25.18 ± 1.53	-3.68	.294
Eating garlic	18.36 ± 3.17	26.37 ± 3.60	0.37	.000

Pre and Post-System Conditions: Pre and post-system conditions in osteoarthritis population reveal in Table 3. The adaptability of the system was higher pre-arbitration than post-arbitration($t=-4.31, p=.016$). The accessibility of the system was significantly higher post-arbitration than pre-arbitration($t=-7.54, p=.000$).

Table 3: Pre and post-system conditions

Items	Pre	Post	t	p
	Mean ± S.D	Mean ± S.D		
Information	27.82 ± 3.15	38.42 ± 3.17	-2.95	.072
Application	18.44 ± 0.49	36.15 ± 0.82	-5.28	.000
Adaptability,	19.52 ± 2.72	31.81 ± 2.56	-4.31	.016
Accessibility	14.75 ± 0.52	35.63 ± 0.43	-7.54	.000
Efficiency	22.08 ± 1.74	35.29 ± 1.83	-3.61	.000
Simplicity	25.19 ± 3.20	37.43 ± 1.75	-1.88	.207
Expandability	23.83 ± 1.63	34.08 ± 1.62	2.49	.000
Cost	38.51 ± 4.16	30.53 ± 3.17	-5.14	.168

Treatment Effects of Osteoarthritis: The treatment effects of osteoarthritis indicate in Figure 6. The experimental group has steadily increased than the control group since the 10 days. The stage of the system arbitration in osteoarthritis patients reveals in Figure 7. The system worked better for osteoarthritis patients after arbitration than before the system arbitration. But after 25 days, the effects tend to decrease.

The mediation studies established in order to verify effectiveness of this study. The findings showed that the condition of osteoarthritis in the system was increased from 13.7% to 25.4% by the arbitration, which is similar to data reported in the previous studies^[11,12]. But the effects of osteoarthritis patients did not last that long.

Periodic training is required to maintain the system's effectiveness to osteoarthritis patients

Fig. 6: Treatment effects of osteoarthritis

Fig. 7: System mediation steps for osteoarthritis patients

CONCLUSION

The research analyzed data on the arbitration of the advanced system to relieve knee osteoarthritis. Based on the results obtained by the study, leg pain had decreased significantly after the arbitration of the system ($t=2.41, p=.035$). Also, the introduction of a state-of-the-art system had proven effective for osteoarthritis population. Moreover, the accessibility of the system was significantly higher after arbitration ($t=-7.54, p=.000$). Therefore, the latest system has been confirmed to be effective in relieving pain of osteoarthritis. The findings are thought to be helpful for the treatment of osteoarthritis in the future

ABSTRACT

Background/Objectives: The aim of this study was to investigate the effects of isometric pull-down exercises on acromio-humeral distance(AHD) in 30°, 60°, 90° and 120° shoulder flexion angles, to establish the force required to achieve a clinically important in the AHD.

Method/Statistical analysis: A total of thirty-six healthy volunteers(18 males and 18females) with a mean age of 19 years participated in this study. Ultrasonography was used to measure AHD in asymptomatic participants during resting position and while performing isometric pull-down exercises at 30°, 60°, 90° and 120° shoulder flexion. The load used during the isometric pull-down exercises was equivalent to 70% of 1RM.

Findings: The change of AHD depending on the shoulder flexion angle was showed significant difference. According to the post-hoc test results, AHD was the longest at 90° shoulder flexion and there was a significant difference.($p < .05$) However, there was no significant difference between gender and dominant/non-dominant arm when compared.

Improvements/Applications: According to the results, there was an increase in AHD which shows the effectiveness of isometric pull-down exercise at 90° shoulder flexion. This study can be used as a base to prove the clinical importance of AHD and as well as a means to develop exercises which may benefit patients with shoulder pathology.

Keywords: *Isometric pull-down exercise, Acromio-humeral distance, 90° shoulder flexion, Shoulder pathology, Ultrasonography*

INTRODUCTION

Pull-down exercises are one of the most popular complex mid back exercises. It is known that pull-up is one of the exercises which uses back muscles. When doing pull-ups, each part of back muscles tend not to get its muscle load appropriately only to follow the course of hands. In order to overcome the shortcomings, pull-down machine was developed. Although there are few comparative studies between pull-down exercises and other popular exercises such as squat and bench

press, we have enough amount of data which shows that pull-down exercises use a lot of muscles in arms and back^[1]. The target muscles to pull-down exercises are latissimus dorsi(LD), teres major, posterior deltoid, trapezius, rhomboid, levator scapulae, biceps brachii, brachialis and brachioradialis. Thanks to those muscles, triceps brachii and rotator cuff are stabilized. It is said that weakened lower trapezius(LT) and middle trapezius increase instability in shoulder joints, causes disease such as impingement syndrome and leads to functional impairment^[2]. It is a source which aggravates pathological findings in shoulder joints^[3].

The prevalence of shoulder pain is 6.9~26% and is one of the most common musculoskeletal disease in primary care. Its coming from musculoskeletal diseases is much higher in working populations and it increases as people age. Pain can have actual impact on an individual's capacity to perform functional or sport-related activities. The most

common shoulder pain is detected in the rotator cuff. Impingement syndrome, including rotator cuff tears (RCT) is the most common diagnosis in shoulder diseases^[4]. Decrease in the subacromial space increases pressure on the soft tissue between acromion and the humeral head, which is an important cause of impingement syndrome^[5]. Isometric exercises for shoulder joint rehabilitation are a safer way to facilitate muscle activation without load increase in the glenohumeral joint, especially for those whose shoulder joint mobility is limited^[6]. The average distance between acromion and humerus head is 11mm, and is reduced to 5.7mm when abduction 90°. acromio-humeral distance (AHD) of less than 6mm is related to RCT. Interventions such as surgery or rehabilitation are performed clinically in general for the sake of increasing AHD^[7].

AHD is the shortest lineal distance between the lowest part of the acromion and adjacent humerus head. AHD depends on the posture of shoulder longest in neutral position (10~15mm) and shortest when abduction 30°~90° at scapular plane and flexion 90° at sagittal plane^[8]. Subacromial pathology is related with the decrease in AHD. Patients with RCT and rotator cuff dysfunction have AHD of 1.9mm, 2.1mm shorter than that of healthy subjects. An average of 2mm difference is clinically significant. Real-time ultrasound (RTUS) is suggested as a reliable measure for AHD. RTUS is a measurement tool for AHD of the shoulder joint in neutral position and active&passive abduction 60°, which has high inter-rater reliability. Ultrasound measurement, when conducting dynamic screening, can make it possible for AHD to be measured easily and quickly without exposure to radiation and also compare the other side shoulder. AHD measurement through ultrasound measurement has been reported^[9].

Critchley et al.(2014) has examined whether isometric pull-down exercises of a variety of forces by those who has subacromial impingement syndrome (SIS) and those who do not have the disease has an impact on AHD. Isometric pull-down exercises showed an increase in AHD for those who have no symptoms of SIS whereas it is clinically important to conduct repetitive tests when it comes to the subject with SIS. It is proposed that the result of subjects with SIS has low consistency and lacks research, thereby tolerating the Isometric pull-down exercises at the same time^[10]. Sealey et al.(2017) measured AHD in those asymptomatic subjects at neutral position at rest and 90° shoulder flexion at rest using

RTUS, and examined isometric pull-down exercises at 100%, 50%, 30%, and 10%. It was suggested that Isometric pull-down exercises can be an appropriate exercise for patients of shoulder pathology because it increases AHD of asymptomatic male. Furthermore, it was proposed that ultrasound measurement of AHD at shoulder flexion 90° is practical and reliable^[11]. Kuncewicz et al.(2015) examined the effect of isometric pull-down exercises to AHD for those who symptomatic and asymptomatic of unilateral Subacromial pain syndrome (SAPS). Compared with 90° active shoulder flexion, AHD has increased during isometric pull-down exercises in asymptomatic shoulders in 100% Maximum voluntary isometric contraction (MVIC). There was no significant difference in AHD between 90° active shoulder flexion or 50% MVIC with or without symptoms. Compared with 90° active shoulder flexion, it was proposed that AHD has increased only during 100% MVIC isometric pull-down exercises of those whose asymptomatic shoulders^[12]. However, other authors reported that it is stimulated the muscle group in LD and serratus anterior (SA) using neuromuscular electrical stimulation (NMES) and examined the effect of muscular contraction. It was also suggested that the biggest increase in AHD appeared in NMES of combined LD and SA muscle.

The preceding researchers examined the change of AHD in pull-down exercises using ultrasound measurement and comparative gender, load, dominant and non-dominant arm. However, there is a lack of study in the change of AHD by the angle and the research of pull-down exercises using 1RM. Therefore, this study is intended to examine the change of AHD by the angle of 30°, 60°, 90° and 120° in Isometric pull-down exercises for those who have no damage in shoulder joints using ultrasound analysis.

MATERIALS AND METHOD

Subject: The subjects of the research are undergraduate students in S University, located in Asan, Chungnam Province. There were instructed enough about the purpose and method of the research prior to the experiment. All the subjects are those who showed voluntary agreement on the participation of the research and they participated in the research after filling out the consent form. The selected participants are healthy 20s, who show no positive reaction to the special test on the instability of shoulders, have no surgical or neurological

lesions or abnormalities, and have no pain or abnormal range of motion during voluntary or passive shoulder flexion-extension. Furthermore, those who have the history of surgery, have an abnormality or neurological problems in the shoulders, and cannot move shoulders because of severe pain were excluded. The total sample size of 36 was selected using G*Power 3.1. A total of 41 (20 males and 21 females) people was selected in order to apply the standard of inclusion and exclusion. The general characteristics of research participants are as follows[Table 1]. This research was performed under the approval of Institutional Review Board (IRB) in Sunmoon University(SM 2017O5-021-2).

Table 1: General characteristics (n = 36)

Gender (male/female)	Male (n=18)	Female (n=18)
Age(years)	19.39 ± 2.23 ^a	19.11 ± 0.68
Height(cm)	175.08 ± 4.83	159.67 ± 4.56
Weight(kg)	72.41 ± 13.06	56.22 ± 10.25

^aValues indicate mean ± standard deviation

Procedure: The research, conducts the anterior drawer test, jerk test and feagin test in order to examine the instability of shoulder joints.

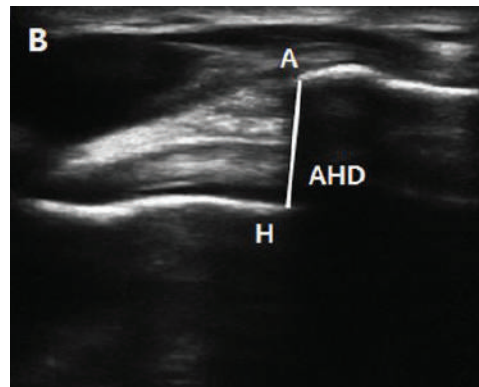

Figure 1: Four postures of shoulder flexion. A: 30° B: 60° C: 90° D: 120°

Prior to the experiment of the research, the research subject’s height and weight were measured using automatic BMI measuring stadiometer (automatic BMI measuring stadiometer, BSM 370, Korea, 2011). In order to determine the appropriate exercise intensity of the research subjects, 70% of 1RM was set as an intensity following the standard of ACSM(American College of Sports Medicine). 1RM was measured as the maximum antebrachial circumference *7.239-62.831 for male and maximum brachial circumference *3.916-34.185 for female. When it comes to maximum antebrachial circumference, the maximum circumference of the forearm was measured when the muscle is fully relaxed. When it comes to maximum brachial circumference, the maximum circumference of the middle of the upper arm was measured when the muscle is fully contracted. The research the subjects were suggested to wear a sleeveless shirt with which the shoulders and arms can be fully exposed for the sake of accurate ultrasound measurement. The subjects performed shoulder flexion four times for each angle with the intensity of 70% of 1RM.

A: The place of ultrasound probe in subacromial space

B: The acromio-humeral distance and surrounding structure acromiohumeral distance(AHD), acromion(A), humeral head(H)

Figure 2: Measurement region

The angle of shoulder flexion was set to 30°, 60°, 90°, 120°[Figure 1] and AHD was measured at rest position before the exercise. During the measurement, the subjects were required to sit on a chair and stare at the front with their back straightened. After the measurement, pull-down exercises by angles were conducted using 3D X- trainer. When measuring the subjects, the AHD of dominant and non-dominant arm was measured using ultrasound measurement while maintaining stable position. At this time, the research subjects were examined randomly depending on the angles. After measuring the AHD to each angle, they took a rest for 30 seconds in a sitting position and continued the rest of the experiment with the same method.

Research measurement equipment and measurement region:

The research measured the angle of shoulder flexion using electronic goniometer(digital absolute+axis™ goniometer, USA, 2008) and used ultrasound measurement (ultrasonography, eZono 3000, Germany, 2011) in order to examine the change of AHD. In this came, the B-mode image was used with the frequency set into 7.5MHz and the image depth of 3cm. During the image acquisition, ample amount of gel was applied between the skin and probe in order to minimize the pressure of skin. The probe remained right angle to the skin in order to raise the accuracy of measurement with the forearm fixed in order to prevent the swaying.

During the measurement, the position of the probe was placed in anterior acromion lateral aspect in greater tubercle level and arranged in scapular plane which is perpendicular to the skin. At this time, the shortest distance between acromion and humerus head in the ultrasound image was measured as AHD[Figure 2].

DATA ANALYSIS

In this research, descriptive statistics were used in order to analyze the mean and standard deviation (SD) of each variable. Statistical analysis of every measured value was calculated using SPSS/PC ver.18.0 for windows program(SPSS INC. Chicago. IL). One-way repeated ANOVA was used in order to figure out whether the change of angle in shoulder flexion is significantly to the increase of AHD. In addition, Bonfferoni method was used in post-hoc test in order to figure out the difference between each variable. The significance level was set to (p<.05) for statistical analysis.

RESULTS

Comparison of AHD between right and left according to shoulder flexion:

The change of AHD depending on the shoulder flexion angles(30°, 60°, 90°, 120°) is presented in [Figure 3]. The AHD depending on angle showed significant difference in right(p<.05). The AHD depending on angles was measured as 11.50mm in resting position, 9.91mm in 30°, 9.14mm in 60°, 10.95mm in 90° and 8.98mm in 120°. The result of post-hoc test showed significant difference between resting and 30°, resting and 60°, and resting and 120°(p<.05). It also showed significant differences between 60° and 90°, and 90° and 120°(p<.05). Similar to right, the AHD depending on angles in left also showed significant differences(p<.05). The AHD depending on angles was measured as 11.59 in resting position, 9.97mm in 30°, 8.95mm in 60° and 11.02mm in 90°, and 9.14mm in 120°. The result of post-hoc testing showed significant difference between resting and 30°, resting and 60°, resting and 90°(p<.05). It also showed significant differences between 30° and 60°, 30° and 90°, 60° and 90°, and 90° and 120°(p<.05).

Figure 3: Comparison of AHD between dominant arm and non-dominant arm according to shoulder flexion.

Comparison of AHD between male and female according to shoulder flexion: It was examined whether there is a difference between genders in the change of AHD depending on the shoulder flexion angles (30°, 60°, 90°, 120°). It only showed that AHD in left 120° of females was 0.02mm longer than that of males. There was no significant difference between genders after comparing the difference of AHD between genders depending on the shoulder flexion angle in right and left each ($p > .05$).

Comparison of AHD between dominant arm and non-dominant arm according to shoulder flexion: It was compared whether there is a change in AHD between dominant arm and non-dominant arm depending on shoulder flexion angles. As presented in and [Figure 3], there was no significant difference both in dominant arm and non-dominant arm depending on angles ($p > .05$).

DISCUSSION

The research examined the impact of the angle on the change of AHD by measuring the change of AHD depending on shoulder flexion angles (30°, 60°, 90°, 120°) using ultrasonography and now discuss the result of the research. The result of the research showed that there is a significant difference of the change of AHD depending on shoulder flexion angles in right and left each ($p < .05$), but there was no significant difference in the change of AHD between genders and in the change of AHD between dominant arm and non-dominant arm ($p > .05$).

Rotator cuff disorders are known to be a major source of shoulder pain in both athletic and nonathletic. Among endogenous and exogenous sources of rotator cuff pathologies, SIS seems to play an important role. In effect, when subacromial space, the space between humerus head and acromion, decrease, rotator cuff tendons and bursa contact with acromion in an unstable manner, thereby possibly activating the rotator cuff pathologies and pain^[15]. In this context, it is important to make an effort to plan surgical intervention and rehabilitation program in order to increase the subacromial space.

According to the study by Robert et al. (2002), acromiohumeral interval (AHI) was 6.40 inside, 7.70 in 90°/IR, 10.90 in 120°, 14.20 in 160°, the shortest among which was inside, and showed no significant difference

in average AHI from 90° to 160°. It also turned out that rotator cuff does not contact directly with anterior acromion^[13]. It contradicts with this thesis. It seems that it is because it focused only on the posture of the angle without muscle contraction of shoulder muscle, which is different from the method of this research, and also internal rotation was combined in 90° flexion.

Critchley et al. (2014) observed an increase in AHD while conducting active pull-downs exercises with 10%, 30%, 50%, 100% maximum voluntary contraction (MVC) to those asymptomatic subjects and there was no significant difference between the proportion of MVC. In addition, there was no significant increase in AHD while conducting active pull-down exercises with 10%, 30%, 50%, 100% MVC to those subjects who have SIS [10]. Furthermore, Kuncewicz et al. (2015) measured AHD under three conditions of unload, 50%, and 100% MVIC at 90° forward flexion posture. The AHD in asymptomatic shoulders has increased more when conducting isometric pull-down exercise with 100% MVIC compared with active shoulder flexion 90°. In addition, there was no significance in other changes of AHD in asymptomatic shoulder during 50% MVIC and symptomatic shoulder at 100% MVIC and 50% MVIC, and showed the tendency to decrease while isometric pull-down exercises^[12]. Despite the fact that there has some difference in the intervention between preceding researches and this research, the fact that the result of AHD in shoulder 90° flexion has similar value supports the basis of this research.

Herbert et al. (2003) compared the AHD of both shoulders of those subjects who has a unilateral SIS in shoulder flexion and abduction position and compared shoulder AHD of both shoulders between those subjects who has SIS and those who are healthy. As a result, the average AHD of SIS subjects in flexion (rest to 130°) varied from 8.3mm to 2.8mm compared with the average AHD of asymptomatic contralateral shoulders of 8.7mm~4.1mm. In addition, it was said that AHD was the shortest in 110°^[14]. However, it is difficult to conclude that the value of the preceding research is accurate because it is difficult for MR image to distinguish articular cartilage of the humeral head from surrounding structures.

Sealey and Critchley (2017) wanted to examine AHD at shoulder 90° flexion with and without load with isometric extension. Load was set at 10%, 30%,

50%, and 100% of MVIC, and men showed significant changes in AHD when compared to women. There was no difference more than 1mm as a result of the AHD value of the dominant arm was compared with the AHD value of the non-dominant arm^[11]. Existing research focused only on load and little research has been done on flexion angles, so this study focused on this point. The study focused on the load showed differences in male and female AHD because of the physiological characteristics that showed less muscle hypertrophy in the strength improvement of women compared to men. However, this study shows that there is no difference in AHD between men and women. The AHD of the dominant arm and the non-dominant arm of this study were not the same as those of the previous studies. Therefore, it can be said that there is little or no effect of hand use on AHD under normal circumstances.

This study compared changes in AHD with shoulder flexion angles during isometric pull-down exercises. In conclusion, the highest AHD value at 90° shoulder flexion was shown. This is because infraspinatus, deltoid anterior & middle parts, supraspinatus, LT contribute to activity at 90° shoulder flexion. In addition, AHD measurements showed that the values of AHD between dominant arm and non-dominant arm and between male and female were similar between various shoulder flexion angles.

Many limitations should be considered in this study. First, the number of subjects is relatively small, and this study explored only the posture of the movement, not the long-term effect of the exercise. Therefore, we can not yet know whether these results have long-term clinical implications. Additional research over time is needed to clarify this aspect. Second, it can not be immediately applied to people with a history of shoulder dislocation because it is a result of a population with no history of shoulder joints. Also, it is difficult to generalize because the population participating in the study is younger than the typical age of those with a history. Third, because the load is fixed to 70% of 1RM and AHD is measured during shoulder flexion, different loads can affect the result. Finally, muscle fatigue in subjects due to isometric pull-down repetition during the experiment may affect the result value. So, it is considered to need study that complements these limitations.

CONCLUSION

This study investigated the changes of AHD according to shoulder flexion angle during isometric pull-down exercises. In conclusion, we confirmed that the isometric pull-down exercises had the largest AHD at 90° flexion of the shoulder, but there was no correlation between changes in AHD between dominant and non-dominant arms and between males and females. Therefore, the change of AHD according to angle of shoulder flexion should be used to diagnose patients with shoulder disease compared with normal shoulder in clinical practice, and to focus on the angle of shoulder flexion to establish safer treatment plan.

Development of Running-bra Pattern for Mid-aged Women

Do Yoon Park¹, Mi Hyang Na¹

¹Dept. of Fashion Design, Cheongju University

ABSTRACT

Background/Objectives: This study aims to develop a running bra pattern, reducing pressure along with the function of the brassiere.

Method/Statistical analysis: Brassiere used in this study are based on 85B full-cup design that is suitable for the standard size in mid-aged women. The wearing test based on wearing the research brassiere covers 12 items in total. As for the statistical analysis, F-test and Duncan's test were conducted in accordance with SPSS 18.

Findings: This study is valuable in that it is a basic pattern of low-pressure running-type brassiere. Therefore, the aim is to carry out a research with regards to the outer clothing of brassiere and underwear with less pressure based on research running-type brassiere.

Improvements/Applications: This result is probably because the research running-type brassiere pattern had less pressure and was comfortable in terms of wear-ability so it had been developed to suit the purpose of the research.

Keywords: *full-cup design, wearing test, running-type brassiere pattern, wear-ability, underwear, basic pattern*

INTRODUCTION

Women wish to express their bodies in a beautiful and voluptuous silhouette. Prior research papers^[1-12] do contain contents regarding various underwear, but patterns of running bras could not be found. In the various precedent studies, the results imply that underwear has a negative impact on health due to excessive pressure on certain areas of the body and others. This study aims to develop a running bra pattern, reducing pressure along with the function of the brassiere. The characteristics of the research brassiere design is that it reduces the pressure

of the shoulder and under-bust band by measuring the neck point to breast point of naturally sagging breasts of mid-aged women then widening the shoulder strap.

RESEARCH METHOD AND PROCEDURES

Subjects: As for the research running-type brassiere, a brassiere pattern combining Product C and Product D was developed in the precedent study(Comparative analysis of running-type brassieres on the market)^[13]. As for the bra-cup, mold brassiere 85B suitable for the breast size of the selected test subject was chosen. As for the shoulder line and back neck line, it was designed by Body considering the ptosis B.P (4.5cm below from inferior breast) of middle age and the elasticity of material based on secondary revision(Made in Japan B85 Body).

Wearing test: The wearing test based on wearing the research brassiere covers 11 items(as shown in Table 1) in total. As for the statistical analysis, F-test and Duncan's test were conducted in accordance with SPSS 18.

Table 1: Items of Wearing Test

Parts	Item	Contents
Bra-cup	Q1	Does the bra-cup adequately hold the breast shape?
	Q2	Does the nipple-right and left and bra-cup come in contact, making it appropriate without creating space in the B·P location?
	Q3	Is there pressure or elation in the center front line, making it suitable?
	Q4	Is the pressure at the lower area of the bra-cup appropriate?
	Q5	Is there elation at the side of the bra-cup, making it suitable?
Torso	Q6	Is the pressure around the shoulders appropriate?
	Q7	Is the flesh around the armpit pushed out and is the pressure appropriate?
	Q8	Is the torso comfortable in general without unnecessary wrinkles?
	Q9	Is the flesh around the back neckline pushed out and is it appropriate?
	Q10	Is the length of the torso appropriate?
	Q11	Is the pressure at the hem appropriate?
	Q12	Is the overall wear-ability appropriate?

RESULTS AND DISCUSSION

Research running-type brassiere pattern’s design:
 The research running-type brassiere pattern design technique is as Figure 1. below.

- **Front pattern:** The dimension of neck point to breast point was measured by considering the sagging status of breast at nude state.
- **Back pattern:** The breast part was based on the ‘Under-bust circumference/4×reduction ratio’ formula and the reduction ratio was set as 92%.
- **Armhole:** As for the shoulder angle, the pattern was designed with 30° for the front shoulder and 25° for the back shoulder. The shoulder strap was 5cm armhole circumference and as a result of the first wearing test, there was a margin of 1.5cm in the front armhole circumference so in the second pattern, the margin of 1.5cm was removed.
- **Reduction ratio:** Despite the fact that the material of the sample has high elastic recovery rate (wale 87%, course 53%), the entire circumference of the under-bust, waist and hip was set as 92% respectively.

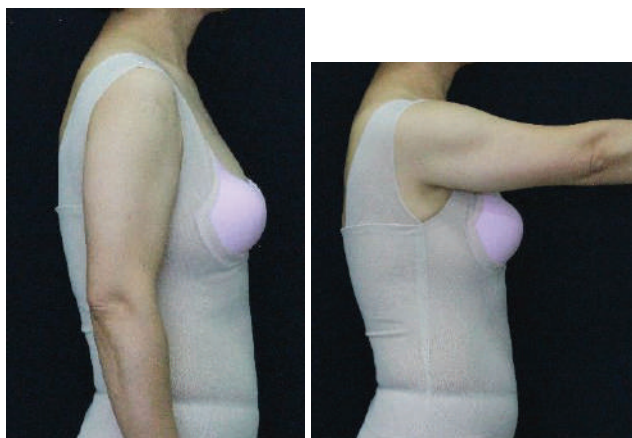

Figure 1: Construction of Research Running-type Brassiere Pattern

B: Bust; W: Waist; H: Hip
 T.L: Total Length;
 W.B.L: Waist Back Length
 H. L: Hip Length;
 U.B.L: Under Bust Line
 N.B: Neck point to Breast point;
 B.I: Back Interscye Fold Length
 F.I: Front Interscye Fold Length;
 R.r: Reduction ratio

Wearing test for research running-type brassiere pattern: The research running-type brassiere was produced for the purpose of minimizing the pressure with regards to the body and the wearing test image is as Figure 2.

Front

Side

Back

Figure 2: Wearing test Image for research running-type brassiere

Bra-cup: As a result of a wearing test, all 5 items related to the bra-cup indicated significant difference in the level of 0.001 and is as Table 2.

Table 2: Comparative analysis of research running-type brassiere and 2 types of market products (bra-cup)

No.	Res.	C	D	F-value
Q1	4.30 a 3.80 b		2.03 c	115.37***
Q2	2.95 b	3.78 a	1.20 c	160.21***
Q3	1.85 b	3.70 a	3.85 a	67.34***
Q4	4.38 a	2.75 b	1.87 c	55.21***
Q5	4.12 a	1.95 c	3.44 b	45.75***

***p < .001, Duncan test (a>b>c)

Q1 indicated that the size of research bra-cup adequately held the breast in the order of the Research type>Product C>Product D.

As for Q2, it indicated that in Product C, the Nipple-right and left and the bra-cup came in contact, not creating space in the B·P location, making it suitable. As for the research type, it was normal with 2.95.

As for Q3, the research type had a low evaluation score compared to Product C and D in the order of D (3.85) ≥ C (3.70) > Research type (1.85).

As for Q4, it was in the order of Research type (4.38) > Product C (2.75) > Product D (1.87).

As for Q5, the research type obtained the highest value in the order of Research type (4.07) > D > C (1.93).

Looking at the result of 5 items of the bra-cup, as for the pressure, research type was outstanding and in items that require adjustment, intermediate results were shown.

Torso: The comparative analysis per item with regards to the torso part is as Table 3.

As a result of wearing test with regards to 7 items related to the torso part, there was significant difference except for Q8.

As for Q6, the research type obtained the highest value out of the questions with 4.96 and there was no difference between Product C and D with 3.87 and 3.80.

In Q7, the research type was much more outstanding than the market products in the order of Research type (4.42)>D>C.

As for Q9, the research type obtained the highest value with 4.78 in the order of Research type>D>C. The flesh at the back neck line area was not pushed out and was appropriate.

As for Q10, the research type obtained the highest value with 3.75, indicating that the torso length of the research type was appropriate. As for Product D(1.84) and Product C(1.78), the length of the torso was not appropriate.

As for Q11, Product D(3.81) indicated that the pressure at the hem was appropriate in the order of D>Research type>C.

As for Q12, the research type obtained 4.87 score in the order of Research type>D>C, with the response indicating that the wear-ability in general was appropriate. Out of 7 items related to the torso, the research type was appropriate in 5 items when compared to the market products.

Table 3: Comparative analysis of research running-type brassiere and 2 types of market products (torso)

No.	Res.	C	D	F-value
Q6	4.96 a	3.87 b	3.80 b	45.47***
Q7	4.42 a	1.31 c	3.78 b	124.31***
Q8	3.81	3.92	3.86	0.42
Q9	4.78 a	3.65 c	4.05 b	17.01***
Q10	3.75 a	1.78 b	1.84 b	97.86***
Q11	3.81 a	2.89 b	3.94 a	21.64***
Q12	4.87 a	3.80 c	4.32 b	15.26***

***p < .001, Duncan test (a>b>c)

The average value with regards to the bra-cup (5 items) and torso (7 items) per product is indicated in Table 3. Looking at Table 3., the average value of bra-cup and torso with regards to the entire 12 items of wearing test was in the order of Research type>Product D>Product C with the research type being outstanding. Figure 3. is Average value in Table 1 & Table 2.

This result is probably because the research running-type brassiere pattern had less pressure and was comfortable in terms of wear-ability so it had been developed to suit the purpose of the research.

This study is valuable in that it is a basic pattern of low-pressure running-type brassiere. Therefore, the aim is to carry out a research with regards to the outer clothing of brassiere and underwear with less pressure based on research running-type brassiere.

Figure 3: Average value in Table 1 & Table 2

CONCLUSION

A running-type brassiere pattern minimizing the pressure on body experienced when wearing the existing brassiere while complementing the sagging breasts of middle age was developed. As a result of a wearing test, the research type’s overall average value was 4.34 while it was 3.16 for Product C and 3.85 for Product D so the brassiere for research was outstanding compared to the 2 types of existing products.

Evaluation of Visual Image with Change in Collar Design and Width

Jeong Ha Kim¹, MiHyang Na²

¹Lecturer, ²Professor, Dept. of Fashion Design, Cheongju University, Korea

ABSTRACT

This study is to analyze the most commonly used collar types in women's tops which are stand, round flat, and soutien collars as well as observe the differences in visual image according to the width of each design. The three designs that were selected were the most standard stand, round flat, and soutien collar, a type of convertible collar. The experiment outfit was made in No.8 size 55. Evaluates visual images of 9 stimulus created through the combination of 3 collar designs and 3 stages of width. As for the statistical analysis, ANOVA and Scheffe test were conducted in accordance with SPSS 24.0. This research is valuable a Study on the Visual Image Evaluation of the collar pattern. Four factors applied the visual image as collar design and Collar width changed : attraction, cuteness, elegance and activity. In the order of soutien collar > round flat collar > stand collar, collar width of 7.5 cm was rated highly in the elegance factor for its comfortable and neat image. This research deals only with 3 types of collar designs but further research of different types of designs is needed.

Keywords: Collar Design, Visual Image, Width Variation, Stand, Round Flat, Soutien

INTRODUCTION

In modern society, collars are a way to express various characteristics and have the merit of being able to match its design with a modern, cute, and intellectual image.

There are various studies on the subject of collars¹⁻¹⁴, but research on its component factors and visual image is not enough.

The purpose of this study is to analyze the most commonly used collar types in women's tops which are stand, round flat, and soutien collars as well as observe the differences in visual image according to the width of each design.

RESEARCH METHOD

Select and create stimulus: The three designs that were selected were the most standard stand, round flat, and soutien collar, a type of convertible collar. The widths of the collars were set to be in 3 steps, 5.5 cm, 7.5 cm, and 9.5 cm based on the rear center line, and in reference to the collar drafting method, we have made Table 1 as the stimuli with 100% Muslin¹⁵.

Table 1: Collar Design & Collar Width

Collar Width	Collar Design		
	Stand Collar	Round Flat Collar	Soutien Collar
5.5cm			
7.5cm			
9.5cm			

EVALUATION METHOD

Evaluator: A total of 48 evaluators, composed of 38 college students in fashion design and 10 Masters and doctorates on clothing, were selected in order to increase objectivity and trust of this research.

Experiment environment: The experiment outfit was made in No.8 (Made in JapanBody)size 55, which is, according to the human body size research, close to the average body size of Korean women at the age of 18~39. Size of each part is as presented in Table 2.

Table 2: Body Size

Body Part	Neck Circumference	Chest Circumference	WaistCircumference	Waist Back Length
Size	31.5cm	84.5cm	65.5cm	38.5cm

Data analysis: In the reliability test of the visual image measurement, with the exemption of 3 items, 19 pairs with Crombach’s alpha value of 0.5 or more, were ultimately selected.

Data analysis was conducted with the SPSS Ver. 24.0 program, and the ANOVA, Scheffetest were used for further post hoc tests.

visual image in accordance with changes in collar design and width.

We have derived Crombach’s alpha for reliability verification and through main component Varimax orthogonal rotation analysis, 4 factors (attraction, cuteness, elegance, activity) were derived that had eigenvalue of one or more.

RESULTS AND DISCUSSION

Component factors of the visual image evaluation test: We have initiated factor analysis to identify the

These 4 factors constituted for 68.917% of the whole variant, and the attraction factor accounted for 23.989%, making it the most important factor of all, and the result of this analysis is as presented in Table 3.

Table 3: Component factors of the visual image evaluation

Factor	Visual Image	Factor loading	Eigen value	Cronbach's α	% of total variance
1 Attraction	Classy/Undignified	0.906	4.558	0.889	23.989
	Trendy/Not trendy	0.848			
	Unusual/Normal	0.793			
	Modern/Classic	0.731			
	Cool/Not cool	0.715			
	Chic/Tacky	0.650			
	Pretty/Chapter Ugly	0.622			
2 Cuteness	Casual/Formal	0.801	3.756	0.812	19.766
	Cute/Old	0.735			
	Lively/Gentle	0.706			
	Younger/Adult	0.703			
	Dynamic/Static	0.584			
	Soft/Hard	0.570			
3 Dignity	Tidy/Not tidy	0.826	2.760	0.788	14.526
	Proper/Burdensome	0.796			
	Comfortable/Uncomfortable	0.718			
	Neat/Not neat	0.693			
4 Activity	Fresh/Tight	0.769	2.021	0.558	10.636
	Open/Conservative	0.700			
Cumulative % of variance		68.917%			

Visual image in accordance with collar design: Visual image in accordance with collar design is as presented in Table 4. In the attraction factor, its results were rated highly in the order of stand>soutien>round collar, and for the cuteness factor, its results were rated highly in the order of round flat>soutien>stand collar. The elegance factor was shown to have no meaningful differences, thus implying that the elegance factor is not greatly affected by changes in types of collar design. Round flat and the soutien collar were rated highly in the activity factor, while stand collar was evaluated as visually tight and conservative.

Table 4: Visual image in accordance with collar design

Factor	Design	Mean			F-value
		Stand Collar	Round Flat Collar	Soutien Collar	
Attraction		4.9024 c	3.5261 a	4.5749 b	61.256***
Cuteness		3.7940 a	5.6938 c	4.7385 b	197.838***
Dignity		5.1443 a	5.1504 a	5.1179 a	0.036
Activity		3.3374 a	4.1707 b	4.0772 b	20.501***

***p<.001, a<b<c

Visual image in accordance with changes in width of a collar: The results of analysis regarding visual image in accordance with changes in collar width, as presented in Table 5 had meaningful differences in all 4 factors at the level of 0.001. Collar width of 9.5cm was rated highly in the attraction factor and evaluated as unique, chic, modern and cool while the collar width of 5.5cm was rated highly in the cuteness factor, implying that the narrower the collar, the cuter and younger the visual image becomes. Collar width of 7.5cm was rated highly in the elegance factor, and evaluated as the most neat and comfortable image. The activity factor was rated highly in the order of 9.5cm>7.5cm>5.5cm, showing that wider collars were evaluated as more open and less tight.

Table 5: visual image in accordance with changes in width of a collar

Factor \ Collar width	Mean			F-value
	5.5cm	7.5cm	9.5cm	
Attraction	4.0290 a	4.3496 ab	4.6249 b	8.251***
Cuteness	5.0921 b	4.4309 a	4.7033 a	12.427***
Dignity	4.8902 a	5.6626 b	4.8598 a	29.164***
Activity	3.3699 a	3.8699 b	4.3455 c	23.789***

***p<.001, a<b<c

Visual image in accordance with collar design and width: The result of the visual image analysis in accordance with collar design and width is as presented in Table 6. The round flat collar was ranked lowest among all width in the attraction factor, while the stand and soutien collar of 9.5cm width were rated the highest, implying that wider collars are viewed as a more classy image. The round flat collar with 9.5cm width was rated the highest in the cuteness factor. The round flat collar with 5.5cm, 7.5cm width and the soutien collar of 5.5cm width, all shared a similar image according to the Scheffe verification result, which implied that a circular design is evaluated as a cuter and more youthful image. Collars of 7.5cm width were rated highly in the order of soutien>round flat>stand in the elegance factor. The soutien collar of 9.5cm width was rated highest in the activity factor, implying that wider collars give a fresher and less conservative image.

CONCLUSION

This research evaluates visual images of 9 stimulus created through the combination of 3 collar designs and 3 stages of width. The results show that wider collars are more attractive while narrower collars give a cuter and more youthful image. The stand collar is deemed visually attractive but rated as tight and conservative.

For active design, the round flat and soutien collar will give a positive visual image. This research deals only with 3 types of collar designs but further research of different types of designs is needed.

Investigating Major Related Determinants of Short or Long Sleep Time among Older Koreans in the Community

Hye-Sook Choi¹, Moon-Hee Kwon²

¹Dept. of Dental Hygiene, ²Dept. of Nursing, Kyungdong University, Wonju, 26495, Korea

ABSTRACT

Background: Sleep time problems are increasing especially for the elderly population globally. This study was conducted to investigate the determinant major factors of sleep time problems.

Method: Over 65 aged respondents were participated and used the data of 1180 subjects through multiple-level logistic regressions with complex sampling methods by the national representative data for a cross-sectional study.

Findings: As results, the prevalence of abnormal sleep, lack or excessive status, was 62.5% of the Korean elderly. The determinant factors of sleep time were gender (female), middle income (economic level) group and age (70-79) significantly.

Improvements: Therefore, specialized public health interventions by gender, age, and economic level should be urgently prepared to control the sleep problem especially for the remarkably aging population in the community.

Keywords: Short or long sleep, Gender, Income, Economic level, Age, Older people, Korea

INTRODUCTION

Short or long sleep problems, which are associated with general health as well as quality of life among the elderly, are rapidly increasing worldwide ¹⁻³. Also either short or long sleep were negatively related with health of genders ¹ and reported to be caused of metabolic syndrome in females ² and related with mental health ⁴ and that mental health such as depression was seriously direct correlation with general health especially among older people ⁵. And insomnia was reported to be influenced by gender, age, education, physical and mental health ⁶. In addition to that, healthy lifestyle behaviors including sleep duration were reported to be very beneficial for preventing of cardiovascular mortality regardless of education level ⁷. According to another study of

sleep and cognitive functions, they reported that sleep deprivation may impair recognition of emotions ⁸. And sleep was reported to be related to mental health among middle aged adults including both genders among general population ⁹. By the English longitudinal study, a decrease of sleep duration was reported to be causing of greater adiposity ¹⁰. By previous study, long sleep was positively associated related with current smoking, alcohol use, living rural area and lack of physical actives¹¹. Also long sleep was reported to be related with Sarcopenia ¹² and later sleep time was reported to being related with higher insulin resistance by cohort study ¹³ and shorter sleep group was reported to be associated with higher risks of hypertension while long sleep one had no association of hypertension incidence ¹⁴. Long sleep and smoking were also reported to be associated with being worse function of memory ¹⁵. And shorter or longer sleep was reported that they had poorer status of health ¹⁶ and significantly related with falls, major dangerous factor of the older people ¹⁷. Longer sleep time was reported that it was related with higher prevalence of stroke especially in women ¹⁸ and the association of sleep health and cardiometabolic risk(CRS) was reported the one that sleep may be the predictor of CRS ¹⁹. Also, by recent

Kyungdong University, Korea

Email: ellizabeth@hanmail.net

another study, they reported that insufficient sleep was related to having lower social capital especially in men²⁰. And it was reported that the people who complained about insomnia, they had poorer health conditions²¹.

Despite of its growing importance, there are rare studies on the association of lack or excessive sleep time and the determinants of especially growing elderly. Through this study, we performed to investigate on the determinant major factors of abnormal sleep time such as too short or long sleep.

MATERIALS AND METHOD

By the 6th KNHANES(Korea National Health and Nutrition Examination Survey data), we examined 1,180 participants to investigate the major related factors of short or long sleep time of older subjects using the complex sampling method through multi-logistic regression by SPSS (ver. 21.0).

RESULTS AND DISCUSSION

Table 1 displays the characteristics of socio-demographic factors like sleep time, factors of life style. The proportions of lack or excessive sleepers were accounted for 62.5%. Over half of them were female (58.3%) and aged 70-79 subjects (52.4%). Two thirds of them were educated level of elementary school (67.3%).

Table 3 shows the independent major related factors of lack of excessive sleep time. Multi-logistic regression revealed that gender (female), income level (middle low, middle high) and aged 70-79 group were positively associated with lack or excessive sleep time. While education level, no-spouse, drinking and family member¹ had been showed of having no relations with short or long sleep time.

Our study showed that the determinants of sleep were the factors of gender (female), middle income, ageing. The prevalence of short or long sleep among the elderly was 62.5% and that was similar to those of Canada's recent study though it had some differences of the subjects, they reported that 65 to 79 ages people had some troubles of sleep duration and quality²². Female, gender specific factor, one of the determinants of sleep durations as one of our results, it was partially proved through previous study of Sweden even if their results are having some differences in gender, they suggested that sleep duration and correlated factors need to be considered on sex-specific of some associations²³. By recent Germany's study, elderly women who especially using more time on housework activities caused of short or long sleep time, had been reported of having poor health²⁴ and these results had in consensus with those of our results in view of female, gender, as the affecting factor of sleep. By Korea's recent study, they reported the association of longer sleep duration and higher prevalence of stroke and the trend was severe in women¹⁸ and these results was supporting the importance of gender specific policies for the future. And with the previous study, female gender, older age were reported to be significantly associated with insomnia²⁵, these results are supporting our results in some points of view though education level, unmarried status, smoking, and drinking variables were not associated factors in our study.

Through our study, middle income factor compared to lower or higher income one, showed more being affected one by sleep, and these results are not in consensus with another study, they reported that sleep health was associated with being lower cardio-metabolic risks among lower and middle wage workers and these differences should be considered of seeming the cause of the different race and subjects ¹⁹.

Older age, the major determinant factor through our study, was supported by the prior study, they revealed of the association of older age and short sleep even though some difference in view of smoking and alcohol use ¹¹. It was reported that some associations of sleep time and metabolic measure might be age dependent¹³ and these ageing variables should be considered as the important major factor.

Smoking and drinking problems which had no relations in our study, have inconsistency with the results of the China's study¹¹ partially due to differences of sample subject characteristics. In the study of relationship between drinking alcohol and sleep durations of US, they reported that environmental, biological and social factors may contribute on their findings ²⁶.

CONCLUSION

According to our results, health professionals should focus on gender, income and aging factors to promote sleep health status in older population as well as proper sleep recommendation policy implications in the community. And further studies to explore those associations of sleep duration and general health factors as well as investigating the certain life style factors through reflecting circadian rhythms should be continued on these older populations in Korea.

Usefulness assessment of Stereotactic Body Radiation Therapy with Breathing Observation (RPM system) in Lung Cancer Patients

Geum-Mun Back¹, Soo-Kyung Na²

¹Ph.D, Dept. of Radiation Oncology, Asan Medical Center, South Korea;

²Professor, Dept. of Radiological Science, Gimcheon University

ABSTRACT

Background/Objectives: The aim of this study is to evaluate the usefulness of the RPM system by comparative analysis in the reproducibility of tumor motion with respiration changes in patients undergoing SBRT.

Method/Statistical analysis: Twenty patients with respiratory gated radiation therapy and 20 patients without RGRT were divided into groups 1 and 2, and shoot 4-Dimensional Computed Tomography, Cone-Beam CT and Fluoroscopy In order to verify the stability of respiration during treatment. We set the reference interval of the respiration signal using Real-time Position Management(RPM) System(version 1.7.5, Varian, USA) for Group 2, and then, we counted the number of off-center values.

Findings: The differences between the average motions are measured by 4-D CT and CBCT the results are 1.0 mm, 1.1 mm, and 1.9 mm in the anteroposterior direction, the axial direction, and the lateral direction in Group 1. The mean axial difference between the 4-D CT and Fluoroscopy in the axial direction's result is 0.6 mm in group 1 and 2.3 mm in group 2. The difference in axial direction between CBCT and Fluoroscopy's result is 1.7 mm in group 1 and 1.4mm in group 2.

In group 2, the number of treatments (20patients, single treatment, 15Gy) without not match with reference respiratory interval is 32 out of 80 times. The mean tumor movement value in all patients is less than 5 mm on average. In this study, the accuracy of the planned dose delivery during treatment can be improved by confirming the movement of the tumor with RPM system even in patients without RGRT.

Improvements/Applications: For improvement of this research we should consider another method for the patient who has very erratic breath.

Keywords: SBRT, RGRT, RPM system, Respiratory interval, 4-Dimensional Computed Tomography

INTRODUCTION

Sophisticated treatment techniques such as IMRT and VMAT, which optimize the dose of tumor tissue and normal organs, have been widely used clinically since the development of radiotherapy technology¹⁻³, and related research activities are actively underway. Besides, The application range of image-guided radiation therapy(IGRT), which can confirm the posture

of the patient and the position of the tumor using the images obtained before the treatment, and corrects the differences between obtained images and planning images, is being gradually expanded.⁴⁻⁵ Although the development of this radiotherapy technique has been enabled SBRT that are difficult to perform surgically⁶, SBRT in thoraco-abdominal site, The movement and position of the tumor may change according to patient's breathing.⁷ So, In the process of establishing the treatment plan, acquisition and analysis of information about respiration and tumor movement are needed in advance.⁸⁻⁹ In our hospital, we measure the tumor movement in 4-Dimensional Computed Tomography(4-D CT) and then decide whether or not to apply Respiratory Gated Radiation Therapy(RGRT) which irradiate only the

Corresponding Author:

Professor, Dept. of Radiological Science,
Gimcheon University, Korea
Email: skna@gimcheon.ac.kr

particular interval based on the patient’s respiratory cycle with reference value(10mm), after that we set the Internal Target Volume (ITV) and Planning Target Volume(PTV).^{10,11}

The patient’s respiration and tumor movement are analyzed using the 4-D CT images acquired within a short time of 10 minutes only. Thus, the movement of the tumor and the patient’s breath could change the treatment dose and be delivered differently than planned during the therapy.

Therefore, we use images obtained from the treatment planning stage through the whole process to evaluate the reproducibility of the tumor motion. In case of patients without RGRT, Observation with RPM system is carried out during the treatment.

After that, patient’s respiration changes are checked and the usefulness of patient respiration observation using RPM system is evaluated.

MATERIALS AND METHOD

From January 2015 to January 2017, among the patients who underwent SBRT, 20patients who underwent RGRT and 20 patients who did not undergo RGRT were selected as Group 1 and 2. Then, during the treatment, the respiration reproducibility and the stability of the patient’s breathing were compared and evaluated.In order to establish the treatment plan, 4-D CT was taken using a 3-D simulator(Lightspeed RT16 CT simulator, General Electric Co. Waukesha, WI, USA) and CT images of each respiratory phase were obtained from 0 to 90%. The computerized treatment planning system(Eclipse treatment planning system, Version 10.0, Varian, USA) was used to measure the movement of the tumor in the anteroposterior (AP), axial (SI), and lateral (RL) directions. [Fig. 1]

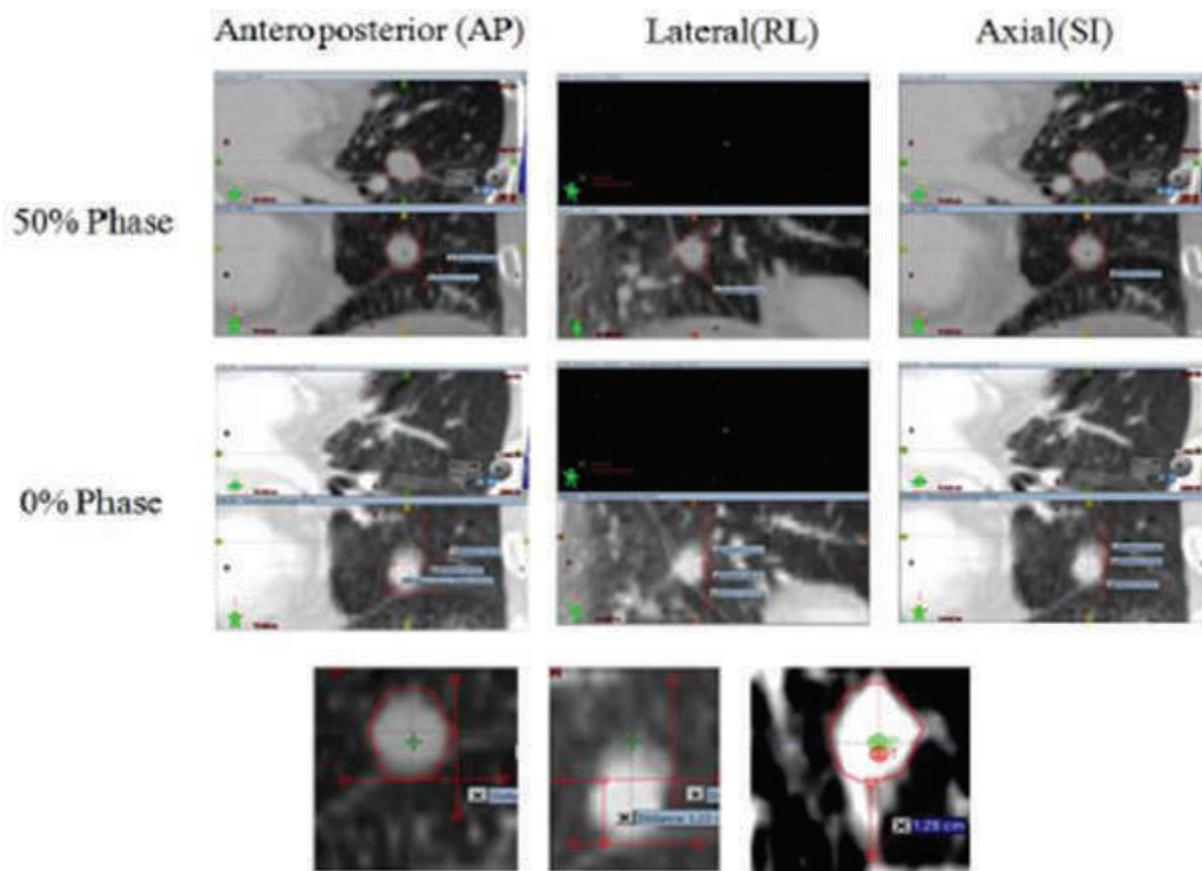

Figure 1: Measurement of tumor motion in 4-DCT images

The RGRT was applied to patients whose tumor motion measurements exceeded 10 mm in a specific direction based on 4-D CT images.

For treatment, we used TrueBeamSTx™(Varian Medical Systems, PaloAlto, USA). Kilo-Voltage(kV) X-ray images and Cone-Beam CT (CBCT) images obtained with the On-Board Imaging(OBI) system for IGRT were used to confirm the posture and location of the tumor before treatment.

In order to confirm the accuracy of IGRT once again and to confirm the movement of the tumor according to the patient’s breathing, we performed the procedure after confirming with fluoroscopic images, and the stored images were used to measure the change of the tumor movement.

Forty patients were treated with the same method and the tumor movement was measured using Offline Review Registration Software(ARIA 10, Varian, USA).[Fig.1, 2, 3]

Figure 2: Measurement of tumor motion in CBCT images

Figure 3: Measurement of tumor motion in Fluoroscopy

Data were collected and analyzed for each patient during a total of 80 times of SBRT performed four times of 15Gy.

To confirming the change of tumor location, before the treatment, we performed guidance image based on the vertebral column adjacent to the PTV during the IGRT process. After that, performed guidance image based on the shift value of the couch and the gross tumor volume, and then, Shift value was compared and analyzed in the anteroposterior (AP), axial (SI), and lateral (RL) directions.

In group 2 patients who were treated without RGRT, the RPM system was used to confirm the stability of the patient’s breathing. The patient’s respiration signal entirely acquired when observing the movement of the tumor with Fluoroscopic image before treatment. The upper and lower margins of movement were set up and counted the number of off-center values during the treatment. [Fig. 4]

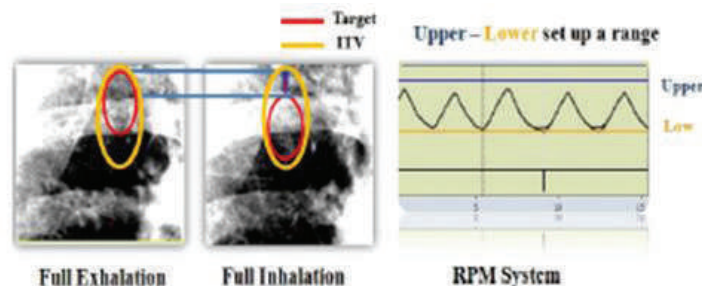

Figure 4: Set up the respiration Upper-Lower range on fluoroscopy images

RESULTS AND DISCUSSION

On the 4-D CT images, the tumor movements in the anteroposterior, axial, and lateral directions were measured. The mean values measured in group 1 with RGRT were 3mm, 15.2mm, and 2mm, and The mean values of Group 2 without RGRT were 1.4mm, 4.2mm, and 1.2mm.

In the same way, on the CBCT images, the mean values of group 1 were 1.5mm, 13mm, 1.3mm, and Group 2 were 0.9mm, 5.0mm, 0.7mm. On the fluoroscopic images, the mean value of axial direction in group 1 was 14.9mm, and group 2 was 6.24mm. [Table 1]

Table 1: Mean value of tumor motion in 4-D CT, CBCT, Fluoroscopy images (unit: mm)

	4-DCT			CBCT			Fluoroscopy
	(AP)	(SI)	(RL)	(AP)	(SI)	(RL)	(SI)
Group1	0.3	15.2	0.2	1.3	13	1.5	14.9
Group2	1.4	4.2	1.2	0.9	5.0	0.7	6.4

In order to compare the motion of the tumor with the CBCT and the fluoroscopic images, the mean value of the axial direction of the same patient was 2.3 mm in Group 1 and 1.6 mm in Group 2. The maximum value of each group was found to be 12.1 mm in group 1 and 6.6 mm in group 2, and the minimum value was 0 mm in group 1 and 2.

In order to confirm the change of tumor movement during the 4 times of SBRT in the same way, the movement of the tumor was measured with fluoroscopic images and compared the measured values for the remaining 3 days based on the measured value of the first day, 13 patients in group 1 and 4 patients in group 2 showed a difference of more than 5 mm.

The mean difference of the tumor movements measured in the axial direction of 4-D CT and fluoroscopic images was 4 mm in group 1 and 2.4 mm in group 2.

The greatest difference of the tumor movement showed in the 25th patient, in Group 1 with a difference of 13.5 mm between the first day and last days, and in Group 2, the fifth patient showed a difference of 6.5 mm between the first and second days. [Fig. 6]

Group 1 and Group 2 had a difference of more than 5 mm in each group, 17 and 16 times, respectively. [Fig. 5]

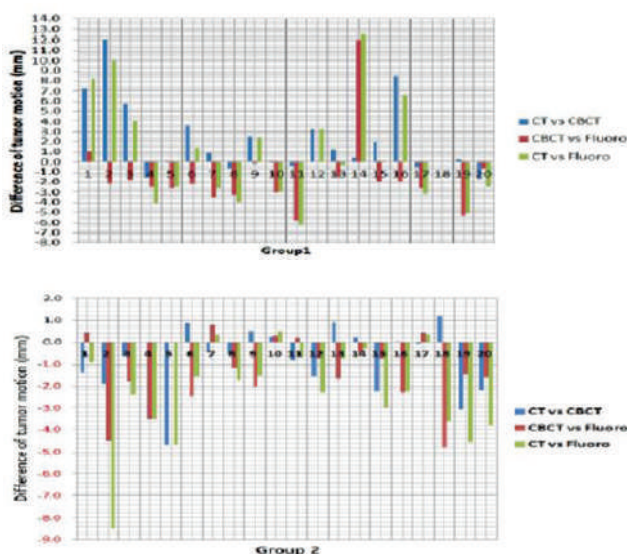

Figure 5: Difference of tumor motion at the Superoinferior (SI) direction in 4-DCT, CBCT and Fluoroscopy images. (unit: mm)

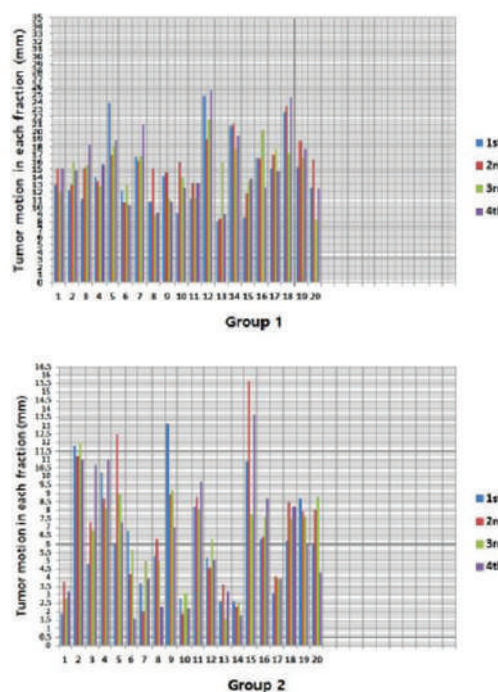

Figure 6: Inter-fractional variation of Tumor motion (unit: mm)

In the IGRT procedure, we performed image guidance based on the vertebral column adjacent to the PTV, followed by image guidance based on the tumor one more time, and after that, the difference of the shift value of the couch was compared in the anteroposterior, axial and the lateral direction.

Group 1 had an average difference of 4.1 mm, 4 mm, and 0.27 mm. Group 2 had 3.3 mm, 3.7 mm, and 2.4 mm difference, but there was a patient with difference of 10mm or more in both groups.

The largest difference between groups was 13 mm in group 1 and 16 mm in group 2. [Table 2]

Table 2: The difference of Couch shift value between bone-based matching and target-volume-based matching in CBCT images (unit: mm)

Shift value	Anteroposterior	Axial	Lateral	Maximum value
Group1	4.1	4	2.7	13
Group2	3.3	3.7	2.4	16

As a result, in group 2, patient respiration was observed using RPM system during treatment, the number of treatment cases with stable respiration without exceeding the pre-treatment respiratory criteria, was 32 out of 120 times in 30 patients, in patients with the most unstable respiration, it was found that treatment dose delivery was interrupted by the 108times of off-center during the one time treatment.

CONCLUSION

In the treatment planning of 40 patients who underwent SBRT, the change in tumor motion or position at the time of treatment did not deviate from the standard considered in the treatment plan, with an average difference of less than 5 mm in actual treatment. However, in some patients showed the difference of more than 10mm.

SBRT without RGRT is performed with patients who sustain stable respiratory status with less than 10mm tumor movement during 4-D CT in treatment. However, in this study, the patient’s respiratory change during treatment with RPM system in Group 2 was observed, and 73% of the patients were found to be out of the setting criteria range more than once during the treatment.

Therefore, even if the tumor movement and position are accurately measured on 4-D CT images, tumor movement and position deviation should be observed consistently. SBRT of 10Gy dose or more per a treatment without RGRT will be better to patients if apply RPM system which not only could reduce errors due to unexpected changes in respiration during treatment but also be able to accurately delivery the planned treatment dose.

ABSTRACT

Background/Objectives: This study investigated the effects of various upper arm resistance exercise on abdominal muscle thickness during bridging posture on stable and unstable surfaces.

Method/Statistical analysis: This study was performed on 30 normal adults (6 men and 24 women). During the performance of the bridge exercise accompanied with BOSU ball to give variations of surface. Resistance exercises focusing on the upper extremities using medicine balls, pilates circle and weight bar were practiced to measure the thickness of muscles by using ultrasound. Independent t-test and one-way ANOVA were used to compare the thickness of the abdominal muscles with the stable and unstable support surface according to the type of upper arm resistance exercise.

Findings: There was a significant difference in abdominal muscle thickness between the stable and unstable support surface groups without upper arm resistance exercise ($p < .05$). However, there was no significant difference in abdominal muscle thickness between the stable and unstable support surface groups with upper arm resistance exercise ($p > .05$). The result of this study showed that all of rectus abdominis(RA), internal oblique(RO), external oblique(EO) and transverse abdominis(TrA) were more thickened at the stable supporting surface than that of the unstable supporting surface. The resistance exercise using pilates circle at the stable supporting surface resulted in thicker muscle in rectus abdominis and external oblique. The resistance exercise using a weight bar resulted in significant change in both internal oblique and transverse abdominis.

Improvements/Applications: The resistance exercise of the arm using various tools and the change of the supporting surface affect the increase of abdominal muscle thickness. In addition, Upper arm resistance exercise may be an effective alternative method for those who cannot apply an unstable support surface to increase the thickness of abdominal muscles.

INTRODUCTION

Spinal stability, which is an important factor in preventing back pain, occurs during simultaneous activation of the trunk muscles^[1]. This simultaneous activation acts like a corset on the bones of the waist and provides stability between spinal segments during functional activity^[2]. Lumbar segmental instability in the absence of bony architecture defects of the lumbar spine is a significant cause of chronic low back pain^[3]. Recent research has focused on the importance of muscle activation for motor control and stability of the lumbopelvic region^[4]. Some evidence exists that transversely oriented abdominal muscles play a specific and crucial role stabilizing the lumbopelvic region^[5].

Trunk bridging exercises are often used to improve lumbopelvic stabilization. These exercises re-train the tuning pattern of the muscles to assume that an optimal ratio between localized partial stabilization and overall torque-generating muscle activity is essential^[6]. Recently, many training methods have used equipment to improve lumbar stabilization by providing an unstable support surface, which enhances proprioceptive sensation^[7]. The purpose of this study is to compare changes in abdominal wall thickness according to the type of upper arm resistance on a stable and unstable support surface.

MATERIALS AND METHOD

Study Method: The subjects selected 30 males and females attending K university in Busan city who fully understood the purpose and method of this study and agreed to participate in the experiment. The thickness of the abdominal muscles was measured using ultrasound in the state of maintaining the bridging posture at the stable and unstable support surface using a BOSU ball.

Measuring equipment: To measure abdominal muscle thickness, we used a diagnostic ultrasound instrument (MyLab One World, Esaote, Italy) with a linear probe to measure muscle and surface layer. We used a BOSU ball (BOSU PRO, FitnessQuest, USA) as the unstable support surface and 3.17 kg weight bars (Patterson Medical, Canada) and 5kg medicine ball (Gymnic, Italy) and pilates circle (Core Body, Taiwan) for upper arm resistance exercises.

Data Analysis: We used IBM SPSS Statistics for Windows (version 23.0) to perform statistical analysis. An independent *t*-test and one-way ANOVA was used to compare abdominal muscle thickness with and without upper arm resistance exercise and with stable and unstable support surfaces. The significance level of .05 was applied for verifying statistical significance.

RESULTS

General characteristic of subjects: The participants included 6 men and 24 women in their twenties. Mean height was 172.50 ± 3.22 cm for men and 161.36 ± 3.78 cm for women. Mean weight was 66.16 ± 10.53 kg for men and 61.87 ± 10.43 kg for women See Table 1 for all participant characteristics.

Table 1: General characteristic of subjects

N = 30

Characteristic	Man	Woman
Age (yr)	21.50 ± 1.22	21.25 ± 1.51
Height (cm)	173.90 ± 4.22	162.16 ± 4.98
Body Weight (kg)	67.13 ± 11.70	62.98 ± 11.57

Comparison of abdominal muscle thickness according to the presence or absence of upper arm resistance exercise and support surface

To compare abdominal muscle thickness according to upper arm resistance exercise and support surface, an independent *t*-test was used. The results are shown in Table 2.

There was a significant difference in the thickness of the rectus abdominis, internal oblique, external oblique, and transversus abdominis muscles between the stable and unstable support surface groups without upper arm resistance exercise (*p* < .05). There was no significant difference in the thickness of the rectus abdominis, internal oblique, external oblique, and transversus abdominis muscles between the stable and unstable support surface groups with upper arm resistance exercise (*p* > .05). These results are shown in Table 2.

Comparison of abdominal muscle thickness according to supporting surface change and upper arm resistance exercise type

In order to compare the changes of the abdominal muscle thickness according to the type of resistance exercise of the arm on the stable support surface, the result of analysis by one-way ANOVA was as shown in Table 3.

Rectus abdomin is showed the highest mean value in resistance exercise using a pilates circle, with a statistically significant difference (*p*<.05).External oblique showed the highest mean value in resistance

exercise using a pilates circle, with a statistically significant difference (*p*<.05).Internal oblique showed the highest mean value in resistance exercise using a weight bar, with a statistically significant difference(*p*<.05). Transversus abdomin is showed the highest mean value in resistance exercise using a weight bar, with a statistically significant difference (*p*<.05).

In order to compare the changes of the abdominal muscle thickness according to the type of resistance exercise of the arm on the unstable support surface, the result of analysis by one-way ANOVA was as shown in Table 4.

Rectus abdomin is showed the highest mean value in resistance exercise using a pilates circle, no statistically significant difference(*p*> .05).External oblique showed the highest mean value in resistance exercise using a pilates circle, with a statistically significant difference(*p*<.05).Internal oblique showed the highest mean value in resistance exercise using a weight bar, no statistically significant difference (*p*>.05).Transversus abdomin isshowed the highest mean value in resistance exercise using a weight bar, no statistically significant difference (*p*>.05).

DISCUSSION

This study aimed to investigate changes in abdominal muscle thickness during upper arm resistance exercise with the use of stable and unstable support surfaces in the bridging posture.

Clinical bridging exercises are commonly used in clinical practice to stabilize the body and improve muscle strength. Bridging exercises is global muscles (e.g., the rectus abdominis muscles and erector spinae muscles) and several local muscles (e.g., transversus abdominis muscles and internal oblique muscles), have been modified in various ways to enhance coordination stability^[8].

In the previous study, when the pylon movement was performed together with external resistance, the activity of the muscles of the hippocampus was changed to maintain the neutral position of the body, thereby controlling the imbalance of the body^[9]. In addition, changes in the activity of the back muscles were found to play an important role in stabilizing the torso in various postures and directions^[10].

Shumway-Cook and Woollacott reported that to maintain balance on unstable support surfaces, joint contraction of muscles passing through the body segment are induced^[11]. In this study, a bridging exercise on a BOSU ball (providing an unstable support surface) without upper arm resistance exercise increased the thickness of the rectus abdominis, internal oblique, external oblique, and transversus abdominis muscles more than on a stable support surface. These results are consistent with a previous study^[12]. However, there was no statistically significant difference in abdominal muscle thickness between the stable and unstable support surface groups during upper arm resistance exercise. This suggests that upper arm resistance exercise increases abdominal muscle thickness similar to using an unstable supporting surface.

Hodges and Richardson reported that the transversus abdominis muscle activity was most significantly altered to maintain the posture of the trunk when bridging exercise with external resistance^[13]. In this study, the abdominal muscle thickness according to the type of arm resistance on the stable support surface was significantly different in rectus abdominis, external oblique, internal oblique, and the transversus abdominis muscle. The rectus abdominis and external oblique of the

surface muscle were the highest in the arm resistance exercise using the pilates circle and the internal oblique and transversus abdominis muscles of the deep muscle were the highest in the arm resistance exercise using the weight bar. In unstable support surface, the rectus abdominis and external oblique of the surface muscle increased the highest in the arm resistance exercise using the pilates circle and the deep oblique and transversus abdominis muscles increased the highest in the arm resistance exercise using the weight bar. However, statistically significant differences were found only in external oblique.

Therefore, the resistance movements of the arms using various tools and the change of the supporting surface affect the increase in the thickness of the abdominal muscles.

CONCLUSION

This study investigated the effects of various arm resistance exercises on abdominal muscle thickness in bridging postures with stable and unstable support surfaces. First, abdominal muscle thickness increased during maintenance of the bridging posture with an unstable support surface without upper arm resistance exercise. Second, although abdominal muscle thickness increased during maintenance of the bridging posture with an unstable support surface with upper arm resistance exercise, this difference was not significant. Third, there was a statistically significant difference in the abdominal muscle thickness between the absence of resistance exercise on the stable support surface and resistance exercise using the medicine ball, weight bar, and pilates circle. We propose that upper arm resistance exercise is an effective alternative method to increase abdominal muscle thickness for those who cannot apply an unstable support surface.

Study on Efficiency of Joint Research on National R&D Projects by Research Entity and Technology Life Cycle

Byeongjeong Kim¹, HanjoJeong²

¹SMEs Support Center, KISTI, 245 Daehak-ro, Yuseong-gu, Daejeon, Korea; ²Department of Information Convergence, Kwangwoon University, 20 Kwangwoon-ro, Nowon-gu, Seoul, Korea

ABSTRACT

Background/Objectives: With the recent growth of industry, there has been a rising demand for evaluation of efficiency of collaborative R&D projects among industries, universities, and research institutes against R&D investments.

Method/Statistical analysis: In this paper, we analyzed the efficiency of the joint national R&D projects performed on the display technology fields, which is considered as an out-performed area as South Korea possesses number of world-leading technologies in the area. To evaluate the efficiency of the joint R&D projects, we mainly used the research outputs of the national R&D projects such as research papers, domestic and overseas patents, technology transfer, and commercialization.

Findings: At first, we compared the productivity of the research outcome for the display technology area with the research outcome of the entire research area. The results of the analysis show that the research efficiency of the display technology area is higher than the efficiency of the other area of research in overall except the technology transfer. In addition, we also analyzed the efficiency of the research based on the technology life cycle and research entities of the joint R&D projects for the display technology area. The results show that the efficiency of the early stages of the joint R&D projects is higher than other life stages in terms of the productivity of the research papers and patents, and the efficiency of the growth and maturity stages is superior on the productivity of the technology transfer and commercialization. Furthermore, the productivity of the research papers of the university is higher than the other research entities while the industry has higher productivity on the technology transfer and commercialization.

Improvements/Applications: With results of analysis shown in this paper, we can apply it for formation and management process of the joint R&D projects to maximize the efficiency of the R&D projects.

Keywords: *Efficiency of Research, Joint Research, Technology Life Cycle, Research Entity, National R&D Projects, R&D Outcome*

INTRODUCTION

South Korea has been one of the largest countries in the world in terms of national R&D expenses^[1, 2]. This study analyzed the research outcomes in terms of the technology life cycle^[3-5] and research entities in order to

evaluate the efficiency of the joint national R&D projects. The research outcomes including research papers, domestic and overseas patents, technology transfer, and commercialization are often considered as the verified research outcome for evaluating the efficiency of researches^[6-9]. In this paper, we analyzed the efficiency of the joint R&D projects specifically related to the display technology field, in which South Korea is regarded as one of the technology-leading countries. To analyze the efficiency of the joint researches, we collected the most of data about the joint R&D projects for the entire research area including the display technology area for the past five years (2012-2016).

Corresponding Author:

Hanjo Jeong
Professor, Department of Information Convergence,
Kwangwoon University, Korea
Email: hanjojeong@kw.ac.kr

The data about the joint R&D projects are collected from the national R&D databased maintained by National Science & Technology Information Service (NTIS) [1]. NTIS collects and manages the data about the national R&D projects nationwide in Korea to share and disseminate the national R&D outcomes such as research papers, research reports, and patents. The data about the joint R&D projects include project-performing duration, budget, related area, research participants with affiliation, research outcomes, etc. With such data, we analyzed the efficiency of the joint R&D projects by classifying and aggregating the data based on the research area of the R&D projects, the types of the research outcomes, the years produced the research outcomes, technology life cycle, the research entities performed the R&D projects, etc.

The rest of this paper is organized as follows. We first present the collected data of the joint R&D projects with the basic statistical analysis on the data to show the status of the joint researches performed in South Korea. Then, we present the methods of the analysis on the various aspects such as yearly statistics, technology life cycle, and research entities, and it also presents the results of the analysis. Lastly, the conclusion is given in the last section.

Status of the Joint National R&D Projects

In this study, the most of the entire joint national R&D projects among industries, universities, and research institutes for the past five years (2012-2016) are collected and analyzed to evaluate the efficiency of the national R&D investments especially for the display technology field. To evaluate the efficiency of the researches, we compared the joint national R&D projects in the display technology area with the entire joint national R&D projects. The joint national R&D

projects regarding TFT, LCD, PDP, FED, OLED, parts/materials, E-Paper, 3D, manufacturing equipment, and measuring system were classified as the R&D projects related to the display technology [10-12].

At first, we analyzed the total R&D expenses for the joint national R&D projects related to the display technology by comparing the R&D expenses on the overall joint national R&D projects. Table 1 shows the amount of the R&D expenses and ratios of the expenses between the entire R&D projects and the display-related R&D projects. The results shows that the entire R&D projects for display technology has high investment budget compared to the overall joint R&D projects because the number of joint R&D projects for display technology takes possession of 1.16% for the entire joint R&D projects while its budget takes possession of 1.27% for the entire budget in the joint R&D projects. The ratios firstly shows the percentage of the joint R&D projects related to the display technology area based on the overall joint R&D projects, and they also shows comparison of the averages of the expenses for a single R&D projects for the display technology and the overall research area. The average of expenses for the joint R&D projects related to the display technology area is appeared a bit higher than the average of the expenses for the entire research area, but it is a small difference that can be neglected on the analysis of the efficiency. With this data of the joint national R&D projects, we analyzed the efficiency of the researches on the display technology field mainly in terms of the number of research outcomes. In addition, the number and amount of the joint R&D projects and the number of their outcomes are aggregated on the technology life cycle and the research entities to analyze the efficiency of the researches. The details of the analysis and its results are shown in next section.

Table1: Status of the Joint Researches on the National R&D Projects

	2012	2013	2014	2015	2016	Total
Number of joint R&D projects for entire field (A)	7,511	8,312	8,056	10,693	11,711	46,283
Number of joint R&D projects for display field (B)	96	94	91	117	137	535
Ratios (B/A)	1.28%	1.13%	1.13%	1.09%	1.17%	1.16%

ANALYSIS OF JOINT RESEARCH EFFICIENCY

In this paper, we used research outcomes in order to evaluate the efficiency of the joint national R&D projects for the display technology area. The research outcomes include research paper, domestic and international patents, and the cases of technology transfer and commercialization. To evaluate the efficiency of the joint R&D projects in the display technology field, we compare the average number of the research outcomes produced as the results of the joint R&D projects both for the display technology area and the entire research area. In addition, the analysis has been performed mainly based on 1) annual statistics of research outcomes, 2) technology life cycle of the R&D projects, and 3) research entities performing the R&D projects. Following subsections show the results of the analysis performed by the criteria.

Annual Joint Research Efficiency: In this section, we show the results of the annual analysis. Table 2 shows the

number of the joint R&D projects related to the display technology field along with their research outcomes for the past five years (2012-2016), and their average number of the joint R&D projects along with their average number of research outcomes. It also shows the average number of the joint R&D projects along with their average number of research outcomes for entire research area.

Figure 1 shows the analysis for the yearly research outcomes. The chart in figure 1 is generated with the average number of the research outcomes for each joint R&D project based on the numbers on table 2. It shows that the most of the research outcomes of the joint R&D projects related to the display technology field have been produced more than the research outcomes in general except the technology transfer. It also shows that the yearly outcomes of both domestic and overseas patents and commercialization have been produced more than the overall average of the research outcomes in general. In addition, the research papers have been produced more than the overall average except 2012.

Table 2: Yearly Outcomes by Joint Researches

Year (Display)	No. of Projects	Research Paper	Patent (KR)	Patent (Overseas)	Technology Transfer	Commercialization
2012	96	64	281	37	63	68
2013	94	102	282	59	15	38
2014	91	137	268	29	35	48
2015	117	154	212	33	10	14
2016	137	187	155	0	2	41
Average (Display)	107.0	128.8	239.6	31.6	25.0	41.8
Average (Total)	9,256.6	10,358.4	4,074.4	336.8	5,054.8	897.8

Figure 1: Yearly Efficiency by Joint Research

Joint Research Efficiency by Technology Life Cycle:

In this section, we show the results of the research-outcome analysis based on the technology life cycle of the joint R&D projects. Table 3 shows the number of the joint R&D projects related to the display technology field along with their research outcomes by classifying the life stages of the joint R&D projects for the past five years (2012-2016). The technology life cycle is classified as four main stages including the introduction, growth, maturity, and decline. The unclassified represents the number of the joint R&D projects that have not been classified as any of the life stages. The attribute of the percentage of expenses represents the percentage of the expenses spent at each stage.

Figure 2 shows the analysis of the research outcomes produced during the technology life cycle of the joint R&D projects. The chart in figure 2 is generated with

the normalized number of the research outcomes for each type based on the percentages of the expenses of projects at each stage. At first, we calculated the average numbers of the research outcomes based on the ratios of the expenses, so that the average numbers represent the efficiency of the research by assuming the equal expenses spent on each life stage. Then, the normalization is performed on the average numbers for each type of the research outcomes. Thus, the normalized numbers on the chart represent that the normalized efficiency of each life stage for each type of the research outcomes. It shows that the efficiency of producing the research papers at the introduction and growth stages is higher than other life stages. For the patents, the efficiency of the growth and maturity stages are higher than the other stages. Lastly, the efficiency of the growth stage is higher than the other stages for the technology transfer and commercialization.

Table 3: Number of Research Outcomes by Technology Life Cycle

Life Stages	Percentage of Expenses	Research Paper	Patent (KR)	Patent (Overseas)	Technology Transfer	Commercialization
Introduction	9.34%	75	68	11	7	12
Growth	21.14%	65	125	13	34	109
Maturity	1.35%	1	21	1	1	4
Decline	0.10%	0	0	0	0	0
Unclassified	68.07%	503	984	133	83	84
Average	7.98%	35.25	53.5	6.25	10.5	31.25

Figure 2: Analysis of Research Outcomes by Technology Life Cycle

Joint Research Outcome by Research Entities: This section shows the results of the research-outcome analysis based on research entities. Table 4 shows the number of the joint R&D projects related to the display technology field along with their research outcomes by classifying the research entities performed the joint R&D

projects during the past five years (2012-2016). The joint R&D projects have been performed by more than one research entities such as industries, universities, and research institutes, so that the percentage of expenses for each research entity might be duplicated.

Figure 3 shows the analysis of the research outcomes of the joint R&D projects performed by the research entities. As in figure 2, the chart in figure 3 is generated with the normalized number of the research outcomes for each type based on the percentages of the expenses on the joint R&D projects performed by each type of research entity. For the normalization, the average numbers of the research outcomes based on the ratios of the expenses are calculated first, so that the average numbers represent the efficiency of the research based on the assumption of the equal expenses on each research entity. Then, the normalization is performed

on the average numbers for each type of the research outcomes. Thus, the normalized numbers on the chart represent that the normalized efficiency of research entity in terms of each type of the research outcomes. The results of analysis show that the efficiency of researches performed by university is higher than other research entities in terms of the production of the research papers and patents. Also, it shows that the efficiency of researches by industry is higher than the other research entities in terms of the technology transfer and commercialization.

Table 4: Number of Research Outcomes by Research Entities

Entities	Percentage of Expenses	Research Paper	Patent (KR)	Patent (Overseas)	Technology Transfer	Commercialization
Industry	36.10%	547	969	132	87	92
University	30.38%	556	927	119	69	63
Institute	15.95%	258	476	56	27	28
Etc.	17.56%	203	378	48	22	53
Average	27.48%	453.67	790.67	102.33	61.00	61.00

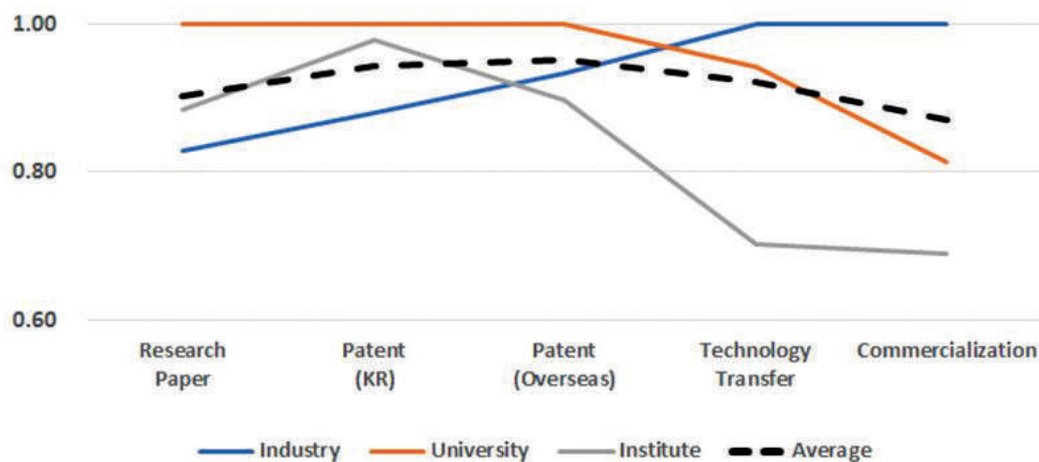

Figure 3: Analysis of Research Outcomes by Research Entities

CONCLUSION

This study analyzed the efficiency of research of the joint national R&D projects mainly for the display technology field, which is the one of the nation's world-leading area. The analysis of the efficiency has been performed based on the research outcome produced as the results of the joint R&D projects for the past five years (2012-2016). In addition, the analysis has been performed with the three criteria of the joint R&D projects that are annual statistics, technology life cycle,

and research entities. For the annual analysis of the joint R&D projects, we compared the productivity of the joint R&D projects related to the display technology field to the entire joint R&D projects, and it turned out to be more productive than the other area of research in overall except the technology transfer. This might be said that the most of the results of the joint researches on the display technology fields have been commercialized instead of the technology transfer. For the analysis based on the technology life cycle of the joint R&D projects, the results of the analysis show that the research papers

and patents are more produced at the early stages of the joint R&D projects, and the technology transfer and commercialization are achieved at the growth and maturity stages. Lastly, the university has more efficiency of the research in terms of the productivity of the research papers, and the industry has more efficiency of the research in terms of the technology transfer and commercialization.

ABSTRACT

Background/Objectives: This study was carried out with the purpose of confirming the effectiveness of the scaling benefit policy in terms of social and economic aspects.

Method/Statistical analysis: In this study, the claim data of National Health Insurance Corporation was used. Data was collected from the national health insurance corporation by using the quo of the scaling benefit data from 2007 to 2016. The number of general dental treatments and scaling cases from 2007 to 2016, where scaling was covered by National Health Insurance benefit, and the total dental costs and dental treatment costs for periodontal treatment were calculated based on the subjects who received the descaling service for each year.

Findings: The number of patients with scaling tended to increase continuously after the scaling insurance policy. The number of dental visits per patient per patient decreased from 2.15 times in 2007 to 1.63 times in 2016, and the number of visits for periodontal treatment also decreased. It is significant that the dental plaque removal policy has increased preventive dental visits. Also, in the long run, it is expected that medical expenses will be reduced through the increase of such visits

Improvements/Applications: Preventive scaling service have been found to be affecting the growth in demand for dental care. Since this service will prevent periodontal disease, dental expenditure is expected to decline over the medium to long term.

Keywords: Coverage, Prophylactic Scaling, National Health Insurance, Periodontal Disease, Prevention Measures.

INTRODUCTION

The life expectancy has increased globally and chronic diseases have increased beyond the prevalence of epidemic diseases, there has been a growing interest in oral health as well as general health^[1]. Periodontal

disease and dental caries are one of the most common chronic disease^[2]. In the past 5 years, the number of patients in gynecologic diseases and periodontal diseases has increased to 46.7% and total medical expenses to 87.1%^[1]. Periodontal diseases are highly prevalent and periodontal disease includes gingivitis and periodontitis, and the worldwide prevalence of gingivitis is reported to reach 90%^[3]. Periodontal disease is a poor results of oral hygiene management, resulting in the formation of a soft tissue pocket between the gingiva and the root. It is a disease that can lead to tooth loss, eventually accompanied by discomfort, pain, and impaired mastication as well as inappropriate treatment^[2,3]. In

particular, periodontal diseases are one of the major causes of tooth loss in elderly^[3]. The cost of treating periodontal disease has been increasing as individuals and social burdens continue to increase^[1].

Prevention of periodontal disease should be based on risk factors, commonly accepted risk factors include the formation of biofilm on periodontal tissue due to lack of proper oral hygiene control^[2]. These precautions should be included at the same time as personal care and management through oral healthcare professionals. To prevention of periodontal disease through oral healthcare professionals includes early oral examination and the purpose of removal of calculus by oral healthcare providers^[2]. In Korea, however, visits to the dental clinic for the prophylactic scaling are rarely reported^[4]. Discussions on the development of measures to prevent periodontal disease continue, and since July 2013, dental health insurance benefits with the highest priority among dental preventive care items have been expanded^[4]. In the past, only the items for which follow-up treatment, such as periodontal disease treatment, was applied, were included for the age of 20 years or more, and only once a year, the elimination of preventive purposes was included as a benefit^[3,5,6]. It is also noteworthy that it is a new policy intervention for the prevention of periodontal disease in adults^[3,5,7].

Prior to the expansion of benefits, the removal of calculus for prevention was a preventive measure for non-payment, so the burden on the cost to pay was relatively large. However, after the benefit application, the burden of copayment decreased sharply to around 13,000 won^[5]. It is likely that this policy will have an impact on improving access to dental access and mitigating unmet dental need^[3,8]. It is estimated that periodontal disease will be prevented and the cost of treating periodontal diseases will be reduced, and the oral health of the people will be improved. However, the effectiveness of this policy has not been measured. The purpose of this study is to evaluate the utility of the scaling insurance benefit policy by confirming the changes and trends of medical use after the scaling insurance benefit, using the insurance benefit data from the National Health Insurance Corporation customized data.

This can be used as a basis for analyzing the change of medical use according to the policy of expanding the

cost of dental calculus and enhancing the accessibility of preventive dental use in Korea.

MATERIALS AND METHOD

In this study, the claim data of National Health Insurance Corporation was used. Due to the development of computer technology since the introduction of the National Health Insurance in 1989, the demand for computerized claims for health insurance increased to 90% in 2001, and since 2005, more than 99% of the accumulated data has accumulated in about 10 years. It was reported to reach 600 billion^[9]. The claim data is representative of the health service contents of the whole nation and is characterized by representative and inclusiveness^[10]. Data were collected from the national health insurance corporation by using the status quo of the quartz removal benefit data. From 2007 to 2016, the subjects who were benefited from the calculus removal service were identified by using the Korean Standard Disease Sign Classification (KCD7) according to the disease name (K05) and the specification specific identification code (U2232, U2233).

The number of visits to the dentist and the total amount of the dental expenses were calculated based on the subjects who received the scaling service for each year. At this time, the precautionary calculus removal was calculated based on the assumption that it would be effective not only in the removal of the calculus but also in the prevention of the oral disease by improving accessibility of the oral healthcare institution.

RESULTS AND DISCUSSION

Table 1 shows the characteristics of the subjects who were removal of calculus from the coverage of the insurance benefits from 2007 to 2016. First, according to gender, 55.98% of women were higher than 44.02% of men. According to the type of health insurance subscription, 51.20% of health insurance subscribers were higher than 48.80% of the medical benefit recipients. The lowest income group had the highest income with 52.79%, followed by the middle group with 33.70% %, and 13.51%, respectively. Finally, depending on the types of calculus removal, 53.22% of calculus removal required subsequent treatment, and 46.78% of calculus removal was performed on the entire oral cavity.

Table 1: General characteristics of subjects

Classification		N	%
Sex	Male	102,637	44.02
	Female	130,542	55.98
Type of health insurance	Health insurance	119,381	51.20
	Medical benefit	113,798	48.80
Income level	Lower	61,839	52.79
	Middle	39,465	33.70
	Higher	15,838	13.51
Type of remove calculus	U2232	124,107	53.22
	U2233	109,072	46.78
Total		233,179	100.00

From 2007 to 2016, the number of patients who visited the dentist for removal of calculus appeared as shown in Fig 1. After the application of the tartar removal benefit policy, it tended to increase continuously. In particular, the number of patients in 2013 is 32,097, which is about 460% higher than in 2012.

**Figure 1: Number of dental visits for scaling**

Table 2 shows the actual use of dental care per patient per year. The average number of dental visits per patient was 1.84 for 9 years, and the number of visits for periodontal treatment was 1.47. The average dental treatment cost per person was about 71 thousand won, and the cost of periodontal treatment was about 55 thousand won. The number of dental visits per patient per year decreased from 2.15 times in 2007 to 1.63 times in 2016, and the number of visits for periodontal related treatment also decreased (Fig 2).

Table 2: Use of dental treatment for periodontal disease

Year	Visit of general treatment	Visit of periodontal treatment	Fee of general treatment	Fee of periodontal treatment
2007	2.15(0.01)	1.72(0.01)	50,372(242)	41,067(191)
2008	2.34(0.01)	1.77(0.01)	57,433(244)	44,681(182)
2009	2.28(0.01)	1.76(0.01)	59,841(244)	47,403(187)
2010	2.20(0.01)	1.72(0.00)	61,995(236)	49,561(179)
2011	2.19(0.01)	1.72(0.00)	63,973(234)	50,781(174)
2012	2.07(0.01)	1.67(0.00)	66,167(287)	53,655(206)
2013	1.76(0.00)	1.41(0.00)	68,046(202)	54,731(101)
2014	1.70(0.00)	1.36(0.00)	71,891(208)	56,467(89)
2015	1.69(0.00)	1.35(0.00)	78,291(254)	58,351(91)
2016	1.63(0.00)	1.33(0.00)	82,638(284)	59,104(89)
Total	1.84(0.00)	1.47(0.00)	71,428(93)	54,737(40)

Figure 2: Trend of dental treatment cost

To treat periodontal disease, huge human and economic resources are inevitable. This is because not only the cost of treatment for periodontal disease but also the cost of treatment increases because dental prosthesis treatment leads to dental prosthesis removal due to severe periodontal disease^[11,12]. Therefore, in the long term, it is considered that a policy to prevent periodontal disease is needed instead of treatment of periodontal diseases and restoration and reconstruction of teeth.^[3,7,13]. The purpose of this study was to investigate the effect of dental stone removal benefit policy by examining the number of patients with dental calculus removed and the change of usage pattern before and after treatment.

This Study has shown that the number of patients visiting the dentist for quartz removal increased by a factor of four after scaling insurance benefits. Since periodontal disease is an inflammatory disease that can be caused by calculus and stasis, the increase in the number of beneficiaries of the periodontal disease removal service is an important factor in societal prevention^[7,11,14]. In other words, it is a positive effect that the economic burden is alleviated due to the benefit of the tartar removal insurance, leading to patients' voluntary dental visits. As a result of checking the number of dental visits and the cost of treatment for a period of one year, the cost of dental treatment increased due to the implementation of various protection policy, but the number of dental visits decreased. These results are positive in that the policy to expand the benefits of tartar removal is clear in the short term and maintains the sustainability of the policy effects. The increase in the cost of dental treatment can be seen as a result of the broadening of the scope of benefits for dental services in cross-sectional areas as a whole. In-depth discussion, it is not the target group directly benefiting from the removal

of plaque removal for prevention purposes, but it can be regarded as a result of the person who visited the dentist for prevention after the policy implementation increased the medical expenses of the periodontitis patient group after diagnosis of periodontitis. In other words, the effect of the policy effect seems to be evident because it was thought that the policy to increase the benefits of preventive plaque removal was influential on the increase of demand for dental care for potential periodontal disease patients^[11,12].

To date, there have been few official research data on the policy effects of strengthening dental protection, and research institutes and academic circles have recently done little to evaluate the dental health insurance. Although periodontal disease reduces the inflammation of the disease, it is highly likely that inflammation will recur, so it is essential to maintain, treat, and prevent periodontal health through continuous professional oral care rather than one-off management^[1,15]. In order to reduce the prevalence of periodontal disease, which is the ultimate goal of the policy, it is not necessary to limit the number of annual benefits and to apply the single preventive benefit item. It will be necessary to continuously expand the policy to apply dental preventive treatment benefits at a level that includes preventive measures such as management education and periodontal disease management fee (plaque control)^[11]. And in order to expand the effect of the policy for periodontal disease patients, which is the mainstay of the application of the calculus removal benefit, it is necessary to expand the salary by reflecting the characteristics of the patient's illness rather than the uniform pay increase. Furthermore, System should be established and follow-up observation on patient management should be conducted.

CONCLUSION

In conclusion, it was confirmed that the policy of prophylactic scaling service was influential on the increase of demand for dental care for potential periodontal disease patients. The increase in the number of patients with scaling and the average cost for periodontal treatment per capita can be interpreted as an increase in the national medical expenses in the short term. However, considering the mid- and long-term effects of preventive services such as scaling will lead to a reduction in periodontal disease, and oral health promotion will be possible in the future.

Meta-analysis of Effects of Cosmetological Manual (Su-gi) Therapy on Psychological Factors -Focused on Journal Articles Published in Korea-

Su-JeongRyu¹, Meoung-Sun Lee¹

¹Department of Beauty Healthcare, Deajeon University, Korea

ABSTRACT

Background/Objectives: The purpose of this paper is to systematically analyze the effect of manual therapy on psychological aspects by considering previous articles on manual therapy published in cosmetology over the past decade.

Method/Statistical analysis: The data was gathered from journal articles on manual therapy published in Korea from January 2008 to December 2017. CMA (Comprehensive Meat-Analysis) version 3 was used for the meat-analysis.

Findings: The meta-analysis of 37 individual studies on the effect size of cosmetological manual therapy relative to psychological factors highlighted the following. First, manual therapy had a statistically significant large effect size in relation to psychological factors overall. Second, by treatment type, Swedish, meridian and myofascial massage had large effect sizes, in comparison to a medium effect size of Lymph massage. Third, by age group, large effect sizes were found in 20-39, 40-64 and 20+ groups, compared to a medium effect size in 65+ group. Fourth, in dependent variables, large effect sizes were found in both protection and risk factor groups.

Improvements/Applications: This meta-analysis of the effects of cosmetological therapy on positive and negative psychological factors by age and treatment type provides scholarly reference data for cosmetology, as well as a systematic theoretical background for developing manual therapy programs applicable in practice.

Keywords: *Manual therapy, Meta-analysis, Psychological factors, Effect size, Complementary and alternative therapy*

INTRODUCTION

Healthcare in modern days has shifted from treatments toward disease prevention and health improvement and from pathologic t to psycho-social healing ^[1]. According to data published in 2017 by the Ministry of Health and Welfare, 13.2% of Koreans experienced depression, which outpaced the prevalence in major advanced countries such as Germany and the U.S., with Korea ranked 28th in

the Gross National Happiness Index 38 OECD member states Depression and fatigue are two of the aspects that define modern society ^[2]. Therefore, psychological and emotional health is drawing increasing attention and central to well-being, which is high on the agenda for contemporary people against the backdrop of growing average life expectancy ^[1].

Likewise, as an approach to improving mental and physical health, complementary and alternative medicine (CAM) is in increasing demand. According to the WHO, more than 41%, 90% and 69% of the entire population use the CAM in the U.S., China and Australia, respectively (WHO, 2012). In Korea, the percentage of CAM users was estimated to increase to 86% in 2008 from 69% in 2001. The high percentage of CAM users is

Corresponding Author:

Meoung-sun Lee

Assistant Professor, Department of Beauty Healthcare
Deajeon University, Korea

Email: leesun1460@hanmail.net

attributable to its viability for overcoming the limitations of Western medicine, increasing the potential for healing and providing psychological stability leading to a higher quality of life [3].

The complementary and alternative medicine includes plant therapy, mind-body interventions, homeopathy and folk remedies, to name a few. The mind-body interventions include the massage (or Su-gi in Korean) therapy. As a collective term for rubdown, acupressure and other therapies using hands, the massage refers to a method of improving health and treating illness by dynamically stimulating the skin with hands in certain ways and eliciting biologic responses [4]. Characterized by movement and touch, the massage therapy comprises specific techniques of stimulating the sensory paths to the cerebrum by activating the pressure, vibration and tactile sensations and unique sensory receptors and is generally considered to reduce anxiety and stress hormone secretion and influence the biologic responses of the body involving the nervous system, circulatory system, immune system and endocrine system as well as the muscle relaxation [5].

Research on the massage therapy has accumulated since 2000. Particularly, quite a few studies on the effects of massage therapy have been published in cosmetology [6]. Korea is ranked 6th in the world in terms of the number of institutions offering cosmetology courses. To secure competitive advantage, the field of cosmetology should increase the support for academic research and professional knowledgeability across the board [7].

Specifically, as for the effects of the massage therapy in view of subjects' psychology and mental health explored in the field of cosmetology in Korea, Jeong (2016) applied the deep tissue massage (DTM) to middle-aged women and reported the massage therapy was effective for relieving subjects' psychological symptoms and depression whilst boosting their self-esteem. Lee (2008) investigated the relationship between the foot massage and depression in senior citizens and reported the remedy decreased symptoms of depression. Applying the back massage to middle-aged women, Kim (2012) concluded the back massage was effective for relieving their mental stress.

To draw systematic conclusions on the effects of the massage therapy on psychological factors by treatment type and age and to present some scholarly reference data for the benefit of cosmetology, this paper meta-analyzes previous studies on the massage therapy used in cosmetology. Meta-analysis is a statistical method of comparatively analyzing the effect sizes across different studies [8].

To that end, this paper focuses on the following: first, it reviews journal articles published in Korea to examine overall effects of the massage therapy on psychological factors; second, it determines the effect size by therapy and age group reported in journal articles published in Korea; and third, it examines the effect sizes of psychological factors relative to the massage therapy.

MATERIALS AND METHOD

This meta-analysis uses CMA 3.0 (Comprehensive Meta-Analysis 3.0 version). The journal articles were collected as follows.

Data collection: First, from January 18th to 25th, 2018, the author searched Korean journal articles published since 2008 involving such keywords as 'Sugi therapy' and 'massage' on <http://www.riss.kr> run by Korea Education & Research Information Service, which returned a total of 702 articles. Out of the 702 articles, the author sorted out 73 articles published in the field of cosmetology based on their titles and abstracts. Second, 7 articles irrelevant to pure Su-gi or massage therapy, another 7 involving discrete characteristics of subjects and 2 using statistics inapplicable to analysis were excluded. Third, excluding 37 articles using irrelevant dependent variables, a total of 20 articles were meta-analyzed.

Article selection criteria: It is critical to articulate the inclusion and exclusion criteria in meta-analysis so as to elicit significant results. The reason for clarifying the reference points for the article selection is to prevent researchers from the selection bias that may arise in the process of literature review [9]. In this paper, the author referred to Lee (2017) for the reference points for the article selection as outlined in Table 1.

Table 1: Reference points for article selection

Area	Reference points
Types of study	Empirical and quantitative studies based on experimental findings
Inclusion criteria	Journal articles published in Korea Excluding articles unpublished at the request of authors

Conted...

Subjects	Adults aged 20 and over Excluding studies on patients or children
Measures	Selecting studies only if clear measures are used
Variables	Selecting studies utilizing the massage (Su-gi) therapy as independent variable and effectiveness of psychological factors as dependent variable
Data processing	Selecting articles only if they quantify the effect sizes

Article selection results: Table 2 shows the articles conforming to the reference points for selection and used for the meta-analysis.

Table 2: Characteristics of theses to be analyzed

Target	Journal name	Age	Variable	Effect

Ji-on Park(2017)	Asian journal of Beauty and cosmetology	40-50 years old	Lymph message	Depression

Criteria for categorizing the variables for analysis: To determine the effect sizes of sub-items in the selected articles and to analyze their effectiveness, the author set up the criteria for sub-categories. Here, the items and contents were categorized by the type of Su-gi (manual) therapy, subjects' age and dependent variable.

Following the age criteria suggested by Ahn(2010) and Park(2009), the age groups were sub-categorized as per the life cycle into early adulthood (19-39 years old), mid-life and mature adulthood (40-64 years old), and late adulthood(65+). Table 3 shows the sub-categories of the articles analyzed.

Table 3: Categorization of moderating variables

Item	Details
Types of manual (massage) therapy	Swedish massage, shiatsu massage, myofascial massage, limp massage, more than two types applied
Subjects' age group	20-39 years old, 40-64 years old, 65+, all ages(≥ 20)

To review previous studies to determine the dependent variables relevant to psychological effects, meta-analyzing stress management programs for workers, Wang (2016) sub-classified the factors into improvement factors showing positive changes and reduction factors manifesting some effects by reducing stress. Choi (2017) meta-analyzed the psychological effects of programs for the elderly and sub-categorized the variables into facilitation variables which facilitated psychological stability and inhibition variables which inhibited psychological instability. Also, reporting on the effects of aroma therapy on stress, Park and Park

(2017) defined such subcategories as psychological stress, physical stress and state anxiety.

Hence, depending on the effects of gaining psychological satisfaction or the effects of relieving psychological anxiety, this meta-analysis of the effectiveness of the Su-gi(massage) therapy subcategorized the dependent variables into the psychological protection factor group involving the emotion quotient, positive self and anti-stress that facilitate positive psychology, and the psychological risk factor group involving depression, stress and negative self that constitute unstable psychology. Table 4 shows the categorized dependent variables.

Table 4: Categorization of dependent variables

Categories	Dependent variables in articles analyzed
Protection factor group	Mental symptoms, anti-stress, emotion quotient, psychological well-being, mood state, activity, expression, psychological symptoms, positive self, compassion and sympathy
Risk factor group	Stress, psychological stress, mental stress, depression, negative self

Data processing: To verify the effect size reported in each study, the author examined the homogeneity of samples across the studies. As the samples and treatment methods varied across the studies, a random effect model was used for analysis [10]. The effect size was determined as per Cohen (1998), i.e. small ($d \leq .20$), medium ($.20 < d < .80$) and large ($d \geq .80$).

RESULTS AND DISCUSSION

This meta-analysis of the effects of cosmetological manual therapy on psychological factors shed light on the following results. As shown in Table 5, since the homogeneity test determined the previous studies were highly heterogeneous, a random effects model was used to measure the effect size.

Table 5: Homogeneity test result

Q-value	df(Q)	P-value	I ²	T ²
287.751	36	.000	87.489	1.120

Overall effect size in psychological domain

Table 6: Overall effect size on psychological factors

Number of studies: 37					
Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
1.600	0.197	1.213	1.987	8.106	.000

As shown in table 6, The overall effect size of manual therapy on psychological factors was 1.600, which was very large and statistically significant.

Effect size by treatment type: Table 7 shows the effect size of manual therapy by treatment type. The analysis of 12 studies on Swedish massage indicated the largest effect size of 1.799, followed by meridian massage (1.661) and myofascial massage (1.270). The lymph massage had a medium effect size of 0.665, which was based on no more than one article and requires caution. Comparative analysis of the effects of different types of massage is hardly documented. The present meta-analysis findings are comparable to Shin (2014) that compared the effects of Swedish massage with that of Thai massage and reported both relieved stress, although the latter employed different age groups and treatment types [11].

Table 7: Effect size by therapeutic manual treatment type

Type	Number Studies	Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
Swedish	12	1.799	0.365	1.084	2.514	4.932	.000
Meridian	18	1.661	0.323	1.027	2.295	5.136	.000
Fascia	6	1.270	0.266	0.750	1.791	4.784	.000
Lymph	1	0.655	0.337	-0.005	1.316	1.945	.052

Effect size by age: Table 8 shows the effect size of manual therapy by age. The effect size was largest in the 20-39 group (2.064), followed by a large effect size of 1.465 in the 40-64 group and a medium effect size of 0.726 in the 65-plus group. Notably, the meta-analysis of the 65+ group was based on no more than two articles. Meanwhile, the meta-analysis of 12 articles involving the 20+ age group indicated a very large effect size of 1.714, which seemed attributable to the high percentage of subjects in their early adulthood and mid-life and mature adulthood. Given physical conditions vary across age groups, it is contestable whether the analyzed effect size involving all subjects aged 20 and over is valid, which warrants attention in further studies on manual therapy [12].

Table 8: Effect size of manual therapy by age

Age group	Number Studies	Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
20-39	7	1.726	0.262	1.212	2.239	6.590	.000
40-64	16	1.249	0.099	1.055	1.444	12.598	.000
65 +	2	0.744	0.252	0.251	1.238	2.958	.003
20 +	12	1.229	0.010	1.036	1.422	12.481	.000

Effect size on dependent variables: Table 9 shows the effect size on dependent variables. The effect size of the protection factor group facilitating positive psychology was 0.859, whereas the risk factor group triggering unstable psychology had a very large effect size of 2.344. These findings suggest manual therapy is significantly effective for increasing positive psychology and decreasing such unstable elements as depression and stress, which is consistent with Jeong (2016) that found myofascial massage raised positive self while reducing negative self in middle-aged women [13].

Table 9: Effect size on dependent variables

Dependent variable	Number Studies	Point estimate	Standard error	Lower limit	Upper limit	Z-value	P-value
Protection factor group	15	0.895	0.135	0.594	1.123	6.360	.000
Risk factor group	22	2.344	0.329	1.699	2.988	7.129	.000

CONCLUSION

This meta-analysis of journal articles on cosmetological manual therapy published over the past decade in Korea was intended to give a scientific and systematic insight into the effectiveness of manual therapy on psychological factors by treatment type and age and to provide some scholarly reference data for cosmetology. Meta-analysis is a method of research to derive quantitative results from previous articles on a topic.

This meta-analysis shed light on the following findings.

First, manual therapy had a very large effect size of 1.600 overall relative to psychological factors, which indicates manual therapy was effective for psychological factors overall.

Second, as for the effect size by treatment type, Swedish, meridian and myofascial massages scored 1.799, 1.661 and 1.270, respectively, which were large in comparison to the medium effect size of lymph massage (0.665). These findings substantiate the positive effects of manual massage on psychological factors irrespective of treatment types. Yet, the analyzed effect size of lymph massage was limited to no more than one article, which warrants the need for further research on the effects of lymph massage on psychological factors.

Third, as for the effect size by age group, very large effect sizes of 2.064 and 1.465 were found in the 20-39 and 40-65 groups, respectively, in comparison to a medium effect size of 0.726 in the 65+ group. Given the analysis of the 65+ group was based on no more than two articles, the effect size of manual therapy in this group is less generalizable, which underscores the need for further research on the effects of manual therapy on psychological factors in the elderly. A large effect size of 1.229 was found in the general adult group aged 20 and over. Still, measuring the effect size in a 20+ cohort requires extra caution, in that physical condition varies across ages, which need be considered in future research on manual therapy.

As for the effect size on dependent variables across the entire articles on manual therapy, very large effect sizes of 2.344 and 0.895 were found in the risk and protection factor groups, respectively. This finding corroborates the effects of manual therapy on decreasing the unstable factors while increasing the protection factors in clients. Such effects as associated with psychological healing underpin the value of manual therapy as a mind-body intervention in the field of complementary and alternative therapy.

Changes in Serum Lipids according to the Amount of Exercise Activity in Middle-Aged Women

Myung-Chul Kim¹, Hang-Sik Park², Jean-Kyung Paik³, Duk-Young Jung⁴, Su-Min Lee⁵

^{1,5}Dept. of Physical therapy, ²Faculty of liberal arts, ³Korea, Dept. of Food & Nutrition, Eulji University, Korea; ⁴R&BD Center, Seongnam Senior Experience Complex

ABSTRACT

The purpose of this study was to identify the effects on basal metabolic rate and serum lipid according to the amount of exercise activity of middle - aged women. We divided 30 middle - aged women into dynamic exercise group and static exercise group in Seongnam Senior Experience Complex on 8 weeks. The before and after tests examined the body weight and height, basal metabolic rate, serum lipids that LDL-cholesterol, HDL-cholesterol, total cholesterol and triglyceride level. Data were analyzed using descriptive statistics. As a result of comparing the changes in before and after results of dynamic exercise group and static exercise group, significant differences were shown in basal metabolic rate($P<0.05$), total cholesterol($P<0.05$). And there was a significant difference in total cholesterol($P<0.05$),LDL-cholesterol($P<0.05$) between the two groups before and after the experiment. The basal metabolic rate and LDL values were changed with or without exercise. And total cholesterol and LDL values showed different changes according to the amount of exercise. Therefore, dynamic exercise with a high amount of exercise is effective in lowering serum lipid.

Keywords: Amount exercise, Static exercise, Dynamic exercise, Basal metabolic rate, Cholesterol rate, Middle-age women

INTRODUCTION

Today, due to rapid economic growth and the development of medical technology, the proportion of elderly people over 65 is increasing. Along with the increase in the elderly population, the average life expectancy in Korea has also increased to 80.8 years (National Statistical Office, 2011). On the other hand, the lifespan of health is 71 years¹, which is lower than the other countries in developed countries such as Japan, Switzerland and England (Ministry of Health and Welfare, 2010).

Elderly people are more likely to become ill due to lowering of their physical function as they get older. As a result, the ability to operate daily life is weakened, and the need for other people's assistance increases, so social and medical problems are emerging.

According to the analysis of medical care trends of the elderly patients in Korea, the number of geriatric patients increased from 899,000 to 1,027,000 in 8 years (2002 ~ 2009). Also total medical expenses increased by 419.5% from 580 billion won to 2,440 billion won (Ministry of Health and Welfare, 2011). Therefore, it is important to treat geriatric diseases, but it is necessary to prevent diseases from the middle and old years in order to maintain and promote the current health status under the social interest to reduce the burden of the national medical expenses and prolong the health life span. Basal Metabolic Rate (BMR) and serum lipids are important factors in the health care of the elderly. Basal

metabolic rate refers to the amount of energy consumed to maintain a life phenomenon. As the physical activity increases, energy required for maintaining the body's homeostasis, autonomic nervous system activity, heartbeat, respiration, and body temperature is increased. Therefore, basic metabolism is an important item for life maintenance².

As the age increases, the basal metabolic rate decreases, which leads to an increase in body fat and a

Corresponding Author:

Hang-Sik Park
Professor, Faculty of liberal arts,
Eulji University, Korea
Email: parkhs@eulji.ac.kr

change in blood lipids³. Increased body fat changes blood lipid levels in the elderly and causes vascular diseases such as arteriosclerosis, cardiovascular disease, and cerebrovascular diseases⁴. Cardiovascular diseases such as coronary artery disease, stroke, and hypertension are closely related to low-density lipoprotein-cholesterol (LDL-C) and high-density lipoprotein-cholesterol (HDL-C). Increased levels of LDL-C, the major carrier of blood cholesterol from aging, are a risk factor for aneurysmal diseases such as atherosclerosis, and increased levels of HDL-C may reduce the risk of cardiovascular disease in the elderly⁵. 95% of cardiovascular diseases result from atherosclerosis associated with LDL-C and HDL-C stated that a major cause of over 50% of atherosclerosis is lack of physical activity⁶. Therefore, regular exercise training is essential and has shown that lowering the levels of total cholesterol (TC), triglycerides (TG), and LDL-C and increasing the levels of HDL-C to prevent sclerosis of the arteries and hypertension⁷.

In addition, several studies have shown that older people can prevent or reverse many of the physical dysfunctions by regular physical activity. And the declining muscle strength of elderly people also reported that regular physical activity can maintain or enhance the functional capacity of fat and muscle⁸.

These studies suggest that proper physical activity and regular exercise in middle - aged and elderly people may delay aging and prevent geriatric diseases. Therefore, it is very important to select important factors of physical activity and carry out planned exercise continuously. In particular, in middle-aged women, continuous physical activity is necessary to overcome the physical changes that come from menopause and emotional disorders caused by social and psychological factors.

Motivation is the most important factor in sustaining exercise. In order to induce motivation, the exercise is most interesting and the group exercise programs with colleagues are good. Therefore, in this study, a dynamic and static group exercise program was developed and applied to increase exercise participation and exercise performance. Dynamic exercise can have a positive effect on performance improvement due to body temperature rise, muscle blood flow increase, and nerve conduction velocity improvement. Static exercise has less energy consumption, less pain due to tissue damage, and less muscle aches to be⁹.

The purpose of this study was to investigate the change of serum lipids before and after the exercise program through the development and operation of 8 week dynamic and static group exercise program for female middle-aged women. . This study was conducted to provide health information for the elderly and middle-aged people.

MATERIALS AND METHOD

Research Design: The purpose of this study is to compare the pre-and post-test results of dynamic group exercise and static group exercise for 8 weeks for 30 middle-aged women on table 1. In this study, we use the convenience sampling method which is a non-probability sampling method. Because it is not easy to use the probability sampling method, also the difficulty in recruiting sufficient candidates for the probability sampling.

Table 1: Basic data of subjects

Total (person)		average age	average height (cm)	average weight (kg)
30		53.45	156.84	53.13
Dynamic person	Static person			
15	15			

We measured body weight, height, and basal metabolic rate using a body composition analyzer (Inbody 720, Biospace, USA, 2005). Also the serum levels of LDL-C, HDL-C, TG, and TC were measured by a serum lipid assay. Pre - test was performed from March 12, 2018 to March 16, 2018, and each experimental group then performed the corresponding dynamic group exercise and static group exercise for 8 weeks. The post-test was conducted from May 14, 2018 to May 16, 2018.

Experimental Method

Dynamic exercise program: Dynamic exercise program is a large-scale energy metabolism movement that requires a lot of activities. The program consisted of a total of 3 exercises including free exercise, senior dance which is low-intensity aerobic exercises to be performed according to 4/4 beat songs, weight bearing exercise on table 2¹⁰. Each exercise took 50 minutes including preparatory exercise and twice a week for 8 weeks in total 16 times.

Table 2: Dynamic exercise program

Type of exercise	Method
Free exercise	1.5 minutes stretching 2. 30 minutes : Lightly run, Waist rotation, Shake upper body, Shoulder rotation 3. 5 minute finishing exercise
Senior dance	1.5 minutes stretching 2. 30 minutes fast 4/4 beat dance 3. 5 minute finishing exercise
Weight exercise	1.5 minutes stretching 2. 30 minutes : Lifting dumbbells(with sit to stand up), Sit-up 3. 5 minute finishing exercise

Static exercise program: Static exercise program is a small-scale energy metabolism movement that requires less activity. Yoga and core exercises are one of the measures to stabilize the waist, It is an exercise method that uses anti-gravity effects to provide balance and stability of the trunk¹¹. In addition, the Gymball movement is suitable for the spinal stabilization exercise on table 3. The exercise frequency was 16 times for 8 weeks for 2 times per week.

Table 3: Static exercise program

Type of exercise	Method
Yoga	1.5 minutes stretching 2. 30 minutes : Lying, sitting, standing, one leg standing position, *Breathing exercise in all position 3. 5 minute finishing exercise
Core exercise	1.5 minutes stretching 2. 30 minutes : Squat exercise, Lift legs in a lying, Keep four foot position 3. 5 minute finishing exercise
Gym ball exercise	1.5 minutes stretching 2. 30 minutes : keep lying on the ball, sit on the ball, standing on the ball with one foot * Keeping time is about 30 seconds 3. 5 minute finishing exercise

Analysis method: The normal distribution test was performed to find out the normal distribution of each test group. Paired sample T-test was performed for the

comparison between the dynamic and static exercise groups. In addition, an independent two-sample T-test was conducted to determine the difference in serum lipids according to each exercise group. Statistical analysis was performed using SPSS version 22.0 and the significance level (α) was 0.05.

RESULTS AND DISCUSSION

Dynamic exercise program: The basal metabolic rate was increased but there was no significant difference and TC decreased significantly difference ($P=0.01$). There was no significant difference in TG, HDL-C, and LDL-C on table 4.

Table 4: Comparison before and after application of dynamic exercise program

	pre	post	P
BMR (kcal)	1206.933 ±98.238 ^a	1211.400 ±101.827	0.394
TC (mg/dL)	196.000 ±31.605	183.067 ±28.831	0.010*
TG (mg/dL)	116.333 ±79.729	110.133 ±57.301	0.687
HDL-C (mg/dL)	62.200 ±10.380	61.533 ±12.340	0.659
LDL-C (mg/dL)	118.133 ±24.219	112.133 ±26.180	0.129

BMR: Basal metabolic rate, * ($P<0.05$)

^aaverage± standard deviation

Static exercise program: There was a significant difference in basal metabolic rate ($P=0.01$). TC and TG decreased but there was no significant difference. There was no significant difference between HDL-C and LDL-C on table 5.

Table 5: Comparison before and after application of static exercise program

	pre	post	P
BMR (kcal)	1170.000 ±60.582 ^a	1180.400 ±57.360	0.014*
TC (mg/dL)	200.600 ±32.704	199.867 ±32.654	0.823
TG (mg/dL)	131.133 ±56.955	121.133 ±46.915	0.478
HDL-C (mg/dL)	58.800 ±10.094	57.667 ±10.533	0.446

BMR: Basal metabolic rate, * ($P<0.05$)

^aaverage± standard deviation

Comparison of pre-post change of between groups:

There was no significant difference in basal metabolic rate, TG, and HDL-C when comparing the pre- and post-change amounts of the dynamic exercise program and the static exercise program. However, there were significant differences in TC(P=0.03) and LDL-C(P = 0.02) on table 6

Table 6: Comparison of pre-post change of between groups

	Dynamic	Static	P
BMR (kcal)	4.467 ±19.657 ^a	10.400 ±14.282	0.352
TC (mg/dL)	-12.933 ±16.829	-0.733 ±12.487	0.032*
TC (mg/dL)	-6.200 ±58.354	-10.000 ±53.073	0.853
HDL-C (mg/dL)	-0.667 ±5.728	-1.133 ±5.592	0.823
LDL-C (mg/dL)	-6.000 ±14.422	7.667 ±15.253	0.018*

BMR: Basal metabolic rate,* (P<0.05)

^aaverage± standard deviation

As life expectancy increases, regular exercise to prepare for geriatric diseases has become an essential element in the lives of the elderly. Therefore, studies on suitable exercise for the elderly have been going on steadily, and many older people are studying ways to participate with interest in exercise. In this study, we tried to examine the effects of the program on the participation of the elderly people in the exercise with the social issues. The purpose of this study was to investigate the changes of basal metabolic rate and serum lipid after exercise in the dynamic and static exercise group for middle - aged women.

The results of previous studies, such as Choi¹², which investigated the correlation between exercise effects and serum lipid changes, showed that pre-post-test was not statistically significant because the subjects' pre-blood test values did not deviate from normal range.

The results of the dynamic exercise group are similar to those of the previous studies, but there is a slight difference in the basic metabolism item. This is considered to be a difference in exercise intensity, and it will be a good study if research on the change of body composition such as basal metabolism according to the future strength is carried out.

In the static exercise group, only the basal metabolic rate showed a statistically significant difference, which is slightly different from the previous studies. These results suggest that basal metabolic rate is more influenced by living environment than exercise.

Comparisons between dynamic and static exercise groups showed statistically significant reductions in TC and LDL-C compared to the static exercise group. These results suggest that continuous dynamic exercise is more effective than static exercise in reducing and preventing the incidence of vascular diseases such as arteriosclerosis, cardiovascular disease, and cerebrovascular disease.

CONCLUSION

This study was undertaken to examine the effect of dynamic and static exercise programs on the serum lipids of middle-aged women twice a week for 8 weeks. First, there was a significant difference in the basal metabolic rate between the static exercise group and the TC in the dynamic exercise group. Second, the result of the difference between groups, there was a significant difference TC and LDL-C showed a significant difference in the comparison between the dynamic exercise group and the static exercise group. These results suggest that dynamic exercise is more effective in promoting health by positively changing serum lipid changes in middle - aged women.

Basal metabolic rate and LDL values were changed with or without exercise. And total cholesterol and LDL values showed different changes according to the amount of exercise. Therefore, dynamic exercise with a high amount of exercise is effective in lowering serum lipid.

Effects of Job Characteristics and Organizational Communication on Job Satisfaction among Dental Hygienists

Da-Young Ryu¹, Yong-Keum Choi², Young-Soo Lee²

¹Associate Professor, Dept. Dental Hygiene, Hyejeon College, Hongseonggun, Korea;

²Associate Professor, Dept. Dental Hygiene, Sun Moon University, Asansi, Korea

ABSTRACT

Background/Objectives: This study aims to identify the effects of job characteristics and organizational communication on job satisfaction among dental hygienists.

Method/Statistical analysis: The participants were 241 dental hygienists in Seoul and South Chungcheong province. The data were collected using a self-report questionnaire and analyzed using independent t-test, one-way ANOVA, Pearson's correlation coefficient, and multiple regression. We used a level of significance of $p < 0.05$.

Findings: Dental hygienists' job satisfaction was positively correlated with job characteristics and organizational communication ($p < 0.01$). Dental hygienists' job characteristics and organizational communication affected job satisfaction ($R^2 = .535$, $F = 20.113$, $p < 0.001$). Task identity was the only subfactor of job characteristics that significantly affected job satisfaction. Horizontal communication, quality of media, and personal feedback significantly affected organizational communication.

Improvements/Applications: To improve job satisfaction, strategies to enhance job characteristics and organizational communication satisfaction should be devised.

Keywords: Job characteristics, Job satisfaction, Organizational communication.

INTRODUCTION

With the increased mean lifespan, interest in improving quality of life is greater than ever. As shown by the rising medical consumerism and the number of people visiting healthcare facilities for health promotion, needs for quality medical service are on the rise, and healthcare facilities are engaging in substantial efforts to improve the quality of their medical service and efficiently manage human resources^[1].

Within an organization, the job is an important medium that connects individuals to the organization, so it is important to understand the job characteristics

of dental hygienists. In dental hospitals and clinics, dental hygienists' jobs usually require skills, proficiency, attention, and judgment. Job characteristics theory states that workers' satisfaction and performance may differ depending on the objective characteristics and traits of a job^[2]. A previous study on clinical nurses reported that job characteristics are positively correlated with job satisfaction^[3,4]. Furthermore, some studies reported that turnover intention decreased with increasing job characteristics^[5] while others found that job characteristics are not associated with turnover intention^[6].

In today's healthcare industry, communication is perceived as an essential clinical skill, and the need for proper communication between medical professionals and service recipients tailored to their needs in a rapidly evolving society is increasingly emphasized. Communication in dental hospitals and clinics plays a crucial role in promoting a shared understanding among dental professionals and successfully providing satisfactory dental care to patients^[7]. Regarding

Young-Soo Lee

Associate Professor,

Dept. Dental Hygiene, Sun Moon University, Korea

Email: dhyslee@sunmoon.ac.kr

communication-related studies in the field of dental hygiene, one study reported that trust in and satisfaction with dental hygienists increase with their medical communication competence^[8], and another reported that higher scores of dental hygienists on informative and affiliative communication as perceived by the patients were associated with higher patient satisfaction and intention to revisit^[9]. Smooth communication among dental professionals influenced patient satisfaction, and smooth communication among coworkers contributed to a lower remanufacturing rate for dental prosthetics^[10]. It has been reported that dental hygienists maintain better communication among themselves than do dentists^[11]. Further, higher satisfaction with organizational communication among dental hygienists was associated with high job satisfaction and organizational commitment with low turnover intention^[12].

However, only a handful of studies have investigated the relations among job characteristics, organizational communication, and job satisfaction or examined the effects of job characteristics and communication on job satisfaction among dental hygienists.

Therefore, this study aims to identify the associations among job characteristics, organizational communication, and job satisfaction as well as the effects of job characteristics and organizational communication on job satisfaction based on a new perspective to provide foundational data to improve the efficiency of dental hygienists working in dental hospitals and clinics.

MATERIALS AND METHOD

Dental hygienists working in one of the randomly chosen dental hospitals and clinics located in Seoul and South Chungcheong province were surveyed from

September 26, 2016, to December 15, 2016. From a total of 244 questionnaires retrieved, three were excluded for being inappropriate for data processing, resulting in a total of 241 questionnaires in the final analysis. A 15-item questionnaire measuring skill variety, task identity, task significance, autonomy, and feedback (three items each) was used to measure job characteristics^[1], and organizational communication was measured using a 24-item questionnaire measuring eight factors of organizational communication, including organization prospect, personal feedback, communication with superior, media quality, horizontal communication, and organizational climate. Job satisfaction was measured with nine items. A five-point Likert scale was used with a higher score indicating higher levels of job characteristics, organizational communication, and job satisfaction. The reliability (Cronbach's α) of the scales was 0.827 for 15 job characteristics items, 0.888 for 24 organizational communication items, and 0.873 for 9 job satisfaction items. The collected data were analyzed using the SPSS/WIN 18.0. Job characteristics, organizational communication, and job satisfaction by general characteristics were analyzed with t-test and one-way ANOVA. The relations among job characteristics, organizational communication, and job satisfaction were analyzed with Pearson's correlation coefficient, and the effects of job characteristics and organizational communication on job satisfaction were analyzed with multiple regression.

Job characteristics, organizational communication, and job satisfaction by participants' general characteristics: Job characteristics and organizational communication significantly differed according to age, total length of career, length of current career, and position. Job satisfaction significantly differed according to age, total length of career, and position [Table 1].

Table 1: Differences among job characteristics, organizational communication, and job satisfaction by general characteristics

Degree of job characteristics, organizational communication, and job satisfaction: The mean job characteristics score was 3.32 ± 0.46 out of 5. Task identity had the highest score at 3.55 ± 0.74. The mean organizational communication score was 3.24 ± 0.48 with the highest score for horizontal communication (3.60 ± 0.70) followed by communication with superior (3.37 ± 0.49) and communication with subordinate (3.33 ± 0.70). The mean job satisfaction score was 3.29 ± 0.62 [Table 2].

Table 2: Degree of job characteristics, organizational communication, and job satisfaction

variables	M ± SD
Job characteristics	3.32 ± 0.46
skill variety	2.99 ± 0.54
task identity	3.36 ± 0.54
task significance	3.55 ± 0.74
autonomy	3.16 ± 0.77
feedback	3.52 ± 0.66
Organizational communication	3.24 ± 0.48
horizontal communication	3.60 ± 0.70
communication with superior	3.37 ± 0.49
media quality	3.12 ± 0.73
organization climate	3.47 ± 0.61

personal feedback	3.02 ± 0.74
organization prospect	2.99 ± 0.83
communication with subordinate	3.33 ± 0.70
Job satisfaction	3.29 ± 0.62

Correlations among job characteristics, organizational communication, and job satisfaction: Job characteristics were significantly positively correlated with organizational

communication (r = .511, p<0.01) and job satisfaction (r = .432, p<0.01) while organizational communication was significantly positively correlated with job satisfaction (r = .611, p<0.01) [Table 3].

Table 3: Correlations among variables

	job characteristics	organizational communication	job satisfaction
job characteristics	1		
organizational communication	0.511 ^{**}	1	
job satisfaction	0.432 ^{**}	0.611 ^{**}	1
^{**} p<0.01			

Effects of job characteristics and organizational communication on job satisfaction: The F value of the regression model was 20.113, which was statistically significant (p <0.001). The R² of the regression equation for job characteristics and organizational communication was .535, showing a relatively high explanatory power. Task significance was the only subfactor of job characteristics that had a significant effect on job satisfaction. Among subfactors of organizational communication, horizontal communication, media quality, and personal feedback had significant effects on job satisfaction [Table 4].

CONCLUSION

In this study, dental hygienists' job satisfaction was positively correlated with job characteristics and organizational communication. Further, dental hygienists' job characteristics and organizational communication affected their job satisfaction. Particularly, task identity was the only subfactor of job characteristics that significantly affected job satisfaction while horizontal communication, media quality, and personal feedback were the subfactors of organization communication that significantly affected job satisfaction. Based on these findings, institutional support to help dental hygienists perceive their job as significant and have expanded autonomy is needed to improve their job satisfaction. Moreover, various communication programs involving all members of the organization should be implemented to facilitate organizational communication.

A study on the s Diffusion of Infectious Disease Issues and Paradox of Public Health

Kyung-Do Seo¹, In-Kyu Choi²

¹Research Scholar, Dept. Kumoh National Institute of Technology, Korea;

²Professor, Dept. Daegu Science University, Korea

ABSTRACT

Background/Objectives: The purpose of this study is to define the political and social debate on the operational problems of public hospitals in Korea as a paradox situation and to find out the elements of paradox in this debate and how to manage it.

Method/Statistical analysis: We analyzed policy issues, IAD analysis, coverage and media frame analysis. We also analyzed policy cases to test the impact of public issue dissemination on the form of media coverage.

Findings: As a result of analyzing the paradox phenomenon of public health policy in Korea, the government's coercive and one-sided management method has not been an efficient solution to aggravate today's public health conflicts. Korea has suggested the need for a democratic conflict management system in the era of localization and democratization. In this controversy, paradoxical factors were found and the public health policy was sought for how to manage it.

Improvements/Applications: In addition to the spread of public issues due to the disaster of infectious diseases after the closure of the Jinju Medical Center, the concentration of profitability in public hospitals has brought attention to the public role of public hospitals and changes the public health policy. Therefore, according to the form of media reports, the policy impact on the spread of medical public issues can be confirmed.

Keywords: *Infectious Disease, Paradox of Public Health, Diffusion of Issues, Public Health, Institutional Approach*

INTRODUCTION

On the one hand, public hospitals in Korea are forced to commercialize healthcare (profitability) due to the problem of deficit management, and on the other hand they face the problem of lack of public health system (loss of publicity). That is, public hospitals have developed policy paradox phenomena that result in 'policy failure' due to problem definition and problem solving that deviated from the original goal of 'improvement of the entire public

health'. After the closure of Jinju Medical Center in 2013, the company tried to increase its medical profitability by claiming to improve its chronic management deficit by surviving. However, after 2015, due to the infectious diseases such as Middle East respiratory syndrome (MERS) since the loss of credibility of the system, there has been a paradox in which public interest in public hospitals has increased.

In short, the most serious problem of public health in Korea is that there is no solution to support public loss when social public health problems such as infectious diseases arise. The importance of the role and existence of public hospitals every time the epidemic that has been prevalent since 2000 (SARS in 2003, H1N1 flu in 2009, Ebola virus in 2014, MERS in 2015, ZIKA virus in 2016) The public and the public have been attracting attention, but when the situation is over, interest in public health

Professor,

Division of Information Communication Engineering,
Daegu Science University, Korea

Email: inkyu8008@daum.net

has disappeared. So far, medical publicity in Korea has been highlighted with social interest and policy issue when incidents such as infectious diseases spread.

Such policy issues, which have a high level of social interest, cause political and social changes in the society, and the media plays a decisive role in policy issues. If the general public's interest in an issue rises, the media will continue to report it, and the media reports will lead to political and social changes in one society by keeping the public interested in the issue [1,2,3].

Public health issues related to public health are likewise emphasized by the media as the public's awareness and the issues are expanded to develop social issues [4,5,6]. Therefore, there has been a directional change in the overall policy systems depending on the media reports on medical issues and publicity issues, and whether the policy direction has a significant effect on public health development and social contribution of the nation as a whole it will be important to confirm.

This study starts from the fact that this policy is essentially simultaneous and coexistent in public hospitals, which is the core of public health policy. In other words, the need for public hospitals, as well as other public institutions, should be understood as a paradoxical situation including conflicting values and elements of profitability and publicity. In public hospitals, various different factors coexist such as improvement of equity through healthcare accessibility of vulnerable areas of the target, strengthening the medical safety net of medical blind spot, guaranteeing the health rights of the people, and eliminating social exclusion. In this regard, public hospitals are recognized as a rational choice to maximize their benefits in consideration of the behavioral characteristics of recipients, whether to pursue the policy or to understand the paradoxical situation and to recognize that a new management strategy is required. And to find ways to find out the appropriate policy effect.

MATERIALS AND METHOD

How to analyze policy paradox case in public health field: Generally, in welfare policy, paradox is classified into three types. First, as a built-in paradox, based on the assumption that welfare policy is maintained based on steady economic growth, economic accumulation is difficult, or the cost burden is different from the

benefit burden group. It is a paradox. Second, it is a political paradox, a paradox due to systematic design mistakes. For example, when the recipient is selected while the National Basic Livelihood Security System is implemented, the remaining classes, especially those in the next level (potential poverty strata), turn into poverty. In addition, selected recipients will not seek to escape the current economic situation or seek other means to avoid being excluded from the supply and demand of the various benefits. This corresponds to a political paradox [7,8]. Third, it is a paradox due to problems in the execution of welfare policy determined as operational paradox. This is mainly due to the overlapping, leakage, and inefficiency caused by the inability of the central government, central and provincial, and local and private networks to operate [9,10].

Institutional Analysis and Development (IAD)

systematic analysis of public health policy: The IAD analysis framework is the simplest form of social institutionalization. However, in actual individual decision-making situations, exogenous variables of bio-physical conditions, rules, and community characteristics can affect complex incentive structures in individuals in the action arena. The purpose of this study is to apply the IAD analysis tool to the case of closure conflict of Jinju Medical Center under the theoretical basis of rational new institutionalism. Especially, we want to analyze the situation of the behavior system by setting it as a game situation.

How to quantify the amount of press releases

on 'diffusion of public issues': The discussion of 'spreading public issues' about the case appears as the press coverage of the press. Therefore, it conducts quantification work on the amount of press coverage of the press. The volume of media coverage of an incident can be quantified by the extent to which the media deals with the issue. In this study, TV or radio use the amount of newspaper coverage rather than the weight of the issue to investigate the media coverage of the incident.

Regardless of the type of paper or the difference in the size of the newspaper, it can be quantified as the number of articles on the issue, the total number of articles, and the total number of articles. Among the three methods, the number of articles (although the number of articles on one side and the articles on the other side are different for each tendency of newspapers) treats all related articles as the same weight in the measurement, . Second, because the area of coverage

includes photographs (perceived as heavy events), it can be more accurate than the number of articles or the total number of articles. However, this method suffers from the difficulty of measuring by measuring the area of newspaper articles on issues.

Third, the way to quantify the number of characters is to quantify the press coverage of the issue as the total number of characters. The weight of the photographs related to the articles may not be taken into consideration, but there is no problem in any quantification method. Therefore, this study quantifies the media coverage as the total number of newspaper articles on issues.

In this study, we search the articles of ChosunIlbo and JoongangIlbo in Korea and analyze the articles. Therefore, we include as many terms related to issues as possible in our search terms.

RESULTS AND DISCUSSION

Analysis of policy paradox case in public health sector: The purpose of privatizing an organization that was operated as a public institution is because it expects to be able to improve the productivity of the organization and ultimately respond to the demand of the public administration more efficiently by securing autonomous responsible management system from the interference of the government. In many countries, however, it points out that institutional responsibility and productivity deteriorate after privatization. This is called ‘paradox of privatization’ in a comprehensive sense. The case of Korea is the case of the closure of Jinju Medical Center and the occurrence of new infectious diseases.

The cause of the disease has not yet been elucidated globally, and many infectious diseases that have not developed vaccine have been developed worldwide, resulting in public anxiety. Ignoring the convergence of the public opinion of the Governor of Gyeongnam Province with regard to the closure of Jinju Medical Center, As a reason, the unilateral declaration of closure was made and enforced. The paradigm conflict surrounding the operation of public medical institutions has surfaced. Paradigm is centered on profitability, government-led restructuring is taking place, and Korea is the world’s second largest casualty sufferer due to the respiratory syndrome in the Middle East in 2015, resulting in astronomical economic losses, restructuring the paradigm of public health policy Necessity is being reconsidered.

Institutional Analysis and Development (IAD) systematic analysis of public health policy: Among the elements of IAD analysis, physical attributes, rules, and attributes of the community are as follows. Changes in the concept of public health as a result of amendments to the Act on Public Health Care On February 2, 2013, the concept of public health changed as a result of the amendment of the Act on Public Health Care. The revised law also means that private medical institutions can provide public healthcare services and do not need the exclusive existence of public medical institutions. The operation of public medical hospitals is efficiency. Most public health centers had problems with chronic deficits and inefficiencies. In other words, public hospitals were seriously in debt, continued deficits, and lack of will to improve management.

According to the situation of the act and the participants, the opposition struggle of the health and medical labor union, the Jinju medical union, the civil society, and the people opposed to the closure started in accordance with the unilateral decision of closure of Gyeongnam Province regarding Jinju Medical Center.

The evaluation shows that the closure case of Jinju Medical Center is a typical example of failure of conflict management when local governments with power decide and pursue public policy and neglect the opponents.

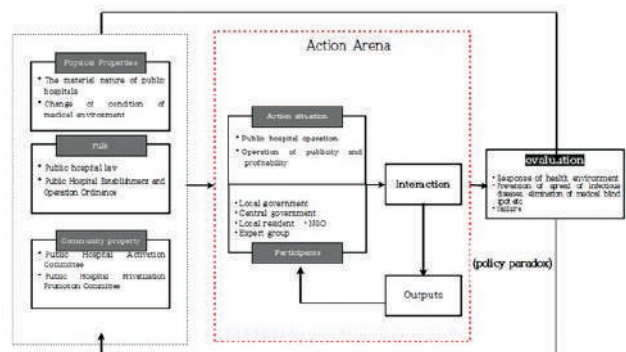

Figure 1: IAD analysis result

Results of quantitative analysis of press release volume: According to the purpose of the study, this study analyzed the media coverage of ‘Infection Disease and Public Health Policy’. According to the analysis results, it can be seen that there is a single network of 315 key word nodes with ‘infectious disease and public health’ as hubs. The connection centrality index of each keyword is 0.26, 0.18, 0.16, 0.14, 0.13, 0.10, 0.08, 0.07, 0.06, 0.03, and so on.

In addition, the infectious disease associated with the keyword with the highest occurrence frequency in the keyword frequency analysis is the role of 'local public hospital', and the result of the network analysis is 0.26, which has the highest mediation center of connectivity. This is due to the fact that there are many media reports expressing the phenomena related to infectious diseases and public health as 'disease management', and in the context of the media reports, this phenomenon is considered as prevention and management in the central government for the purpose of establishing countermeasures against the new pandemic. And the tendency to understand it as interest is strong. In other words, it is necessary to prevent such conflicts and wastes by clarifying local affairs and delegation affairs.

Table 1: Connection centrality and mediation of key words (2000 ~ 2018)

Ranking	Keyword	Connection centrality	Mediation centrality
1	Regional base public hospitals	0.26	0.21
2	Disease control center	0.18	0.19
3	Epidemic management	0.16	0.17
4	Mers	0.14	0.14
5	Public interest in public hospitals	0.13	0.09
6	Public hospital deficit	0.10	0.08
7	National Hospital	0.08	0.07
8	Disease management	0.07	0.05
9	Restructuring of medical institutions	0.06	0.03
10	Jinju Medical Center closes	0.03	0.02

CONCLUSION

This study was analyzed with two purposes. First, it examines the paradoxical phenomenon of public health policy. Second, it examines the influence of media reports on public issues. To achieve the purpose of research, IAD analysis, which is an institutional approach, and how the process of policy decision making changes. Based on

this research, we have solved the research problems and found out the problems of the paradox of public health such as the case of Jinju Medical Center and suggested policy suggestions and implications. In this study, the government's coercive and one-sided management method has led to the suggestion that democratic conflict management methods are required for the localization and democratization era. In the process of resolving the paradox of the policy, there should be no government illegal activities.

This study concludes that the government should recognize and protect the legitimate rights of residents, even if they are in conflict with each other. This study can be used as a policy strategy that can be a model for the decision process of public health policy related to the success of public health in the future by identifying the paradoxical phenomenon of policy on public health policy. It is expected. In other words, this study will be able to improve the overall system by understanding the paradox of public health and diffusion of infectious disease issues from a systematic point of view.

The Effects of Fall Prevention Static and Dynamic Trunk Stabilization Exercises on the Balance of Elderly Females

Sang-HO Lee¹, Dong-Yeop Lee²

¹Contract Professor, ²Associate Professor, Dept. of Physical Therapy, SunMoon University, Korea

ABSTRACT

Objectives: The purpose of this study is to investigate the effects of static/dynamic trunk stabilization exercises on the balance abilities of female patients above the age of 65 years.

Method/Statistical analysis: This study included 30 females above the age of 65 years, who were randomly divided into the static trunk exercise stabilization group (n=15) and the dynamic trunk exercise stabilization group (n=15). The stabilization exercises were performed three times a week for four weeks. Static and dynamic balance abilities were measured before and after the exercise to determine its effects. Frailty and cooperative studies of intervention techniques-4 (FICSIT-4) and one leg standing test (OLST) were measured to evaluate static balance, while time up & go test (TUG) and functional reach test (FRT) were measured to evaluate dynamic balance.

Findings: Our results showed that static trunk stabilization exercises significantly improved static balance ability (OLST) and dynamic balance ability (TUG) ($p<0.05$). Dynamic trunk stabilization exercises significantly improved static balance abilities (FICSIT-4, OLST) and dynamic balance abilities (FRT, TUG) ($p<0.05$). OLST, which reflects static balance ability, significantly differed between the two groups ($p<0.05$).

Improvements/Applications: The static/dynamic trunk stabilization exercise group showed improvements in balance abilities, and in both groups, static and dynamic balances improved. In terms of effectiveness, no significant differences were observed between the outcomes of static and dynamic trunk stabilization exercises.

Keywords: Trunk stabilization exercise, Elderly Women, static balance, dynamic balance, Fall, elderly

INTRODUCTION

With advancements in medical technology and the improved economy, the average life expectancy has increased, and the geriatric population above the age of 80 years is rapidly increasing¹. As of December 2017, the Korean society is considered an aged society, with 14.02% of the population above the age of 65 years². In 2026, Korea is expected to become a super-aged society³.

Balance is a complex process that maintains the body's posture by adapting to changes in the environment

through voluntary adjustments⁴]. Increased age causes degenerative changes throughout the body, which leads to decreased proprioception², reflexes, and cognition and increased reaction and body-weight shifting times⁵. Decreases in balance abilities occur around the age of 60 years, which, along with decreased muscle strength and flexibility, causes falls⁶.

Exercise programs can effectively prevent falls in the elderly population⁷. Studies on fall prevention for the elderly are actively being conducted and have reported that exercise programs effectively improve joint range of motion, muscle strength, and balance abilities, which contribute to fall prevention⁸. Fall-prevention exercises include complex exercise programs that include tension bands, tai-chi, Swiss-ball, and dance-sports, which have been reported to effectively improve physical fall-prevention variables such as flexibility, muscle strength, and balance regulation abilities⁹.

Trunk stabilization exercises strengthen deep muscles, such as the spinal stability muscles, abdominal muscles, hip muscles, and pelvic muscles¹⁰. Trunk stabilization exercises stabilize the waist area and provide balance and stability against gravity, which allows the body to maintain an upright posture. Cooperation between the flexor and extensor muscles of the trunk and increased abdominal cavity pressure, which are secondary to increased abdominal spring force, further stabilizes the trunk¹¹. Trunk stabilization exercises simultaneously train the back muscles and multifidus muscles to effectively improve balance and correct unstable postures¹².

Trunk stabilization exercises that use a static mat improve trunk stability by coordinating contraction of the trunk muscles while the limbs are in motion¹³. Static trunk stabilization exercises and static segmental trunk exercises increase the cross-section area of the multifidus muscles¹⁴, while dynamic trunk stabilization exercises improve dynamic body balance. These exercises improve trunk stability and prevent falls. Furthermore, trunk stabilization exercises that are performed in a dynamic environment stimulate proprioception and increase activity of the motor cortex in the cerebrum, which consequentially improves balance and balance maintenance¹⁵. Dynamic trunk stabilization exercises progress from weightless to weight bearing exercises, stable to unstable surfaces, simple to complex exercises, and slow to fast movements^{16, 17}.

This study investigated the type of exercise that is more effective in improving balance of elderly females of 65 years of age or above. Our results will provide a basis for the development of effective future trunk exercise programs.

METHOD

Participants and duration: This study was conducted from June 10, 2018 to July 11, 2018 and included 30 female residents of D city who were 65 years of age or above. The participants were randomly divided into static and dynamic trunk stabilization exercise groups. The selection criteria included 1) participants with no visual impairments, 2) participants with no circulation disorders such as hypertension, 3) participants with no pain-induced exercise restrictions, 4) participants with no neurological impairments that affect balance or gait, and 5) participants who understood the procedure and purpose and volunteered for the study.

Evaluation tools: FICSIT-4 and OLST were used to evaluate static balance, while TUG and FRT were used to evaluate dynamic balance. Measurements were taken three times at each session, from which the average value was calculated. Evaluations were performed before and after exercise training.

Static balance

Frailty and Injuries Cooperative Studies of Intervention Techniques-4(FICSIT-4): FICSIT-4 is a tool that evaluates static balance and is divided into seven categories. Measurements are taken in four different postures: while the participant is standing with feet together (parallel), while the participant is standing with one foot's heel next to the other foot's great toe (semi-tandem), while the participant is standing with feet aligned (tandem), and while the participant is standing on one foot (one-leg standing). The evaluation tool is made up of a total of 28 points, and the score of each category ranges from 0 to 4. With the exception of the one-leg standing positions, the postures are further divided into open and closed-eyed, for 10 seconds. To prevent falls, therapists were in close contact with the patient during measurement. The examination/reexamination reliability of FICSIT-4 was $r=.66$ ¹⁸.

One leg standing test (OLST): The static balance ability can be measured faster than the other methods, and the fall-risk is predictable. The reliability between measurers is $ICC=.9$, sensitivity is 95%, and specificity is 58%¹⁹. While the participant is standing with her eyes open, the participant is asked to spread both arms parallel to the ground surface and lift one leg, upon the measurer's instruction. The lifted leg was to be maintained at a knee angle of 90 degrees. The measurements were taken while the participants had their eyes open, and the maximum time between initiation and tremor of the upper/lower limbs was recorded²⁰. The measurements were performed three times, and the average value was recorded.

Dynamic balance

Functional Reach Test(FRT): The participants were asked to stand next to a wall, extend their arms frontally, parallel to the ground surface, and bend over their trunks while reaching forwards, as far as possible. The distance that the finger tips travelled until one foot detached from the ground was measured in cm. To prevent falls, the examiner stood next to the participant throughout the process. The reexamination reliability of FRT and inter-examiner reliability were high, at 0.92 and 0.98, respectively²¹.

Time Up & Go Test (TUG): TUG is a reliable and effective tool for measuring mobility in the weak elderly. The participants are asked to sit on a chair with the armrest at 46 cm above the ground. A turning point was placed 3 m from the chair, and the participant is asked to get up from the chair, go around the turning point, and sit back down. The reliability of TUG and inter-examiner reliability were high, at $r=0.99$ and $r=0.98$, respectively²².

METHOD

The participants were randomly distributed in each group 15 in the static trunk stabilization exercise group and 15 in the dynamic trunk stabilization exercise group. For both groups, one exercise session was composed a five-minute warm-up, 20 minutes of trunk stabilization exercise, and a five-minute cool-down. A one-minute break was provided when the participant complained of pain or discomfort. Each participant underwent the 30-minute exercise session three times a week for four weeks. Three physical therapists with three or more years of experience and six assistants aided the exercise sessions.

Static trunk stabilization group: The static trunk stabilization exercise was composed of flexibility and isometric exercises. The exercise was performed while the participant is laying on the mat in a static position, without being worried about gravity. The exercise was designed to improve stability and was performed in the pelvic lift position, the pelvic lift with one leg lifted position, and the quadruped with one leg and one arm raised position²³.

Dynamic trunk stabilization group: The dynamic trunk stabilization exercise was composed of a pelvic lift, an alternating diagonal movement of contralateral limbs while the participant was laying down, and a contralateral limb rise in the quadruped position. The exercise program was composed of dynamic exercises that simultaneously strengthen stability and mobility²⁴.

Analysis method: The SPSS 20.0 program was used for data analysis. To investigate the normal distribution

of categories between the groups, the Shapiro-Wilk test was performed. To evaluate changes before and after the exercise programs in both groups, a paired 2-sample test was used. Lastly, to evaluate differences between the two groups, an independent 2-sample test was performed. The significance level of the study (α) was .05.

RESULTS

Characteristics of the participants: The mean age of the participants in the static trunk stabilization exercise group was 70.07 ± 3.09 years, the mean height was 152.53 ± 6.49 cm, and the mean weight was 51.60 ± 7.33 kg. The mean age of the participants in the dynamic trunk stabilization exercise group was 71.20 ± 2.96 years, the mean height was 151.47 ± 7.02 cm, and the mean weight was 50.73 ± 5.65 kg. The characteristics of the participants are shown in Table 1.

Changes in static balance based on study methods

Changes in one leg standing balance: The static trunk stabilization exercise group showed a significant increase in one leg standing balance, from 11.48 ± 0.74 sec before exercise to 11.73 ± 1.03 sec after the exercise ($p < .05$). The dynamic trunk stabilization exercise group also showed a significant increase in one leg standing balance, from 12.00 ± 1.31 sec before exercise to 13.33 ± 1.44 sec after the exercise ($p < .05$). A significant difference was observed in OLSTs between the two groups (Table 2).

FICSIT-4: Frailty and Injuries Cooperative Studies of Intervention Technique

OLST: One Leg Standing Test

Changes in FICSIT-4: The static trunk stabilization exercise group showed an increase in FICSIT-4, from 21.47±2.13 points before exercise to 22.13±2.32 points after exercise. However, the increase was not statistically significant. The dynamic trunk stabilization exercise group showed a significant increase, from 21.26±2.37 points before exercise to 22.47±2.92 points after exercise (*p*<.05). No significant difference was observed in FICSITs between the two groups (Table 2).

Changes in dynamic balance based on study method

Changes in Functional Reach Test: The static trunk stabilization exercise group showed a significant increase in FRT scores, from 13.73±1.29 cm before exercise to 15.93±2.15 cm after exercise (*p*<.05). The

dynamic trunk stabilization exercise group also showed a significant increase, from 12.60±1.92 cm before exercise to 15.13±2.36 cm after exercise (*p*<.05). No significant difference was observed in FRTs between the two groups (Table 2).

Changes in Time Up and Go: The static trunk stabilization exercise group showed a significant decrease in TUGs, from 11.93±1.10 sec before exercise to 11.13±1.06 sec after exercise (*p*<.05). The dynamic trunk stabilization exercise group also showed significant a decrease, from 12.07±0.70 sec before exercise to 10.87±0.63 sec after exercise (*p*<.05). No significant difference was observed in TUGs between the two groups (Table 3).

DISCUSSION AND CONCLUSION

Balance abilities in the elderly are related to personal stamina as age increases. Weakened muscle strength affects quality of daily life activities. Muscle strength and stamina are closely related to balance and gait²⁵. Among the physical properties of the elderly, decreased balance abilities and physical reaction times decrease the quality of life and interferes with independent living. The most prominent problem that arises from decreased physical properties is falling²⁶. At least 33% of the elderly who are above the age of 65 years experience falls yearly, among whom more than 50% experience recurring fall injuries²⁷. A previous fall increases the risk of recurrence by 2–3 times, and falls are responsible for major injuries in the elderly population²⁸.

Trunk stabilization exercise increases the stability of the spinal cord and improves instability of complex segmental movement²⁹. Improved balance abilities allow the correct posture to be maintained during voluntary motion and are important for daily life activities³⁰. Therefore, improvements in balance abilities through trunk stabilization exercises correct abnormal gait and decreases fall risk.

Jang et al.³¹ studied 20 female adults who were above the age of 65 years to investigate the effects of core exercise programs. A study that investigated female adult body composition, stamina, balance abilities, and cognition compared TETRAX (a balance ability evaluation) before and after an exercise program. The results showed a significant decrease in balance ability score, from 35.90 ± 7.29 to 28.70 ± 6.42 , in the core exercise program group, while no significant changes were observed in the control group. A study by Park³² investigated the effects of a core program on the balance abilities of the elderly. In this study, 40 elderly participants were studied for eight weeks, before and after trunk stabilization exercises. The results showed that FRT distance significantly increased, and significant changes were also observed in TUG time. Foss et al.³³ investigated the relationship between trunk muscle strength fortification and balance and found significant changes in TUG and FRT scores. A study by Kim³⁴, in which female elderly participants performed isometric core exercises for eight weeks, found significant changes when TUG was performed after strengthening of the lower limbs. Lastly, Hwang and Lee³⁵ investigated the effects of ball exercises on the balance and functional

motion of elderly females and found a significant change in TUGs, which could be due to the similarity of ball and trunk stabilization exercises. In both exercises, trunk muscle strengthening is secondary to the goal of maintaining a center of gravity³⁶.

In this study, significant changes in OLST, which evaluates static balance abilities before and after trunk stabilization exercise, were observed in both the static and dynamic exercise groups ($p < .05$). Furthermore, significant differences between the two groups were observed. The change in FICSTI-4 was only significant in the dynamic exercise group. However, no significant differences between the two groups was observed. Changes in TUG, which evaluates dynamic balance, were significant in both the static and the dynamic groups ($p < .05$), but no significant difference was observed between the two groups. Changes in FRT were significant in both the static and the dynamic exercise groups ($p < .05$), but no significant difference was observed between the two groups. These results show that trunk stabilization exercises effectively improve static balance. Since there are no significant differences between the groups, it is difficult to distinguish which exercise program is more effective in improving static balance.

Changes in balance abilities after the trunk stabilization exercise program coincide with the results of previous studies. For the elderly population to safely carry out daily activities, balance abilities must appropriately maintain the body in different environments. However, an inactive lifestyle causes decreased muscle strength and flexibility, which ultimately leads to decreased balance and an increased risk of fall.

Static and dynamic trunk stabilizations exercises were compared to determine which type more effectively improves balance. Although dynamic trunk stabilization exercise has a relatively more positive effect on static and dynamic balance, the differences compared to static trunk stabilization exercise is insignificant. However, since the changes in FRT and TUG are relatively less in the static trunk stabilization group, it can be inferred that dynamic trunk stabilization exercise is preferable to static exercises.

When elderly individuals are unable to perform dynamic trunk stabilization exercises, static trunk stabilization exercises could be an alternative to improve balance. In further studies, the duration of the exercise training and the number of participants should be more diverse, to produce meaningful results.

The Causal Effects of Job Characteristics and Organizational Culture on Knowledge Sharing among Health Care Professions

Da Ye Lee¹, Ji Eun Cha²

¹Korean Life Skill Education Center, Chung-Ang University, KS013 Seoul, Korea; ²Pulmonology Center, Incheon St. Mary's Hospital, KS006 Incheon, Korea

ABSTRACT

Background/Objectives: The purpose of the study was to identify factors influencing knowledge sharing among health care professionals.

Method/Statistical analysis: A total of 234 nurses participated in this study. Eight variables related to knowledge sharing, including job characteristics (job fitness, job challenge, job autonomy) and organizational culture (relation orientation, innovation orientation, task orientation, hierarchy orientation) were measured using reliable instruments. The data were analyzed using descriptive statistics, Pearson's correlation analysis, and a path analysis.

Findings: The path analysis showed that job fitness and job challenge had a direct effect on knowledge sharing and job autonomy mediated the effect of relation orientation culture on knowledge sharing. The fit indices of the model satisfied the model fit criteria.

Improvements/Applications: The findings of the study reveal the important role of organizational culture, especially relation orientation, in knowledge sharing in health care professions.

Keywords: Knowledge Sharing, Job Characteristics, Organizational Culture, Health Care Professions, Relation orientation

INTRODUCTION

As the 4th industrial revolution leads to enhanced awareness of creative development of professionals and knowledge management, a need for a knowledge-based organization management has been increasing. Knowledge sharing, a key component of knowledge management, is the act of organization members integrating knowledge by finding and acquiring the knowledge required for task completion^[1]. It is a process of creating new knowledge by sharing, cooperating, and learning new ideas^[2]. It has been reported that knowledge sharing enhances task solving methods and innovative actions of organization members^[3], positively influences

work satisfaction and organization commitment and increases the organization's task performance^[4], work efficiency^[5], and organizational efficacy^[6]. The factors that influence knowledge sharing include characteristics of knowledge, organizational culture, organizational basis, information technology basis, and evaluation and reward system^[7]. Among those, organizational culture is considered a key factor that determines the performance of knowledge sharing and knowledge application^[8]. Organizational culture has an important influence on an organization's attitude and behavior. It symbolizes the homes, values, beliefs, norms, rules, rituals, and symbols that the members of the organization share. An organization that has a knowledge-friendly culture, leadership, concentration of management, and high levels of trust, interest, and openness is typically successful in knowledge sharing^[9].

With growing public interest in health and medical service and increased efforts to make patients feel safer and enhance the quality of treatment^[10], attention to organizational culture in public health is also expanding.

Accordingly, hospital organizations need to solve problems and grow bigger through knowledge sharing to strengthen the competitiveness of public health organization, which can be classified as a knowledge industry.

The public health is a comprehensive field with various types of organizations, such as hospitals, schools, clinics, and private and public organizations. As such, it also has a wide array of people working in it. Nurses take up more than 30% of all hospital personnel. They work in non-hospital sittings as well, which makes them the most influential contributors to the productivity of health and medical organizations. Nurses are in charge of public health management in hospitals, public health, medical groups, schools, and private and public organizations. Based on the basic factors of health and medicine or nursing tasks, they work either alone or together with other nurses, considering the characteristics of the places they are working in. The work scope of health and medical professionals is stipulated by the guidelines offered by the medical law, regional health law, and industrial safety health law, and its details may vary according to the types and forms of the organizations. A job is a combined concept of tasks assigned to individuals regularly, the responsibilities of which differ according to each position and work field^[11]. According to job characteristics, workers recognize sense of fulfillment, sense of responsibility, and performances. Such psychological state has been found to influence work performances, absence, or job transfer^[12]. Especially more diverse and independent jobs tend to positively affect job satisfaction levels^[13]. Such job characteristics are known to significantly influence knowledge sharing along with organizational culture, but research on the correlation between job characteristics and knowledge sharing is lacking.

Since health and medical professionals deal with health and life issues, they are required to carry out tasks strictly according to the guidelines. This leads to a traditionally strict and authoritarian organization management^[14]. Since their performances are often a matter of life and death, the organizational culture is highly tense and does not tolerate even the smallest mistake. However, such rigidity may hinder knowledge sharing and organizational development. To flexibly prepare for the changes and gain competitiveness in the knowledge society, the organization must make efforts to create an environment that enables active knowledge sharing. To this end, there is a need to study the influence

of the job characteristics and organizational culture on knowledge sharing in the health and medical industry.

Advanced research on knowledge sharing mostly belongs to the fields of public servants, private enterprises, and cyber education. The few researches on the health and medical field studied the influences of nurse organizations on nurses' knowledge sharing^[15], the influences of nurses' knowledge sharing on innovative behavior and organizational commitment^[3]^[16], and the influences of nurses' knowledge sharing on organizational commitment^[17]. Therefore, there is a need for a more systematically designed research to figure out the influences of the job characteristics and organizational culture of health and medical professionals on knowledge sharing.

To achieve this objective, this research has been conducted to study the relations between the job characteristics, organizational culture, and knowledge sharing among health and medical professionals who must adhere to regulatory job standards and complicated job trends. Additionally, it aimed to analyze the indirect effects of organizational culture recognition on the relationship between job characteristic and knowledge sharing. Lastly, it intended to provide rudimentary data to guide program and policy development that could contribute to knowledge sharing. Detailed research objectives are as follows.

1. Analyze the extent of subjects' job characteristic, organizational culture, and knowledge sharing.
2. Analyze the paths among the subjects' job characteristic, organizational development, and knowledge sharing.

MATERIALS AND METHOD

This cross-sectional research aimed to analyze the paths between job characteristic, organizational culture, and knowledge sharing among nurses in the health and medical professional field.

Theoretical framework: Literature review has shown that job characteristics and organizational culture influence knowledge sharing. To study the causal relations among the subcategories of job characteristics, subcategories of organizational culture, and knowledge sharing and to further explore the effect of major factors that affect knowledge sharing and organizational culture, we designed a framework depicted below in Figure 1.

Figure 1: Theoretical Framework

Research Subject and Data Collection: Typically, the number of subjects required for a path analysis is 15~20 times that of measured variables. Therefore, this research considered roughly 25~30% of elimination ratio due to omission and duplication of surveys and came up with the finalized questionnaire of 234 subjects.

The research subjects were nurses working in businesses, hospitals, or health medical organizations who had more than 6 months of experience in their current workplace. They participated either in job training of related committees or in remote-controlled classes of K University. After the authorization of research ethics (authorization certification number- ABN01-201704-21-06), the data was collected from April to July 2017 using a structured questionnaire. The participants were provided with explanation and handed agreement forms. They signed the agreements prior to participating in the surveys. They were notified that the survey results were going to be used only for the purposes of this research. The demographic characteristics of the participants indicated that 86.8% were women, and the average age was 35.5. Additionally, 100 worked in the health department of businesses (42.7%), 121 in medical facilities (15.7%), and 13 in public organizations, including clinics and schools (5.6%). A majority worked for private organizations, with work experiences varying from a minimum of 6 months to a maximum of 34 months. Their average working experience was 4.76 (\pm 6.31) years.

Research Instruments: Knowledge sharing, job characteristic, and organizational culture were measured on 5-point Likert scales, providing the average and variation, with higher scores indicate higher positivity.

Knowledge sharing tool: Knowledge sharing measure comprises a 6-question index, the validity of which was measured by [18] within domestic companies, among [19] model, including the extent of available knowledge within an organization, awareness on the source of knowledge and the rate of acceptance. The tool's reliability measured by Cronbach's α was 0.880 in [18] and 0.810 in this research.

Job characteristic tool: Job characteristics tool was modified from [20]. The tool comprised 16 questions assessing job fitness, job challenge, and job autonomy. A factor analysis that was used to test the tool's validity indicated that 4 questions assessing job fitness, 4 questions assessing job challenge, and 5 questions assessing job autonomy loaded well on their corresponding factors while 3 questions had to be dropped. (2,4,11) The tool's reliability was acceptable according to Cronbach's $\alpha = .849$ in [20] and .866 in this research. The reliability values for job fitness, job challenge, and job autonomy subcategories were .902, .798, .915, respectively.

Organizational culture tool: Organizational culture tool was based on a survey used by [21], which [5] modified to fit domestic situations. A factor analysis revealed that 5 relation orientation questions, 7 innovation orientation questions, 4 task orientation questions, and 5 hierarchy orientation questions loaded well on their factors. Accumulation accuracy was 68.8%. The tool's reliability was acceptable according to Cronbach's $\alpha = .756$ in [5] and .934 in this research. The reliability values for relation orientation, innovation orientation, task orientation, and hierarchy orientation subcategories were .840, .935, .812, .873, respectively.

DATA ANALYSIS

SPSS and AMOS programs were used to analyze the research data. All variables including the participants sociological characteristics were analyzed using descriptive statistics (average, standard deviation, frequency, percentage), and the multicollinearity among variables were analyzed using the Pearson correlation coefficients. Specifically, a factor analysis of job characteristics and awareness on organizational culture was conducted to select the final variables. For path analysis, maximum likelihood method was used, and for the analyses of indirect and total effects, bootstrapping method was used. The model fit was evaluated based on the absolute fit index Chi-square (χ^2), goodness of fit index (GFI), adjusted goodness of fit index (AGIF), comparative fit index (CFI), normed fit index (NFI), and the root mean squared error of approximation (RMSEA). The model's path significance was verified with standardized coefficient (γ , β), C.R. (Critical Ratio), and p value. The significance of endogenous variables was verified using the squared multiple correlation (SMC.)

RESULTS AND DISCUSSION

RESULTS

Prior to the path analysis, the results of multicollinearity among variables are shown in Table 1. The scores for job characteristics subcategories were 3.96 ± 0.70 for job challenge, 3.85 ± 0.82 for job fitness, and 3.29 ± 0.79 for job autonomy. For organizational culture, score for hierarchy orientation was the highest at 3.43 ± 0.83 , followed by task orientation (3.29 ± 0.72), relation orientation (3.27 ± 0.67), and innovation orientation (2.91 ± 0.79). The mean score for knowledge sharing was 3.97 ± 0.51 .

Table 1: Correlational Relationships between the Variables

Variables	Job fitness <i>r</i>	Job challenge <i>r</i>	Job autonomy <i>r</i>	Relation orientation <i>r</i>	Innovation orientation <i>r</i>	Task orientation <i>r</i>	Hierarchy orientation <i>r</i>	Knowledge sharing <i>r</i>	M ± SD
Job fitness	1								3.85 ± 0.82
Job challenge	.560***	1							3.96 ± 0.70
Job autonomy	.230***	.209**	1						3.29 ± 0.79
Relation orientation	.242***	.222**	.417***	1					3.27 ± 0.67
Innovation orientation	.216**	.274***	.296***	.621***	1				2.91 ± 0.79
Task orientation	.077	.213**	.212***	.297***	.558***	1			3.29 ± 0.72
Hierarchy orientation	.313***	.222**	.337***	.415***	.458***	.314***	1		3.43 ± 0.83
Knowledge sharing	.450***	.476***	.205**	.310***	.168*	.186**	.230***	1	3.97 ± 0.51

*: $p < .05$, **: $p < .01$, ***: $p < .001$

The Pearson correlation coefficients ranged from .077 (job fitness and task orientation) to .621 (relation orientation and innovation orientation.)

The results of the path analysis are shown in Table 2. For job fitness, direct effect ($\beta = .241, p = .002$) and total effect ($\beta = .265, p = .003$) were significant. Indirect effect with organizational culture as the parameter ($\beta = .024, p = .391$) was not significant. For job challenge, direct effect ($\beta = .308, p = .002$) and total effect ($\beta = .265, p = .003$) were significant while indirect effect ($\beta = -.010, p = .608$) was not. For job autonomy with organizational culture as the parameter, the indirect and total effects for knowledge sharing ($\beta = .084, p = .004$) were significant. Relation orientation, innovation orientation, and task orientation were all significant for direct and total effects on knowledge sharing. Hierarchy orientation was not significant for either direct or total effect ($\beta = .036, p = .504$).

Table 2: Direct, Indirect and Total effect in Reduced Model

Variables		Knowledge sharing			
		Direct effect	Indirect effect	Total effect	SMC
		β (<i>p</i>)	β (<i>p</i>)	β (<i>p</i>)	%
Job characteristics	Job fitness	.241(.002)	.024(.391)	.265(.003)	32.6
	Job challenge	.308(.002)	-.010(.608)	.298(.002)	
	Job autonomy		.084(.003)	.084(.004)	
Organizational culture	Relation orientation	.271(.002)		.271(.002)	
	Innovation orientation	-.230(.008)		-.230(.008)	
	Task orientation	.140(.037)		.140(.037)	
	Hierarchy orientation	.036(.504)		.036(.504)	

For job autonomy, the path with relation orientation as the parameter among indirect effects with organizational culture as the parameter was significant ($\beta= .390, p=.038$) in Table 3.

Table 3: Indirect effect

Paths				Coefficient	SE*	Standadized coefficient	p-value*	
Job autonomy	->	Relation orientation	->	Knowledge sharing	0.040	0.019	0.390	0.0379
Job autonomy	->	Innovation orientation	->	Knowledge sharing	0.003	0.014	0.261	0.8273
Job autonomy	->	Task orientation	->	Knowledge sharing	0.005	0.009	0.195	0.5710
Job autonomy	->	Hierarchy orientation	->	Knowledge sharing	0.004	0.012	0.287	0.7209

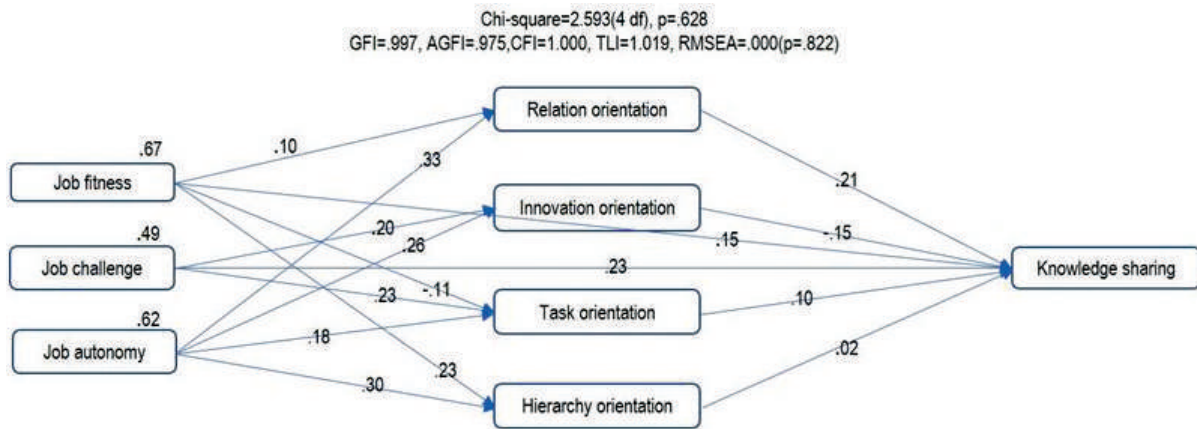

Figure 2: A path diagram of the study

The final path diagram of the study is shown in figure 2. Explanatory power for knowledge sharing for the above path analysis was 32.6%, and no additional paths emerged based on adjusted variables. The goodness of fit indices were all satisfactory, with $\chi^2 = 2.593(p=.628)$, GFI = .98, AGFI = .997, CFI = 1.000, TLI = 1.019, and RMSEA = .000, indicating that the model fit the data well ($\chi^2 \leq 3$; $p > 0.05$; GFI, AGFI, TLI > .09; RMSEA < .005).

DISCUSSION

This research showed that among job characteristic categories, job challenge score was highest at 3.96, followed by job fitness (3.85) and job autonomy (3.29). Job challenge refers to the extent to which one needed to exert new efforts to develop his/her own capabilities outside of repetitive and mundane daily tasks. Job fitness refers to the harmony between internal and external rewards provided by tasks or the harmony between one’s abilities and the job requirements. Job autonomy

refers to the extent to which the person has ability to decide the work schedule, process, and methods involve in task execution [22]. Although nurses execute nursing tasks according to the law and the guidelines, they face new patients every day and find themselves in new health and medical situations. They are required to make specific judgements and take actions in response to unique situations using their knowledge and available technology, which explains the high score on job challenge. Their job autonomy is relatively low because inexperienced nurses need to act according to their bosses’ orders and under their supervision, and some of their actions are guided strictly by the doctors’ orders.

Similar results on such job characteristics have also been reported in other studies. A research on nurses with 1+ year of experience working in secondary and tertiary medical facilities[20] reported scores of 3.72 for job challenge, 3.67 for job fitness, and 3.01 for job autonomy. In another research, [17] found that nurses in medical facilities scored on average 3.7 on job fitness, 3.9

on job challenge, and 3.4 on job autonomy while nurses in businesses scored 4.0 on job fitness, 4.0 on job challenge, and 3.1 on job autonomy, similar to this research. In a different research ^[23], the nurses scored 3.78 on job fitness, 3.71 on job challenge, and 3.11 on job autonomy. These scores are slightly different from those found this research, but in both cases, job autonomy ranked the lowest. In a research conducted with research professionals ^[24], the scores were 3.57 for job challenge, 3.56 for job fitness, and 2.93 for job autonomy. The figures were overall lower compared to those found in this research, probably because nurses tend to view their professions more optimistically compared to other job holders.

Among organizational culture, hierarchy orientation (3.43 ± 0.83) was the highest, followed by task orientation (3.29 ± 0.72), relationship orientation (3.27 ± 0.67), and innovation orientation (2.91 ± 0.79). Advanced research on organizational cultures of nursing industry has reported various findings. In a research on public nurses^[25], hierarchy orientation was the highest at 22.45, followed by innovation at 18.10, similar to this research's findings. The same results have been found in a research by ^[26]among nurses working in tertiary medical facilities. However, in a different research by ^[27], the relationship orientation culture score was the highest, which was followed by hierarchy.

A research on different types of organizational cultures of clinical facilities ^[28]showed that humanitarian culture was recognized most widely, followed by progressive, hierarchical, and task-based cultures. In a different research on organization culture of nursing departments in clinical facilities^[29], relation-oriented culture had the highest score, followed by innovation orientation, task orientation, and hierarchy orientation. Such findings support the existence of various types of organizational cultures, as they are autonomically created by the organization members, rather than having fixed characteristic according to the organization type. In other words, this shows that organizational culture could be improved through efforts of organization members.

Knowledge sharing of research subjects was 3.97 ± 0.51 in this research. In a research on nurses working for general hospitals ^[15], knowledge sharing score was 3.33, consistent with 3.34 reported by ^[3]. In ^[18], the average score for 200 company workers was 3.6. Knowledge sharing score was particularly high in this research. Although accurate comparison is difficult

because the job fields and time of research differed across studies, the findings generally support the growth of knowledge sharing in the health and medical field where professional knowledge is important.

In the path analysis of job characteristic, organizational culture, and knowledge sharing, job fitness and job challenge had significant direct and total effects but not significant direct effects. Job autonomy, with organizational culture as the parameter, had significant indirect and total effects on knowledge sharing. Through indirect effect with organizational culture as the parameter, only the path with relation orientation as the parameter was significant. The fields of health and medical services including hospitals are highly labor-intensive and require the approach of multiple teams. Additionally, nurses in medical facilities work shifts, so they need to take over the tasks accurately. This characteristic shows that the knowledge sharing of health and medical professionals is high, with job fitness and job challenge playing a significant role in knowledge sharing. On the other hand, high job autonomy means that one can carry out a task independently. This could instead work as a detriment to knowledge sharing, implying that organizational culture could lead to wider knowledge sharing and that organization-oriented culture plays a crucial role in doing so.

According to advanced studies on the factors of knowledge sharing, knowledge sharing requires organizational members' trust, interest, openness, and networking abilities. Furthermore, organizational culture that creates, passes, and utilizes knowledge supports the use of computers, intranet, and active communication ^[30,31]. From a cultural-organizational perspective, reliability, openness in communication, participation in decision-making, and innovation are important variables^[32] noted that innovation oriented organizational culture influences knowledge sharing, which in turn enhances the efficacy of organizational tasks. In a research on nurses, the most important predictor variable was openness in communication, explaining 37.8% of variance in knowledge sharing ^[15]. Other studies^[33] ^[34]reported similar findings, supporting the conclusion that relation-oriented culture is a crucial factor in knowledge sharing.

On the other hand, hierarchical culture could deter knowledge sharing. This research showed that the paths between relation orientation, innovation orientation, task orientation, and knowledge sharing were significant, while hierarchy orientation did not have significant direct

and total effects. The health and medical field, which deals with people's lives, traditionally emphasizes rules, regulations, and precision in task execution. Since it follows strict rules^[14], hierarchical cultures are common, and they are helpful in emergency situations with critical patients who require the care of knowledgeable and experienced workers. However, many research results imply that hierarchical and strict cultures negatively influence job satisfaction and organizational performance and thus lead to higher turnover rate^[25,27,35]. Additionally, in the health and medical field that deals with human lives, reports on incidents and errors could be another form of knowledge sharing. Task oriented culture had a positive correlation with the intent to report medication error. However, when the organization had a hierarchical communication system, or its powers were centered on top, the intent to report medication error dropped^[36]. As such, hierarchical culture deters the knowledge sharing activities and hinders people from acting flexibly in case of crisis, so it is likely to lead to more errors^[37]. This negatively affects not only the development of the field, but also the patients' lives. Hence, the hierarchy in nursing industry needs to improve.

The research findings suggest that job characteristics and organizational cultures are important variables that affect knowledge sharing among health and medical professionals, including nurses. Among those, relation-oriented organizational culture was a particularly important parameter in knowledge sharing. Therefore, organizations should refrain from fostering hierarchical and top-down cultures and strive to create communicative and cooperative cultures instead.

This research contributes to the existing studies in that it managed to precisely analyze the indirect effects of organizational culture awareness on the relationship between job characteristic and knowledge sharing of health and medical professionals, specifically nurses. Although nurses must abide by strict working standards as medical professionals and official licenses, relation orientation, rather than hierarchy orientation, was found to be more important in knowledge sharing. However, it should be noted that the health and medical field is very broad and encompasses a wide number of jobs, so the findings cannot be easily generalized. Furthermore, since the concept of knowledge sharing is not yet well-known in the field, further research should focus on different jobs and participants.

CONCLUSION

This cross-sectional study was designed to investigate the indirect effects of organizational culture on the relationship between job characteristics and knowledge sharing and study the relations between job characteristics, organizational culture, and knowledge sharing among nurses who are a part of health and medical professional community working in medical facilities, businesses, and public organizations.

Job characteristics that directly influence knowledge sharing of nurses working in health and medical facilities were job fitness and job challenge. Job autonomy did not have a direct effect on knowledge sharing. Job autonomy influenced knowledge sharing through organizational culture. Only relation orientated organizational culture turned out to be a significant direct predictor of knowledge sharing. Hierarchical organizational culture did not contribute to knowledge sharing.

In conclusion, there is a need to develop a strategy that would increase job fitness, which directly influences knowledge sharing of nurses, encourages job challenge, and enhances job autonomy that influences organizational culture indirectly through awareness. Furthermore, programs aimed at relation orientation should be established to increase the awareness of organizational culture and thus to expand knowledge sharing among medical professionals.

The Effect of Team-based Learning (TBL) on Leadership, Empowerment, and Followership of Nursing Students

Ok Hee Koo¹

¹Assistant Professor, Dept. of Nursing, Baekseok University, Cheon-an, Republic of Korea

ABSTRACT

Background/Objectives: The purpose of this study was to examine the effects of leadership class on senior nursing students using team-based learning (TBL).

Method/Statistical analysis: This study, a single group pre-post treatment design, measured five types of leadership awareness level, empowerment level, and followership style of the study participants. The students were 60 students of B university nursing school seniors. As a leadership training program, the study was run in total of 12 hours through 6 weeks with 2 hours in a week. The descriptive statistic factors such as mean and standard deviation were used for continuous variables. Paired- t-test was used to compare the level of leadership code before and after TBL.

Findings: By examining the results of each item, the strategists scored an average of 6.84 points before the TBL and an average of 8.15 points after the TBL, the pre-mean of 6.86 and the post-mean of 8.08 for practitioners, the pre-mean of 6.85 and the post-mean of 7.96 for talent manager, the pre-mean of 5.86 and post-mean of 7.55 for human resource developer, the pre-mean of 7.05 and the post-mean of 8.12 for self-development, and the pre-mean of 6.71 and the post-mean of 7.98 for the total leadership level. Statistically significant changes were noted in all five items ($p < .001$). The average level of empowerment of the students was higher than the normal with average of $3.61 \pm .42$ (maximum 5). Most of them were pragmatist followers (87%).

Improvements/Applications: By setting the control group or randomizing samples to generalize the result of study, the future study, verifying the effect of TBL class considering complex variables such as critical thinking, study satisfaction, self-fulfillment, creativity other than leadership variables, is proposed.

Keywords: TBL, Leadership, Empowerment, Followership, Nursing Students

INTRODUCTION

A.I. (artificial intelligence), Big Data, and the fourth industrial revolution are the most issued topics recently. The development of science has brought enormous effects on every area in our society. And, education is not an exception. In order to not reach a situation where humans are unable to control, the paradigm of education has to be changed¹. To develop nurses with capability of working actively and taking responsibilities in the fast-changing medical field, nursing school professors are applying various teaching-learning method as a component of education transformation to make students to be owner of learning and to participate actively in classes, rather than typical cramming education or standardized evaluation process. Team-based learning (TBL), a type of learning that learners accomplish study achievement by participating in learning with efficient

communication skills, helps nurses, who have to work with health care professionals as a team in medical fields, to develop skills such as interaction with co-workers, communication, team work, and decision making².

In a team-based activity, leadership is considered as a key point of great team performance³. Recently, a group leadership that is executed by all team members is attracting more attention than a leadership that is executed out by a single leader. Since leadership is an important factor that affects not only an individual talent but team productivity development, an education for developing leadership is essential⁴. Because a view that leadership is an essential talent for all nurses in clinical fields has been approved, a leadership research about nurses and nursing students are processing recently rather than the leadership research that was centered on nursing manager in the past⁵⁻⁸.

According to “Leadership Code”⁹ that has a motto that ‘we are all leaders,’ one has to start executing from oneself to become a great leader. And, each one can be a great leader if he or she knows the principle of leadership and executes it. In addition, the book describes that leadership is a concept that changes through time because it can be developed from the individual leadership to the organizational leadership if other members, not just oneself, know and execute the principle of leadership. Through the analysis of leadership data, the book suggests 5 leadership codes, a common factor that decides leadership. It says that one with a great leadership has to control oneself and has an ability to set an example to other members, and it calls this a personal competence. The five leadership codes are the followings. Code 1: shape the future (strategist). Code 2: make things happen (practitioner). Code 3: engage today’s talent (talent manager). Code 4: build the next generation (human resource developer). Code 5: improve in yourself (self-development).

A nurse needs to have a sympathetic mind and an ability to understand creatures who need nursing. And, she also needs to apply her own nursing knowledge well. If the power of sensitivity, culture, and creation are projected to be more valuable in the future society, nurse will be one of the jobs that cannot be replaced by robots. Especially for the nursing school seniors who will become the leading role of nursing field in future, investing oneself and maintaining feedbacks by

compensation and punishment according to the result of their own set goals are essential leadership skills as a self-control system.

Motivating students through active participation and enabling students to study voluntarily by arousing learning motivation through provision of various presentation opportunities, TBL is considered as an effective instructional method¹⁰. Even though other studies about TBL focused on variables such as learning commitment⁷, learning motivation, and learning attitude⁸.¹¹, this study is structured to see how the leadership class using TBL affects the leadership ability of students.

METHOD

Samples and TBL procedure: This study, a single group pre-post treatment design, measured five types of leadership awareness level of the study participants before the TBL leadership session and measured them again after the session. The students were 60 students of B university nursing school seniors. And, the study was conducted from September 1st to October 15th in 2016. Through an individual learning and interaction between team members, an education procedure that was structured to maximize outcomes of team and individual was conducted. As a leadership training program, the study was run in total of 12 hours through 6 weeks with 2 hours in a week. The summary of each week’s session is explained in the table 1.

Table 1: Each week’s session contents

	Contents
1 st Session	Composition of team by 5 members (Total 12 teams) The understanding of leadership Finding leaders in the past (using books and videos) Finding leaders around oneself Pre-measurement of level of leadership code
2 nd Session	Improvement of communication (self-introduction between team members) Brainstorming: -“How to be loved by team members” -“How to compliment nicely” -“How to reconcile effectively when there is a discord with a team member”
3 rd Session	The understanding of power Power improvement (“plan my life”) The understanding of empowerment Measurement of empowerment The strategy of empowerment enhancement (using books and videos)

Conted...

4 th Session	The understanding of the followership Finding followers in the past (using books and videos) Measurement of the Kelly followership type The requirement of a beginning nurse
5 th Session	The understanding of conflict management Selection of a recent topic about conflict Personal solution about conflict and the opinion sharing about the result Sharing of friends' advice
6 th Session	Team presentation of recent journals about leadership (including followership and empowerment) Questions and answers on each team's presentation by other teams Evaluation on each team's presentation by other teams Post-measurement of level of leadership code

Instruments: The level of leadership code is measured with Likert-type 10-points scale and in the five areas of the total 26 items suggested by Dave Ulrich, Norm Smallwood & Kate Sweetman⁹: 4 items in strategist, 5 in practitioner, 5 in talent manager, 5 in human resource developer, 7 in self-development. Higher score means more talent a student has. In this study, the value of Chronbach's alpha is .945 in pre-measurement and .955 in post-measurement.

The instrument that Choi Jiwon¹² practiced was used for the measurement of level of empowerment. It was measured with Likert-type 5-points scale and the total of 29 items: 16 items in personal competence, 5 in group orientation, 8 in self-determination. The value of Chronbach's alpha was .84 in the study of Choi Jiwon and it was .887 in this study.

The Kelly's instrument¹³ was used for the measurement of followership type. It was Likert-type 6-points scale. With 10 items of independent, critical thinking and dependent, uncritical thinking and 10 items of active participation and passive participation, it was evaluated to find out which type each student corresponds to out of 5 types.

DATA ANALYSIS

The collected data were analyzed using SPSS statistics 18.0¹⁴ and the significance level was set at .05. The descriptive statistic factors such as mean and standard deviation were used for continuous variables. Paired- t-test was used to compare the level of leadership code before and after TBL.

Ethical Consideration: For ethical consideration, the purpose of the study, anonymity of data, and confidentiality were explained, and students were asked to participate the survey voluntarily. Moreover, the

explanation that any student could withdraw from the study at his own will anytime and the collected data would be only used for the study was explained.

RESULTS AND DISCUSSION

The analytical result of leadership code difference between before and after the study is explained in the table 2. Looking at the result of each item in detail, the average of strategists is 6.84 before TBL and the average is 8.15 after TBL. For practitioners, it is 6.86 before TBL and 8.08 after TBL. For talent manger, it is 6.85 before and 7.96 after. For human resource developer, it is 5.86 before and 7.55 after. For self-development, it is 7.05 before and 8.12 after. The average of total leadership is 6.71 before TBL and 7.98 after TBL.

Table 2: The comparison of leadership code of Nursing Students

(N = 60)

		M	SD	t	p
Strategists	Before	6.84	1.18	8.148	.000**
	After	8.15	1.10		
Practitioners	Before	6.86	1.15	7.937	.000**
	After	8.08	1.01		
Talent manager	Before	6.85	1.13	8.177	.000**
	After	7.96	0.99		
Human resource developer	Before	5.86	1.61	9.106	.000**
	After	7.55	1.15		
Self-development	Before	7.05	1.24	6.575	.000**
	After	8.12	1.08		
Leadership	Before	6.71	1.09	10.448	.000**
	After	7.98	0.93		

**<.001

Looking at the result of each week's session contents, in the first week session, students had become aware of the importance of leadership and the required talents for a leader through understanding of leadership concept and consideration of finding leaders around them. In the second week, students shared solutions through brainstorming about -"How to be loved by team members," "How to compliment nicely," "How to reconcile effectively when there is a discord with a team member." To prevent the confidentiality, which is a weakness of brainstorming, they practiced brainwriting, a writing down method instead of speaking each other. In the third week, since one has to be conscious of the goal of her life to improve her power, students wrote down "plan my life" in 1 year later, 2 years later, 5 years later, 10 years later, 20 years later, 50 years later, and 100 years later. And, they had a time to think about what they need to prepare for succeeding the goal of life. The result showed that most of them want to pass the national exam and work as approved nurses in the hospital where they want to work for long years. And, they responded that they want to have a vacation trip after the exam. The average level of empowerment of the students was higher than the normal with average of $3.61 \pm .42$ (maximum 5). Compared to the average empowerment score of 3.40 (maximum 5) that was resulted from the study of relationship between types of leadership and empowerment¹⁵ that was conducted to 386 nursing students, it is considered that the empowerment level of the contemporary nursing students is highly improved. In the fourth week, throughout the program of the understanding of unfamiliar followership concept, students found out his own followership type and the required talents for becoming an exemplary follower. Most of them were pragmatist followers (87%). In the fifth week session of the conflict management, the students were asked to recall any conflict occurred in school life and practices in the past few weeks and to share with colleagues about their own solution and opinions on the results. Students had conflicts mostly with friends, boyfriends, and families and figured out psychological comfort and better solutions voluntarily through the sharing process with team members. In the sixth week, throughout the team presentation about leadership, followership, and empowerment, students understood the importance of leadership that is treated in the area of nursing management study. Also, team evaluation on each team members' presentation skill, contents of paper, preparation skill, attitude, and

teamwork skill was implemented and they shared opinions on TBL each other. Finally, they checked the change in their awareness of leadership through the pre and the post measurement of leadership code.

Examining the change in leadership awareness of nursing students through TBL, it was approved that most areas were statistically and similarly improved. TBL induces a positive learning effect to students and a motivation to study independently about knowledge regarding assignments¹⁶. The development of individual leadership skill is realized through development in various areas. Especially, leadership is an extremely important skill for graduating nursing students who will play a role as professional nurses in upcoming years. TBL is considered to be helpful for not only change in positive learning method but understanding oneself and his advantage because it can find solution and bring synergy effect to each other through group discussion and collaboration.

Considering both short-term and long-term perspectives at a same time, good leaders think and act voluntarily⁹. The Code 1 "Plan the Future (strategist)" presented in the Leadership Code, means understanding the way that must be made for the success of an organization as a future professional. Since students showed the highest score on this area (Post-M=8.15/ Maximum 10), it is considered that they will show how to develop themselves and the organization in the future with a strong vision. The Code 2 "Make things Happen (practitioner)" means accomplishing tasks given to them to make strategy to actually happen in real life. Nursing is a practice learning. To provide nursing with quality, a nurse has to lead a change, take a responsibility, understand works that needs to be delegated, and practice procedure that brings harmony and collaboration with other teams. In the Kelly's result of the followership type examination¹³, students were mostly pragmatist type (87%). The pragmatist type is a type of response that usually occurs in an unstable situation. The result explains the current situation well where students are mostly worried about graduation and national exams. It was found that personal goal setting and support of an organization were necessary to make students become exemplary types in organizations in the future. The Code 3 "Engage Today's Talent (talent manager)" means creating a positive working environment through communicating with members, organizing goals of a company and members, and providing resources to achieve the goals.

In other words, working with enjoyment is important. After an interview with students who had TBL classes that was centered on learners, Lee et al.¹⁷ found out that the participation of TBL students were higher than that of the ordinary learning method. The Code 4 “Build the Next Generation (human resource developer)” means planning the future talent development, finding the future workers, and helping students finding talents and building experiences. The result that this item received the lowest average score (Pre-M=5.86) in the study demonstrates that students focus only on themselves and they lack on future-oriented perspective about the next generation. However, many progress has been made in the TBL, and the students had been able to confirm the necessity and importance of future-oriented perspective education as well as the reality-oriented education. The Code 5 “Improve in Yourself” (self-development) means that everything can be a learning material if one has a passion to learn from everything around herself because a leader is a learner. The leadership level of nursing students was also high (Post-M=7.98) and it was found that it was improved through leadership training. If one does not hesitate a new challenge and participates with interests and determination, one can not only complement weakness but grow strengths.

CONCLUSION

The purpose of this study was to examine the effects of leadership of graduating nursing students through TBL. The result shows that TBL was effective in improving the leadership level of the students. Through applying the five codes of Leadership Code on nursing students that was not applied in the nursing field before, it is found out that the most significant meaning of this study are identifying leadership awareness of the students and finding out the possibility that the nursing students will grow as great leaders in nursing organizations.

Developing leadership is a very important skill for senior nursing students because they have to play roles as professional nurses in the future. Nursing is a practicing study. In order to provide high quality nursing to patients, nurses need to lead changes, take responsibilities of serious decisions, and cooperate with other teams. The TBL leadership class was meaningful in a way that it helped students finding the change in their positive learning attitude, discovering their strengths, and understanding themselves.

However, the study has a limitation in which it did not control the intervention of the third variable because it was designed as a single group pre-post. By setting the control group or randomizing samples to generalize the result of study, the future study, verifying the effect of TBL class considering complex variables such as critical thinking, study satisfaction, self-fulfillment, creativity other than leadership variables, is proposed.

Relationship between Sleep and Oral Health among Korean Adults

Hye-Sook Choi¹, Moon-Hee Kwon²

¹Dept. of Dental Hygiene, ²Dept. of Nursing, Kyungdong University, Korea

ABSTRACT

Background: Modifiable short or long sleep duration is related with general health. Therefore, they may influence on oral health.

Method: To identify the relations between sleep and oral health, we examined. 5,285 adults, aged 19 and over, were selected and comprised by the cross-sectional study. Oral health behaviors like chewing and tooth brushing were measured. After adjusting, short or long durations were significantly related with poor oral health.

Findings: Normal sleep duration (7-8 hours/day) was associated with good oral health while short or long sleep duration may be harmful behavioral factors for getting worse of oral health among Korean adults.

Improvements: Public health professionals for primary health care should consider the sleep recommending policies and strategies for the oral health as well as general health.

Keywords: Sleep duration, Obesity, Physical Activity, Chewing difficulty, Short or long sleep

INTRODUCTION

Unhealthy lifestyle factors are reporting as the major issue, world-wide. Also, unhealthy life style behaviors are related with mortality¹. Sleep duration, short or longer, have been associated with several health outcomes in adults²⁻⁵ as well as associated with increasing the Alzheimer's Disease (AD)⁶. In addition, a functional oral factor as masticatory performance is very beneficial in older adults⁷. Also, oral health was known as the critical factor for the adults to maintain their independent lifestyle⁸ as well as related with self-rated health among adults⁴. Oral functions like chewing was reported to be related to mental health^{6,9} which was known for managing oral health, lifestyle and overall health care of the elderly¹⁰. And that undesirable health habits were reported to be caused of possible determinants of impaired intellectual activities¹¹. Recently it was reported that the association of lower sleep quality and lower oral

health¹². Moreover, the factors of education, gender, obesity and self-rated health were strongly related to health inequalities¹³. Through previous study, it was revealed that education and income were potential risk factors for oral health behaviors¹⁴. Also, it was reported that tooth brushing and tooth-paste users showed more status of tooth retention¹⁵ and physical activities from walking to vigorous sports are safe for healthy aging¹⁶. Additionally poor oral health reported to be related with obesity¹⁷. But little is known about the relations between sleep, other influencing factors and general major oral health behaviors. Therefore, we examined the relationship between sleep durations and oral health through major lifestyle factors.

MATERIALS AND METHOD

The 5,285 participants, South Korean, were the self-reported survey subjects from the 6th KNHANES by Korea Centers for Disease Control and Prevention (KCDCP). We used of collected available questionnaires about sleep and oral health status like chewing and tooth brushing as well as demographic data and analyzed using multiple logistic regressing by SPSS (ver. 21.0). General characteristic data were calculated by weighted or not weighted frequency. A

chi-square was used for those values differences. And for the influencing degree of the healthy or unhealthy behavior variables such as sleep, walking, obesity and economical-activity, multi-logistic regression was performed. The significance level was $p < .05$.

RESULTS AND DISCUSSION

Descriptive data(Table1.)revealed that 35-64 age group(56.2%), female (50.6%), married (77.8%)and majority of participants were good education level (High school and College) except lowest education level (17.5%). In terms of sleep, half of them were excessive or short sleep duration group. As to oral health, some participants (21.1%) had chewing difficulty problem complaints, and almost all of the participants had good habits of tooth brushing. About onethirds of them (38.3%) did not participate in economic activities and over half of them (62.6%) did not engage in walking activities. As to alcohol and smoking, over half those (58.5%) had drinking habits and some of them had smoking habits (23.4%), under or excessive body weight (37.0%).

To observe the influencing factors on oral health (Table 2.), logistic regression was conducted. The results revealed short or excessive sleep duration, economical activity,walking activity and under or excessive body weight significantly influenced on oral health status.

Table 2: Relationship between oral health and affecting factors of Korean adults

Table 3 shows healthy behaviors like walking, economical-activity or unhealthy factors such as short or long sleep and obesity were all the affecting factors on the general oral health significantly. But after adjusting the confounding variables, short or long sleep duration variable (OR 1.21; 95% CI; 1.03-1.43; $p < .05$) compared to normal sleep one was the most influencing factor on the general major oral health state such as chewing, a kind of mastication, which was reported to be positively associated with obesity even if they were most of cross sectional studies¹⁸. Supporting to keep normal sleep duration was the crucial major factor for good oral health through our study and has shown them in previous findings^{4,5}. In recent study of the relationship between sleep quality and lower oral health¹², they proved on their association, but we had some difference in view the point of sleep duration and oral health.

Some reported the small association of weight change and sleep duration¹⁹, according to recent US study, they reported on the close connection between sleep quantity and body mass index²⁰ of College students but those findings were not proved in our results seeming cause of some difference in the subjects etc. Healthy life style factors were reported to have some differences by socio-demographic characteristics such as age, gender, race and region¹.

We used healthy or unhealthy life style factors to identify the influencing factors on the major factor of oral health closely connected with the general health of Korean adults. We show how short or long sleep duration, the unhealthy life style factors, are meaningfully associated with the major oral functional health factor. It might be urgently considered that public health professionals should focus on healthy lifestyle factors such as sleep quantity, encouraging physical activities and economical activities, and managing obesity of Korean adults not only to reduce dramatically increasing medical expenses, but also to create good models of the community for the future.

CONCLUSION

Through our study, we suggest that focusing on normal sleep duration (7-8 hours/day) policy, the healthy life style factor, should be considered as the major prevention strategy for keeping and improving oral health status influencing on the general health among South Korean adults. Focusing on the healthy behaviors like sleep, walking, under or excessive body weight management and encouraging economical-activities, shaping healthy behaviors would be strongly renewed as the point of view of public health in social contexts against communicable, chronic disease and dramatically increasing medical costs. More researches on these healthy or unhealthy life style factors are needed for preparing and managing the public health interventions to promote oral health as well as general health in Korea.

ABSTRACT

Background/Objectives: The purpose of this study was to investigate how high school students in adolescence are satisfied with their external appearance and to find out the relationship between facial satisfaction and dental aesthetic treatment.

Method/Statistical analysis: A total of 600 copies were distributed using the self-filling questionnaire from September 30th to October 6th, 2017, and 558 copies of the questionnaires were collected and analyzed. Statistical analysis of the collected data was performed using SPSS WIN ver. 24.0. Appearance satisfaction means a subjective assessment related to the level of self-satisfaction or dissatisfaction with the external appearance of a person and measured by the 5-step Likert scale. General characteristics were analyzed by using frequency analysis, X²-test, t-test, one-way ANOVA, Pearson correlation analysis.

Findings: 188 (33.7%) of the male and 125 (22.4%) of the female respondents answered that the most important part for appearance was the face. In addition, same result came along with academic, vocational, boy's only, girl's only, coed high school, being in relationship, and popularity. There was statistically significant difference in the perception of dental aesthetic treatment, 54 (9.7%) males and 11 (2.0%) females showed that males had more negative thoughts than females. Although there is a statistically significant difference in facial satisfaction with maxillofacial satisfaction, dental aesthetic treatment has a negative correlation with it as well as statistically significant differences was not found respectively.

Improvements/Applications: Therefore, many publicity and efforts are needed to increase the interest in oral and maxillofacial adolescents, and it is necessary for young people to develop socio-cultural phenomena and adolescents so that they can grow into health, physically and psychologically, people in various social and cultural environments as well as parent, teachers, mass media, and others seems to be responsible for delivering a healthy appearance culture.

Keywords: facial, satisfaction, dental aesthetic treatment, high school, students

INTRODUCTION

Adolescence is a time when people react sensitively to physical changes and characteristics and become more interested in their appearance. In addition, adolescence is a process of developing values, attitudes, and functions

necessary for social participation as a social emergency period, recognizes the importance of social ideation and appearance of physical appearance through four socialization factors such as mass media, parents, and further internalize their values^[1].

Because of the influence of pop culture, people tend to uniformly judge their own appearance by comparing themselves with popular models or actors in movies, beautiful models in magazines, and people in TV commercials which were given their appearance satisfaction^[2].

These social phenomena are more likely to be affected by external stimuli and influences than those

Division of Health Sciences,

Dongseo University, South Korea

Email: icealswl@gdsu.dongseo.ac.kr

of adults, when adolescents undergoing many changes in the process of physical and mental growth without proper definition of values and dignity^[3]. In this way, for the adolescents, appearance is an important measure to express themselves and can be a factor to help school adaptation. Therefore, proper appearance management and correct perception can enhance the self-esteem of adolescents and thus positively affect school life.

The reason why adolescents are interested in body and appearance is that adolescents' physical attractiveness or physical image has a significant relation with positive self-evaluation, popularity, and relationship with friends^[4] and also with self-esteem^[5]. In addition, evaluation of adolescent body has an important influence on self-concept and social development after adolescence^[6].

The purpose of this study was to investigate how high school students in adolescence are satisfied with their external appearance and to find out the relationship between facial satisfaction and dental aesthetic treatment.

MATERIALS AND METHOD

Subjects: A total of 600 copies were distributed using the self-filling questionnaire to U high school in Yangsan areas, J, Y, and M high school in Busan area from September 30th to October 6th, 2017, and 558 copies of the questionnaires were collected and analyzed.

Research method: Statistical analysis of the collected data was performed using SPSS WIN ver. 24.0. Appearance satisfaction means a subjective assessment related to the level of self-satisfaction or dissatisfaction with the external appearance of a person and measured by the 5-Likert scale. General characteristics were analyzed by using frequency analysis, chi-square test, independent samples t-test, one-way ANOVA(Analysis of variance), Pearson correlation analysis.

RESULTS AND DISCUSSION

General characteristics of subjects: The subjects were 38 students (6.8%) in the first year, 142 students (25.5%) in the second year, and 378 students (67.7%) in the third year of the high school. 412 students (73.8%) attend in academic high school whereas 125 students (26.2%) attend in vocational high school. 291 students are in coed high school, 225 students (40.3%) are in boy's high school and 42 students (52.2%) are in girl's high school which was the least percentage of all subjects. There were 413 students who answered that they are not in relationship whereas 145 students have answered that they are in a relationship with opposite sex. Among these students, self-judgment on popularity between low, medium, and high were distributed as 8.2% (low), 69.4% (medium), and 22.4%(high).

Adolescent face image recognition according to general characteristics: 188 male students (33.7%) and female students (22.4%) answered that the most important part of the outlook (external appearance) was the face. Male students answered in the order of body shape, height, lower body, other parts (etc.), upper body where female students answered in the order of body shape, height, lower body, upper body, and other parts (etc.) after majority selection of face. The face was found to be an important part of appearance in all the high school composition which are academic/vocational high school, boy's/girl's high school, and coed high school regardless of being in relationship or not as well as the popularity. The statistically significant differences were found depending on the school structure and the presence of being in relationship.

Difference in the Average of Youth Facial Satisfaction according to general characteristics: The satisfaction rate of the first impression was 3.25 ± 0.83 for males and 2.97 ± 0.77 for female students. Mean rating for the first year of the high school students was 3.45 ± 0.89 which was the highest followed by 2nd and 3rd grades. In the school system, the number of vocational students was 3.32 ± 0.73 which was 0.24 points higher than the academic high school. In the school structure, boy's high school was the highest at 3.39 ± 0.81 followed by coed high school and female high school. Students being in relationship 3.24 ± 0.81 had an average score of 0.17 points higher than students who were not in relationship. The most popular students with the highest score of 3.57 ± 0.85 showed statistically significant results in terms of gender, grade, school system, school structure, relationship and popularity.

The face satisfaction rate was 3.14 ± 0.67 for male which is higher than the female students and 3.43 ± 0.76 for the 1st grade, 3.14 ± 0.59 for vocational high school students, 3.19 ± 0.67 for boy's high school students, 3.18 ± 0.66 for students who are in relationship, and 3.42 ± 0.68 for high popularity respectively. There was statistically significant difference in sex, grade, school structure and popularity, but it did not appear to be a factor affecting total face satisfaction because there was no significant difference in school system and being in a relationship.

There were statistically significant results in grade, school system, school structure, and popularity in maxillofacial satisfaction where there was significant difference in sex, grade, school structure, being in relationship, and popularity in maxillofacial interest.

Recognition of dental aesthetic treatment according to general characteristics: In the perception of dental aesthetic treatment, 54 (9.7%) were male and 11 (2.0%) were female which shows the male students were more negative than female students. 29 (5.2%) in coed high school, 34 (6.0%) for boy's high school, 3 (0.6%) in girl's high school had negative recognition on dental aesthetic treatment. 58 (10.4%) without relationship with opposite sex had more negative recognition than 7 (1.3%) of those who are in relationship. There was a statistically significant difference in the perception of dental aesthetic treatment when the gender, school structure, and being in relationship were dissatisfied with the part of the maxillofacial.

Correlation between face satisfaction and dental aesthetic treatment awareness: Maxillofacial satisfaction according to facial satisfaction showed a high positive correlation and statistically significant difference. The higher the face satisfaction, the more negative correlation was found on the dental aesthetic treatment, but note statistically significant.

Table 5: Correlation between face satisfaction and dental aesthetic treatment awareness

Variable	Face satisfaction	Dental aesthetic awareness	Maxillofacial satisfaction
Face satisfaction	1		
Dental aesthetic awareness	-.009	1	
Maxillofacial satisfaction	.891	-.017	1

*by Pearson correlation analysis

Modern society is called “Lookism” and the value of the appearance has been increased so that it is not unmistakable. As a result, interest in the appearance of young people is also increasing. In Addition, although many articles on appearance have been published, there is little research on the effect of oral and maxillofacial region on appearance, aesthetics treatment, and there is limited research to discuss the weight and appearance issues of Asian adolescents [7].

In this study, we surveyed high school students about their appearance satisfaction, oral maxillofacial and dental aesthetic treatments. As a result, in the present study, 33.7% of the male and 22.4% of the female students were answered that the facial appearance was the most important part of the external appearance followed by body shape, height, lower body, etc., upper body for males and body shape, height, lower body, upper body, and etc. for females. This is a contrast to the study in Mahoney and Finch (1976) which showed that the most important factor in determining the physical attractiveness of women was weight and face, whereas in men, face was the first and weight was third [8].

In modern society, appearance is the first criterion for judging who the other person is. People have the property

of unconsciously evaluating their impressions through their appearance [9]. With the emphasis on the importance of appearance, various media such as the Internet and TV have seen the benefits of beautiful appearance, and regardless of whether they are male or female.

The face satisfaction rate was 3.14 for male which is higher than the female students and 3.43 for the 1st grade, 3.14 for vocational high school students, 3.19 for boy's high school students, 3.18 for students who are in relationship, and 3.42 for high popularity respectively. This is interpreted as Joiner et al. that female students tend to be more susceptible to physical changes due to higher physical inclinations and to secondary physical changes, resulting in lower physical satisfaction compared to male students [10].

According to Frost & Mckelvie's study of elementary school students, high school students, and college students, on the relationship between appearance satisfaction and self-esteem was found to be lower on girls than boys, and high school students was the lowest. For those adolescents who have confidence in their appearance tend to form a positive identity, by expressing their own personality through their appearance and recognizing them as an indicator of the uniqueness

which will lead to have positive impact for developing the self-identity during adolescence.

In the perception of dental aesthetic treatment, 9.7% were male and 2.0% were female which showed that the male students have more negative perception than female students. In addition, it was generally accepted that dental aesthetic treatments are used to solve when they are unsatisfied with oral teeth, jaws (chin), mouth, which leads not to be confident in their appearance. As a result, it was found that many publicity and efforts were needed to increase interest in oral and maxillofacial on adolescents.

Adolescents' attention to the appearance is increasing daily. Students who undergo cosmetic surgery continue to increase, and they are overly immersed in their appearance due to the socio-cultural influence that is sensitive to external stimuli, which could possibly increase the risk of side effects and mental sequelae. In order to enable young people to grow into a healthy, physically and psychologically, society in a variety of socio-cultural environments, people such as parents, teachers, and mass media people who can affect its phenomena are responsible for shaping a healthy appearance culture.

CONCLUSION

As the social phenomenon of cosmopolitanism spreads, in the adolescent period when the values and self-concept are not properly established, more attention is paid to the appearance than the adult, and it is stimulated and influenced from the appearance itself which can be led to the core factor of the self-concept as well as the body image of the person can be obsessed. The purpose of this study is to investigate through survey and analyze the perception of facial satisfaction and dental aesthetic treatment among Busan and Yangsan areas' high school students and the results is as follows:

1. 33.7% of the male and 22.4% of the female respondents answered that the most important part for appearance was the face. In addition, same result came along with academic, vocational, boy's only, girl's only, coed high school, being in relationship, and popularity.
2. The satisfaction rate of the first impression was 3.25 for males and 2.97 for female students and there was statistically significant results were

found in gender, grade, school system, school structure, being in relationship, and popularity.

3. The face satisfaction rate was 3.14 for male which is higher than the female students and there was a statistically significant difference in gender, grade, school structure, and popularity but no significant difference was found in being in relationship.
4. There was statistically significant result in the grade, school system, school structure and popularity in maxillofacial satisfaction where gender, grade, school structure, being in relationship, and popularity in maxillofacial interested showed significant results.
5. In the perception of dental aesthetic treatment, 9.7% were male and 2.0% were female which shows the male students were more negative than female students. Also, there was statistically significant result in gender, school structure and being in relationship in dental aesthetic treatment.
6. Although there is a statistically significant difference in facial satisfaction with maxillofacial satisfaction, dental aesthetic treatment has a negative correlation with it as well as statistically significant differences was not found respectively.

The Association between Leadership Styles of Adolescent Football Coaches and Players' Social Skills

Kyung-Seok Han¹, Chun-Ho Yang¹

¹Dept. of Marine Sports Hanseo University

ABSTRACT

Background/Objectives: This study was conducted to determine the effect of the leadership style of adolescent football coaches on the social skills of players.

Method/Statistical analysis: To that end, a questionnaire was administered to a total of 215 athletes registered with the Korea Football Association as of 2018. Data were analyzed using SPSS 21.0 for frequency, exploratory factor analysis, reliability, correlation and multiple regression analysis.

Findings: The findings were as follows. First, an analysis of the correlation between the leadership types of adolescent football coaches and the social skills of players showed that the training order had a positive correlation with empathy, self-direction, self-control and self-expression. Democratic behavior, social support and positive reinforcement had a positive correlation with empathy, self-direction and self-control. The authoritative style showed a positive correlation with empathy and self-expression. Second, a review of the association between leadership types of adolescent football coaches and empathy of athletes found a positive effect between the training order type ($\beta=.653$, $p<.001$) and positive reinforcement ($\beta=.102$, $p<.05$), while a negative effect was detected between authoritative guidance ($\beta=-.152$, $p<.001$). Third, a review of the association between the leadership types of adolescent football coaches and the self-direction of athletes found a positive effect between the training order type ($\beta=.255$, $p<.001$), social support ($\beta=.139$, $p<.05$) and positive reinforcement ($\beta=.364$, $p<.001$). Fourth, a review of the association between leadership types of adolescent football coaches and athletes' self-control showed a positive correlation between democratic behavior ($\beta=.302$, $p<.001$) and social support ($\beta=.464$, $p<.001$). Fifth, a review of the association between the leadership types of adolescent football coaches and athletes' self-expression showed a positive impact of authoritative leadership style ($\beta=.152$, $p<.05$).

Improvements/Applications: As democratic behavior and social support play a positive role in self-control, coaches of adolescent football players should adopt these coaching styles for adequate self-control of players.

INTRODUCTION

The management environment and competitive landscape of corporations and sports teams are rapidly changing. Successful survival is ensured under effective organizational and human source development and

management¹. The management of organizational members in a highly competitive environment requires the maximum level of motivational skills. The leadership style of sports coaches is a key engine that drives their vision and objectives². For example, leaders who guidesports teams must develop and manage the capabilities of the team and its members. In addition, leaders must provide direct and indirect performance capabilities that can contribute to realizing the team vision.

The leadership type of the sports coach has a direct effect on players and becomes an important factor in their psychological development and growth². Therefore,

Email: healthyang@hanseo.ac.kr

the leadership type of sports coaches for adolescents must lead to improved performance, as well as manage their physical strength, contributing to acquisition of techniques and tactics. Coaching activities of the leader in addition to managing match performance, such as managing aspects of everyday life, also important an important role.

While the leadership type of the coach affects athletes of individual sports and team sports differently, the various coaching activities play a key role in maximizing the team's capabilities³. However, these days most coaches suffer from stiff competition faced by the teams or the players' university admissions that lead to emphasis on winning matches above everything else.

Sports groups bring two or more people together to achieve a common goal⁴. In particular, in competitive sports, members of the team are required to perform better than their opponents by tapping into their full potential⁵. In general, sports coaches define the team's goals and contribute to realization of their vision by providing the players with techniques and motivation⁶. Thus, the leadership type of sports coaches defines the overall process underlying the goal realization of the team and its members⁷.

Since evaluation of coaching capabilities is conducted based on the winner, in many cases competent teams or players are fostered under great coaches. Even in the same team, match performance may vary depending on the coach⁸. A leader plays a huge role in an individual's life and occasionally redirects their life. In particular, the role of the leader is especially important for adolescents due to their sensitive personalities. Therefore, the leadership style of coaches has become a subject of academic interest, and plays an important role in various fields. Studies involving leadership style have been actively undertaken in fields such as business management, administrative studies, and psychology⁹. Even in sports, studies focusing on the leadership type and sports coaches have led to high expectations of efficiency in the field. In Korea, too, various studies have been conducted investigating the leadership style of sports coaches^{10,11,12,13}. While such studies have been undertaken in football, too^{14, 15, 16}, studies investigating the social skills of players are lacking.

Social skills refer to appropriate communication and interaction, or the capability to adequately adjust to

the social environment¹⁷. Football players experience great stress during adolescence while forming peer relationships. Good social skills can help maintain smooth peer relationships and address any issues that may arise^{18,19}. Therefore, the need for improving social skills in football players in middle or high school is growing. Students with well-developed social skills can not only lead others effectively, but also maintain a positive relationship, in responding appropriately to others' orders²⁰. Therefore, effective leadership styles of coaches that can help improve social skills in football players to better adjust to school life, are needed.

METHODOLOGY

Subjects: The study population included adolescent football players in the Honam region as of 2018. Convenience sampling was used to select 250 study subjects. A questionnaire was distributed to study subjects who were asked to fill them out on their own. The completed questionnaire copies were retrieved immediately. Excluding those with insufficient or dual responses, a total of 215 copies were used for final analysis. The general characteristics of the study subjects were as listed in Table 1.

Table 1: General characteristics of study subjects

Variable	Category	Frequency (number of people)	Percentage (%)
Age	14 years	26	12.1
	15 years	36	16.7
	16 years	30	14.0
	17 years	43	20.0
	18 years	38	17.7
	19 years	42	19.5
Position	Striker	90	41.9
	Defender	125	58.1
Athletic experience	Less than 2 years	26	12.1
	2 years-3 years	54	25.1
	3 years-4 years	54	25.1
	4 years-5 years	51	23.7
	5 years or longer	30	14.0
Total		215	100

Study tool: The questionnaire comprised 3 questions pertaining to the socio-demographics of the study participant, 27 questions involving the independent variable of leadership style and 33 questions related to the dependent variable of social skills, yielding a total of 53 questions.

The leadership types in this study were analyzed using the revised version of questions of Kim²¹, which in turn represents a translated version of the Leadership Scale for Sports (LSS) developed by Chelladurai & Saleh²². Leadership style was categorized into 5 types: training order type, authoritative guidance type, democratic behavior type, social support type and positive reinforcement. The number of questions for each variable was as follows: 10 questions pertaining to the training order type, 3 questions related to authoritative guidance, 6 questions involved democratic behavior, 5 questions concerned social support and 3 questions represented positive reinforcement.

Social skills were measured using the Social Skill Rating System (SSRS) originally developed by Gresham & Elliott²³ and translated by Mun²⁴, which was then complemented and revised to fit the purpose of this study. Social skills consist of a total of 4 categories of empathy, self-direction, self-control and self-expression. A total of 5 questions related to empathy, 7 questions involved self-direction, 4 questions pertained to self-control and 7 questions concerned self-expression.

Responses to each question were measured on a 5-point Likert Scale, with “not at all” scoring 1 point, “no” scoring 2 points, “average” 3 points, “yes” 4 points, and “very much so” 5 points.

Exploratory factor analysis and reliability: To verify reliability, construct validity verification and exploratory factor analysis were used. Only questions with a factor load of .40 or greater were used when the Varimax method was applied. As this study uses a multi-category scale to measure similar concepts, Cronbach’s alpha coefficient in accordance with internal coherence standards was used for verification of reliability.

Leadership style: Leadership styles were extracted by selecting 5 factors with an Eigen value of 1.0 or greater. Leadership styles were categorized into five factors as follows: training order, democratic behavior, authoritative

guidance, social support and positive reinforcement. Explanatory power was found to be approximately 58.5% of total variance. The KMO standard fitness in this study was .839 with a significance probability of .000, representing a fit for factor analysis. The reliability of the sub-variables of leadership style were as follows: .640 for training order, .688 for democratic behavior, .645 for authoritative guidance, .620 for social support type and .684 for positive reinforcement. These figures indicate a high reliability for internal consistency.

Social skills: For social skills, 4 factors with an Eigen value of 1.0 or higher were extracted. Social skills were categorized into the 4 factors of empathy, self-direction, self-control and self-expression. Explanatory power was approximately 56.4% of total variance. In this study, the KMO standard fitness was .826, and the significance probability was .000, indicating appropriate factor analysis. The reliability for the sub-variables of social skills is as follows: .656 for empathy, .640 for self-direction, .684, for self-control, and .766 for self-expression. These figures indicate a high reliability for internal consistency.

Statistical analysis: SPSS (ver 21.0) was used for statistical analysis of different leadership styles of football coaches affecting the social skills of players. The detailed analysis was as follows: First, a frequency analysis was conducted to review the socio-demographic variables of the study subjects. Second, to review the validity and reliability of each category in the questionnaire, an exploratory factor analysis was carried out and Cronbach’s alpha was calculated. Third, to review the correlation between the leadership type of football coaches and the players’ social skills, a correlation analysis was conducted. Fourth, a multiple regression analysis was conducted to review the effects of the leadership style of the football coach on the players’ social skills. All statistical hypotheses were verified at a significance level of $\alpha=.05$.

RESULTS

Correlation between leadership style and social skills: Pearson’s correlation coefficient was calculated to review any correlation between the leadership style of adolescent football coaches and the adolescent football players’ social skills. The results are presented in Table 2.

Table 2: Correlation between leadership style and social skills

Subvariable	A	B	C	D	E	F	G	H	I
Training order	-								
Democratic behavior	.341 ***	-							
Authoritative guidance	-.074	.249 ***	-						
Social support	.145*	.550 ***	.107	-					
Positive reinforcement	.285 ***	.245 ***	.036	.376 ***	-				
Empathy	.736 ***	.342 ***	.165*	.224 ***	.327 ***	-			
Self-direction	.422 ***	.381 ***	.047	.383 ***	.520 ***	.392 ***	-		
Self-control	.153*	.517 ***	.049	.585 ***	.144*	.234 ***	.284 ***	-	
Self-expression	.151*	-.047	.149*	.024	.015	.152 *	-.063	.015	-
*p<.05, ***p<.001									

As seen in Table 2, the training order type had a positive correlation with empathy ($r=.736$), self-direction ($r=.422$), self-control($r=.153$) and self-expression ($r=.151$). Democratic behavior showed a positive correlation with empathy ($r=.342$), self-direction ($r=.381$) and self-control ($r=.517$). Authoritative guidance had a positive correlation with empathy ($r=.165$) and self-expression($r=.149$). Social support type had a positive correlation with empathy ($r=.224$), self-direction ($r=.383$) and self-control ($r=.585$). Positive reinforcement showed a positive correlation with empathy ($r=.327$), self-direction($r=.520$) and self-control ($r=.144$).

Association between leadership style and social skills

Association between leadership style and empathy: As seen in Table 3, leadership style had a significant effect on empathy. The significance of the entire regression equation was $F=59.170$ ($p<.001$), and the explanatory power was found to be approximately 58.6% ($R^2=.586$) of total variance. The beta value, which represents the relative effect of leadership type on empathy showed a positive effect with training order ($\beta=.653$, $p<.001$) and positive reinforcement types ($\beta=.102$, $p<.05$), but a negative effect with authoritative guidance ($\beta=-.152$, $p<.001$).

Table 3: Association between leadership style and empathy

	B	SE	β	t	F	R ²
Constant	.605	.257		2.357*	59.170***	.586
Training order	.711	.054	.653	13.124***		
Democratic behavior	.121	.067	.106	1.808		
Authoritative guidance	-.116	.036	-.152	-3.244***		
Social support	.048	.055	.049	.870		
Positive reinforcement	.081	.040	.102	2.053*		
*p<.05, ***p<.001						

Association between leadership style and self-direction: As seen in Table 4, leadership type had a significant effect on self-direction. The significance of the entire regression equation was $F=27.723$ ($p<.001$), and explanatory power was approximately 39.9% ($R^2=.399$) of total variance. The beta value or the relative effect of leadership type on self-direction showed a positive effect with the training order type ($\beta=.255$, $p<.001$), social support($\beta=.139$, $p<.05$) and positive reinforcement ($\beta=.364$, $p<.001$).

Table 4: Association between leadership type and self-direction

	B	SE	β	t	F	R²
Constant	.808	.289		2.797**	27.723***	.399
Training order	.259	.061	.255	4.258***		
Democratic behavior	.136	.075	.127	1.806		
Authoritative guidance	.004	.040	.006	.109		
Social support	.127	.062	.139	2.041*		
Positive reinforcement	.270	.044	.364	6.077***		

*p<.05, **p<.01, ***p<.001

Association between leadership type and self-control

Table 5: Association between leadership type and self-control

	B	SE	β	t	F	R²
Constant	1.792	.289		6.208***	29.047***	.410
Training order	.008	.061	.008	.129		
Democratic behavior	.325	.075	.302	4.323***		
Authoritative guidance	-.051	.040	-.071	-1.270		
Social support	.428	.062	.464	6.897***		
Positive reinforcement	-.078	.044	-.104	-1.752		

***p<.001

As seen in Table 5, leadership style had a significant effect on self-control. The significance of the entire regression equation was F=29.047 (p<.001), and explanatory power was approximately 41.0% (R²=.410) of total variance. The beta value or the relative effect of leadership type on self-control showed a positive effect with democratic behavior (β=.302, p<.001) and social support (β=.464, p<.001).

Association between leadership style and self-expression

Table 6: Association between leadership style and self-expression

	B	SE	β	T	F	R²
Constant	4.162	.488		8.533***	2.125*	.048
Training order	-.182	.103	-.133	-1.768		
Democratic behavior	-.115	.127	-.080	-.902		
Authoritative guidance	.146	.068	.152	2.138*		
Social support	.066	.105	.054	.631		
Positive reinforcement	.047	.075	.047	.622		

*p<.05, ***p<.001

As seen in Table 6, leadership types had a significant effect on self-expression. The significance of the entire regression equation was F=2.125(p<.05), and explanatory power was approximately 4.8%(R²=.048) of total variance. The beta value representing the relative effect of leadership type on self-expression showed a positive effect under authoritative guidance type(β=.152, p<.05).

DISCUSSION

This study was conducted to review the effect of leadership styles of football coaches on the social skills of players. A correlation analysis between the leadership types and the social skills of athletes showed that training order had a positive correlation with empathy, self-direction, self-control and self-expression. Under democratic behavior and social support, a positive correlation was observed with self-control, empathy and self-direction, while under authoritative guidance a positive correlation was observed with self-direction and self-expression. A regression analysis showed that the training order and positive reinforcement had a positive effect on empathy, while a negative effect occurred under authoritative guidance. The training order, social support and positive reinforcement patterns had a positive effect on self-direction, while democratic behavior and social support type had a positive effect on self-control.

In addition, authoritative guidance had a positive effect on self-expression. These findings suggest that when training order and positive reinforcement leadership contributed to increased empathy whereas authoritative guidance may decrease empathy. Therefore, football coaches should increase empathy via democratic behavior rather than adopt an authoritative coaching style. Moreover, this study found that the training order, social support and positive reinforcement led to a positive effect on self-direction. Self-direction refers to proactively leading one's tasks. Self-direction in a sports environment suggests pursuit of individual opportunities and a clear expression of likes and dislikes. Fostering an environment that facilitates self-direction of athletes is a major role of the coach and leader. Therefore, to encourage positive self-direction of football players, a leadership based on training order, social support and positive reinforcement is recommended. In fact, the study by Kim²⁵, also supports this finding, based on the argument that the leadership style oriented towards training and order has a positive effect on the self-direction of middle school students who participate in sports.

Self-control is the ability of the self as an agent controlling the self as an object to ensure appropriate behaviors in a given situation. Democratic behavior and social support in football coaching have a positive effect on the self-control of football players by acting as a deterrent against the satisfaction of short-term desires, as well as the direct expression of their emotions.

Notably, democratic behavior or social support rather than training order or authoritative type had a more positive effect on the self-control of players. Given that adolescents in middle or high school have a tendency to rebel when suppressed or overly controlled, adopting a coaching style that recognizes the individual athlete and supports them appears to result in a positive self-control, partly out of a desire to meet expectations.

In summary, training guidance and positive reinforcement have a positive effect on empathy and self-direction, while an authoritative approach has a negative effect on empathy, suggesting the need for appropriate leadership style for coaches of adolescent football players. Moreover, as democratic behavior and social support play a positive role in self-control, coaches of adolescent football players should adopt these coaching styles for adequate self-control of players.

CONCLUSION

This study was conducted to identify the effects of leadership style of adolescent football coaches on the players' social skills. To that end, a total of 215 adolescent football players registered with the Korean Football Association as of 2018 were used as subjects in a questionnaire. Data were analyzed using SPSS 21.0 for frequency, exploratory factor analysis, reliability verification, correlation analysis and multiple regression analysis. The findings were as follows.

First, a review of the correlation between the leadership style of adolescent football coaches and the players' social skills revealed that training order had a positive correlation with empathy, self-direction, self-control and self-expression. Democratic behavior, social support and positive reinforcement had a positive correlation with empathy, self-direction and self-control. Authoritative guidance was positively correlated with empathy and self-expression. Second, a review of the association between the leadership style of adolescent football coaches and the social skills of players found a positive effect between training order ($\beta=.653$, $p<.001$) and positive reinforcement ($\beta=.102$, $p<.05$), but a negative effect under authoritative guidance ($\beta=-.152$, $p<.001$). Third, a review of the association between leadership style of adolescent football coaches and the players' self-direction revealed a positive effect with the training order ($\beta=.255$, $p<.001$), social support ($\beta=.139$, $p<.05$) and positive reinforcement ($\beta=.364$, $p<.001$).

Fourth, a positive effect on players' self-control was observed with democratic behavior ($\beta=.302, p<.001$) and social support provided by the coaches ($\beta=.464, p<.001$). Fifth, the self-expression of players was enhanced under the authoritative style ($\beta=.152, p<.05$).

Association between Selection Attribution of Marine Tourism in Jeju, Overall Satisfaction and Motivation

Young-Hee Han¹, Kyung-Seok Han², Chun-Ho Yang²

¹Dept. Taxation Namseoul University; ²Dept. of Marine Sports Hanseo University

ABSTRACT

Background/Objectives: This study was conducted to identify the association between the selection factors of Jeju marine tourism, overall satisfaction and motivation.

Method/Statistical analysis: To that end, a questionnaire was administered to a total of 290 Korean tourists participating in marine swimming, sight-seeing and skin scuba diving in Jeju. Data were analyzed using SPSS 21.0 for frequency and exploratory factor analysis, reliability verification, correlation and multiple regression analysis.

Findings: The findings were as follows. First, selection attributions of Jeju marine tourism showed a positive correlation with overall satisfaction and motivation. Second, the selection attributions of Jeju marine tourism for overall satisfaction were positively affected by safety measures ($\beta=.668$, $p<.001$), natural environment ($\beta=.251$, $p<.001$) and cost ($\beta=.078$, $p<.05$). Third, safety measures ($\beta=.532$, $p<.001$), natural environment ($\beta=.221$, $p<.001$), cost ($\beta=.268$, $p<.001$) and accessibility ($\beta=.227$, $p<.001$) positively affected the intention to re-visit. Fourth, while safety measures ($\beta=.257$, $p<.001$) and natural environment ($\beta=.606$, $p<.001$) positively affected tourists' recommendation, the cost factor ($\beta=-.155$, $p<.01$) negatively affected their intentions for recommendation.

Improvements/Applications: Safety measures, natural environment, cost and accessibility were positively associated with overall satisfaction. In particular, safety measures and natural environment had a positive effect on the intention to re-visit and the intention to recommend. However, cost had a negative effect on the intention to recommend to others.

Keywords: *Marine tourism, selection attribution, overall satisfaction, intention to re-visit, intention to recommend*

INTRODUCTION

The sea covers 70% of the total surface area of the Earth and has a great influence on the economic, social and cultural activities of mankind. The marine life has been predominantly the domain of fishery; however, as marine tourism increases, leisure and tourism activities are increasingly becoming popular, in addition to such activities in land-locked areas. In particular, conversion of marine resources into tourist attractions assumes great significance ¹. Given the cases of industrialized

countries, marine tourism is seen as an area with high growth potential in terms of participation rate and economic implications ². Launch of cruise routes and development of high function dry suits facilitate marine tourism to realize mankind's aspirations.

Overall, tourism around the world is moving from land-locked areas to marine attractions. In industrialized countries, the participation rate for marine tourism is around 40~50%, and marine tourist sites are being developed through waterside space development projects. Key hubs for marine tourism include beaches, marinas and cruise terminals, with cruise, skin scuba diving, wind surfing and yachts constituting a large share of marine sports. In Korea, too, marine sports activities have increased, along with the development of waterside spaces ¹. In addition, with increased interest in green and blue tourism in Korea, interest in marine tourist activities

has also grown, with activities not only occurring on the beach, but also on, in and under the sea. Recreational aspects of beaches and marinas are being emphasized³. Marine tourism has also increased the expectation for efficient and optimal usage of resort areas off, on or under sea. Tourism is expected to increase the focus on activities, with alternative tourism focusing on the sea attracting further development.

Jeju Island is emerging as the optimal area for marine tourism, given its natural environment as a volcanic island, growing interest in green and blue tourism and a shift in tourist paradigms. In addition to its attractiveness as a marine tourist destination, it has mild weather, a wide range of marine eco-system and a beautiful natural environment that offers great potential as a marine tourism attraction⁴. Understanding of marine tourists and their behavior is needed to meet their demand for Jejuin marine tourism. Previous studies have analyzed the tourist consumer profile to formulate marketing strategies based on their motivation, selection attributions, tourism satisfaction and behavior. Selection attribution refers to consumers purchasing a bundle of attributes, rather than seeing the product as a single item⁵. Similarly, selection attribute refers to the attitude that leads to purchase based on a product's attributes compared with other attributes^{6,7}.

The factors underlying the selection of a tourist product are important behavior al variables determining the decisions made by tourists during their visit. Moreover, the concept of selection attribution is often used together

with the benefits of participation or selection factors. Selection attribution of tourist products is considered a key variable facilitating forecast satisfaction and motivation. Various empirical studies have been conducted to determine the structural association among these variables; however, studies investigating marine tourism only started to appear in the 2000s when Lee⁸ argued that selection attributions of marine tourism are the driving force for marine tourism. However, empirical studies that address various categories of selection attributions are unavailable, and almost no studies reviewed the association between selection attribution, overall satisfaction and motivation in marine tourism. Therefore, this study was used to conduct an empirical analysis of the factors considered important by Korean tourists who participated in swimming at sea, sight-seeing or skin scuba diving, when selecting marine tourism, and their association with overall satisfaction and motivation.

METHODOLOGY

Study subjects: Korean tourists who participated in swimming at sea, sight-seeing or scuba diving in Jeju from July to September 2017 were selected as the study population. Convenience sampling was used to select 300 study subjects. A questionnaire was distributed and subjects were asked to fill it out themselves. The completed questionnaire was immediately retrieved. Excluding those with insufficient responses or with double-marked responses, a total of 290 copies were used for the final analysis. The general characteristics of the study subjects are listed in Table 1.

Table 1: General characteristics of study subjects

Variable	Category	Frequency (n)	Percentage (%)
Gender	Male	153	52.8
	Female	137	47.2
Age	20s	66	22.7
	30s	102	35.2
	40s or older	122	42.1
Companion	Spouse/lover	38	13.1
	Club member/work colleague	93	32.1
	Family/relative	88	30.3
	Friend	71	24.5
Area of residence	Metropolitan area	101	34.8
	Chungcheong	34	11.7
	Gyeongsang	43	14.8
	Jeolla	52	17.9
	Gangwon	60	20.7
Participation type	Swimming	134	46.2
	Off-shore sightseeing	98	33.8
	Skin scuba diving	58	20.0
Total		290	100

STUDY TOOLS

The questionnaire consisted of 5 questions involving socio-demographic characteristics, 18 questions pertaining to selection attribution as an independent variable, 5 questions related to overall satisfaction which is a mediating variable and 4 questions on motivation, which is a dependent variable.

Selection attribution is defined as attributes that affect a consumer's decision-making or selection of alternatives^{6,7}. In this study, it is defined as an important factor that underlying a decision whether or not to participate in marine tourism. Satisfaction is the subjective feeling of an individual regarding the use or ownership of a product or services⁹. Based on previous studies reporting that the overall satisfaction for a single item reflected customer satisfaction better than satisfaction for each attribute and reduced errors in measurement^{10,11,12}, in this study, satisfaction was defined as an overall subjective feeling of the participants in marine tourism after their tourist activities.

It was measured as a single item. Motivation was defined as an individual's will or belief that represents specific future behaviors following a specific perspective^{13,14}. The measurement elements vary across different studies. In this study, it was defined as the will or belief of tourists and their willingness to forward information on a product or service to others. Four sub-variables of selection attributions were used in this study: safety measures, natural environment, cost, and accessibility. Motivation consisted of a total of 2 items, which were intention to re-visit and intention to recommend.

Responses to each question was measured on a 5-point Likert Scale, with "not at all" assigned 1 point, "no" scoring 2 points, "average" 3 points, "yes" considered 4 points and "very much so" resulting in 5 points.

Exploratory factor analysis and reliability: To verify the validity, exploratory factor analysis was used. Using the varimax method, only questions with a factor load of .40 or greater were selected. In addition, to verify the reliability, Cronbach's alpha coefficient was used in accordance with internal consistency standards.

Selection attribution: In this study, 20 selection attributions of marine tourism were used for the survey. An exploratory factor analysis was conducted to convert

the selection attributions to factors. After an analysis of the factors and reliability, items with a factor load of less than 0.6 and 2 items associated with a difficult factor expression were excluded, resulting in a total of 18 questions. A detailed analysis of the results shows that factor load and communality were both .06 or greater. Four factors with an Eigen value of 1.0 or greater were extracted for selection attribution. The initial Eigen values of selection attributions were as follows: Safety measures (9.051), natural environment(1.763), cost(1.166) and accessibility (1.026). Explanatory power was found to be approximately 72.256% of total variance. The KMO value which is used to verify the sample fitness was .905, and Bartlett's test of sphericity was 3721.551(sig=.000), indicating the significance probability. Reliability was .820 for safety measures, .867 for the natural environment, .853 for cost, and .841 for accessibility, indicating a high internal consistency.

Motivation: Motivation for marine tourism in this study was measured using a total of 6 items. To convert motivation into factors, an exploratory factor analysis was conducted. According to analysis of factors and reliability, items with a factor load of less than 0.6, and 2 items with difficulty in factor expression were excluded, resulting in a total of 4 items. A specific review of the results show s that factor load and communality,were both .06 or higher. For motivation, 2 factors with an Eigen value of 1.0 or greater were extracted. The initial Eigen value of motivation was classified into intention to re-visit (2.383) and intention to recommend (1.207), with explanatory power accounting for approximately 89.765% of total variance.

The KMO value representing the sample fitness was .570, and Bartlett's test of sphericity was 609.702(sig=.000), indicating the significance probability. In terms of the reliability for sub-variables of motivation, intention to re-visit scored .792 and intention to recommend scored .767, indicating a high reliability for internal consistency.

STATISTICAL ANALYSIS

SPSS(ver. 21.0) was used for statistical analysis of the association between selection attribution of Jeju marine tourism, the overall satisfaction, and motivation. Frequency analysis was used to review the socio-demographic variables of the subjects. The validity and reliability of each item on the questionnaire was reviewed

via an exploratory factor analysis and Cronbach's alpha was calculated. Participants' overall satisfaction and motivation were analyzed in a correlation analysis of their selection attributions in Jejumarine tourism. A multiple regression analysis was conducted to review the effect of selection attributions of Jeju marine tourism on overall satisfaction and motivation. All statistical hypothesis tests were conducted at a significance level of $\alpha=.05$.

RESULTS

Correlation between the selection attributions of Jeju marine tourism, overall satisfaction and motivation: Pearson's correlation coefficient was calculated to correlate the selection attributions of Jeju marine tourism

with the overall satisfaction and motivation. The results are displayed in Table 2.

As seen in Table 2, safety measures had a positive correlation with overall satisfaction ($r=.911$), intention to re-visit ($r=.739$) and intention to recommend ($r=.612$). Natural environment had a positive correlation with overall satisfaction ($r=.753$), intention to re-visit ($r=.416$) and intention to recommend ($r=.740$). The cost factor had a positive correlation with overall satisfaction ($r=.710$), intention to re-visit ($r=.655$) and intention to recommend ($r=.538$). Accessibility was positively correlated with overall satisfaction ($r=.719$), intention to revisit ($r=.655$) and intention to recommend ($r=.538$).

Table 2: Correlation between the selection attributions of Jeju marine tourism, overall satisfaction and motivation

Sub-variable	Safety measures	Natural environment	Cost	Accessibility	Overall satisfaction	Intention to re-visit	Intention to recommend
Safety measures	-						
Natural environment	.655***	-					
Cost	.699***	.573***	-				
Accessibility	.725***	.597***	.652***	-			
Overall satisfaction	.911***	.753***	.710***	.719***	-		
Intention to re-visit	.739***	.416***	.655***	.655***	.648***	-	
Intention to recommend	.612***	.740***	.538***	.538***	.691***	.328***	-
*** $p<.001$							

Association between selection attribution and overall satisfaction

Table 3: Association between selection attribution and overall satisfaction

	B	SE	β	t	F	R2
Constant	.089	.086		1.035	508.694***	.877
Safety measures	.637	.034	.668	18.941***		
Natural environment	.240	.027	.251	8.784***		
Cost	.066	.026	.078	2.549*		
Accessibility	.033	.032	.033	1.037		
* $p<.05$, *** $p<.001$						

As seen in Table 3, selection attribution showed a significant effect on overall satisfaction. The significance of the overall regression equation was $F=508.694$ ($p<.001$), and explanatory power was approximately 87.7% ($R^2=.877$) of total variance. Beta value representing the relative effect of selection attribution on overall satisfaction showed a positive value for safety measures ($\beta=.668$, $p<.001$), natural environment ($\beta=.251$, $p<.001$), and cost ($\beta=.078$, $p<.05$).

Association between selection attribution and motivation

a. Association between selection attribution and motivation

Table 4: Association between selection attribution and intention to re-visit

	B	SE	β	t	F	R²
Constant	.614	.171		3.585***	119.370***	.626
Safety measures	.579	.067	.532	8.648***		
Natural environment	.240	.054	.221	4.427***		
Cost	.258	.052	.268	5.000***		
Accessibility	.258	.064	.227	4.047***		
***p<.001						

As seen in Table 4, selection attribution revealed a significant effect on the intention to re-visit. The significance of the entire regression equation was F=119.370(p<.001), and explanatory power was approximately 62.6%(R²=.626) of total variance. The beta value, which is the relative effect of selection attribution on the intention to re-visit was positive in terms of safety measures (β=.532, p<.001), natural environment (β=.221, p<.001), cost(β=.268, p<.001) and accessibility (β=.227, p<.001).

b. Association between selection attribution and intention to recommend

Table 5: Association between selection attribution and intention to recommend

	B	SE	β	t	F	R²
Constant	.633	.174		3.628***	101.592***	.588
Safety measures	.272	.068	.257	3.986***		
Natural environment	.640	.055	.606	11.563***		
Cost	-.144	.052	-.155	-2.744**		
Accessibility	.100	.065	.090	1.533		
***p<.001						

As seen in Table 5, selection attribution showed a significant effect on the intention to recommend. The significance of the entire regression equation was F=101.592(p<.001), and explanatory power accounted for approximately 58.8%(R²=.588) of total variance. The beta value showed a positive effect in safety measures (β=.257, p<.001) and natural environment (β=.606, p<.001), whereas a negative effect for cost (β=-.155, p<.01).

DISCUSSION

Experts forecast that the 21st century will be a marine century. In recent years, countries around the world have taken renewed interest in the sea resulting in growing competition in this field. As the importance of the sea grows, interest in marine tourism will also grow in Korea, as has been observed in industrialized countries.

The paradigm for 21st century tourism involves a shift in focus from land-based tourism to sea-based tourism, and from sight-seeing to experience-oriented tourism. The sea covers a large area of the Earth’s surface and can be used in all its dimensions including the sea surface, undersea and the beach. The potential for development is enhanced by space provided for a variety of experiences and activities. Given the potential for development and increased interest in the sea, a basic understanding of marine tourists, their psychology, selection attribution and satisfaction is needed to create the demand for marine tourism. Therefore, this study was conducted to correlate the selection attribution of Jeju marine tourism, with overall satisfaction and motivation. The findings showed that the selection attribution of Jeju marine tourism had a positive correlation with both overall satisfaction and motivation.

Jeju Island consists of multiple tourist facilities and services. The selection attribution of participants in Jeju's marine tourism is affected by various factors. Selection attribution refers to the social, physical, psychological and behavioral characteristics of the tourists related to their perceptions and experiences in marine tourism. Participant tourists compared it with other tourist products based on the selection attributions, based on the benefits and finally selected marine tourism. Marine tourism is closely associated with the changes in tourists' attitudes and values, and increased interest by stakeholders in current and expected demand¹⁵. Marine tourism can be defined broadly to include tourist activities that use the sea or the beach. The activity occurs in a specific space unlike in the inland areas, with different selection attributions than those of regular tourism.

Dawn & Thomas¹⁶ classified the evaluation of satisfaction into three stages: pre-consumption, consumption and post-consumption. In this process, overall satisfaction is affected by commercial services, transport, safety facilities, beliefs and intangible products related to leisure activities. From this perspective, safety measures, natural environment and cost had a positive effect on the overall satisfaction, suggesting a positive correlation between the selection attributions of participants in marine tourism and overall satisfaction. Yoon¹⁷ noted that decision-making related to a tourist destination affects satisfaction by combining with overall attributes of the tourist destination. Jeon, Choi & Sim¹⁸ argued that accessibility, auxiliary facilities, service quality and attractiveness have a positive effect on satisfaction, partially supporting the findings of this study.

All sub-variables of selection attribution had a positive effect on the intention to re-visit. Safety measures and natural environment had a positive effect while cost had a negative effect on the intention to recommend. Among the selection attributions, safety measures and natural environment scored high, indicating that safety measures and natural environment are becoming increasingly important in guiding a tourist motivation. Moreover, it points to the need to address the changing desires of participants to increase their interest and attraction for marine tourism in Jeju. Indeed, safety measures to prevent accidents during marine tourism, as well as efforts to maintain a clean and pleasant natural environment are needed. He Xin¹⁹ noted that in the association between selection attribution

and motivation, a significant impact was found in both intention to re-visit and intention to recommend, suggesting tourists' intentions to re-visit or recommend the destination to others.

CONCLUSION

This study was conducted to identify the association between selection attributions of Jeju marine tourism, overall satisfaction and motivation. To that end, a questionnaire was administered to a total of 290 Korean tourists participating in swimming at sea, sight-seeing or scuba diving in Jeju during 2017. Data were analyzed using SPSS 21.0, for frequency, exploratory factor analysis, reliability verification, correlation and multiple regression analysis. The findings were as follows.

First, the selection attribution of Jeju marine tourism had a positive correlation with both overall satisfaction and with motivation.

Second, a review of the association between the selection attribution of Jeju marine tourism and the overall satisfaction revealed a positive effect on safety ($\beta=.668, p<.001$), natural environment ($\beta=.251, p<.001$) and cost ($\beta=.078, p<.05$).

Third, a review of the association between the selection attribution of Jeju marine tourism and intention to re-visit found a positive effect on safety ($\beta=.532, p<.001$), natural environment ($\beta=.221, p<.001$), cost ($\beta=.268, p<.001$) and accessibility ($\beta=.227, p<.001$).

Fourth, a positive effect of safety measures ($\beta=.257, p<.001$) and natural environment ($\beta=.606, p<.001$) on tourists' recommendations to re-visit, whereas a negative effect based on cost ($\beta=-.155, p<.01$).

Safety measures, natural environment, cost and accessibility were positively associated with overall satisfaction. In particular, safety measures and natural environment had a positive effect on the intention to re-visit and the intention to recommend. However, cost had a negative effect on the intention to recommend to others.

The Desire to Win Determines Match Performance Abilities of Taekwondo Athletes in Elementary School

Kyung-Seok Han¹, Chun-Ho Yang¹

¹Dept. of Marine Sports Hanseo University

ABSTRACT

Background/Objectives: This study was conducted to identify the association between the desire to win and match performance ability of Taekwondo athletes in elementary schools.

Method/Statistical analysis: To that end, a questionnaire survey was conducted involving a total of 239 students in their 4th to 6th year of elementary school, who were registered with the Korean Taekwondo Association as of 2018. Data were analyzed using SPSS 21.0 for frequency analysis, exploratory factor analysis, reliability verification, correlation analysis and multiple regression analysis.

Findings: The findings were as follows. First, the desire to win was positively correlated with all sub-variables of match performance ability. Second, a review of the association between the desire to win and match performance success in elementary school Taekwondo athletes showed a positive effect on all three sub-variables of desire to win ($\beta=.111$, $p<.05$), fighting spirit ($\beta=.429$, $p<.001$) and confidence ($\beta=.187$, $p<.01$). Third, a review of the association between the desire to win in Taekwondo athletes in elementary school and their psychological maturity revealed that there was a positive effect in desire to win ($\beta=.248$, $p<.001$) and confidence ($\beta=.480$, $p<.001$). Fourth, a review of the association between the desire to win in Taekwondo athletes in elementary school and their match performance maturity showed that there was a positive correlation in desire to win ($\beta=.240$, $p<.001$) and confidence ($\beta=.467$, $p<.001$).

Improvements/Applications: Given these findings, the desire to win in Taekwondo students of elementary school can be said to have a positive effect on their match performance ability.

Keywords: *Desire to win, confidence, match performance success, psychological maturity, match performance maturity*

INTRODUCTION

Taekwondo athletes face huge competitive pressure in many matches, leading to tension, anxiety and overall mental stress, which are important factors in determining their chances of winning other players. The high tension and anxiety felt by Taekwondo athletes in matches affect their performance ability¹.

Taekwondo matches require technique but also good stamina, as well as the ability to control, adjust and maintain

one's psychological state to bring out one's full potential². Techniques used in Taekwondo matches are elaborate and complex. They need to be prompt and accurate to strike before the other party reacts. When psychological stability is maintained, better performance is possible.

As in any other sport, performance ability is determined through competition. Victory over the opposing athlete requires excellent techniques and tactics and the stamina to compete in all rounds. In addition to psychological stability, the desire to win and confidence are essential for victory. Therefore, many Taekwondo athletes strive to improve their physical function^{3,4}. Athletes competing in a Taekwondo match note that technical prowess is the most important factor determining performance, and is the result of interaction between one-performance Taekwondo matches are elaborate and complex.

Often, due to unexpected reasons, athletes are not able to manifest their full capabilities, despite better stamina, technique or tactics ⁵. With improvements in physical technique and high-tech sports gear, the athlete and complex, adjust and maintain one verification, assumed even more importance in recent years ⁶. It has led to measures to resolve psychological issues and enhance psychological control and improvement for the best performance.

If Taekwondo athletes can identify the strategies to effectively control or adjust the various factors that may appear in a match situation, they can successfully address psychological issues. Previous studies report how psychological or social factors affect sports performance in a variety of fields and not just Taekwondo and emphasize self-management ^{7, 8}, psychological satisfaction ^{9, 10}, mental ability to handle the match result ^{11, 12} and psychological techniques for improved match performance ^{1, 13}. Meanwhile, the desire to win enhances performance and a strong goal-driven mentality to overcome a painful or challenging situation in sports, referred to as psychological factor, affects match performance, in association with the psychological strength ¹⁴. The desire to win which refers to the ongoing ability to execute match performance techniques even in a competitive situation can be conceptualized into a desire for success, fighting spirit and confidence. ¹⁵.

The desire to win represents mental prowess and has a positive effect on match performance under appropriate self-management ¹⁶. The strong desire to win and the confidence that one can beat the opposing athlete represent mental prowess in the sport scene. Therefore, the desire to win is one of the most basic psychological factors that athletes must have ¹⁷. Previous studies analyzing the desire to win and match performance ^{8, 18}

show that both theoretically and from experience, the athlete must have ¹⁷. Pressings athlete represent mental prowess the match performance ¹⁵.

Match performance in sports is the result of interaction between physical and psychological factors. From the perspective of sports psychology, it is the association between kinetic function and psychological variables. In general, match performance ability refers to the comprehensive ability in a sports situation including the athlete psychology, it is the association by genetic factors, as well as physique, stamina, workout level and experience, psychological state, experience and conditions of the arena ⁸. As such, even when an athlete is fit for a specific sport and can manage training to maximize his function, unless the external and internal psychological factors are managed, the goal cannot be realized ¹⁹. Therefore, this study reviews the effect of the desire to win among Taekwondo athletes in elementary school on their match performance ability, to provide various data for improved match performance and the ability to appropriately control psychological situations uncondusive to the goal.

METHODOLOGY

Study subjects: Taekwondo students who were in the 4th grade or higher in elementary school and who were registered with the Korean Taekwondo Association as of 2018 were selected as the study population. Elementary students of 4th grade or higher were selected to increase the reliability of the questionnaire, by ensuring that the subjects understand the question. Convenience sampling was used to select a total of 250 subjects. Excluding 11 copies of the questionnaire with insufficient or unreliable responses, a total of 239 copies were used for the final analysis. The general characteristics of the subjects are listed in Table 1.

Table 1: General characteristics of study subjects

Variable	Category	Frequency (n)	Percentage (%)
Gender	Male	169	70.7
	Female	70	29.3
Year	4 th year	47	19.7
	5 th year	80	33.5
	6 th year	112	46.9
Athletic experience	Less than 1 year	39	16.3
	1 year–2 years	51	21.3
	2 years–3 years	67	28.0
	3 years or more	82	34.3

	Regional competitions	123	51.5
	No awards won	26	10.9
Total		239	100

STUDY TOOL

A questionnaire was used as the study tool. The questionnaire consisted of 4 questions involving personal traits, 11 questions pertaining to the desire to win, which is an independent variable, and 13 questions on match performance ability, which is a dependent variable.

The scale to measure the desire to win originally developed by Shin, Kim, Park¹⁵ and reconfigured by Jeon, Choo¹⁸, Kim, Han²⁰ was revised for this study. The desire to win includes fighting spirit, confidence, and desire for success. Match performance ability was measured using the questionnaire that was originally developed by Highlen&Bennett²¹ and reconfigured by Chae²² and Hong¹⁰. Match performance ability consisted of match performance success, psychological maturity, and match performance maturity. Responses to the questions were measured on a 5-point Likert Scale.

Exploratory factor analysis and reliability: To verify the validity, construct validity verification as well as exploratory factor analysis were used. Applying the varimax method, only questions with a factor load of .40 or greater were selected. Since a multi-category scale was used to measure the same concept in this study, Cronbach's a coefficient was used in accordance with the reference for internal consistency to verify the reliability of the study tool.

Desire to win: For desire to win, 3 factors with an Eigen value of 1.0 or greater were extracted. Factors associated with the desire to win were categorized into confidence, desire to win and fighting spirit. The explanatory power

of the desire to win was found to be approximately 68.0% of total variance. KMO standard fitness was found to be .807($p < .001$). The reliability testing of the sub-variables in the desire to win showed a confidence of .661, desire to win.601, and fighting spirit.696, indicating a high internal consistency.

Match performance ability: For match performance ability, 3 factors with an Eigen value of 1.0 or greater were extracted. Factors of match performance ability included match performance success, psychological maturity and match performance maturity. The explanatory power of match performance ability was approximately 60.7% of total variance, and KMO standard fitness was .837($p < .001$). A verification of the reliability of the sub-variables of match performance ability found a match performance success value of .680, psychological maturity value of .643, and match performance maturity value of .639, indicating a high internal consistency reliability.

Data processing: In this study, questionnaire response sheets with insufficient or unreliable responses were excluded from the analysis. Statistical analysis was carried out using SPSS 21.0. Specifically, frequency analysis was conducted for the socio-demographic characteristics of the subjects. Verification of the fitness of the tool was done through factor analysis, and verification of reliability conducted with Cronbach's α . A correlation analysis and multiple regression analysis were carried out for the desire to win and match performance ability in elementary school Taekwondo athletes. The significance level of all data was set at $p < .05$.

RESULTS

Correlation analysis for desire to win and match performance ability

Table 2: Correlation between desire to win and match performance ability

Sub-variable	Desire to win	Fighting spirit	Confidence	Match performance success	Psychological maturity	Match Performance maturity
Desire to win	-					

Conted...

Fighting spirit	.435***	-				
Confidence	.434**	.301***	-			
Match performance success	.379***	.534***	.364***	-		
Psychological maturity .489***		.328***	.610***	.372***	-	
Match performance maturity	.429***	.214***	.562***	.479***	.516***	-
***p<.001						

To identify the correlation between the desire to win and match performance ability, Pearson The significant coefficient was calculated. Table 2 shows the results of the correlation analysis.

As seen in Table 2, the desire to win had a positive correlation with match performance success (r=.379), psychological maturity (r=.489), and match performance maturity (r=.429). Fighting spirit had a positive correlation with match performance success (r=.534), psychological maturity (r=.328), and match performance maturity (r=.214). Confidence had a positive correlation with match performance success (r=.364), psychological success (r=.610), and match performance maturity (r=.562). In other words, the desire to win had a positive correlation with all sub-factors of match performance ability.

Association with the desire to win and match performance ability

Association between the desire to win and match performance

Table 3: Association between desire to win and match performance ability

	B	SE	β	t	F	R ²
Constant	.907	.295		3.073**	40.263***	.339
Desire to win	.126	.071	.111	1.764*		
Fighting spirit	.389	.054	.429	7.220***		
Confidence	.184	.058	.187	3.152**		
*p<.05, **p<.01, ***p<.001						

As seen in Table 3, the desire to win had a significant effect on match performance success. The significance of the entire regression equation was (F=40.263, p<.001), and the explanatory power was approximately 33.9%(R²=.339) of total variance. The beta value, which represents the relative effect of the desire to win on match performance success, and showed a positive effect on the desire to win (β=.111, p<.05), fighting spirit (β=.429, p<.001) and confidence (β=.187, p<.01).

Association between the desire to win and psychological maturity

Table 4: Association between the desire to win and psychological maturity

	B	SE	β	t	F	R ²
Constant	1.284	.238		5.388***	61.219***	.439
Desire to win	.246	.057	.248	4.273***		
Fighting spirit	.060	.043	.076	1.382		
Confidence	.413	.047	.480	8.762***		
***p<.001						

As seen in Table 4, the desire to win had a significant effect on psychological maturity. The significance of the entire regression equation was $F=61.219(p<.001)$. Explanatory power was approximately 43.9% ($R^2=.439$) of total variance. The beta value, which represents the relative effect of the desire to win on psychological maturity, showed a positive effect on the desire to win ($\beta=.248, p<.001$) and confidence ($\beta=.480, p<.001$).

Association between the desire to win and match performance maturity: As seen in Table 5, the desire to win had a significant effect on match performance maturity. The significance for the entire regression equation was $F = 43.852 (p < .001)$, and the explanatory power was approximately 35.9% ($R^2 = .359$) of total variance. The beta value revealed a positive effect on the desire to win ($\beta = .240, p < .001$) and confidence ($\beta = .467, p < .001$).

Table 5: Association between the desire to win and match performance maturity

	B	SE	β	T	F	R ²
Constant	1.328	.249		5.344***	43.852***	.359

Confidence	.392	.049	.467	7.975***		

* $p<.05$, *** $p<.001$

DISCUSSION

This study was conducted to identify the association between the desire to win and match performance ability in Taekwondo athletes at elementary school. Based on the correlation analysis and multiple regression analysis conducted, the following findings are discussed.

The desire to win refers to the desire to successfully end a match. In particular, athletes with a strong desire to win indicate a strong ego and a strong desire not to lose¹⁷. From this perspective, the desire to win is an absolute psychological necessity for athletes. A review of the impact of the desire to win on match performance revealed that fighting spirit and confidence determined success, while the desire to win and confidence affected psychological and match performance maturity. In terms of the psychological factors of Taekwondo athletes, weak mental prowess or desire to win failed to bring out their full potential²³, resulting in failure. Meanwhile, a strong desire to win and do the best in actual matches resulted in the manifestation of athletefull potential. Therefore, the desire to win among elementary school Taekwondo athletes suggests a positive effect resulting in successful performance. In particular, confidence affects psychological success and maturity, which is consistent with the study conducted on judo athletes¹¹ that reported how the Korean style desire to win had a statistically significant effect on successful execution of a match. The desire to win or confidence in elementary school

Taekwondo athletes can have a positive effect in running a match, and confidence positively affects the match outcome. The claim that when the desire to win or fight is expressed, positive thinking can be maintained during a match, which in turn enhances match performance²⁴ is in line with the argument of this study. In addition, the study that found the desire to win has a significant effect on the studentsmatch performance^[20] suggesting that the desire to win is an important psychological factor in match performance.

CONCLUSION

This study was conducted to identify the association between the desire to win and match performance ability of Taekwondo athletes in elementary schools. To that end, a questionnaire survey was conducted involving a total of 239 students in their 4th to 6th year of elementary school, who were registered with the Korean Taekwondo Association as of 2018. Data were analyzed using SPSS 21.0 for frequency analysis, exploratory factor analysis, reliability verification, correlation analysis and multiple regression analysis. The findings were as follows.

First, the desire to win was positively correlated with all sub-variables of match performance ability. Second, a review of the association between the desire to win and match performance success in elementary school Taekwondo athletes showed a positive effect on all three sub-variables of desire to win ($\beta=.111, p<.05$), fighting

spirit ($\beta=.429$, $p<.001$) and confidence ($\beta=.187$, $p<.01$). Third, the correlation between the desire to win and psychological maturity in elementary school Taekwondo athletes revealed a positive effect on the desire to win (psychological maturity in elementary school Taekwondo athlete the correlation between the desire to win and match performance maturity in elementary school Taekwondo athletes revealed a positive effect on the desire to win ($\beta=.240$, $p<.001$) and confidence match performance maturity in elementary school Taekwondo athletes confidence ($\beta=.187$, $p<.01$).

The Implementation of a Digital Healthcare Service for People with Disabilities: A Pilot Study

Soo-Kyung Bok¹, Youngshin Song²

¹Professor, Dept. of Rehabilitation Medicine, College of Medicine; ²Professor, College of Nursing, Chungnam National University, 266 Munwha-ro, Jung-gu, Republic of Korea

ABSTRACT

Background/Objectives: The purpose of this pilot study was to implement a digital healthcare service, and identify the satisfaction of people with disabilities either in their homes or in facilities who used this service.

Method/Statistical analysis: People with disabilities residing in community and welfare institutions were recruited. In the pilot study, medical information such as blood sugar, blood pressure, and Braden scale scores were recorded with an online digital healthcare system. Health care providers counseled and educated patients regarding their chronic diseases and rehabilitation-associated risk factors over the course of 6 months. After study completion, their satisfaction was surveyed using the SERVQUAL model.

Findings: To facilitate this pilot study, 1 university hospital, 2 local clinics, and 5 welfare institutions participated and a total of 166 people with disabilities were recruited. Of the sample, 10 participated in a rehabilitation exercise program. Participants answered a questionnaire regarding their satisfaction with digital healthcare services. The numbers of video conferences, and blood sugar monitoring and blood pressure tests were 474, 4415, and 4251, respectively. After completion of the pilot study, the satisfaction level was scored as 89.63 points, ranging from 0 (no satisfaction) -100 (high satisfaction); thus, demonstrating a high level of satisfaction.

Improvements/Applications: This pilot study can be used as a basic model for a digital healthcare system and can contribute to the improvement of awareness of digital healthcare services for people with disabilities.

Keywords: Healthcare system, Disability, Satisfaction, Digital, Compliance

INTRODUCTION

The worldwide prevalence of disability is reported to be about 15.6%, but the prevalence is 18.0% among developing countries and 11.8% among developed ones^[1]. Many people with disabilities have problems not only managing their physical difficulties with daily life, but also from having to assess health-related services. The WHO states that “disability is a global public health issue because people with disability, throughout the life course, face widespread barriers in accessing health and related services, such as rehabilitation, and have worse health outcomes than people without disability” (p. 1)^[1].

Corresponding Author:

Youngshin Song
Professor, College of Nursing,
Chungnam National University, South Korea
Email: yssong87@cnu.ac.kr

In the “WHO Global Disability Action Plan 2014-2021,” three objectives were proposed: “a) to remove barriers and improve access to health services and programs; b) to strengthen and extend rehabilitation, habilitation, assistive technology, assistance and support services, and community-based rehabilitation; and c) to strengthen collection of relevant and internationally comparable data on disability and support research on disability and related services”(p. 3)^[1]. Among these objectives, access to the health service is the first priority. In particular, if a disabled person contracts a chronic disease, access to the healthcare service becomes a requirement, rather than an option, for life support.

People with disabilities may not be able to move freely due to their limited physical conditions and limited access to a transportation system when they need to visit the hospital. A digital healthcare system (DHS)

that consists of a computer and video tele-monitoring system can be one solution for assistance in accessing healthcare services in that situation^[2].

The definition of “digital healthcare” comprises healthcare-related technology such as digitalized information systems. Mobile digital devices and implanted biosensors to monitor physical functions or chronic disease conditions can be referred to as digital healthcare, in general^[2]. DHS, as driven by the use of internet-based digital health monitor systems, can be involved in the telemedicine practices of their primary healthcare providers. Telemedicine using digital technologies can involve monitoring patients’ self-care of their chronic health conditions at home without the need to visit their healthcare providers. Thus, they will be able to more easily communicate with healthcare providers via technology such as a videoconferencing system^[3]. Such technologies not only improve patient convenience but also lower the cost of care in the improvement of patients’ health outcomes. For example, a telecare system that involves patients’ self-monitoring at home contributed to a reduction in readmissions rates in the US^[4].

To encourage and monitor the physical functions and chronic medical conditions of people with disabilities at home and welfare facilities, a digital healthcare system can be useful in Korea. However, the Korean healthcare insurance system does not provide financial support for digital health devices such as mobile tele-monitoring systems and internet-based videoconferencing counseling. Since the DHS is only in its developing stages, a health policy agreement in terms of the commercialization of medical costs has not been reached. To date, several studies regarding the use of a wireless mobile device to monitor chronic medical conditions such as blood pressure have been conducted, but few have encouraged the monitoring of physical function in disability using an internet-based videoconferencing and health monitoring system. Therefore, the purpose of this pilot study was to develop a DHS for people with disabilities and then analyze participant satisfaction.

MATERIALS AND METHOD

Sample: The sample for this pilot study of the application of and satisfaction with the DHS was recruited from among community-dwelling individuals who either lived in their own houses or disability facilities in D-city, South Korea. A total 166 participated. Among these,

40 were living their own houses and 126 were from 5 disability facilities.

The inclusion criteria were follow as: people with disabilities who: a) had been diagnosed by a physician, b) aged over 18 years, and c) could operate the DHS. Participants who had been admitted to the hospital to treat an acute health problem were excluded from this study.

Procedures: Several steps were involved in this pilot study: a) constructing the DHS, b) recruiting the participants and disability facilities, c) implementing the DHS for a duration of 5 months, and d) surveying participant satisfaction with the DHS.

Measurement

Demographics and utilization of the healthcare system: Participant demographics were collected such as gender, age, educational level, monthly income, duration of the disability, types of disability, and the main caregiver. Utilization of the healthcare system included time spent visiting the healthcare system, types of transportation used when visiting the healthcare system, and distance traveled to the healthcare system.

Outcomes and satisfaction with the DHS: The DHS outcomes measured included the frequency of blood sugar and blood pressure tests, and video conferences over the course of 5 months.

Satisfaction with the DHS was surveyed using a paper-pencil questionnaire. Items in this questionnaire were developed based on the SERVQUAL model^[5]. The SERVQUAL model was based on concepts regarding perceived service quality. It is a multiple-item scale used to assess the consumer’s perceptions. In this pilot study, two different versions were used to collect information concerning satisfaction with the DHS. To identify DHS satisfaction among participants who were living in their homes, a 5-item questionnaire (version 1) was distributed. For participants who were residing in facilities, a 9-item questionnaire was used (version 2). Version 1 consists of items measuring satisfaction aspects including trustfulness, kindness, facilities/equipment, and DHS organization. Version 2 included these and 4 additional items (friendship, professionalism, staff competence, and intention to reuse). The responses for versions 1 and 2 were measured on a scale ranging from 1 (extremely disagree) to 5 (extremely agree). High scores indicated greater satisfaction. The reliability values (Cronbach’s alpha) of versions 1 and 2 were 0.91 and 0.89, respectively.

STATISTICAL ANALYSIS

Descriptive statistics were performed using IBM SPSS Statistics Software. Frequencies, percentages, means, and standard deviations were used to calculate the distribution of the demographics and the degree of DHS satisfaction.

RESULTS

Demographics and utilization of the healthcare system: Table 1 presents the demographics of the participants who were living at home and in welfare facilities [Table 1].

Of the 166 participants, 62.6% were male, and the mean age of the participants who were living at home

was 53 years. Of those who were living in the disability facilities, the mean age was 36 years. Mean years of having the disability was 14 and 23 for those who were living in their own homes and those living in disability facilities, respectively. The main type of disability was brain damage for both types of participants (home 65.0%; facilities 34.1%). Both types of participants visited the healthcare system once a month (home 37.5%; facilities 69.0%). The most frequently used form of transportation was a taxi and a facility vehicle for those who lived in their own homes (47.5%) and those who lived in disability facilities (42.9%), respectively. The travel time to visit the healthcare system was under 30 minutes for both types of participants (home 47.5%; facilities 34.9%).

Table 1: Demographics and utilization of the healthcare system (N = 166)

Demographics		Participants who were living at (in)	
		Home (n = 40), n (%)	Disability facilities (n = 126), n (%)
Gender	Male	15(37.5)	86(68.3)
	Female	25(62.5)	40(31.7)
Age, years	M±SD	53.53(±12.99)	36.98(±12.14)

Contents and outcomes of digital healthcare service: The DHS model was composed of a participant self-monitoring system and healthcare provider videoconferencing system. If the participants who were living either at home or in the disability facilities checked their blood pressure and blood sugar using tele-monitoring devices, that information could be stored in the computer system so the healthcare provider could check it. If some problematic changes were found in the data, a healthcare provider could counsel and educate the participants using the videoconferencing system. Nurses who visited regularly (twice a week) checked the tele-monitoring devices and participants' physical and emotional changes under the guidance of the physicians.

Figure 1 shows the digital healthcare service model.

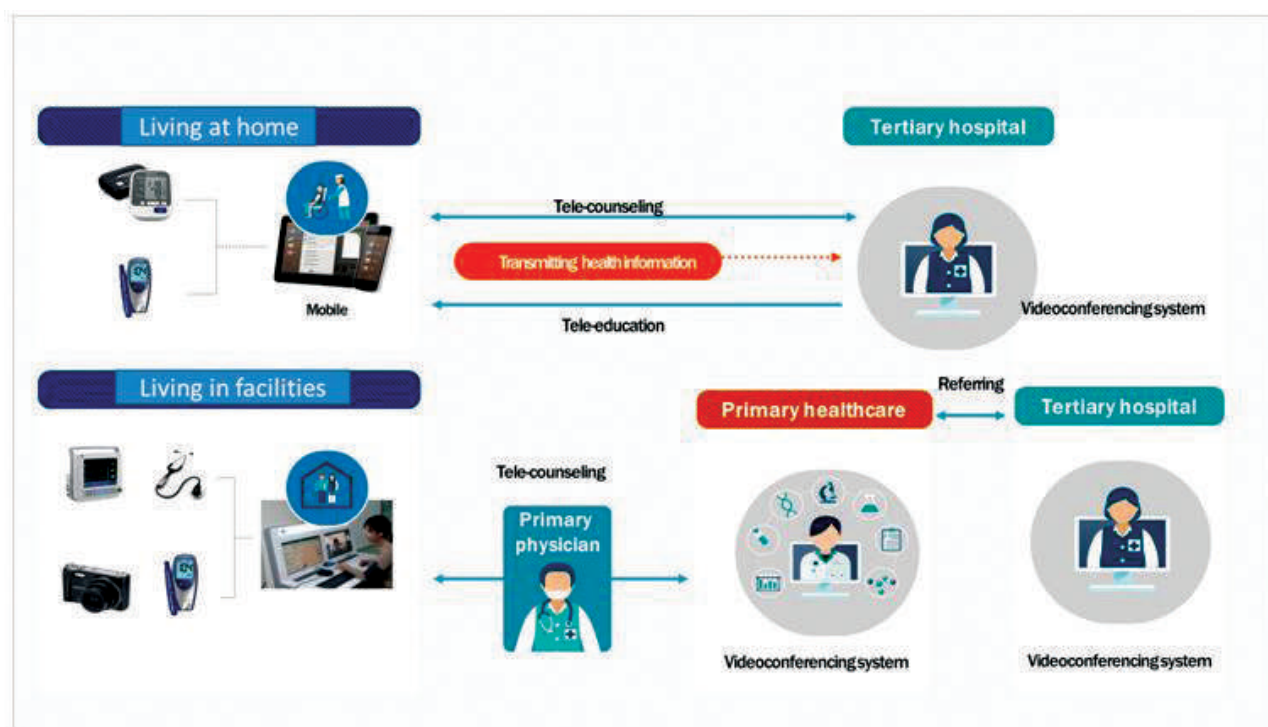

Figure 1: The model of digital healthcare service

The number of blood sugar monitoring tests conducted were 1851 and 2564 for participants who lived at home and in the disability facilities, respectively. The frequencies of blood pressure monitoring were 1716 and 2499 for participants who lived at home and in the disability facilities, respectively. The numbers of counseling sessions via video were 124 and 350 for participants who lived at home and those who lived in the disability facilities, respectively. The outcomes from this pilot study are presented in Table 2.

Table 2: Process outcomes of digital healthcare service

Outcomes	Participants who living at (in)		Total
	Home (n=40), frequency	Disability Facilities (n=126), frequency	
Blood sugar monitor	1851	2564	4415
Blood pressure monitor	1716	2535	4251
Videoconferencing	124	350	474

Satisfaction with the digital healthcare service

Table 3 presents the participants’ satisfaction scores.

The sums of the DHS satisfaction scores were 95.13 and 87.89 points, on a scale ranging from 0-100, for participants who lived in their own houses and those who lived in disability facilities, respectively. That is, the degree of satisfaction was greater among participants who lived in their own houses compared to their counterparts.

Among participants living at home, higher scores were found for all 9 factors (truthfulness, kindness, friendship, professionalism, equipment satisfaction, staff competence, organization, recommendations to others, and intentions to reuse). Those living in the disability facilities also had high scores in truthfulness, kindness, equipment satisfaction, organization, and intentions to reuse the DHS.

Table 3: Satisfaction score of digital healthcare service in participants

Satisfaction	Participants who living at (in)			
	Home		Disability Facilities	
	M ± SD	MIN - MAX	M ± SD	MIN - MAX
Trustfulness	8.72 ± 1.89	5.00 - 10.00	8.50 ± 1.43	4.00 - 10.00
Kindness	19.35 ± 1.44	13.00 - 20.00	35.83 ± 4.24	14.00 - 40.00
Friendship	9.32 ± 1.02	6.00 - 10.00	-	-
Professionalism	9.62 ± 1.00	6.00 - 10.00	-	-
Facilities/equipment	9.58 ± 0.87	7.00 - 10.00	26.40 ± 3.62	12.00 – 30.00
Staff competence	14.63 ± 1.16	9.00 - 15.00	-	-
Organization	14.25 ± 1.37	9.00 - 15.00	8.57 ± 1.41	4.00 – 10.00
Recommendation	4.82 ± 0.59	2.00 - 5.00	-	-
Intention to reuse	4.82 ± 0.59	2.00 - 5.00	8.67 ± 1.62	2.00 - 10.00
Total	95.13 ± 7.65	64.00 - 100.00	87.89 ± 10.25	64.00 - 100.00

DISCUSSION

This pilot study aimed to develop a digital healthcare system and evaluate how satisfied with it people with disabilities were in one rural area of Korea. To develop this DHS, several multidisciplinary professionals, such as a physician, computer programmer, nurses, and a physical therapist, were involved. As a result, mobile communication, videoconferencing, and computer refereeing systems were developed, as was visiting care based on internet networking. Moreover, the participants were satisfied with the DHS.

According to a systematic review of m-Health technology by Free et al^[6], digital devices were used in the existing literature to support clinical decisions, collect data, prescribe medicine, and remind patients of their appointments. In this pilot study, the purpose of the DHS was to make a clinical decision and monitor the changes in the health outcomes of patients with disabilities. Consistent with previous studies^[7,8], the video and audio modes of communication using a computer and mobile device were effective for assessing the data and making a decision. Digital health has been applied to various populations, but little research has focused on disability

care. A health care delivery system geared toward those with disabilities should be driven by patients' needs and their individual situations. A healthcare system that is focused on patient-centered care can explore all necessary factors, including resources^[9]. DHS may contribute to the development of and increase in patient-centered care for people with disabilities.

The effect of DHS in this pilot study was evaluated as participants' satisfaction with DHS. The degrees of satisfaction among the two types of participants (those living at home and in disability facilities) were high. However, digital technology did not satisfy all populations in a previous study. In a study of heart patients, they did not use this technology owing to the emotional burden of having to monitor the patient consistently^[10]. In contrast to that study of heart disease, people with disabilities were satisfied with DHS because they could easily communicate with their healthcare providers via mobile and videoconferencing systems. Visiting nurse care also contributed to improve DHS satisfaction. In this pilot study, the participants were satisfied not only with the equipment/organization but also with the competence of the nursing staff. A regular visiting nurse system that incorporated digital technology was more effective for encouraging patients to maintain their health conditions. DHS satisfaction was higher among those living in their homes than among those living in disability facilities. The home can be one node for a network of digital technologies. In this pilot study, multiple healthcare providers were involved in various roles such as answering patients' questions, interpreting the data supplied by telecare patients, and diagnosing and prescribing medication. Digital health technology that encourages patients' self-monitoring and self-care behaviors has contributed to changing the healthcare environment from "mechanical" medicine to "informational" medicine over the past decade^[11]. The trend toward telemedicine and e-Health practices has become an important area in several countries, whereas the healthcare system in Korea is still in its infancy.

Therefore, this study could be the trial that confirmed the possibility of "e-scaped medicine," as mentioned by Nettleton^[11]. That is, this DHS application may play a role in "medical gaze," as it is distributed over different healthcare providers and various locations^[10,12].

CONCLUSION

Applying the DHS over the course of 5 months promoted participants' satisfaction in terms of trustfulness, kindness, facilities/equipment, DHS organization, friendship, professionalism, staff competence, and intention of reuse. Based on this pilot study, highly technological DHS should be considered as one Korean healthcare system to encourage self-care and self-monitoring.

ABSTRACT

Background/Objectives: purpose of this study was to investigate the effect of squat exercise on the muscle activity and myocardial burden of the lower limb according to water depth.

Method/Statistical analysis: Subjects performed aquatic squat at knee and waist levels. The SBP and leg EMG were measured before and after the experiment, and the myocardial burden was calculated by multiplying the measured heart rate and SBP. Statistical analysis was done by Two-way ANOVA, The value of significance was .05.

Findings: Both the aquatic squats showed a significant increase in lower extremity muscle activity and myocardial burden after the operation. Among the two methods, the knee-level squat increased the muscle activity and enhanced myocardial burden rate.

Improvements/Applications: Both the aquatic squats showed a significant increase in lower extremity muscle activity and myocardial burden after the operation. Among the two methods, the knee-level squat increased the muscle activity and enhanced myocardial burden rate.

Keywords: EMG, Lower Limb, Heart Rate, iEMG, Squat

INTRODUCTION

Aquatic exercise is performed using water resistance. It was initially used to treat musculoskeletal diseases and has been used for various purposes in the past¹. Hydrostatic pressure refers to the pressure constantly exerted on the surface of a submerged object. When the body is submerged in the water, the pressure on the submerged end eliminates blood stagnation, and restores circulation². Buoyancy, another characteristic of water, refers to the force of lifting a submerged object, and reduces the load on the joints and diminishes the risk of injury to the lower limb during aquatic exercise^{3,4}. The buoyancy and its effect on the joint depends on the water depth². The hydrostatic pressure and buoyancy reduce the physiological stress during aquatic exercise, and may

have a positive effect on exercise performance by helping joint mobility and muscle strength⁵. In addition, when the body is submerged, the abdominal and the intubation pressure are increased, and the amount of the first pulse is increased, along with rapid venous blood circulation^{6,3}.

The hemodynamic response refers to heart rate and blood pressure. When the heart rate is multiplied by the systolic blood pressure (SBP), the pressure on the myocardium is known as the rate-pressure product(RPP)⁷. During exercise, SBP and heart rate are simultaneously increased, which also enhances myocardial burden rate⁸.

Abdominal muscles continue to use a small force⁹, while walking on the ground in water leading to increased abdominal muscle activity compared with the ground gait¹⁰. High iEMG levels during physical activity suggest enhanced muscle mobilization and energy consumption¹¹.

In a previous study, when the walking speed was 53.3m/min or more, the oxygen intake and heart rate were higher in the waist, knee, ankle, and water

Corresponding Author:

Hanseo University, Seosan, 31962, Korea,
Email: healthyang@hanseo.ac.kr

compared with walking on the ground. However, the walking speed was ^{1,3,4}the oxygen uptake did not differ between the waist height and the ground conditions¹².

In another previous study, it was found that the heart rate and oxygen intake at the thigh level immersion was higher than at the chest level¹³. In addition, a significant correlation was found between depth and physiological variables. The difference in water depth in aquatic exercise affected the exercise load and suggested that the training effect varied according to the water depth^{14,15}. Thus, the aquatic exercise varied from the ground motion and the physiological reaction, and the effect on the joints differed according to the water depth.

However, previous studies investigating most aquatic exercises were limited to upper extremity and

walking. The purpose of this study was to determine the optimum water depth for aquatic squat by comparing the effect of squat exercise according to differences in EMG response and deep burden.

MATERIALS AND METHOD

Subjects: The experimental subjects included 8 males in their 20s, living in C city D university in Chungcheongnam-do. None of the subjects had any health conditions and all participants signed written informed consent after the study goals and experimental procedures were explained. They were instructed that they were free to drop out of their own volition during the experiment. The physical characteristics of the subjects are shown in [Table 1].

Table 1: Subject characteristics

				(M ± SD)
Subject (N)	Age (yr)	Weight (kg)	Height (cm)	Body Fat (%)
8	26.71 ± 2.73	79.71 ± 5.26	177.2 ± 4.1	17.01 ± 3.99

Experimental Method: The experiment was carried out at the Aqua Center of D Spa Medicine Laboratory of A city. The subjects were randomly divided into two groups based on waist and knee depth. To participate in the experiment, we participated in three experiments per person. Each experiment was performed at one-week intervals to provide sufficient rest. In the experiment, blood pressure was measured for 10 min. After the warm-up exercise, a squat was performed and a wireless heart rate monitor was used to measure the heart rate. Immediately after the end of the squat exercise, the blood pressure and the highest heart rate were measured, followed by an isometric squat for 15 s to measure EMG. The EMG patch after blood pressure measurement was attached in about 5 min. Excessive activities were restricted from one week prior to the study until the end of the study and smoking and drinking or medication were prohibited. [Figure 1] shows the experimental design of this study.

according to depth and –the values before exercise were analyzed using repeated two-way ANOVA. In the presence of a significant difference, contrast and simple methods were applied for post-comparison. The statistical significance level was set to a P value of .05.

Aquaticsquat

Knee-deep squat

Waist-deep squat

Figure 2: Aquatic squat

Figure 1: EMG measurement procedure

Statistical analysis was done using the SPSS 22.0 statistical package. The changes in EMG and CPT

The Aquatic squat was conducted at DSpa in A city of Chungcheongnam-do. The squat was performed 9 times for a duration of 3 min at a speed of one every 2 s. The up and down phases were each 1 s long and the knee angle was 90°. The squat was modified by Kim¹⁶ to fit the purpose of this study¹⁶. The water depth was set to the waist and the knee levels, and the water temperature was maintained at 28-30°C. The lower part of the participant's knee was submerged, and the waist depth criteria were locked to the anterior vertebral column. The squat shape according to the water depth is shown in [Figure 2].

EMG: The subject's muscle activity was measured using a surface wire EMG (Laxtha: Korea) and the EMG response before and after each experiment was determined in an isometric squat with a knee bent 90°. The iEMG value was measured for 5s.

Figure 3: The shape of the surface electrode

The subject's muscle activity was measured using a surface-wired EMG and the muscle activity was measured by iEMG. In this experiment, two surface electrodes were connected 1 cm apart from the insertion site of the muscle, and the skin outer layer was removed to minimize the noise during measurement. The skin surface was cleaned with alcohol before the experiment. The data were calculated by setting the offset control to 0 and the band pass filtering to 10 ~ 400Hz. The measurement posture was set in an isometric squat position, and the site was set to Vastuslateralis, Vastusmedialis, anterior tibialis, Gastrocnemiusmedialhead. The measurement time was 15 s, and the EMG data for the middle 5 s and not the initial or terminal 5 s were used¹⁷. The shape of the surface electrode is shown in [Figure 3].

Heart rate: The heart rate was measured using the Polar (S610i, Finland) wireless heart rate monitor with a wireless transmitter on the chest, and the highest value was measured immediately after squat.

Systolic blood pressure: The cumulative hemorrhagic shrinkage was measured at rest and immediately after exercise, and an automatic blood pressure monitor (EASY X 800, R) was used. The blood pressure monitor was placed next to the test site of exercise for immediate measurement after exercise. After the aquatic squat, the right upper arm was positioned at the heart level and the blood pressure measured immediately. After the squat, blood pressure was measured within one minute.

Rate Pressure Product: The RPP was calculated using the formula: heart rate* systolic blood pressure

RESULT

iEMG response before and after aquatic squat at knee and waist depth

iEMG response of vastuslateralis: As shown in [Table 2], a statistically significant difference in the muscle activity of the vastuslateralis was detected at knee and waist levels, without any statistically significant difference in the muscle activity of the lateral broad-spectrum muscle before and after the squat at each depth. Conversely, the interaction with water depth before and after exercise was statistically significant ($p = .002$). As a result, in the aquatic squat at the knee level, the iEMG increased after the exercise, and the aquatic squat at the waist depth showed a decrease in the iEMG after the exercise.

iEMG response of vastusmedialis: As shown in [Table 2], a statistically significant difference was observed in the muscle activity of vastusmedialis according to the depth of the knee and waist. No statistically significant difference in the vastusmedialis activity was observed before and after the squat exercise at each water depth. On the other hand, the interaction between water depth and muscle activity before and after exercise was statistically significant ($p = .01$). As a result, in the aquatic squat at knee depth, the iEMG increased after the exercise, and the aquatic squat at waist depth showed a decrease in iEMG after the exercise.

iEMG response of tibialis anterior: As shown in [Table 2], a statistically significant difference was found in the muscle activity of the tibialis anterior according to the depth of the knee and waist height. No statistically significant difference in the tibialis anterior activity was detected before and after the squat exercise at each water

depth. On the other hand, the interaction between water depth and muscle electrical activity before and after exercise was statistically significant(p=.01).As a result, in the aquatic squat at knee depth, the iEMG increased after the exercise, and the aquatic squat at waist depth showed a decrease in iEMG after the exercise.

iEMG response of gastrocnemius medialhead: As shown in [Table 2], a statistically significant difference in

the activity of gastrocnemius was found according to the knee and waist height. The activity of the gastrocnemius muscle before and after the squat exercise,measured at each water depth was also statistically significant. Also, the interaction between water depth and electrical activity before and after exercise was statistically significant (p <.05). As a result, in the aquatic squat at knee and waist depth the iEMG decreased after the exercise.

Table 2: Two-way ANOVA test results for iEMG during aquatic squat exercise (µV)

Changes in RPP during aquatic walking according to waist depth: As shown in [Table 3], a statistically significant difference in the RPP was found according to the depth of the knee and waist height. Statistically significant difference in the RPP was detected before and after the squat exercise at each water depth. The interaction between water depth and electrical activity before and after exercise was statistically significant(p=.001). As a result, it was shown that the RPP increased after exercise rather than before exercise in all exercise conditions. In the ground walking, after exercise the RPP was slightly increased to 2,215 at knee depth, to 8,973 after exercise and 14,282 after exercise in waist-deep water, suggesting significant increases.

DISCUSSION

The purpose of this study was to investigate the differences in aquatic squat movement according to water

depth. We analyzed the heart rate and lower extremity muscle activity following knee-deep and waist-deep aquatic squat exercise. Therefore, we analyzed the changes in myocardial burden and muscle activity during

aquatic squat using buoyancy and hydrostatic pressure, which are characteristics of water. The depth of water was based on waist and knee heights.

Subjects aquatic squat for 3min at each water depth. The SBP and EMG were measured before and after the aquatic squat. The heart rate was the highest immediately after exercise.

The squat exercise is a typical exercise to train the lower leg muscles, and increase the muscular strength^{18,19}. The squat movement involves the ankle, the knee, and the hip joints, and the coordinated movements of various muscle groups²⁰. As a result, the squat movement has been widely used to enhance performance and as a therapeutic exercise²¹.

The squat increases the strength of the knee joint and can be performed by various exercise methods. However, it is a difficult exercise^{22, 23}. In addition, the unstable posture during squat exercise may trigger injuries²⁴.

However, aquatic exercise reduces the impact on the joints during exercise due to buoyancy, and is considered safe for the elderly and patient populations^{25, 26}. In addition, aquatic exercise has been shown to prevent the recurrence of tensions or injuries that often occur in other exercise programs, and the effects are comparable to those of resistance exercise²⁶.

The muscle activity of the vastus lateralis was statistically significant before and after the squat exercise. Significant differences were found in the muscle activity of the vastus lateralis before and after the squat, and a significant difference in the interaction effects between the method and the timing. In the iEMG reaction of the vastus lateralis muscles, the aquatic squat at kneedepth showed an increase of 10.03 (μV) from 64.99 ± 8.48 (μV) to 75.02 ± 11.69 (μV) after the experiment. After the experiment at ± 7.81 (μV), the value of 4.55 (μV) decreased to 63.44 ± 12.48 (μV). This result was similar to that of previous studies that showed higher muscle activity in the lower extremity muscles as the weight increased. The muscle activity decreased because of reduced body weight at waist level than at knee depth²⁷.

A statistically significant difference was detected in the activity of vastus medialis before and after the squat movement according to the water depth. A statistically significant difference in the activity of vastus medialis was

detected before and after the squat between the methods. A statistically significant difference in interaction effect was also observed. In the iEMG reaction of the vastus medialis, the aquatic squat at kneedepth showed an increase of 15.81 (μV) from 59.79 ± 6.26 (μV) to 75.60 ± 10.28 (μV) before the experiment. After the experiment at ± 4.07 (μV), the value decreased by 3.68 (μV) to 57.55 ± 14.66 (μV). In the previous study, the use of wider and inward roots as the main roots increased at lower loads, however, the use of coaxial roots as well as the wider and inner wider roots was similar as the load increased. These results suggest that the depth of the knee was shallower than that of the waist²⁸.

A statistically significant difference in the muscle activity of the tibialis anterior was observed before and after the squat movement according to the water depth. A statistically significant difference in the muscle activity of the tibialis anterior was found both before and after the squat movement between the methods. Significant differences were found in interaction effects. In the iEMG response of the anterior tibialis, the aquatic squat at the depth of the knee showed an increase of 9.19 (μV) from 60.64 ± 4.72 (μV) to 69.83 ± 7.26 (μV) after the experiment. After the experiment at 6.37 (μV), there was a decrease of 15.52 (μV) to 46.29 ± 8.16 (μV). The ankle activity of the tibialis anterior was lowered following waist-deep squat exercise, and the anatomical basis of the ankle was the ankle spine (ASIS) %, 25%, and 10%, respectively.

A significant difference in altered severity burden was noted before and after the squat movement according to the water depth. A statistically significant difference in severity burden was found between the methods and the periods. In all exercise conditions, the cardiac burden tended to increase after exercise. However, in the ground squat, the cardiac burden after exercise increased significantly before exercise, and the knee and waist depth increased slightly after exercise compared with pre-exercise values suggesting that the buoyancy of the water reduces the effect of the weight load during the squat, and at waist depth, the water level decreased to 41% of the body weight. Such decrease in weight facilitates free movement in the water than in the ground. As a result of the reduced biomechanical stress, which is the pressure affecting the body via interaction with external forces, the risk of injury and the effect on joints are reduced, and the aquatic squat is less severe than the ground squat²⁹.

The analysis of changes in heart muscle activity and heart rate during squat exercise according to the water depth indicates that stability and effect of aquatic exercise are superior to exercise on the ground due to buoyancy, resistance, hydrostatic pressure, and viscosity. The increase in maximal oxygen uptake and cardiopulmonary endurance in aquatic exercise can be effectively used in rehabilitation.

CONCLUSION

The purpose of this study was to compare the iEMG and the severity of vastus lateralis, vastus medialis, tibialis anterior, gastrocnemius medial head during squat exercise according to the differences in water depth. We measured the iEMG and cardiac burden by randomly assigning walking and squat exercises to 8 20-year-old adult males. The results were as follows.

First, the muscle activity of the vastus lateralis before and after exercise increased after the submergence squat exercise at knee depth and decreased after the submergence squat exercise at waist depth. The differences showed statistical significance.

Second, the muscle activity of the vastus medialis before and after the exercise decreased after the submergence squat exercise at waist depth, and the iEMG increased after the aquatic squat exercise at knee height. The differences showed statistical significance between different methods.

Third, the muscle activity of the tibialis anterior before and after exercise increased iEMG after the knee squat exercise. The iEMG decreased after the waist-deep aquatic squat exercise, and a statistically significant difference was observed between the methods and the interactions thereof.

Fourth, the muscle activity of the gastrocnemius medial head before and after the exercise decreased iEMG after aquatic squat exercise at knee and waist depth, with statistically significant differences across the different methods, with time.

Fifth, the altered severity burden during the walking exercise before and after the exercise was increased in both conditions, and was the highest after walking at waist depth. A statistically significant difference was detected in liver interactions.

Therefore, squat at knee depth is more effective for intense training, and squat at waist depth is more effective for stability of the squat using aquatic exercises.

Factors Affecting on Nursing Performance of Delirium for General Hospital Clinical Nurses

Eun Min An¹, Ju Young Park², You Jeong Jo¹, Hyun Ji Kang¹

¹Nurse, Nursing Department, ²Professor, College of Nursing, Konyang University Hospital, 158 Gwanjeodong-ro, Seo-gu, Daejeon, Korea

ABSTRACT

Background/Objectives: This cross-sectional study attempted to identify factors affecting nursing performance of delirium among general hospital clinical nurses.

Method/Statistical analysis: Study participants were 158 registered nurses in general hospitals. Data were collected from May 9 to May 11 2018, using structured questionnaires. Data were analyzed with SPSS 23.0.

Findings: Nursing performance of delirium had significant positive correlations with self-confidence in caring for patients with delirium ($r=.51, p<.001$), ethical awareness ($r=.18, p=.023$), and the importance of delirium nursing ($r=.49, p<.001$). In this study, factors influencing nursing performance of delirium were self-confidence in caring for patients with delirium and the importance of delirium nursing with R^2 value 43%.

Improvements/Applications: This study's results can be used as basic data to develop educational programs and to improve work environments in developing strategies to enhance nursing performance for patients with delirium.

Keywords: Delirium, Nurse, Factor, Performance, Importance

INTRODUCTION

According to recent statistics from the National Statistical Office^[1], the proportion of elderly people aged 65 or older in Korea increased rapidly from 9.8 % in 2007 to 13.8 % in 2017. As the proportion of the elderly in the inpatient population increases due to the aging of the population, there is an increasing interest in management of the elderly health problems such as falls and delirium. In particular, delirium is a neuropsychiatric symptom accompanied by a wide range of symptoms such as impaired cognitive function and psychopathy, disruption of the sleep arousal cycle, impaired perception, impaired thinking, impaired language function, and mood instability^[2]. It is known that delirium is more prevalent in elderly, cardiac patients, burn patients, patients with cognitive impairment, withdrawal patients, and acquired immunodeficiency

patients^[3]. The incidence of delirium occurs in 14 ~ 56% of inpatients abroad^[4], and delirium in the elderly patients occurs sporadically in the recovery room^{5[6]} in Korea, 5.4% of patients admitted to hospital and general hospital experience delirium^[7]. It occurs mainly in the intensive care unit (55.3%)^[8], but it can occur in various medical fields such as 22.2% in patients after orthopedic surgery^[9], and 57.7% in terminal cancer patients^[10].

As a result of delirium, the patient has a deteriorated prophylactic cognitive ability and functional dependence due to lowering of the body and cognitive function, leading to a longer hospital stay due to pathological condition, the burden of care increases. In addition, the burden on nurses is increased, which causes stress and causes difficulties^{[11][12]}. Therefore, the clinical nurse needs to make an effort to find delirium early and to actively mediate it in the recovery of the surgery and admission of the patient.

In the management of delirium, the nurse is the first witness to recognize the early symptoms of delirium as it has a long contact time with the patient from admission to discharge. However, according to the basic survey

Corresponding Author:

Konyang University, Korea
Email: jypark@konyang.ac.kr

on the delirium of general hospital nurses^[13], although 80.4% of nurses have experienced delirious nursing, 77% of the nurses have only 0-2 delirium interventions. It is important to develop a multidisciplinary delirium nursing intervention education program in consideration of delirium due to various factors. Also, it is necessary to investigate the factors of the nursing provider in order to perform delirious nursing.

According to a preliminary study in Korea, nurses who take care of patients with a delirium in clinical practice can have difficulties in understanding the patient's uncooperative behavior, finding the cause of the disorder, and efficient management of the patient^[14]. In other words, delirious patients are more anxious and aggressive than other subjects, and it is difficult to cooperate with them. Therefore, the nursing performance of delirium is correlated with stress on delirium^{[11][14][15]}. However, some recent studies have shown that stress on delirium is not correlated with delirium nursing performance^{[16][17]}. Therefore, it is necessary to repeat the study to confirm the relationship between delirium nursing performance and delirium nursing stress.

In the prior study on influencing factors related to the performance of delirium care, the self-confidence of delirium nursing, working environment, education experience on the delirium, and clinical experience were the factors that showed the greatest confidence in the delirium performance at 32%^[16]. In addition, the awareness of importance of delirium nursing and self-efficacy are given 32.3% explanatory power^[18]. The nurses' self-efficacy can be expressed as self-confidence in nursing practice. They can motivate and change the nurse's job performance in the clinic, and can handle the work efficiently. It is a factor to get good quality nursing ability in the face of failure even if it fails^[19]. Based on the results of the study^[20-22] that the higher the self-efficacy, the better nursing performance and job performance, and the higher awareness of the importance of delirium nursing, the better delirium nursing intervention, in addition to the nursing work environment, delirium nursing education experience, and clinical career, it can be inferred that nurse's perception such as the importance awareness and self-confidence of delirium nursing can have a significant effect on delirium nursing performance.

On the other hand, as the science and technology develop, the medical field in the hospital is changing and developing, and in order to respond appropriately to the

new environment due to their leading development, the practice based on the ethical basis should be emphasized. Since the nurse is the closest medical practitioner to the life and death of the patient, the nursing practice is the decision of the nurse every moment and the decision of the nurse is based on the personal ethical consciousness^[23]. As a result, the ethical awareness of nurses has become a very important part of the nursing field. According to recent preceding studies on trends in nursing ethics, ethical awareness accounted for 33.7% of the research subjects related to ethics. Detailed topics include life ethics consciousness, end-stage medical decisions, do not resuscitate (DNR), and euthanasia^[24]. While the delirium we encounter at the actual clinical practice may also include ethical problems in carrying out nursing, studies related to these are insufficient.

The purpose of this study was to investigate the relationship between delirium nursing performance and delirium nursing stress, delirium nursing self-confidence, ethical awareness, and the importance of delirium nursing in university hospital clinical nurses who provide nursing services directly to delirium patients. Also, the purpose of this study was to investigate the factors affecting delirium nursing performance and to provide basic data for effective program development to improve delirium nursing performance. Therefore, this study aims to provide basic data for effective program development to improve the performance of delirium nursing in the future. The purpose of this study is to provide basic data on effective delirium nursing practice by identifying factors affecting delinquent nursing performance of clinical nurse. The specific purpose is as follows. 1) To assess correlation between stress of delirium nursing, self-confidence in caring for patients with delirium, ethical awareness, the importance of delirium nursing, and the performance of delirium nursing. 2) To assess the influence of participants' delirium nursing stress, self-confidence in caring for patients with delirium, ethical awareness, the importance of delirium nursing on the performance of delirium nursing.

MATERIALS AND METHOD

Design: This descriptive investigative study assessed the effects of nurse' delirium nursing stress, self-confidence in caring for patients with delirium, ethical awareness, the importance of delirium nursing on the performance of delirium nursing.

Participants: Participants comprised 158 nurses in city D selected through non-random convenience sampling. G*Power 3.1.5 was used to calculate the appropriate sample size of 157 participants for regression analysis with $\alpha = .05$ (type-I error), 80% power, and 0.15 medium effect size, wherein independent variables were delirium nursing stress, self-confidence in caring for patients with delirium, ethical awareness, the importance of delirium nursing, and the dependent variable was the performance of delirium nursing. Questionnaires were administered to 172 prospective subjects who met the inclusion criteria; after excluding insincere responses, 158 returned questionnaires were analyzed. Data were collected from May 9 to May 11, 2018 by researchers or trained research assistants who explained the research purpose, survey, and procedure for completing the consent form. Self-report questionnaires were distributed only to those who consented to participate. The survey took about 20 minutes to complete.

Measures: The structured questionnaire used in this study—adapted from existing tools—comprised 83 questions on delirium nursing stress (20 items), self-confidence in caring for patients (15 items), ethical awareness (33 items), importance of delirium nursing (23 items), performance of delirium nursing (23 items), and general characteristics (5 items).

Delirium nursing stress: Stress is a relationship between human beings and the environment that is assessed by oneself as exceeding the limits of an individual's ability to threaten their well-being^[25]. The tool to measure delirium nursing stress was originally developed by^[26], was modified by^[27]. It comprises 20 items scored on a 10-point Likert scale ranging from “Not at all” (0 point) to “Very much so” (10 points), with higher scores implying delirium nursing stress. Cronbach's α was 0.85 in^[28] study and 0.88 in this study.

Self-confidence in caring for patients: Self-confidence in caring for patients refers to the degree to which nurses can perform delirium nursing efficiently independently^[29]. The tool to measure self-confidence in caring for patients was originally developed by^[29], was modified by^[30]. It comprises 15 items scored on a 10-point Likert scale ranging from “Not at all” (0 point) to “Very much so” (10 points), with higher scores implying greater confidence in nursing performance. Cronbach's α was 0.96 in^[30] study and 0.96 in this study.

Ethical awareness: Nursing ethics is the code of conduct of nurses based on moral ideals of goodness and evil^[31]. We used the 38-item ethical values Scale developed by^[32] and used by^[33]. Items were scored on a 5-point Likert scale ranging from “Not at all” (1 point) to “Very much so” (5 points), with higher scores indicating greater positive ethical awareness. The Cronbach's α was 0.68 in^[33] study and was 0.67 in this study.

Importance of delirium nursing: Importance refers to the degree to which the value or weight of the work is considered important based on certain criteria. Recognition is to know things clearly and understand them correctly^[34]. In this study, the importance of delirium nursing means how important it is to delirium nursing. we used the 23-item that were originally developed by^[35]. Items were scored on a 4-point Likert scale ranging from “Not at all” (1 point) to “Very much so” (4 points), with higher scores indicating greater perception of delinquent nursing. The Cronbach's α was 0.65 in^[35] study and 0.86 in the present study.

Performance of delirium nursing: Performance of delirium nursing is the identification of the risk factors for delirium in nursing subjects, prevention of delirium, and the degree of nursing activity for the recovery of delirious patients^[11]. we used the 23-item that were originally developed by^[35]. Items were scored on a 4-point Likert scale ranging from “Not at all” (1 point) to “Very much so” (4 points), with higher scores indicating greater performance of delinquent nursing. The Cronbach's α was 0.65 in^[35] study and 0.90 in the present study.

Ethical Consideration for Research Subjects: The research protocols were approved (IRB No. KYUH 2018-05-001) by the institution's research ethics committee before conducting the study and were carried out in accordance with The Code of Ethics of the World Medical Association (Declaration of Helsinki). Information obtained for sampling was not used for any purpose other than this study, and data were only collected after providing assurance of anonymity and protection of personal information to voluntary participants from whom written informed consent had been obtained.

DATA ANALYSIS

Data were analyzed using SPSS Statistics 23.0 (IBM Corp., Armonk, NY). Descriptive statistics, including frequencies, percentages, means, and standard deviations

were used to assess participants' general characteristics, levels of delirium nursing stress, self-confidence in caring for patients with delirium, ethical awareness, the importance of delirium nursing on the performance of delirium nursing. Relationships between study variables were analyzed using Pearson's correlation. Finally, a multiple regression was used to identify predictors of performance of delirium nursing.

RESULTS AND DISCUSSION

Significant positive correlations were observed between the performance of delirium nursing and self-confidence in caring for patients with delirium ($r=.51, p<.001$), ethical awareness ($r=.18, p=.023$), and the importance of delirium nursing ($r=.49, p<.001$). Significant positive correlations were observed between the importance of delirium nursing and self-confidence in caring for patients with delirium ($r=.17, p=.038$), and ethical awareness ($r=.16, p=.019$). Finally, significant positive correlations were observed between self-confidence in caring for patients with delirium and work stress in the sub-area of the delirium nursing stress ($r=.20, p=.011$) in Table 1. In this study, the relationship between delirium nursing performance and delirium nursing stress, delirium nursing self-confidence, ethical awareness, and delirium nursing importance was positively correlated. In the study by [36] and [16], it is concluded that delirium nursing performance has a

positive correlation with self-confidence. The results of this study suggest that delirium nursing programs can be used to improve delirium nursing performance by enhancing self-confidence by repeated learning and education^[37]. There was no direct previous study of the relationship between delirium nursing performance and ethical awareness. However, there was a positive correlation between the level of ethical awareness and the nursing performance of nurses performing general nursing practice and patient safety management activities^{[38][39]}, as the nurses not only included delirium nursing but also all nursing activities. According to the results, delirium nursing is also part of performing nursing work, so it can be a basis for the correlation that higher ethical awareness will lead to higher delirium nursing performance. Therefore, nurses who take care of life need to reflect on the ethical awareness during delirium nursing work, and it is possible that the delirium nursing performance can be improved by developing and applying the ethical-related delirium scenario to establish desirable ethical viewpoint. The importance of delirium nursing was positively correlated with performance. The results are the same as those of^[40]. In the study of^[41], the higher the perception of importance of nursing intervention, the higher the performance of nursing intervention. Based on the results of this study, it can be deduced that delirium nursing performance will be higher when the recognition of the importance of delirium nursing is improved.

Table 1: Correlations between Major Variables and Performance of Delirium Nursing

	Self-confidence	Ethical Awareness	Importance	Performance
	r(p)			
Stress of Delirium Nursing	.15(.070)	-.01(.885)	-.01(.929)	-.01(.868)
Delirium Nursing Stress	-.04(.595)	-.03(.715)	-.09(.271)	-.07(.393)
Interpersonal Stress	.11(.176)	-.08(.351)	-.03(.694)	.02 (.805)
Nursing Work Stress	.20(.011)	-.00(.990)	.05(.561)	.00(.950)
Self-confidence		.11(.159)	.17(.038)	.51(<.001)
Ethical Awareness			.16(.049)	.18(.023)
Importance				.49(<.001)

Multiple regression analysis, with the variables for which results were significant in the univariate analyses ($p<.05$) as independent variables (i.e., delirium nursing stress, self-confidence in caring for patients with delirium, ethical awareness, the importance of delirium nursing), was performed to identify factors predicting the performance of delirium nursing. Normal

p-p residual plots, scatter plots, Durbin Watson statistics, tolerance levels, and variance inflation factors were calculated to check the fundamental assumptions of multiple regression analysis. The Durbin Watson statistic was 1.95, which indicated low risk of autocorrelation. Tolerance levels ranged from 0.65 to 0.93, and variance inflation factors ranged from 1.00 to 1.03, suggesting

that multicollinearity was not an issue. The explanatory power of the regression model was 43.0%. Self-confidence in caring for patients with delirium ($F=55.57$, $p<.001$) and importance of delirium nursing ($F=58.25$, $p<.001$) were significant predictors of the performance of delirium nursing in Table 2.

The effect of delirium nursing on delirium nursing self-confidence (26%) was increased by the importance of delirium nursing, which showed an explanatory power of 17%, indicating a total explanatory power of 43%.

This is similar to the results of the study that self-confidence^[16], self-efficacy, and importance^[18] are the major factors affecting delirium nursing performance. In conclusion, delirium nursing performance is found

to increase with increasing confidence and importance of delirium nursing. Therefore, in order to increase the delinquent nursing performance of clinical nurses, it is necessary to develop various delirium nursing simulation programs and to actively mediate ways to develop self-confidence through opportunities to intervene directly or indirectly through delirium nursing situations. It is important to recognize the importance of nursing practice and prevention activities of delirium nursing and the importance of nurses' role in delirium nursing. Therefore, the delirium nursing education program consisting of induction factors for delirium, awareness of changes in consciousness of delirious patients, and nursing prevention activities should be given priority in the undergraduate education.

Table 2: Correlations between Major Variables and Performance of Delirium Nursing

Influence factor	Model 1				Model 2			
	β	t	p	VIF	β	t	p	VIF
(Constant)		19.97	<.001			2.63	.010	
Self-confidence	.51	7.46	<.001	.00	.44	7.21	<.001	1.03
Importance					.41	6.72	<.001	1.03
	R ² =.26; Adj. R ² =.26; F=55.57(<.001); R ² change=.26				R ² =.43; Adj. R ² =.43; F=58.25(<.001); R ² change=.17			

The purpose of this study was to investigate the factors affecting the delinquent nursing performance at the time of the lack of previous studies on the factors affecting delirium nursing performance. It is thought that delirium may have a positive effect on the prevention and early detection of delirium, and the health promotion and recovery of delirium subjects, considering these factors when developing and applying delirium nursing performance improvement program. In addition, the analysis of the causal factors of delirium based on the results of this study will have educational and clinical significance in the management of effective delirium patients.

CONCLUSION

The purpose of this study was to investigate the factors affecting delirium nursing performance in 158 clinical nurses. Delirium nursing performance was positively correlated with delirium nursing self-confidence, ethical consciousness, and delirium nursing importance. The effect of delirium nursing on delirium nursing self-confidence (26%) was increased by the importance of

delirium nursing, which showed an explanatory power of 17%, indicating a total explanatory power of 43%. Based on these results, it is necessary to consider delirium nursing self-confidence, delirium nursing importance, and ethical consciousness in the development of program to improve the clinical nurse's delirium nursing performance. This can be expected to maximize its effectiveness when linked to undergraduate curriculum.

This study has several limitations. First, the convenient sampling method employed in this study may limit the generalization of this study's findings. Second, a cross-sectional design adopted in the study may contaminate the results with temporary psychological or physiological conditions of the participants. To increase the validity of these findings, a random sampling or a longitudinal study including various specialties and settings is recommended. Also, in order to increase the reliability and validity of the results of the study on the ethical awareness which was correlated with the delinquent nursing performance, it is necessary to develop a tool for the delirium nursing ethical awareness by further study.

ABSTRACT

Background: Number of aged people has been rapidly increased. due to increase of aged people in our country at present, geriatric, chronic disease is rapidly increased and it was emerged as a social issue.

Objectives: In this study, in order to prevent dementia that is senile disease creating various social problems at an early stage, integrated dementia prevention program was presented and its effectiveness is intended to be verified. 24 people normal elderly living in the community.

Method: Progress of this study and data collection period was 3 months from June to August, 2014 and objective of the study was explained to test subjects before starting the test and a consent form for participation in the study was received from them. In the study, intervention period was 10 weeks and it was progressed based on 3 times week and integrated dementia prevention program was directed to be performed for 60 minutes per 1 time.

Statistical analysis: In this study was to use a pre-post test, statistical program Spss 18.0 version was used.

Findings: Cognitive function change of test subjects who participated in integrated dementia prevention program is as evaluation score was significantly increased ($p < 0.01$) in MMSE-K and MOCA-K that evaluate cognitive ability before/after participation in the program, cognitive function was shown to be improved. Depression change of test subjects who participated in integrated dementia prevention program is as evaluation score was significantly decreased ($p < 0.01$) in GDS-K score that evaluates depression level before/after participation in the program, depression was shown to be decreased. Quality of life change of test subjects who participated in integrated dementia prevention program is as evaluation score was significantly increased ($p < 0.01$) in EuroQol-5D that evaluates quality of life before/after participation in the program, quality of life was shown to be improved.

Improvements: Cognitive abilities of the subjects were improved, decreased depression and improved quality of life.

Applications: We have to develop diversified intervention programs for preventing dementia and it is expected that more systematic program would be developed and be widely utilized in the elderly of local community and each institution.

Keywords: Dementia, Cognition, Depression, Occupational therapy, Elderly.

INTRODUCTION

At present, environment of life has been greatly improved owing to development of medical technology and science and consequently, as human average life is increased together with enhancement of quality of life,

number of aged people has been rapidly increased. Due to increase of aged people in our country at present, geriatric, chronic disease is rapidly increased and it was emerged as a social issue¹. According to data of Statistics Korea in 2015, our country has already entered into aging society in 2000 and in 2015, the elderly population aged over 65 was 6.62million that accounts for 13.1% of the total population and in 2030, it is forecasted that such population would exceed 20% and we will enter into super aging society². As the population is increased, geriatric diseases are also increased and among these, the disease having the highest incidence rate as a social issue is dementia. Number of dementia patient in our country was app. 540,000 and its number is being increased rapidly and it is estimated that in 2050, number of dementia patient would reach app. 280,000 by it being increased by 2 times every 20 years in the future³. Dementia is an organic mental disease in which cognitive function and mental function such as judgment, language, emotion being undertaken by human cerebrum are degenerated and it is learned as complex clinical syndrome causing problem in daily life, social activity and inter-personal relation by accompanying symptoms including depression, delusion⁴. Like this, as a disease decreasing quality of life of patients themselves and requiring sustained care of supporter as well, dementia causes serious mental, psychological, physical, economic burden to the supporters⁵. Like this, we have to promptly recognize problems of dementia and now is the time to exert an effort of overcoming dementia at nationwide level for decreasing its incidence rate and moderating development speed by controlling dementia at an early stage^{6,7}. In this study, in order to prevent dementia that is senile disease creating various social problems at an early stage, integrated dementia prevention program was presented and its effectiveness is intended to be verified.

METHOD

Participants: Subjects of the study were 24 normal elderly women aged ≥ 65 years, who had visited a dementia support center located in the D region, Seoul, from June to August 2014.

Design: This study is an experimental research for observing change of cognitive function, depression, quality of life by providing normal elderly living in local community with integrated dementia prevention program and pre-post design for a single group was performed.

Measures: In this study, to assess the cognitive functions of elderly subjects, the following tools were used: 1) Mini-Mental Status Examination, Korean version (MMSE-KC) and 2) Montreal Cognitive Assessment, Korean version (MOCA-K). For assessment of depression, the Korean version of the Geriatric Depression Scale (K-GDS) was used. Lastly, quality of life was measured by EuroQol five dimensions questionnaire (EuroQol-5D).

Mini Mental State Examinations–Korea (MMSE-K): As cognitive function scale, Korean type MMSE-K that was standardized by Gwon, Yong-Cheol and Park, Jong-Han⁹ by targeting the elderly of our country based on Mini Mental State Examinations developed by Folstein, Folstein and MeHug⁸ was used. This Tool is composed of total 30 points including disorientation 5 points for time, that for place, memory registration 3 points, memory recall 3 points, concentration (attention), calculation 5 points, language function 7 points and understanding/ judgment 2 points and it is analyzed that the more score is high, the more is cognitive function high. Reliability at the time of developing this tool was Cronbach's α .86 and reliability of MMSE-K evaluation tool was .79¹⁰.

Montreal Cognitive Assessment–Korea (MOCA-K): MoCA-K is a tool being prepared based on The Montreal Cognitive Assessment (MoCA) developed by Nasreddine¹¹ in order to sort out mild cognitive impairment through its modification, supplement, Korean language translation and validity evaluation. This tool is composed of 7 areas including space execution power (5 question items), vocabulary (3), attention (8), writing skill (3), imagination (2), progressive recollection (5), disorientation (6) in order to evaluate general cognitive ability and based on full score of 30 points, difference of cognition depending on education level was compensated by adding 1 point of target who has education level below 6 years. This tool is an evaluation tool for sorting out mild cognitive impairment and its restricted line is below 22 points that means cognitive impairment. Reliability at the time of developing evaluation tool was Cronbach's α .83¹¹ and that of MoCA-K that is translation tool was Cronbach's α .81~.84¹⁰.

Geriatric Depression Scale–Korea (GDS-K): In order to evaluate geriatric depression level, that was designed by Kee¹² through modification of developed by Yesavage and Sheikh to be matched with reality of our country was used. This evaluation tool is composed of total 15 question items including 5 items of positive form and

10 items of negative form. “No” to 5 items (1, 5, 7, 11, 13) of positive form becomes 1 point and “Yes” to remaining 10 negative items 1 point. Total score of 0-5 points is regarded as normal, 6-10 mild depression and 11-15 serious depression and the more score is high, the more gets depression level serious. In this study also, reliability Cronbach’s alpha value was .85.

EuroQol-5 dimensions (EQ-5D): In order to measure, compare quality of life of research targets, evaluation tool of EuroQol-5 was used. This evaluation tool is composed of EQ-5D utility value (EQ-5D index) and EQ-5D visual analogue scale (EQ-5D vas) comprising 5 question items asking present health condition and this is health related quality of life scale¹³.EQ-5D utility value evaluates 5 question items such as exercise, bathing, daily life activity, pain/inconvenience, anxiety/depression in 3 stages and score of answer of such items is estimated through estimation model for Korean quality of life¹⁴.

Progress of this study and data collection period was 3 months from June to August, 2014 and objective of the

study was explained to test subjects before starting the test and a consent form for participation in the study was received from them. In the study, intervention period was 10 weeks and it was progressed based on 3 times/week and integrated dementia prevention program was directed to be performed for 60 minutes per 1 time. This program was performed by dividing it into detailed program of 4 types including physical activity (muscular strength, balance), meta memory class, reminiscence therapy, self-esteem training.

RESULTS

Changes in cognitive functions before and after the integrative dementia prevention program: Cognitive function change of test subjects who participated in integrated dementia prevention program is as shown in table 1. As evaluation score was significantly increased ($p < 0.01$) in MMSE-K and MOCA-K that evaluate cognitive ability before/after participation in the program, cognitive function was shown to be improved.

Table 1: Comparison of cognitive functions before and after the intervention program

Evaluation	Pre-test ($M \pm SD$)	Post-test ($M \pm SD$)	<i>t</i>	<i>p</i>
MMSE-KC	28.04 ± 2.42	28.92 ± 1.38	-2.94	.007*
MOCA-K	24.21 ± 2.71	26.08 ± 2.60	-4.62	.000*

The values are mean ± standard deviation, MMSE-KC: Mini-Mental Status Examination, Korean version, MOCA-K: Montreal Cognitive Assessment, Korean version, * $p < 0.05$ by Paired t test

Changes in depression before and after the integrative dementia prevention program: Depression change of test subjects who participated in integrated dementia prevention program is as shown in table 2. As evaluation score was significantly decreased ($p < 0.01$) in GDS-K score that evaluates depression level before/after participation in the program, depression was shown to be decreased.

Table 2: Comparison of depression before and after the intervention program

Evaluation	Pre-test $M \pm SD$	Post-test $M \pm SD$	<i>t</i>	<i>p</i>
K-GDS	3.25 ± 3.32	1.25 ± 2.21	5.00	.000*

The values are mean ± standard deviation, K-GDS: Geriatric Depression Scale Korean Version, * $p < 0.05$ by Paired t test

Changes in quality of life before and after the integrative dementia prevention program: Quality of life change of test subjects who participated in integrated dementia prevention program is as shown in table 3. As evaluation score was significantly increased ($p < 0.01$) in EuroQol-5D that evaluates quality of life before/after participation in the program, quality of life was shown to be improved.

Table 3: Comparison of quality of life before and after the intervention program

Evaluation	Pre-test <i>M ± SD</i>	Post-test <i>M ± SD</i>	<i>t</i>	<i>p</i>
EuroQol-5D	73.33 ± 10.49	81.67 ± 14.27	-3.92	.001*

The values are mean ± standard deviation, EuroQol-5D: EuroQol five dimensions questionnaire, * $p < 0.05$ by Paired t test

DISCUSSION & CONCLUSION

This study is a similar test research being performed based on pre/post design for a single group for exploring what is an effect of integrated dementia prevention program for the elderly of local community on geriatric cognitive function, depression, quality of life. When observing the result of this study, it could be concluded that integrated dementia prevention program showed a result of improving cognitive function ability, reducing depression and enhancing quality of life of normal elderly¹⁶. This result was similar to the research result of Hwang, Yoon-Jeong and Chung, Won-Miet al¹⁵ and it could be concluded that providing the elderly with dementia or general elderly with diversified dementia-related program would enhance geriatric function. In view of above result, we have to develop diversified intervention programs for preventing dementia and it is expected that more systematic program would be developed and be widely utilized in the elderly of local community and each institution. As a limitation of this study, it is hard to generalize the result of this study as number of test subject was limited and it targeted only female subject.

ABSTRACT

The purpose of this study was to invest the effect of communal exercise with ‘ Parkinson home exercise’ application on gait ability. Twenty nine subjects were randomly divided into three groups; CSG (Communal Exercise with Smart app Group), ISG (Individual Communal Exercise with Smart app Group) and CG (Control Group). The subjects were instructed to carry out 10 weeks exercise program. Values were measured before and after the exercise program and the differences were analyzed by two-way repeated measures ANOVA and Scheffe post-hoc test ($P<.05$). In the present result, ambulation time and single leg support (%) were significantly increased among groups; CSG was the most significant among groups ($P<.001$). Double leg support (%) and distance time were significantly difference among time ($P<.001$). These findings indicate that communal exercise with smart app. can be effective in gait ability for PD patients.

Keywords: Parkinson’s disease, Communal exercise, ‘Parkinson home exercise’ application, spatial parameters, temporal parameters

INTRODUCTION

Exercise is an important therapeutic intervention for patients with Parkinson’s disease because of its beneficial effects such as gait ability improvement, fall prevention, and improvement in physical performance¹.

However, although exercise is an essential therapeutic intervention for such patients, it is realistically difficult for patients to participate in voluntary and constant physical exercise as the lesion progresses, because they lose confidence, avoid interpersonal relationships, and are unable to lead an independent life^{1,2}.

Accordingly, the Association of Physical Therapists in Parkinson’s Disease (ADDP) developed the Parkinson home exercise application for smart phones so that

patients can receive visual and auditory feedback whenever and wherever they are. However, regardless of the quality of the program, its effect is limited if patient participation is low. It is important to motivate patients to participate in programs consistently. Such motivation can be provided through active recommendations for participation from supervisors and development of an environment where patients can work out with other patients in a similar situation³. In particular, communal exercise improves interpersonal relationships and enhances social functioning. This greatly contributes to improvement in physical performance⁴

Thus the aim of this study is to prove the effects on gait ability of group exercise program with external stimuli of smart app., which feeds a visual and auditory signal back to the patients of PD.

PROCEDURE FOR PAPER SUBMISSION

Subjects: The participants of this study were twenty-nine patients diagnosed with non-demented PD in a community-dwelling in South Korea. The participants

were randomly divided into the Communal Exercise with Smart app. Group (n=10,CSG), Individual Exercise with Smart app Group(n=10, ISG) and Control Group(n=9, CG). Selection criteria were a diagnosis of PD according to department of neurosurgery of Y Hospital, classification at modified Hoehn and Yahr(H&Y) stage 1 through 3 and able to gait of independence.

Subjects were excluded if they had other neurologic problem such as acute medical problems that could affect gait, a score below 23 on the Mini-Mental State Examination and fallen more than once in the prior year. The physical characteristics of the subjects are shown in Table 1.

Table 1: Physical characteristics

Groups	Gender	Age (yrs)	Hoehn & Yahr stage	BMI (kg/m ²)	Duration of disease(yrs)	MMSE-K
CSG (n=10)	M1, F9	71.10 ± 5.10	2.71 ± .48	23.62 ± 1.42	6.22 ± .78	20.70 ± .94
ISG (n=10)	M1, F9	73.50 ± 6.93	2.42 ± .51	22.45 ± 1.61	5.90 ± .87	21.40 ± 1.07
CG(n=9)	M1, F8	72.75 ± 7.94	2.53 ± .53	25.12 ± 2.13	6.25 ± 7.70	20.75 ± 1.03

Communal Exercise with Smart app Group (CSG), Individual Communal Exercise with Smart app Group(ISG), Control Group (CG),. Values are mean± SD.

Table 2: Parkinson home exercise program

Week	Order	Exercise type(time)	Contents	Intensity	Frequency
Week 1-3	Smart app. program	Relaxing exercise(5min)	Relaxing arms, leg	RPE 13-15	3days/ week
		Relaxation using breathing(5min)	Feel your breathing Experience deep breathing		
		Flexibility(10min)	Stretching on lying, sitting		
		Balance & coordination training(10min)	Standing up Stepping away		
		Walking(10min)	Walking straight		
Week 4-6		Relaxing exercise(5min)	Moving and relaxing back		3days/ week
		Relaxation using breathing(5min)	Relaxation using breathing		
		Flexibility(10min)	Stretching on sitting, standing		
		Walking with rhythms(10min)	Walking with rhythms		
		Balance & coordination training(10min)	Lunge, reaching Chair forward, backward		
Week 7-10	Relaxing exercise(5min)	Tensing and relaxing neck & trunk	3days/ week		
	Relaxation using breathing(5min)	Relaxation using breathing			
	Flexibility(10min)	Stretching on sitting, standing			
	Starting/Freezing(10min)	let go 1,2,3' start, stop, turn, back, forward, big steps.			
		Balance & coordination training(10min)	Stepping away		
	Cool down (10min)	Breathing exercise	Segmental, diaphragmatic and deep breathing	RPE 8-9	

Study design: Subjects were randomly separated into CSG, ISG and CG in order to evaluate single limb support(%), double limb support(%), ambulation time and distance time before and after the 10 weeks exercise intervention. The process of this study is as following figure 1.

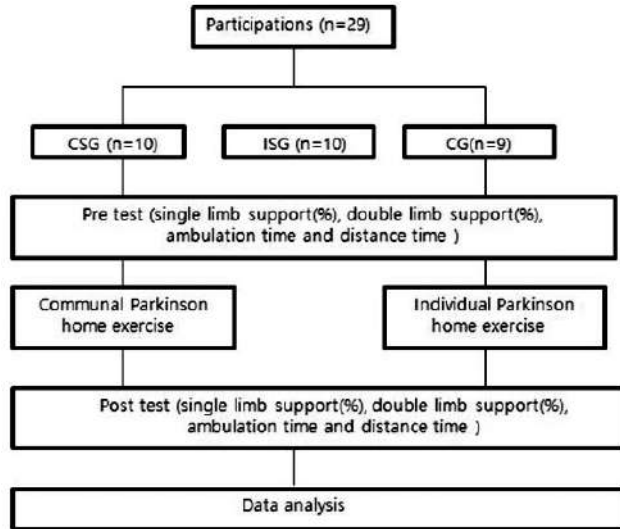

Figure 1: The screening g process

Measures of gait parameters: The GAITRite system(GAITRite, CIR systems Inc., Clifton, NJ, USA, 2008) is made of 5m length walkway and 16,128 sensors. Over the walking of the subject, the system automatically detect pressures through the sensors, and delivers the data to the computer to calculate gait parameters. The subjects walk three times and the calculated average of the three trials was used to analyze the data.

Exercise intervention: Subjects performed a communal exercise program using a smart application for 60 min, three times per week, for a period of 10 weeks, which focused on improving their deep breathing, relaxation levels, flexibility, strength, balance, and gait pattern.

The subjects and caregivers were instructed how to use the smart application and how to perform the exercise program. The exercise program used a smart application named “Parkinson home exercise application” (APPDE, 2009), which has been developed by the Association of Physiotherapists in Parkinson’s Disease Europe (APPDE).

Saving Files in TIFF: Most graphing programs allow you to save graphs in TIFF; however, you often have no control over compression or number of bits per pixel. You should open these image files in a program such as Microsoft *Photo Editor* and re-save them using no compression, either 1 or 8 bits, and either 600 or 220 dpi resolution (File > Properties; Image > Resize). See Section III.C for an explanation of number of bits and resolution.

Data Analysis: With all data obtained from this study, we calculated Mean (M) and Standard Deviation (SD) using SPSS/PC 18.0 statistic program for Windows. We carried out two-way repeated measures ANOVA analysis used to demonstrate the differences among values from the experimental groups (CSG, ISG, and CG) and measuring period (before/ after 10-weeks intervention). In addition, when the statistical significance in the data was shown, post-verification of Scheffe post-hoc test analysis was conducted. Statistical significance was adopted at P < 0.05 in this study.

RESULTS

The change of temporal parameters: As shown in table 3, after 10-weeks intervention, CSG and ISG groups showed the significant improvement in single limb support(%), double limb support(%) and ambulation time; ambulation time change of CSG was the most remarkable among three groups(P<.01).

Table 3: Change of temporal gait ability

DISCUSSION

Gait disability, reduced mobility, falls risk and social isolation affect bad influences on PD patients' physical and mental health, social interaction, and quality of life¹². Most of all, gait disability is associated with increased risk of falls and hospitalization, decrease of independence and even higher risk of mortality^{3,5}. Therefore gait disability is the best barrier for them to restrict physical performance and to reduce the mental health, social interaction and health-related quality of life^{6,7,8}.

Most useful method to improve gait ability is regular exercise⁹. But it is very hard for them due to complex symptoms representing disorders of cognition, language, depression and fatigue, self-care, communication as well as motor disorder. Therefore, resent researches are reported that communal exercise improved physical performance and emotional stability by enhanced familiarity and social integrity function⁴. The social interaction and physical performance were improved as a consequence of the communal exercise undertaken by the PD patients¹⁰. On the other hand, Association of Physiotherapists in Parkinson's Disease (APPDE) released 'Parkinson home exercise' which provides easy

exercise guide and audio-video stimulus. It makes PDs easy to exercise¹.

The spatiotemporal parameters of gait in PD patients were improved by the external audio-video stimulus^{4,11}. Besides, they felt similarity during the communal exercise and it made better social integrity function³. The aforementioned social facilitation effect from communal exercise motivated their willing to overcome the physical disorder, competitive spirit and can-do attitude^{4,11}.

Thus, we have investigated the effect of a communal exercise program with the smart phone app. on gait ability by comparing with the effect of an individual exercise group and a control group.

As a result of this study, communal exercise program with smart phone app. for PDs was effective to improve gait ability. After 10-weeks exercise, temporal parameters of CSG and ISG groups showed the significant improvement in single limb support(%), double limb support(%) and ambulation time. Especially the change of ambulation time in CSG was the most remarkable among three groups (P<.01). And

spiral parameters of CSG and ISG groups showed the significant improvement in distance time, which was showed significant differences among groups ($P<.05$). These finding indicates that the communal exercise with smart phone app. have benefit on gait ability comparing to individual exercise. According to recent research reported that outcomes relating to gait significantly improved in walking speed and balance of PD following the exercise intervention². But it was very difficult to find any precedent study and similar research using smart application for PDs' communal exercise. Therefore comparison result and conclusion could not be drawn. The present study examines community-dwelling patients, who tend to have weaker socioemotional relationships with families, relatives, neighbors, etc. These patients could improve their gait ability more when they worked out with peers than when they worked out alone because a group workout actively motivated them.

As a conclusion, this communal exercise using audio-video feedback by smart phone application has positive effect on gait ability. The communal exercise motivated PD patients' emotional stability by enhanced familiarity and social integrity function and the audio-video feedback helped their physical performance of the exercise.

On the Effect of College Students' Attitude towards computer on their Academic Procrastination

Wonshik-Na

Professor, Dept. of Computer Science, Namseoul University, 91 Daehakro seonghwaneup Sebukgu Cheonansi Chungcheongnamdo, Korea

ABSTRACT

Background/Objectives: The central goal of the present research is to identify how college students' attitude towards computer affects their studying/learning and academic procrastination.

Method/Statistical analysis: The subject group consisted of a group of 209 students taking general education courses at N University located in Choongnam, Korea. The collected data from a survey questionnaire was analyzed by using a set of statistical methods: a frequency analysis for demographic characteristics, a correlation analysis as well as a regression analysis.

Findings: It was found that the subfactors of the attitude under discussion - confidence, usefulness and desire to learn-showed a significant positive correlation among one another, while the negative feeling of anxiety or fear was not significantly correlated with other subfactors. Overall, however, the attitude toward computer was closely correlated with academic procrastination: the higher the attitude toward computer, the lower academic procrastination.

Improvements/Applications: The findings of the current research are expected to help us recognize the importance of the attitude towards computer and to help students improve their learning capacity.

Keywords: *College Students, Attitude towards computer, Academic Procrastination, confidence, usefulness, learning capacity*

INTRODUCTION

There is no doubt that modern society can be characterized as an era of mass media information. In particular, computer is considered as a typical media of the present times that helps college students perform their academic activities, search information, enjoy their leisure time and do shopping. And the list of the things they can do with a computer can include much more than these.

Elementary and secondary school students in Korea live a very tight life: they stay at school from very early in the morning to very late in the evening. Even in this structured schedule, some adolescents struggle with a serious problem of addiction to games or internet. The current research started with a question of how college students are now utilizing computer(Soonhee Kweon et al, 2008)¹.

In reality, college students are considered as a grown-up adult and/or as an intellectual individual.

That is perhaps partly responsible for the fact that not much research has been conducted into college students' addiction to internet games or smart phones or into their psychological problems. Also, very few researches have been reported into their attitude toward computer.

College students may control their everyday schedule for weekdays by choosing their classes and also plan for their free time during the weekend and vacation times. It might be meaningful to examine how they use computer in their everyday life and also what attitude toward computer they have, partly because it might be closely related with their academic learning.

Dukran Park et al(2015)² reported that students' and ordinary people's perception of computer exerted an influence in a way or another on their performance and effect of learning and considered it as a core element for learning. The definition of the attitude towards varies from scholar to scholar and it may also differ depending on measurement tools. However, it might be generally

defined as one's feelings and utilization of computer, which clearly affect his or her everyday life.

A positive attitude towards is expected to help college students gain much knowledge and abilities that might contribute to the development of society (Ami Cho, 1999)³ It is also expected that sound and solid culture of computer utilization would help adolescents and students lead desirable lives.

THEORETICAL BACKGROUNDS

Understanding the attitude towards computer:

Computer has long been used as an essential tool in modern society. At present, it may not be dispensable in every aspect of our everyday lives. In particular, computer has greatly changed the scene of education: the education paradigm solely based on off-line has long disappeared. The so-called cyber learning or e-learning has been a great portion of education and training for students at every level (Bona Kim et al, 2010)⁴ Thus, it should be natural that students' attitude toward computer would impact their learning (Hyunjin Kim, 2013)⁵.

Utilization of computer could be the two sides of the same coin: it might result in both positive and negative results. Of the negative aspects of computer, addiction to games and entertainment, formation of mistaken values and being misled to crimes have often been cited (Chisun Oh, 1999)⁶.

In short, the attitude towards computer refers to one's attitude of how he or she would use computer. An attitude literally means the way in which an individual feels or thinks about a certain thing or phenomenon. Thus, the attitude towards computer means an individual's feeling about the use and effect of computer (Hyekyung Suh et al, 2004)⁷

Nowadays, even toddlers learn to use computer and adolescents use it for entertainment, music and shopping as well as for learning and information-searching. It might be safe to say that computer is now being used nationwide by everybody including seniors.

College students are naturally expected to be good at using computer. Thus, there seems to be little interest in the influence of their attitude towards computer on their learning and studying. However, it is a very meaningful question to ask how their perception and utilization of computer affects their college life. Above all, college

students are at the last stage of education getting prepared to enter the real world. Thus, any factor leading to academic procrastination would be a big obstacle for them in their preparation for their careers (Jiwon You, 2013)⁸ The present study, thus, attempts to see whether and how their attitude towards computer affects academic procrastination.

Understanding Academic Procrastination: Academic procrastination of college students might result from a variety of reasons. It might happen partly because they need to do various things in addition to studying: club activities, voluntary service, leisure activities, and overseas traveling. Meeock Suh (2014)⁹, for example, classified the reasons into two categories: internal and external. The former includes lack of desire for studying, lack of confidence in learning, intentional procrastination, failure in information processing and psychological problems such as perfectionism.

The external causes for academic procrastination can be exemplified by difficulty in handling learning materials and projects, excessive amount of assignments, team projects and various extracurricular activities. As mentioned above, very few researches have tackled the issue of the effect of the attitude towards computer on academic procrastination. In reality, college students use computer for other activities than studying: listening to music, watching video files, playing games and shopping. It can be easily assumed that these nonacademic activities would, in turn, turn out to be major hindrances to learning and studying. The results of the current analysis are expected to offer suggestions or guidelines to help them use computer in a desirable way.

RESEARCH METHOD

Scale for Computer Attitude: This research adopted Chisun Oh & Youngbae Kang's (1999)¹⁰ model used in their paper 'Adolescents' Attitude toward Computer and their Experiences' to measure computer attitude. It consists of 17 items belonging to four categories: confidence in computer use (4 items), usefulness (5 items), desire to learn computer (5 items) and negative emotions against (3 items). Each item was measured on a five-point Likert scale, a higher score meaning a better attitude toward computer (Cronbach's $\alpha = .603$).

Scale for Academic Procrastination: The subjects' academic procrastination was measured by adopting Sherer, M (1997)¹¹, Younhee Song's (2012)¹² scale,

which was intended to distinguish students with chronic academic procrastination from others. The measurement tool was composed of 19 items including such statements as ‘I procrastinate in doing something until the last minute.’ and ‘I often hurry up frantically to meet the deadline.’ A higher score, with 9 reverse items, signified a lower level of academic procrastination. Cronbach a was obtained at .848.

Analysis Method: The current research proceeded with a set of statistical analyses: a frequency analysis of the subject group’s gender, year and major field, and the mean and standard deviation of technical statistics of their attitude toward computer and academic procrastination,

a correlation analysis of the two variables of attitude toward computer and procrastination, and, finally a regression analysis to identify the effect of computer attitude on academic procrastination.

RESEARCH RESULTS

General Characteristics of Research Subjects:

The subjects of the current research consisted of a group of 209 college students who were attending at N University located in Cheonan, Korea, and taking a computer-related class in the academic year of 2016. A questionnaire was handed out to 230 students, but 209 of them were collected for final analysis.

Table 1: General Characteristics of Research Subjects

Total	Gender		Year				Major				
	M	F	1	2	3	4	Engineering	Business	Welfare	Health related	Arts & Sports
N	136	73	10	83	69	47	59	63	28	37	22
209	(65.1)	(34.9)	(4.8)	(39.7)	(33)	(22.5)	(28.2)	(30.1)	(13.4)	(17.7)	(10.5)

As shown in Table 1, 136 (65.1%) subjects of the group were male and the rest (73, 34.9%) were female students. In terms of their grades, sophomores accounted for the largest portion of 83(39.7%), followed by juniors (69, 32.5%), seniors (47, 22.5%) and freshmen (11, 5.3%). As far as their major fields are concerned, it might be assumed that the group showed a nearly even distribution, considering the number of students enrolled at each school of the university: business (63, 30.1%), engineering (59, 28.2%), health sciences (37, 17.7%), welfare (28, 13.4%) and arts & sports (22, 10.5%).

Attitude towards computer & Academic Procrastination according to their Gender and Grades: The mean and standard deviation of their attitude towards computer and academic procrastination according to their gender and grades are found below.

Table 2: Attitude towards computer & Academic Procrastination depending on their Gender and Grades

Factors	Character	M	SD
Attitude towards Computer	Male	3.1032	0.4228
	Female	3.1547	0.3784
Academic procrastination	Male	3.7024	0.5052
	Female	3.8125	0.4546
Attitude towards Computer	Freshmen	3.2412	0.3955
	Sophomore	3.1779	0.47973
	Junior	3.1373	0.3353
	Senior	3.0501	0.3593

Conted...

Academic procrastination	Freshmen	4.0105	0.2576
	Sophomore	3.7273	0.4795
	Junior	3.7941	.4747
	Senior	3.6293	0.5441

As illustrated in Table 2, female students were found having a better attitude towards computer and a lower academic procrastination than male students. In terms of grades, in turn, freshmen had a better attitude towards computer and a lower academic procrastination than any other upper class students.

Attitude towards computer & Academic Procrastination depending on their Major Fields

Table 3: Attitude towards computer & Academic Procrastination depending on their Major Fields

Valuables	Major Fields	M	SD
Attitude towards Computer	Engineering	3.1466	0.4482
	Business	3.0691	0.3571
	Health-related	3.145	0.3147
	Welfare	3.221	0.5063
	Arts and Sports	3.1765	0.3177
Procrastination of learning	Engineering	3.7734	0.4722
	Business	3.7226	0.5078
	Health-related	3.6184	0.5296
	Welfare	3.8208	0.4394
	Arts and Sports	3.7273	0.5225

As shown in Table 3, those students majoring in welfare-related fields recorded the most positive attitude towards computer and the least academic procrastination. In contrast, business majors were the last in terms of attitude towards computer, while the students majoring in health-related fields were found having the greatest academic procrastination.

Table 3 Attitude towards computer & Academic Procrastination depending on their Major Fields

Results of Correlation Analysis: An analysis of the correlation was conducted between a set of subfactors of the attitude towards computer and academic procrastination.

Table 4: Correlation analysis of the attitude towards computer and academic procrastination

Variables		[1]	[2]	[3]	[4]	[5]	[6]
Confidence	[1]	1					
In ability to use computer							
Usefulness of computer	[2]	.473**	1				
Desire to learn computer & computer experience	[3]	.316**	.279**	1			
Anxiety or fear of computers	[4]	.059	-0.34	-0.44	1		
Total attitude towards Computer	[5]	.788**	.788**	.530**	.05	1	
Total academic procrastination	[6]	.113	.142*	.037	-0.005	.156*	1

* P<.05, **. P<.01

As illustrated in Table 4, the subfactors of confidence, usefulness and desire to learn showed a significant correlation among one another, while the negative feeling of anxiety or fear was not correlated with other subfactors, as expected. Overall, however, the attitude toward computer was closely correlated with academic procrastination: the higher the attitude toward computer, the lower academic procrastination.

A regression analysis of the attitude towards computer and academic procrastination

Table 5: A regression analysis of the attitude towards computer and academic procrastination

Model	Sum of squares	df	Mean square	F	Sig. p
regression	1.211	1	1.211	5.145	0.024
residual	48.703	207	0.235		
Total	49.914	208			

As shown in Table 5, a regression analysis found that the attitude toward computer significantly affected academic procrastination of the subjects, which means that the better attitude towards computer students have, the lower their academic procrastination they show.

A regression analysis of the attitude towards computer and academic procrastination

Table 6: A regression analysis of the attitude towards computer and academic procrastination

Variables	Model	Sum of squares	df	Mean square	F	Sig. p
Confidence in ability to use computer	regression	0.632	1	0.632	2.656	0.105
	residual	49.281	207	0.238		
	Total	49.914	208			
Usefulness of computer	regression	1.004	1	1.004	4.25	0.04
	residual	48.894	207	0.236		
	Total	49.914	208			

Conted...

Desire to learn computer & computer experience	egression	0.067	1	0.067	0.277	0.599
	residual	49.847	207	0.241		
	Total	49.914	208			
Anxiety or fear of computers	regression	0.001	1	0.001	0.004	0.947
	residual	49.912	207	0.241		
	Total	49.914	208			

As shown in Table 6, among the sub-variables of computer attitude, only the usefulness factor for computer had a significant effect on academic procrastination and other factors had no significant effect. However, when the attitude toward the whole computer has a significant effect on the academic procrastination, the usefulness of the computer is highly related to the academic achievement. A regression analysis found that the attitude toward computer significantly affected academic procrastination, which means that the better attitude towards computer students have, the lower their academic procrastination they show

Concluding Remarks: After being admitted to a college through very tough competition, college students in Korea, then, exert every effort to acquire necessary skills and abilities required by society. Of extensive learning and training for that purpose, computer application skills are a very important and necessary part. The present research attempted to identify their attitude towards computer and also the impact of the attitude on their academic life at college.

ABSTRACT

Many college students try to grow and change with the help of understanding themselves based on personality tests. The present study aims to examine how their personality types influence their ego-resilience and self-efficacy. The concept of ego-resilience might involve one's effort to control one's emotions, how difficult one's situation might be, and adapt oneself. Self-efficacy, in turn, basically refers to an individual's belief in himself or herself. For that purpose, a group of 218 sophomore and junior students at D University located in Gyeongbuk Province and N University in Cheonan participated in the study. The analysis methods include the program of SPSS 19.0, a frequency test, independent sample t-test, a correlation analysis and a regression analysis. It was found that a significant difference existed between the two types of personality in terms of their ego-resilience and self-efficacy. A similarly significant difference was also found between a set of subfactors of ego-resilience and self-efficacy. A variety of educational programs taking these into consideration might be necessary to help college students develop themselves. In other words, customized distinctive training for a particular type is expected to be effective in producing talented manpower at college.

Keywords: ego-resilience, MBTI test, personality, introversion, extroversion, self-efficacy.

INTRODUCTION

Colleges endeavor to produce competent manpower who can contribute to the development of society by using their abilities and talent. For that purpose, colleges prepare a variety of programs to train their students that may affect curriculum and teaching methods. However, it is not easy to bring about desirable changes in students' lives, not matter how good the education/training programs and teaching methods, partly because the students vary in the level of their participation and concentration. In Particular, there seems to be agreement that the quality of college life crucially depends the will and attitude of each individual student. Thus, the personality traits of a student would have a significant influence on his or her college life.

Seligman (2002)¹ explained that an individual tries to identify his or her strong personality traits and develop them with an aim to use them as well as their talent. J. Kim and E. Lim (2014)² also defined 'personality' as an intrinsic individual concept characterizing one's behavior and style of adaptation in life. Many researches

have reported that personality types might influence one's interpersonal relationship, school life, self-efficacy, learning experiences, decision on career and mental stress.

The current research started with keen interest in how college students' personality traits would affect their everyday lives as well as their college lives. Using the conventional Myers-Briggs Type Indicator (MBTI) tests identifying an individual's personality, we aim to examine whether and how their introversion and extroversion influence their ego-resilience and self-efficacy.

Many researches have been conducted, with recognition of the importance of personality and character, on the types of personality, but most of them are based on a set of 16 types and a set of 8 indicators. Very few attempts have been made on the relationship between introversion/extroversion and college students' behavior in their academic lives.

Thus, the present research, based on the dichotomy of introversion and extroversion, focuses on the effect of their personality types on their ego-resilience which

might indicate their ability to cope with external changes and control and manage internal states. Also, under discussion is their self-efficacy, which may refer to the degree of an individual's belief and trust in his or her performance of given tasks and ability to do the tasks in the future. The results of analysis are expected to help college students change and grow in the future. It is also expected that this research will provide base data for any attempt to develop an education curriculum individually customized for students and shed some light on the growth and self-improvement of college students.

THEORETICAL BACKGROUND

The concept and distinction of introversion/extroversion might be based on psychological types of Jung's philosophy and it is well represented in Myers & Briggs' MBTI test of personality types. The contrast and index might explain one's preference of different direction in using one's energy and attention and managing one's thought and behavior: internal or external. Extroverts cherish experiences and are behavior-oriented. Also, they are good at and enjoy expressing their thoughts and interacting with other people. Introverts, on the other hand, tend to be considerate and thoughtful. They take things seriously and, as a consequence, might be slow in making decisions or putting into action. Such personal characteristics should be taken as unique, not as weak or strong, and be developed further so that they can be used in any effort to develop themselves.

Ego-resilience refers to one's capacity that helps maintain balance and flexibly respond and adapt to changing environmental needs often coupled with stressful events or occasions (Block and Block 1980)³. Such an ability would enable one to cope with present difficulties, depression or stressful situations and control one's emotions by appealing to interest in various things and orientation towards the future (E. Park, E. Lee, 2013)⁴. In this extremely competitive society with a serious social problem of youth employment, collegians as adults should enhance their ego-resilience and grow to become desirable citizens by overall understanding of themselves.

Self-efficacy refers to the extent of an individual's feeling and sense of satisfaction followed by his or her completion of a certain task. It may also mean one's belief in his or her own ability to complete tasks and reach goals. It might be assumed that a particular person's self-efficacy might depend on his or her personality traits.

K. Han (2005)⁵ reported that self-efficacy exerts a significant influence on personal management of health and that it also helps reduce stress – physical, emotional and cognitive – with the help of cushioning role of self-control.

Y. Park and E. Kim (2001)⁶ also reported that self-efficacy had a positive effect on the ability to cope with stress and it may also affect overall satisfaction with life. Self-efficacy refers to an individual's belief in his or her own ability and, thus, is closely related with his or her personality traits. Thus, it should be meaningful to examine the relationship between self-efficacy and the two types of personality: introversion and extroversion.

RESEARCH METHOD

Research Subjects: The current research was conducted with a personality type test and a questionnaire which was handed to a group of 270 students taking liberal arts classes. 218 of the group participated in the research, submitting their answers to the survey: 130 from D University located in Gyeongbuk Province and 88 from N University in Cheonan. The class at D University was mainly for senior students and the one at N University for juniors and seniors.

The main reason for selecting these upper class students was our assumption that they were likely to be more interested in their careers, college life and personality types. It was found that 124 of the group might belong to extroverts (48 male and 76 female), whereas 94 could be classified as introverts (59 male and 35 female).

Table 1 illustrates the general characteristics of the participants.

Table 1: Illustrates the general characteristics of the participants

Type	Gender		Year		Major					
	M	F	3	4	Humanities	Social Science	Engineering	Management	Others	total
Extra version type	48	76	37	87	23	33	18	45	5	100
	(38.7)	(61.3)	(29.8)	(70.2)	(18.5)	(26.6)	(14.5)	(36.3)	(4)	
Intra version type	59	35	40	54	25	24	22	14	9	100
	(62.8)	(37.2)	(42.6)	(57.4)	(26.6)	(25.50)	(23.4)	(14.9)	(9.6)	

RESEARCH SCALE

MBTI Personality Type Test: The measurement tools for this study include a version of MBTI personality test and a ego-resilience scale. The MBTI-style test adopted for this study consisted of 32 items used in B. Kim(2003)⁷s research, which was modified by Hogan and Champagne(1979)⁸ from the self-reporting test developed by Myers and Briggs⁹.

Ego-resilience: Ego-resilience, in turn, was measured by adopting Atsushi(2002)¹⁰, which contain subfactors of emotion control, variety and interests and concern and positive future-orientedness.¹¹ A set of 21 items were measured on a five-point Likert scale. A higher score meant a higher ego-resilience.

Self-efficacy: A. Kim’s(1997)¹² slightly modified version of Sherer et al. (1982)¹³ was adopted to measure self-efficacy for the current research. The subfactors of self-efficacy in this measurement tool include confidence, self-control, preference for difficult tasks measured on a

five-point Likert scale. A higher score was meant to be a higher self-efficacy.

ANALYSIS METHOD

The program of SPSS Version 19.0 was used to analyze the collected data. A frequency test to analyze characteristics of the subjects and technical statistics to obtain the mean and standard deviation for each scale were also conducted. An independent sample t-test, correlation analysis and regression analysis were made in order to identify the characteristics of introversion/extroversion and their effect on ego-resilience and self-efficacy.

RESULTS OF ANALYSIS

This section presents the results of analyzing the subjects’ ego-resilience and self-efficacy depending on their different personality types.

Technical Statistics of Measurement Variables: Table 2 shows the mean and standard deviation of measured data for the subfactors of ego-resilience and self-efficacy.

Table 2: Mean and Standard Deviation Variables

Factors	N	M	SD
Interests and concern	218	2.8571	0.69215
Emotion Control	218	2.5946	0.57678
Positive future Orientedness	218	2.5008	0.77326
Ego-resilience(M)	218	2.6553	0.57431
confidence	218	2.7857	0.65763
self-control,	218	2.7297	0.64366
Preference for difficult tasks	218	2.5706	0.70617
Self-Efficacy(M)	218	2.7081	0.62295

Independent sample t-test: As shown in Table 3 presenting the analysis results of the t-test, different types of personality would have different impact on their ego-resilience and self-efficacy.

Table 3: Independent sample t-test and Personality Types

Categorization	Levene’s test for Equality of variances		t-test for Equality of Means			
	F	Sig.	t	df	Sig. p (2-tailed)	Mean difference
Ego-resilience	2.064	0.152	6.065	216	.000***	0.44137
			6.168	210.789	.000	0.44137
Self-Efficacy	5.048	0.026	9.413	216	.000	0.67686
			9.724	215.678	.000	0.67686

*p<.05, **p<.01, ***p<.001

As shown in Table 3, a statistically significant difference was found between introverts and extroverts in their ego-resilience: $t=6.065$, $p=.000$. Also, an independent sample t-test found a significant difference between the two types in their self-efficacy ($t=9.724$, $P=.000$).

Correlation between Measurement Variables of Personality Types: Person correlation analysis was performed to see the relationship among the variables and factors of ego-resilience and self-efficacy. The results of analysis were found below in Table 3.

Table 3 Correlation between Ego-resilience and Self-efficacy

Table 4: Correlation between Ego-resilience and Self-efficacy

Categorization		[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]
Interests and concern	[1]	1							
Emotion Control	[2]	.583**	1						
Positive future Orientedness	[3]	.553**	.660**	1					
Confidence	[4]	.124	.150*	.122	1				
Self-control	[5]	.254**	.241**	.217**	.569**	1			
Preference for difficult tasks	[6]	.140*	.082	.056	.278**	.463**	1		
Ego-resilience (M)	[7]	.837**	.870**	.859**	.154*	.277**	.109	1	
Self-Efficacy (M)	[8]	.284**	.267**	.233**	.756**	.936**	.530**	.306**	1

* $p<.05$, ** $p<.01$, *** $p<.001$

As shown in Table 4, the subfactors of ego-resilience variety in interests, emotion control and positive future-orientedness-had a high corelation with those of self-efficacy - confidence and self-control. It was also found that the subfactor of preference for difficult tasks had a weak correlation with variety in interests and no correlation with emotion control and positive future-orientedness. In conclusion, it might be assumed that the two factors of ego-resilience and self-efficacy are correlated to some extent.

A regression analysis of the attitude towards computer and academic procrastination

Table 5: A regression analysis of the Self-resillienceand Self-efficacy

Categorization	Model	Sum of squares	df	Mean square	F	Sig. p
Interests and concern	regression	6.779	1	6.779	18.912	.000***
	residual	77.431	216	.358		
	Total	84.210	217			
Emotion Control	regression	6.021	1	6.021	16.632	.000***
	residual	78.189	216	.362		
	Total	84.210	217			
Positive future Orientedness	egression	.4590	1	.4590	12.451	.001**
	residual	79.620	216	.369		
	Total	84.210	217			

* $p<.05$, ** $p<.01$, *** $p<.001$

As shown in Table 5, Interest and interest, emotional control and positive future orientation, which are sub-factors of ego-resilience, have a statistically significant

effect on self-efficacy. As a result, it can be predicted that ego - resilience and self - efficacy may have a significant effect on each other regardless of personality type.

CONCLUDING REMARKS

This study found that introverts and extroverts had a significant difference in their ego-resilience and self-efficacy. Also, a close correlation between the measurement variables existed according to two personality types. Such a finding is expected to help college students find right paths to develop themselves by understanding their characteristics. Also, it might be suggested that college education take different personality types into more consideration in preparing any curriculum customized for a particular type of students. Better understanding of oneself is a requisite in enhancing self-efficacy and ego-resilience and growing into a competent member of society.

A Study of a Model of Christian Alternative Schools

Manoh Han

Division of Education, Baekseok University

ABSTRACT

Background/Objective: This study intends to inquire into theoretical background of general alternative education and alternative schools, and deal with the significance necessity, definition, philosophy of education, purpose, curriculum and quality and qualifications of teachers with respect to Christian alternative schools.

Method/Statistical analysis: This paper seeks to offer an alternative to Christian schools in the Korean public school system as it faces an overall challenge in recent years. The education philosophy, goal, purpose of establishment, instruction methods and specific cases are analyzed for Christian schools that have been established based on the spirit of Christianity in Korea, as an alternative to existing schools. The study seeks to identify a model for Christian alternative schools that can be applied to the Korean environment and what would be the best characteristics for such schools.

Findings: There are many existing studies that analyzed cases of various alternative schools in Korea. However, there is a lack of studies that compiled data on how Christian alternative education and Christian alternative schools are practiced. This study will contribute to serving as a useful reference material for those who want to establish Christian alternative schools. Moreover, this study intended to inquire into a model of Christian alternative schools applicable in Korea as well as the aspect of the most desirable Christian alternative school. To be concrete, regarding the most desirable Christian alternative schools, this study proposed principles and realistic alternatives for people who intend to establish and operate Christian alternative schools on the basis of concrete Christian worldview in terms of philosophy of education, purpose, educational purposes, educational goals, curriculum, characteristic project (education), qualifications and role of teachers. Specifically, the paper seeks to present the principles and realistic alternatives based on a Christian world view applied to the education philosophy, goal, purpose of establishment, curriculum, specific projects (instruction) and qualification of instructors.

Improvements/Applications: As such, this paper is expected to offer valuable insight into those seeking to establish a Christian alternative school. This study will make it possible to understand a model of Christian alternative schools which is the most desirable and applicable in Korea.

Keywords: *leadership; Christian alternative school; education; philosophy of education; curriculum; School*

INTRODUCTION

Significance of Christian alternative school: This term “Christian alternative school” is considered a term used for the first time in this present study. “Christian alternative school” refers to a faith community school where students directly experience and practice their faith in the wings of Christian faith, supplied with characteristics and form of general alternative schools. Most of all, regarding the purpose of establishment and philosophy of education, they are based on Christian worldview for educational purposes and goals of educational activities. Through the concepts of a small school, special learning methods, love for nature, work-

based activities, community life and faith education and training different from what is provided by general Christian schools, it offers the most desirable education fostering true disciples of Jesus Christ.

Kim Tae-yeon asserts that “A Christian alternative school is a learning community where all educational activities are carried out based on Christian worldview intending to actively expand the Kingdom of God on earth, and students are prepared to have frontier spirit for the Kingdom of God by being trained as disciples of Christ in the ‘vivid harmony’ with other beings and all members (teachers, students, parents and staff) are making utmost efforts for true education of the supreme quality.”

Unlike other schools, Christian alternative schools are characterized by a community of faith. In Christian schools, people did not gather in search of interests but under the confession of faith with the concern of education. Therefore, basically, Christian community attributes feature such schools. In a broad sense, a Christian alternative school can be considered a part of church. However, a Christian alternative school presents dissimilarities from a church in the sense that it is a specialized educational institution. Basically, a school focuses on education, among many other areas of human life. Moreover, the intrinsic function of school lies in accumulating professional skills and methods required for education and effectively handing down them. Comparably, the main function of church resides in glorifying and worshipping God. Furthermore, church also plays a role in proclaiming and delivering Word of God.

A Christian alternative school teaches the same truth as church and the ultimate objective lies in the same but it has intrinsic roles of its own different from those of church. Christian schools are required to cooperate with churches, and churches also need to respect the intrinsic roles of Christian schools and help schools. The mutual cooperation and balance are highly important.

In summary, a school serving the Kingdom of God and people of the Kingdom is a Christian school. A Christian alternative school is a place fostering the saved people who thoroughly recognize the creation and reign of God. It has to be a completely biblical school. A school based on the core of biblical messages is a Christian alternative school.

BACKGROUND

Philosophy of education of Christian alternative schools: “The philosophy of education of Christian alternative schools, in short, resides in God-centered education. This is a contrast to humanism commonly pursued by general education. Theocentrism as a philosophy of education of Christian schools means that education does not happen centered on humans but on God. In God-centered education, the agent of education is not humans but God, and the ultimate goal is also with God. Moreover, it signifies that the contents and methods of education are also based on the will and truth of God.”¹

Christian alternative schools must establish their identity from the biblical and Christian worldview, and

are required to have distinct conviction and devotion in philosophy of education. The philosophy of education must be described on the basis of Christian faith and fulfilled in the reality of education.

Educational purposes and educational goals of Christian alternative schools

Educational purposes: Considering that the educational purposes of Christian alternative schools are identical to those of Christian schools, this study intends to make reference to educational purposes of Christian schools first. Regarding the purposes of Christian schools based on Christian worldview, Van Brummelen mentioned core biblical commands of Christian worldview in four directions, and these four concepts are not separable but complementary and supportive.

Firstly, students are to research the created world of God based on creation command and cultural mandate (Genesis 1: 26-28, 2: 15), and while studying, students are to have mission as servants of the created world. Even though the created world is decadent, students must have mission as servants. In spite of being a corrupt created world, it is fundamental that a Christian school should proclaim marvel to the creation of God, and lead students to tread on the path of Lord by serving God and neighbors with the talents given by God. Teachers are required to instruct students how God created the world for the benefit of people and how people should take care of the world. Moreover, teachers should help students in realizing that each one has been called to serve God as the body of Christ and individually members of I, in each field of the society. Teachers with frontier mind should guide students to dedicate themselves to serving the Kingdom of God with joy and act with creativity while they are experiencing, learning and applying academic rules.

Secondly, based on the given command (Matthew 28:18-20), teachers should make clear that in God we live and move and have our being (Acts 17:28). Teachers must encourage each student to have a personal relationship with God, and as a teacher who tied a personal relationship with Christ should be a leading model of obedient and joyful life. It is necessary for teachers to recognize authority of Christ to make an effort to reveal Christ in the teaching of the classroom, and teach students all things taught by Christ. Also, teachers should teach students that Christ set an example for teaching and asked a meaningful answer. For example,

teachers are to teach that Christ set an example for serving and modesty required as Christians by washing the disciples' feet.

Thirdly, based on the great commandments (Matthew 22:37-39), teachers are to love their students as themselves when they teach students. When there is love, teachers can truly teach students. When teachers teach students with love, this will be a key to "not being conformed to this world, but being transformed by the renewal of the mind" of students (Romans 12:2). Education means changes. Only love can change students. Students should be encouraged to make a commitment to Christ and Christian way of life and willingly serve God and neighbors.

Fourthly, based on faith fellowship (Galatians 6:2, 6:10; Acts 2:42-47), praise and thankfulness must be included and specified in the curriculum. Teachers and students must feel thankful to the grace of God both personally and collectively. Through serving school and society, the school community should encourage students to praise a variety of graces. Students are to be guided to show thankfulness for the grace of others and learn how to help one another. Christian alternative schools must create fellowship in Holy Spirit, work and study together in order for students to experience a great community of which Head is Christ.

The purpose of Christian alternative schools ultimately resides in teaching students to recognize that they are the image of God. The classroom should provide students with background in which students realize Christian view of the world for real as well as fulfill and develop this view of the world. The classroom must become a community glorifying and praising God, where students realize God's love and become the members of Christ, in the middle of mutual trust between teachers and students and exploration of created world of God"²

In the book published by Research Society of Christian Schools of ACTS Education Research Center, which has been forming and preparing a Research Center since 1998 to establish a Christian alternative school, Christian School we are dreaming of, the concept of Christian alternative school is defined as follows:

The base of a school we are dreaming of resides in evangelical faith. In other words, it is a school founded on the salvation only by believing in Christ.

The education provided in this school must be based on Christian worldview and the criteria must originate from the Holy Scripture of the Word of God. The base of biblical human view lies in the fact that humankind was created by the image of God. Therefore, humankind is a holistic being and uniquely created to maintain each one's individuality. Human has capacity and possibility of ruling, but is a limited being only discovered in God at the same time. Being a mere God's handiwork, human and nature cannot serve as a basic fundament for knowledge and values. Only God can be absolute standards. In particular, for humankind in complete decadence, the only base to understand true holistic knowledge is by way of restoring relationship between God and humankind through Christ, and the Holy Scripture serves as a criterion for this knowledge. The purpose of saved life of humans described in the Holy Scripture consists in ultimately serving God by restoring orders of God in the individual life, as well as serving others and administrating nature.

Therefore, based on the Words presented by the Holy Scripture, it is possible to establish the educational purposes of school as follows:

Firstly, it is to lead students to have a personal relationship with God and achieve recovery in each one's life (Matthew 28:18-20). Secondly, it is to lead each student to realize his or her own calling given by God and become a competent disciple of Christ serving God and neighbors (Genesis 1:26-28)

EDUCATION GOAL

Firstly, in terms of revealing the base and frame of Christian discernment in life, students must seek Christian vision of life and existence based on standards of Word of God as well as Christian way of life.

Secondly, in terms of promoting development by concept, capacity and creativity, students are supposed to realize how each one was called to serve God as members of Christ in each sector of the society, and develop the capacity of using, taking care of, forming and enjoying the world of God to the maximum.

Thirdly, by leading students to experience the meaning of life based on Christian worldview, students are supposed to willingly make personal and collective decisions from the biblical perspective and develop values and inclination in harmony with Christian principles.

Fourthly, students are encouraged to devote themselves to Christ and Christian way of life and readily serve God and neighbors. Students are guided to experience how to give God the entirety of life including thoughts, words and behaviors; furthermore, they are supposed to dedicate themselves to cooperating with other members in developing Christian way of life.³

Curriculum of Christian alternative schools: The curriculum of Christian alternative school aims to make students praise sovereignty of Christ over all creatures. The purpose of curriculum of Christian alternative school is to discover wisdom and knowledge originated in the revelation of God, and to make students become committed servants of God through this. This must be a means of enlightenment of the world of God as well as the position of each student within. In the end, the curriculum must recognize God-centered base in terms of core and purposes, and it should be structured allowing students to have understanding and discriminative awareness of the world of God and love and serve God in the world in which they live.

For this reason, regarding the center of the curriculum of Christian alternative schools, it means that for God and His minister of creation, bondage and conservation, the Holy Scripture serves as a starting point for the center of the curriculum, namely, origin, definition and purpose. Besides, this means that nothing is value neutral in the curriculum, and the learning activities are focused on worshipping and serving God in all aspects of life.

True knowledge starts with God of revelation and includes all forms of life, demanding that students and teachers dedicate themselves to God and serve God in all spheres of the world. Like this, the curriculum of Christian alternative schools must be structured in order that the revelation of God should be at the root of it.

The curriculum of Christian alternative schools possesses both religious aspects and educational aspects at the same time. Knowledge is ultimately displayed in the analytic frames of standards influencing students' world view and way of life; therefore, these two terms enrich each other and are closely related.

“When God created humankind, He created us allowing a deeper understanding of truth and its new application to different situations and generations. Furthermore, human activities constantly pursue new phases of truth that God already reserved in the structure

of the universe. For this reason, it is possible to add new materials to the curriculum and a general reexamination is equally required according to the lighting direction of the Holy Scripture. Considering that knowledge as a whole is for the glory of God, life as an entirety and whole people, this is what the curriculum aims at.”⁴ Consequently, the most fundamental mission of Christian alternative schools and teachers can be summarized as the integration of faith into learning (subjects).

“Moreover, there are educational aspects in the curriculum of Christian alternative schools. Christians, as good servants of God, should show exceptional zeal for learning of the world created by God. An authentic Christian alternative school ought to achieve the integration of religious aspects into educational aspects, in other words, a true biblical integration between church attributes and school attributes. This does not allow complementary correlations. The integration of two horizontal and vertical elements must be realized as shown in the following diagram (Figure 1). Figure 1 explains that all curriculums of Christian alternative schools should consolidate the curriculums by origin of the Bible, and be educated and structured with Bible-based content.

Figure 1: Relationship between Bible and Subject⁵

In other words, in the center of all curricula, there must be the Word of God. Through the Word of God, all sciences must be reinterpreted. The entirety of these acts must be moving forward the glory of God. This integration should form the characteristics of the curriculum of Christian alternative schools.”⁶

Qualifications and roles of teachers of Christian alternative schools: To be teachers of Christian alternative schools, they must be equivalent to the Disciples of Christ who are devout filled with the Holy Spirit and have a strong sense of duty. This chapter intends to describe the qualifications of teachers as follows:

Firstly, teachers must play a role as kings. This does not necessarily mean that teachers must sovereign over students. It simply means that they should use correct authority to operate the class and instruct students. Naturalist and progressivist teachers are like gardeners, so they are not supposed to impose any restrictions on students.

Secondly, teachers should play a role as prophets. In other words, teachers must proclaim the will of God to students. Not only through the Holy Scripture but also through general knowledge from the subjects, teachers must convey the truth of God to students. The given mission of teachers resides in teaching students to follow the intention of God by discerning plans of God toward nature and society. Exactly like the prophets who proclaimed the will of God to Israelis who led their lives arbitrarily, teachers are responsible for making a clear proclamation of what to live for.⁷

Thirdly, “Teachers must have love for students and assurance of possibilities of students. It is because education which is not based on love is not able to change the life of students. Students can grow to the same extent as the belief of teachers in possibilities of their students. Everyone is a being with the image of God, so no one can restrict the possibilities. Therefore, only the ones who know how to love students and see the possibilities in them in accordance with these biblical perspectives are qualified to be teachers.

Fourthly, they must be the ones who have professional knowledge of the subject and make efforts to develop creative teaching methods. It is because it is not possible to attract interests of students in learning without a broad and deep understanding of the subject. All knowledge and sciences existent in the world are under the rule of God; therefore, we Christians should not neglect knowledge and sciences. For this reason, teachers should prepare a variety materials related to subjects beyond textbooks, in particular, by steadily researching the connection between the content of subject and the real world, teachers should find the best way to avoid uniform teaching methods to deliver the truth meaning. Diverse methods of teaching and learning should be developed to apply to classes depending on the content of subjects and level and reaction of students.

Fifthly, they must be the ones who have Christian historical consciousness to build dreams in students. Only

the one who has a dream can make another dream. Only the teachers, who fulfill the dreams given by God based on correct historical consciousness, are able to lead students in a correct manner. This way, students can finally become the ones who dream the dream given by God”⁸

Sixthly, “Teachers must zealously read the Holy Scripture and meditate on the Word. The Word of God wants to rule characters and thinking of all teachers. Only when the characters of teachers do not have dominating attitudes but serving attitudes like Christ, teachers can teach students with truly serving mind.

Seventh, teachers must have biblical perspectives not only in the aspect of characters but in the aspect of knowledge at the same time. It is because it is hard to say that a teacher with a good character has good biblical knowledge accordingly.”⁹

Eighth, all teachers are to be cheered up and encouraged by the Holy Scripture. The Holy Scripture says that God is our true teacher. The Bible also indicates that God gives lessons to us, reproaches us and educates us in a correct and righteous way through the Word of God. For this reason, the one who is filled with the Word of God can become a good teacher.

Lastly, teachers play a role as chief officiating priests. This role means that teachers beg God for the benefit of students. Even when students commit fault for being immature, teachers must be ready to kneel down in front of God, on behalf of the guilty students. Teachers, who do not offer intercessory prayers on behalf of their students, are considered the ones who are not properly fulfilling their duties as teachers.

The following extract is taken from a text written by Lim Tae-gyu (Gwangyeong High School teacher, Seoul) belonging to a Research Society preparing the establishment of a Christian alternative school.

“Teachers should meet the following three qualifications. Firstly, teachers must have educational vision expecting that students under their responsibility will transform and the Kingdom of God will expand through their students. Secondly, teachers are required to obey constant training of Christian thoughts and character and must continuously build Christian maturity. Thirdly, teachers should have precise and profound knowledge of specialized area and research and practice teaching method oriented to creativity and

biblical approach. Delivering the content of education in a proper and correct way toward Christian orientation depends on the role of each teacher. Ecclesiastical content can be delivered in a non-Christian manner and non-Christian content can bring Christian educational effects through Christian illumination. Most of all, the influence of character given by teachers can be the most crucial key to Christian education.”¹⁰

This was extracted from a research content aiming at establishment of a Christian alternative school in a gathering for founding Dream High School. Dream High School is a research gathering composed of professors and teachers intending to devote themselves to establish a Christian school through Research Society of Christian Schools. Lim Tae-gyu (Gwangyeong High School teacher) is a leader of the gathering and this school is supposed to open in 2003.

CONCLUSIONS

This study inquired into philosophy of education, purpose, purpose of establishment, educational methods, curriculum, qualifications and roles of teachers of Christian alternative schools, founded on the basis of Christian spirit among alternative schools in South Korea, as an alternative to the current reality in which Christian schools, which are within the public education system, lose the essence and wander about in front of overall crises of the immediate education. Moreover, this study intended to inquire into a model of Christian alternative schools applicable in Korea as well as the aspect of the most desirable Christian alternative school.

ABSTRACT

In machine learning, ensemble methods are emerging and powerful strategies to improve the robustness and accuracy of both the supervised and unsupervised learning solutions. The basic principle of ensemble strategy is to work on a combination of diversified base classifiers and regressors to strengthen the both kind of weak classifiers and regressors and are available for a single task, merging all of the results which leads to better performance of the classifiers and regressors. In this study, an attempt has been made to implement study and analyze the importance of ensemble strategies on either classification and regression techniques to predict the class label or future value respectively. Here, for experimentation two sets of different datasets are used for both of the tasks and the proposed estimator based on weighted stacking has been experimented and evaluated in two levels using RF, a variant of ANN i.e. Multi-Layer Probabilistic Neural Network (MLPNN), a lazy learner k -NN if first level of experimentation to get the individual predictions of those heterogeneous models and the in second level of experimentation, the weighted stacking ensemble learning has been experimented with SVM and the performance of the all the individual models along with stacked SVM have been evaluated using various performance matrices such as; specificity, sensitivity and F-score as well as T-test based statistical analysis has been considered to accept the performance of the proposed model.

Keywords: Classification; regression; ensemble learning; Weighted stacking; Random Forest; Multi-Layer Probabilistic Neural Network; k -Nearest Neighbor; Support Vector Machines

INTRODUCTION

Broadly, data classification can be defined as the process of arranging the data into relevant categories for ease of extracting the data or information out of this data properly and can be protected more efficiently. This classification task, not only focuses on easier extraction of data, it has of particular importance with respect to risk management, compliance as well as data security^{1,2}. In machine learning, classification can also be defined as a process to predict the unseen data or future data^{3,4}. The classes are basically represented as areas or volumes called

as decision regions and the decision boundary differentiates between the different classes. In machine learning, there are many state of the art classification algorithms such as; Artificial Neural Network (ANN)⁵, Decision Tree⁶, Random Forest (RF)⁷, k -Nearest Neighbor (k -NN)⁸ and Support Vector Machines (SVM)⁹ etc. are available and also, many researches are going on to develop many hybridized and optimized classifiers. Similarly, regression and prediction also falls under the category of supervised learning strategy like classification and both works on recalling the past experiences. This general method of predicting the future based on past experiences is the core of classification and regression analysis. In machine learning, the classifiers are also being used to predict the future value. The classification is a process to predict the class label on unseen data, and can be categorized as; binary classification i.e. trying to know simply the yes/no and multi class classification i.e. trying to put an example into one of a number of classes, whereas; regression tries to predict a real value such as; to predict the value of stock tomorrow based on its past performance^{10,11}.

There are several issues need to be addressed while formalizing the learning process, such as; (a) the performance of the learning algorithms for both classification and regression tasks need to be measured on unseen data, known as testing phase; (b) measuring the performance of the classifiers and regressors should depend on the type of problem we are trying to solve; and (c) there should be a strong relationship between the data that both the type of algorithms uses at the training time and the testing time^{12,13}. In machine learning, ensemble methods are emerging and powerful strategies to improve the robustness and accuracy of both the supervised and unsupervised learning solutions^{14,15}. The basic principle of ensemble strategy is to work on a combination of diversified base classifiers and regressors called as 'models' to strengthen the both kind of weak classifiers and regressors and are available for a single task, merging all of the results which leads to better performance of the classifiers and regressors. In other words, ensemble learning strategies can be defined as, to combine the multiple base classifiers or base regressors to produce the enhanced result in comparison to a single classifier or regressor^{16,17}. Voting, averaging, weighted average is widely used ensemble learning strategies in machine learning domain. Voting is a simple ensemble technique, in which the multiple models are used to make predictions for each data input and the predictions made by each model are called as a 'vote' and the predictions that we get from the majority of models for each data input are used as the final prediction for that data input. Similarly, while the predictions are made for each data point by averaging the predicted results of all the models used for classification and regression is known as 'averaging'. Weighted average strategy is an extension to the averaging strategy, where, different weights are assigned to all the models and those weights defines the importance of each model used for prediction. The advanced form of ensemble learning such as; stacking, blending, bagging and boosting are also being used widely for classification and regression tasks. Staking ensemble learning used prediction results from multiple models to design a new model and this new model is used for final prediction on the test set. In bagging, the random subsets are created from the original datasets using bootstrapping method including all the features then, a user specified estimator is used for all those smaller subsets of data and finally, the predicted results from all the models are combined to find the prediction. But, in boosting ensemble strategy, the each subsequent

model attempts to correct the error of the previous models whereby, the succeeding models are dependent on the predictions of previous models^{18,19}.

In this study, an attempt has been made to implement study and analyze the importance of ensemble strategies on either classification and regression techniques to predict the class label or future value respectively. Here, for experimentation two sets of different datasets are used for both of the tasks and the proposed estimator based on weighted staking has been experimented and evaluated in two levels using RF²⁰, a variant of ANN i.e. Multi-Layer Probabilistic Neural Network (MLPNN)^{21,22}, a lazy learner k -NN²³ in the first level of experimentation to get the individual predictions of those heterogeneous models and the in second level of experimentation, the weighted staking ensemble leaning^{24,25} has been experimented with SVM and the performance of the all the individual models along with stacked SVM have been evaluated using various performance matrices such as; specificity²⁶, sensitivity²⁷ and F-score²⁸ as well as T-test based statistical analysis²⁹ has been considered to accept the performance of the proposed model.

The rest of the paper has been outlined as follows; in section 2, the related work on ensemble strategies for both the classification and regression problems have been explored, the methodologies adopted for experimentation are discussed in section 3; section 4 outlines the proposed ensemble learning strategy; the experimentation and result analysis are given in section 4 and finally, section 5 concludes the paper with future scope of this proposed work.

Staking normally uses the concept of competition among the multiple base classifiers or regressors to train the same set of data using average, max, min etc to obtain a higher degree of prediction accuracy. It uses two layer approach of learning. The prediction output of the base learners act as the input to the second layer of algorithm to optimally combine the model prediction to obtain a good estimator. It has been found that, staking yields better performance than the trained base classifiers or regressors and is being used to estimate the bagging error rate. The advantages of stacking have been improved by adding the weighted version of data. The predictions of base models are combined through weighted majority voting or weighted sum to estimate the final prediction. The above mentioned advantages motivated to persue this work to evaluate the performance of both classifiers and regressors to estimate the predicted result.

MATERIALS AND METHOD

In this section, we introduce the various learners used for classification and regression as well along with the staking and weighted staking methods. The performance evaluation measures are also been discussed here briefly. The various learners used for experimentation are, RF^{7,20,37,38}, MLPNN^{21,22}, *k*-NN^{8,23} and SVM^{9,50}. RF^{7,20} is a supervised learning approach; it creates a forest of decision trees, trained with bagging in which this bagging approach employs a combination of learning strategies to increase the prediction result. The most commonly used ANN is MLPNN, a probabilistic neural network (PNN) is an alternative to MLPNN. This combination of back propagation and PNN predicts the unknown pattern and minimizes the misclassification rate^{29,30}. The *k*-NN falls under the category of lazy learners and it stores all the information about the available patterns and classifies new instances based on similarity measures such as; distance functions and it is also a non-parametric learning approach^{8,23}. SVM works on the principle of fitting a boundary to a region of points which belong to one class and once the boundary between the classes based on training data are fitted, SVM will be able to predict the class label of test data. The main advantages of this learning strategy is that, once a boundary is obtained, most of the training data is redundant and all it needs is a core of points named as support vectors to identify and set the boundary to classify or predict the new instances^{9,50}.

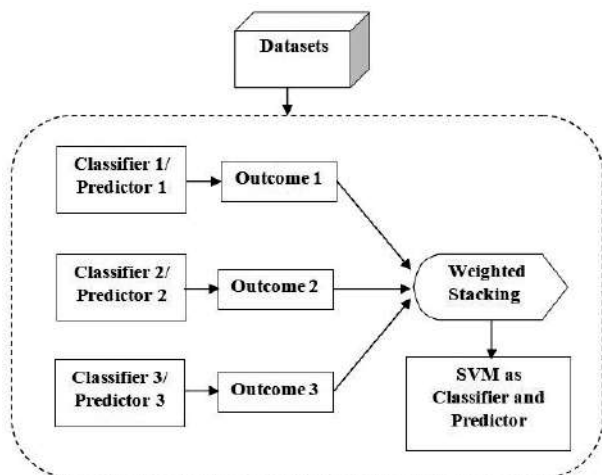

Figure 1: Broad scope of the proposed classification and regression strategy based on weighted stacking

Stacking is a simple ensemble learning strategy of combining the diversified base learners or classification models and uses a first-level or base level prediction

approaches from a few basic classifiers and the uses another model at the next level to predict the output from the first level of predictions^{31,32}. To validate and measure the recognition performance of the proposed weighted stacking based estimator, the sensitivity, specificity and F-1score are being used and experimented^{33,34}. Basically ensemble learning methods are used to enhance the performance of weak learning methods and produce better results. Voting classifier is a technique that can be used for both classification and regression problems. Basically, this method is applied to extract the best result out of a set of results. Weighted majority voting technique generally applies some weightage to each estimator output instead of taking only outputs. The stacking, which can be used for ensemble learning, generally considered as multilevel ensemble learning, because it uses more than one level of learning estimators instead of only one has been used for experimentation.

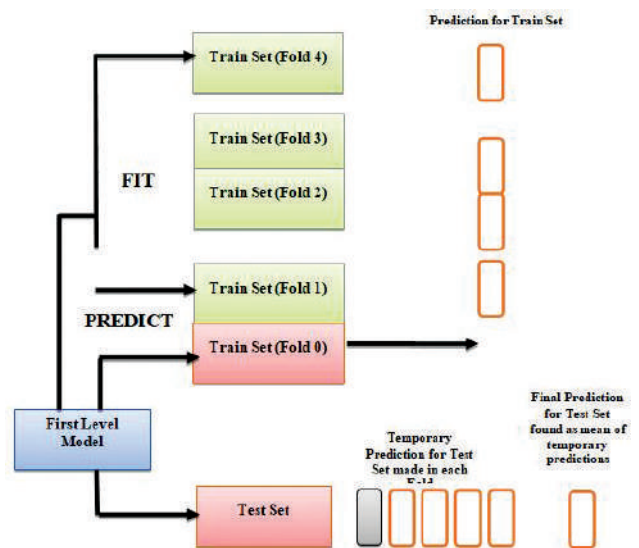

Figure 2: Working procedure for first level and one fold stacking procedure in ensemble learning

In this work, we have proposed a new method for ensemble learning based on weighted stacking approach. Here, in each level of stacking there are different weights given to decide the estimator performance. There are mainly two levels for stacking is done using three first level models and then, the outputs of these predictions are used as features for 2nd level of prediction. Generally, any model can be used in 1st and 2nd level, but here, the three model classifiers such as; random forest, multi layer probabilistic neural network and *k*-nearest neighbor are used for prediction. The outcomes of those classifiers for classification and prediction has been used as input to the stacking ensemble strategy, and then SVM^{35,36}

has been used for both classification and regression on different sets of datasets as discussed earlier and detailed in **Table 1** and **Table 2**. The broad scope of this study and the working procedure for first level and one-fold stacking in ensemble learning are outlined in **Figure 1** and **Figure 2** respectively.

FINDINGS

This section presents the conducted experiments on classification as well as regression tasks on two sets of

three different datasets as discussed in **Section 4.1**. The effectiveness of the proposed ensemble learning was investigated through two levels of experiments using four state of the art classifiers and one weighted stacking ensemble strategy.

Datasets description: For experimentation and to analyze the performance of the proposed weighted stacking based ensemble learning for both classification and regression the following two sets of datasets are used as given in Table 1 and Table 2 with their descriptions.

Table 1: Datasets used for classification problem

Dataset	#Instances	#Classes	#Attributes	Type	Missing Values
Chronic Kidney Disease	400	2	25	Real	Yes
Diabetic Retinopathy Debrecen	1151	2	20	Real	No
Cardiotocography	2126	3	23	Real	No

Table 2: Datasets used for regression problem

Dataset	#Instances	#Attributes	Type	Missing Values
Parkinsons Telemonitoring	5875	26	Real	No
Wine Quality	4898	12	Real	No
Energy Efficiency	768	8	Real	No

Parameters setup

Table 3: Parameters used for experimentation

Classification/ Regression strategies adopted for experimentation	Parameters considered with their values associated
RF	Max depth=5
MLPNN	Optimizer=Limited Memory BFGS, learning rate=0.5, hidden layer size= based on input size
k-NN	No. of neighbors= 7
Stacking	No. of folds = 5, stratified = True
SVM	Kernel = radial basis function

In this work, four classifiers such as; RF, MLPNN, k-KK and SVM and one staking based ensemble method has been experimented for both classification and regression. The values of the parameters are detailed in **Table 3** and are used those parameters are used to assess the performance of proposed ensemble learning based on weighted stacking.

RESULT ANALYSIS AND DISCUSSION

To enhance the performance weak or base learners, the ensemble strategies have been proposed. In this work, a voting based ensemble strategy has been devised

to enhance the performance of both classification and regression problem. Two different sets of three datasets each for classification as well as regression are being experimented. Voting classifier is a technique has been used for both classification and regression problems and basically, this method is applied to extract the best result out of a set of results. Weighted majority voting technique generally applies some weightage to each estimator output instead of taking only outputs. The stacking, which can be used for ensemble learning, generally considered as multilevel ensemble learning, because it uses more than one level of learning estimators instead of only one has been used for experimentation.

In this work, the weighted stacking based ensemble learning approach works in two levels and in each level of stacking there are different weights given to decide the estimator performance. There are mainly two levels for stacking is done using three first level models and then, the outputs of these predictions are used as features for 2nd level

of prediction. Generally, any model can be used in 1st and 2nd level, but here, the three model classifiers such as; RF, MLPNN and k -NN are used for prediction. The outcomes of those classifiers for classification and prediction have been used as input to the stacking ensemble strategy, and then SVM has been used for both classification and regression.

Table 3: Accuracy obtained for classification problem

Datasets Experimented	Accuracy Measure			
	RF	MLPNN	k -NN	Stacking with SVM
Chronic Kidney Disease	0.93	0.95	0.90	0.96
Diabetic Retinopathy Debrecen	0.78	0.80	0.77	0.89
Cardiotocography	0.83	0.85	0.78	0.90

Table 4: Improvement of proposed Stacking with SVM with respect to RF, MLPNN and k -NN for classification problem

Datasets Experimented	Difference from RF	Difference from MLPNN	Difference from k -NN
Chronic Kidney Disease	0.03	0.01	0.06
Diabetic Retinopathy Debrecen	0.11	0.09	0.12
Cardiotocography	0.07	0.05	0.12

The accuracies are being observed for individual base models as well as staking based SVM model as shown in **Table 3** and **Table 5** for classification and regression type of problems respectively. From **Table 3** and **Table 4** for classification problem, it can be seen that, proposed weighted staking based estimator for classification is showing more accurate result with 96%, 89% and 90% for Chronic Kidney Disease, Diabetic Retinopathy Debrecen and Cardiotocography datasets respectively. The improvement observed of RF is 3%, 11% and 7%, for MLPNN is 1%, 9% and 5% and similarly for k -NN 6%, 12% and 1% for three datasets arranged sequentially in **Table 4**.

Table 5: Accuracy obtained for regression problem

Datasets Experimented	Accuracy Measure			
	RF	MLPNN	k -NN	Stacking with SVM
Parkinsons Telemonitoring	0.84	0.90	0.81	0.92
Wine Quality	0.88	0.92	0.78	0.95
Energy Efficiency	0.87	0.90	0.81	0.95

Table 6: Improvement of proposed Stacking with SVM with respect to RF, MLPNN and k -NN for regression problem

Datasets Experimented	Difference from RF	Difference from MLPNN	Difference from k -NN
Parkinsons Telemonitoring	0.08	0.02	0.11
Wine Quality	0.07	0.03	0.17
Energy Efficiency	0.08	0.05	0.14

Table 7: Performance recognition rate of classification with respect to Specificity, Sensitivity, and F1-score

Classifiers/ Regressors	Performance Measures	Datasets experimented		
		Chronic Kidney Disease	Diabetic Retinopathy Debrecen	Cardiotocography
RF	Specificity	0.91	0.82	0.84
	Sensitivity	0.91	0.82	0.84
	F1-Score	0.91	0.82	0.84
MLPNN	Specificity	0.94	0.82	0.83
	Sensitivity	0.94	0.82	0.83
	F1-Score	0.94	0.82	0.83
KNN	Specificity	0.96	0.74	0.77
	Sensitivity	0.96	0.74	0.77
	F1-Score	0.96	0.74	0.77
Stacking with SVM	Specificity	0.97	0.91	0.93
	Sensitivity	0.97	0.91	0.93
	F1-Score	0.97	0.91	0.93

Table 8: Performance recognition rate of regression with respect to Specificity, Sensitivity, and F1-score

Classifiers/ Regressors	Performance Measures	Datasets experimented		
		Parkinson’s Telemonitoring	Wine Quality	Energy Efficiency
RF	Specificity	0.86	0.84	0.85
	Sensitivity	0.86	0.84	0.85
	F1-Score	0.86	0.84	0.85
MLPNN	Specificity	0.92	0.93	0.95
	Sensitivity	0.92	0.93	0.95
	F1-Score	0.92	0.93	0.95
KNN	Specificity	0.79	0.75	0.86
	Sensitivity	0.79	0.75	0.86
	F1-Score	0.79	0.75	0.86
Stacking with SVM	Specificity	0.94	0.97	0.96
	Sensitivity	0.94	0.97	0.96
	F1-Score	0.94	0.97	0.96

Similarly, for regression, the accuracies observed from **Table 5** are 92%, 95% and 95% for Parkinsons Telemonitoring, Wine Quality and Energy Efficiency datasets respectively. The improvement of proposed estimator for regression observed are, 8%, 7% and 8% with respect to RF, 2%, 3% and 5% with respect to MLPNN and 11%, 17% and 14% with respect to *k*-NN for all three datasets arranged sequentially in the **Table 6**. For both types of problems, the proposed staking based SVM estimator is giving superior result with respect to the laze leaner *k*-NN with greater improvement of RF and MLPNN.

For more validation and better observation of proposed weighted staking based estimator, the various

other performance measures such as; specificity, sensitivity and F1-score are being computed for both classification as well as regeression problems and are given in **Table 7** and **Table 8** as well as the values are shown in histograms in **Figure 3** and **Figure 4** for both classification and regeression problems with respect to two different sets of datasets as discussed earlier. For classification problem type, it can be better visualized that, proposed estimator is approaching towards 100% more accurate with 97%, 91% and 93% for Chronic Kidney Disease, Diabetic Retinopathy Debrecen and Cardiotocography datasets respectively. Similarly, for regression, it can be seen that, proposed estimator, giving 94%, 97% and 96% for Parkinsons Telemonitoring, Wine Quality and Energy Efficiency datasets respectively.

Figure 3: Histogram for performance recognition rate observed for classification problem for Chronic Kidney Disease, Diabetic Retinopathy Debrecen and Cardiocography datasets

Figure 4: Histogram for performance recognition rate observed for regression problem for Parkinsons Telemonitoring, Wine Quality and Energy Efficiency datasets

Statistical analysis using paired T-test: Finally, to evaluate the significance of stacked ensemble method, paired T-test was carried out. The results obtained by best individual method (MLPNN) and stacked ensemble were compared pair wise for five independent runs. The null hypothesis was the case, whereby no differences between the results of the two methods consisting of non-regularized and regularized of same category were observed. The results are tabulated in **Table 9** and **Table 10** for classification and regression problems respectively. It can be observed from tables that, the null hypothesis is rejected as the p-values are closer to zero, which strengthens the argument that, proposed regularized Gradient Boosting approach achieved improved performance than the non-regularized methods.

Table 9: Paired T-test of classification problem (all three datasets)

DISCUSSION ON OBSERVATIONS

In summary, the main contributions of this work are:

- (a) The predictions for both classification and regression problems are being addressed with experimentation and validation for the proposed weighted stacking based estimator is showing above 90% accurate results.
- (b) The proposed estimator beats the most state-of-the-art academic benchmark datasets with respect to standard base learners for both classification and regression.
- (c) The ensemble based estimator, provides an insight about the data and learning strategies with respect to standard base or weak learners and are being compared with proposed ensemble learning with overall decrease in complexity and increase in accuracies as well as validity.
- (d) To establish the robustness of the model, various other performance measures such as; specificity, sensitivity and F1-score are being computed and the results obtained are very promising for the classification and regression problems.
- (e) From the statistical test, it can be observed that, the null hypothesis is rejected as the p-values are closer to zero, which strengthens the argument that, proposed regularized Gradient Boosting approach achieved improved performance than the non-regularized methods.

CONCLUSION AND FUTURE SCOPE

In this paper, a novel weighted stacking based estimator for both classification and regression problem has been addressed which works in two levels of experimentation and the accuracies are observed and validated through specificity, sensitivity and F1score as well as statistical significance T-test as been conducted to validate the model. Two of datasets with three datasets for each problem type has been collected from academic benchmark site for experimentation. The three different types of learners such as RF, MLPNN and k-NN are being individually used for classification and regression and also the predicted outputs of those individual learners are being used for second level of experimentation with weighted staking and SVM as learning strategy for both classification and regression. The accuracies observed

are very promising and also the improvements of staking based SVM for problem types is out performing with respect to three base or weak learners used in this study for experimentation. This work can be extended with respect to other heterogeneous learners and also various other ensemble strategies can be used to experiment with different datasets.

ABSTRACT

Background/Objectives: In recent times, the number of men with osteoporosis has increased, and interest on this topic has also increased. This research was conducted to look into the regulatory effects of Gami-Shinkiwihan on osteoporosis induction.

Method/Statistical analysis: The experimental subjects were split into three groups: a control group consisting of 8-week-old male ICR mice that had undergone no treatment, an osteoporosis-elicited group (OPE group) consisting of 24-month-old ICR male mice that had undergone no treatment, and a Gami-Shinkiwihan treatment group (GS group) consisting of 24-month-old ICR male mice that had undergone Gami-Shinkiwihan (0.56 g/kg/day) treatment for 10 weeks. After the experiment, the mice from all the experimental groups were dissected, and they were analyzed through histochemical and immunohistochemical methods.

Findings: Compared to the OPE group, in the GS group, the osteoporosis-induced area was decreased, the RANKL positivity was decreased, and the osteoprotegerin (OPG) positivity was increased. Compared to the OPE group, in the GS group, the bone matrix distribution was increased and the osteocalcin (OPC) and osteopontin (OPN) positivity was increased.

Improvements/Applications: The outcomes of this research suggest that Gami-Shinkiwihan inhibits osteoclastogenesis, by decreasing RANKL levels and increasing OPG levels, and increases bone matrix distribution and OPC and OPN activities in the osteoblast.

Keywords: Gami-shinkiwihan (GS), Osteoporosis, Osteoprotegerin (OPG), Reaction of activation of nuclear factor kappa B ligand (RANKL), Osteocalcin (OPC), Osteopontin (OPN)

INTRODUCTION

With an extended life expectancy and an increasingly aging population owing to advances in medicine and science, chronic degenerative diseases have become a major cause of death in the modern society. Osteoporosis has become the most important health problem in elderly and middle-aged people, because a reduction in bone

mass in both men and women occurs with increasing age. The incidence of fractures due to osteoporosis, which is caused by the complex action of various factors such as increasing aging population, is increasing. In addition, the resulting increase in medical costs may result in serious socioeconomic losses ^[1].

Osteoporosis is an important metabolic bone disease characterized by a decline in bone formation and an increase in bone resorption, bringing about a reduction in the absolute bone mass per unit mass, a thinning of the bony cortex, a decrease in the quantity and size of bony trabeculae, and a consequent increase in fracture that may be caused by even a small external impact ^[2, 3]. In other words, the early treatment and prevention of osteoporosis is valuable since due to a gradual

decrease in bone mass, osteoporosis is asymptomatic until fracture occurs, and despite recent development of various treatments, the recovery from osteoporosis is very difficult once it has progressed [4].

The peak bone mass is greater in men than in women, and the bone size is larger in men than in women. Overall bone loss according to age is smaller in men than in women because compensatory action in the exosteam is greater and bone resorption in the endosteum is smaller in men than in women [5,6]. Thus, in the past, osteoporosis was thought to be a disease that is often observed only in women, and most osteoporosis studies and medical care are focused on women. However, as the society is rapidly aging lately, the number of men with osteoporosis has also rise. In addition, Cooper et al. [7] reported that 30% of 1.7 million hip fractures worldwide in 1990 occurred in men, and an epidemiological survey [8] in Canada estimated that the incidence of fracture in men will be similar to that in women by 2025. As such, osteoporosis in men is newly recognized as one of the most important diseases.

In oriental medicine, osteoporosis is considered to occur since the “yin” or “yang” in the kidneys is clinically weak, with focus on the relationship between the kidney and bone. Its treatment is also focused on a prescription to invigorate the energy in the kidney.

There are previous studies on the efficacy of herbal medicines for osteoporosis, including a research by Choi et al. [9] regarding the effects of Kamijoagiem on osteoporosis by noting that the energy in the kidney was so hot that the water in the kidney may become scarce, and the bone space is not filled with bone marrow; a study by Choi et al. [10] regarding the effects of Eucommiae cortex and Herba Cynomorii on osteoporosis; a study by Lim et al. [11] regarding the effects of bakuchiol, the main constituent of *Psoralea corylifolia* L extract, on osteoporosis; and a research by Lee et al. [12] regarding the effects of *Radix Rehmanniae Preparata* on osteoporosis. This indicates that the previous studies have mainly been conducted on osteoporosis due to a lack of kidney-“yin” energy and kidney-“eum” energy with focus on treatments and prescriptions for invigorating the kidney energy.

However, these studies have conducted only on osteoporosis in women, and there are no studies on oriental medicine prescriptions to be used for osteoporosis in men.

Gami-Shinkiwhanis Shinkiwhan^[13], a typical herbal medicine that helps to invigorate insufficient energy in the kidneys to function properly, added with medicinal herbs including *Rubus coreanus*^[14], *Fructus lycii*^[15], *Bombyx batryticatus*^[16], *Fructus amomi Amari* ^[17], *Eucommiae cortex*^[18], and *Acanthopanax cortex* ^[19] that can further strengthen the energy in the kidney. Moreover,

it is an herbal medicine prescription that is intended to strengthen its intrinsic action through the addition of the 6 herbs.

The authors investigated the effects of Gami-Shinkiwhan on the induction of male osteoporosis and its induction mechanism using histochemical and immunohistochemical methods, in this study.

Materials and Methods

Materials

Experimental animals and classification of experimental groups

In our experiment, 8-week-old and 24-month-old ICR mice were used. The mice were confined in the laboratory for 1 week and then experiments were performed on it.

The experimental animals were split into three groups: a control group, an osteoporosis-elicited group (OPE group), and a Gami-Shinkiwhan treatment group (GS group).

The control group is made up of 8-week-old ICR male mice without restriction on diet and drinking water. The OPE group consisted of 24-month-old ICR male mice without restriction on diet and drinking water. The GS group was put Gami-Shinkiwhan at a dose of 0.56g/kg/day into 24-month-old ICR male mice for 10 weeks without diet restriction.

The present study was conducted after obtaining approval (smecae 16-05-05) from the Animal Experiment Ethics Committee at Semyung University, South Korea.

Manufacture of Gami-Shinkiwhan

The Gami-Shinkiwhan used in our experiment is composed of medicinal herbs Sukjihwang, Sansuyu, Sanyak, Omija, Ikjiin, Mogdanpi, Bockboonja, Ogapi, Googija, Baekbokryung, Taeksa, Doochung, Baekgangzam. A total of 2000 ml of distilled water was added to 470g of medicinal herbs and the solvent was boiled for 2 hours at 100° C for extraction. The extracted solution was centrifuged to remove impurities and was concentrated under depressurized on a rotator evaporator (Eyela, Japan), followed by lyophilization to obtain 21.9 g of powder.

Methods

Experimental tissue specimen production

All the mice from the experimental groups that completed the experiment were anesthetized with ether and were dissected. The femurs were separated from the thighs

and were replated for 24 hours in 10% NBF. They were treated with a decalcification solution (BBC, UK) for 12 hours, washed, and embedded in paraffin using conventional methods to make serial sections with a thickness of 5 μ m.

Histochemical methods for osteoporosis observation:

Masson's trichrome staining was accomplished to make an objective observation changes in the femur. First, the femurs were treated with Bouin solution for 1 hour at 50-60°C. Then, picric acid was eliminated using ethanol 70%. They were responded with Weigert's iron hematoxylin for 10 minutes to perform nuclear staining and were treated with phosphomolybdic-phosphotungstic acid, Biebrich scarlet-acid fuchsin for 15 minutes, and aniline blue for 5 minutes for observations using an optical microscope (BX50, Olympus, Japan).

Phloxine-tartrazine staining was carried out watching changes in the dispersion of collagen fibers and bone matrix in the femur narrowly. The femur tissue sections were stained with Mayer's hematoxylin for 5 min and were responded with phloxine solution for 30 min. They were then fractionated in tartrazine solution and then were reversed for observation.

Histochemistry for observation of osteoporosis development:

Immunohistochemical staining was conducted to observe changes in the osteoprotegerin (OPG) and reaction of activation of the nuclear factor kappa B ligand (RANKL) involved in the pathogenesis of osteoporosis. First, bone tissue sections underwent proteolysis for 5 minutes with proteinase K (20 μ g/ml) and were responded, for 2 hours, with 10% normal goat serum, a blocking serum. The bone sections were reacted with mouse anti-RANKL (1:50, Santa Cruz Biotechnology, USA) and mouse anti-OPG (1:50, Abcam, USA), primary antibodies, in a humidified chamber at 4°C for 3 days. Then, they were connected

with biotinylated goat anti-mouse IgG1 (1:100, DAKO, USA), a secondary antibody, at room temperature for 1 days, and then responded with the avidin biotin complex kit (Vector Lab, USA) for 1 hour at 36°C. They were color-developed in 0.05-M tris-HCl buffer solution (pH 7.4) containing 0.01% HCl and 0.05% 3,3'-diaminobenzidine and underwent contrast staining with hematoxylin.

Immunohistochemistry for observation of osteoblasts:

Immunohistochemical staining was carried out using mouse anti-OPC (1:50, Santa Cruz Biotechnology, USA) and mouse anti-OPN (1:50, Santa Cruz Biotechnology, USA) to investigate changes in the distribution of osteocalcin (OPC) and osteopontin (OPN) produced in osteoblasts.

Image analysis: To investigate immunohistochemical results and the distribution of osteoporosis-induced areas, image analysis was accomplished using Image Pro Plus (Media Cybernetics, USA) and the results are shown as means \pm standard deviation. The areas randomly selected from each group were photographed at x40 or x400 magnification to perform image analysis with positive pixels/ 20,000,000 pixels. Statistical analysis was conducted using SPSS software program (SPSS 23, SPSS Inc., USA). One-way ANOVA was used to test significance ($P < 0.05$), and Duncan's multiple range test was used for post-hoc testing.

RESULTS

Regulatory effects of Gami-Shinkiwihan on osteoporosis induction:

Make a comparison between the OPE group and the control group, the proportion of osteoporosis-induced area was rise by 141% in the OPE group, whereas it was decreased by 45% in the GS group, make a comparison between the OPE group and GS group in figure 1.

Figure 1: Regulatory effects of Gami-Shinkiwihan on osteoporosis induction. Arrow, osteoporosis area; BM, bone marrow; bar size, 100 μ m; M/T, Masson's trichrome; Ctrl, control; OPE, osteoporosis-elicited group; GST, Gami-Shinkiwihan treatment group.

Regulatory effects of Gami-Shinkiwihan on osteoporosis induction: The results showed that the RANKL positivity was increased by 310% in the OPE group drawn a comparison with the control group, was decreased by 14% in the GS group drawn a comparison with the OPE group, was declined by 75% in the OPE group compared to the control group, and was increased by 180% in the GS group drawn a comparison with the OPE group as shown in figure 2, table 1, and table 2.

Figure 2: Regulatory effects of Gami-Shinkiwihan on osteoporosis induction. Arrow, positive reaction; BM, bone marrow; bar size, 50 μm; RANKL, the receptor for the activation of the nuclear factor kappa B ligand; OPG, osteoprotegerin; Ctrl, control; OPE, osteoporosis-elicited group; GST, Gami-Shinkiwihan treatment group

Table 1: Analysis of reaction of the activation of the nuclear factor kappa B ligand (RANKL) Distribution

Objective	Group		
	Control	OPE group	GS group
RANKL	47,614±1,474	195,312±4,788	168,320±2,928*

Values are expressed as mean±standard deviation (n = 8). Image analysis for 20,000,000 pixel cells.*p <0.05 compared to the osteoporosis-elicited (OPE) group.

Table 2: Analysis of osteoprotegerin (OPG)distribution

Objective	Group		
	Control	OPE group	GS group
OPG	62,055±1,266	15,610± 697	43,719±1,494*

Values are expressed as mean±standard deviation (n = 8). Image analysis for 20,000,000 pixel cells.*p <0.05 compared to the osteoporosis-elicited(OPE) group.

Regulatory effects of Gami-Shinkiwihan on osteoblast activity: Phloxine-tartrazine staining, which was performed to observe changes in collagen fiber and bone matrix distribution in the femur, revealed that the bone matrix dispersion was higher in the GS group than in the OPE group.

Immunohistochemical staining using mouse anti-OPC and mouse anti-OPN, which was performed to investigate osteocalcin (OPC) and osteopontin (OPN) distribution, revealed that compared to the control group the OPC positivity was decreased by 65% in the OPE group and compared to the OPE group, was increased by 253% in the GS group. In addition, compared to the control group, the OPN positivity was declined by 50% in the OPE group and compared to the OPE group, was increased by 171% in the GS group in figure 3, table 3, and table 4.

Figure 3: Regulatory effects of Gami-Shinkiwhan on osteoblast activity. Asterisk, bone matrix-vacated region; Arrow, positive reaction; BM, bone marrow; Bar size, 50 μm; P/T, phloxine-tartrazine staining; OPC, osteocalcin; OPN, osteopontin; Ctrl, control; OPE, osteoporosis-elicited group; GST, Gami-Shinkiwhan treatment group.

Table 3: Analysis of osteocalcin (OPC) distribution

Objective	Group		
	Control	OPE group	GS group
OPC	123,537±2,254	43,778±1,489	154,563±2,589*

Objective	Group		
	Control	OPE group	GS group
OPN	58,296±1,324	29,086±1,023	78,905±1,264*

Values are expressed as mean±standard deviation (n = 8). Image analysis for 20,000,000 pixel cells.*p < 0.05 compared to the osteoporosis-elicited(OPE) group.

DISCUSSION

Bone tissue continues its lifelong changes with bone formation and bone resorption to maintain homeostasis of bone mass and the skeleton, thereby destroying the old bone and creating a new bone. In other words, the bone tissue is continuously remodeled. Osteoclasts and osteoblasts are involved in such bone remodeling. The bone remodeling includes old bone destruction or resorption by osteoclasts differentiated from hematopoietic stem cells, where calcium is released into the bloodstream and is used to maintain body function. whereas, osteoblasts produced from mesenchymal stem cells form a new bone, resulting in bone remodeling. Ultimately, the bone tissue homeostasis is kept through a constant equilibrium between bone forming and bone destruction rates. When the bone destruction rate is accelerated, fractures easily occur due to bone weakening, and osteoporosis is a bone metabolic disease caused by such andisequilibrium between osteoclasts and osteoblasts [20,21].

Osteoporosis is a degenerative disease dominated by an increase in fracture incidence and low bone mass due to an imbalance between osteocytes resulting from metabolic skeletal abnormality due to aging. The World Health Organization (WHO) defines as osteoporosis is a systemic skeletal disease characterized by low bone mass and microstructural deterioration of bone tissue with a consequent increase in bone fragility and susceptibility of fractures [22].

Modern society is now entering an aging society with rapid socioeconomic growth and improved healthcare. As the mortality of male elderly people is gradually lowered owing to increasing interest in health, the number of male elderly people is expected to increase [23]. The prevalence rate of male osteoporosis is also estimated to gradually increase as bone mineral density in men decreases with age as in women [1]. Accordingly, the social and medical interest in osteoporosis, which was thought to be a disease that occurs only in women, is directed to male osteoporosis, and studies regarding the treatment and prevention of osteoporosis in men are actively conducted.

Although there are previous studies on bone mineral density in men, including studies on factors related with bone mineral density in Korean middle-aged men [24], the relationship between bone mineral density and testosterone in middle-aged men [25], and health behavior and biochemical makers related to bone mineral density in adult men [26], there are no study investigating osteoporosis induction and its induction mechanism in men.

In addition, treatment of male osteoporosis is in line with female osteoporosis treatment. Yoon et al. [27] stated that one of the treatment options for osteoporosis is the inhibition of osteoclastic differentiation. Drugs such as estrogen, calcitonin, and bisphosphonates have been widely used as inhibitors of bone resorption through the degradation of osteoclast function [28]. However, these drugs have given a presentation to be related with some adverse effects such as a growth in low bone mineral density, weight gain, gastrointestinal damage, hypokalemia, atrial fibrillation, and osteonecrosis of the jaw [29,30]. Therefore, to minimize such adverse effects, it is necessary to develop substances for the treatment and prevention of osteoporosis, which can minimize bone loss and promote bone formation using natural materials with low toxicity.

In oriental medicine, osteoporosis is thought to occur due to a lack of “yin” and “yang” in the kidney and has thus been treated using herbal medicines that can strengthen the energy of the kidney.

The Gami-Shinkiwahan used in this study is an herbal medicine prescription of Shinkiwahan added with six herbal drugs, namely *Bombyx batryticatus*, *Rubus coreanus*, *Acanthopanax cortex*, *Eucommiae cortex*, *Fructus amomi amari*, and *Fructus lycii*, and is intended to further strengthen the action of Shinkiwahan that can boost the energy of the kidney.

There are previous studies on Gami-Shinkiwahan including a study reporting that Gami-Shinkiwahan increased the level of serotonin in the hippocampal tissue, reduced the actions of caspase-3 and HDAC3 associated with apoptosis, and was involved in an increase in SHH associated with hippocampal tissue proliferation, thereby improving depression due to aging [31]; a study reporting that Gami-Shinkiwahan inhibited the apoptosis of Sertoli cells and seminiferous cells in the seminiferous tubules and increased the production of Sertoli cells, sperm, and testosterone, thereby improving male reproductive

dysfunction due to aging [32]; and a study suggesting that Gami-Shinkiwah increased the production of NO, inhibited PDE5 activity through the activation of eNOS in the corpus cavernosum tissue, and blocked the extracellular calcium influx through the activation of cGMP, thereby relaxing penile cavernosal smooth muscle [33]. In addition, a study reported that Gami-Shinkiwah made the spongy matter in the femur dense to suppress the development of osteoporosis due to aging and reduced fat deposits in the quadriceps femoris to suppress muscle atrophy due to aging, thus indicating that Gami-Shinkiwah may be effective for musculoskeletal diseases due to aging [34]. However, there is no report on the effects of Gami-Shinkiwah on the induction of osteoporosis and its induction mechanism.

In this regard, the authors of this study examined the regulatory effects of Gami-Shinkiwah, which works to invigorate the kidney, on the induction of male osteoporosis due to aging and its induction mechanism using histochemical and immunohistochemical methods.

By observing these changes in the femur, in the GS group, the proportion of osteoporosis-induced area was declined compared to the OPE groups significantly. This means that osteoporosis induction was suppressed by the administration of Gami-Shinkiwah, indicating that Gami-Shinkiwah is effective in suppressing osteoporosis induction.

In addition, the results of the experiment on the pathogenic mechanism of osteoporosis showed that in the GS group, the RANKL positivity was decreased compared to the OPE groups significantly, whereas compared to the OPE group, the OPG positivity was increased in the GS group significantly.

Meanwhile, RANKL and OPG are released from osteoblasts and are involved in osteoclastic differentiation.

The activated immune cells binds to receptor (RANK) or RANKL produced by osteoblasts located in osteoclasts and precursor cells to promote osteoclast formation and activity, and activated osteoclasts form an actin ring composed of a fibrous actin sequence between the cell membrane and bone matrix to secrete proteases and proton, thereby absorbing bone matrix and then reducing bone mineral density. On the other hand, OPG acts mainly to inhibit binding of RANKL to RANK, thereby reducing bone resorption and inhibiting RANKL-induced osteoclastic differentiation [35,36].

In other words, the results of this research showed that when Gami-Shinkiwah was administered, the RANKL positivity was decreased, whereas the OPG positivity was increased, indicating that Gami-Shinkiwah influenced RANKL and OPG activity, thereby inhibiting osteoclast formation and activity.

Compared to the OPE group, the bone matrix distribution of collagen fibers in the femur was observed more in the GS group, indicating that Gami-Shinkiwah brought about an increase in bone matrix, thereby inhibiting the induction of osteoporosis.

OPN is a non-collagenous bone protein produced by osteoblasts and is known to promote the adhesion and migration of bone cells involved in bone metabolism to bone tissue and to increase bone mineralization. Therefore, OPN is mainly used as an early biomarker of bone formation [37]. OPC is synthesized by osteoblasts at the time of bone remodeling and is a specific biochemical marker of bone turnover. Approximately 30% of newly synthesized OPC is secreted into the blood. Therefore, measuring its blood concentration can detect the activity of osteoblasts, which reflects the degree of bone regeneration [38].

The results of our experiment showed that compared to the OPE group, the OPC positivity and OPN positivity were rise in the GS group. This indicates that Gami-Shinkiwah increases bone formation and thus has an effect of suppressing the induction of osteoporosis.

Taken together, it is thought that Gami-Shinkiwah inhibits the induction of osteoporosis by inhibiting osteoclast formation and activity, increasing bone matrix by decreasing RANKL and increasing OPG, and increasing bone formation by increasing OPC and OPN.

CONCLUSION

We conducted our experiment to investigate the regulatory effects of Gami-Shinkiwah, an herbal medicine which works to invigorate kidney energy, on osteoporosis induction and its mechanism in the aged male mice receiving Gami-Shinkiwah by using histochemical and immunohistochemical methods in the present study. The results are as follows:

1. Gami-Shinkiwah significantly decreased the increased osteoporosis-induced area in the OPE group.

2. Gami-Shinkiwihan significantly decreased the increased RANKL positivity in the OPE group.
3. Gami-Shinkiwihan significantly increased the decreased OPGpositivity in the OPE group.
4. Gami-Shinkiwihan increased the decreased bone matrix distribution due to aging.
5. Gami-Shinkiwihan significantly increased the decreased OPC positivityin the OPEgroup.
6. Gami-Shinkiwihan significantly increased the decreased OPN positivity in the OPE group.

From the aforementioned results, it is thought that Gami-Shinkiwihan inhibits the induction of osteoporosis by decreasing RANKL activity, increasing OPG activity, increasing decreased bone matrix distribution due to aging, and increasing the activities of OPC and OPN, which are produced in osteoblasts.

ABSTRACT

Background/Objectives: To evaluate antibacterial and antioxidant activities using *Pleurotus eryngii* extracts.

Method/Statistical analysis: TPC, TFC, DPPH, and ABTS activities were examined for antioxidant effects. In order to determine the antimicrobial activity, we also studied these extracts using six multi-resistant bacteria through paper disc diffusion.

Findings: The content of total polyphenols ranged from 1.67 mg GAE/g extract in acetone extract to 1.31 mg GAE/g extract in EtOH extract. The content of total flavonoid varied from 7.77 mg CE/g extract in EtAC extract to 0.61 mg CE/g extract in EtOH extract. At the result of DPPH activities of all extracts were higher than the ascorbic acid solution. DPPH activity of EtAC extract was the highest value at 81.0%. In addition, the highest ABTS activity was observed in EtOH extract at 88.4%. DPPH activity showed a stronger correlation with TPC and TFC. EtOH extract and acetone extract showed antimicrobial activity against six microorganisms. The EtOH extracts were the most effective against *Enterobacter cloacae*, and the most significant acetone extracts were the most effective for *Escherichia coli*.

Improvements/Applications: Based on this study, *Pleurotus eryngii* can be a good candidate for natural antioxidants and antimicrobials.

Keywords: antimicrobial, antioxidant, flavonoid, *Pleurotus eryngii*, polyphenol

INTRODUCTION

Various diseases such as brain diseases, heart diseases, atherosclerosis and autoimmune diseases are increasing in humans of the modern society due to changes in diet as well as excessive stress. Additionally, the incidence rate of various cancers is increasing due to incremented use of environmental

chemicals. Because there are many natural plants with intrinsic biological activities that may prevent various oxidation reactions, studies are continuously conducted to discover natural products with antioxidant effects that maintain health and delay aging, as well as natural products with antineoplastic effects that prevent cancer; most importantly however, studies are more actively developed to especially discover biologically active substances derived from natural products^[1,2].

Plants have various antimicrobial substances including secondary metabolites or their derivatives such as alkaloids, terpenoids, quinolones, flavonoids, phenolic compounds and volatile oil^[3]. Mushrooms are generally recognized to be effective in Chinese medicine and traditional medicine, and are known to be effective in the treatment of chronic diseases by

increasing the defensive system of the human body through diseases such as phagocytosis^[4]. Among the various natural products, mushrooms especially have their characteristic scent and taste, and are recognized as a low-calorie food with abundant nutrients. Additionally, mushrooms contain β -glucan and are reported for their effects of preventing various diseases through their anti-neoplastic and immunostimulatory actions as well as effects of lowering cholesterol; for this reason, they are used as ingredients in functional health foods as well as in medical products, thereby increasing the annual mushroom production rate by 3~4%^[1,2,5].

The scientific name of Saesongi mushroom is *Pleurotus eryngii*. Its general name and the name of species is registered as King Oyster Mushroom, while its product name is registered as Saesongi mushroom^[5]. Dried *P. eryngii* not only offer approximately 37.7% of protein content with abundant amino acids, but also contain β -glucan, polysaccharopeptides and polysaccharides such as polysaccharide-protein conjugates, Vitamin C, minerals and Vitamin B12 (treatment factor to pernicious anemia), substance not commonly seen in other mushrooms^[5,6]. *P. eryngii* have solid and excellent flesh due to the compact plectenchyma in their fruiting body and have less water content than other mushrooms, offering their value as a functional edible mushroom^[5,7]. *Pleurotus ostreatus*, which belongs to the same *Pleurotus* family as *P. eryngii*, contains lovastatin and therefore lowers cholesterol, and is additionally reported to be effective in breast cancer as well as in colon cancer^[8].

This study was compared and analyze the antioxidant as well as the antimicrobial activity of *P. eryngii*, a mushroom with characteristics of a functional food product, extracted to solvents such as acetone, ethanol (EtOH) and ethyl acetate (EtAC); this was achieved by measuring not only the antioxidant activity such as the antioxidant (DPPH, 1,1-diphenyl-2-picrylhydrazyl; and ABTS, 2,2'-azino-bis (3-ethylbenzothiazoline-6-sulfonic acid) radical scavenging activity, total polyphenol contents (TPC), and total flavonoid contents (TFC) but also the antimicrobial activity against 6 multi-drug resistant bacteria.

MATERIAL AND METHOD

Materials: *P. eryngii* used in this study were purchased in a sliced form from Duriban farm (Gwangju, Korea), and were used in a powdered form after natural air drying. Aluminium(III) chloride hexahydrate, ascorbic acid,

catechin, 2,2-diphenyl-1-picrylhydrazyl, 2,2'-azino-bis (3-ethylbenzothiazoline-6-sulfonic acid) diammonium salt, Folin-Ciocalteu reagent, and gallic acid used in the antioxidant activity test were purchased from Sigma-Aldrich Co. (St. Louis, MO, USA), and extra pure reagents were used for acetone, EtOH, and EtAC. The 6 species of bacteria used for the antimicrobial assay using *P. eryngii* extracts were 3 species of Gram-positive bacteria containing *Micrococcus luteus* (KCTC1915), *Staphylococcus aureus* (KCTC1928), and *Bacillus subtilis* (KCTC1918) and 3 kinds of Gram-negative bacteria including *Pseudomonas aeruginosa* (KCTC1637), *Enterobacter cloacae* (KCTC1685), and *Escherichia coli* (KCTC2441). All bacteria were harvested from Korean Collection for Type Cultures (KCTC, Daejeon, Korea), and activated from subculture in according to each of their culture conditions.

Preparation of *P. eryngii* extracts: 400 mL of solvent were added to 50 g of powdered *P. eryngii*, which was then extracted and filtered (Advantec MFS, Tokyo, Japan) for 48 hr in room temperature. Rotary evaporator (EYELA A-1000S, Tokyo, Japan) was used to remove the solvents of the filtrate, and the concentration was set to 50 mg/mL by diluting in dimethyl sulfoxide (DMSO, Sigma-Aldrich Co., St. Louis, MO, USA). After such process, the extracts were used in the test with storage at -20°C. Solvents used for *P. eryngii* were EtAC, acetone and EtOH, which each have different polarities but allow easy removal.

TPC of *P. eryngii* extracts: The TPC was measured via chromogenic assay revealing blue color obtained from reaction between Folin-Ciocalteu reagent and phenolic compounds contained in the *P. eryngii* extracts^[9]. 45 μ L of 1 N Folin-Ciocalteu reagent (Sigma-Aldrich Co., MO, USA) were mixed to 45 μ L of *P. eryngii* extracts, and the mixture reacted at normal room temperature for 3 minutes to promote the reaction. After mixing 910 μ L of 2% Na₂CO₃, the mixture was fixed for 30 min. And then the absorbance was measured at 760 nm using a spectrophotometer (MECASYS, Daejeon, Korea). At the TPC results were presented as mg gallic acid equivalent (GAE)/g extract by drawing a calibration curve with concentration of 100.0, 50.0, 25.0, 12.5, 6.25 and 3.125 μ g/mL, using gallic acid as the standard. All results are presented as average values calculated from three series of tests.

TFC of *P. eryngii* extracts: The TFC was measured using Han's method^[10]. 1L of distilled water were added to 250 μ L of *P. eryngii* extracts, to which 75 μ L

of 5% NaNO₂ was added; the mixture was then fixed for 5 min for reaction. 150 µL of 10% AlCl₃ was added, the mixture was then fixed for additional 6 min. 500 µL of 1.0 M NaOH were added, the remaining volume was filled with distilled water to establish a total volume of 2 mL. The mixture was fixed for 15 mins and then measured for its absorbance at 510 nm. At the TFC results were presented as mg catechin equivalent (CE)/g extract by drawing a calibration curve with concentration of 100.0, 50.0, 25.0, 12.5, 6.25 and 3.125 µg/mL, using catechin as the standard. The results are presented as average values calculated from three series of tests.

Measurement of DPPH: The Blois method was used to measure the DPPH activity as the evaluation of antioxidant activity of *P. eryngii* extracts^[11]. 970 µL of 0.1 mM DPPH solution were added to 30 µL of the extracts. The mixture was fixed for 30 min in the darkroom and then measured for its absorbance at 517 nm. The results were presented as the mean value calculated from 3 independent experiments tests. 1 mM ascorbic acid was used as the positive control. The DPPH activity was calculated as follows:

$$\text{DPPH (\%)} = \left(1 - \frac{\text{Absorbance of solution added with reagent}}{\text{Absorbance of solution without reagent}} \right) \dots(1)$$

Measurement of ABTS: This method of Re et al. was used after partial revision to measure the ABTS activity after partial modification^[12]. After mixing 7.4 mM ABTS diammonium salt with 2.6 mM potassium persulfate in a 1:1 ratio, the mixture was fixed for 24 hr in the darkroom to prepare the ABTS cation solution. The absorbance was then adjusted to 0.7 at 734 nm using a spectrophotometer. 30 µL of *P. eryngii* extracts was mixed with 970 µL of ABTS solution. The mixture was fixed for 30 min in the darkroom to facilitate their reaction, and its absorbance was measured at 734 nm. The results were presented as the mean value calculated from 3 independent experiments. 1 mM ascorbic acid was used as the positive control. The ABTS activity was calculated as follows:

$$\text{ABTS (\%)} = \left(1 - \frac{\text{Absorbance of solution added with reagent}}{\text{Absorbance of solution without reagent}} \right) \times 100 \dots(2)$$

Measurement of antibacterial activity: The antimicrobial activity of *P. eryngii* extracts was measured using disc diffusion method^[13]. Lysogeny Broth (LB) culture liquid medium was used for the 6 species of bacteria to be used in the study, in which the bacteria were aerobically cultured for 24 hr at 37°C. Its absorbance was diluted to 0.1 at 600 nm and then the bacteria were smeared to the petri dish. 30 µL (1.5 mg/disc) of *P. eryngii* extracts were sprayed to the paper disc (6 mm diameter, Whatman International, MO, USA) and then the disc was cultured aerobically for 12 hr in a 37°C incubator. The diameter of the clear zone was measured using Vernier caliper (0~150 mm, color world, China), which was used to compare their antimicrobial activities. The results are presented as average values calculated from 3 independent experiments.

STATISTICAL ANALYSIS

All the results were presented as mean ± standard deviation. SPSS 24.0 (SPSS 24.0, IL, USA) was used for statistical analysis. And Duncan's test was used for ANOVA (p <0.05). Pearson's correlation analysis was conducted to analyze the correlation among the DPPH/ABTS activity, TPC, and TFC.

RESULTS AND DISCUSSION

Extraction yield, TPC, and TFC: The extraction efficiency is affected by the chemical qualities of the biologically active substance, method of extraction, temperature, time of extraction and size of reagent molecules, as well as the solvent used for the extraction, resulting in different yield of extraction. In this study, solvents including acetone, EtOH, and EtAC were used to select efficient solvents for extraction of biologically active substances from *P. eryngii*. The yield of extracts obtained from extraction of powdered form of naturally dried *P. eryngii* using acetone, EtOH and EtAC are presented in **Table 1**. *P. eryngii* extracted using EtOH resulted in an extraction yield of 3 times and greater than that of other solvents. As it is reported that the yield of extraction generally increases in a polar solvent^[14]. It was also clear that the extracts in this study increase as the solvent polarity used for extraction increases. Similar to the study of Lin et al. that reported the yield of extraction of *P. eryngii* using EtOH^[15], this study also demonstrated a yield of 3.04 ~ 3.16%.

Table 1: Yield (%) of different solvent extracts from *P. eryngii*

	Solvent for Extraction		
	Acetone	EtOH	EtAC
Yield (%)	0.98	3.14	0.60

Polyphenol is a representative component of food-derived functional substance and is an aromatic compound with more than 2 phenolic hydroxyl, easily dissolved in water or alcohol. It is not only recognized for its antioxidant activity, but also for its anti-inflammatory, anti-thrombotic and anti-neoplastic effect^[16, 17]. Here, gallic acid was used as the standard to obtain the TPC of each *P. eryngii* extract, and its results are presented in **Table 2**. Acetone, EtAC and EtOH were used to measure the TPC of *P. eryngii* extract according to each solvent. The TPC of *P. eryngii* extracts, in the order of greatest to least, were as follows: extracts using acetone ≈EtAC>EtOH, demonstrating 1.31 ~ 1.67 mg GAE/g extract. This revealed a significant difference between acetone, EtAC extract and EtOH extract. Such results were similar to the TPC of *Lentinus edodes* reported by Han et al.^[1, 2], while the contents were less than that of *Auricularia auricula-judae* reported by Yu et al^[18]. It has been reported by Oh et al.^[16] that the order of polyphenol contents extracted from *P. eryngii* according to each solvent was in the order of water > 50% EtOH> 99% EtOH, and that the amount of polyphenol, an antioxidant substance, differs depending on the polarity of the solvent. However, in contrast to such results, this study has revealed the lowest amount of polyphenol in EtOH extract and has demonstrated that acetone and EtAC are the most appropriate solvents for polyphenol extraction. The amount of polyphenol in *L. edodes* from the order of greatest to the least has been reported as acetone extract >EtOH extract >EtAC extract by Yu et al.^[18], while the amount in *A. auricula-judae* has been reported as EtOH extract > acetone extract >EtAC extract by Han et al^[1, 2]. The solubility of polyphenol differs according to the location of hydroxyl group, the size of the molecule and the length of the hydrocarbon chain, and is also greatly affected by the type of solvent used in the extraction, the time of extraction and temperature; it is generally known that polyphenol is well dissolved in diverse solvents such as acetone, EtAC, EtOH, and methanol^[19]. The components of phenolic compounds contained in *P. eryngii* are reported to be phenolic acids such as p-hydroxybenzoic acid, procatechuic acid, vanillic

acid, syringic acid, cinnamic acid and caffeic acid, and flavonoids such as catechin, rutin, and naringin^[20, 21]. Therefore, as demonstrated in the results of this study, the reason that the amount of polyphenol was greater in acetone and EtAC solvents than in EtOH is that the amount of polyphenol does not increase with increasing polarity of the solvent, and that the phenolic compounds of *P. eryngii* differ in the type of compound, the degree and the quality of dissolution according to the type of extraction solvent.

Table 2: TPC&TFC of *P.eryngii* extracts

Solvent	TPC (mg GAE/g extract) ¹⁾	TFC (mg CE/g extract) ²⁾
Acetone	1.67 ± 0.05 ^{a3)}	5.34 ± 0.12 ^b
EtAC	1.63 ± 0.03 ^a	7.77 ± 0.18 ^a
EtOH	1.31 ± 0.02 ^b	0.61 ± 0.02 ^c

Results present the mean and ± SD of values obtained from 3 independent experiments.

¹⁾The value is indicated in mg of gallic acid equivalent per gram of extract

²⁾The value is indicated as catechin equivalent per gram of extract.

^{3)a,b,c}Means with different letters within a column are significantly different at $p < 0.05$ using Duncan's test.

Flavonoid, which belongs to yellow polyphenol that have C6-C3-C6 as its backbone, is abundantly found in all parts of plants as well as in grains and fruits^[22]. Additionally, it is a representative food-derived functional substance with antioxidant activity as found in procyanidin and tannin^[17]. The TFC was 7.77 ± 0.18 mg CE/g extract in EtAC extract, demonstrating a significant difference with that of acetone extract and EtOH extract; similar to the TPC, the amount was the lowest in the EtOH extract. The TPC and TFC were also the highest in EtAC extract than in acetone and EtOH extract in *L. edodes* as reported by Lee et al^[23] Flavonoids can generally be classified according to their chemical structure into phenolic acids that have benzoic acid and cinnamic acid as its basic structure and into C6-C3-C6 structure with 2 phenyl rings. Examples of flavonoids include flavones, flavanones, flavonols, isoflavones, anthocyanins, and flavan-3-ols. Flavonoids of low polarity such as isoflavones, flavanones, and flavonols

are generally well dissolved in solvents of low polarity such as chloroform, EtAc, dichloromethane, and diethyl ether, while flavonoids of high polarity such as flavonoid glycoside and aglycon are extracted to alcohol or alcohol-water mixtures. Consequently, the reason that the TFC of *P. eryngii* were highest in EtAc extract is considered to be that the amount of flavonoids of low polarity such as isoflavones, flavanones, and flavonols was greater than other flavonoids.

DPPH radical scavenging activity: DPPH activity is generally used to measure the antioxidant activity in the food and plants. Such method uses the mechanism in which DPPH, a violet soluble substance with stabilized free radical, reacts with the electron or hydrogen of the antioxidant and is reduced, resulting in a change from the violet color to a vague yellow color, as well as a decrease in the maximum absorbance at 515 ~ 520 nm^[11]. The results of measurement of DPPH activity in *P. eryngii* extracts are presented in **Figure 1**. The activity was the highest in EtAc extract as of $81.0 \pm 0.95\%$, and the activity of acetone extract and EtOH extract was each found to be $79.1 \pm 0.56\%$ and $77.4 \pm 0.33\%$, respectively. Such results demonstrated a significantly increased radical scavenging activity in comparison to the activity of $76.8 \pm 1.33\%$ in ascorbic acid used as the positive control ($p < 0.05$). Yoon et al.^[24] has reported a DPPH radical scavenging activity of 37.9% in *P. eryngii* used as the positive control in 80% EtOH extract of *P. eryngii* cultured in culture medium with sodium glutamate; in comparison with such results, the radical scavenging activity was found to be greater than 2 times in this study. Cho et al.^[25] has reported that the radical scavenging activity increases with increasing concentration in methanol and water extract, and that the DPPH activity increases in methanol, which has lower polarity than that of water. Han has reported that in the case of *Ramaria botrytis*, the DPPH activity was in the order of methanol > EtOH > acetone > EtAc, and in the case of *L. edodes*, the order was EtAc > acetone > EtOH^[10, 2]. Additionally, Han et al. has reported that the EtOH extract demonstrated a relatively highest radical scavenging activity in *A. auricula-judae*^[18]. Therefore, the order of solvents appropriate for measurement of DPPH activity of *P. eryngii* was identical to that of *L. edodes*, and the radical scavenging activity was the highest in EtAc in comparison to that of other solvents, suggesting that biologically active substances with low polarity commonly affect the antioxidant activity.

Generally, phenolic compounds greatly affect the antioxidant activity; however, the TPC or the TFC do not show a direct correlation with antioxidant activity. This may be because each phenolic compound has different antioxidant activity, and because the phenolic compound itself may have low antioxidant activity despite having the highest amount of polyphenol or flavonoids. Nevertheless, a positive correlation was found between the TPC and the DPPH activity in this study.

Figure 1: DPPH activity using extracts from *P. eryngii*

1 mM ascorbic acid was used as a positive control.^{a,b,c} Means with different letters are significantly different at $p < 0.05$ using Duncan's test.

ABTS radical scavenging activity: ABTS activity, which enables rapid confirmation of antioxidant substance from natural product, can be measured by observing the change in color from turquoise to colorless appearance as the ABTS free radical formed by reaction with potassium persulfate is removed by the antioxidant contained in the extract^[26, 27]. The results of measurement of ABTS activity in *P. eryngii* extracts are presented in **Figure 2**. The activity was the highest in EtOH extract as of $88.4 \pm 0.22\%$, demonstrating a significantly increased radical scavenging activity in comparison to the activity of $62.3 \pm 0.46\%$ in ascorbic acid used as the positive control ($p < 0.05$). The activity of acetone and EtAc extract was each found to be $57.5 \pm 3.24\%$ and $23.7 \pm 2.41\%$, respectively. Consequently, the ABTS radical scavenging activity in EtOH extract was approximately greater than 3 times than that of EtAc extract. Similar to the scavenging activity of $79.4 \pm 0.5\%$ in 80% methanol extract of *P. eryngii* reported by Hong et al.^[28], it was evident in this study that the radical scavenging activity was higher in EtOH extract of high polarity. Additionally, similar to the reports that DPPH, a stabilized free

radical, generally measures the antioxidant activity of hydrophobic substance, and ABTS, a cation radical, measures the antioxidant activity of both hydrophilic and hydrophobic substance^[29,30], this study demonstrated a higher DPPH activity in EtAc extracts of low polarity, and a higher ABTS activity in EtOH extracts of rather high polarity. Furthermore, the reason that the ABTS was overall higher than DPPH in EtOH extract of *P. eryngii* is considered to be that *P. eryngii* contains more hydrophilic antioxidant substances.

Figure 2: ABTS activity using extracts from *P. eryngii*

1 mM ascorbic acid was used as a positive control.^{a,b,c,d} Means with different letters are significantly different at $p < 0.05$ using Duncan’s test.

Correlation between the TPC/TFC and antioxidant activity: Pearson correlation analysis was conducted to investigate a relationship among antioxidant activity (DPPH and ABTS), TFC, and TPC. And its results are presented in **Table 3**. The correlation coefficient between TPC and TFC was found to be 0.869, demonstrating a strong positive correlation ($p < 0.01$). Although there was a positive correlation between TPC and DPPH as well as between TFC and DPPH (0.694 and 0.905, respectively), there was a negative correlation with ABTS (-0.748 and -0.975, respectively) ($p < 0.05$). It is generally thought that the TPC or the TFC would directly affect the antioxidant activity; however, it appears that the radical scavenging activity may be rather different according to the structural interaction among compounds, for the degree of antioxidant activity may be different in each phenolic compound, and the antioxidant activity may be affected by various biologically active substances other than phenolic compounds, such as organic acid and peptides.

Table 3: Correlation coefficient for TPC, TFC, and antioxidant activity (ABTS and DPPH) of *P. eryngii* extracts

	TPC	TFC	DPPH	ABTS
TPC	1.000	-	-	-
TFC	0.869**	1.000	-	-
DPPH	0.694*	0.905**	1.000	-
ABTS	-0.748*	-0.975**	-0.932**	1.000

* $p < 0.05$, ** $p < 0.01$.

Antibacterial activity of *P. eryngii* extracts: Paper disc diffusion, a method generally used for the measurement of antibacterial activity of plants, was used to search out the antibacterial activity of *P. eryngii* extracts against multi-drug resistant bacteria. The measurement of growth inhibition activity of *P. eryngii* extract against 6 bacteria are presented in **Table 4**. The antimicrobial activity of EtOH extract was found to be in the order of *E. cloacae* > *M. luteus* > *S. aureus* > *B. subtilis* > *P. aeruginosa*. EtAc extract did not demonstrate antimicrobial activity against *E. coli*, but demonstrated a similar antimicrobial activity against other species. On the other hand, acetone extract demonstrated the highest antibacterial activity against *E. coli*. Acetone, EtOH, and EtAc extract all showed a similar growth inhibition activity against *P. aeruginosa*. The extract showed a rather higher antimicrobial activity against *M. luteus* than in *P. aeruginosa*, among which 8.09 mm of clear zone was formed in EtOH extract. EtOH extract also demonstrated the highest antibacterial activity against *E. cloacae*. While EtOH extract and EtAc extract demonstrated no or rather weak antibacterial activity against *E. coli*, acetone extract demonstrated a high activity of 9.72 mm. The antibacterial activity against *B. subtilis* and *S. aureus* was rather high in EtOH extract than in other extracts. Consequently, excluding the fact that acetone extract was the highest in antimicrobial activity against *E. coli*, EtOH extract demonstrated the highest antibacterial activity against the remaining 5 bacteria. Although Kalyoncu et al.^[31] have reported that EtOH extract of *P. eryngii* shows antibacterial activity against *E. coli* and *S. aureus*, and none against *B. subtilis* and *E. cloacae*, this study has demonstrated antibacterial activity of EtOH extract against all 6 oral bacteria species.

Table 4: Antibacterial activities of several solvent extracts in *P. eryngii*

	Acetone	EtOH	EtAC
<i>M. luteus</i>	+	++	+
<i>S. aureus</i>	+	+	+
<i>B. subtilis</i>	+	+	+
<i>P. aeruginosa</i>	+	+	+
<i>E. cloacae</i>	+	++	+
<i>E. coli</i>	++	+	-

-, no inhibition (≤ 6 mm); +, slight inhibition ($- 8$ mm); ++, moderate inhibition ($- 10$ mm).

CONCLUSIONS

After natural air drying and powder preparation of *P. eryngii*, its extraction using solvents including acetone, EtOH and EtAC were measured for its antioxidant and antimicrobial activity. TPC, TFC, and DPPH/ABTS activities were examined for antioxidant activity, and paper disc method was used to observe growth inhibition for antimicrobial activity. The TPC of *P. eryngii* was significantly higher in acetone and in EtAC than in EtOH. The TFC was the highest in EtAc, followed by acetone and EtOH. The DPPH and ABTS activity was each found to be 81.0 ~ 77.4%, 88.4 ~ 23.7%, respectively. In the case of DPPH activity, all 3 extracts demonstrated a higher radical scavenging activity than in ascorbic acid, while in the case of ABTS activity, EtOH extract demonstrated a higher activity than in ascorbic acid. There was a positive correlation between the TPC and the TFC; although both contents showed a positive correlation with DPPH, the contents showed a negative correlation with ABTS. Upon measurement of antibacterial activity of *P. eryngii*, acetone extract and EtOH extract demonstrated antibacterial activity against all 6 bacteria, including *B. subtilis*, *P. aeruginosa*, *S. aureus*, *E. coli*, *M. luteus*, and *E. cloacae*, and EtAC extract demonstrated antibacterial activity against the remaining 5 bacteria excluding *E. coli*. Based on such results demonstrating antibacterial and antioxidant activity of *P. eryngii*, it is expected that *P. eryngii* may be used as ingredients in various natural antioxidants, antimicrobials and health functional foods in the future.

Work Commitment and Servant Leadership among Teacher Education faculty of State Colleges and Universities (SUCs) in Region III

Julieta M. Lagasca¹, Teody San Andres²

¹Professor, Dept. of Technical Teacher Education, Tarlac State University; ²Bulacan State University

ABSTRACT

Educators, especially teachers, have crucial commitment and leadership roles in the classroom to achieve success in developing empowered and productive students. These two attributes contribute to authentic and altruistic teaching necessary in bringing about transformation of students' lives. This study was conducted in order to determine and analyze the work commitment and servant leadership levels of 160 teachers, chairpersons and deans of TEIs in SUCs of Region III using a descriptive -correlational study design. The educational attainment of the teachers was obtained and related to the work commitment and servant leadership of the respondents. Likewise, the work commitment level was related to the respondents' servant leadership level. Mean and Pearson r were used to facilitate the analysis and interpretation of data. Findings revealed that 24% of the respondents possess doctorate degrees, 44% are master's degree holders, and 32% are still working towards the completion of their master's degree. On the level of work commitment, teachers generally displayed high level of commitment to towards their students (3.76); towards the community (3.71); and towards their profession (4.08). As to their level of servant leadership, findings show positive outcomes for observing ethics (4.58), conceptual skill (4.29), helping subordinates grow and succeed (4.18), empowering (4.15), emotional healing (4.12) and putting subordinates first (4.01). However, teachers need to improve more on creating value for community (3.49). Further findings show that educational attainment of the respondents was positively related to their commitment to students (.686), community (0.765) but not related to their commitment to their profession (0.451). Likewise, educational attainment was positively related to their servant leadership skills on conceptual skills (0.767), creating value for the community (0.776), emotional healing (0.687), helping subordinates grow (0.721), putting subordinates first (0.721) but not positively related to ethics (0.379). Moreover, the work commitment level and the servant leadership of the respondents are positively related (0.822). A model for work commitment and servant leadership for teachers is proposed in this study.

Keywords: *Work commitment, servant leadership, authentic teacher, altruistic teacher*

INTRODUCTION

Educators are leaders. They lead students towards successful acquisition of knowledge, skills and attitude necessary to become productive members of the community. Educators are crucial in honing students' potentials, which are their tools in adapting to the changing society world and cope with its complexities. Likewise, they have a vital role in ushering students to contribute to global peace, harmony and development^{1,2,3}.

What does it take to be a leader in school? Experts in education offer variety of factors that make school leaders effective. According to Morrison⁴, effective

school leaders have high expectations and are very ambitious for the success of their students; demonstrate that distractions or disadvantages are not barriers to success; focus relentlessly on improving the quality of teaching through continuous professional development; expert in assessing and monitoring students' academic progress; develop students individually through internal and external exposures; have high regard for student progress and personal development; they relate well with school stakeholders; and possess rigor for evaluation of student learning with clear strategies.

In addition, effective school leaders according to Sutcliffe⁵ are visionaries; courageous and willing to take

risks; passionate and committed; emotionally intelligent; possess great judgment, make the right calls and wise; optimistic and resilient; persuasive; and curious. Successful school leaders are excellent networkers and make the most out of every opportunity that comes along.

Moreover, Crippen⁶ asserted that effective school leadership entails service and commitment. Teacher-leaders must reflect on authentic attitude in the classroom. The school administrators must display genuine leadership through example and dedication towards work. School leadership is “doing and becoming” together with their circle of influences. It is less of telling people what and how to do things but in accomplishing things as a team.

Aside from commitment, teachers as educators must be a servant leader. They play special role of being servant leaders in the classroom, with the stakeholders, such as the parents and the community. According to Heather Keleghan⁷, to be servant leaders, teachers strive to dedicate and devote themselves to the well-being of whom they serve-teachers, parents and other stakeholders, not seeking for their own personal gains but in looking after the gains of others that come under their tutelage. This is an altruistic and authentic approach in teaching. Weimer⁸ stated that authentic teachers act in the interest of their students, being sincere and candid and concerned about the development of their students.

To be servant leaders, Keleghan believes that teachers have to be humble to the point of putting others’ concern over their ego and pride. Servant leaders need to nurture and heal. They develop students to create their best future. Make students realize the importance of building relationship with people. Servant leaders empower their students and dream great things for them. This means that servant leaders are visionaries. They direct students towards the attainment of their dreams.

This paper then focused on ascertaining the servant leadership and commitment of faculty in Teacher Education Institutions (TEIs) of SUCs in Region III and relating both variables. Model of work commitment and servant leadership for teachers was developed based on the findings of the study.

LITERATURE REVIEW

To achieve success in teaching, teachers need to possess key characteristics that will bring about

substantial transformation of students under their care. Ideally, to become a model teacher entails all the positive adjectives one can mention such as to be loving, caring, understanding, kind, warm, enthusiastic, approachable, just, open-minded, empathic and others. However, above these desirable characteristics, teachers must be authentic and altruistic to impact on the lives of their students^{9, 10, 11}

Commitment and servant leadership are two authentic and altruistic attributes of a teacher. Teachers must stay committed to their special role in the classroom, regardless of their circumstances. They have to be servant leaders-seeking not of their own but putting the needs of those they serve above theirs. To possess these attributes, seem insurmountable in an extremely complex society but are essential in bringing about change and impact to the students.

According to Cox¹², committed teachers are put their students first in the teaching profession, devoted to their school, lifelong learners, contributors to their profession, and 21st Century learners. Committed teachers seek to address students’ needs and wants by providing a wide-variety of teaching strategies and approaches that will respond and appeal to the students. They are devoted to the school activities by their involvement in school organizations and volunteer their time outside class hours to train and involve in student activities. They do not stop learning. They attend to trainings and seminars that will further enhance their teaching competence. Committed teachers are involved in finding ways of improving their school. They are also dedicated towards adapting to change in the 21st Century. They strive to become technological and innovative to stay relevant in today’s fast changing world.

In the study of Hussen, W/Tgegn and Teshome¹³, work commitment of teachers was categorized into three. These are commitment towards students, community and profession. Commitment towards students include interaction with students, using active learning techniques, engaging students in learning, using continuous assessment of instruction, demonstrating flexibility and responsiveness, demonstrating knowledge of students, creating an environment of respect and managing student behavior. On commitment to community, these are establishing a culture of learning, creating a symbolic relationship between the school and community, orienting the community

towards the importance of education as a lifelong process, commitment to basic values and preserving and transferring cultural heritage. On the other hand, commitment to profession includes reflection of teaching, maintaining accurate records, communicating with families, participating in a professional community, growing and developing with the professionally, showing professionalism, demonstrating knowledge of content and pedagogy, setting instructional outcomes and managing classroom procedures.

Moreover, experts believe that teachers must be servant leaders. According to Vanderbilt¹⁴, servant leadership starts when teachers recognize student needs and prioritize addressing these needs first before attending to their personal concerns. She said that servant leaders value people; develop people; build community; display authenticity; provide leadership and share leadership. Spears¹⁵ also underscored ten characteristics of servant leaders which are the ability to listen to intently to the voice of others, not just his own in planning and decision-making; empathy, which means the ability to understand the feeling of others; healing- the gift of reconciliation rather than spreading hate and instigating breaking up relationships; awareness- seeking to know and be updated; persuasion and influence; conceptualization and foresight; stewardship; commitment to the growth of people; and contributes to community building.

In the study of Noland and Richards¹⁶, servant leaders have the ability for emotional healing- which means the sensitivity of teachers towards student problems, mending or patching broken relationships; creating value for community-involvement in community development and in finding ways on how they can actively engage in community activities; conceptual skills- teachers are competent; empowering; helping subordinates grow and succeed; putting subordinates first; and having ethics.

Work commitment and servant leadership are important attributes that need to work together towards attainment of success in developing the students. The study of Muthia and Krishnan¹⁷ found a link between commitment and servant leadership. Servant leadership enhances work commitment, especially when transformational leadership is low. Moreover, Gedifew and Bitew¹⁸ examined the relationship of servant leadership to student learning engagement and academic achievement in the Ethiopian Higher Educational System. The authors found that teachers'

servant leadership positively impacted on students' learning engagement and academic achievement. The researchers recommended that activities to enhance teachers' servant leadership must be implemented. The findings of Gedifew and Bitew¹⁸ was confirmed in the study of Crabtree¹⁹ which yielded a significant positive relationship between the characteristics of servant leadership and the students in their reading achievement scores in South Virginia Schools.

More importantly, work commitment and servant leadership enable teachers to be authentic and altruistic. According to Fernandez²⁰, authentic and altruistic teachers make a long-lasting impact on the lives of the students. Authentic teachers are more passionate, approachable, attentive, capable and knowledgeable.

This study then was conducted in order to assess the work commitment and servant leadership of the TEI faculty of SUCs in Region III. The goal is to develop a model of work commitment and servant leadership for teachers towards a more authentic and altruistic teaching.

RESEARCH PROBLEMS

1. What are the respondents' highest educational attainment?
2. What is the work commitment level of the respondents towards their:
 - 2.1 students,
 - 2.2 community and
 - 2.3 profession?
3. What is the servant leadership of the respondents along:
 - 3.1 emotional healing,
 - 3.2 creating value for community,
 - 3.3 conceptual skills,
 - 3.4 empowering,
 - 3.5 helping subordinates grow and succeed,
 - 3.6 putting subordinates first, and
 - 3.7 ethics?
4. Are the work commitment and servant leadership of the respondents significantly related to their educational attainment?
5. Is the work commitment of the respondents related to their servant leadership?

6. What model of leadership and work commitment could be proposed to attain authentic and altruistic leadership of among teachers in TEIs based on the findings of the study?

HYPOTHESES

1. There is no significant relationship between the educational attainment of the respondents and their work commitment and servant leadership.
2. There is no significant relationship between the work commitment of the respondents and their servant leadership.

METHOD

Research Design: The descriptive-correlational design was employed in the research execution, analyzing and interpreting data on the commitment and servant leadership of faculty in TEIs of SUCs in Region III. The work commitment level and the servant leadership of the respondents were correlated. Likewise, the educational attainment of the respondents was related to their work commitment and servant leadership.

Research Respondents: The respondents of the study were 150 teachers selected randomly 10 deans from the 10 TEIs of Region III SUCs, a total of 160. The sample size for the teachers was set at 50% of the total 300 teacher population of the 10 SUCs in Region III. For the deans, the sample size was based on complete enumeration technique.

Research Instruments: The questionnaire to determine the commitment of the respondents was adopted from the study of Hussen, W/Tgegn and Teshome¹³. On the other hand, the servant leadership questionnaire was adopted from the study of Noland and Richards¹⁶.

Ethical Considerations: To ensure the rights of the respondents, their identity was kept confidential throughout the paper. Data gathered from them were reported in summary. Informed consents were executed by the respondents to signify their voluntary participation in the study.

Statistical Treatment: Frequency, percentage and mean were used as descriptive statistical treatments. Pearson r was used for the correlation.

RESULTS AND DISCUSSIONS

Highest Educational Attainment of the Respondents:

The respondents' highest educational attainment and their type of work were determined and the data are shown in Table 1.

Table 1: Highest Educational Attainment of the Respondents

Educational Attainment	f	%
Doctorate Degree	38	24
Master's Degree	71	44
Bachelor's Degree	51	32
Total	160	100

Table 1 shows the highest educational attainment of the respondents comprising the deans and faculty members. As reflected, the respondents were dominated by those with master's degree (44%) followed by faculty with BS Degree (32%) and doctorate degree (24%). Most of the faculty members with BS degree are currently enrolled in the graduate program and hope to finish in the soonest possible time. To be qualified for a permanent status, teachers are required to possess at least the necessary master's degree to teach in the College of Education. Respondents with doctorate degrees majored in educational management and mostly comprised the deans and chairpersons. Respondents with master's degree majored in their specialization, except for some who majored in educational management. Under the current vertical articulation policy, it is recommended that teachers must align their graduate degree to their field of specialization as provided in Memorandum Circular ²¹.

Based on the findings, some teachers in TEIs in SUCs of Region III still need to complete their master's degree and pursue doctorate degree since studies showed that teachers who possess graduate degrees are more likely to have good decisions and avoid risky behaviors. They become valuable members of the educational institutions and contribute to student high achievement ^{22, 23, 24, 25}.

Level of Work Commitment of the Respondents: To determine the work commitment of the respondents, they were given commitment survey questionnaires based from the study of Hussen, W/Tgegn and Teshome¹³. Table 2 shows the data.

Table 2: Work Commitment of the respondents towards their students

Indicators	Mean	Verbal Description	Level of Commitment
Teachers create a relaxed and supportive environment where the students trust their teachers to help them to be successful.	4.10	Often	High
Teachers encourage students to formulate and work for high individual goals in the development of physical, intellectual and creative aspects.	4.09	Often	High
Teachers respect students and their rights showing a sympathetic and positive attitude towards them.	4.07	Often	High
Teachers recognize individual differences among students and seek to meet their individual needs.	3.58	Often	High
Teachers refrain from commenting unprofessionally about their students.	3.54	Often	High
Teachers inform appropriate individuals and agencies about the students' educational needs.	3.49	Sometimes	Medium
Teachers never punish or blame a student if the student did not understand the teacher in the class.	3.48	Sometimes	Medium
Overall Mean Score	3.76	Often	High

Table 2 reflects the work commitment of the teachers towards their students. As seen, the highest level of commitment displayed by the teachers was on creating a relaxed and supportive environment where the students trust their teachers to be successful (4.10). Teachers tell them to aim high and reach the pinnacle of success. Teachers claimed that they are able to communicate to students about the importance of setting goals and having the passion to achieve them (4.09). Teachers encourage students to work diligently and responsibly in class in order to reach their goals. Teachers open the communication with students and make themselves available for any academic or personal concern. Teachers try to be optimistic in class, modeling sympathy and interest to students' cares and activities (4.07). Teachers impress upon the students the power of positivity and taking deterrents and obstacles as challenges to achieve and become somebody in the future.

Moreover, teachers are able to recognize individual differences in class (3.58). They knew that each student is unique and have their own intelligences and learning styles. Teachers try hard to meet students' unique learning needs through setting schedules for academic consultations and talking privately to students needing special academic guidance. In the process, teachers try to be professional at all times and avoid remarks that tarnish students' respect and trust (3.54). Teachers are aware of their professional ethics and are mindful of

the need to maintain desirable and stress-free learning environment.

However, teachers need to work more on their relationship with stakeholders who must take interest on the academic progress of their students like the parents and guidance office staff. Data obtained showed mean of 3.49, equivalent to *sometimes*, on the teachers' efforts to inform agencies and institutions on the learning needs of the students. Likewise, teachers need to improve how they handle students' low performance in class as the mean generated for the response was 3.47, having a verbal description of *sometimes*. Sometimes teachers tend to lose control over their emotions when students repeatedly fail to cope with lessons especially for students who were always late or absent in class.

Over-all, teachers' work commitment towards students are high as attested by a grand mean of 3.76, with a verbal description of *often*. However, there are areas that teachers need to improve which is seeking support from interested parties regarding student academic progress and on modifying approach in communicating more hard work for students who consistently fail to cope with class. According to Mahuro, Hungi and Lamb²⁶, teachers must work hand-in-hand with parents or guardians for the development of the students. In addition, teachers must focus on looking for ways to engage students in class rather than putting much effort on fixing unproductive behavior²⁷.

Table 3: Work Commitment of the respondents towards the community

Indicators	Mean	Verbal Description	Interpretation
Teachers respect the community and to be loyal to the school system and the community.	4.08	Often	High
Teachers work to improve the quality of education in the community and to strengthen the community’s moral, spiritual and intellectual life.	4.04	Often	High
Teachers are actively involved in community development efforts.	3.49	Sometimes	Medium
Teachers keep parents informed about the progress of their children.	3.48	Sometimes	Medium
Teachers seek to establish friendly and cooperative relationship with parents.	3.47	Sometimes	Medium
Overall Mean Score	3.71	Often	High

On the commitment of the respondents towards community, their respect and loyalty gained the highest mean at 4.08, with a verbal description of *often*, interpreted as *high*. Teachers claimed that they high respect and regard of the community since they are aware that the community looks up to the vital role of education in attaining development. Likewise, teachers claimed they often work to improve the quality of education they provide to the students and the community as a whole (4.04). They expressed their concern over the intellectual and spiritual transformation of the students in order to attain community transformation. It is saying that what the community becomes, depends on what the individual’s quality of life is.

However, teachers’ beliefs must translate to concrete efforts. Results of computation of teachers’ response on active community involvement was only 3.49, *sometimes* and level of commitment is *medium* and relationship to parents was also *sometimes* (3.47), including informing parents about the academic progress of their children (3.48). Consistent to the data in Table 2, teachers must improve on strengthening parent/community- teacher/school relationship.

Over-all, the grand mean generated was 3.71, indicating high commitment of teachers to community. However, teachers must make extra effort in active engagement with parents and community. As Abraham and Ememe²⁸ put it, effective school-community relation is a key performance indicator for the administrators.

Table 4: Work Commitment of the respondents towards their profession

Indicators	Mean	Verbal Interpretation	Interpretation
Teachers regard the profession as a life career and consider membership in the profession as permanent.	4.58	Always	Very High
Teachers adhere to a code of ethics regarding membership, conduct and practice.	4.56	Always	Very High
Teachers refrain from assigning professional duties to non-professional personnel when such assignment is not in the best interests of the students.	4.53	Always	Very High
Teachers commit to the ideal of service to humankind rather than to personal gain.	4.08	Often	High
Teachers exert every effort to raise the educational standard and to improve one’s services to promote a climate in which the exercise of professional judgment is encouraged.	4.07	Often	High
Teachers demand a high order of intellectual skills.	4.01	Often	High
Teachers appropriately use of time granted for professional purposes.	3.45	Sometimes	Medium
Teachers use the writing or research findings of others with intellectual honesty for their professional development.	3.41	Sometimes	Medium
Overall Mean Score	4.08	Often	High

On the respondents' commitment towards their profession, teachers claimed they always regarded their profession as lifetime career and they are permanent members of their professional organization (4.58) and they have very high adherence to the code of ethics (4.56). Teachers are very much aware of the ethics they have to maintain and try hard not to dishonor their organization. They know the standard personal and professional attributes of ideal teachers and are determined to live up to the community expectations.

Likewise, teachers do not delegate professional work to non-professional ones no matter how busy they are (4.53). They know what work to assign to non-teachers in order to lighten up their complex job responsibilities. For instance, assessment and evaluating academic progress of students are theirs while maintaining classroom cleanliness can be delegated to parents, students or housekeeping staff. Attending trainings and seminars are their personal commitment while registration work in seminars can be done by clerks.

Moreover, teachers commit to discharge their jobs, putting students interests on top of their personal gains (4.08). Teachers show this commitment when they have to postpone or skip family gatherings because they have to escort students in a competition or to any school activity; when they have to report to school on non-school days for special gatherings, such as trainings or when they have to undertake remedial classes for slow performers.

Teachers make an effort to improve their competence, decisiveness and make wise choices (4.07). They realize that they need to reflect on daily classroom activities and use their reflections to improve student learning. They need to continue learning to be relevant and effective, considering

how technology is fastly changing educational landscape. They continue to strive for higher quality of teaching and understanding (4.01) and attain high standard of thinking and knowing. They are aware that they have to cope with explosion of information brought about by the internet. They need to prepare to face students who are empowered with knowledge and skills outside the classroom, while dealing with the changing attitude of students because of the influence of technology.

However, teachers need to manage their time wisely, giving a room for continuous education despite the gargantuan job responsibilities they have to face every day. Results of the mean of response on appropriate use of time for professional development were low at 3.45, *sometimes*. This means that teachers need to develop work schedule which will allow them to attend professional development activities. Similarly, teachers also need to improve on how they regard research findings and integrate these in their lessons. The mean rating was 3.41, which means teachers' use of research in their class is not consistent.

Over-all, teachers' level of commitment towards their profession was generally high as attested by a grand mean of 4.08, except for the two variables on time for professional development and in integrating research findings in the teaching-learning process. According to Dynarksy²⁹, teachers must understand the value of research in teaching. According to him, often times, teachers do not see the importance of using research findings. If only teachers open their perspectives, research results help teachers on what does not work in the teaching-learning process. Evidence teaching provides interventions to support student, teacher and school improvement.

Table 5: Summary of Work Commitment of the respondents

Work Aspect	Mean	Verbal Interpretation	Interpretation
Commitment towards Students	3.76	Often	High
Commitment towards community	3.71	Often	High
Commitment towards Profession	4.08	Often	High
Grand Mean	3.85	Often	High

Table 5 shows the summary of the level of work commitment of teachers towards their students (3.76), community (3.71) and profession (4.08). The results appear to be good, however, they have to improve on enhancing their commitment to the community.

According to Grover³⁰ community is important stakeholders in the teaching-learning process. They can provide resources; participate in school affairs; and provide security for the teachers and school.

Servant Leadership of the Respondents: The servant leadership ability of the respondents was determined using an adopted questionnaire from Noland and Richards¹⁶. Data are shown in Tables 6.

Table 6: Servant Leadership of the respondents on based on Emotional Healing

Indicators	Mean	Verbal Interpretation
Emotional Healing		
Teacher helps students when they have personal problems.	4.23	Often
Teacher cares about student’s personal well-being.	4.09	Often
Teacher takes time to talk to a student on a personal level.	4.08	Often
Teacher can recognize if a student is feeling down.	4.06	Often
Grand Mean	4.12	often
Creating Value for Community		
Teacher encourages students to get involved in community activities.	3.56	Often
Teacher is always interested in helping the community.	3.49	Occasionally
Teacher emphasize giving back to the community to the students.	3.48	Occasionally
Teacher is involved with community activities.	3.44	Occasionally
Grand Mean	3.49	Occasionally
Conceptual Skills		
Teacher can tell if there is something wrong going on in class.	4.56	Very Often
Teacher is able to think through complex problems.	4.37	Often
Teacher can solved academic problems in new and creative ways.	4.12	Often
Teacher has a thorough understanding of the class and its goals.	4.09	Often
Grand Mean	4.29	Often
Empowering		
Teacher gives students the freedom to handle difficult situations in the way they feel is best.	4.23	Often
Teacher encourages students to handle important academic decisions on their own.	4.16	Often
Teacher trained students to make decisions.	4.12	Often
Teacher gives students the responsibility to make important decisions about their own academic work.	4.08	Often
Grand Mean	4.15	Often
Helping students grow and succeed		
Teacher is interested in making sure students reach their academicgoals.	4.23	Often
Teacher provides students with academic experiences that enable them to develop new skills	4.21	Often
Teacher makes student development a priority.	4.17	Often
Teacher is interested to know students’ academic goals.	4.12	Often
Grand Mean	4.18	Often
Putting subordinates First		
Teacher cares more about students’ success than his or her own.	4.12	Often
Teachers puts students’ interest above his or her own.	4.01	Often
Teacher sacrifices his or her own interests to meet students’ needs.	4.00	Often
Teacher does what he or she can to make students’ jobs easier.	3.89	Often
Grand Mean	4.01	Often

Conted...

Ethics		
Teacher maintains healthy relations with his or her colleagues.	4.67	Very Often
Teacher would not sacrifice ethical principles in order to meet success.	4.58	Very Often
Teacher has high ethical standards.	4.56	Very Often
Teacher is always honest.	4.52	Very Often
Grand Mean	4.58	Very Often
Overall Mean Score	4.12	Often

Generally, teachers have manifested positive servant leadership in all aspects except for creating value for community. This is indicated by a low mean score generated, which is 3.49. This is equivalent to a verbal description of *occasionally*. According to Peterson³¹, servant leaders are civic-minded; empower others to serve for a cause; and believe that when they serve collectively, the impact is significant.

Table 7: Summary of the Servant Leadership of the Respondents

Indicators	Grand Mean	Verbal Interpretation	Rank
Ethics	4.58	Very Often	1
Conceptual Skills	4.29	Often	2
Helping Subordinates grow and succeed	4.18	Often	3
Empowering	4.15	often	4
Emotional Healing	4.12	Often	5
Putting Subordinates first	4.01	Often	6
Creating Value for the Community	3.49	Occasionally	7
Over-all Mean	4.12	Often	

It can be gleaned in Table 7 that teachers' ethics got the highest mean of 4.58 while creating value for community got the lowest mean of 3.49. Findings indicate that teachers need to improve their community involvement in order to enhance their servant leadership skills. According to Wilson³², servant leaders foster a sense of community support and outreach. They feel the urge to help people surrounding them grow and actively participate in events that will build the community.

Relationship of Educational Attainment and Work Commitment and Servant Leadership

The educational attainment of the respondents was related to their work commitment and servant leadership. Data are shown in Table 8 and 9.

Table 8: Relationship of Educational Attainment and Work Commitment

Work Commitment Aspect	R Value	Decision	Interpretation
Commitment towards Students	0.686	Reject Ho	Significant
Commitment towards community	0.765	Reject Ho	Significant
Commitment towards profession	0.451	Accept Ho	Not Significant

*level of significance=0.05

Table 8 shows that the educational attainment of the respondents is positively related to their commitment to students (0.686) and community (0.765) but not

with commitment towards profession (.451). Values indicate that as the educational attainment advances, the level of commitment also increases toward students

and the community but not towards profession. The researchers attribute this to the fact that when teachers pass their licensure examination, they already feel a part of the teacher force with a responsibility of educating individuals to reach their goals.

The findings on the positive relationship of educational attainment to the commitment of the respondents towards their students and community is consistent to the result of the study conducted by

Bakan, Ersahan and Buykbese³³ that the organizational commitment of teachers in Turkey was positively related to their educational attainment.

Relationship of Educational Attainment and Servant Leadership of the Respondents

Educational attainment of the respondents was likewise related to their servant leadership. Data are reflected in Table 9.

Table 9: Relationship of Educational Attainment and Servant Leadership

Servant Leadership Aspect	R Value	Decision	Interpretation
Conceptual Skills	0.767	Reject Ho	Significant
Creating Value for the Community	0.776	Reject Ho	Significant
Emotional Healing	0.685	Reject Ho	Significant
Empowering	0.687	Reject Ho	Significant
Ethics	0.379	Accept Ho	Not Significant
Helping Subordinates grow and succeed	0.721	Reject Ho	Significant
Putting Subordinates first	0.746	Reject Ho	Significant

*level of significance=0.05

Table 9 shows the relationship between the educational attainment of the respondents and their and servant leadership skills. As shown, educational attainment shows positive relationship with conceptual skills (0.767), creating value for the community (0.776), emotional healing (0.685), empowering (0.687), helping subordinates grow (.0721) and putting subordinates first (0.746). Findings indicate that the higher the educational attainment, the better is the respondents' servant leadership skills. The findings are consistent with the conclusion of Fischer and De Jong³⁴ that servant leadership perception of respondents was positively related to educational attainment and school achievement.

However, educational attainment is not positively related to ethics (0.379) of the respondents. This indicates that the educational attainment of the respondents is not positively related to their ethics skills. The researcher

attributes this to the fact that all respondents, regardless of their educational attainment are very much aware of the code of ethics of their teaching profession and are also oriented on the need to respect school stakeholders, which includes students and parents, not only their superiors and colleagues. Findings that educational attainment is not related to servant leadership skills is consistent with the results of the study conducted by Salame³⁵ in Jordan and Cunningham³⁶ in Michigan, that teachers' educational attainment is not related to the servant leadership of the teachers.

Relationship of Work Commitment and Servant Leadership of the Respondents

The work commitment and the servant leadership were related using the Pearson r. Data are shown in Table 10.

Table 10: Relationship of Work Commitment and Servant Leadership

Area	Mean	Pearson r Value	Decision	Interpretation
Work Commitment Level	4.01	0.822	Reject Ho	Significant
Servant Leadership	4.11			

*level of significance=0.05

Table 10 shows the relationship between the work commitment and servant leadership of the respondents. As reflected in Table 10, the Pearson r value computed is 0.822, which indicates the rejection of the null hypothesis. It means that the work commitment of the respondents is positively correlated to their servant leadership skills. Findings are consistent with the conclusions of Setyaningrum³⁷, Krog&Govender³⁸ and Sokoll (2014) that servant leadership is significantly

related to the commitment of the respondents in various organizations.

Proposed Model of Work Commitment and Servant Leadership for Teachers

Based on the findings of the study, the researchers developed a model of work commitment and servant leadership for teachers. The researchers call this the San Andres and Lagasca Model of Work Commitment and Servant Leadership for teachers (SL Model).

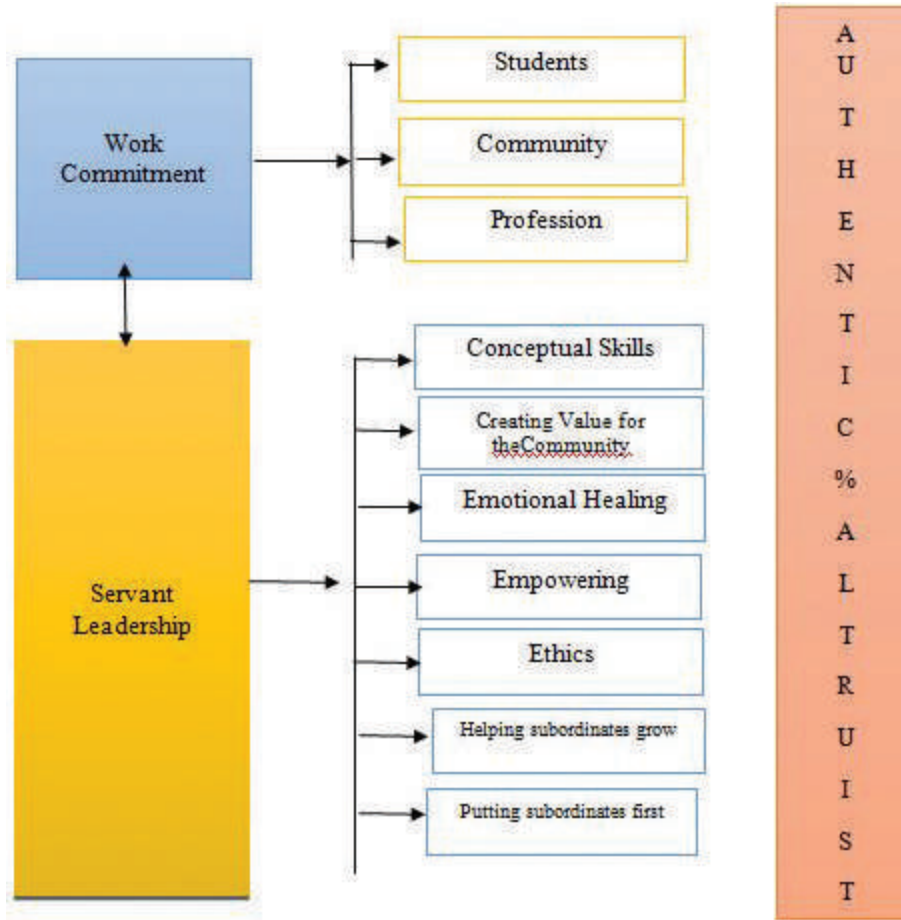

Figure 1: San Andres and Lagasca (SL) Model of Work Commitment and Servant Leadership for Teachers

Figure 1 shows a model of work commitment and servant leadership for teachers. The authors call this the San Andres and Lagasca (SL) model of work commitment and servant leadership for teachers. For the work commitment, teachers must be committed to their students. Teachers must be concerned with the individual development of their students. It includes 5 Cs- (1) creating a learning environment favorable to learning; (2) concern for individual differences; (3) competent teaching; (4) catering for learning needs; and (5) caring attitude.

Commitment towards the community includes 5 Cs also – (1) concern for community development; (2) cooperate and participate with community activities; (3) communicate openly with the parents and community leaders; (4) care for community harmony (5) cater to the family needs.

Commitment to the profession likewise involves 5 Cs – (1) continue education; (2) collaborate with colleagues; (3) create innovative ways or engage in research; (4) care to respect other colleagues; and (5) concern for the integrity of the teaching profession.

For the servant leadership, teachers are expected to have conceptual skills. This is the teacher's abilities in class, which includes 3 Cs (1) creative or innovative way of solving problems in class; (2) critical thinking; and (3) cascade knowledge, skills and desirable attitude to students. In addition, servant leaders create value for community. They have to (1) collaborate, (2) cooperate, (3) communicate with the community. Moreover, servant leaders are emotional healers. They (1) can discern students with problems; (2) care for students who are feeling down; and (3) contribute options to address student problems. Furthermore, servant leaders empower students. They train students not to (1) consult teachers every time they have problems but learn to solve on their own; (2) challenge students to be responsible in making their own decisions; and (3) capacitate students to reach their goals. Servant leaders also observe their ethics. They (1) care to maintain the dignity of their profession; (2) concern to respect others in the profession; and (3) carries high ethical standards. Servant leaders help subordinates grow and develop. They (1) care for the welfare of the students; (2) concerned with the attainment of students' goals; and (3) challenge students to pursue excellence. Lastly, servant leaders put subordinates first. They (1) cater to the students' needs above their own; (2) carry a burden of making lessons easily understandable to students; and (3) care about students' success rather than their own.

CONCLUSIONS

1. Deans and Teachers of TEIs in Region III SUCs are mostly graduates of master's and doctorate degrees but a considerable number are still yet to finish their graduate courses.
2. Deans and teachers of TEIs in Region III SUCs have high work commitment towards their students, community and profession but they have low participation in community activities.
3. Deans and teachers of TEIs in Region SUCs have manifested positive servant leadership skills in the aspect of ethics, conceptual skill, helping subordinates grow and succeed, empowering, emotional healing and putting subordinates first but they need to improve more on creating value for community.

4. Educational attainment of the respondents is positively related to their work commitment towards students and community but not towards their profession.
5. Educational attainment of the respondents is positively related to the servant leadership, except for ethics. Regardless of educational attainment, teachers and deans have similar servant leadership skills.
6. The work commitment levels of deans and teachers are positively related to their servant leadership skills. Generally, the higher the educational level of the deans and teachers, the better is their servant leadership skills.

RECOMMENDATIONS

1. Teachers should finish their graduate degree courses to increase their level of work commitment and servant leadership.
2. Teachers must increase their level of community involvement. Work commitment and servant leadership are not confined only in school but must extend to the community in order to inspire the community members to be responsible, cooperative and unified in their goal of becoming productive and functional towards family and community development.
3. Teachers must also improve their relationship with parents in order to motivate them to get actively involved in the academic endeavors of their children. For teachers thorough understanding of the behavior of students in class and their culture, they need to get to know the parents well.
4. The model developed in the study maybe adopted by teachers in order to improve their work commitment level and their servant leadership skills.
5. Future research may repeat the study and include determining whether the work commitment level and servant leadership of the teachers are positively related to the student and school achievement.

ABSTRACT

Conventional X-ray medical imaging technology used information of x-ray absorption difference due to tissue density difference in the subject. On the other hand, X-ray phase contrast imaging technology is a technology that uses phase contrast information to dramatically increase boundary information between homogeneous materials or similar materials with little difference in density. In order to model the medical phantom that is capable of acquiring and evaluating X-ray phase contrast images, the spatial dose distribution and the absorbed dose were evaluated and analyzed to present the data to the medical phantom optimal design. As a result of the absorbed dose measurement before and after penetration around fixed scattering grid using glass dosimeter, the average absorbed dose before penetration was measured to be $110.8 \pm 1.41 \mu\text{Gy}$ and the absorbed dose after penetration was measured to be $9.18 \pm 1.08 \mu\text{Gy}$. When the scattering and phase contrast images of the graphite material with almost no difference in contrast between the absorbed images were obtained and analyzed, images with relatively large image information were acquired. This result is expected to be used as an important basic data for determining the position of the subject and decreasing the medical exposure dose when acquiring the phase contrast images.

Keywords: *Wireless computing, Exposure dose, phase contrast imaging, phantom, glass dosimeter, X-ray*

INTRODUCTION

X-rays are invisible and are a unique energy source that can ionize and penetrate matter in waves. Because of these characteristics, it is used in many fields such as life science field, logistics distribution field, security search field, defense field, and medical field^[1].

Especially, in the medical field, many applications and contributions have been made to examine and diagnose fracture of the human body, vascular diseases, brain diseases, cancer diseases, osteoporosis diseases, and the like. Due to these utilization, medical exposures account for the largest portion of the human radiation exposure except natural radiation among these contributions^[2, 3].

Medical radiation is used in the medical field by securing legitimacy because it has a lot of benefits on the diagnostic information received by the patient rather than by radiation damage. Besides, in order to optimize the patient's radiation protection, efforts are being made to minimize the patient's dose while obtaining optimal images to agree with ALARA (As Low As Reasonably Achievable) concept^[2-5].

Since medical radiation using X-rays occupies most of the average annual exposure dose of man-made radiation source, research and technology development are continuing to institutionalize exposure dose management, minimize exposure dose, and obtain optimal image^[1, 6].

Conventional X-ray medical imaging technology used information of x-ray absorption difference due to tissue density difference in the subject. On the other hand, X-ray phase contrast imaging technology is a technology that uses phase contrast information to dramatically increase boundary information between homogeneous materials or similar materials with little difference in density^[7-15].

For this reason, X-ray phase contrast imaging technology is an imaging technology that is well suited for material inspection when the density is low and the imaging effect due to X-ray absorption does not appear^[16].

To detect small phase changes due to x-ray refraction in a subject, a grid-based x-ray interferometer system and phase contrast image acquisition technique are required^[17].

The x-ray phase contrast imaging images the x-ray velocity difference at two adjacent points when the x-ray passes through the material. Since the real number of the refractive index that determines this velocity is about one thousand times larger than the absorption coefficient, it is more efficient than images that use absorption difference of conventional X-ray and has the feature to reduce radiation dose^[16, 18].

Active research is being carried out on X-ray phase contrast imaging technology from 2D plane image to three-dimensional 3D image in the field of computer tomography^[2,3,18]. Various attempts are also being made to develop techniques for obtaining phase contrast images^[10,11,15]. However, these studies have been devoted to dose assessment based on irradiation dosimeter, and not much research has been conducted on the exposure dose using a glass dosimeter despite its multi-faceted usefulness: It is a human tissue equivalence dose meter, repeated readings of radiation dose and cumulative dose measurement are possible, the range of measurable dose is wide, it has less fading effects, but it has better direction and energy dependence. And we have not been able to use specialized medical phantoms to evaluate image quality and exposure dose.

For these reasons, in this study, we analyzed the spatial dose distribution and the absorbed dose in order to model the medical phantom that is capable of acquiring and evaluating the X-ray phase contrast image by presenting data for optimal design of a medical phantom^{19,20,21}.

RESEARCH SUBJECTS AND METHOD

Measurement of Spatial Dose and Half Value Layer: For radiation generator FPD (Flat Panel Detector), we have used CXD-R185 System of JW Medical Equipment. For Detector, we have used a mobile detector of DR TECH.

In the measurement of the spatial dose distribution, the distance between the X-ray tube and the grid was fixed

at 100 cm and evaluated using a Unfors-Xi measuring apparatus at a distance of 89 cm. Exposure conditions were 40kVp 20mA 2mAs, and 10 measurements were made for each condition to obtain the mean value, as in Figure 1.

Figure 1: Half value layer measurement and irradiation dosimeter in computer awareness analysis

Absorbed Dose Measurement Using Glass Dosimeter: In the measurement of absorbed dose, the distance between the X-ray tube and the grid was fixed at 100 cm and evaluation was made at distances of 89 cm and 111 cm with the grid in the middle. Exposure conditions were 40kVp 20mA 2mAs, and 10 measurements were made for each condition to obtain the mean value.

For measurement of absorbed dose, a glass dosimeter Dose Ace (Model GD-352M, FGD-1000) was used, as in Figure 2. Annealing process was performed at 400° C for 1 hour before cooling in consideration of the characteristics of the device, and 5-15 µGy of background was measured. After the panoramic scan, the pre-heating was performed at 70° C for 1 hour before cooling. The dose values irradiated to the device were read through the reader 10 times repeatedly, and the mean and standard deviation were calculated. The background dose was subtracted from the calculated value to derive the dose value^[5].

Figure 2: Glass dosimeter reader

Medical Phantom Manufacturing and Image Evaluation for Phase Contrast Only: In order to acquire and evaluate the absorbed dose phase contrast image, a phantom made of polyethylene material is inserted into a circular rod having a diameter of 10.5 cm, drilling five holes with a diameter of 1 cm and filled with graphite, bismuth, tungsten, barium sulfate and aluminum powder, manufacturing a medical phantom. Absorption, scattering, and phase contrast images were acquired using a self-produced phantom. The focal length was 600 mm, the fixed grid was 700 mm, and the distance between the focus and detector was 1,448mm. Exposure conditions were 22kVp 20mA 630msec for acquiring images and analysis, as in Figure 3.

Figure 3: Phantom for phase contrast only

RESULTS AND DISCUSSION

Spatial Dose and Half Value Layer Measurement Results

For spatial dose distribution and half value layer measurement, the distance between the X-ray tube and the grid was fixed at 100 cm and evaluated using a Unfors-Xi measuring device at a distance of 89 cm. Exposure conditions were 40kVp 20mA 2mAs, and 10 measurements were made for each condition to obtain the mean value.

At a distance of 90cm from the focal point, the spatial dose distribution was 12.09mR at the central part, 9.98mR at the anode side, and 12.51mR at the cathode side, showing dose disparity according to the angle of the target. The measured dose was 10.84mR in the upward direction of focus and 11.84mR in the downward direction, and the irradiation dose showed different spatial dose distribution according to the direction with respect to the focus.

In addition, the half value layer, which measures the quality of the x-ray according to the direction of the

focus, was measured to be 1.29 mmAl in the center, 1.28 mm Al in the cathode, 1.32 mm Al in the anode, and 1.31 mm Al in the upper and lower parts identically. This phenomenon is caused by the inclination of the anode. The overall x-ray dose is increased on the cathode side, but the X-ray dose with the shortest energy is relatively less and the X-ray dose is relatively decreased with respect to the anode. And the shortest wavelength x-rays tend to increase relatively, as in Table 1.

Table 1: Measurement Results of Spatial Scattering and Half Value Layer

Direction	Exposure dose	Half value layer
Cathode	12.51 mR	1.28 mmAl
Anode	9.98 mR	1.32 mmAl
Center	12.09 mR	1.29 mmAl
Up	10.84 mR	1.31 mmAl
Down	11.94 mR	1.31 mmAl

Measurement Result of Absorbed Dose of Glass Dosimeter:

To obtain the phase contrast image, two methods are used, one is to place the subject in front of the grid and the other is to place the subject behind the grid. For this reason, in the measurement of absorbed dose, the distance between the X-ray tube and the grid was fixed at 100 cm and evaluation was made at distances of 89 cm and 111 cm with the grid in the middle. Exposure conditions were 40kVp 20mA 2mAs, and 10 measurements were made for each condition to obtain the mean value.

As a result of the measurement of the absorbed dose before and after penetration around fixed scattering grid using glass dosimeter, the average absorbed dose before penetration was measured to be $110.8 \pm 1.41 \mu\text{Gy}$ and the absorbed dose after penetration was measured to be $9.18 \pm 1.08 \mu\text{Gy}$, as in Table 2.

To obtain the phase contrast image, two methods are used, one is to place the subject in front of the fixed scattering grid and the other is to place the subject behind the fixed scattering grid. Judging from the results, it seems to be better to acquire images by placing the subject behind the fixed scattering grid in terms of dose management.

Table 2: Results of Dose Measurement Based on Grid Position

Direction	Pre-grid penetration	After grid penetration
Cathode	111.3 ± 1.51µGy	9.4 ± 1.07µGy
Anode	107.7 ± 1.45µGy	8.6 ± 1.03µGy
Center	109.7 ± 1.51µGy	9.3 ± 1.46µGy
Up	112.2 ± 1.07µGy	9.3 ± 0.88µGy
Down	113.3 ± 1.52µGy	9.3 ± 0.95µGy
Mean	110.8 ± 1.41µGy	9.18 ± 1.08µGy

Absorption, Scattering, Phase Contrast Image Acquisition: The X-ray absorptive image acquires the images by the difference of absorption coefficient of the substance. As the density difference of the tissue becomes bigger, the contrast of the image becomes bigger and it becomes more convenient to diagnose the disease or to confirm the foreign substance. On the other hand, the x-ray scattering and phase contrast imaging images the x-ray velocity difference at two adjacent points when the

x-ray passes through the material. Since the real number of the refractive index for determining the velocity is about one thousand times larger than the absorption coefficient, it is more efficient and has features that can reduce radiation dose [15].

Especially, phase contrast imaging is a technology that dramatically increases boundary information between homogeneous materials or similar materials with little difference in density, and is used for clinical breast imaging or low dose computed tomography.

The X-ray absorption difference imaging is distorted due to the geometric position because the image is generated by the x-ray attenuation coefficient of the tissue. Overcoming these drawbacks is scattering and phase contrast imaging. The scattering image and the phase contrast image provide a high discriminative power to identify the material by correcting the scattering degree by correcting the geometric distortion through a mathematical algorithm, as in Figure 4.

Figure 4: Absorption [A], scattering [B], phase contrast [C] imaging

These results show the usefulness of scattered image and phase contrast image when describing soft tissues, which are regions where the X-ray absorption difference in human organs and tissues is small.

When the absorption difference of X-rays in adjacent tissues is small in the absorptive image, the discrimination ability is degraded in the image, but the scattered image and the phase contrast image can show the distinguishing ability in this case.

In other words, organ or tissue composed of a substance with a low effective atomic number has a poor contrast or resolution of the image in the absorption difference image. In this case, the scattered image and the phase contrast image can improve the contrast and resolution of the image and can help diagnosis of the disease from the image.

These technologies show many applications in the medical field to diagnose and treat human diseases in the future and it will contribute to the reduction of radiation dose. With the development of X-ray scattering and phase contrast imaging technology, many researches and developments on medical phantom that can quantitatively acquire and evaluate images should be carried out.

CONCLUSION

In this study, the spatial dose and the half value layer were measured in order to model the medical phantom that is capable of acquiring and evaluating the X-ray phase contrast, and the medical phantom was manufactured for acquisition and analysis of images. As a result of measuring the half value layer according to the

direction of the focus in the low-energy medical X-ray region, the center portion was 1.29 mm Al, the cathode was 1.28 mm Al, the anode was 1.32 mm Al, and the upper and lower portions were 1.31 mm Al identically. As a result of the absorbed dose measurement before and after penetration around fixed scattering grid using glass dosimeter, the average absorbed dose before penetration was measured to be $110.8 \pm 1.41 \mu\text{Gy}$ and the absorbed dose after penetration was measured to be $9.18 \pm 1.08 \mu\text{Gy}$. When the scattering and phase contrast images of the graphite material with almost no difference in contrast between the absorbed images were obtained and analyzed. images with relatively large image information were acquired. This result is expected to be used as an important basic data for determining the position of the subject and decreasing the medical exposure dose when acquiring the phase contrast images.

Physical and Psychological Factors Affecting Smartphone Addiction in Adolescents According to Depression

Weon-Hee Moon¹, Myoungjin Kwon²

¹Dept. of Nursing, University of Paichai, South Korea; ²Dept. of Nursing, University of Daejeon, South Korea

ABSTRACT

This study was conducted to identify factors influencing smartphone addiction depending on the presence of depression, a significant influential factor. This study was conducted on 54,603 individuals with depression from among the participants of the 2017 Youth Health Behavior Online Survey (13th edition). The general, physical, and psychological characteristics were weighted and analyzed using IBM SPSS 23.0 after creating a complex sample survey file, with the significance level set at .05. This study indicated that there were differences in general, physical, and psychological characteristics according to depression, as well as differences in factors influencing smartphone addiction. Intervention programs should be implemented using the results of this survey on factors influencing smartphone addiction in adolescents.

Keywords: Smartphone addiction, Depression, Adolescent

INTRODUCTION

According to a Ministry of Science, ICT, and Future Planning study on smartphone overuse among 29,712 individuals aged between 13 and 69, 18.6% (7,860 individuals) were deemed to be at risk of smartphone dependency, and adolescents were the largest group, representing 30.3% (1,523 individuals)¹.

The primary content utilized by adolescents aged between 10 and 19 in the group at risk of smartphone dependency was messengers and games; the utilization rate of instant messengers such as KakaoTalk or Facebook that allow for peer-to-peer real-time transfers of data such as images or photos online was 97.4% for middle school students and 98% for high school students².

Among adolescents, the smartphone is a tool that forms and transmits peer culture, and can, therefore, be regarded as a key factor in understanding their culture³.

Despite the convenience and efficiency of smartphones, overuse is associated with problems such

as dependency and addiction. Particularly, adolescents are more prone to addictive behavior compared to adults as they have not yet developed full control over themselves⁴.

Typically, addictive behavior associated with smartphone overuse is related to individual characteristics such as depression or loneliness; interpersonal relationships, such as conflict with peers and family, social delinquency, and lack of sociability; as well as health issues at the physical and psychological level, such as stress, strained eyes, insomnia, lack of focus, or aggressiveness⁵.

Depression is an influential factor in adolescent smartphone addiction; as the depressed state becomes more intense, individuals tend to be more engaged with the virtual world, and such engagement reemphasizes the dissatisfaction and loneliness in interpersonal relationships, in turn, intensifying depression⁶⁻⁷.

Existing studies show that the factors influencing internet addiction in adolescents can be largely divided into individual characteristics, such as physical and psychological, and environmental factors.

Gender was one of the factors considered, and female students had higher tendencies of smartphone addiction. In addition, lower academic performance and financial

Corresponding Author:

Myoungjin Kwon

Assistant Professor, Dept. of Nursing,
Daejeon University, Korea

Email: mjkwon@dju.kr

status led to higher levels of smartphone addiction⁸⁻¹⁰. Moreover, perceptions, attitudes and frequency of family meals were strong predictors of smartphone addiction in adolescents¹¹. Emotional factors such as self-control, stress, and suicidal ideation also influenced smartphone addiction in adolescents¹²⁻¹⁴.

Physical activity for adolescents is effective in reducing or preventing smartphone addiction, reducing the anxiety from smartphone addiction, and increasing satisfaction with life¹⁵⁻¹⁶. Smoking is an influential factor in smartphone addiction; however, some studies have asserted that it does not influence smartphone addiction, and thus verification is needed on this front¹⁷⁻¹⁸.

While the smartphone can be a convenient tool that allows for real-time search and communication if used effectively, overdependence on it leads to negative influences on various aspects of life. Compared to adults, adolescents lack the ability to exercise appropriate control, which is why education and management regarding the effective use of smartphones is required. For effective education and management, it is necessary to identify the factors influencing smartphone addiction and create the appropriate contents for interventions. This study was conducted to identify factors influencing smartphone addiction in adolescents according to the presence of depression, a significant influential factor, and to provide basic data for education and management in the context of effective smartphone use.

RESEARCH METHODOLOGY

Research Design: This is a descriptive study that conducted a secondary analysis of the 2017 Youth Health Behavior Online Survey (13th edition) to identify factors influencing internet addiction in adolescents according to the presence of depression.

Research Subjects: The subjects of this study were 54,603 individuals from among the 622,766 participants aged 12-18 of the 2017 Youth Health Behavior Online Survey (13th edition) who indicated the presence of depression (sadness and despair) in the last 12 months with “yes” or “no” answers. The Youth Health Behavior Online Survey is a confidential, self-administered survey carried out by the Ministry of Education, Ministry of Health and Welfare, and Korea Centers for Disease Control and Prevention for the purposes of identifying the status of health in Korean adolescents, calculating health indicators for planning and evaluating

health promoting projects for adolescents, and identifying adolescent health indicators that are comparable between countries. The survey included 800 sample schools nationwide and was administered after training the teachers in charge of research support and oversight. Gifts were provided after the survey administration.

Research Method: The survey was carried out by assigning an internet-connected computer per participant for the students of sample classes in the computer rooms of the participating schools. The students’ seats were assigned randomly, and the survey was confidential and self-administered.

Research Variables: General characteristics: Gender, age, academic performance, financial status, residence type, frequency of high-caffeine beverage consumption per week in recent days, number of breakfasts per week, frequency of fast food consumption per week, and experience of having a part-time job.

Psychological factors: Stress, subjective body image, subjective health, smartphone addiction, suicidal thoughts, suicidal plans, and attempts at suicide.

Data analysis Methodology: IBM SPSS 23.0 was utilized with weighted average values to create a complex sample planning file to be analyzed, with the significance level set at .05.

The levels of general, physical, and psychological factors of the subjects were estimated using constants and the weighted percentages.

Comparisons between groups were made using chi-square or t-tests.

- Logistic analysis was used to analyze factors influencing internet addiction.

RESEARCH RESULTS

Comparison of General Characteristics: Given the presence of depression, there were differences between the 2 groups depending on gender, age, academic performance, financial status, frequency of high-caffeine beverage consumption, frequency of breakfast, frequency of fast food consumption, residence type, and experience of having part-time jobs ($p < .001$). Depression was more prevalent in those who were female, aged, had lower academic performance, lower financial status, consumed more caffeine, were less likely to have breakfast, had more fast food, did not reside with family, and with part-time job experience.

Comparison of Physical and Psychological Characteristics: Depending on the presence of depression, there were differences between the 2 groups in terms of the level of fatigue recovered from through sleep over 7 days, weight control efforts, BMI, drinking, smoking, experience with sexual intercourse, subjective body image, subjective health, suicidal thoughts, suicidal plans, suicide attempts, and smartphone addiction ($p < .001$). There were no differences in the number of days of 60 minutes or more physical activity over the past week.

Individuals indicated higher depression in the group that demonstrated insufficient fatigue recovery from sleep, weight loss attempts, and normal BMI, and those who drank and smoked, engaged in sexual intercourse, experienced high stress, considered themselves obese, perceived themselves to be unhealthy, engaged in suicidal thoughts and plans and attempted suicide, and those with higher scores of smartphone addiction.

Factors Affecting Smartphone Addiction: In individuals not experiencing depression, the level of smartphone addiction was 1.076 times higher in those aged 12-15 years compared to those aged 16-18 years. Smartphone addiction was lower for individuals with higher academic performance. In terms of fast food consumption frequency, those consuming it twice a week or less had a 0.721 times lower level of smartphone addiction than those consuming at least once a day, and in terms of residence type, the level among those living with family was 1.422 times higher than those not residing with their family. Those with part-time experience had 1.105 times higher levels of smartphone addiction compared to those who did not, and smartphone addiction was lower for those engaging in low levels of physical activity. Individuals who recovered from fatigue sufficiently through sleep had low levels of smartphone addiction. In terms of weight control efforts, individuals engaging in no weight control effort had 1.158 times higher smartphone addiction levels, 1.206 times higher if they attempted to lose weight, and 1.215

times higher if they attempted to gain weight. In terms of BMI, smartphone addiction was higher when individuals had 25 or higher BMI, and those who did not engage in smoking or drinking had lower levels compared to those who did. Smartphone addiction was lower for those without sexual intercourse experience by 0.818 times compared to those with experience. It was high for those with high stress, and 0.858 times less for those perceiving themselves to be of average build compared to those perceiving themselves to be very obese.

In subjects with depression, men had 0.874 times lower smartphone addiction levels compared to women, and in terms of age, those aged 12-15 years had 1.319 times higher levels of smartphone addiction, similar to the findings with subjects with no depression. Smartphone addiction was lower for those with good academic performance, and in terms of financial status, all groups showed higher levels compared to those indicating low financial status, which differed from individuals without depression. Individuals consuming fewer high-caffeine beverages had higher levels of smartphone addiction, and those eating breakfast at least 3 times a week had 0.909 times less smartphone addiction compared to those eating 4 times a week. Those with part-time experience had 1.233 times higher levels of smartphone addiction compared to those who did not, and individuals with low levels of physical activity had higher levels of smartphone addiction. Individuals with insufficient recovery from fatigue through sleep showed higher addiction, and those not engaging in weight maintenance efforts showed 1.144 times higher addiction compared to those who did. In terms of BMI, smartphone addiction was higher when individuals had 25 or higher BMI, and those who did not engage in smoking or drinking had lower levels compared to those who did. Smartphone addiction was 0.786 times lower for those with no sexual intercourse experience, and higher levels of stress indicated higher levels of smartphone addiction (Table 1).

Table 1: Factors Influencing Smart Phone Addiction

Characteristics		Not depressed (n=40,753)			Depressed (n=13,850)

DISCUSSION

The purpose of this study was to provide basic data for programs for effective smartphone use in adolescents by identifying influential factors according to the presence of depression.

The results of this study indicated that smartphone addiction was higher in female adolescents and adolescents who drank. Choi et al.¹⁸ also indicated that factors negatively influencing smartphone addiction were being female, drinking, and internet overuse. As such, it is necessary to develop a smartphone addiction intervention program that considers individual characteristics such as gender, drinking, and smoking.

This study also showed that higher academic performance was associated with a lower probability of smartphone addiction, and higher financial status was associated with a higher probability of smartphone addiction. Chung et al.¹⁹ indicated that factors influencing smartphone addiction in Korean adolescents were female gender, drinking, low academic performance and low levels of subjective health; Suk and Ku⁸ showed that the level of smartphone addiction was higher for those with low academic performance and financial status.

According to previous studies, the characteristics of adolescents that influence smartphone addiction vary depending on type and intensity. It is necessary for attempts at smartphone addiction intervention for adolescents to diversely review and reflect sociocultural backgrounds and individual characteristics. Furthermore, repeated studies are needed to establish theoretical foundations.

The results of this study indicated that individuals with insufficient fatigue recovery from sleep had a higher likelihood of smartphone addiction compared to those responding that they had adequate recovery. These results are different from existing studies; according to Boumosleh and Jaalouk⁶, 35.9% of smartphone addicts with depression, a strong influential factor of smartphone addiction, reported fatigue from sleeping late, with 38.1% reporting lower quality of sleep and 35.8% indicating sleeping less than 4 hours owing to smartphone use. As such, further research appears necessary.

This study indicated that individuals with low levels of physical activity and high stress had higher smartphone addiction; this is in line with Haug et al.'s study²⁰. Kim²¹ asserted that stress is closely related to smartphone use, as the world accessed through smartphones is used as a method to access pleasure inaccessible in the real world and to reduce pain. As such, it is important to conduct interventions to reduce stress to reduce the level of smartphone addiction.

The results of this study showed that adolescents who did not have suicidal thoughts had lower levels of smartphone addiction compared to those who did. Kawabe et al.²² found that the mental health, including suicidal thoughts, of adolescents who are addicted to smartphones, was poorer than those who did not have smartphone addiction. Sohn et al.²³ also found that suicidal ideation was high in adolescents showing addiction to cyberspace, and that it was closely related to depression. Emotional disorders including depression immerse the individuals in cyberspace, which is relatively stable and gives them a feeling of superiority; this immersion

then exacerbates emotional issues, resulting in a vicious cycle. A diverse range of interventions is required to bring the adolescents out from the virtual space accessed through smartphones and back to the real world. Various studies on the factors influencing smartphone addiction should be conducted to confirm these factors, and actual intervention programs reflecting these factors should be carried out.

CONCLUSIONS

For adolescents in Korea, the smartphone goes beyond being a daily necessity; it is critical for maintaining interpersonal relationships. The effective use of smartphones can lead to a higher quality of life because of their convenience; however, overdependence can lead to the pursuit of a virtual image while ignoring reality, devastating the actual life. Factors influencing smartphone addiction in adolescents are diverse; they can be divided into individual characteristics, including physical and emotional factors, and environmental factors. Depression is a key factor influencing smartphone addiction. Those with depression tend to be focused on the ideal, virtual world and its interpersonal relationships, instead of the real one where they feel anxious and depressed. Moreover, factors such as gender, academic performance, financial status, type and form of diet, physical activity, drinking, smoking, stress, and suicidal ideation significantly influence smartphone addiction. Therefore, interventions for easing and preventing smartphone addiction in adolescents should consider these influential factors. Additionally, further research is needed to identify more influential factors.

A Study on Learning Satisfaction's Relations to Career Adaptation and Psychological Independence in College Students

Mihee Han

*Dept of General Education, Namseoul University, 91 Daehakro Seonghwaneup Sebukgu
Cheonansi Chungcheongnamdo, S. KOREA*

ABSTRACT

Background/Objectives: This study is designed to investigate the effects a college student's learning satisfaction has on his or her career adaptation and psychological independence from their parents

Method/Statistical analysis: The subjects of this study consist of 183 students of D University located in Seoul. The analysis tools used here are as following: a frequency analysis and descriptive statistics as demographic features; a one-way layout analysis of variance to examine the effects of learning satisfaction on career adaptation and psychological independence; a correlation analysis to understand the relationships among the variables.

Findings: This research result shows that learning satisfaction had a significant effect on career adaptation. Also, learning satisfaction and Career adaptation had a significant effect on psychological independence from fathers, while it did not on psychological independence from mothers. and learning satisfaction and career adaptation and psychological independence from father proved closely correlated to each other while there are apparently no correlation between psychological independence from mother.

Improvements/Applications: Through this study, it becomes necessary to deliberate on how to improve learning satisfaction among students and on how to give strong support to universities and instructional media to have positive effects on students

Keywords: *College Student, Learning satisfaction, Career adaptation, psychological independence, Positive effect.*

THE NECESSITY AND PURPOSE OF THE STUDY

Students may enter a college usually after deciding what to major in—unlike when they were in secondary school. If they are satisfied with their major, it will raise the levels of self-esteem, give them self-confidence and enable them to lead a very desirable college life. On the other hand, if they find their major subjects too unsuitable or too difficult for them, many of them may feel conflicted and lose interest in college life itself.

In reality, college is a preparatory institution where one can equip oneself with competencies and qualifications

to live as a member of society. For this reason, a college student's satisfaction with his or her major, namely, learning satisfaction is expectedly very closely related to his or her career decision and development. But considering that Korean students, in general, have been extremely accustomed to the routine of studying since secondary school days, it may be necessary to examine if college students are excellent in studies because they have developed longtime study habits since childhood or because, owing to their suitability to their major subjects, their learning satisfaction helps them have various purpose and competence.

Therefore, this study intends to research into the relationship of a college student's high level of learning satisfaction with his or her later adult psychological independence and career adaptation. Regarding this, Jongho Shin et al(2006)¹ report that academic activities at school have positive effects on mastery goal orientation

Corresponding Author:

helpful to future jobs or studies, and also on learning satisfaction by the medium of mastery goal orientation.

Klein, Noe and Wang(2006)², on the other hand, argue that students with lower levels of mastery goal orientation tend to have higher levels of learning satisfaction. This shows that academic goal orientation and learning satisfaction have little to do with each other (qtd. in YoungjuJoo, et al. 2012)³. Therefore, this study too has been initiated by questioning how learning satisfaction and career adaptation are related. levels of learning satisfaction.

Also, this study intends to look into how relevantly independent from their parents are those students with high learning satisfaction who make efforts with keen awareness of their future career. It is no exaggeration to say that college students may cope with a big task of psychological independence from their parents as they are put in their late adolescence and early adulthood. Therefore, by preparing to enter the society, they may have to achieve independence from parents whom they have until now relied on. It is revealed that psychological independence is significantly related to adaptation to college and social life, interpersonal relations, career development, career maturity, career decision. However, the research into correlations among learning satisfaction, career adaptation and psychological independence from parents have so far been quite insufficient, and thus this study is to examine carefully the effects of college students' learning satisfaction on career adaptation and on psychological independence and the correlations among those factors. It is thus expected that this study will help a university promote systematic educational courses and support in order for their students to have a clear sense of career goals and to enhance their qualities and competences as societal members psychologically independent from their parents.

This study will discuss the following points. First, college students' learning satisfaction is likely to have significant effects on career adaptation. Second, learning satisfaction would have significant effects on psychological independence. Third, learning satisfaction, career adaptation and psychological independence will be co-related to one another.

enrolment percentages in the university. Dropout in residential university is caused by academic, family and personal reasons, campus environment

and infrastructure of university and varies depending on the educational structure agreed by the university. Thus, this work aims to effectively formulate education program and institutional infrastructure through which the student's enrollment rate at the university will get increased significantly. The main aim of this paper is to develop a improved decision tree model and to derive a classification rules to predict whether student will graduate or not using the historic dataset. In this paper, improved decision tree model is used to generate the model. Information like age, parent's qualification, parent's occupation, academic record, attitude towards university was collected from the students to forecast the group of students needs the periodical monitoring.

BACKGROUND

Learning satisfaction can be defined as a state of mind gained when the aim of learning is accomplished or when an individual learner's expectation is fulfilled(Wolman, 1989)⁴. In other words, learning satisfaction refers to a sense or an attitude that a person has in regard to learning. In fact, learning satisfaction in itself does not represent educational quality and efficacy in objective ways although it can be utilized as an indicator that helps us estimate the quality and efficacy of efficacy to some degree. Despite the drawbacks, however, the result of measuring the level of satisfaction in an academic situation would be put to good use in forecasting effective education(qtd. in DongwookHan, 2014)⁵

In order to raise the level of learning satisfaction, according to the argument by Chul Kim and Daesung Ma(2005)⁶, one should recognize individual variations based on various capabilities, interests and concerns among students and thus devise proper teaching methods in accordance with the variations. To make a student learn genuinely, the teacher should try to lead a student to become a self-initiated, active participant(Wooshim Chang, 2016)⁷.

Then, how is the relations between learning satisfaction and career preparation. Usually, a student devoted to his or her studies is expected to make intense preparations to find a job or to develop a career.

Career adaptation, in particular, refers to the degree of readiness to deal with changing jobs and working conditions(Super &Knasel, 1981)⁸. In other words, it means one's competences or attitudes to cope with current

situation in positive and active manner while keeping in mind future situations yet to come. Various variables regarding career adaptation are offered and introduced as causes of work values, communication competencies, interpersonal relations, social support, career decision and immersion, openness and autonomy(Eunyoung Son, Soonhee, Lee 2012)⁹.

Also, psychological independence as a variable regarding learning satisfaction indicates an acquisition of freedom of thought and action by breaking away from dependent relations and bondage to one’s parents. As one plans and decides one’s specific career especially while in college, one comes to show more and more attachment patterns as they grow to be an independent subject with a strong desire to know about their new environment. At

the same time, they display a low level of attachment to their parents, their early attachment figures. It is true that the level of vocational maturity is determined according to the degree of psychological independence in the college years when students make specific career plans and preparations(Allen, 2008)¹⁰. Therefore, psychological independence as well as learning satisfaction is assumably related to career adaptation, helping an individual’s growth with such variables.

RESEARCH METHOD

Research Subjects: This study has surveyed 201 students at D University located in Seoul, and selected, as subjects, 183 students who gave earnest answers.

Table 1: Socio-demographic characteristics

N	Gender		Year in university				Major Fileds				
	Male	Female	1	2	3	4	Humanities	Social Science	Business	Engineering	Physical
183	85	98	32	58	48	45	34	70	34	29	16
(%)	(46.4)	(53.6)	(17.5)	(31.7)	(26.2)	(24.6)	(18.6)	(38.3)	(18.6)	(15.8)	(8.7)

As shown in Table 1, The total number of students participating in this study was 183 (male: 85, female: 98). The distribution of grade is 32 in the first grade and 58 in the second grade. In addition, the third grade is 48 and the fourth grade is 45 students. The major fields are Humanities (34), Social Science (70), Business (34), Engineering (29), Physical (16).

Measurement Tools

Learning Satisfaction: To measure the level of learning satisfaction, this study makes use of the tools developed by Lent et al.(2013)¹¹ and adapted and applied by Jinkwan Kim(2014)¹². This survey consists of 6 items on a Likert-type scale of one to five.

Career Adaptation: To measure career adaptation of each student, this study utilizes validation criteria revised and adapted by Okhyon Choi and Bongwhan Kim(2006)¹³ and applied by Hakyung Kim (2016)¹⁴. This survey consists of 6 items on a Likert-type scale of one to five.

Psychological Independence: This study makes use of Psychological Separation Inventory (PSI) created by Hoffman(1984)¹⁵ and utilized by Hanik Jo and Sanghee Won(2013)¹⁶. From PSI, conflictual psychological separation inventory’s 20 questions were used in this study. In case of questions as to psychological independence from parents, this study distinguish between father and mother.

RESULTS OF ANALYSIS

The results of various analyses are presented as in the following.

The Mean and standard deviation of the variables: Table 2 exhibits the statistical data under discussion for the variables of psychological independence from mothers, fathers, learningsatisfaction, degree of career adaptation, psychological independence from fathers.

Table 2: Statistical data for main variables

Categorization	N	Minimum	Maximum	Mean	Standard deviation
Psychological independence (mothers)	183	1.50	4.00	2.7172	.57864
Learning Satisfaction	183	1.67	4.67	3.0392	.55124
Career adaptation	183	2.33	4.83	3.5264	.50973
Psychological independence (Fathers)	183	1.77	4.34	2.9780	.37841
Total	183				

As shown in Table 2, the mean and standard deviation for the variables of psychological independence from mothers, learning satisfaction, degree of career adaptation, psychological independence from fathers were obtained at 2.7172(SD=.57864), 3.0392(SD=.55124), 3.5264(SD=.50973), 2.9780(SD=.55124), respectively.

The effect of the mean variables: A regression analysis was conducted among the four main variables of psychological independence from mothers, learning satisfaction, degree of career adaptation, psychological independence from mothers and fathers. The results were found in Tables 3-7.

Table 3: Regression analysis of learning satisfaction and career adaptation

Model	Sum of Squares	df	Mean Square	F	Sig. p
Regression	16.522	1	16.522	97.195	.000***
Residual	30.767	181	.170		
Total	47.289	182			

* P<.05, **. P<.01, *** p<.001

As shown in Table 3, Regression analysis of learning satisfaction and career adaptation found the following Result, F= 97.195, P<.01, which also exhibits that the model is significant enough.

Table 4: Regression analysis of learning satisfaction and Psychological independence

	Model	Sum of Squares	df	Mean Square	F	Sig. p
2	Regression	.001	1	.001	.003	.955
	Residual	56.559	173	.327		
	Total	56.560	174			

As shown in Table 4, Regression analysis of learning satisfaction and Psychological independence from mothers found the following Result, F= 0.003, P>.01 which also exhibits that the model is not significant.

Table 5 : Regression analysis of Career adaptation and Psychological independence

	Model	Sum of Squares	df	Mean Square	F	Sig. p
3	Regression	.221	1	.221	.659	.418
	Residual	60.717	181	.335		
	Total	60.938	182			

As shown in Table 5, Regression analysis of Career adaptation and Psychological independence from mothers found the following Result, F= 0.659, P>.01 which also exhibits that the model is not significant

Table 6: Regression analysis of learning satisfaction and Psychological independence(fathers)

	Model	Sum of Squares	df	Mean Square	F	Sig. p
4	Regression	10.378	1	10.378	119.776	.000***
	Residual	15.683	181	.087		
	Total	26.061	182			

* P<.05, **. P<.01, *** p<.001

As shown in Table 6, Regression analysis of learning satisfaction and Psychological independence from fathers found the following Result, F=119.776, P<.01 which also exhibits that the model is significant enough.

Table 7 : Regression analysis of career adaptation and Psychological independence (fathers)

	Model	Sum of Squares	df	Mean Square	F	Sig. p
5	Regression	9.677	1	9.677	106.896	.000***
	Residual	16.385	181	.091		
	Total	26.061	182			

* P<.05, **. P<.01, *** p<.001

As shown in Table 7, Regression analysis of career adaptation and Psychological independence from father found the following Result, F=106.896, P<.01 which also exhibits that the model is significant enough.

As shown in Tables 3-7, learning satisfaction had a significant effect on career adaptation and psychological independence from fathers, while it did not on psychological independence from mothers. Career adaptation also had a significant influence on psychological independence from fathers, but not on psychological independence from mothers. What it means might be that higher learning satisfaction would lead to higher career adaptation and eventually affects psychological independence from fathers, However, it is interesting that higher learning satisfaction would not affect psychological independence from fathers, It might indicate that even college students are psychologically dependent on mothers and that high career adaptation would not easily lead to psychological independence from mothers.

Correlation The effect of the mean variables

Table 8: Correlation coefficients for the main variables

Main Variables		[1]	[2]	[3]	[4]
Psychological independence (mothers)	[1]	1			
Learning satisfaction	[2]	.004	1		
Career adaptation	[3]	-.060	.591**	1	
Psychological independence (Fathers)	[[4]	-.022	.631**	.609**	1

** . P<.01

As shown in Table 8, a significant correlation was found between learning satisfaction on one hand and career adaptation and psychological independence from fathers on the other hand. Career adaptation, in turn, showed

a significant correlation with learning satisfaction and psychological independence from fathers. However, the variable of independence from mothers was not closely correlated with learning satisfaction and career adaptation.

CONCLUSION

There are a diversity of surprisingly useful and convenient benefits in the modern information age. What seems unchanged, however, is that one's studies are nothing less than one's own shares that nobody else can substitute even with so much information and so many convenient facilities provided. As a result of this research, it is conceivable that through the effects of learning satisfaction on career adaptation psychological independence and the results of their correlation, far more efforts should be made to prepare for measures and supports to enhance learning satisfaction.

Also, preparing the educational grounds would be urgent so that, while completing their college courses, students may grow as mature and competent adults to adapt to and cope with their careers. For this, it is important to support and encourage every individual student to acquire clear their self-knowledge and to clarify their interests, concerns, capabilities and aims. In doing so, it is as much necessary to support and urge universities to promote genuine learning and create desirable environment.

The Effects of Career Barriers and Career Efficacy on Job Seeking Stress: A Comparative Perspective of Nursing and Social Welfare University Students

So-Yun Choi¹, Kyung-Sook Kim²

¹Department of Social Welfare, ²Department of Nursing, Namseoul University, Daehakro 91 Sunghwaneup Cheonansi, Chungnam, Kore

ABSTRACT

Background/Objectives: The purpose of this study was to compare the perception of employment among university students majoring in nursing and social welfare, which are representative professions in the field of human services.

Method/Statistical analysis: A purposive sample of 135 students was recruited for the cross-sectional survey design. The data collected from the survey were analyzed by using SPSS 18.0. Descriptive statistics, T-test, and hierarchical regression analysis were conducted in regular order.

Findings: The hierarchical regression analysis confirmed the effect of career barriers on job seeking stress and career efficacy. Model 1 included personal characteristics of students. Model 2 added major satisfaction to Model 1. Model 3 added career barriers to Model 2. The results of this study showed that the higher the perceived career barriers, the higher the job seeking stress ($\Delta R^2 = .328$, $p > .001$), and that the lower the perceived career barriers, the higher the career efficacy ($\Delta R^2 = .477$, $p > .001$).

Improvements/Applications: Based on the results of empirical analysis, this study proposed the need for systematic guidance to promote the career efficacy of nursing and social welfare students.

Keywords: Major satisfaction, Career barrier, Job seeking stress, Career efficacy, Social work student, Nursing student.

INTRODUCTION

In the context of high youth unemployment rate in the Republic of Korea as a severe social problem, this study compares the major satisfaction, job seeking stress, and career barriers of nursing students and social welfare students who are commonly majoring in human services. In addition, this study examines the effects of career barriers on job seeking stress and career efficacy, and seeks to draw practical implications for their career preparation. In Korea, some departments of humanities and social sciences that are not preferred in the industrial

field are subject to the restructuring of university, and the number of students is reduced or the departments are merged. In the case of the preferred departments, there is a mismatch between the supply of graduates and the demand of practice field. In some cases, it takes a long time to find a job¹. In fact, the issue of social advancement of young people into labor market is now becoming a serious social problem, and the government is examining various ways to improve the employment rate of young people at the national level, but it is not easy to solve the problem². The fields of nursing and social welfare are the major human service areas and women predominate. Since the 2000s, there has been a similar trend in that the number of departments and students has been steadily increasing due to the strengthened health and welfare policies and the increased social demands³. In addition, both departments are similar in that they are supervised by the same Ministry of Health and Welfare regarding the

Associate professor, Department of Nursing,
Namseoul University, South Korea
Email: kgs4321@nsu.ac.kr

qualification of departments and students. However, the two majors differ in the management of the educational curriculum and the supply and demand of professional workers. In the case of nursing, the qualifications of students are strictly controlled by detailed standards through a university accreditation⁴, but in the case of social welfare, the standards and accreditation are flexible to a degree⁵.

The educational requirement to become a social worker is available not only in universities but also in a wide variety of courses of study. This reality differs from the field of health, including nursing, in that it provides detailed standards for raising professionalism, manages educational curriculum in universities, and controls the supply and demand of professional workers. The ease of acquiring social worker qualifications ultimately can lead to an excessive supply of professional social workers and bring about problems of entry barriers in labor market and unstable employment as well as controversy over the special expertise of social workers⁶.

Constantly high youth unemployment rate is emerging as a social problem. Getting a job at the same time as graduation became a story of the past. In this situation, universities are fully committed to curriculum management and student guidance in order to cultivate students as talented people fitted in the practice field and to activate their social participation. In particular, the human service field, which provides services to people, requires ethical responsibility that universities must cultivate by internalizing the professional value of human dignity as well as raise professionalism⁷.

However, even if students are well prepared, they are experiencing various career barriers and job seeking stress before entering society⁸. The average employment rate of university graduates is 64% in 2016, which is different depending on the major⁹. In the case of health-related workers whose demand is continually increasing recently, employment rate after graduation is high, compared to other majors, since the government manages the number of university students. But, in the field of social welfare, the barriers to entry into the labor market are high due to the excessive supply of social workers, compared to the demand. Therefore, it is reported that university students majoring social welfare experience high career barriers and job seeking stress ahead of their graduation¹⁰. To this end, more studies should be made to promote career efficacy and mature career attitude.

Career barrier is defined as individuals' perceptions of situations that negatively influence career choice and career goals in the course of career-related processes. Career barrier is a complex concept that includes the lack of job-related information or career directions, and the external difficulties such as various conditions and academic backgrounds¹¹. Most of the studies related to career barriers have set career barriers as an independent variable and examined the effects of career barriers on the resultant variables. According to previous studies, career barriers can lead to unsettled career decision, job seeking stress, and even depression¹². Entry into the labor market after graduation is one of the major developmental tasks in adolescence¹³. However, the recent increase in the number of NEETs has made it difficult to apply job and marriage as universal developmental tasks in adolescence. Many studies report that university students are already experiencing job seeking stress before graduation.

Stress is not a problem in itself, but it can cause problems in mental health, depending on how one copes with the stress, so there must be a mechanism to respond appropriately¹⁴. In particular, in the case of job seeking stress, it is a very important task to improve the capacity to buffer job seeking stress, since personal efforts to cope with are very limited in the social environment of long-term stagnation and low economic growth. In this regard, the sense of efficacy, which means self-confidence in solving problems¹⁵, can be a very important variable in coping with job related stress. According to previous studies, career efficacy has a significant role in solving a variety of career-related problems, alleviating job-seeking stress, and motivating to decide concrete career direction. In addition, it has been reported that major satisfaction has a positive effect on career decision and career efficacy^{16,17}.

In this context, the purpose of this study is to compare the differences in major satisfaction, career barriers, job-seeking stress, and career efficacy, which are perceived by nursing and social welfare undergraduate students in the field of human services. In addition, this study examines the effect of career barriers on job seeking stress and career efficacy. In this context, this study focuses on students majoring in nursing and social welfare, which are the representative field of human services continually expanded in accordance with changes in the demographic and social environment. The purpose of this study is to

compare the major satisfaction, job seeking stress, career barriers, and career efficacy of nursing and social welfare students, and examine the effects of career barriers on job seeking stress and career efficacy.

This study differs from previous studies in that this study empirically analyzes the effects of career barriers on job seeking stress and career efficacy in a comparative perspective of different majors. Finally, this study suggests policy implications to improve students' career decision-making capacity and minimize career barriers¹⁹.

MATERIALS AND METHOD

Research problems: The research problems of this study are as follows.

First, what is the level of major satisfaction, career barriers, job seeking stress, and career efficacy perceived by nursing and social welfare students?

Second, are there differences in major satisfaction, career barriers, job seeking stress, and career efficacy between nursing and social welfare students?

Third, do career barriers perceived by nursing and social welfare students affect job seeking stress?

Fourth, do career barriers perceived by nursing and social welfare students affect career efficacy?

Sampling: In order to minimize the effect of external variables, this study aimed at nursing and social welfare students belonging to the same university. The subjects of this survey were the third and fourth grade students who took some major courses and considered more directly about job and career. The survey was conducted in September 2016, and the questionnaires available for data analysis were collected from 119 students in social welfare department and 46 students in nursing department.

Measurements: The measures used in this study were those whose reliability was reported in domestic studies. The measure of career barriers used in An's study (2013) were composed of six sub-concepts of 22 items (lack of job information, external barrier, lack of self-clarity, lack of awareness of need, discrimination, indecisiveness). Major satisfaction was measured by the measure of five-item scale used in the same study¹⁸.

Job seeking stress was measured by a scale consisting of five sub-concepts of 21 items (personality, family environment, schoolwork, school environment, job seeking uncertainty)¹⁹. Career efficacy is a measure of efficacy associated with career decision, consisting of five sub-concepts (planning, problem solving, self-evaluation, goal setting, and collection of job-related information)²⁰.

Statistics: The data collected from the survey were analyzed by using SPSS 18.0. Descriptive statistics, T-test, and hierarchical regression analysis were conducted in regular order.

RESULTS AND DISCUSSION

The respondents consisted of 46 nursing students and 118 social welfare students as shown in table 1. The third grade students were 53% and the fourth grade students were 47%. Female students predominated and the average age was 22.3 years. The students who participated in group activities during university life was 47% of the total respondents.

As the result of t-test, this study found that social welfare students were more aware of career barriers and experienced more job-seeking stress than nursing students were. Nursing students showed more confidence in their major satisfaction and career direction than social welfare students did.

Table 1: General Characteristics

Characteristics	Category	N (%)
Age	Mean ± SD	22.3 ± 1.68
Gender	Male	45(28.8)
	Female	116(71.2)
Major	Nursing	46(28)
	Social Welfare	118(72)
Group activity	Participated	77(47.2)
	Not involved	86(52.8)
Grade	3	87(53.4)
	4	76(46.6)

The mean of major variables was shown in Table 2: major satisfaction 3.6, career barriers 2.41, job-seeking stress 2.45, and career efficacy 3.28. The correlations between the main variables are shown in Table 3.

Table 2: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Major satisfaction	165	1.20	5.00	3.623	.586
Job-seeking stress	157	1.00	4.43	2.470	.646
Career barriers	161	1.00	4.21	2.406	.697
Career efficacy	158	1.00	5.00	3.284	.652

Table 3: Correlations

	Career barriers	Job-seeking stress	Career efficacy
Major satisfaction	-.261**	-.274**	.298***
Career barriers		.579***	-.659***
Job-seeking stress			-.426***

The t-test confirmed whether there is a difference in the mean of major variables between nursing and social welfare students and whether the difference is statistically significant. As shown in Table 4, career barriers and job seeking stress were higher in social welfare students than in nursing students. Conversely, major satisfaction and career efficacy were higher in nursing students than in social welfare students.

Independent sample T-test examined the statistical significance on the difference of the mean. The results of

Levine’s Test for Equality of Variance showed that the difference between nursing students and social welfare students was statistically significant in terms of major satisfaction, career barriers, job seeking stress, and career efficacy²¹.

In other words, social welfare students thought that they had higher career barriers and experienced more job seeking stress than nursing students did. In addition, the nursing students showed more confidence in major satisfaction and career direction than social welfare students did.

Table 4: Comparison of Mean between Nursing and Social Welfare Students

	Major	N	Mean	Std. Deviation	t	p
Major satisfaction	Social Welfare	114	3.539	.54944	-3.340	.001
	Nursing	46	3.865	.59338		
Career barriers	Social Welfare	114	2.5665	.62544	5.001	.000
	Nursing	46	1.9982	.70978		
Job-seeking stress	Social Welfare	111	2.5794	.60477	3.59	.000
	Nursing	45	2.1843	.66551		
Career efficacy	Social Welfare	113	3.1133	.59814	-5.59	.000
	Nursing	45	3.7022	.59842		

The hierarchical regression analysis was used to control the effects of personal characteristics and major satisfaction and analyze the effects of career barriers on job seeking stress and career efficacy. Model 1 included gender and group activity. Model 2 added major satisfaction to Model 1, and Model 3 added career barriers to Model 2. Multi-collinearity was found to be acceptable through tolerances and VIF.

Table 5 shows the effect of career barriers on job seeking stress. Both Model 2 with major satisfaction

and Model 3 with career barriers showed statistically significant results. Model 1 was not statistically significant, but it was found that students who participated in group activities had comparatively lower job-seeking stress.

In Model 2, the higher the major satisfaction, the lower the job seeking stress. In model 3, the higher the career barriers, the higher the job seeking stress. The effect of Model 3 was $\Delta R^2 = .328$ ($p > .001$), which was increased by .261, compared to Model 2.

The effects of carrier barriers on carrier efficacy are shown in Table 6. Model 1 was not statistically significant, but students who participated in group activities showed higher career efficacy, contrary to the influence of career barriers on jobseeking stress.

Model 2 shows that the higher the group activity and major satisfaction, the higher the career efficacy. In model 3, the lower the career barriers, the higher the career efficacy. The effect of Model 3 was $\Delta R^2=.477$ ($p>.001$), which was increased by .323, compared to Model 2.

Table 5: Job Seeking Stress

	Model 1		Model 2		Model 3

CONCLUSION

This paper proposed an improved decision tree algorithm for prediction of dropout student. This study analyzed the effects of career barriers perceived by university students on job seeking stress and career efficacy in Korea, where youth employment rate is about 60% after graduation. In particular, this study examined the difference in career barriers and job seeking stress between nursing students and social welfare students, and analyzed empirically the effects of preceding variables on job seeking stress and career efficacy.

The results of this study are as follows:

First, in the case of nursing where the accreditation of curriculum and the management of manpower are strict, career barriers and job seeking stress are low and major satisfaction and career efficacy are high, compared to social welfare where the accreditation and manpower management are not strict.

Second, participation in group activities has a negative effect on job seeking stress and a positive effect on career efficacy. Third, job seeking stress is high as students perceive that career barriers are high, and career efficacy is high as students perceive that career barriers are low.

Based on the results of this study, the following suggestions can be made. First, strict management of

curriculum in majors related to human services is necessary. In the field of humanities that guide human life in a better way, the curriculum should be strictly managed based on the value of human dignity as well as professionalism. Even though the criteria for obtaining a qualification are provided, it is easy to acquire a qualification for social worker from various courses of study as well as universities. This reality not only hinders the entry of university graduates into the labor market, but also causes the problem of lowering the quality of overall social work. As a result, it becomes an important factor that affects job seeking stress of social welfare students. Because this barrier to entry into the labor market is a part that young people cannot solve voluntarily, the problem needs to be solved from the social and structural dimensions. In the case of social welfare, as in nursing, there should be a new approach to minimize career barriers of university graduates, such as rigorous management of curriculum, strict evaluation of demand and supply of social workers, and university accreditation.

Second, given that career barrier is a complex concept, customized guidance needs to be provided to students to minimize career barriers. Because there are diverse career barriers such as personal indecisiveness, lack of information, and lack of external support, there will be differences in the circumstances that students perceive as barriers. In this study, the analysis was based on the overall average. However, in order to be able to concretely address the various barrier problems, the university will need to take decisive measures to revitalize career support center and provide customized supports.

Third, it will be necessary to promote career efficacy through increased participation in various group activities. In the case of the nursing and social welfare, which are practical studies, it is necessary to support group activities as an informal mechanism for enhancing professional expertise in addition to the regular curriculum of the university. Finally, strategies to cushion job seeking stress and strengthen career efficacy are needed. Since efficacy is the confidence of oneself to solve the problem, it can be linked to the efficacy of the major. During the course of study, students should be equipped with skills and expertise needed to solve problems themselves after graduation through diverse teamwork and teaching methods.

Promoting of Healthy Cities through Social Ecological Paradigm

Nam Sook Kim

Dept. Social Welfare Tongmyong University, Nam-gu, Busan, Korea

ABSTRACT

Background/Objectives: The approach of new healthy cities is a concept based on the social, economic, and psychological aspects of city dwellers. This study has made some suggestions for building healthy cities as a new paradigm, which emphasizes social and ecological factors.

Method/Statistical analysis: As a primary data, this study developed a questionnaire designed as ecological and systematic factors about the health and healthy city factors, and analyzed 283 cases out of 300 cases, excluding 17 cases that were lacking. For the secondary data, this study used the information already available, such as the website of Gijang-gun, statistical reports, and Busan statistical portals.

Findings: The population of Gijang is gradually increasing due to the influx of population in Jeonggwan New Town. Gijang is a city of festivals utilizing natural resources. It is one of the most successful festivals in Korea that attract tourists from all over the country every year. Abundant local resources can be a beneficial resource to inspire residents to participate in the region. However, in this study, residents and healthy city experts of Gijang showed lukewarm attitudes toward local participation and cooperation. They showed positive attitudes toward Gijang's food supply, housing supply, and anxiety about crime, which are the foundation of the healthy city. Compared to the abundant food and housing supply, Gijang has difficulty in public transportation. As seen in this survey, residents have a strong desire for health care. It was found that the anxiety about crime was comparatively low while the anxiety about natural disasters seemed to be very high. Also, the high willingness of residents to continue to reside in the region means that there is abundant social capital available for future regional development.

Improvements/Applications: Gijang has a combined form of a city urban and agricultural. Gijang's public transport bases are relatively poor compared to those of other local governments. However, the maximization of the local resources they have can be used for health promotion and health education of Gijang dwellers.

Keywords: urbanization, healthy cities, social and ecological paradigm, environment, dwellers

INTRODUCTION

Urbanization has brought about changes to city dwellers' lifestyle and their living environment. The Healthy city Project aims to cope with health issues that have emerged with urbanization. The approach to healthy cities scopes with social and economic aspects, and is a concept based on the socio-economic and psychological aspects of city dwellers. Efforts to improve urban health through quantitative and qualitative improvements in the urban environment surrounding human beings were further triggered by the conceptualization of healthy cities by Hancock and Duhl (1988) ^[1]. They presented the characteristics of healthy cities as shown in Table 1.

Table 1: Parameters for Healthy cities

1	A clean, safe, high quality physical environment (including housing quality)
2	An ecosystem which is stable now and sustainable in the long term
3	A strong, mutually-supportive and non-exploitative community
4	A high degree of public participation in and control over the decisions affecting one's life, health and well-being
5	The meeting of basic needs (food, water, shelter, income, safety, work) for all the city's people
6	Access to a wide variety of experiences and resources with the possibility of multiple contacts, interaction and communication

Conted...

7	A diverse, vital and innovative city economy
8	Encouragement of connectedness with the past, with the cultural and biological heritage and with other groups and individuals
9	A city form that is compatible with and enhances the above parameters and behaviours
10	An optimum level of appropriate public health and sick care services accessible to all
11	High health status (both high positive health status and low disease status)

Hancock argued that local governments should take the lead and implement ‘health for all mankind’ strategy to promote the health of the urban population. Currently, 93 local governments in Korea have joined and are active in the Alliance for Healthy cities and are active [2]. In recent years, as national and local government efforts to revitalize the city have been actively carried out, the urban regeneration and understanding of the health of residents have to be in place [3]. Because urban regeneration and healthy cities have a common goal of enhancing urban environment and quality of life through environmental, social and physical improvements [4]. Studies in foreign countries have already discussed the effects of regeneration of residential areas and improvement of the surrounding environment on the physical and psychological health of residents [5]. The ideas are shown in Figure 1 [7].

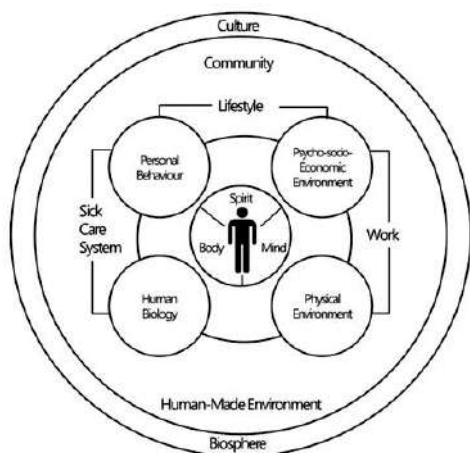

Figure 1: The Mandala of Health, a Model of the Human Ecosystem

This study employs the social ecosystem theory to identify healthy cities. The social ecosystem theory is

a theory of the relationship between the system and the environment, in which the community is composed of various sub systems, and each system is understood as an organism that interacts with each other, but maintains balance and seeks change as an independent entity [8, 9]. In other words, successful healthy cities require the cooperation of the public and the government to induce residents to participate through the interaction between the subsystems and existing resources in the local community. This study presents some suggestions for building healthy cities as a new paradigm, which emphasizes social and ecological factors. To achieve the purpose of the study, a regional survey of residents was conducted and some suggestions were made based on the results.

MATERIALS AND METHOD

Characteristics of Research Sites

Geographical Features: In Figure 2, Gijang-gun is located at the eastern end of Busan Metropolitan City, on the southern tip of the Korean peninsula. The Daeun Mountains in the northwest area of Gijang lie on the border of Yangsan City. The three towns including Gijang-gun, Jangan-eup, and Ilgwang-myeon in the eastern region are adjacent to the East Sea. The northeast area is on the border of Ulju-gun, and the southwest faces Haeundae-gu and Geumjeong-gu of Busan.

Figure 2: Location of Gijang-gun

Population Trend: Gijang-gun’s population has grown by 10.1% in 2009 due to the influx of population in Jeonggwang New Town. The net number of migration is the second most prominent population movement in the country. It is in stark contrast to the declining population of Busan as a whole as shown in Table 2 [10].

Table 2: Population Trend of Gijang

Year	Total	Men	Women	The Number of Households	Increase and Decrease
2009	89,159	44,713	44,671	35,334	10.1
2010	102,557	51,211	51,346	40,664	14.7
2011	108,095	53,840	54,255	42,806	5.4
2012	114,566	56,941	57,625	45,186	6.0
2013	132,507	71,581	66,888	51,846	15.6
2014	144,748	71,581	73,167	56,606	9.2
2015	153,093	75,755	77,338	60,024	6.0
2016	158,527	78,373	80,154	62,810	3.5
2017	161,651	80,067	81,584	65,738	

Local Resources: Gijang is a city full of festivals utilizing natural resources. It is so great that it can be the most successful festival example in Korea, and it is visited by many tourists from all over the country every year. There are festivals such as tidal flat mud village festival, anchovy festival, seaweeds kelp festival, conger eel festival, Chaseong culture festival, Cheolma Hanwoo Bulgogi festival, and Good fishing ritual festival. Excavation of various local festivals and successful local festival events are important factors that can lead to mutual interest and cooperation among local residents, and these characteristics of Gijang-gun may establish social capital in the future and will be local assets with high availability.

Survey: Korea Healthy Cities Partnership (KHCP) explains the 11 healthy cities requirements, including the following social and ecological factors; Active participation of city dwellers and control of any problems having an influence on individual life, health, and welfare; All city dwellers satisfied with factors in everyday life (including food, water supply, housing conditions, income, safety, and working conditions); Establishing interaction and communication among city dwellers, and gaining access to resources; Promoting history culture and biological heritage or the linkage between all groups within the community and individuals. The study drew up a healthy city questionnaire based on 11 factors presented by the KHCP.

A survey was conducted for 220 residents and 80 healthy city experts on healthy city Gijang between July 1, 2016 and October 30, 2016. A total of 283 cases were analyzed, with the exception of 17 poor returns. The questions were ‘food supply’, ‘housing supply’, ‘medical supply’, ‘security of crime’, and overall satisfaction with life in Gijang. In addition, the Busan Metropolitan Government social survey data was used in part.

RESULTS AND DISCUSSION

The questionnaire items are about Gijang’s food supply. In terms of the questionnaire item, ‘rich in food’, 53.1% of the residents and 71.3% of the experts answered that Gijang was ‘rich in food’, demonstrating that residents and experts commonly answered very positively about the food of Gijang as in **Figure 3**. When asked about housing issues, 53.7% of residents and 57.6% of experts answered positively that ‘housing supply is smooth’ in the item about housing.

Figure 3: Degree of Food Supply

On the other hand, in the item that Gijang’s medical level (number of medical facilities, number of medical staff) was sufficient, 44.7% of the residents and 60% of the experts answered that it was not enough, revealing the vulnerability of Gijang as a healthy city as in **Figure 4**. There was a difference between the two groups. Experts, rather than residents, responded negatively to the adequacy of medical care. The vulnerability in Gijang’s health has been uncovered. With both urban and rural characteristics, Gijang has a unique lifestyle. While there is abundant food supply and housing supply, there still are difficulties in public transportation. As shown in this survey, residents have a strong desire for health care. The full use of existing nuclear hospitals should be considered.

Figure 4: Adequacy of Medical Supply

In the item on the safety of Gijang such as crime and security, etc., 41.3% of experts and 39.4% of residents answered that they were safe, showing that it was a

little more favorable response than not safe. However, the Busan Metropolitan City Survey^[10] (biennial survey, data from 2015 is the most up-to-date data) shows the characteristics of Gijang worthy of looking closely as in **Table 3**. Compared with the basic local self-governing bodies of Busan Metropolitan City on ‘feelings of local uneasiness factors’, there was nothing unusual about crime and/or violence, but compared to other basic local self-governing bodies, the anxiety about natural disasters can be seen to be remarkably high in Gijang.

Table 3: Anxiety about Natural Disasters

	Feel Very Much	Feel A Little	Moderat	Not Feel Much	No Feeling At All
Total	12.6	38.5	29.7	15.2	2.8
Jung-gu	11.1	34.5	28.1	19.4	6.1
Seo-gu	12.6	36	32.8	13.7	4
Dong-gu	6.3	31.5	29.2	25.9	5.4
Yeongdo	12.3	32.6	29.9	15.3	5.6
Jin-gu	10.2	38.8	30.7	16.7	2.4
Dongnae	14	38.6	28.4	15	3.2
Nam-gu	9.6	34.6	30.2	20.5	3.2
Buk-gu	18.6	41.4	27.1	10.2	1.9
Haeundaeu	11.7	39.4	30.6	15.3	2.9
Saha-gu	12.1	41	30.5	14	1.6
Geumjeong	13.6	46.3	28.3	9.6	1.5
Gangseo-gu	15.9	41.9	28.8	11	2
Yeonje-gu	10.9	33.1	29.6	19.7	4.1
Suyeong-gu	12.4	38.9	27.7	15.8	3.6
Sasang-gu	10.1	37.9	33.3	15.9	1.9
Gijan-gun	25.7	38.8	25.2	8.5	1.3

In the opinion of residents and experts on local resources, the respondents who answered “Gijang is a local community that make good use of local resources (local festivals, local products)” were 48.5% of residents and 55% of experts, showing a very positive attitude, while 13.8% and 2.5% respectively of the respondents who answered “they do not use them well”. The use of local resources can have a huge influence on the social welfare of residents.

On the other hand, 50.2% of the respondents answered ‘normal’ and 34.5% answered ‘active’ to the item, ‘Do you think that there are various encounters, exchanges, contacts and interaction among the residents of Gijang?’, and in case of experts, 46.3% of them answered ‘normal’, and 35.0% answered ‘active’. While they answered that they are very positive about using local resources, they showed lukewarm attitudes towards the exchange and

interaction among the residents. With regard to the item, ‘Is Gijang a healthy city?’, they showed neutral attitudes. 44.8% of the residents and 47.5% of the experts answered that it was normal as in Figure 5.

Figure 5: Is Gijang a Healthy City?

As shown in **Figure 6**, for the item, “I have a willingness to continue to live or work in Gijang”, 74.9% of the residents and 55.0% of the experts answered that they were highly willing to live or work in Gijang. This item shows the loyalty to the region. The high willingness of residents to continue to reside in the area means a wealth of social capital that can be used for future regional development.

Figure 6: Willing to Stay or Work

CONCLUSION

In the results of the survey, the opinions of residents living in Gijang and experts related to healthy city of Gijang can be summarized as follows.

First, the opinions on health related food, housing supply, and safety for crime in general had positive attitudes. Given that the appetite for food, housing, and safety to lead a healthy life are very basic needs, Gijang can be a well-being community as a residential area. However, there is a need to improve the regional image of healthy city Gijang as they showed a neutral attitude toward the issue of whether Gijang to be as a comprehensively healthy city.

Second, while they were positive for the safety of crime, in contrast, their attitude toward safety for natural disasters was very negative. Considering the geographical features of Gijang, it is a very natural outcome and the usual safety education and training to prepare for this should be provided to the community. Since the premise of health is safety, the identification of Gijang as a safe city is necessary for future healthy city planning.

Third, there was a very positive assessment of the local festivals and its use of regional specialties, which can be regarded as local resources of Gijang. The regional festivals that utilize the characteristics of Gijang are a very important resource that can enhance residents' cohesiveness and community spirit. As both residents and experts showed a positive attitude toward the use of these resources, in practice, these have proven to be a social capital that can enrich their lives and further enhance the value of Gijang. These positive assessments are to be the potential that new residents and existing ones of Gijang will continue to interact with each other. However, their views on exchanges and interactions among residents turned out to be different. They showed lukewarm responses to various meetings, exchanges and interactions among local residents.

Lastly, they showed very positive attitudes about the willingness of staying in or working in Gijang. In particular, 74.9% of the respondents said they would continue to live in the region, indicating that the residents are highly satisfied with the region. This positive attitude can be an important step in understanding the possibility of active participation of residents when policies are implemented to build a healthy city through cooperation between the public and the government.

Based on these results, suggestions for the healthy city Gijang are as follows.

First, the basic principle of a healthy city is to provide the residents with the safety in their daily life. Gijang has geographical characteristics of being adjacent to the mountain and the coast, and urban and rural and fishery complexes, and there are elements of various disasters (large typhoon, forest fire, earthquake, tsunami, drought) as compared with those of other basic self-governing bodies in Busan. The image of healthy city Gijang and safe city Gijang should be strengthened. A safety education manual is required to strengthen the sense of disaster preparedness of residents and to be shared by the people and the government. To achieve this, safety education manuals should be distributed and promoted centered on schools and industries. It is necessary to develop visiting education by taking advantage of the characteristics of Gijang where the public transportation is not well organized. Also, the high desire for medical services requires the development of visiting services through public health centers.

Second, by using the local festivals of Gijang, which are already active and considered to be a successful case, it is necessary to strengthen the community consciousness of residents. By arranging a system for local residents to participate in various local festivals, it is necessary to raise the social capital that leads to the development of local community with the effect of increasing local participation awareness of residents. Participation in volunteer activities through festivals promotes harmony between existing residents and newly arriving residents, and increases residents' local participation and interest in the region. This can lead to community change.

Third, Gijang has many other unique characteristics compared to other basic self-governing bodies in Busan. As seen from this survey, they showed very high satisfaction with food, housing and the safety from crime.

Also, they hope to continue living and working in Gijang. This fact means that Gijang has important resources that a healthy city needs. On the other hand, the lack of medical care and the anxiety of natural disasters are factors that harm healthy city Gijang. The government should be the center, and it should complement these shortcomings based on the cooperation of residents.

The definition of a healthy city is changing from a medical model to a social model. That is, it means not only physical health but also social, emotional, and cultural health of the community and should be developed into a comprehensive concept of healthy city through participation of residents. Korea continues to undergo changes such as urbanization, urban development, and urban redevelopment. Above all, the concept of healthy cities cannot be overlooked for cities where residents can live a long life. This study suggested the construction of a healthy city based on a new paradigm centered on social and environmental factors.

Review on Privacy Preserving of Medical Data in Cloud Computing System

Sridhar Reddy Vulapula¹, Malladi Srinivas²

¹Research Scholar, ²Professor, KLEF Department of CSE

ABSTRACT

In current scenario, tele-medicine system is the emerging health-care service, where health professionals can treat, evaluate and diagnosis a patient using tele-communication technology. Data in health-care system denotes a set of medical health data (X-ray, fMRI data, scans of lung, brain, etc.), which are complex and larger in number. It is infeasible to handle the medical-datasets using traditional hardware and software. So, it is essential to develop a practical approach to balance the privacy protection and health-care data sharing. In order to deal these concerns, several methodologies are developed, most of the researches focused only on a small scope of issue with single concept. This review paper analysis the researches done on privacy preserving of medical-data in cloud computingsystem and also examines the major issues faced by the conventional techniques. This procedure helps the researchers to give better solution for the current concerns faced in the privacy preserving of medical-data in cloud system.

Keywords: *Cloud computing, cloud data storage, cloud service provider, medical data, and privacy preserving.*

INTRODUCTION

Big data analytics is the process of collecting and assessing the enormous amount of data for obtaining new knowledge, which is applied in the fields of medical, weather forecasting ^[1], purchase history analysis, etc. Nowadays, tele-medicine is one of the emerging research fields for e-health research ^[2]. The health-care industry includes patient data in the form of social media posts (blogs, and twitter feeds), clinical decision support system (laboratory, prescriptions, medical imaging, pharmacy, physicians written notes and other administrative data) ^[3], ^[4], machine generated sensor data, medical journal articles, etc. These multimedia medical data are infeasible to manage by using traditional software and hardware. Cloud computing is the finest system to overcome the issues of big-data, because it delivers computation for analyzing and organizing the data, and also provides enough storage space ^[5], ^[6]. Cloud architectures pave the way for improvement and cost trade-off with availability and reliability enhancement. In cloud storage, the user can access their personal data at anytime and anywhere without storing the data at local.

Though, the cloud service provider does not completely trust the cloud storage due to the verification of data integrity, which happens at non-trusted cloud

servers. Similar to cloud computing, the health-care cloud computing is also have different problems associated to its security. The most important issues are cyber-security concerns, absence of security standards, policy and legal problems, data protection, lack of transparency, privacy protection and software licensing ^[7], ^[8]. To resolve these issues, several methodologies were developed for balancing the privacy protection and health care data sharing. For instance, multi-key privacy-preserving deep learning methodology ^[9] and triangular data privacy preserving protocol ^[10] was employed for cloud data security. However, these approaches showed better data storage security, but the encryption and decryption time was too high. In this paper, review on the privacy preserving of medical data in cloud system has been done in order to analysis the performance and concerns of conventional methodologies. This process motivates the researcher's for further research work in preserving of health-care data.

This review paper is composed as follows, Section II presents the overview of privacy preserving of medical data in cloud system. Section III reviews several recent papers on privacy prese ving in cloud computing system. Section IV represents the research gap. In section V, objective of the research is presented. The conclusion is made in the section VI.

Over-view of privacy preserving of health-care data in clouds: Generally, privacy preserving of medical data in cloud system consists of three major steps such as, acquisition of medical data, data encryption and decryption, and system model for cloud data storage.

Types of medical data: The data acquisition is the initially stage of privacy preserving of medical data in cloud system. In this scenario, two types of medical data are acquired such as, text and image data. It is necessary to select appropriate data; if the data is not acquired satisfactorily then the intended operations may not be achievable. A few example of text and image data are detailed below.

Image type: The image type medical data are acquired from the standard benchmark datasets: T1-WCEMRI, Mammographic Image Analysis Society (MIAS), OASIS dataset, etc. All these datasets are related to medical field. A brief description about the acquired datasets are determined below.

- **T1-WCEMRI dataset:** The original T1-WCEMRI dataset contains 3064 medical images form

233 patients with three types of brain tumor's: glioma-1426 slices, pituitary tumour-930 slices and meningioma-708 slices.

- **MIAS dataset:** MIAS is an organization of UK research groups, which generates a database of digital mammograms. The original dataset digitized at 50 micro pixel edge, then the database is reduced to 200 micro pixel edge of 1024×1024 pixels ^[11]. The dataset consists of 322 digitized images that are available on 2.3 GB 8mm (Exabyte) tape.
- **OASIS dataset:** The original OASIS dataset contains 1500 raw image scans, which is captured from 609 normal adults and 489 persons at different stages of cognitive decline ranging in age from 42-95 years. This database consists of 2000 MR Sessions that comprises of susceptibility weighted imaging, arterial spin labelling, diffusion tensor imaging sequences, time of flight, etc. ^[12]. Figure 1 shows the sample images of T1-WCEMRI, MIAS and OASIS datasets.

Figure 1: a) Sample T1-WCEMRI dataset image, b) MIAS dataset image, c) OASIS dataset image

Text type: The text type medical data are acquired from the standard benchmark datasets: Cleveland, Hungarian, star-plus, Switzerland datasets, etc. The description about the acquired databases are detailed below.

- **Cleveland dataset:** The Cleveland database consists of 76 characteristics under 14 categories. Many machine learning researchers have used the Cleveland database. The field named “goal” refers to the patients with the heart disease^[13]. It represents the value from 0 to 4, which separates from the absence of heart disease to the presence. Six of the 76 characteristics are removed due to incomplete data. Some of the patient's name and

their social security number are eliminated from the dataset that are replaced with the dummy values for the privacy purpose.

- **Hungarian dataset:** The format of Hungarian database is similar to Cleveland database. The Hungarian database comprises of 261 examples. Three or four examples are neglected due to incompleteness of the data. The class distribution of Hungarian database demonstrates 62.5% absence of heart disease and 37.5% have heart disease.
- **Star-plus dataset:** The star-plus dataset comprises of six subjects, and above forty trails of functional

magnetic resonance imaging data are collected for each subject [14]. An individual trail contains averagely 5000 voxels for one snap-shot, which is collected for every 0.5 seconds.

- **Switzerland dataset:** Switzerland dataset is collected from University Hospital Zurich, Switzerland by William Steinbrunn, M.D and from University Hospital Basel, Switzerland by Mattias Pfisterer, M.D. It includes 123 data instances and 14 attributes. The class distribution of Switzerland dataset shows 93.5% presence of heart disease and 6.5% absence of heart disease. After the acquisition of medical data, data encryption and decryption is carried out for preserving the privacy of medical data in cloud system.

Medical data encryption and decryption: Homomorphic encryption is the form of encryption, which performs computation on cipher-texts and generates the encrypted result. In decryption phase, the matching operation is performed on the plain-text. The homomorphic encryption is divided into two types such as, fully homomorphic and semi homomorphic schemes. Some of the common homomorphic methods used in medical data encryption and decryption are discussed below.

Enhanced homomorphic crypto-system: The Enhanced Homomorphic Crypto-system (EHC) is used for homomorphic decryption and encryption to with-stand the problem of indistinguish ability under chosen plain-text attack. In homomorphic encryption, the system performs computation on the encrypted data without knowing the knowledge of real value. At last, the encrypted data or message is send to decryption phase for decrypting the encrypted data^{33,34,35,36}. While performing on real value, the decrypted outcome must be equal to the intended computed value. To overcome this concern, a specific structure is presented by EHC [15]. The encryption and decryption of EHC is determined below,

Select large prime numbers "p" and "q".

Calculate $m = p * q$.

Generate a random number "r".

Where, "r", "m" and "q" values should be kept secret.

Shared key is "p".

Encryption:

Encryption (X, m, p, q, r) .

Assume $X \in Z_p$.

Calculate $Y = (X + r * p^q) \pmod m$.

Output $Y \in Z_c$.

Decryption:

Decrypt (Y, p) .

Input $Y \in Z_c$.

Calculate $X = Y \pmod "p"$ output $X \in Z_p$.

Benaloh crypto-system: Benaloh crypto-system is a homomorphic encryption approach with an improvement of expansion factor [16]. Though, the private and public keys are generated as follows,

Consider two large parameters "p" and "q", with a block size "R".

- "R" divides $(p - 1)$.
- "R" and $(p - 1)/R$ are reasonably prime.
- "R" and $q - 1$ are reasonably prime.
- $n = pq$.

Select $y \in (Z_n)^* = \{x \in Z_n : \gcd(x, n) = 1\}$,

$$y^{\frac{\phi}{R}} \neq 1 \pmod n \tag{1}$$

Where, ϕ represented as $(p - 1)(q - 1)$, (y, R, n) are considered as public key and the two prime numbers "p" and "q" are denoted as private key.

Encryption:

In case, if m is an element in Z_R and u is a random umber in $(Z_n)^*$, then calculate the randomized encryption of m using the equation (2).

$$E_R(m) = \{y^m u^r \pmod n : u \in (Z_n)^*\} \tag{2}$$

For easy verification, equation (2) is re-written as follows,

$$E_R(m_1) \times E_R(m_2) = E_R(m_1 + m_2) \tag{3}$$

Decryption:

The decryption function of m and u is denoted in the equation (3).

$$(y^m u^R)^{(p-1)(q-1)/R} = y^{m(p-1)(q-1)/R} u^{(p-1)(q-1)} = y^{m(p-1)(q-1)/R} \pmod n \tag{4}$$

Since, $m < R$ and $y^{(p-1)(q-1)/R} = y^{m(p-1)(q-1)/R} \neq 1 \pmod n$, Benaloh cryptosystem concludes that $m = 0 \pmod R$

if $(y^m u^R)^{(p-1)(q-1)/R} = 1 \pmod n$. In case, if $z = y^m u^R \pmod n$ is an encryption of m by using secret key (p, q) determine whether $m = 0 \pmod R$. If R is small, decrypt z by employing a non-negative integer ms such that $(y^{-mz} \pmod n) \in E_R(0)$.

Brakerski-Gentry-Vaikuntanathan crypto-system: Brakerski, Gentry and Vaikuntanathan developed a first fully homomorphic encryption scheme, which does not need bootstrapping [17]. The developed methodology delivers better performance on base security with learning errors. This encryption method is implemented in the open source library along with several optimizations approaches. The developed encryption scheme is an asymmetric encryption methodology, which is utilized for the encryption by means of bits.

Encryption: (Plain-text m , public-key Pub): Ciphertext c .

Decryption: (Cipher-text c , private-key Priv): Plain-text m .

Level shifting operation:

Rescale (Cipher-text c): Cipher-text c' .

Switch-key (Augmented Cipher-text c): Cipher-text c' .

Homomorphic operation:

Add (Cipher-text c_1 , Cipher-text c_2): Cipher-text c_{sum} .

Mul (Cipher-text c_1 , Cipher-text c_2): Cipher-text c_{mul} .

System model for cloud medical data storage: This sub-section describes about the system model for cloud medical data storage, as shown in the figure 2. Generally, the cloud data integrity architecture contains following parties [18],[19]. The general function of each individual party is described below.

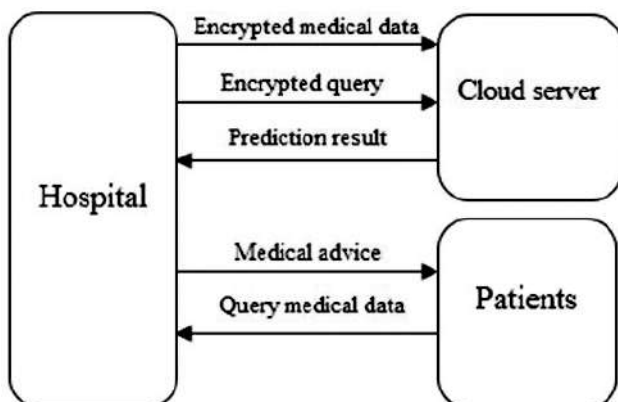

Figure 2: Cloud medical data storage system

Data owner: At first, the data owner needs to register with cloud service provider server. After registration, cloud service provider generates private and public key and send the keys to data owner. Once the data owner register with cloud server, the data owner allowed to download and upload the resource/data in the cloud server. The respective data are encrypted and upload in the cloud server. Usually, key generation is an important step in data storage, which includes two keys such as private and public key. The sender encrypts the data using public key, and only the holder have private key to decrypt the respective data.

User: In order to access the network, initially the user needs to create an account. After creating the account, user want to login the account and request the work from cloud service provider. Based on the user request, cloud service provider will process the user requested work. The network coding use the programming languages like .net or java for communicating with the cloud server. The user can access the requested data by sending the request to cloud server provider.

Cloud service provider: Cloud service provider has a combination of hardware and software resources and also delivers flexible online data storage and computing. In data storage, the cloud service provider comprises of huge amount of data and also handles the data owner and user information for authentication. The cloud service provider stored the data owner and user information in the database. In order to process the user requested job, the cloud server redirects the user requested job to any of the queue. In queue, virtual machines are utilized to process the user requests.

Third party auditor: Based on the data owner request, the third party auditor audits the data, which are uploaded by the data-owner. The TPA need to register with the cloud server for auditing the user requested data. The TPA updates the auditing information at certain time period, so the security of data is ensured. Also, the auditor update to the data-owner, if there is any change occurred while auditing the data.

Key generation: Generally, the key generation techniques includes two stages set up stage, and challenge-prove stage. The brief description about each stage is detailed below.

Set-up stage: The set-up stage is a series of operation at the client end for initializing the system. This stage includes three functions,

- Key generation (1^{key}): This section includes probabilistic key generation methodology $\{skey, pkey\}$, which considers security parameter key as an input. The inputs are considered as a private key $skey$ and the outputs are denoted as a public key $pkey$. The data-owner publishes public $pkey$, and keeps private key $skey$ as a secret key for decrypting the respective data.
- Tag generation ($skey, pkey, m \rightarrow$ meta data): The meta-data considers the client document $skey, pkey$ as an input and the outputs (meta-data tags δ) are stored locally by the client. At the server end, the corresponding documents m and tag δ are remotely stored by the client.
- Block-sig-generation: After generating the tag document δ , the data-owner creates signatures for each data block using cryptographic hash function.
- Gen-challenge ($c \rightarrow \{chal\}$): This operation considers the client's private parameter c as an input and the output challenge $chal$ for the future query.
- Gen-proof ($p_s, m, \delta, chal \rightarrow \{G\}$): It takes user public parameters p_s , meta-data δ , document m and challenge $chal$ as an input and the output G is given to the user for verifying the server, whether it outsourced the document correctly or not.
- Check-proof ($pkey, chal, meta\ data, G \rightarrow \{"reject", "accept"\}$): This operation is used to check the server possession of the target documents. It considers the user public key $pkey$, challenge $chal$ made by the client, evidence G and meta-data δ as an input. By analysing the evidence G , the function results as either "accept" or "reject".

Challenge-prove stage: The challenge-prove stage is an interaction process between the server and client. The client determines the issues and sends the challenges to the server. The server evaluates the corresponding challenges and replies output to the client. The challenge-prove stage contains three operations, which are listed below.

LITERATURE REVIEW

Several techniques are suggested by researchers in privacy preserving of medical-data in cloud systems. In this scenario, brief evaluations of some important contributions to the existing literatures are presented.

Author	Methodology employed	Advantage	Limitation	Performance measure
X. Liu, R.H. Deng, Y. Yang, H.N. Tran, and S. Zhong, [20]	A Hybrid Privacy preserving Clinical decision support System (HPCS) with light-weighted data mining approach was proposed for monitoring the patient's health condition in real-time.	Compared to the existing approaches, the developed methodology effectively solves the computational overflow problem by analysing the experimental result.	While performing with more users, the developed approach leads to two major issues: inadequate data backups and data loss.	Computational and communication cost
J. Li, J. Li, X. Chen, Z.Liu, and C. Jia, [21]	In this research, a hybrid architecture (combination of fuzzy keyword search and AttributeBased Encryption (ABE) algorithm) was proposed to tackle the problems of privacy preserving in cloud computing.	The experimental outcome confirmed that the proposed methodology was more significant than the existing approaches in terms of time cost	The developed cloud computing system was an open-ness cloud computing system, so social engineering and phishing attacks were common here.	Time cost
J.J. Yang, J.Q. Li, and Y. Niu, [22]	To secure the medical data in cloud environment, an effective methodology was proposed. The developed methodology contains four major steps (vertical data partition, data merging, integrity checking and hybrid search across cipher and plain text.	In multi-cloud paradigms, the proposed methodology provides better balance between the privacy protection and medical data utilization.	The developed methodology provides insecure data sharing in the condition of one to one solution.	Time cost

Conted...

H. Zhang, Z.Zhou, L.Ye, and D.U. Xiaojiang, [23]	In this study, a new data partition methodology: extended quasi identifier technique was proposed in cloud computing for reducing the data privacy concerns.	The developed data privacy preserving methodology was applicable in several real scenes, because it could incur low information loss.	The developed cloud computing system still consists of vulnerabilities, specifically in the networks that have several data-owners and complex infrastructures.	Time cost, and average relative error
C. Zhang, L. Zhu, C.Xu, and R. Lu, [24]	APrivacy Preserving Disease Prediction (PPDP) system was proposed to improve the level of privacy protection.	The developed methodology effectively encrypts and outsourced the medical data to the cloud server.	The PPD approach have several positive benefits, but there were numerous security problems and ensuring privacy was extremely difficult.	Computational time
H.A. Al Hamid, S.M.M. Rahman, M.S. Hossain, A.Almogren, and A. Alamri, [25]	A bi-linear pairing cryptography with tri-party one round authentication key protocol was proposed in order to store and access the medical data securely.	The developed authentication key protocol security analysis shows that the proposed approach was robust against all security attacks.	In most of the cases, the developed methodology does not supports the direct-order operation in cloud server.	Memory requirement, decryption time, encryption time and key generation time.
X. Liu, R. Lu, J. Ma, L.Chen, and B. Qin,[26]	Developed a new privacy preserving patient centric Clinical Decision Support System (CDSS)with naïveBayesian classifier for securing the patient's information privately.	Naïve Bayesian classifier excavates the useful information from large clinical data for improving the CDSSs.	Sometimes, the developed classifier leads to collusion problem between the cloud platform and processing unit.	Running time
A. Alabdulatif, H. Kumaraage, I.Khalil, and X. Yi, [27]	In this study, a light-weighted homomorphic encryption methodology was utilized for ensuring the data security	Qualitative and quantitative analysis shows that the developed approach performs consistently with less over-heads and high detection accuracy in cloud-based anomaly systems.	The developed methodology need efficient processing facility and large volume of data, otherwise it leads to critical issues of security, data-ownership and privacy.	Execution and encryption time
A.Alabdulatif, and M. Kaosar, [28]	A homomorphic encryption system based on DomingoFerrer approach was proposed forsecuring the analytic services and cloud based storage.	The proposed methodology: Extended DomingoFerrer determines both positive and negative ranges in cloud computing system. This action helps to improve the security of cloud based storage system.	Still, an effective computing methodology was required to further improve the cloud storage system.	Encryption, decryption, multiplicationand addition time
L. Lyu, J.C. Bezdek, Y.W. Law, X.He, and M. Palaniswami, [29]	To address the challenges in cloud service, a two stage method (Repeated Gompertz (RG) and Random Projection (RP) matrix) was proposed.	The two stage algorithm (RG+RP) preserves the privacy of both anomalous and normal data.Also, it delivers better recovery rates in several benchmark medical datasets.	The computational time cost was bit high, while performing with two stage process.	Recovery rate

Conted...

H.H. Nguyen, [30]	In this research, Lloyd based methodologies were developed to address the problem of privacy preserving k-modes.	The developed methodology provides secured private key for the data-owner, which prevents the stored data from the attackers.	Only, a few attacks were utilized to withstand the capacity of developed methodology.	Friedman test and runtime
K. Xing, C.Hu, J. Yu, X.Cheng, and F. Zhang, [31]	This paper considered the issue of mutual privacy protection in social participatory sensing, which was decreased by using k-means clustering algorithm.	In experimental analysis, the k-means clustering methodology shows better solutions to the collusion attacks.	In multi-clouds, the k-means clustering partition the data vertically, so it was difficult to protect the entities of clusters.	Accuracy and recall
H. Kaur, N.Kumar, and S. Batra, [32]	In order to enhance the health care recommendation system efficiency, a new algorithm: Privacy Preserving Collaborative Filtering (PPCF) with Arbitrary Distributed Data (ADD) approach was proposed.	Compared to other recommendation systems, the developed system shows better on-line prediction generation time and off-line model generation computation time.	The developed approach was only applicable for structural medical database by means of vertical splitting. It does not supports unstructured medical data.	Coverage and mean absolute error

CHALLENGES

In current scenario, a few challenges need to be resolved in the field of privacy preserving of medical data in cloud computing system. In this cloud system, it is essential to reduce the storage in private cloud on the off chance, where the entire sensitive information is stored. An efficient service is required to attain proper incoming data storage, indexing maintenance, and accessing capacity. In addition, finding an appropriate set of attributes for sanitization would minimize the side effects, especially when sensitive information overlaps with non-sensitive information. These procedures are achieved by following the below mentioned objectives.

CONCLUSION

The e-health care system is the most emerging and developing system for preserving the personal health data. The cloud based health care system makes the personal health record more flexible and efficient. In order to evaluate and diagnose a patient, the health-professionals need to access patients medical records (brain scans, fMRI data, X-ray, etc.), which consists of enormous multi-media data. For supporting mobility and efficient access for both the patients and health-professionals, the medical records need to be stored in big data storage in the health-care cloud. This review paper gives an overview of privacy preserving of

health care-data in cloud computing system and also evaluates the existing methodologies by means of advantage, limitation and performance measure, which is detailed in the table 1. Still, there is much work to be done on privacy preserving of health care-data in cloud computing system for delivering better data security. This review paper will help the readers to understand the state-of-the-art in privacy preserving of medical-data in clouds and also motivates more meaningful works.

FUTURE WORK

The researchers follow some of the major objectives in privacy preserving of medical data in cloud system, which are discussed below.

- Develop a clustering methodology for preserving the medical records in hybrid clouds.
- Develop a hybrid query based secure methodology for data storing, retrieving and ensuring the safe usage of medical resources/records and also to provide better solutions to the problems like data privacy protection and lack of transparency.
- Develop a privacy-preserving outsourcing framework under the hybrid cloud mode.
- Develop a secure system to overcome the drawback of Computational time and cost while encrypting and decrypting data.

Grandchildren Parenting Experiences of Grandparents

Yun-JeongKim¹

¹Department of Nursing, 155-40 Baejae-ro, Seo-Gu, Daejeon, Korea

ABSTRACT

Background/Objectives: This study was to explore the meaning of life found in the life story of grandparents who are parenting their grandchildren.

Method/Statistical analysis: This study employed the phenomenological analysis method proposed by Colaizzi. The study was conducted through face-to-face in-depth interviews based on a semistructured interview guide. In-depth interview is a process of communication with purpose and it is where the researcher engages in purposeful conversation with the participant to create knowledge related to the subject to utilize the content provided by the research participant as research data.

Findings: The study results are grandparents taking care of grandchildren showed 3 categories Worth, Relations with adult children, and Difficulties of parenting. Grandparents taking care of grandchildren showed 3 categories 'Worth', 'Relations with adult children', and 'Difficulties of parenting'. The above study results show that grandparents taking care of grandchildren were participating in parenting through their own parenting experiences and parenting literature although they were not largely influenced by their own grandparents in the past.

Improvements/Applications: This study can be provided as basic data for education of grandparents participating in parenting grandchildren and young couples trying to find a balance between work and family.

Keywords: *Grandchildren, Grandparents, Experience, Qualitative, nurture.*

INTRODUCTION

Data The biggest characteristic of modern society is the equal social life among men and women due to education level increase, changes in values regarding employment, and self-realization desires in women.

The high rate of employment of married women due to the increase of social participation of women is acting as a core factor in bringing social changes and family changes¹.

Important changes that appeared especially after the 1960s include deterioration of extended families, decrease of traditional families, as well as the phenomenon of multiculturalism along with increase of international immigration.

This rapid changes in family and society created a sense of crisis in young women responsible for childbirth and parenting leading to an increase of households without children and this led to the low birthrate phenomenon² with the birth rate of 1.24.

This phenomenon is expanding into a crisis for each household as well as a national crisis. As the participation in economic activities of married women increase, the biggest difficulty that inhibit the coexistence of work and family for women is the problem of parenting after childbirth².

Looking at the fact that while more than 70% of working mothers with preschool age children utilize early childhood education institutions and still entrust their children³ to the children's grandparents in other times, parenting support from grandparents is an alternative plan of preschool age children parenting and can be an important resource as the role of supporting economic activities of the married adult children⁴.

Especially the reason why parenting by grandparents are preferred with younger age of children is because grandparents are trustworthy and take care of the children with affection⁵.

Therefore the purpose of this study was to explore the meaning of life found in the life story of grandparents who are parenting their grandchildren.

After setting their children on their feet, they felt “emptiness, loneliness and dreariness as if one corner of the heart were with a hole” while the feeling of relief of having achieved the assigned duty was accompanied by the feeling of emptiness and depression by becoming needless people.

The results of study show that they have much time to spare in general, so they enjoy leisure time; however, they also suffer from depression by the loss of meaning of life and sense of purpose by feeling confused in the meaning of life due to changes and loss of family relationship through marriage of their children and death of spouse.

However, most of them led their usual life, enjoyed their hobbies they wanted to have for a long time and were fully occupied with volunteer activities, thinking that the volunteer works were equivalent to the act of gaining virtue for their children.

In particular, one of the reasons why they take care of their grandchildren is that they are proud to see their daughter or daughter-in-law working in the field of their expertise.

This is one of the characteristics of people belonging to baby boomer generation of which working women and participation in society were started to be considered absolutely positive.

Due to the changes in perception of women in the sense that their daughter and daughter-in-law must work, they were willing to actively help in taking care of their grandchildren.

For this reason, the study coincided with the research results⁶, in the sense that they felt responsible for rearing their grandchildren and they want to play a role as primary fosterers in accordance with blood-tied tradition of our country's culture.

This has the same context as the result of research⁷ in the sense that the main motive of taking care of their grandchildren resides in the fact that there are no other proper options or the situation is inevitable.

This means that the elderly in the old stage of life use their time and ability for the benefit of others and society, and it is considered the same context as the result of survey done by Kelly in the sense that this experience gives them an opportunity to actively participate in the society to which they belong, serving as an indispensable factor for social integration of the elderly into the society.

In sum, after making their children independent from them, grandparents think that the act of rearing their grandchildren is rewarding in life and lead an enjoyable life through the activity⁸.

The following results show what influenced the current role as grandparents, view on childrearing, relationship with their adult children, difficulties while rearing their grandchildren, advantages in rearing their grandchildren and desirable childrearing.

MATERIALS AND METHOD

The study was conducted through face-to-face in-depth interviews based on a semistructured interview guide. In-depth interview is a process of communication with purpose and it is where the researcher engages in purposeful conversation with the participant to create knowledge related to the subject to utilize the content provided by the research participant as research data.

Here, the researcher does not only unilaterally accept the content of the interview but as the role of intervening in the experience composition of the participant in the interview process.⁹

Preliminary research participants were 3 grandparents who were not participants in the study. The interview time for the preliminary study was around one hour to one hour and a half per session and it was determined after the interview if there were difficult questions that the preliminary study participants could not understand, if there were additional questions that should have been asked, and if the interview time was appropriate.

Also, recordings were made with the agreement about the recording of the interview and after the interview, the recorded contents were all transferred and analyzed.

To obtain validity and reliability of the study, the study strived to minimize prejudice by researchers against research participants in the process of data collection and analysis.

Methods: This research conducted analysis according to the method described by Colaizzi, out of phenomenological data analysis methods.

To achieve this, analysis was conducted through listening to recorded in-depth interview of participants, reading the transcription of it, and composing the

meaning by making general, abstract topics from extracted sentences to categorize a broader level. To distinctively describe what research participants express during categorizing process, their interview responses were repetitively read and categorized into topics before receiving counsels from nursing professors with many experience in qualitative research.

This researcher read many times the manuscript written based on the recording of the in-depth interviews with study subjects, made general and abstract themes with the sentences extracted from the manuscript to built a semantic structure, and categorized them in a larger level.

In the categorization process, this researcher repeatedly read study participants' interviews to accurately describe their expressions and categorized themes, and then took advice from three professors in nursing department, who have a lot of experience of qualitative research.

This study used the phenomenological analysis method proposed by Colaizzi.

This researcher read many times the manuscript written based on the recording of the in-depth interviews with study subjects, made general and abstract themes with the sentences extracted from the manuscript to build a semantic structure, and categorized them in a larger level.

In the categorization process, this researcher repeatedly read study participants' interviews to accurately describe their expressions and categorized themes, and then took advice from three professors in nursing department, who have a lot of experience of qualitative research. According to the flow of themes in the analyzed data, this researcher integrated and comprehensively explained material experience.

Ethical Considerations for research Performance:

Since qualitative research is performed by a direct relationship with research participants, privacy can be exposed, which is very difficult to control it in an appropriate manner.

Therefore, a prerequisite is consent and cooperation of the family and relevant supervisors as well as prior consent. Before conducting interview, research purposes were explained to the participants and a written consent was obtained from them.

The following things are promised with participants.

- (1) the interview content will not be used except for the research purposes
- (2) transcribed data and recorded files will be discarded immediately after the research is completed
- (3) a report was processed anonymously, and
- (4) private personal information will not be disclosed.

Furthermore, the participants had the full right to refuse participating in the research at any time during the interview.

RESULTS AND DISCUSSION

The study results are as follows.

Table 1 Grandparents taking care of grandparents showed 3 categories Worth, Relations with adult children, and Difficulties of parenting.

The above study results show that grandparents taking care of grandchildren were participating in parenting through their own parenting experiences and parenting literature although they were not largely influenced by their own grandparents in the past.

While grandparents are involved in raising grandchildren to expect adult children's success, it is difficult because of differences in educational perceptions among adult children.

Nevertheless, grandparents for finding the meaning of life such as happiness, worth, and mission through the parenting of grandchildren

Table 1: Grandchildren Parenting Experiences of Grandparents

Upper category	Lower category
Worth	Meaning in life
	Economic assistance
	Appreciation
Relations with adult children	Regret
	Conflict
	Trust
Difficulties of parenting	Physical and emotional difficulties

Grandparents taking care of grandchildren showed 3 categories 'Worth', 'Relations with adult children', and 'Difficulties of parenting'.

The above study results show that grandparents taking care of grandchildren were participating in parenting through their own parenting experiences and parenting literature although they were not largely influenced by their own grandparents in the past.

While grandparents participate in the parenting of their grandchildren expecting the success of their adult children, due to the differences in the perception of education between their adult children, it also acted as a factor that made it difficult for grandparents.

Nevertheless, grandparents look for meaning of life such as happiness, worth, and mission through the parenting of grandchildren.

Firstly, the result shows that the execution of a role as grandparents is mainly influenced by the method of childrearing of their parents, books on childcare and childrearing experience.

This coincides with preceding research in the sense that a positive childrearing behavior of a grandmother gives significant influences on positive childrearing behavior of a mother, while a positive childrearing behavior of a mother exerts an impact on the self-conception of a child¹⁰.

Moreover, research participants, who had already finished the childrearing duty, recalled the memory of childrearing of the past by reading books on childcare in preparation for being inadequate to childrearing. As research participants wish to be helpful in rearing grandchildren by receiving proper education in tune with the times, it is estimated that education oriented to grandparents relevant to childrearing in accordance with today's trends will be urgently needed.

Secondly, as for view on childrearing of grandparents, they wanted their grandchildren to be recognized by people by having all-round balance of health, love and character and fulfilling the duty with autonomy.

This manifests the same context as the survey result in the sense that grandparents taking care of their grandchildren are expected to play roles accomplishing socioemotional support, active parental role and educational function, emphasizing the dual roles as fosterers and educators.

At the same time, this coincides with the research result in the sense that grandparents can play a role as powerful supporters for their grandchildren, while as critics and advisers for their children regarding the attitude of childrearing.

Moreover, when necessary, the parental role can be also supported by grandparents.¹¹

First, the past experience of grandparents raising grandchildren felt was 'strictness and warmth' and 'losing one's temper and differences'. The goal of their adult child dependence period was earning time on their side and getting well-prepared ending for their later years. The motivation of raising grandchildren was the expectation of children's success and absence of caring children.

Second, the significant impact on role performance of grandparents was education for children occurred while living with their grandparents, baby books and experience of child rearing.

The view of grand childbearing was 'health, love, the good morale of grandchildren', 'grand children who are self-regulating and established everywhere.

The relationship between grandparents and adult child was proved as the 'proudness and pitifulness' and trusting son-in-law and daughter-in-law.

The difficultness of raising grandchildren is 'playfulness and education', 'emotion control and guidance of life'.

The conflict between grandparent and adult child was the different view of education.

Although raising the grandchildren was being exhausted, there were also some advantages that occurred such as 'the harmony of family' and 'worthwhile'.

Third, the meaning of grandparent raising grandchildren's life was happiness, responsibility, worthwhile, emotional support, respect and recognition.

Those results of research showed that though there was no such a huge effect from the parents of grandparent, the grandparent could participate in raising the grandchildren through the experience of raising their child and information from baby book.

Actually, the grandparent usually participated in raising grandchildren since they have expected the

success of their adult child and wants to support them with 'proudness and pitifulness', the different view between grandparent and adult child was one of the factors that made grandparent tired. Even though those happenings occurred sometimes, grandparents have figured out the true meaning of life like happiness, worth while and responsibility through raising their grand children.

CONCLUSION

It can be concluded that the study found that in the parenting reality where the number of grandparents participating in parenting gradually increase, participation in parenting by grandparents led to successful senescence through an achievement of sense of productivity apart from the meaning of life and the significance of the study is in that it gives positivity in the participation by grandparents in the parenting of grandchildren which is being activated due to social changes and that it can provide basic data on education of grandparents.

The results of the study can be provided as basic data for education of grandparents participating in parenting grandchildren and young couples trying to find a balance between work and family, and the significance of the study is in providing positive perspective of parenting of grandchildren and the lives of many grandparents.

Besides the meaning of life, we can see as this study showed that raising the grand children leads the grandparent to successful aging with their achievement in the infant care reality that the number of grandparent raising grand children started increasing.

It also granted the affirmation of the participating in the raising of grand children which is being revitalized by the changes of the society as well as it can provide the basic of grandparents' education.

Smoking Prevention School Projects Perceived by Health Teachers

Jung Im Kim

*Department of Nursing, Kyungdong University, Wonju-siGangwon-do, Republic of Korea, ASI KR KS007
WONJU, Republic of Korea*

ABSTRACT

Background/Objectives: The purpose of this study was to investigate the perception of smoking prevention programs in schools by the teachers.

Method/Statistical analysis: The survey was conducted from December 30, 2015 to October 31, 2016 by web survey in Gyeonggi-do in Korea. The subjects of the study were 95 health teachers working in 95 elementary, middle and high schools in Gyeonggi Province. The analysis of the study was conducted using the SPSS 23.0 Windows version program, and the analysis was performed using frequency analysis and chi-square test.

Findings: The perceptions of health teachers on school smoking prevention programs differ according to the type of school, which is the structural environmental characteristic of the school where the health teacher works, and the designation of smoking cessation in the school.

Improvements/Applications: As a result of this study, it is considered that it is necessary to establish an in - school smoking cessation environment such as designation of smoking cessation in school, smoking counseling, and smoking prevention program that affects the level of perception of smoking cessation by school teachers.

Keywords: *Health Teacher, Smoking Prevention School Projects, School Environment*

INTRODUCTION

Korean male smokers are 50% who start to smoke in adolescents under 19 years of age¹. Therefore, the burden of the death of Korean men due to smoking is very large¹. The health risk is higher when the age at which smoking is started is younger, as the amount of smoking and the frequency of smoking increases. Therefore, it is necessary to implement a smoking cessation policy as a priority target for adolescents². Youth smoking in Korea is showing a decline in 2016. As a result of the experience of smoking prevention and smoking cessation education in middle and high schools in 2016, 63.8% of boys and 66.9% of girls were increased compared to the previous year and the price of tobacco was also increased³. The smoking rate of adolescents increased due to the environmental characteristics like the retail store where easy to buy cigarettes around the school⁴. The results of the survey on youth smoking cessation showed that they were exposed to various media that received smoking cessation education or promoted smoking cessation at school⁵. As mentioned above, smoking cessation requires various

forms of smoking cessation education in the education field along with the policy efforts of the nation.

In a school that has major activities in adolescence, a health teacher is a medical nurse who is the primary health care worker in the school and plays an important role in health education and health care so that students can form healthy lifestyles and resolve their own problems⁶. Health teachers are aware of their roles as school health professionals and participate in school health programs⁷. In addition, the higher the awareness of health teachers about the school health promotion project, the higher the teacher's work practice and the higher the perceived job performance⁸. Smoking prevention programs targeting individual students and the whole school are needed at school⁹.

The purpose of this study was to investigate the general characteristics of health teachers in charge of primary health care in schools and to investigate the differences in awareness of school smoking prevention programs.

MATERIALS AND METHOD

Purpose of Study: The specific objectives of this study are as follows;

First, this study examined the general characteristics of health teachers and environmental characteristics related to smoking cessation in working schools.

Second, this study investigates the awareness of health teachers on smoking prevention programs in school.

Study Design: The purpose of this study is to investigate the perception of smoking prevention centered school project in health teachers.

Selection Process of the Subject: The subjects of this study were 118 health teachers working at 118 elementary, middle and high schools in Gyeonggi - do attending health teacher training. The survey period was from October 31, 2015 to December 30, 2015. The survey method was firstly explained to the subjects of the study by explaining the purpose of the research, and after receiving the consent form, the structured questionnaire of the self - filling method was used. The data were collected from 95 questionnaires except 23 questionnaires which had many missing values.

Data Analysis: The analysis of the study was conducted using the SPSS 23.0 Windows version program, and the analysis was performed using frequency analysis and chi-square test. The questionnaires used in the research were revised and supplemented based on national and international references and expert validity¹⁰. The general characteristics were composed of age, gender, career of nurse, career of smoking prevention and smoking cessation. The environmental characteristics were composed of 5 types of school type, total number of students, smoking cessation area, smoking counseling program, and smoking counseling experience. Teachers' awareness of smoking prevention programs consisted of two items; The Cronbach's α value of the research tool used in this study was 0.717.

RESULTS AND DISCUSSION

General characteristics of the subjects and the environmental characteristics of the school: Table 1 shows the general characteristics of the subject and the environmental characteristics of the school. The results of the study showed that the age of the health teachers were 43 (45.3%), 40 (35.8%) and 18 (18.9%). The

teachers' career was 40 (42.1%) for less than 5 years, 31 (32.6%) for more than 10 years and 24 (25.3%) for less than 5 years. The teachers' smoking cessation experience was less than one year (53.7%), less than 5 years (22.2%), and more than 5 years (22.2%). The types of schools where health teachers work were 55 (57.9%) in elementary school, 24 (25.3%) in middle school and 16 (16.8%) in high school. Health teachers answered that 91 (98.5%) of the environmental characteristics related to smoking cessation were designated as smoking areas in the school. There were 64 (67.4%), no less than 5, 24 (25.3%) and seven or more (7.3%) questions on the counseling experience of health teachers.

* :Fisher's exact test

CONCLUSION

The results of this study showed that there was no difference in the perception of school smokers' prevention programs among the general characteristics such as age, career, number of students and kind of school. However, there was a difference in the perception of smoking prevention programs according to the environmental characteristics related to smoking cessation at school, such as the career guidance of health teachers, the designation of smoking cessation at school, the smoking counseling program, and the number of cigarette counseling.

Therefore, for the success of the youth smoking cessation project, it is required to develop the smoking cessation environment of the school and to develop the training program to strengthen the professional capacity of the health teachers as school health professionals.

Proposal Study on Public Data-Centered Crime Prevention Through Environmental Design (CPTED) in Seoul City Utilizing Classical Music

Ji-Heon Song¹, Sung-Jun Kim²

¹Student, ²Assistant Professor, Dept. of Bigdata Industry Security, The Graduate School of Namseoul University, Korea

ABSTRACT

Violent crimes have increased continuously due to the development of urban society and have become a threatening factor against the residential safety of citizens. The prevention of these crimes is always a major topic in human society and one of the fundamental elements of the quality of life and safety of citizens. In recent years, much attention has been paid to environmental design through the Crime Prevention Through Environmental Design (CPTED) as a preventive measure. Currently, South Korea is promoting the openness and utilization of public data, and crime prevention is one of the fields that can utilize public data actively. This approach to crime prevention utilizing public data will be helpful for the proposal of policies from new viewpoints departing from the general utilization measures of CPTED that improve streetlights and closed-circuit television (CCTV) installations, whose limitations have been pointed out as they are only mechanical surveillance. Thus, this study sets the research scope based on the statistics of the status of five criminal offenses by administrative district in recent years provided by the data portal in Seoul City, the capital of South Korea, as the utilization data and concentrates on the analysis. Based on the analysis results, this study proposes a method to utilize classical music as a new policy for regions where the improvements are most needed. The open-source Python analysis program was employed as the main data analysis and visualization method.

Keywords: CPTED, Public Data, Data Analysis, Classical music, Python

INTRODUCTION

A number of studies have been conducted on crime prevention for the safety of citizens from violent crimes that occur in cities along with the development of modern society. These studies have found that crime occurrences were closely related to the environments and crimes can be deterred or reduced through environmental changes and improvements ^[1]. Among them, some effective improvement measures were proposed focusing on closed-circuit television (CCTV) around the roads, including alleys, night lighting, the reorganization of a typical street to ensure a line of sight and increase

maintenance images, the installation of signposts, and the removal of blind spots ^[2].

However, such policies have revealed some limitations in areas where general Crime Prevention Through Environmental Design (CPTED) is used. As a result, if only the hardware and physical aspects of the CPTED are considered to place stress on security in communities, those communities are regarded as falling into exclusive and hardline images. Thus, a study suggested that a software approach based on daily living environments is also needed ^[3]. As a software approach, western countries have utilized classical music in specific areas as a crime prevention policy.

The promotion of the openness and utilization of public data in Korea will be helpful for providing a new alternative in this context. Thus, this study aims to identify the crime status by administrative district by analyzing the public data of Seoul from the portal and proposes a preventive measure utilizing classical music

Corresponding Author:

in administrative districts that are vulnerable to crime. In Section 2, recent studies related to crime prevention using CPTED and classical music are presented. In Section 3, the study methodology is defined. In Section 4, current statistics on and characteristics of crime in crime-prone regions in Seoul are analyzed. In Section 5, limitations and constructive study directions to overcome the limitations are proposed, and in Section 6, the analysis results are summarized and discussed. Finally, in Section 7, the conclusions are given and further studies are briefly described.

Current Practice and Research: In this section, the basic concepts of the CPTED, which is significant deterrent to crime, are investigated through the effects and limitations of currently utilized CPTEDs. After this, the effect of utilizing classical music, which is a newly proposed measure, and cases of other nations are studied.

Basic CPTED concepts: Research on the alternatives to crime prevention and reduction has been conducted for a long time, and a number of studies have been conducted in various fields, including perception of crimes, crime psychology, creation of crime prevention environments, and police activities [4]. Among these studies, the concept of CPTED has been proposed and utilized for a long time through environmental design to combine physical environments and social factors. CPTED was proposed by Jeffery as a strategy to reduce crime and fears by manipulating factors related to environments [5].

Figure 1: CPTED concept

As shown in Figure 1, the central concept of CPTED is surveillance and access control. As related policies, ensuring the visibility and openness of streetlights improves crime prevention and a non-intrusive surveillance function through CCTV installation is also known to be effective for crime prevention, particularly against the five criminal offenses [6].

The strategies for this basic concept have been divided into “strengthening surveillance, access control, territorial reinforcement, legibility, activity support, and management and maintenance as a developed guideline”

[7]. Newman defined territoriality as a combination of mental, psychological, physical, and cultural dimensions that should be maintained as a physical environment with regard to territorial reinforcement that can be conveniently accessed by the software approach [8].

Studies on currently utilized CPTED: The installation of CCTV and security lighting is the most typical current utilization method of CPTED. Studies on the policies for utilizing CPTED acknowledge the effect of existing methods but express their clear limitations.

A study on the effect of CCTV for crime prevention in Seoul reported the reduction effect on murder, rape, and theft in administrative districts whose population was larger than others. However, crimes of assaults and aggravated robbery, the main crimes discussed in this study, were not significantly reduced statistically. In particular, no crime reduction effect was found in the case of assaults, which are often regarded as an opportunistic crime. In addition, although CCTV installation had a reduction effect on theft crimes, particularly in the early days of the installation, the marginal effect gradually dropped even if the number of CCTV installations was increased, which revealed the need for other public security alternatives [9].

As another typical method, security lights can be used, and there has been a study on the regression analysis of the effect of the number of security lights on crime prevention. The study determined that the number of security lights itself has some effects on crime prevention, but no significant correlation with actual prevention was found [4].

Study on the effect of classical music on crime prevention: The proposed alternative to existing policies is listening to classical music, which can be effective and contribute to crime prevention. It is a more humanistic policy as a soft crime prevention policy, and there have been studies on the proven effect of using classical music for restraining impulsiveness with various groups for crime prevention.

A study on restraining the impulsiveness of middle school students at the development stage indicated that classical music was effective because the melodies of classical music are easy to listen to and widely liked. In addition, this study emphasized the effect of listening to classical music more than popular songs, which increased impulsiveness [10]. Another study also proved

that individual music therapy, including listening to music, had a positive impact on the impulsiveness and self-control of children from low-income families [11]. A study on the effect of music therapy on patients with schizophrenia verified that music therapy reduced anxiety and impulsiveness and improved self-control significantly [12]. A study on listening to music by military groups also revealed that music listening reduced stress and promote emotional stability and vitality through the expansion of the music environments used in the military base [13].

Case study on crime prevention utilizing classical music: There have been successful cases of crime prevention utilizing classical music.

A loitering problem of teenagers in the car park of a 7-Eleven store in Canada was resolved by using classical music [14], and aggravated robberies, assaults, and vandalism were reduced by 33%, 25%, and 37%, respectively, by utilizing music in the London Underground [15]. The crime rate was reduced by 40% when classical music was played through the speakers in West Palm Beach [16], and the loud sound of opera music or carol songs were played in the entrance of the subway in Copenhagen Denmark to prevent drug dealers and homeless people from gathering around the subway [17].

Research Approach: The data that were quantitative bases of regional and crime information were relatively recent data in 2016 provided by the public data portal in Seoul City. The data were collected and summarized according to the purpose of this study. The crime occurrences and arrest statuses in the administrative districts in Seoul were visualized using the Python analysis program based on the above data, and the administrative district that needed the new alternative policy the most was selected. After this, the results were compared and analyzed with existing crime occurrence studies based on the features of the administrative district selected as the final crime region out of all the features of Seoul City provided by the portal.

Study on Crime Region in Seoul: The data were classified into three types to investigate the crime region. First, the number of crime occurrences, the number of arrests of offenders, and the number of residents by district were used and visualized as data to select a region. Second, data about crime occurrence places and the crime motives of offenders were analyzed to determine the characteristics

of crime in the entire region of Seoul. Finally, the data were classified as population movement rate, visitors at major tourist attractions, and market status to analyze the characteristics of the crime region.

Selection of major crime regions in Seoul: Python was used as the main tool in the analysis to select a region. For the crime rate, the number of crime occurrences in each district was divided by the number of residents, and for the arrest rate of offenders, the number of crime occurrences by district was divided by the number of arrests of offenders by district to calculate the crime occurrence and arrest rates by administrative district in Seoul. The above results are shown in Figure 2, in which the number of crime occurrences with a higher rate is depicted with a darker color and the number of arrests with a lower rate is marked with smaller circles on the Google map.

map

```

Figure 2: Crime and arrest rates in Seoul with main visualization code

The code execution results showed that Jongno-gu had the highest crime rate followed by Jung-gu and Yeongdeungpo-gu, as marked in Figure 3. In the three districts, the lowest arrest rate was that of Jung-gu, followed by those of Yeongdeungpo-gu and Jongno-gu, indicating that Jung-gu needed the crime prevention policy the most.

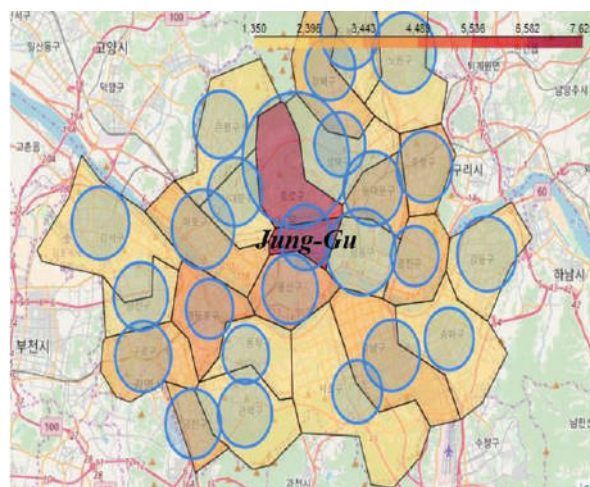

Figure 3: Visualization of crime and arrest rates in Seoul

Characteristics of crime in Seoul: The data analysis results on the crime occurrences exhibited that aggravated robberies (9,329 cases), assaults (24,535 cases), and rape (986 cases) occurred in the street, which had the most crimes in common, followed by entertainment places (2,000 cases or more), and in the case of aggravated robberies, shops were the second-most common places (4,400 cases). These data results are consistent with existing study results that the number of entertainment places is significantly correlated with the number of aggravated robberies, thefts, and assaults ^[1].

In addition, a major motive of offenders who committed serious crimes was impulsiveness, as shown in the data regarding the crime motive. The characteristics of crimes due to impulsiveness can be found in existing studies. The crimes that are committed impulsively without controlling anger properly are defined as anger/impulsive crimes ^[18], and chronicle anger (46%) was pointed out as the main motive of offenders in random street assaults that occurred in 2012 ^[19]. In addition, one of the reasons why Koreans experienced anger-related crimes was the outcome-oriented thinking and behavior of Koreans, which increased stress further ^[20]. Thus, this study proposes a preventive measure as the crimes with an impulsive motive analyzed in the above data are viewed as anger/impulsive crimes.

Regional characteristics of the major crime occurrence place: The regional characteristics of the final selected district of Jung-gu are as follows: First, it has a high floating population (around 17-18%). This is higher than any other region whose floating population was around 15% to 16%. This result is consistent with an existing study that found that the most influential factor on the five criminal offenses in Seoul was the floating population. ^[1]

Second, Jung-gu is a district that has the second-largest tourist population (3,913,660 visitors) in Seoul. This figure is larger than the number of residents (121,151 persons) by 32 times as well as the daytime moving population (442,225 persons). A previous study reported a steady increase in sexual and violent offenses, the characteristics of crimes committed by Chinese people living in Korea ^[21]. Jung-gu is one of the most-visited places by foreigners in Seoul as a tourist attraction, which could be an influencing factor of the increase in crime.

Third, the number of markets by district was analyzed, and Jung-gu had the most shops (21,876 shops) in Seoul. It had more shops than the second highest district of Jongno-gu (10,738 shops) nearly by double. This figure verifies that a place with many shops is vulnerable to crimes, as described in Section 4.2, as shops and entertainment places are crime-prone places. The high crime rate in Jung-gu is also supported by the previous study result that restaurants and accommodations in tourist cities had a high rate of crime ^[22].

Development Practices: This study provided the most recent crime status by analyzing recent one-year data in Seoul. However, it did not determine the previous status and change. In addition, this study lacked numerical accuracy due to the use of comparative analysis with general existing studies rather than technical and detailed analysis techniques to analyze the characteristics of crime. Thus, to overcome these limitations, analysis techniques that can provide more detailed figures are required and persuasive power needs to be increased through long-term studies in the future.

DISCUSSION

Jung-gu was selected as the district that required a new change after the serious crime and arrest rates were marked on the map based on the public data of Seoul. The crime motive of most crimes found in the public data was impulsivity, and, regarding the data about crime occurrence places, most thefts occurred in the streets and shops. The most common crime occurrence places for assaults and rapes were streets and entertainment places. Previous studies on CPTED in Korea have not proposed a preventive policy with regard to the detailed characteristics above. Furthermore, existing studies on CPTED have proposed measures focusing on CCTV and security right installation, as suggested in existing physical measures. However, these measures were limited as their crime prevention effects were insignificant. Thus, this study proposed playing classical music in specific areas to overcome the limitations of existing preventive measures.

CONCLUSIONS AND FUTURE WORK

This study concludes that playing classical music was appropriate as a measure to restrain impulsiveness and took various environmental variables into consideration

for crime prevention in Seoul. This study result contributes to preventive policies to overcome the limitations of existing physical policies for the prevention of various crimes, and employs the crime motive of impulsiveness, which had not been studied before in Korea. In addition, if the proposal with the new suggestion of playing classical music in Jung-gu, which is characterized by the most diverse crime occurrence in Seoul, is proven to be effective, this policy will be expanded to other districts in the future. To increase the reliability of the new proposal in this study, another analysis study is needed to continue the use of a numerically significant analysis technique, and a long-term range rather than the short-term range used in this study will be adopted to study the change in crimes in Seoul.

Effect of Action Observation of Meaningful Tasks on Upper Extremity Motor Function in Patients with Stroke

Jong-Bae Choi¹, Bo-Kyoung Song²

¹Department of Occupational Therapy, Kyung Hee University Medical Center, 23 Gynghedae-roDongdaemun-gu, Seoul, Republic of Korea; ²Department of Occupational Therapy, Kangwon National University, 346 Hwangjo-gil, Dogye-eup Samcheok-si Gangwon-do Republic of Korea

ABSTRACT

Background/Objectives: The purpose of this study was to survey the influence on action observation of meaningful tasks on upper extremity function in patients with stroke. Thirty stroke patients were prospectively randomized to an action observation of meaningful tasks (AOMT) group or action observation of simple joint movement (AOJM) group.

Method/Statistical analysis: All patients performed traditional occupational therapy and physical therapy. Both groups additionally performed action observation for 20 minute/day, 5 days/week, for 4 weeks. The AOMT group executed an action observation of meaningful tasks, AOJM group executed action observation of simple joint movement. To evaluate the effects of intervention, a Wilcoxon signed-rank test was used to contrast before- and after-intervention results in each group. The Mann-Whitney *U* test was used to contrast changes in outcome measures between the groups.

Findings: The Fugl-Meyer Assessment (FMA) before-test score in the AOMT group was 24.33±10.27 and the after-test score was 27.27±10.61. The Wolf Motor Function Test (WMFT) before-test score was 18.60±11.66 and the after-test score was 22.13±12.35. Significant changes in the FMA and WMFT were observed in the AOMT group. The mean change in FMA score was 2.93±2.63 in the AOMT group and 0.93±2.40 in the AOJM group, showing a statistically significant difference. The mean change in WMFT score was 3.53±2.90 in the AOMT group and 0.80±1.78 in the AOJM group, showing a statistically significant difference. The AOMT group showed a significant increase in upper extremity function after the intervention.

Improvements/Applications: This study demonstrated that action observation of meaningful tasks significantly improves upper limb movement in patients with stroke. We present evidence that action observation of meaningful tasks has a beneficial effect in occupational therapy for movement disorders after stroke.

Keywords: stroke, action observation, upper extremity motor function, meaningful tasks, mirror neuron system

INTRODUCTION

After stroke, patients can have severely impaired upper extremity motor function. Stroke causes upper extremity hemiplegia, especially loss of grasping ability, because of the complex modes of hand function. Furthermore, pain, muscle contracture, spasticity, and uncomfortable upper limb movement result in limb disuse, interfering with long-term functional recovery^[1,2]. Therefore, many patients develop upper extremity disorders and their ability to perform everyday life is severely limited^[3]. Therapeutic approaches to rehabilitation include a variety of physical interventions

to induce voluntary movement and more use of the affected upper extremity [4]. Neuroplasticity occurs through repetitive, voluntary movement of paralyzed upper limbs. Intervention methods after stroke are considered necessary to avoid disuse of the upper limb[5].

Action observation is an effective tool to promote motor learning. Some authors suggest that action observation and actual practice have similar motor learning effects, as they share activation of the cerebral cortex sensory-motor systems associated with motor performance[2]. Action observation of others or of a model appearing in images automatically activates the same components of the nervous system as are involved in the practical motor functions[6].

Use of the mirror neuron system (MNS) is a new recovery strategy for the upper limb of in patients withcortex infarction. When a patient observes or imitates another person’s movements, the same components of the nervous system may be activated to some extent, resulting in self-movement. The MNS has been used in research on motion and understanding of behavioral intent, speech, empathy, and social interaction since its discovery[7,8]. Neurons with mirror-like characteristics are found in both cerebral cortex areas and constitute the MNS. A system alike to that observed in monkeys has been discovered in persons. According to many neurophysiology studies, observations of object manipulation as well as direct manipulation of objects control the activity of the exercise area involved in actual practice[9].Thus, action observation training can contribute to the formation of definitive movement by providing clear and specific information about the standard operations required to perform a function [10].

In other study, patients were asked to achieve reaching tasks in a new space and achieved better after seeing a video portraying people studying to reach in the similar new space compared with those who observed the similar action in different space[11]. In a crucial study of the role of the cerebral cortex in human imitation,areas associated with the actual implementation of simple finger movements were conclusively identified during observations of the same movements made by different individuals, compared to the results with giving of space or representative signals[12]. Indeed, action observation improves motor function [13] and appears to be a dependable intervention for enhancing upper extremity movement after stroke [14]. However, action observation

tasks differ among various studies, ranging from simple joint movements to basic daily activities[3,15]. Therefore, the effect of intervention on the type of operational observation task is uncertain. This study researched the effects of action observation of meaningful tasks in stroke patients to determine their effect on upper motor function.

MATERIALS AND METHOD

Subjects: The study involved 30 participants diagnosed with cerebro vascular accident at K hospital, Seoul, Korea. These participants met the selection criteria and gave voluntary knowledgeable consent to take part in the study. The incorporation criteria were as follows: (1) age ≥19 years, (2) diagnosed with brain damage, (3) brain injury within 6 months,(4) a score of ≥24 in the Korean version of the Mini-Mental State Examination (MMSE-K) and no communication problems, and (5) absence of pain and edema in the affected hands.

The exclusion criteria were as follows: (1) cognitive impairment with MMSE score of <24, (2)serious upper extremity spasticity,(3) serious bone and joint deformity or muscle a trophy. Detailed participants individual information are described in Table 1.

Table 1: Individual information of patients

Characteristics	AOMT group (n=15)	AOJM group (n=15)
Age (y), mean ± SD	63.00 ± 10.55	63.40 ± 6.65
Sex (male/female)	7/8	6/9
Type of stroke (Hemorrhage/ Infarction)	6/9	7/8
Sideofhemiplegia (Right/Left)	5/10	7/8
Onset of stroke months, mean ± SD	3.00 ± 1.18	3.90 ± 1.28

SD: standard deviation.

AOMT: action observation of meaningful tasks, AOJM: action observation of simple joint movements.

Materials: The Fugl-Meyer Assessment-Upper Extremity(FMA)scale was used to evaluate behavior, including reflection; shoulder, elbow, wrist, and finger cooperative movements; detachment movements; and consist of 33 units. The maximum score is 66.FMA has excellent reliability and validity and is greatly suggested for post-stroke assessment of movement[16].

The Wolf Motor Function Test (WMFT) was used to assess limb movement while supplying insight into body joint and upper extremity action. This includes 15 tasks, 6 joint segment moves, and 9 integrated feature moves. The completion time was recorded and the quality of work was rated. The highest score is 5 and the total score is 75^[17].

To evaluate the effects of intervention, a Wilcoxon signed-rank test was used to contrast before- and after-intervention results in each group. The Mann-Whitney *U* test was used to contrast changes in outcome measures between the groups. Data were analyzed using SPSS Version 18.0 for Windows. Results were considered significant at *p* values <0.05.

Methods: The subjects were arbitrary separated into AOMT group (n=15) and AOJM group (n=15). Both groups accepted traditional physical therapy and occupational therapy for 30 minutes/day, 5 days/week,

for 4 weeks. In addition, the AOMT group achieved action observation of meaningful tasks and the AOJM group achieved action observation of simple joint movements for 20 minutes a day. The action observation tasks for each of the two groups were selected based on prior studies^[3]. In the action observation intervention, a video showed specific motion of upper limb movement and a whole of 10 movement videos were used for tasks by each group. All action was recorded by the same model and every action was filmed from 2 different angles (frontal plane and sagittal plane). The effect of showing behavior from different points of view is supported by recent monkey studies. The visual response of the monkey mirror neurons was recorded while presenting a film of action from different visual standpoints^[18]. Each video was approximately 2 minutes in duration. Patients in both groups were trained by the occupational therapist to pay attention and observe each task on the TV.

Table 2: Action observation tasks for each group

Action observation of meaningful tasks in the AOMT group	Action observation of simple joint movements in the AOJM group
1. Using chopsticks	1. Scapula protraction and retraction
2. Using a pencil	2. Shoulder flexion and extension
3. Using a computer mouse	3. Shoulder adduction and abduction
4. Hand washing	4. Elbow flexion and extension

6. Dressing	6. Wrist flexion and extension
7. Drinking with a water bottle	7. Wrist ulnar deviation and radial deviation
8. Grasping and release of tennis ball	8. Wrist circumduction
9. Handling of a credit card	9. Finger adduction and abduction
10. Combing hair	10. Hand grasping and release

RESULTS AND DISCUSSION

Clinical parameters before and after treatment: Upper extremity motor function in both groups before and after treatment is shown in Table 3.

The FMA before-test score in the AOMT group was 24.33±10.27 and the after-test score was 27.27±10.61. The before-test WMFT score was 18.60±11.66 and the after-test score was 22.13±12.35. Significant changes in the FMA and WMFT were observed in the AOMT group. The FMA before-test score in the AOJM group was 23.40±11.59 and the after-test score was 24.33±10.18. The before-test WMFT score was 17.20±12.17 and the after-test score was 18.00±12.02. There was no significant difference between FMA and WMFT scores in the AOJM group.

Table 3: Clinical parameters before and after treatment

	AOMT group			AOJM Group		
	Before-test	After-test	p-value	Before-test	After-test	p-value
FMA	24.33(10.27)	27.27(10.61)	<.001*	23.40(11.59)	24.33(10.18)	<.155
WMFT	18.60(11.66)	22.13(12.35)	<.000*	17.20(12.17)	18.00(12.02)	<.104

The values are means (standard deviation).

FMA: Fugl-Meyer Assessment, WMFT: Wolf Motor Function Test, *p<0.05 by Wilcoxon signed-rank test

AOMT: action observation of meaningful tasks, AOJM: action observation of simple joint movements.

Comparison of results between the AOMT and AOJM groups: The mean changes in upper extremity motor function scores in the 2 groups are compared in Table 4.

The mean change in FMA was 2.93±2.63 in the AOMT group and 0.93±2.40 in the AOJM group, showing a statistically significant difference. The mean change in WMFT was 3.53±2.90 in the AOMT group and 0.80±1.78 in the AOJM group, showing a statistically significant difference. Mean changes in the FMA and WMFT were significantly greater in the AOMT group.

Table 4: Comparison of results between the AOMT and AOJM groups

	Mean change		p-value
	AOMT group	AOJM group	
FMA	2.93(2.63)	0.93(2.40)	<.038†
WMFT	3.53(2.90)	0.80(1.78)	<.004†

The values are means (standard deviation).

FMA: Fugl-Meyer Assessment, WMFT: Wolf Motor Function Test, †p<0.05 by Mann-Whitney U test.

AOMT: action observation of meaningful tasks, AOJM: action observation of simple joint movements.

DISCUSSION

The present study demonstrated that action observation of meaningful tasks resulted in significant improvement of upper limb movement in stroke patients with established disability. This improvement was quantified using standard motor function scales. These improvements were similar to those observed when actually performing an action, but were observed in the AOJM group. Thus, action observation with previous training has an impact on neural rehabilitation exercise.

Previous studies have steadily shown that action observation is a beneficial way to study or promote movement of a particular action skill^[19]. However, the

tasks applied in action observation varied. One studies applied simple manipulation of small balls^[20], while another study targeted simple joint movements^[21]. In this research, we compared simple joint movement tasks with meaningful functional tasks using action observation. Greater improvement of upper extremity function was noted when meaningful tasks were observed. Fogassi et al. reported that the cerebral cortex is facilitated with observation of meaningful movements related to a goal rather than to simple actions^[22].

In another study, classic ballet dancers have shown greater activation of the same area while observing ballet movement rather than Capoeira movement^[23]. Similarly, the MNS was more strongly activated in professional pianists while observing a piano performance rather than musically innocuous exercises. Complementing this finding is the demonstration of the task of action observation and the MNS in learning new athletic abilities^[24]. Prior results support the findings of this study. Thus, observation of meaningful tasks, an important intervention in occupational therapy, will contribute to the promotion of upper extremity movement in stroke patients through individual motivation and activation of the motor cortex.

The limitations of this research are a little participant size and variable functional status of the brain. It is necessary to study not only the effect on motor function in stroke patients but also the effect on the motor cortex. This method occurred to be superior to that of ordinary neuro rehabilitation therapy and the effect is sustained for at least 4 weeks after intervention. The beneficial effect of treatment is performed through observation of routine meaningful tasks.

We suggest that the therapeutic effect should be improved by applying observation of everyday life to recent stroke rehabilitation treatment.

CONCLUSION

The aim of this research was to investigate the effect of upper extremity movement in response to action observation of meaningful tasks in stroke patients. This research investigated the effects in patients with early-stage stroke. Action observation of meaningful tasks is a useful way to enhance motor and sensory function in stroke patients with severe impairment of actual upper extremity movement. In conclusion, we present

proof that action observation of meaningful tasks has a beneficial effect on treatment of movement disorders after stroke.

The Case Study and Analysis of Technology through Sports and ICT Convergence in Korea

Se-Yun Kim¹, Yong-Bae Jeon¹

¹Dept. of Sport Management, DanKook University, 119, Dandae-ro, Dongnam-gu, Cheonan-si, Chungnam, KS002

ABSTRACT

Background/Objectives: This study attempted to examine the examples of the convergence of information and communication technology and sports.

Method/Statistical analysis: This study mainly focuses on secondary data such as literature review and various research reports. Research results, technology, and products through sports and ICT convergence are classified into 6 categories. Three subjects with a Ph.D. degree in related fields were verified and classified according to the criteria.

Findings: In future, taking a cue from traditional sports, esports will adopt similar revenue-generating models; smart traditional sports will adopt esports innovations, particularly in fan engagement, live streaming and the event experience; creative content will be key for successful esports sponsorships and the value of esports streaming rights will increase as Twitch and its rivals seek exclusive content.

Improvements/Applications: The next phase of the quality, volume and variety of content will increase, it will be harder and harder to cut through; to stay relevant, sports, brands and media.

Keywords: *ICT, Sports, Convergence, Esports, Big Data*

INTRODUCTION

It has been reported that the sports industry of Korea is growing due to increased leisure time from five-day work week and five-day school week, rapid growth of the leisure industry from family camping and outdoor activities, and nationwide pursuit of happiness and health in the aging society^[1]. Accordingly, with increasing interest in the sports industry, relevant industries have been combined into a single market centered on consumers. The new sports market was formed by convergence with other industries like IT. New additional services were created by combining sportswear and service, facility and service, and sports and health using IT^[2].

Especially, simulation sports based on virtual reality (VR) and augmented reality (AR) are receiving the attention^[3]. Sports and IT have converged and organically combined with the simulation industry, constantly expanding the scope. VR technology has shown rapid development, and hobbies of people are changing with the vitalization of 'screen sports'^[4]. Screen sports allow people to enjoy sports without restraints such as space, equipment, season and weather.

Looking at the pace of technology development, what would sports look like after 10 years? Paradigms of the past will definitely become useless. Would sports authorities and fans be able to adapt to such changes? The purpose of this study is to conduct a case study on technologies that are being implemented through convergence of ICT and sports and tendencies that will appear in the near future, and to provide insight for many unspecified individuals who are related to the sports industry.

Accordingly, this study aimed to examine convergence of ICT and sports. Especially, cases and trends were analyzed by classifying convergent sports

ICT into six areas: 1) VR and AR screen sports; 2) ICT and Olympic Games; 3) ICT and smart stadium; 4) big data and sports; 5) e-sports evolution; and 6) sports business models based on convergent technologies.

METHOD

This study mainly focuses on secondary data such as literature review and various research reports. Research results, technology, and products through sports and ICT convergence are classified into 6 categories. Three subjects with a Ph.D. degree in related fields were verified and classified according to the criteria.

Reviews (Sports ICT and Policy Trend in Korea)

Status of Sports ICT Industry in Korea: The global sports industry has grown by 5.27% per year from 2006 to 2017 and is predicted to show annual growth of 4% until 2020. As such, the sports industry is showing consistent growth despite the worldwide economic recession.

Gross sales of the Korean sports industry were 36.5 trillion won in 2015, which was 2.95% of GDP. The sports Industry also contributes to job creation. The job creation effect of the sports industry was found to be 14.4 (persons / billion won), even higher than the culture industry (12.4) known as a representative job-creating industry.

Also, the sports industry plays the role of a global business, which can lead to creation of jobs by pioneering new markets through convergence with other industries. Screen golf that converges sports and science created a new market of 1.7 trillion won (2015).

Nike attracted new consumers by launching Nike Plus with Apple. Nike increased its sales volume by 30% through products related to IT^[5]. Sports ICT is a scientific technology that converges sports science with other fields of study to analyze physical activities, enhance health, improve athletic performance of professional athletes and prepare the grounds for vitalization of leisure activities. Convergence of sports and ICT provides equipment that can accurately measure records of athletes, increase trust of the audience in fair judgment, and expand participation in leisure and sports activities.

In particular, the sports industry is changing with the expansion of living sports due to increase of income and interest in health. The wellness market of Korea that converges sports, ICT and medical service has size of

76 trillion won (2014), which is about 7% of GDP. This market is predicted to grow at an annual rate of 10% until 2020. Especially, the development of wearable computer, which provides body information to consumers who participate in sports activities to maintain and enhance their health, is accelerating.

The sports ICT industry is creating a new market with the expansion of leisure sports such as mountain climbing. It is especially expanding in the field of virtual sports. There are diverse areas of convergence for sports and ICT, including athletic performance measuring devices, devices helping improvement of athletic performance, devices for fair judgment and recording, and virtual sports experiences. Also, as the number of sports competitions and participants is increasing, new ICT will be developed to reduce emission of pollutants and operating expenses during construction and operation of sports facilities. In addition, smart app trainers display exercise information and path of users on a map so that users can design their own exercise courses based on desired exercise intensity and time. Indoor leisure devices based on VR (ski simulator, tennis, etc.) are also under development. The number of Korean ICT companies that can develop convergent sports ICT was 19,553 in 2015, increased by 3.7% compared to 2014 (18,854). This is only 0.54% of companies in all industries.

Policy Trend of Sports ICT in Korea: The Ministry of Science, ICT and Future Planning established the K-ICT strategy so that ICT can take a leading role in growing national economy and bring forward the core government task of 'creative economy'^[6]. By investing 9 trillion won starting in 2016, the strategy aims to accomplish 17 tasks in 4 major areas such as 8% growth of ICT, ICT production of 240 trillion won in 2020, export of 210 billion dollars, improved constitution of the ICT industry, large-scale investment in the ICT industry, finding of packaged sales channels including China and developing nations, and fostering of 9 strategic industries including the new SW industry.

In relation to sports and ICT, the Ministry of Science, ICT and Future Planning plans to invest 600 billion won until 2020 to demonstrate 5G technologies for the first time in the world at the 2018 PyeongChang Olympic Winter Games and to commercialize 5G in 2020. The reason for selecting sports as the primary sector of the K-ICT strategy is because the ICT industry of Korea is highly competent at about 90% level

compared to the United States, a nation with the world's best technologies, but Korea lacks ICT associated with sports [7]. The new industry based on wearable computer is expected to dominate new future markets.

The Ministry of Culture, Sports and Tourism announced a mid to long-term plan (2015~2019) for the promotion of the game industry, which is related to sports ICT. The plan is to foster global companies and increase size of the market by 10% a year from 10 trillion won in 2015 to 13 trillion won in 2019, increase export volume by 10% a year from 2.8 billion won in 2015 to 4 billion won in 2019, and increase the employment effect by 3% a year from 100,000 jobs in 2015 to 120,000 jobs in 2019.

Particularly, the Ministry of Culture, Sports and Tourism will create a new market by supporting R&D on sports, secure world class technologies through research on sports and scientific technologies, and foster the sports industry as a new national growth engine. The Ministry of Trade, Industry and Energy announced the regional industrial promotion plan in 2015 to invest 190.7 billion won into central businesses that can contribute to the vitalization of regional economy by creating added values and jobs. The capital area and Gangwon Province selected the sports ICT industry (sports knowledge service industry) as the primary industry^{7,8,9,10}.

To improve capability for industrial and academic innovation and increase competitiveness of regional industries by creating a groundwork for R&D through convergence of sports and ICT and supporting companies, the government invested 35 billion won into Creative Economy Innovation Center and programs connected with regional industries. Creative and convergent R&D were promoted through demand survey and Creative Economy Innovation Center.

RESULTS

Simulation sports market of Korea: The simulation sports market of Korea is estimated to be 5 trillion won in 2018. Screen golf marked the beginning of simulation sports. Screen golf was started with a machine that was imported from the United States in 1990s¹⁸. Size of the screen golf market was about 1.7 trillion won in 2015. There are about 8,000 screen golf clubs in Korea. The screen golf business of Korea is not only popular within the nation but also in various vacation sports in the world and houses of wealthy families in the Middle East. Size of the screen sports industry increased with the addition

of baseball in 2014, and the scope of screen sports is expanding. 'Football Pantage I' at Seoul World Cup Stadium is a popular online theme park that combines soccer and VR / AR technologies. VR technology was applied to the fitness area.

In addition, realistic experience VR has become an alternative for outdoor sports that are disappearing due to air pollution and irregular weather. The project on the development of sports and education convergence platform supervised by the Ministry of Culture, Sports and Tourism and Korea Sports Promotion Foundation until July 2019 is a representative example of support on indoor sports. This platform is intended to provide experience in sports and correct postures using ICT and VR technologies.

ICT and PyeongChang Olympic: The 2018 PyeongChang Olympic Winter Games embodied five ICT services. First is the world's first 5G (5th generation telecommunication). A 5G demonstration network was constructed for the first time in the world, which enabled advanced imaging service with excellent two-way, high-definition and 3D images. Realistic media were presented by developing exclusive terminal devices and using a demonstration network.

Second are convenient IoT services. Indoor spatial information, AR guide, kiosk making cheer messages by recognizing user motions, and mobile app providing information about tour courses, accommodations, restaurants and transportation were provided. Third is UHD (ultra high-definition) broadcasting, which is 4 times clearer than HD TV.

Important events such as figure 1 skating were successfully broadcasted in 4K UHD. Fourth is smart AI. An automatic interpretation and translation service was provided between Korean language and 8 other languages (English, Chinese, Japanese, French, Spanish, German, Russian and Arabic) at Olympic Stadium (guide robots) and on a mobile app (Genie Talk).

Autonomous driving vehicles were operated near Pyeongchang, and a 24-hour AI call center was operated during the Olympics period to provide information about events and traffic. Last are exciting VR services. VR experiences for ski jump, snowboard and bobsleigh simulating actual sites of the PyeongChang Olympic Games and VR roller coaster and shooting game were provided. VR game attraction and K-pop concert were also available.

5G realistic image

5G connected car

Augmented reality(AR)guide

Figure 1: ICT used during PyeongChang Olympic Winter Games

ICT and Smart Stadium

Figure 2: KT wiz and SK used Smart Stadium System

Figure 2 shows the technology applied to KT and SK Ballpark. In the SK baseball field, IOT-based parking guidance system, food and souvenir ordering and billing system are installed to enhance user convenience. IOT-based energy saving air-conditioning system has been constructed, and toilets and kiosks also provide congestion information. We also built Big Data based player motion analysis system. VR mobile live streaming service and GIGA VR baseball relay have serviced in real time.

KT Wiz is a professional baseball team with the home stadium in Suwon. KT Wiz Park started a mobile live baseball streaming service using GIGA VR in 2016. Images taken by VR cameras installed at the first base, third base and catcher’s box are combined in real time to generate videos. The audience can connect to GIGA Wi-Fi in the stadium and watch the live VR streaming on

their smartphone. Figure 2 shows the technology applied to KT and SK Ballpark.

Figure 3: MLB and iBeacon Service[9]

Figure 3 shows how the iBeacon app is implemented on the smartphone in MLB. iBeacon is providing a variety of game information and fan services to fans looking for a baseball field through Apple’s ‘Micro-location’ technology on smartphones in MLB. Visitors who

have an iPhone have access to stadium maps, barcode-stained tickets and seat location information services through smart phones. You can get virtual points on your smartphone and download coupons that are available on the team store in the arena. Figure 4 shows how the wireless system actually works in MLB. Wireless service is available in all MLB venues since 2016.

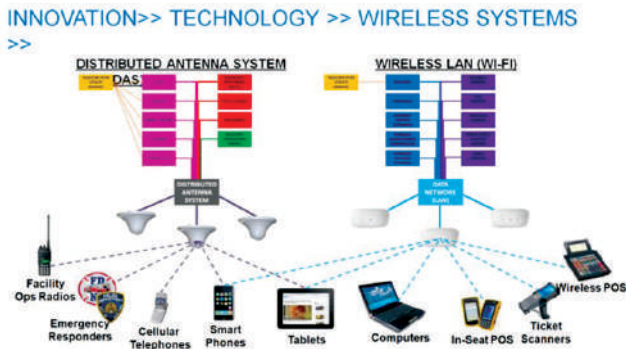

Figure 4: MLB and Wireless System[10]

Big Data and Sport

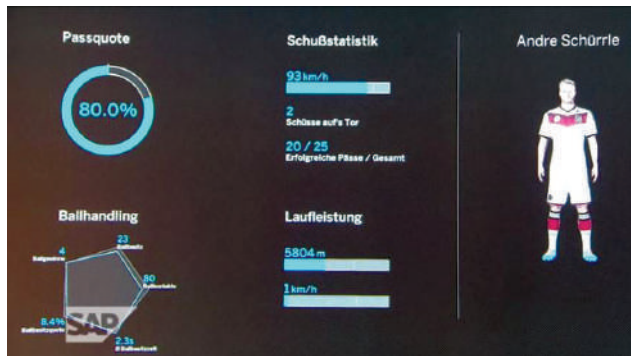

Figure 5: SAP ‘Match Insight’[11]

Figure 5 shows the actual operation of ‘Matchinsight’, which was used by the German national team who won the 2014 World Cup. ‘Matchinsight’ of SAP had an influence on winning of the 2014 World Cup by the German national soccer team. This is a representative example of big data used in sports. The German national soccer team collected and analyzed biometric information of athletes and game information in real time to make decisions on tactics and substitutions. Before this, soccer did not rely as heavily on big data as other sports. The German national soccer team used big data to collect and analyze unstructured data. In the case of baseball, the scope of analysis was limited to simple records such as batting average, earned run average and win rate in the past. Nowadays, baseball teams can measure conditions of athletes such as exercise intensity, efficiency of posture, joint angle, spin rate, speed and

heart rate, which can be applied to training. Baseball is greatly increasing the usage of big data.

Esports Evolution: Growth of e-sports in Korea was affected by the large-scale construction of high-speed internet networks after the financial crisis of Asia in 1997. There is an opinion that high unemployment rate at the time caused many people to find something to do [12]. Widespread supply of LAN gaming centers played an important role in helping growth of e-sports in Korea. Korea e-Sports Association under the Ministry of Culture, Sports and Tourism was founded in 2000 for the purpose of encouraging and regulating e-sports.

The e-sports industry showed a tremendous growth in 2010s, both in terms of the audience and prize money. Although large-scale tournaments were established prior to the 21st century, the number and size of tournaments was increased from about 106 in 2000 to about 260 in 2010.

Efforts to commercialize esports and harness its audience engagement power are intensifying, and the sector is primed for further strong growth, states the report. Games publishers are playing a more active role in building businesses around the esports scenes related to their titles. Activision Blizzard’s Overwatch League is perhaps the most prominent example of the changing approach. Blizzard has adopted familiar elements from traditional sports to create the global league: franchise teams, multiple league-wide partner brands, an exclusive media rights deal. It’s a bellwether project: many eyes are on it to see if Blizzard can build the large, global audience it is aiming for.

Sport Business Model: In future, sponsorships will become more flexible and tailored, and will include more value-in-kind; brands will seek rights holders that understand their business strategies and can align sponsorships with them; rights holders will invest more in digital content and activation capabilities, in order to engage fans, collect data and service sponsors; and, rights holders that can prove their value using data will take larger shares of the sponsorship revenue pie. The researchers examined and modeled the degree of sports and ICT convergence in various aspects, and the following conclusions were drawn. Figure 6 shows the final result of this study.

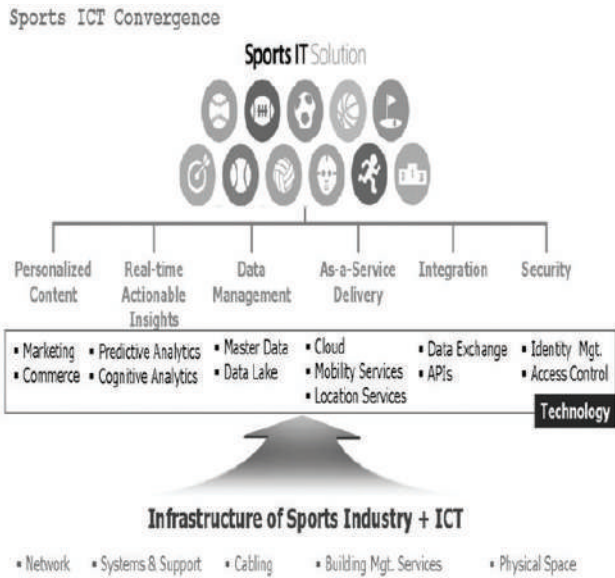

Figure 6: The results of Sports and ICT Modeling

CONCLUSION

The next phase of the quality, volume and variety of content will increase, it will be harder and harder to cut through; to stay relevant, sports, brands and media will have to experiment with new technologies such as voice activation, VR, AR and chatbots; digital media will continually give birth to new influencers and publishers, appealing to different generations and segments of the audience; and, rights holders will explore ways of monetizing the new types of content, through sponsorship and subscription products.

University, Korea; ⁴Genome-based BioITConvergence Institute, Korea; ⁵Department of Pharmaceutical Engineering and Biotechnology, Sunmoon University, Korea

ABSTRACT

Background/Objectives: To evaluate antibacterial and antioxidant activities using *Pleurotuseryngii* extracts.

Method/Statistical analysis: TPC, TFC, DPPH, and ABTS activities were examined for antioxidant effects. In order to determine the antimicrobial activity, we also studied these extracts using six multi-resistant bacteria through paper disc diffusion.

Findings: The content of total polyphenols ranged from 1.67 mg GAE/g extract in acetone extract to 1.31 mg GAE/g extract in EtOH extract. The content of total flavonoid varied from 7.77 mg CE/g extract in EtAC extract to 0.61 mg CE/g extract in EtOH extract. At the result of DPPH activities of all extracts were higher than the ascorbic acid solution. DPPH activity of EtAC extract was the highest value at 81.0%. In addition, the highest ABTS activity was observed in EtOH extract at 88.4%. DPPH activity showed a stronger correlation with TPC and TFC. EtOH extract and acetone extract showed antimicrobial activity against six microorganisms. The EtOH extracts were the most effective against *Enterobacter cloacae*, and the most significant acetone extracts were the most effective for *Escherichia coli*.

Improvements/Applications: Based on this study, *Pleurotuseryngii* can be a good candidate for natural antioxidants and antimicrobials.

Keywords: antimicrobial, antioxidant, flavonoid, *Pleurotuseryngii*, polyphenol

INTRODUCTION

Various diseases such as brain diseases, heart diseases, atherosclerosis and autoimmune diseases are increasing in humans of the modern society due to changes in diet as well as excessive stress. Additionally, the incidence rate of various cancers is increasing due to incremented use of environmental chemicals. Because there are many natural plants with intrinsic biological activities that may prevent various

oxidation reactions, studies are continuously conducted to discover natural products with antioxidant effects that maintain health and delay aging, as well as natural products with antineoplastic effects that prevent cancer; most importantly however, studies are more actively developed to especially discover biologically active substances derived from natural products^[1,2].

Plants have various antimicrobial substances including secondary metabolites or their derivatives such as alkaloids, terpenoids, quinolones, flavonoids, phenolic compounds and volatile oil^[3]. Mushrooms are generally recognized to be effective in Chinese medicine and traditional medicine, and are known to be effective in the treatment of chronic diseases by increasing the defensive system of the human body through diseases such as phagocytosis^[4]. Among the various natural products, mushrooms especially have

Corresponding Authors:

Kun-Ok Lim & Tae-Jin Oh

Professor, Department of Dental Hygiene & Department of Pharmaceutical Engineering and Biotechnology
Sunmoon University, Korea

Email: kolim139@sunmoon.ac.kr

tjoh3782@sunmoon.ac.kr

their characteristic scent and taste, and are recognized as a low-calorie food with abundant nutrients. Additionally, mushrooms contain β -glucan and are reported for their effects of preventing various diseases through their anti-neoplastic and immunostimulatory actions as well as effects of lowering cholesterol; for this reason, they are used as ingredients in functional health foods as well as in medical products, thereby increasing the annual mushroom production rate by 3~4%^[1,2,5].

The scientific name of Saesongi mushroom is *Pleurotuseryngii*. Its general name and the name of species is registered as King Oyster Mushroom, while its product name is registered as Saesongimushroom^[5]. Dried *P. eryngii* not only offer approximately 37.7% of protein content with abundant amino acids, but also contain β -glucan, polysaccharopeptides and polysaccharides such as polysaccharide-protein conjugates, Vitamin C, minerals and Vitamin B12 (treatment factor to pernicious anemia), substance not commonly seen in other mushrooms^[5,6]. *P. eryngii* have solid and excellent flesh due to the compact plectenchyma in their fruiting body and have less water content than other mushrooms, offering their value as a functional edible mushroom^[5,7]. *Pleurotostreatatus*, which belongs to the same *Pleurotus* family as *P. eryngii*, contains lovastatin and therefore lowers cholesterol, and is additionally reported to be effective in breast cancer as well as in colon cancer^[8].

This study was compared and analyze the antioxidant as well as the antimicrobial activity of *P. eryngii*, a mushroom with characteristics of a functional food product, extracted to solvents such as acetone, ethanol (EtOH) and ethyl acetate (EtAC); this was achieved by measuring not only the antioxidant activity such as the antioxidant (DPPH, 1,1-diphenyl-2-picrylhydrazyl; and ABTS, 2,2'-azino-bis (3-ethylbenzothiazoline-6-sulfonic acid) radical scavenging activity, total polyphenol contents (TPC), and total flavonoid contents (TFC) but also the antimicrobial activity against 6 multi-drug resistant bacteria.

MATERIAL AND METHOD

Materials: *P. eryngii* used in this study were purchased in a sliced form from Duriban farm (Gwangju, Korea), and were used in a powdered form after natural air drying. Aluminium(III) chloride hexahydrate, ascorbic acid, catechin, 2,2-diphenyl-1-picrylhydrazyl, 2,2'-azino-bis (3-ethylbenzothiazoline-6-sulfonic acid) diammonium salt, Folin-Ciocalteu reagent, and gallic acid used in the

antioxidant activity test were purchased from Sigma-Aldrich Co. (St. Louis, MO, USA), and extra pure reagents were used for acetone, EtOH, and EtAC. The 6 species of bacteria used for the antimicrobial assay using *P. eryngii* extracts were 3 species of Gram-positive bacteria containing *Micrococcus luteus* (KCTC1915), *Staphylococcus aureus* (KCTC1928), and *Bacillus subtilis* (KCTC1918) and 3 kinds of Gram-negative bacteria including *Pseudomonas aeruginosa* (KCTC1637), *Enterobacter cloacae* (KCTC1685), and *Escherichia coli* (KCTC2441). All bacteria were harvested from Korean Collection for Type Cultures (KCTC, Daejeon, Korea), and activated from subculture in according to each of their culture conditions.

Preparation of *P. eryngii* extracts: 400 mL of solvent were added to 50 g of powdered *P. eryngii*, which was then extracted and filtered (Advantec MFS, Tokyo, Japan) for 48 hr in room temperature. Rotary evaporator (EYELA A-1000S, Tokyo, Japan) was used to remove the solvents of the filtrate, and the concentration was set to 50 mg/mL by diluting in dimethyl sulfoxide (DMSO, Sigma-Aldrich Co., St. Louis, MO, USA). After such process, the extracts were used in the test with storage at -20°C. Solvents used for *P. eryngii* were EtAC, acetone and EtOH, which each have different polarities but allow easy removal.

TPC of *P. eryngii* extracts: The TPC was measured via chromogenic assay revealing blue color obtained from reaction between Folin-Ciocalteu reagent and phenolic compounds contained in the *P. eryngii* extracts^[9]. 45 μ L of 1 N Folin-Ciocalteu reagent (Sigma-Aldrich Co., MO, USA) were mixed to 45 μ L of *P. eryngii* extracts, and the mixture reacted at normal room temperature for 3 minutes to promote the reaction. After mixing 910 μ L of 2% Na₂CO₃, the mixture was fixed for 30 min. And then the absorbance was measured at 760 nm using a spectrophotometer (MECASYS, Daejeon, Korea). At the TPC results were presented as mg gallic acid equivalent (GAE)/g extract by drawing a calibration curve with concentration of 100.0, 50.0, 25.0, 12.5, 6.25 and 3.125 μ g/mL, using gallic acid as the standard. All results are presented as average values calculated from three series of tests.

TFC of *P. eryngii* extracts: The TFC was measured using Han's method^[10]. 1L of distilled water were added to 250 μ L of *P. eryngii* extracts, to which 75 μ L of 5% NaNO₂ was added; the mixture was then fixed for 5 min for reaction. 150 μ L of 10% AlCl₃ was added, the mixture was then fixed for additional 6 min. 500 μ L of 1.0 M NaOH were added, the remaining volume was filled

with distilled water to establish a total volume of 2 mL. The mixture was fixed for 15 mins and then measured for its absorbance at 510 nm. At the TFC results were presented as mg catechin equivalent (CE)/g extract by drawing a calibration curve with concentration of 100.0, 50.0, 25.0, 12.5, 6.25 and 3.125 µg/mL, using catechin as the standard. The results are presented as average values calculated from three series of tests.

Measurement of DPPH: The Blois method was used to measure the DPPH activity as the evaluation of antioxidant activity of *P. eryngii* extracts^[11]. 970 µL of 0.1 mM DPPH solution were added to 30 µL of the extracts. The mixture was fixed for 30 min in the darkroom and then measured for its absorbance at 517 nm. The results were presented as the mean value calculated from 3 independent experiments tests. 1 mM ascorbic acid was used as the positive control. The DPPH activity was calculated as follows:

$$\text{DPPH (\%)} = \left(1 - \frac{\text{Absorbance of solution added with reagent}}{\text{Absorbance of solution without reagent}} \right) \times 100 \dots(1)$$

Measurement of ABTS: This method of Re et al. was used after partial revision to measure the ABTS activity after partial modification^[12]. After mixing 7.4 mM ABTS diammonium salt with 2.6 mM potassium persulfate in a 1:1 ratio, the mixture was fixed for 24 hr in the darkroom to prepare the ABTS cation solution. The absorbance was then adjusted to 0.7 at 734 nm using a spectrophotometer. 30 µL of *P. eryngii* extracts was mixed with 970 µL of ABTS solution. The mixture was fixed for 30 min in the darkroom to facilitate their reaction, and its absorbance was measured at 734 nm. The results were presented as the mean value calculated from 3 independent experiments. 1 mM ascorbic acid was used as the positive control. The ABTS activity was calculated as follows:

$$\text{ABTS (\%)} = \left(1 - \frac{\text{Absorbance of solution added with reagent}}{\text{Absorbance of solution without reagent}} \right) \times 100 \dots(2)$$

Measurement of antibacterial activity: The antimicrobial activity of *P. eryngii* extracts was measured using disc diffusion method^[13]. Lysogeny Broth (LB) culture liquid medium was used for the 6 species of bacteria to be used in the study, in which the

bacteria were aerobically cultured for 24 hr at 37°C. Its absorbance was diluted to 0.1 at 600 nm and then the bacteria were smeared to the petri dish. 30 µL (1.5 mg/disc) of *P. eryngii* extracts were sprayed to the paper disc (6 mm diameter, Whatman International, MO, USA) and then the disc was cultured aerobically for 12 hr in a 37°C incubator. The diameter of the clear zone was measured using Vernier caliper (0~150 mm, color world, China), which was used to compare their antimicrobial activities. The results are presented as average values calculated from 3 independent experiments.

Statistical analysis: All the results were presented as mean ± standard deviation. SPSS 24.0 (SPSS 24.0, IL, USA) was used for statistical analysis. And Duncan's test was used for ANOVA (p <0.05). Pearson's correlation analysis was conducted to analyze the correlation among the DPPH/ABTS activity, TPC, and TFC.

RESULTS AND DISCUSSION

Extraction yield, TPC, and TFC: The extraction efficiency is affected by the chemical qualities of the biologically active substance, method of extraction, temperature, time of extraction and size of reagent molecules, as well as the solvent used for the extraction, resulting in different yield of extraction. In this study, solvents including acetone, EtOH, and EtAC were used to select efficient solvents for extraction of biologically active substances from *P. eryngii*. The yield of extracts obtained from extraction of powdered form of naturally dried *P. eryngii* using acetone, EtOH and EtAC are presented in **Table 1**. *P. eryngii* extracted using EtOH resulted in an extraction yield of 3 times and greater than that of other solvents. As it is reported that the yield of extraction generally increases in a polar solvent^[14]. It was also clear that the extracts in this study increase as the solvent polarity used for extraction increases. Similar to the study of Lin et al. that reported the yield of extraction of *P. eryngii* using EtOH^[15], this study also demonstrated a yield of 3.04 ~ 3.16%.

Table 1: Yield (%) of different solvent extracts from *P. eryngii*

	Solvent for Extraction		
	Acetone	EtOH	EtAC
Yield (%)	0.98	3.14	0.60

Polyphenol is a representative component of food-derived functional substance and is an aromatic compound with more than 2 phenolic hydroxyl, easily dissolved in water or alcohol. It is not only recognized for its antioxidant activity, but also for its anti-inflammatory, anti-thrombotic and anti-neoplastic effect^[16, 17]. Here, gallic acid was used as the standard to obtain the TPC of each *P. eryngii* extract, and its results are presented in **Table 2**. Acetone, EtAC and EtOH were used to measure the TPC of *P. eryngii* extract according to each solvent. The TPC of *P. eryngii* extracts, in the order of greatest to least, were as follows: extracts using acetone \approx EtAC > EtOH, demonstrating 1.31 ~ 1.67 mg GAE/g extract. This revealed a significant difference between acetone, EtAC extract and EtOH extract. Such results were similar to the TPC of *Lentinusedodes* reported by Han et al.^[1, 2], while the contents were less than that of *Auricularia auricula-judae* reported by Yu et al.^[18]. It has been reported by Oh et al.^[16] that the order of polyphenol contents extracted from *P. eryngii* according to each solvent was in the order of water > 50% EtOH > 99% EtOH, and that the amount of polyphenol, an antioxidant substance, differs depending on the polarity of the solvent. However, in contrast to such results, this study has revealed the lowest amount of polyphenol in EtOH extract and has demonstrated that acetone and EtAC are the most appropriate solvents for polyphenol extraction. The amount of polyphenol in *L. edodes* from the order of greatest to the least has been reported as acetone extract > EtOH extract > EtAC extract by Yu et al.^[18], while the amount in *A. auricula-judae* has been reported as EtOH extract > acetone extract > EtAC extract by Han et al.^[1, 2]. The solubility of polyphenol differs according to the location of hydroxyl group, the size of the molecule and the length of the hydrocarbon chain, and is also greatly affected by the type of solvent used in the extraction, the time of extraction and temperature; it is generally known that polyphenol is well dissolved in diverse solvents such as acetone, EtAC, EtOH, and methanol^[19]. The components of phenolic compounds contained in *P. eryngii* are reported to be phenolic acids such as p-hydroxybenzoic acid, procatechuic acid, vanillic acid, syringic acid, cinnamic acid and caffeic acid, and flavonoids such as catechin, rutin, and naringin^[20, 21]. Therefore, as demonstrated in the results of this study, the reason that the amount of polyphenol was greater in acetone and EtAC solvents than in EtOH is that the amount of polyphenol does not increase with increasing polarity of the solvent, and that the phenolic compounds

of *P. eryngii* differ in the type of compound, the degree and the quality of dissolution according to the type of extraction solvent.

Table 2: TPC & TFC of *P.eryngii* extracts

Solvent	TPC (mg GAE/g extract) ¹⁾	TFC (mg CE/g extract) ²⁾
Acetone	1.67 \pm 0.05 ^{a3)}	5.34 \pm 0.12 ^b
EtAC	1.63 \pm 0.03 ^a	7.77 \pm 0.18 ^a
EtOH	1.31 \pm 0.02 ^b	0.61 \pm 0.02 ^c

Results present the mean and \pm SD of values obtained from 3 independent experiments.

¹⁾The value is indicated in mg of gallic acid equivalent per gram of extract

²⁾The value is indicated as catechin equivalent per gram of extract.

^{3)a,b,c}Means with different letters within a column are significantly different at $p < 0.05$ using Duncan's test.

Flavonoid, which belongs to yellow polyphenol that have C6-C3-C6 as its backbone, is abundantly found in all parts of plants as well as in grains and fruits^[22]. Additionally, it is a representative food-derived functional substance with antioxidant activity as found in procyanidin and tannin^[17]. The TFC was 7.77 \pm 0.18 mg CE/g extract in EtAC extract, demonstrating a significant difference with that of acetone extract and EtOH extract; similar to the TPC, the amount was the lowest in the EtOH extract. The TPC and TFC were also the highest in EtAC extract than in acetone and EtOH extract in *L. edodes* as reported by Lee et al.^[23] Flavonoids can generally be classified according to their chemical structure into phenolic acids that have benzoic acid and cinnamic acid as its basic structure and into C6-C3-C6 structure with 2 phenyl rings. Examples of flavonoids include flavones, flavanones, flavonols, isoflavones, anthocyanins, and flavan-3-ols. Flavonoids of low polarity such as isoflavones, flavanones, and flavonols are generally well dissolved in solvents of low polarity such as chloroform, EtAC, dichloromethane, and diethyl ether, while flavonoids of high polarity such as flavonoid glycoside and aglycon are extracted to alcohol or alcohol-water mixtures. Consequently, the reason that the TFC of *P. eryngii* were highest in EtAC extract is considered to be that the amount of flavonoids of low polarity such as isoflavones, flavanones, and flavonols was greater than other flavonoids.

DPPH radical scavenging activity: DPPH activity is generally used to measure the antioxidant activity in the food and plants. Such method uses the mechanism in which DPPH, a violet soluble substance with stabilized free radical, reacts with the electron or hydrogen of the antioxidant and is reduced, resulting in a change from the violet color to a vague yellow color, as well as a decrease in the maximum absorbance at 515 ~ 520 nm^[11]. The results of measurement of DPPH activity in *P. eryngii* extracts are presented in **Figure 1**. The activity was the highest in EtAC extract as of $81.0 \pm 0.95\%$, and the activity of acetone extract and EtOH extract was each found to be $79.1 \pm 0.56\%$ and $77.4 \pm 0.33\%$, respectively. Such results demonstrated a significantly increased radical scavenging activity in comparison to the activity of $76.8 \pm 1.33\%$ in ascorbic acid used as the positive control ($p < 0.05$). Yoon et al.^[24] has reported a DPPH radical scavenging activity of 37.9% in *P. eryngii* used as the positive control in 80% EtOH extract of *P. eryngii* cultured in culture medium with sodium glutamate; in comparison with such results, the radical scavenging activity was found to be greater than 2 times in this study. Cho et al.^[25] has reported that the radical scavenging activity increases with increasing concentration in methanol and water extract, and that the DPPH activity increases in methanol, which has lower polarity than that of water. Han has reported that in the case of *Ramaria botrytis*, the DPPH activity was in the order of methanol > EtOH > acetone > EtAC, and in the case of *L. edodes*, the order was EtAC > acetone > EtOH^[10, 2]. Additionally, Han et al. has reported that the EtOH extract demonstrated a relatively highest radical scavenging activity in *A. auricula-judae*^[18]. Therefore, the order of solvents appropriate for measurement of DPPH activity of *P. eryngii* was identical to that of *L. edodes*, and the radical scavenging activity was the highest in EtAC in comparison to that of other solvents, suggesting that biologically active substances with low polarity commonly affect the antioxidant activity. Generally, phenolic compounds greatly affect the antioxidant activity; however, the TPC or the TFC do not show a direct correlation with antioxidant activity. This may be because each phenolic compound has different antioxidant activity, and because the phenolic compound itself may have low antioxidant activity despite having the highest amount of polyphenol or flavonoids. Nevertheless, a positive correlation was found between the TPC and the DPPH activity in this study.

Figure 1: DPPH activity using extracts from *P. eryngii*

1 mM ascorbic acid was used as a positive control.^{a,b,c}Means with different letters are significantly different at $p < 0.05$ using Duncan's test.

ABTS radical scavenging activity: ABTS activity, which enables rapid confirmation of antioxidant substance from natural product, can be measured by observing the change in color from turquoise to colorless appearance as the ABTS free radical formed by reaction with potassium persulfate is removed by the antioxidant contained in the extract^[26, 27]. The results of measurement of ABTS activity in *P. eryngii* extracts are presented in **Figure 2**. The activity was the highest in EtOH extract as of $88.4 \pm 0.22\%$, demonstrating a significantly increased radical scavenging activity in comparison to the activity of $62.3 \pm 0.46\%$ in ascorbic acid used as the positive control ($p < 0.05$). The activity of acetone and EtAc extract was each found to be $57.5 \pm 3.24\%$ and $23.7 \pm 2.41\%$, respectively. Consequently, the ABTS radical scavenging activity in EtOH extract was approximately greater than 3 times than that of EtAC extract. Similar to the scavenging activity of $79.4 \pm 0.5\%$ in 80% methanol extract of *P. eryngii* reported by Hong et al.^[28], it was evident in this study that the radical scavenging activity was higher in EtOH extract of high polarity. Additionally, similar to the reports that DPPH, a stabilized free radical, generally measures the antioxidant activity of hydrophobic substance, and ABTS, a cation radical, measures the antioxidant activity of both hydrophilic and hydrophobic substance^[29, 30], this study demonstrated a higher DPPH activity in EtAC extracts of low polarity, and a higher ABTS activity in EtOH extracts of rather high polarity. Furthermore, the reason that the ABTS was overall higher than DPPH in EtOH extract of *P. eryngii* is considered to be that *P. eryngii* contains more hydrophilic antioxidant substances.

Figure 2: ABTS activity using extracts from *P.eryngii*

1 mM ascorbic acid was used as a positive control. ^{a,b,c,d}Means with different letters are significantly different at $p < 0.05$ using Duncan’s test.

Correlation between the TPC/TFC and antioxidant activity: Pearson correlation analysis was conducted to investigate a relationship among antioxidant activity (DPPH and ABTS), TFC, and TPC. And its results are presented in **Table 3**. The correlation coefficient between TPC and TFC was found to be 0.869, demonstrating a strong positive correlation ($p < 0.01$). Although there was a positive correlation between TPC and DPPH as well as between TFC and DPPH (0.694 and 0.905, respectively), there was a negative correlation with ABTS (-0.748 and -0.975, respectively) ($p < 0.05$). It is generally thought that the TPC or the TFC would directly affect the antioxidant activity; however, it appears that the radical scavenging activity may be rather different according to the structural interaction among compounds, for the degree of antioxidant activity may be different in each phenolic compound, and the antioxidant activity may be affected by various biologically active substances other than phenolic compounds, such as organic acid and peptides.

Table 3: Correlation coefficient for TPC, TFC, and antioxidant activity (ABTS and DPPH) of *P.eryngii* extracts

	TPC	TFC	DPPH	ABTS
TPC	1.000	-	-	-
TFC	0.869**	1.000	-	-
DPPH	0.694*	0.905**	1.000	-
ABTS	-0.748*	-0.975**	-0.932**	1.000

* $p < 0.05$, ** $p < 0.01$.

Antibacterial activity of *P. eryngii* extracts: Paper disc diffusion, a method generally used for the measurement of antibacterial activity of plants, was used to search out the antibacterial activity of *P. eryngii* extracts against multi-drug resistant bacteria. The measurement of growth inhibition activity of *P. eryngii* extract against 6 bacteria are presented in **Table 4**. The antimicrobial activity of EtOH extract was found to be in the order of *E. cloacae* > *M. luteus* > *S. aureus* > *B. subtilis* > *P. aeruginosa*. EtAc extract did not demonstrate antimicrobial activity against *E. coli*, but demonstrated a similar antimicrobial activity against other species. On the other hand, acetone extract demonstrated the highest antibacterial activity against *E. coli*. Acetone, EtOH, and EtAc extract all showed a similar growth inhibition activity against *P. aeruginosa*. The extract showed a rather higher antimicrobial activity against *M. luteus* than in *P. aeruginosa*, among which 8.09 mm of clear zone was formed in EtOH extract. EtOH extract also demonstrated the highest antibacterial activity against *E. cloacae*. While EtOH extract and EtAc extract demonstrated no or rather weak antibacterial activity against *E. coli*, acetone extract demonstrated a high activity of 9.72 mm. The antibacterial activity against *B. subtilis* and *S. aureus* was rather high in EtOH extract than in other extracts. Consequently, excluding the fact that acetone extract was the highest in antimicrobial activity against *E. coli*, EtOH extract demonstrated the highest antibacterial activity against the remaining 5 bacteria. Although Kalyoncu et al.^[31] have reported that EtOH extract of *P. eryngii* shows antibacterial activity against *E. coli* and *S. aureus*, and none against *B. subtilis* and *E. cloacae*, this study has demonstrated antibacterial activity of EtOH extract against all 6 oral bacteria species.

Table 4: Antibacterial activities of several solvent extracts in *P.eryngii*

	Acetone	EtOH	EtAC
<i>M. luteus</i>	+	++	+
<i>S. aureus</i>	+	+	+
<i>B. subtilis</i>	+	+	+
<i>P. aeruginosa</i>	+	+	+
<i>E. cloacae</i>	+	++	+
<i>E. coli</i>	++	+	-

-, no inhibition (≤ 6 mm); +, slight inhibition (~ 8 mm); ++, moderate inhibition (~ 10 mm).

CONCLUSIONS

After natural air drying and powder preparation of *P. eryngii*, its extraction using solvents including acetone, EtOH and EtAC were measured for its antioxidant and antimicrobial activity. TPC, TFC, and DPPH/ABTS activities were examined for antioxidant activity, and paper disc method was used to observe growth inhibition for antimicrobial activity. The TPC of *P. eryngii* was significantly higher in acetone and in EtAC than in EtOH. The TFC was the highest in EtAc, followed by acetone and EtOH. The DPPH and ABTS activity was each found to be 81.0 ~ 77.4%, 88.4 ~ 23.7%, respectively. In the case of DPPH activity, all 3 extracts demonstrated a higher radical scavenging activity than in ascorbic acid, while in the case of ABTS activity, EtOH extract demonstrated a higher activity than in ascorbic acid. There was a positive correlation between the TPC and the TFC; although both contents showed a positive correlation with DPPH, the contents showed a negative correlation with ABTS. Upon measurement of antibacterial activity of *P. eryngii*, acetone extract and EtOH extract demonstrated antibacterial activity against all 6 bacteria, including *B. subtilis*, *P. aeruginosa*, *S. aureus*, *E. coli*, *M. luteus*, and *E. cloacae*, and EtAC extract demonstrated antibacterial activity against the remaining 5 bacteria excluding *E. coli*. Based on such results demonstrating antibacterial and antioxidant activity of *P. eryngii*, it is expected that *P. eryngii* may be used as ingredients in various natural antioxidants, antimicrobials and health functional foods in the future.

Effect of Horse Riding and Horse Riding Simulator Exercises on the Balance of the Elderly

Eun-Ja Kim¹, Dae-hun Kim¹

¹Department of Physical Therapy, Faculty of Health Science, Kyungdong University, Wonju-Munmak, Gangwon-do, Republico Korea

ABSTRACT

Background/Objectives: This study aims to determine the effect of horse riding and horse riding simulator exercises on the balance of the elderly.

Method/Statistical analysis: The subjects of this study were 12 male elderly who performed horse riding group 6 elderly and horse riding simulator group 6 elderly. The horse riding and horse riding simulator exercises were conducted for 30 min. twice a week for 12 weeks

Findings: The study results showed that each of the groups had a significant improvement in limit of stability, functional reach test, and time up & go test before and after the intervention. In addition, the comparison results between the groups showed that there was a significant difference in limit of stability whereas no significant difference was found in functional reach test, and time up & go test.

Improvements/Applications: Horse riding and horse riding simulator were effective in the balance of the elderly and there was a significant difference between each of the groups. However, the horse riding simulator can be done in the indoor, reduce a fall risk possibility and less economic burden. Thus horse riding simulation is accepted as more effective method as an intervention method to improve the elder balance ability.

Keywords: Horse riding, Horse riding simulator, Elderly, Balance, Simulator Exercises.

INTRODUCTION

The muscle strengthening and posture control training are very important to the prevention of fall since muscle weakening due to aging-related physical changes degrade the balance ability of the elderly, which causes a frequent fall of elderly^[1]. Simple repetitive motions that require concentration are suitable for muscle strengthening and posture control of the elderly. Based on this principle, horse riding can be one of the exercises that are suitable for the elderly^[2]. The rehabilitation through horse riding can overcome

physical and psychological disabilities and horse riding has been applied to rehabilitation treatments for various diseases such as musculoskeletal disorders, neurological disorders, and mental disorders clinically^[3]. Therapeutic riding refers to a treatment using a horse, which can be applied as a tool for various therapeutic purposes. The therapeutic horse riding has physical, emotional, social, cognitive, behavioral and educational purposes. The movements of horse can activate muscles of arms and legs as well as trunk muscles of horse riders thereby having an effect of muscle strengthening, and can help patients with cerebral palsy to develop normal motor abilities and patients with problems in the central nervous system to learn functional movements due to the normal sensorimotor stimulation. Among the sensorimotor stimuli, a vestibular input can increase balance ability by the control of the righting and equilibrium responses. In addition, the effect of the improvements on balance abilities is applied to individual patients^[4]. In therapeutic riding, trunk forward riding and backward riding

movements as well as upper extremity arms outstretched to the sides and reaching down to touch stirrups in the lower extremity are repeated. These movements can improve balance control abilities due to the activation of trunk extensor and strengthen muscle strength in the upper and lower extremities^[5]. The horse movements can generate the similar effect of normal walking exercise for horse riders as three-dimensional movements and it can input sensorimotor stimulation in the gravity direction. The characteristic of horse riding is a rehabilitation training method suitable for patients with mobility disorder^[6]. The degradation in balance abilities due to changes in physical functions in the elderly can cause a fall or mobility disorder during daily activities. As an exercise method to improve balance abilities of the elderly, horse riding can help improvements on static balance abilities for the elderly^[7]. Furthermore, horse riding can improve abilities of physical functions for the elderly whose physical functions are degraded thereby giving vitality during daily activities and preventing a fall. In this way, the therapeutic riding for improving the balance for elderly people has been training with Horse riding simulator recently. Indoor horse riding simulator can be more interesting than general equilibrium training and has the advantage of improving balance through various movements of the trunk. Balance training using an indoor horse riding simulator is more common than outdoor horse riding^[8]. The purpose of this study is to determine the effect of horse riding and horse riding simulator exercises on balance control of the elderly. This study aims to help the application of horse riding clinically by comparing the effects between the outdoor horse riding and the indoor horse riding simulator on balance abilities.

MATERIALS AND METHOD

Study Subjects Ethical Consideration: The subjects in this study were the elderly aged over 65 years. There were chosen at the Horse Riding Education Center located in Hyunnae-myunGosung-gun in Gangwon-do. A total of 12 subjects were divided into six horse riding group(HR) and six horse riding simulation group(HRS). The subjects participated in this study with voluntary consent after being fully informed about the purpose and method in this study. The selection criteria of the study subjects were those who had no orthopedic, neurological,

or medical abnormalities. Among study subjects, mean age, height, and weight of subjects in Horse riding (HR, n=6) group were 76.7±4.9 years old, 160.2±5 cm, and 68.3±8.6 kg while those of horse riding simulator (HRS, n=6) group were 75.6±3.2 years old, 162.1±4.5 cm, and 70.2±4.2 kg. All subjects were male.

Measurement Method: The subjects in the HR group rode horses bred in Jeju and trained in the Horse Riding Education Center. The subjects wore protective helmets and vests. An assistant held the reins and subjects performed a total of 30 min. exercise consisting of five min. of warm-up exercise, 20 min. of horse riding, and five min. of cool down exercise twice a week for 12 weeks. To prevent a fall, only horse walking was used. HR group program is shown in Table 1

And The HRS group used a horse simulator (S-rider, Shinwha Electron Co. Ltd, Korea) and horse riding programs of walking, slow trot, and fast trot were selected. A total of 30 min. HRS exercise was conducted as follows: five min. of warm-up exercise, 20 min. of horse riding simulator, and five min. of cool-down exercise twice a week for 12 weeks. For the assessment of balance ability of the study subjects, limit of stability (LOS) was measured using Biorescue (RM Ingenierie, France) and visual instruction was provided by the laptop screen, and the foot plate of the equipment was connected. LOS was measured by recording the maximum range at each direction in the manner of transferring the center of gravity toward the arrow on the screen. At that moment, the center of gravity was indicated by a red point. The balance ability before and after the HR and HRS exercise was assessed using functional reach test (FRT) and time up & go test (TUG). FRT was used to assess dynamic balance in standing. The subjects stood barefoot, placed their feet shoulder width apart, and held both arms parallel to the ground with the palms facing down. The subjects extended both arms to the maximum, then stretched forward as far as possible with their arms parallel to the ground and the distance moved was measured. TUG test sat in an armchair. At the start of the test, they stood up and walked 3 meters, then walked back to and sat in the armchair[Figure 1].

Table 1: HR group program

Program	Time	Horse riding contents
warm-up	10 minute	sitting on horse, using proper posture, take horse by the reins, standing in the stirrups
Horse riding	20 minute	riding forwards, riding without stirrups, riding independently, maneuvering the horse in a figure eight pattern on flat ground
warm-down	10 minute	stretching exercises

**Figure 1: HR group program**

Data Analysis: The study data were processed statistically using SPSS version 18. The normal distribution was proven by the Kolmogorov-Smirnov test. To compare changes in measured variables before and after the upper extremity training in both groups, the Wilcoxon test was conducted. The Mann-Whitney U Test was also conducted to compare differences in measured values in each group. The statistical significance level of all tests was set to $\alpha=.05$.

FINDINGS

The study results showed that HR had a significant difference in LOS, FRT, and TUG before and after the intervention, and HRS had also a significant difference in LOS, FRT, and TUG before and after the intervention. The comparison between HR and HRS groups showed that LOS had a significant difference whereas FRT and TUG had no significant difference between them [Table2].

Table 2: Comparison of LOS, FRT and TUG between groups

	Group	Pre	Post
LOS (mm2)	HR*	216.9 ± 79.0	266.2 ± 77.1†
	HRS*	218.9 ± 74.8	231.7 ± 75.1
FRT (cm)	HR*	18.8 ± 2.7	26.5 ± 2.2
	HRS*	18.5 ± 3.4	24.0 ± 5.9
TUG (secs)	HR*	13.1 ± 1.7	8.3 ± 1.2
	HRS*	13.1 ± 1.4	9.3 ± 1.9

HR: Horse riding, HRS: Horse riding simulator, LOS: Limits of stability, FRT: Functional reach test, TUG: Time up and go test, * $p<0.05$ by pair t-test, † $p<0.05$ by independent sample t-test

DISCUSSION

Therapeutic riding influences a posture control significantly due to sensorimotor stimulation through physical movements during horseback riding in the front, rear, left and right directions. In particular, the coordination of head and trunk during horseback riding can increase posture stability^[9]. In addition, it can increase muscle activity and dynamic stability of trunk thereby reducing a risk factor of fall of the elderly^[10]. Horse riding helps communication between living animal and human due to its characteristics. The movement of a horse is similar to a gait of human, which can facilitate the movement of the center of gravity in the human body and effective in improvements on balance by activating muscles around the pelvis^[11]. The horse riding simulation has an advantage of doing exercise consistently as it can attract the elderly' interest although it is a relatively low strength of exercise task. It can also be effective for the elderly to have a similar exercise amount as much as that of healthy adults^[13]. The comparison results of trunk stability exercise using balls and HRS showed that the gait capability was more improved by HRS, and FRT and TUG were also significantly different by performing HRS. The HRS was also effective in dynamic as well as static balance as it can generate an input to the motor,

visual, somatosensory, and vestibular systems. It is highly desirable for the elderly who have experienced a fall as an indoor exercise and it can improve balance ability, which is highly beneficial as a preventive exercise against falls^[13].

The center of gravity in human body is moved in various directions while performing a HRS exercise and proximal muscles are activated when a posture is controlled in the gravity direction so that the righting reflex occurs due to the central nervous system regulation. In addition, muscles around the pelvis are also activated thereby increasing the trunk stability as well as increasing the LOS^[10].

The present study had a significant difference in LOS, FRT, and TUG before and after the exercise of HRS, which indicated the effect on improvements of balance abilities for the elderly. The elderly subjects in the previous study were consistent with the HRS training parameters. These results implied that the HRS exercise which was performed in the indoor had an effect on trunk muscle activation of the elderly as it increased posture control ability by various sensorimotor stimuli. HR is suitable as one of the various intervention methods for gait and balance of those who have physically functional disabilities^[14] and it can increase coordination, range of motion of joints, balance, gross and fine motor skill, and muscle strength thereby improving increases in self-esteem, reduction in stress, psychological stability, and quality of life^[5].

It can also get a positive effect on psychological stability and increase in physical body functions, resulting in improvements on daily activity capabilities. However, HR can be a burden economically and time limitation, which can be drawbacks^[15]. However, the HRS group had a significant difference in LOS, FRT, and TUG before and after the exercise. The comparison results between the HRS and HR groups showed that there was a significant difference only in LOS. The HR exercise performed in the outdoor for the elder had more fall risk and higher economic burden. In contrast, the HRS exercise is a method of exercise intervention that can be done in the indoor and can reduce a fall risk possibility. In this regard, the HRS exercise can be more helpful as an exercise method to improve the elder balance ability.

The dementia elderly and the normal old man were improved by using the indoor horse riding machine in the

level of balance, and the balance ability was improved. Continuous exercise was helpful for the improvement of the elderly balance and also for emotional stability even with low intensity horses rehabilitation riding exercise^[16]. The elderly are more likely to engage in sport activities than younger people, but they are less likely to participate in horses rehabilitation riding activities, but they can cause interest. It also has effects on aerobic exercise and psychological stability^[17].

In addition, communication between humans and horses can reduce stress if a person is unable to maintain normal social relationships due to dysfunction. Increased postural stability and reduced stress increase the quality of life in the elderly.

The horses rehabilitation riding of the elderly has been carried out a lot in the previous studies using the indoor riding machine, but there is not enough research on the horse rehabilitation riding training in the outdoors. The horse rehabilitation riding exercise becomes an active weight-bearing exercise while maintaining posture on the horse, and the trunk muscles related to posture maintenance are activated by various sensory stimuli.

Therefore, it is effective to improve the balance ability for the fall prevention of the elderly, and it is judged that the improvement of the balance ability affects the quality of life. In this study, we did not study the quality of life after elderly riding rehabilitation training. However, improvement of equilibrium ability after riding rehabilitation training improves the quality of life by improving functional mobility.

CONCLUSION

Decreases in strength and balance due to aging cause falls. There are generally a lot of exercises to strengthen strength and balance to prevent falls. However, the general exercise is lost interest and does not exercise constantly. And the elderly prefer to exercise through hobby activities. Riding rehabilitation has many merits as an exercise method for the prevention of falls in the elderly.

The equilibrium motion and the horse riding simulation on the unstable support surface improved the static and dynamic balance ability of the horse riding simulation before and after the exercise. These results suggest that rhythmic movements on the horse are more effective in improving balance ability than balanced training in the static posture^[18].

As the elderly population increases, there is a growing interest in quality of life and the need for exercise to prevent falls is emphasized. Strengthening and balancing exercise for fall prevention are more static than dynamic exercise. Exercise using horse riding simulation is very effective for the elderly as exercise method for dynamic posture control.

In the present study, the balance improvement after HR training for the elderly was consistent with the previous studies, but the variables of improvement in physical function excluding balance were not measured in this study. In the future, it will be necessary to study various variables after HR training. The limitations of this study are a small number of subjects and more studies are needed in relation to elderly walking and psychological factors of therapeutic riding.

A Collaborative Outlier Detection Method for High Dimensional Data sets

Sarita Tripathy¹, Prasant Kumar Pattnaik², Laxman Sahoo²

¹Assistant Professor, ²Professor, School of Computer Engineering, KIIT University

ABSTRACT

In the popularization of data mining techniques there is increasing demand among the researchers and academicians to detect the ramified database of different kinds that deals with areas such as healthcare sector, insurance, banking etc. Many researchers proposed different methods which were distance based approaches, density based approaches, depth based approaches etc. but these approaches were not able to deal properly with high dimensional datasets. This paper proposes a collaborative outlier detection approach for high dimensional dataset with four phases say Normalization phase, Reduction phase, Clustering phase, and lastly Feature bagging phase. The experiment was conducted on lung Cancer dataset obtained from UCI repository and the outcomes are recorded, moreover the outcome shows that detection accuracy improves considerably and simultaneously there is decrease in the execution time by five percent.

Keywords: DBSCAN, Feature Bagging, Median MAD Normalization, Outlier, Principal Component.

INTRODUCTION

Observations which are inconsistent with the rest of the data present in the data set are known as Outliers^[1]. The outliers are the observations which have a higher integrated squared error than a threshold. The detection of this type of inconsistent data is required for many applications in real life, which includes detection of crimes, fraudulent transaction detection, intrusion detection in the network, in stock market, data analysis in hospitals, etc. The types of outliers can be classified into various classes namely: Outliers as points consisting of multidimensional data, outliers which are contextual consisting of sequence of data which are discrete and are dependency oriented, time-series etc. Attributes which are contextual and behavioral are used for defining each instance to a particular context. Outliers which are collective which does not consider individual data but a collection of data. In general any outlier detection

method^[2] creates a normal pattern and after that assigns an outlier score to the data points which is based on how much it is deviated from the pattern which is normal. Some of the models are, models based on extreme values, models based on probability, models which are linear, models based on proximity, models based on information theory, models based on high dimensional data etc. Both uni-variate and multivariate data can be checked for outlier on the basis of whether they are categorical or continuous. In data which are uni-variate, features like shape, center, distribution of data and relative position are considered. In bi-variate data use of prediction can be done by using correlation and regression, also multiple regressions can be done using multivariate data. Estimations used in statistics such as standard deviation and also the mean are highly affected due to the points which lie away from the center of the data set. Poisson and Gaussian distribution are statistical methods when applied to large data set. In this paper a collaborative method is proposed. The organization of the rest of the paper is in section 2 the review of literature is done, in section 3 the methodology is discussed, in section 4 the proposed algorithm is presented followed by experimental analysis in section 5 and finally the conclusion and future work in section 6.

REVIEW OF LITERATURE

The categorization of outlier detection methods in general can be grouped as supervised and unsupervised methodologies. The methods based on distance, density, statistical and high dimensional datasets are grouped into unsupervised outlier detection.

S. Ramaswamy, R. Rastogi, and K. Shim, proposed a method in year 2000^[3] which is based on the distance calculation function which is the most popular method. In this technique the outlierness of a data point was specified depending on its distance from k-nearest neighbour based on distance.

Similar methods were proposed in year 2002 by ^{[4],[5]}and ^[6]. The approach based on density involves the data points with varying densities as compared to the densities of data points present in the surrounding. The method of computing density was different from one another.

W. Jin, A. Tung and J. Han, proposed such type of method in the year 2006^[7] which is known as Local Outlier Factor. The degree of LOF for each data point is calculated which determines the degree of outlierness. Further he proposed a method^[8] which was similar to LOF with additional feature of taking epsilon-neighbourhood as reference. In this method MDEF known as Multi Granularity Deviation Factor was determined.

C. Aggarwal and P. S. Yu proposed ABOD in the year 2008^[9] which is very effective and stated that angles are not affected by the distance.

Zhang, M. Hutter and H. Jin proposed a method in year 2009^[10] which were based on extracting the local outlier. In this method for each data point the neighbour's in reverse order were also found.

P. Kriegel, P. Kröger, E. Schubert, A. Zimek, proposed a method LoOP in the year 2009^[11] which considered the outlierness metric as the relative distance from its neighbors. This method calculated the top-n outliers. The next category of algorithms which were independent of the distance functions were used for high Dimensional datasets.

C. Aggarwal and P. S. Yu proposed a method^[12] of outlier detection which is grid based. The dataset in this method is first divided into grids the outliers are found in these grids first.

P. Kriegel, P. Kröger, E. Schubert, A. Zimek, and proposed SOD in the year 2009^[13] in this method the outlier determined first in the subspaces. In this paper collaborative method for enhancing the outlier detection for high dimensional dataset is proposed.

A Collaborative Outlier Detection Algorithm

The proposed algorithm consists of four phases:

- i. Normalisation Phase
- ii. Dimensionality Reduction Phase
- iii. Clustering Phase
- iv. Feature Bagging Phase

Normalization Phase: In Normalization phase the dataset is normalized. The dataset used may consist of number of attributes and each attribute requires a different unit for measurement and due to this reason it is required that the dataset be normalized. For the processes such as clustering and classification it plays a significant role. The most popular method of normalization is z-score, min-max and median-MAD methods. Some of the methods studied by ^[14] Median is an estimator of location which has a highest breakdown point of 0.5. The Median Absolute Deviation has the same definition i.e. it is an estimator of scale. It is immune to sample size. Huber (1981) described MAD as the only useful ancillary estimate of scale. It is more robust than the traditional interquartile range in which the breakdown point was only 0.25. The steps of calculations of median involve at first arranging the observations in ascending order, then determine the mean rank of the statistical series and also finally determining the value which is associated with that rank. Considering a statistical series 1, 2, 2, 7, 9, 10, 10 and 1005. The formula for the average rank is $(n+1)/2$ i.e. 4.5. Therefore median is between 4th and 5th values i.e. in our example between seven and nine (i.e. eight). The MAD calculation is straight forward as median as it is nothing but median absolute deviation from median. In statistics it is considered as a variability measure of a quantitative data which is univariate. Let us consider a dataset X_1, X_2, \dots, X_n the absolute deviations of the median from the median of the data given.

The formula is: $MAD = \text{median} (|X_i - \text{median}(X)|)$

The method starts with the deviation from the median of the data, then the absolute values of the median is calculated. This measure is unaffected by the

outliers in a particular dataset than that of the standard deviation. In case of standard deviation the mean square distance is calculated this results in weighing heavily of the large deviations and thus influence of the outliers is high. On the other hand in MAD, this type of deviation is not there and acts robustly in estimating the scale than other methods like sample variance or standard deviation. This phase is the step 1 of proposed algorithm described in the subsection 3.5.

Dimensionality Reduction Phase: In Dimensionality Reduction phase the dimensions of dataset is reduced by the application of Principal Component Analysis(PCA)^[15]. In this method statistics of the data set is taken and orthogonal method of transformation is used which transforms an observation into a variable set which are then mapped with set of variables known as principal components. The number of unique observation is equal to the original number of variables or original number minus one. Out of the number of principal components obtained after applying the method the component having highest variance is the first component and each of the components followed by it has the variance with the restriction that they are orthogonal to the feature those precede the result comprising of vectors which are uncorrelated to one another on the basis of orthogonally. This method is generally a tool to explore predictive modelling. Mostly it can be used for visualizing distances which are genetically related and how the population are related. The process consists of decomposition of eigen value of correlation based matrix or decomposing of the matrix after normalization for each of the attribute in the matrix. The result is obtained generally by getting the value of weight associated with each of the original variable which is standardized and it should be multiplied with the value of the component. Also this method is used in reduction of dimension of the data-set. Dimensionality reduction of the data-set is also done using this method. Taking an instance if we keep the first two principal components it finds the components in the two dimensional plane where the distribution of high dimensional data set is the most, where as if two different directions in the data set are chosen at random, then the clusters may spread apart and most likely to overlap with one another and cannot be distinguished. Linearity is the most powerful assumption in PCA.

Considering $m \times n$ matrices, let the original recorded dataset be X and the re-represented dataset, If P is a linear transformation is represented by equation 1:

$$PX = Y(1)$$

X is transformed into Y by the help of the matrix P , which is represented as follows:

$$\begin{aligned}
 PX &= \begin{bmatrix} p_1 \\ \vdots \\ p_m \end{bmatrix} [x_1 \cdots x_n] \\
 Y &= \begin{bmatrix} p_1 \cdot x_1 & \cdots & p_1 \cdot x_n \\ \vdots & \ddots & \vdots \\ p_m \cdot x_1 & \cdots & p_m \cdot x_n \end{bmatrix} \\
 y_i &= \begin{bmatrix} p_1 \cdot x_i \\ \vdots \\ p_m \cdot x_i \end{bmatrix}
 \end{aligned}$$

Dot product of row in p and the corresponding values of X represents each coefficient of Y_i . Hence, the rows of P is a new basis vectors which represents the columns of X .

Effect of PCA on Data with Outliers: When the data set is noisy PCA is most advantageous as it is more easier if the variance spreads over the few components rather than over the whole set of components, so comparatively the noise effect becomes less as the signal-to-noise-ratio of the first few components is higher. This effect of concentrating much of the signal on the first few components can be achieved by PCA's dimensionality reduction feature the latter principal components may be dominated by noise, and so they can be discarded without great loss. This phase is the step 2 of the proposed algorithm in subsection 3.5.

Clustering Phase: In Clustering phase the clustering is applied to the preprocessed dataset. It is a density based algorithm. It forms clusters by grouping the data points which are having dense neighboring data points^[16]. Sensitivity to noise is less for DBSCAN and it can also handle datasets which are high dimensional. Core point is one which has number of surrounding points greater than the $MinPts$ in the range of points of Eps -neighbourhood. A point which is in the Eps -neighborhood of the other point and which is itself not a core point, and the third type of point as shown in fig1 is a noise point which is outside the boundary of Eps . If the count of the points present in each points Eps -neighborhood is greater than $Minpts$ then a cluster is created. This phase is the step 3 and 4 of the proposed algorithm in sub section 3.5.

Fig. I

The Feature Bagging Phase: In feature bagging phase it consists of calculation of feature bagging based outlier factor (FBBOF). It is an ensemble based method^[17,18,19]. The results depends on the Local Outlier Factor(LOF). With each iteration a randomly selected variable set with a randomly selected variable set with a randomly chosen size which is in the range of $d/2$ to d (representing the dimensionality of the input data)is taken. The scores of LOF are calculated for each of the selected data subset and FBBOF is the score which is the cumulative sum of each iteration.

Local Outlier Factor: A complex process is followed in this method to determine the value of the outlier of a datapoint.It is a density based method. It determines the value of the outlier of a datapoint. It is a density-based method. it determines the local densities of a point along with its neighboring point. The outlier degree is calculated to be the ratio of a point’s density and the average of densities of points present in nearest neighbor proposed the first method based on density, it is more advantageous, than distance based method. If a point p is there the LOF is defined for a parameter K as:

$$LOF_K(p) = \frac{\sum_{o \in K(p)} \frac{lrd_{K(o)}}{lrd_{K(p)}}}{|N_K(p)|}$$

For a point p the distance of reachability is denoted as:

$$reach_{distK}(p, o) = \max(K_{distance(o)}, dist(p, o))$$

The density of local reachability is expressed as:

$$lrdK(p) = 1 / \frac{\sum_{o \in K(p)} reach_{distK}(p, o)}{|N_K(p)|}$$

The distance of reachability for a point is represented as:

$$reach_{distK}(p, o) = \max(K_{distance(o)}, dist(p, o))$$

The difference between density of the data point and density of neighbour of data point is reflected by LOF. The distance to the nearest neighbour is considered as the neighbourhood. Higher the value of LOF means that the degree of being an outlier is higher. This phase is the step 5 and 6 of the proposed algorithm in subsection 3.5.

Proposed Algorithm

Input: Data set D.

Output: Outlier points.

Step1: The Median MAD Normalization method is applied to the dataset D

Step2: PCA is applied to the Normalizeddataset D, and low dimensional dataset l is obtained.

Step3: DBSCAN is applied to the low dimensional dataset to get the noise point’s n1.

Step4: Let the noise points be taken as cluster0 and each of the other points are taken ascluster1.

Step5: For each point in the noise set n1 calculateFBBOF.

Step6: The points having high FBBOF are added to the noise set n1and removed from cluster1.

Output: The set n1.

FINDINGS

The analysis of the experiment performed and efficiency of the algorithm which is proposed. on Lung Cancer data set was used for analysis which is obtained from the UCI repository; it has in total 32 instances and 56 attributes. The efficiency of proposed algorithm when applied to the Lung cancer dataset can be judged by the result as shown below in Table1:

Table I: Comparison of Accuracy

Algorithm	Eps	Minimum points	Accuracy
FBOD	.4	.4	0.7500
ABOD	.4	.4	0.7778
SOD	.4	.4	0.8750
Proposed Algorithm	.4	.4	0.9848

Fig. II: Graphical representation of accuracy comparison

The following table gives the comparison of execution time of the proposed algorithm with the existing algorithms:

Table II

Algorithm	Execution Time
FBOD	26.44
ABOD	23.48
SOD	36.773
Proposed Algorithm	25.05

The precision, recall and F1 score for the algorithms is obtained. We can use precision as a measure for evaluating the correctness of the algorithm, more the precision lesser is the false positive and also lesser accuracy means higher the false positive. On the other hand the recall will measure the integrity or sensitivity of the algorithm, with the increase in recall the false negative becomes lesser and as the recall decreases latter increases. The F1 score is calculated by the combination of recall and precision, more the F1 score means better is the model used.

The following metrics are used for measuring the efficiency:

$$P = \frac{TP}{TP + FP}$$

$$R = \frac{TP}{TP + FN}$$

The F1 Score is defined as:

$$F1 \text{ Score} = \frac{2 * P * R}{P + R}$$

Where P represents = Precision

R represents = Recall

TP = True Positive

FP = False Positive

FN = False Negative

The three measures for the proposed algorithm is presented in the following table. From the analysis it is clear that our proposed algorithm have higher value of F-measure which proves that it is a more efficient method.

Table II

Algorithm	P	R	F-measure
FBOD	0.5	0.5	0.5
ABOD	0.33	0.67	0.4422
SOD	1	0.66	0.7951
Proposed Algorithm	0.833	1	0.9088

The graphical representation if given in Fig-III

Fig. III: Comparison of Precision, Recall and F1 measure

The Fig-IV below represents the receiver operating curve for SOD and the Fig V which follows it represent the ROC curve of the proposed algorithm.

Fig. IV: Roc curve with SOD

Fig. V: Roc curve with Proposed Algorithm

CONCLUSION

The proposed method which uses feature bagging based outlier factor which proves to be better than the existing algorithms as the accuracy increases considerably. The median MAD technique of normalization is very much effective in obtaining accurate result as this method is robust to outliers. From the experimental analysis it is concluded that higher accuracy is obtained. The techniques such as random forest can be introduced to further improve the results which is our future work.

Knowledge Management for Youth: Skill India for Global Knowledge Economy

Sasmita Mohanty

Associate Professor, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, India

ABSTRACT

The competitive edge of developed economies in the last few decades has been driven by novel technologies starting from personal computers to internet and telecommunication. These technologies are based on knowledge and information creation and dissemination and hence the new socio-economic developments stemming from the same are referred to as knowledge revolution and have changed the nature and organisation of work and economy. In this new trend in global knowledge economy how prepared is India? Despite a demographic dividend can India compete? The focus of the paper is to throw light on the key knowledge area where Indian youth needs to be skilled for India's competitive edge in global knowledge economy.

Keywords: *Knowledge economy, Skills and Competencies, Indian Youth, Workforce preparation.*

INTRODUCTION

Global knowledge economy is defined in terms of production based on knowledge intensive activities that contribute to an accelerated pace of technological and specific advance as well as equally rapid obsolescence¹. The key resource in knowledge economy includes intellectual capabilities than physical or natural resources. The role that steel and cotton (and coal and petroleum in later phase) played in the industrial economy is now replaced by information and communication technology in the knowledge era². Hence research and development for innovation is the pivotal structure on which knowledge economy is dependent on. Consequently, the traditional linear mode of innovation is replaced by multitude fold of lateral flows of innovation in a knowledge economy³. Innovation in technology features as the most important feature of this new knowledge economy as all sectors of the economy rely on the knowledge creation, dissemination and application accelerating the contribution of service sector to the economy⁴. Daniel Bell, Friedrich Hayek, Fritz Machulp, Gary Becker and Peter Drucker are the proponents of knowledge economy and found the role of knowledge (especially theoretical) as the axial principles of society and investigated its role in human capital development, in organisations, in national economic development etc⁵⁻⁶⁻⁷⁻⁸. The rethinking of knowledge as pivotal in the rationale for KBE is based on efforts of Organisation for

Economic Cooperation and Development (OECD) and World Bank (WB) to popularise the concept in the advent of globalisation as well as percolation of information and communication technology to all aspects of economic activities^{9,10,11}.

MATERIALS AND METHOD

Promoting education and facilitating skills training for all will benefit the nations in the smooth transition to a knowledge economy. This happens in two ways. First, the nations which have high number of educated youth are fertile grounds for development of science and technology particularly knowledge-based technology¹². Secondly, an increase in education and skills level of a nation ensures a correspondent increase in economic growth¹³. Once the significance of education is established, it poses two different challenges in policy agenda for educationists. First challenge is to increase the quantity and quality of human capital in order to meet the demands of a knowledge economy. Second challenge lies in narrowing down the income disparities. The jobs today are radically different than they were few decades back. In the new knowledge based economy farm and factory jobs have been replaced greatly by white collar skilled jobs both in manufacturing and services sector the later having witnessed a large boom in the current decades. And this is true for India as well as elsewhere including the USA¹⁴. New jobs created since the

beginning of this millennium have been skewed towards white collar office employment and in knowledge jobs comparing to production or extraction jobs like farming and mining.

This paper uses an analytical structure to comprehend the World Bank rhetoric as well as that of Organisation of Economic Cooperation and Development. With a comparative framework of existing framework the paper attempts at finding the required skills for developing youth for a knowledge economy.

The World Bank in its Report on Lifelong Learning and Knowledge Economy in Developing Countries (2003) reported three reasons of skills gap for knowledge economy¹⁵. First, knowledge is being developed and applied in novel ways creating demands for novel methods for creating and disseminating information. Second, product cycles have shortened and thus need for innovation is greater than ever. Third, trades being increasingly worldwide create pressure on the producers to innovate, thus intensifying the need for skills development and up-gradation. A detailed structured analysis of existing literature, primary data from interviews with policy makers as well as secondary data of policy documents are used to reach at conclusion.

The last few decades have witnessed creation of jobs which require professional skills that might not be honed through four years college course or might require special training. Rapid growth of information and communication technology and the skills related to these require special training that need to be refreshed every now and then due to rapid obsolescence of the same technology and the replacement of new technology. There has been a debate on the skills possible remedies for the same through national policy agendas^{16,17,18&19}. The focal point of these debates reached a niche in the economic crisis after 2008.

The Knowledge Economy and India: India has an extraordinary potential to be a knowledge superpower in near future. It is endowed by a “demographic dividend” as the age structural transition is dominated by youth population. It also has pool of human capital. India also strong and substantial educated Diaspora abroad. It was in 2005 that the World Bank report on India as a knowledge economy declared that India has reached an optimum level to transit to knowledge economy since the ample work force in subsistence and non productive

sectors can be shifted and used in knowledge intensive productive sectors or even in converting non-productive sectors to knowledge intensive productive sector. The advantages that India has in knowledge sector that will help in its transition to knowledge economy are many:

First India has a huge pool of talent, an English speaking skilled workforce, especially in the sciences. It may well facilitate the international exchange of ideas, knowledge, goods and services, and capital to a greater extent^{19,20}. **Secondly** India is a democratic country with the largest democratic market in the world. **Third** India also has a large (skilled and educated) Diaspora that creates knowledge linkages and networks with a wide network of Indian doctors, engineers and scientists abroad. **Fourth**, all the institutions of a free market economy such as well developed financial sector and a dynamic private sector are present in almost all economic activities. **Fifth**, the infrastructure in science and technology is also well developed and is diversified. **Finally** in recent years there has been huge development in information and communication technology in which India has truly become a world leader in software services.

With these advantages India can become a knowledge based economy thereby improving its economic growth and social development while enhancing its competitiveness in the global market. The Planning Commission’s report on ‘India as Knowledge Superpower: Strategy for Transformation’ (2001) and ‘India Vision 2020’ seek ways to address the knowledge economy issue within India, specifically focusing on building up a guided approach for smooth transition to knowledge economy^{21,22}. However, till now in the year 2014 this transition to knowledge economy has not been achieved completely.

There are four pillars on which knowledge economy stands: a strong economic and institutional regime, a skilled and educated work force, an efficient innovation system, and a dynamic information infrastructure. To strengthen its position as a knowledge economy, India has to strengthen each of these pillars through strong reforms in these sectors. However, in this paper the second pillar has been dealt with, i.e., a skilled and educated workforce.

India has the world’s youngest work force with a median age way below that of China and OECD countries. The Registrar General and Census Commissioner of

India (RGCCI) projection of population of India show an increase of population from one billion in 2011 to 1.400 billion in 2026. In the first quarter of 21st Century the share of workers in the age group of 15 to 59 in total increase would be 83 %. India is endowed with the ‘demographic dividend’ which means that India has a higher group of working population as a portion of larger population which leads to low dependency ratio and a higher benefit to competitiveness and growth. This is in a huge advantage that India has especially considering the fact that the Western developed nations are suffering from aging population which is affecting their economic growth and productivity reversely. Half the population of India was younger than 25 in 2010. It will change to half the population being under 28 in 2030, making India a very young country for the next 20 years. By 2020 it is expected that average Indian will be 29 years old as compared to average of 37 years in China and the USA, 45 years in Europe and 48 years in Japan.

This demographic dividend that we are so proud of is expected to contribute to growth and prosperity in several ways. Principally, it will ensure adequate labour supply for carrying out growth agenda. But this is possible only with the support of a skilled and trained work force that can cater to the demands of new set of industries that are technology based especially in knowledge intensive industries. Though India will have enough manpower to fulfil its domestic needs as well as export to fill the gap created in the global market due to aging, it remains a challenge for India to impart proper training for skills development. Government of India among many proactive steps has also demarcated a few significant sectors in which skills training mechanism are to be developed at a regular basis.

The surplus of trained work force can lower the dependency ratio thereby increasing the economic output of the country only given that they are skilled enough to contribute to the knowledge intensive industries in global demands for labour force in knowledge intensive jobs²⁴. However, for reaping the benefits of demographic dividend the development processes in India must ensure workforce of a desired quality to get employment opportunity as they enter the labour force²⁵. The NSSO data for the first decade of this millennium showed a sharp decline in labour force participation among rural youth and a dormant increase in urban youth showing a delayed entry into workforce (National Sample Survey Office, 2010), However, a simultaneous

report also showed that the unemployment ratio among youth is shooting up with more open unemployment among youth than before. There is utter irony in rampant unemployment at one hand and lack of skilled personnel to serve a knowledge economy at the other, a gap that can be filled only with a conscious effort made as a part of development process to upgrade skills level of the youth. For creating a knowledge economy, it is essential to have a skilled work force to develop, generate, transfer, disseminate and apply knowledge effectively.

Figure 1: Percentage of Workers Receiving Skill Training (Country Wise)

According to a report by FICCI on skills development and training of workforce, out of twelve million workforces entering into labour market each year in India, majority are unskilled and the skill capacity is merely only four million. This means India needs to develop its skills development capacity through education to produce trained human capital. Without planned efforts towards increasing the skills training capacity, there is a threat of demographic dividend turning out to be demographic burden (Ashish Bose, 2007). For any government at the centre or in the states, it is a real challenge to absorb the vast masses of unemployed and poor- quality employable youth. This is going to affect productivity of labour and also threaten law and order. Hence there is a dire need for increasing the employability of the youth as well as create and enhance skills level for the youth through skills training. Ironically India faces the coexistence of huge unemployment along with huge skills shortage at the same time. NASSCOM-Mc Kinsey Report (2013) also is apprehensive of a huge skills shortage in future lest the training capacity is increased in both IT related and BPO related skills in India. The World Bank while projecting prospective high economic growth in countries maintains that India’s Total Factor Productivity is at a stage where it can be harnessed to give effective results for its human capital by applying its knowledge resource

(World Bank, 2003). The current century demands a current set of skills competencies which were hitherto non-existent. Fostering such skills in the institutions of higher education as well as vocational training centres is important for all countries including India. However, such an effort demands an open, flexible and creative education from basic to tertiary level. Additionally to help the citizenry continuously upgrade their existing skills level it is essential to have a strong lifelong learning system in place. India still has large dropout rates at all levels of education, about 104 million children out of school. Female participation in secondary and tertiary level is much lower. Powerful missions in the forms of total literacy campaign and girl child education have made deep impacts, however efforts need to be further made to enhance educational attainment a reality.

Figure 2: Growth in Manpower Requirement in India by 2022

Findings: What Competencies for Knowledge Economy?

In the eighties and nineties, the first wave of globalisation created demands for borderless value chains for low-skilled, low-value work while all highly skilled value activities remained within country that

the companies belonged to. For instance, companies in the USA had all high skilled and high valued jobs in USA where as low-skilled ones were outsources. Now on the contrary in the second phase of globalisation in the beginning of 21st century transnational companies operate the human resource from across the globe to retain talents especially in high valued and high skilled jobs. Territory remains redundant although the home locations of companies are used for strategy formation and coordination.

In the earlier job market training on the 3Rs (Reading, Writing and Arithmetic) along with on-the-job training was enough for a stable career for a lifetime. However in the current global economy, the additional skills required are centered on communication, creativity, divergent thinking, socializing etc. the skills gap is not so much the traditional skills as it is of training on disposition towards work, productive and responsible habits etc (along with basic knowledge of the 3Rs).

In short the skills required from youth in knowledge economy would be thinking skills (critical thinking, problem solving, creativity and innovation), communication skills (the ability to communicate easily using technology), team work and leadership skills (the interpersonal skills to work effectively and provide effective leadership to collaborative work modules, leveraging strengths of others as well as own to complete task), lifelong learning and self direction (learning continually to upgrade skills level), technology adoption and application (effective application of technology to solve problem and develop further) and finally professionalism and work ethics. Skills and human resource issues have become more important to corporate competitive advantage than ever with a focus on innovation and intellectual capital across all business sectors.

Table 1: Critical Skills for Knowledge Economy

Thinking Skills	Critical thinking, problem solving, creativity, and innovation
Communication	The ability to communicate effectively using the variety of methods and tools available in today’s environment
Teamwork and Leadership	The interpersonal skills to work effectively in a team and to provide leadership through collaboration, motivation, and leveraging the strengths of others
Lifelong Learning and Self-Direction	Continually improving one’s capabilities by taking responsibility to set goals, improve skills, and show initiative
Technology Adoption and Application	A firm foundation of technology skills including concepts and operations, selecting appropriate tools, and solving problems with appropriate technology
Professionalism and Ethics	Demonstrate personal accountability and effective work habits: punctuality, working productively with others, and time and workload management

Source: Cochran and Lekies, 2008²⁷

Tough the traditional technological knowledge along with 3Rs and on-job training is equally or even more important now than ever, it has also been supplemented with other soft skills such as social skills, interpersonal relations and divergent and creative thinking. Therefore to succeed in the workplace at an individual level these skills are the pre-requisite. However, at a national level to empower the youth the skills also need to be focused in the policy agenda to produce a skilled and talented workforce. To do so, the measurements that Indian government needs to focus on are the following:

Workforce preparation of youth: Considering these set of skills, it is easy to predict that to train these skills requires exposure to work environment. Youth programmes must include work force participation of the youth in different segment of the economy instead of youth joining workforce. There is a difference in planned youth programme providing youth with work force preparation and the youth joining the work force leaving higher studies or professional course. Yet in India, planned exposure of the youth to the workplace preparation is non-existent or extremely low. A planned work force preparation programmes across the country giving not only abstract knowledge of work but also practical hands n experience on the same can be extremely helpful in learning through contact with adults doing the job. Youth participation in work force on a leisure time basis (such as summer camp or industry attachments) is a big force in closing the skills gap as well as opportunity gap. However these programmes instead of being one-shot activity should rather be a complex web of variety of activities catering to different jobs for different development stage or aptitude.

Lifelong learning: In the knowledge economy where routine tasks are simplified to give way to more complicated tasks for completion of projects, Social skills and critical thinking are crucial. To acquire them one needs to continuously upgrade skills; one of the reasons behind lifelong learning.

Tertiary Education: Universities are the ground in which research and development is carried out for the development and dissemination of knowledge. Research and innovation are the basic foundation on which country's profile on knowledge economy stands. Hence, a modernist makeover is to be given to higher education through national policy agenda if a smooth transition to knowledge economy is to be achieved. Of particular

importance here is to be attached to mobility of students, teachers and research scholars across boundaries to facilitate smooth transfer, sharing and acquisition of knowledge among nations. Hence it is essential to showcase Indian Universities for international students. Youth in India should be encouraged to engage in research and development and perceive research as a lucrative career option.

Youth in Networked economy: Knowledge economy is based on networked economy, an economy of increased communication networks. Youth must be encouraged towards greater knowledge sharing and collaboration, partnering each other towards increased prosperity. Vocational Education and Training (VET) can work as an agenda of youth transition in a networked society. VET in schools policies are an attempt to provide pathways between schooling, training and employment.

Benchmarking for skills profiles: There must be a standardised skills benchmarking or profile of the youth in the country to regulate the skills level as well as provide support for the development for filling the gap if any. This is not just to keep track of the number of people going for skills training but also for making it easier for the youth to choose the right job in future.

Importance of Tacit Knowledge: Knowledge intensive work depend on the use of 'tacit' knowledge that resides in people's minds in the form of expertise and/ or experience, rather than being written down (or codified) in manuals, guides, lists and procedures. Hence codification of tacit knowledge into explicit readable and learnable paradigms becomes essential to the economy. Previous economy in the twentieth century saw the growth of Taylorism which was based on Fordist kind production management where the knowledge of the workers was captured in the shape of assembly line. In the knowledge economy since the reliance has increased more on the tacit knowledge, therefore codification or digitization becomes important to the economy. This encompasses translating knowledge work into working knowledge through the extraction codification and digitisation of knowledge into software prescripts and packages that can be transmitted and manipulated by others regardless of location. Youth in India therefore be trained as apprentice as part of their work force preparation.

R&D and Innovation: If India is to sustain this phase of economic development and lead the global knowledge

economy then there has to be a systematic plan to inculcate spirit of innovation in the youth. Introducing the importance of research at a young age will go a long way in bridging the gap in R&D and develop an attraction for research and innovation. At school the curriculum has to be remodelled to impart more research aptitude and innovative capability. Similar to the science experiments done in the laboratory to prove or disprove cause and effect, many different experiments and hands on experiences on other subjects can also be carried out along with positive reinforcement for students for divergent thinking on those subjects.

The paper analysed several aspects of education and skills required to excel in a knowledge economy. A highly specialized skills set based on these areas of importance for knowledge economy are prerequisites when it comes to success and competitiveness in global market. They are essentially based on areas of expertise on which Indian youth in the formal education system are not trained. It is found that preparing Indian youth for edge in global competitiveness, a new set of skills based on digitized network may be initiated. Especially effective in this rung is the importance of codification of tacit knowledge. Knowledge, that is difficult to transmit by virtue of being tacit and therefore in need of codification, needs to be focused on. This entails translation of knowledge work into working knowledge. The process through which this is done is called codification and digitization of information into software prescripts and packages. Youth in India therefore can be trained as apprentice as part of their work force preparation so that they can transmit and manipulate these codified data regardless of location.

Secondly, it is found that the need for emphasizing research and development for initiating innovation goes a long way in empowering a nation in the global competition in knowledge. Youth in India have to be aware of importance of research at an young age to be successful in this trail. School curriculums have to impart training on developing research capabilities.

It is found that there is a much lackadaisical approach in the education governing bodies when it comes to the importance of life-long-learning and importance of adapting to new challenges thrown by knowledge economy. Though in India adult education has been a part of the total literacy campaign, we have

to understand that lifelong learning goes beyond this. Work force must be prepared for any new challenge and change in the production system, through continuous learning and skills training. Therefore work place skills imparting for the unskilled and semiskilled must be part of the lifelong learning.

CONCLUSION

Knowledge codification and commodification is a norm in global economy based on competition. Hence research and development for innovation is the pivotal structure on which knowledge economy is dependent on. For innovation through research and development the youth is the main vessel through which realisation of knowledge economy is possible. However, the youth in India are yet to be exposed to any kind of workforce preparation skills development. Entrepreneurship and innovations which are stressed at the national level is yet to become a reality. Consequently the irony of unemployment and unskilled labour exists side by side to skilled unemployment. There is a huge gap between the skills level and the jobs in the market. The labour market's demand for skills remains unsatiated as the education system and skilling programmes do not cater to the existing demand in the market. The global skills web explains the discrepancy of existing skills gap and rate of unemployment among youth to be large. Matching the two to create a balance for economic development to cater to the knowledge economy would be a challenge but not an impossible one to achieve.

The youth development programmes in the country attempting to bridge the gap between skills and training are restricted to certain areas leaving large chunk of urban youth and rural unemployed behind. If India is to emerge as a global knowledge economy then it has to make way for innovation through building youth for future knowledge jobs. Increasing Knowledge workers would also increase the national potential for further development in research boosting national economy.

Surveillance of Microorganisms and Their Drug Sensitivity Patterns in Diabetic UTI Patient at a Tertiary Care Teaching Hospital

Moumita Das¹, Swayamprabha Sahoo¹, Ishwar Chandra Behera², Srikant Kumar Dhar³, Mahesh Chandra Sahu⁴

¹Research Scholar, Medical Research Laboratory, ²Professor, Department of Community Medicine, ³Professor, Department of Medicine, ⁴Assistant Professor, Medical Research Laboratory, IMS and SUM Hospital, Siksha O Anusandhan Deemed to be University, K8, Kalinga Nagar, Bhubaneswar, Odisha, India

ABSTRACT

Background: Urinary Tract Infection (UTI) is one of the common infections affecting people, both from the community and hospital. The causative pathogens for UTI and their drug sensitivity patterns vary from region to region. Changes in their genetic constituents with time might be the reason.

Aim: In this study, we aimed investigate the profile of common uropathogens and assess their antibiotic sensitivity patterns with commonly used drugs for UTI patients.

Materials and Method: In this study, 153 urine samples were analyzed with routine microscopy, culture and sensitivity for a period of six months at Institute of Medical Science and SUM Hospital, Bhubaneswar, Odisha. Both bacteria and fungi were used for drug sensitivity test.

Result: A total no. of 54 Gram positive bacteria and 40 Gram Negative bacteria were isolated. *S. aureus* was the most common GPC isolated and *P. aeruginosa* was the most common GNB. *E. coli* was the second most GNB which showed resistance to Cephalosporins and Aminicoumarin group. 4 *Candida* species were isolated, to which Clotrimazole was the most susceptible antifungal agent. *Staphylococcus* sp showed resistance to β -lactams and Macrolids group of antibiotics. *Shigella* sp showed resistance to β -lactams. *C. albicans* was found to be the common Fungi isolated, followed by *C. krusei*.

Conclusion: Since the drug sensitivity pattern changes from place to place and varies from time to time. The culture sensitivity therapy should be practiced before empirical administration of antibiotics.

INTRODUCTION

The occurrence of diabetes mellitus is at an alarmingly increasing rate all around the world and has almost become a serious health issue especially in developing countries¹. At least one diabetic patient will be found at every door.

Urinary tract infections and diabetes share an immense relationship. Urinary tract infections are one of the most common microbial disease that has been encountered in medical practice and affects people of all ages. Urinary tract infection's prevalence has been estimated, all around the world to be 150 million persons per year. Diabetic patients has higher risk of getting an UTI than non-diabetic ones².

This is because diabetes mellitus is a heterogeneous group of disorders that has been characterized by variable degrees of insulin resistance, impaired insulin secretion and increase in production of urine³. Diabetic patients encounter urinary urgency, incontinence during night, painful urination and retention of urine in the bladder, making the urinary tract most frequent infection site.

Corresponding Author:

IMS and SUM hospital, Bhubaneswar,
Email: mchsahu@gmail.com

Explanation to increased UTI in diabetic patients might be the nerve damage, caused due to high blood glucose levels, which affects the ability of the bladder to sense the presence of urine and hence allowing the urine to stay in the bladder for longer time, increasing the probability of infection. Another possible reason can be, high glucose level in urine adds to the environment for bacterial growth².

Besides, diabetic patients suffer various impairments in the immune system and poor metabolic control. This causes long term complications like Diabetic Neuropathy and Cystopathy³. In most cases microorganisms causing UTIs are multi drug resistant and are difficult to be treated. Lots and lots of money is spent each year for the treatment of such patients. But it is of no use if the antibiotics are administered empirically. Such pathogens are needed to be identified and the susceptibility is needed to be tested and then the antibiotic must be administered. Hence our aim of the study is to identify the causative organism and pattern of sensitivity to different antibiotics so that there would be specific antibiotic administered for specific organism.

MATERIALS AND METHOD

This study was carried out among outpatient department, in patient department of Diabetes and Neuro science ICU. Samples included urine and high vaginal swabs. Both male and female from 20 years of age were taken into consideration for study. Samples were taken from patients suspected to have fungal infections attending the outpatient department and obtained from in-house hospitalized patients, from both, who had no prior history of UTI as well as who were administered antibiotics (in order to study the multidrug resistance).

Bacterial isolation and identification procedures:

Isolation of uropathogens was performed by surface streak procedure on both Blood Agar and Cystine lactose electrolyte deficient agar medium and vaginal swab was streaked on Blood Agar and MacConkey Agar. The plates were studied after over night aerobic incubation at 37 degree C (BOD incubator, REMI, Mumbai, Maharashtra, India). After growth of bacteria, they are identified with culture morphology and biochemical tests of conventional methods.

Susceptibility testing: Antimicrobial susceptibility of isolates was tested for all 18 bacterial and fungal pathogens by disc diffusion method. The plates that showed growth of another colony within the inhibition zone were again isolated and identified and antimicrobial susceptibility was checked. The antibiotic discs and their concentrations were: Amikacin (AK, 30mcg), Amoxycycline (AMC, 30mcg), Azithromycin (AZM, 15mcg), Cefoperazone (CPZ, 75mcg), Cefotaxime (CTX, 30mcg), Cefuroxime (CXM, 30mcg), chloramphenicol (C, 30mcg), Ciprofloxacin (CIP, 5mcg), Clarithromycin (CLR, 15mcg), Colistin (CL, 10mcg), CoTrimoxazole (COT, 25mcg), Gentamycin (GEN, 10mcg), Levofloxacin (LE, 5mcg), Linezolid (Lz, 30mcg), moxifloxacin (MO, 5mcg), Nalidixic acid (Na, 30mcg), Norfloxacin (Nx, 10mcg), ofloxacin (Of, 5mcg), Oxacillin (OX, 1mcg), Penicillin-G (P, 10units), Novobiocin (NV, 5mcg), Tetracycline (Te, 30mcg), Tigecycline (TGC, 15mcg). All the antimicrobials used for study were obtained from Himedia. A standard inoculum was made by inoculation single colony in 2ml nutrient broth, after 3 hrs of incubation, spreaded on Muller-Hinton agar (Himedia); antibiotic discs were dispensed after drying the plate for 3-5 minutes and incubated at 37 degree C overnight. Antifungal susceptibility was also tested. The antifungal discs and their concentrations were – Clotrimazole (CC, 10 mcg), Miconazole (MIC, 30 mcg), Ketoconazole (KT, 10 mcg), Itraconazole (IT 10 mcg), Nystatin (NS 50 mg), Fluconazole (FLC 10 mcg), Amphotericin-B (AP 20 mcg). All the antimicrobials used for study were obtained from Himedia. A standard inoculum was made by inoculation single colony in 2ml nutrient broth, after 3 hrs of incubation, spreaded on Muller-Hinton agar (Himedia); antibiotic discs were dispensed after drying the plate for 3-5 minutes and incubated at 37 degree C overnight.

RESULTS

A total of 153 samples were received, out of which 137 were urine and 16 were high vaginal swabs. Among which 57.51% showed growth and 42.48% did not show any growth. Out of all 153 samples 56.86% were female patients and 43.13% were male patients (Table 1). The samples received from patients aged – 21 to 88 years. Culture positivity was seen mostly from age 21-70, but higher culture rate was seen in 51-70 (53.33%) (Table 2).

Table 1: Age and sex distribution of patients that showed maximum growth

Sl. No.	Age Group	No of Male Patients	No of Female Patients	Organism
1	21-30	4 (21.05 %)	15(78.94%)	12
2	31-40	8 (32%)	17(68%)	19
3	41-50	13 (46.42%)	15(53.57%)	16
4	51-60	19 (42.22%)	26(57.77%)	24
5	61-70	13 (52%)	12 (48%)	11
6	71-80	5 (71.42%)	2(28.57%)	4
7	81-90	4 (100%)	0	2
Total		66	87	116

Patients from age 21-90 years were taken under consideration, including male and female patients . It was observed that patients of 50-60 years of age showed more growth ,followed by patients aged 31-40 years and 41-50 years aged people. Patients aged 81-90 years showed least growth. Hence , patients between 31-60 years suffered more from infection.

Table 2: Total no of clinical samples cultured for the study

Sl. No.	Sample Type	No. of Sample	Sample Showed Growth	Sample Showed No Growth
1	URINE	137(89.54%)	74(54.01%)	63(45.98%)
2	H.V.SWAB	16(10.45%)	14(87.5%)	2(12.5%)
	TOTAL	153	88(57.51%)	65(42.48%)

The samples received included Urine and High Vaginal Swabs.89.54% of samples were Urine and 10.45% were High Vaginal Swabs. Among 89.54% of urine samples , 54.01% showed growth and 45.98% sowed no growth. Among 10.45% of High Vaginal Swabs, 87.5% showed growth and 12.5% showed no growth.

47.71% samples were from IPD, 35.94% were from NSICU and 16.33% were from OPD.15.90% showed multiple infection ie., more than one organism were found(Table 3). Total of 18 isolates were found including Bacteria and Fungus. (table 4).

Table 3: Organism isolated from Urine and High vaginal swab culture

Sl. No.	Types of Organisms	Frequency	%
1.	Candida albicans	12	10.34
2.	Candida glabrata	2	1.72
3.	Candida krusei	4	3.44
4.	Candida tropicalis	2	1.72
5.	Citrobacter sp	1	0.86
6.	CONS	4	3.44

4.	Candida tropicalis	50%	60%	100%	100%	100%	100%	100%

DISCUSSION

In this study 61.43% of samples showed growth. Among which 45.28% were gram positive, 38.67% was gram negative, 18.86% was found to be *candida* and 6.6% was found to be GPB. *Staphylococcus* and *Enterococcus* was found to be predominant, and showing resistance mostly to beta lactams and cephalosporins group of antibiotics. Among gram negative bacteria, *Pseudomonas* sp and *shigella* sp were predominant and showed resistance to carbapenems, macrolids and oxazolidinones group of antibiotics. *C.albicans* was predominant which was resistance to Ketozazole and Amphotericin -B.

Despite the wide spread availability of antibiotics, urinary tract infection (UTI) remains the most common bacterial infection in human population⁴. The risk of developing infection in diabetes is higher due to abnormalities in the host defence and high glucose in urine⁵. *E.coli* was the predominant isolate in significant

bacteriuria. *E.coli* was followed by *Klebsiella pneumoniae*, as a common isolate in our study. Whereas CONS were the majority isolates⁵. *E.coli* were the predominant 10 (31.25%) isolates causing UTI, followed by *Staphylococcus aureus* -8 (25%), *Pseudomonas aeruginosa*-5 (15.62%), *Proteus mirabilis* -5 (15.62%), *Klebsiella pneumoniae* -2 (6.25%) and *Serratia marcescens* - 2 (6.25%)⁶ *E.coli* was chief isolate accounting 56.7% followed by *K. pneumoniae* as 21.62% and others among total isolates in diabetics⁷The isolation rate of *E. coli* from urine culture was higher (64.6 per cent) among diabetic patients followed by *Klebsiella pneumoniae* (12.1 per cent) and *Enterococcus* (9.9 %) ⁸. The bacteria isolates were; Coagulase negative Staphylococci (CNS) (37.5%), *E.coli* (24%), *Klebsiella pneumoniae* (12.5%), *Staphylococcus aureus* (15%) and *Streptococcus* sp (10%) (Joseph Aje et al). *Escherichia coli* was the predominant uropathogen followed by *Klebsiella pneumoniae* and they were together involved in 76.2% of UTI cases² *Escherichia coli*

was the most common isolated bacterial uropathogen followed by *Enterococcus faecalis*, *Staphylococcus saprophyticus* and *Pseudomonas aeruginosa*⁹. *E. coli* is the most common organism. Organism responsible for the hospital acquired infection may have tendency to develop multiple drug resistance¹⁰. The six overall most common isolates were: *Escherichia coli*, accounting for 47% of isolates in both hospitals, followed by *Candida* spp. (10.8%), *Klebsiella pneumoniae* (9.6%), *Streptococcus agalactiae* (GBS; 9.5%), *Enterococcus faecalis* (4.2%) and *Pseudomonas aeruginosa* (4.1%)¹¹. The most common bacterial isolate was found to be *E. coli* (45.7%, 1103/2412), which was followed by Coagulase-negative Staphylococci (18.6%, 449/2412) and *Klebsiella* species (8.3%, 199/2412)¹². The most common organism isolated was *Klebsiella pneumoniae* at 42.4%. Gram-negative bacilli made up about 23 (69.7%) of the isolates¹³. Commonly recovered UTI isolates were *E. coli*, *K. pneumoniae*, *Pseudomonas sp* and *S. aureus*¹⁴. *E. coli* was the commonest isolated uropathogen followed by coagulase-negative *Staphylococci*¹.

CONCLUSION

UTIs are prevalent among diabetic patients due to their weak immune system and excess sugar in urine. Ignorance of risk factors and empirical use of drug leads to antibiotic resistance. The susceptibility patterns as seen in this study tend to suggest that it is absolutely necessary to obtain sensitivity reports before initiation of antibiotic therapy in cases of suspected urinary tract infection (UTI). This paper opines that the ultimate decision to use a particular antimicrobial against UTIs depends on culture susceptibility otherwise it became toxic/resistant. Hence, the empirical therapy should be eliminated and drugs should be administered only after Antibiotic Sensitivity Test.

Assessment of Degree of Collaboration to “Airway Foreign Body” Indian Literature through Bibliometric Snapshot

Manoj Mishra¹, Santosh K Swain², Swayamprabha Sahoo³, Mahesh C Sahu⁴

¹Central Library, ²Department of Otorhinolaryngology, ³Research scholar, Medical Research Laboratory,

⁴Assistant Professor, Medical Research Laboratory, IMS and SUM hospital, Siksha “O” Anusandhan Deemed to be University, K8, Kalinganagar, Bhubaneswar, Odisha, India

ABSTRACTS

Background: The foreign body reaction composed of macrophages and foreign body giant cells is the end-stage response of the inflammatory and wound healing responses following implantation of a medical device, prosthesis, or biomaterial. This study is attempted on all papers published on foreign body in Scopus index journals.

Materials and Method: In this retrospective study, the publication trend, citation trends for top articles, distributions of journals and Scopus categories were analyzed. Five bibliometric indicators including total articles, independent articles, collaborative articles, first author articles, and corresponding author articles were applied to compare publications between countries and institutions. All the data and information were retrieved from the SCOPUS data base on 27 October 2017 for a period of 2007 to 2016.

Results: The number of article in first author is very less as compared to the article with multi authorship. With T test, it is revealed that open access articles are less published as compared to the closed access article, which is considered to be very statistically significant at $P=0.0073$. It is observed that the top 10 authors published 17% of total documents and other 150 authors published the rest 83% documents. It is found that 45.5% of total documents were published in top 15 journals and the rest 67 journals published 55% documents.

Conclusions: FBs in the ear and nose were found more frequently in children, and the throat was the most common site of FBs in adults and elderly people. Most of the nasal and aural FBs can be easily removed in the ER or OPD. Parents/caretaker should not allow children to play with coins or other small objects to prevent the risk of FB ingestion or insertion. The research on FB should be carried out in larger amount to solve the problem for intake of FB.

Keywords: Foreign body reaction, bibliometric, Scopus, Foreign body giant cells

INTRODUCTIONS

A foreign body (FB) is any object in a region that is not meant to be, where it can cause harm by its mere presence if immediate medical attention is not sought¹. It can be found in the ear, nose, and throat (ENT) region. FB may be classified as animate (living) and inanimate

(nonliving). The inanimate FBs can further be classified as organic or inorganic and hygroscopic (hydrophilic) or non-hygroscopic (hydrophobic)². The presence of FBs in the ENT region is one of the most common causes of Otolaryngology emergencies. FBs can be introduced spontaneously or accidentally in both adults and children. Generally, FBs are more common in younger children; this may be due to various factors such as curiosity to explore orifices, imitation, boredom, playing, mental retardation, insanity, and attention deficit hyperactivity disorder, along with availability of the objects and absence of watchful caregivers³.

MATERIALS AND METHODV

Data used in this retrospective study were retrieved from the Scopus database, the online version of the Scopus databases 7th-10th December 2017. The database was searched under the keywords “Foreign Body” in terms of topic (title, abstract, author keywords, and Key Words Plus) within the publication year with a limit of 2007 to 2016. Key Words Plus supplied additional search terms extracted from the titles of articles cited by authors in their bibliographies, database, and substantially augmented title-word and author-keyword indexing⁴. Non-article-type documents such as reviews, meeting abstracts, editorial materials, proceedings papers, letters, book chapters, news items, corrections, and notes were excluded. The final filter was the front page, in which only the articles having the search keywords in their first page including article title, abstract, and author keywords were retained⁵. The impact factor of a journal was based on the Journal Citation Report 2012. The number of citations of an article in a single year, for example 2012, was referred to as the C2012 and the total number of citations since publication to 2012 was referred to as the TC2012^{6,7}. The collaboration type was determined by the addresses of the authors. Collaboration could

be classified as either a single-country article, in which all authors’ addresses were from the same country, or an international collaborative article, which was co-authored by researchers from multiple countries⁸. The records were downloaded and reorganized using Microsoft Excel 2010. In the SCOPUS database, the corresponding author was designated as the “reprint” author; this study instead used the term “corresponding author”. In a single author article where authorship was unspecified, the single author was both first author and corresponding author. Similarly, for a single institution article, the institution was classified as the first author’s institution and the corresponding author’s institution.

RESULTS

All articles published in scopus data base from the year 2007 to 2016 were analyzed and it was revealed that the number of publications increases year to year and in the year 2015 the highest number of publications published (Table 1). With T test, it is revealed that open access articles are less published as compared to the closed access article, which is considered to be very statistically significant at P=0.0073.

Table 1: Year wise distribution of documents with open Access

Year	Number of document	Percentage	Open Access document	Closed Access document	Percentage
2007	4	2.60	1	3	25.00
2008	7	4.55	2	5	28.57
2009	7	4.55	0	7	0.00
2010	16	10.39	6	10	37.50
2011	16	10.39	4	12	25.00
2012	19	12.34	5	14	26.32
2013	14	9.09	5	9	35.71
2014	21	13.64	7	14	33.33
2015	33	21.43	8	25	24.24
2016	17	11.04	7	10	41.18
Total	154	100.00	45	109	29.22

Table 2: Distribution of published documents with Authorship pattern

Year	Single Author	Double Author	Triple Author	Four Author	Five Author	More than Five Author	Grand Total
2007	0	0	0	4	0	0	4
2008	0	1	3	1	1	1	7
2009	0	1	2	2	2	0	7

Conted...

2010	3	0	2	6	1	4	16
2011	0	3	5	6	2	0	16
2012	0	1	3	9	2	4	19
2013	3	3	3	3	0	2	14
2014	0	3	5	6	2	5	21
2015	2	6	4	13	6	2	33
2016	3	1	2	6	3	2	17
Total	11	19	29	56	19	20	154

Similarly, the number of author in published article were analyzed and it is found that as compare to single author the multi author papers are more. Among 154 articles 11 articles are published with single author, 19 articles are published with double author, similarly triple author articles are 29 and other articles are also documented (Table 2).

Fig. 1

With Anova results, it is revealed that there is a significant difference in the authors participated for publishing articles at P=0.0003.

It is observed that the top 10 authors published 17% of total documents and other 150 authors published the rest 83% documents (Table 3).

53 journals published one document each	53	34.42	65.58
Total number of journals = 82	154	100.00	100.00

It is found that 45.5% of total documents were published in top 15 journals and the rest 67 journals published 55% documents.

Degree of collaboration: Degree of collaboration is a measurement of the prominent area of inquiry in

scientific studies indicating the trend in patterns of single and joint authorship. It is examined in this study of the Indian publications on Airway Foreign Body during this ten year period, as shown in Table-6. The degree of collaboration "C" is 0.93 which means there is less work of single authors in comparison to the multiple authors.

Table 6: Degree of Collaboration

Year	Single Author Paper N _s	Multiple Author Paper N _M	N _M + N _S	Degree of Collaboration (C)
2007	0	4	4	1.00
2008	0	7	7	1.00
2009	0	7	7	1.00
2010	3	13	16	0.81
2011	0	16	16	1.00
2012	0	19	19	1.00
2013	3	11	14	0.79
2014	0	21	21	1.00

The extent of collaboration in research can be measured with the help of the formula:

$$C = \frac{N_M}{N_M + N_S}$$

Where, C= Degree of Collaboration

N_M = Number of multiple authors

N_S = Number of single authors

In ten year study, a total number of 154 papers were published in India and indexed in SCOPUS database. The number of authors was varied from article to article. A comparative study between single author and more than one author was taken and it was found that statistically significant at two tailed p – value where p = 0.000068 in t test (Table 6).

Table 7: Documents published in different subjects

Name of the Subject	Document	Percent
Medicine	148	85.06
Biochemistry, Genetics and Molecular Biology	10	5.75
Pharmacology, Toxicology and Pharmaceutics	9	5.17
Environmental Science, Nursing, Veterinary, Social Science	4	2.30
Dentistry	3	1.72
Total	174	100.00

The total documents published and indexed in Scopus database are distributed in different subjects.

medicine is the macro subject and other four subjects are micro subjects (Table 7).

DISCUSSION

Adults and older children usually give a history of FB lodgment in ENT. But younger children are brought to the clinic by anxious parents or relatives. FBs may vary widely in shape, size, and composition, and the symptoms may range from asymptomatic to acute life threatening condition. In our study, the most common age group affected was age < 10 years, similar to results found in many other studies⁹⁻¹³. This may be due to the tendency of young children to lodge objects into the natural orifices of body, accidentally or intentionally. The ear was the most common site for FBs in young children, who not only insert objects in their ears but also into the ears of their siblings and friends. Common ear FBs include cotton wool, bean, bead, paper/plastic, eraser, insect, paddy seed, and popcorn kernel. Patients usually present with earache, aural fullness, or ear discharge. Occasionally it may be asymptomatic and found incidentally during routine otoscopic examination. A high incidence of living FBs (i.e., ticks) in our study is explained by the fact that the people in the villages of Chitwan go to the jungle to collect fodder and graze cattle. Many people get ticks in the ear when they go for jungle safari, as Chitwan is a famous tourist destination in our country and attracts both domestic and international tourists. Examination under a microscope helps to confirm the presence of FB in the ear and aids in its removal under intravenous sedation/GA to minimize trauma to the tympanic membrane and external auditory canal. It is useful especially in children who are

not cooperative to allow proper otoscopic examination when there is associated otitis externa. Ear syringing led to successful removal of most of the non-hygroscopic FBs. Negative pressure suctioning can be useful especially when there is aural or nasal discharge along with the FB. Our study showed that there is predominance of FBs in the nose in younger children, which was seen in many other studies.^{1,3,12} Unilateral, foul-smelling, purulent nasal discharge in children must be regarded as due to FB until proved otherwise. With growth and cognitive development, the introduction of FB in the nostrils diminishes significantly, which is found only in patients with psychiatric disorders. FB in the nose or ear is usually unilateral, although it can be bilateral, as in one of our patient with FB grams in both nasal cavities and another case of FB erasers in both the external auditory canals. Sometimes there can be multiple ear or nose FBs as well. FB ingestion is a common problem. The most frequently swallowed FBs in children include coins and metallic FBs (parts of playing objects), and meat bones (chicken bone/fish bone/mutton/buffalo meat) are common in adults and elderly patients^{13,14}. Heavy consumption of alcohol and eating meat simultaneously, especially during festivals, along with poor mastication may be the cause for meat bone/bolus impaction in adults. In elderly, edentulous patients, defective peristalsis due to age-related neuromuscular in coordination and poor masticating habits are the predisposing factors for the cause of impaction of meat bone/bolus in the esophagus. Moreover, in elderly people there are commonly other underlying pathologies that cause narrowing of the digestive tract. Coin was the most common FB in the throat in children in our study, which is similar to other studies.^{12,14}

CONCLUSION

FBs in the ear and nose were found more frequently in children, and the throat was the most common site of FBs in adults and elderly people. Most of the nasal and aural FBs can be easily removed in the ER or OPD. Parents/caretaker should not allow children to play with coins or other small objects to prevent the risk of FB ingestion or insertion.

ABSTRACT

Objectives: The statistics undoubtedly indicates that the nursing staff comprises the majority among the medical professionals. Nurses' workload and their work have been challenged. The aim of the study is to examine the relationship of various stress indices and selected background variables with perceived stress level of beginner CCU nurses.

Method: The investigation was carried out in critical Care Unit (I.C.U) of selected multi-specialty hospitals in Bhubaneswar during the period November 2015. I.C.U nursing stress scale was used to assess stress factors.

Results: The demographic profile of the CCU Nurses showed that the large group of the studied sample (51%) were ≤ 25 years of age, around (61%) of nurses were single. Distribution of nurses according to their exposure to ICU stress factors illustrated that (38% and 27 %) of nurses were suffering from severe stress and moderate stress respectively regarding thinking on direct patient care, and (26 % and 34 %) of nurses were suffering from severe stress and moderate stress respectively regarding inadequate knowledge and skill. Regarding lack of support, it was found that (22 % and 27%) of nurses were suffering from severe stress and moderate stress respectively. The regression model proved that level of stress was more dependent on "management of the unit" and less dependent on "interpersonal conflict".

Conclusion: The present study has been helpful in understanding the contribution of various dimensions of stress and selected professional variables towards perceived stress level of ICU nurses. This study will orient about different components of stressors for which we could check turn over and absenteeism of nurses.

Keywords: Dimensions of stress, professional variables, perceived level of stress, ICU nurses

INTRODUCTION

In modern hospitals the nursing care of critically ill patient in an intensive care unit (ICU) differs from a general hospital ward in many respects: the staff/patient ratio is larger, there is a great deal of multifarious electronic equipment, more vital therapeutic treatments are followed and morbidity and mortality are higher.

However, studies indirectly pointed out that critically ill patient as frustrating to look after. This is relevant because these patients are expensive to take care of and become very taxing to nurses and doctors¹. Elevated stress level occurs from the unvarying anticipation that critically ill patients will deteriorate in connection with the complication of care. This complication is intrinsic in the developed hi-tech application of the ICU². As a result, professionals who are capable to recognize which reasons aggravate stress, they can build up plans to deal with what these reasons and accordingly develop their worth of life and of work³. Nurses are confronted with stressors that come with the pressures of assuming with caring for a large number of patients suffering from

IMS and SUM Hospital, Bhubaneswar
Email: mchsau@gmail.com

ailment or sickness. The issue of stress in nursing should be checked comprehensively and accurately⁴.

Nurses with less ICU experience are considered to care for highly dependent patients more challenging than experienced nurses and may perceive that ICU setting is a more strenuous and stressful environment in which to work. In an operational setting where turnover and lack of nursing staff is apparent and forecasted to deteriorate, this is cause for real apprehension about future resourcing for this patient group⁵.

Recognition of work-related stressors and strategies that can be employed for managing occupational stress for the nursing profession have been receiving bigger concern by researchers, nursing institutes, and employers over the last two decades. A study comparing occupational stress among nurses and non-nurses shows that nurses experience significantly more stress factors than their non-nurse colleagues⁶.

Nurses are confronted with severe stress in Indian hospitals because of the scarcity of nurses. A male ICU nurse feels significantly higher stress level as contrasted to females. Second, male ICU nurses from private hospitals proved significantly higher level of stress than the government ICU nurses on different dimensions of Organizational Role Stress Scale⁷.

According to some estimates, job stress is the key factor in 70% of absentee employees and almost wasting of 10% of the country's gross domestic product⁸. Occupational stress may be responsible for many of the organizational outcomes such as decline in performance, job dissatisfaction, lack of motivation and commitment, as well as an increase in absenteeism and turnover⁹. Nurses in hospitals are prone to experience job stressors than those in other backgrounds, which may be appropriate for ICU nurses when compared to indoor nurses¹⁰. A study on Workforce issues and potential solutions reported that globally, intensive care nurses are central part of critical care team. These nurses add to better patient outcomes, decreased morbidity and mortality, diminished complications and errors, and decreased overall costs¹¹.

Now nursing has become a profession in its own right. People have higher expectations from nurses for the medical service they deliver to the society. Therefore, nursing has become more demanding, more challenging and more complicated. Correction of stress

would be possible by recommending an evidence-based set of strategies, which would help in sustaining nurses in the I.C.U setting. Therefore, it is necessary to bring the attention of the administration as well as practicing nurses towards the problem of work-related stress in critical care setting. It is important to highlight the stress indices and demographic factors those trigger the intensity of stress in beginner nurses.

METHOD

The investigation was carried out in critical care unit of selected multi-specialty hospitals in Bhubaneswar, during the period January-June 2016. A purposive sample consisted of 270 nurses, who work in the previously mentioned settings invited to participate in the study. 252 participants returned a completed questionnaire. Therefore, the final participants were 252 CCU nurses.

Selected background variables of the registered nurses of C.C.U were collected by using C.C.U nurse's background information sheet, which included different demographic and professional variables. Critical care nursing stress scale was used to identify stressors (factors of CCU stress) as regards direct patient care, inadequate knowledge & skill, lack of support, interpersonal conflict & management of the unit. The questions used the 4-point Likert scale from not at all stressful to very stressful. The score were calculated for as follows: scores 1 = low level of stress, scores 2 = moderate level of stress and scores 3 = high level of stress.

Inclusion Criteria

- Registered nurses who work more than one week and less than one month of experience in present ICU - Nurses are not independently providing nursing care to the patient.
- Nurses working in CCUs and must have finished their orientation period, were included in this study.

Exclusion Criteria

- Nurses working in pediatric and neonatal CCUs.
- Nursing Supervisors and Nurse Educators of CCUs.

Statistics

The quantitative data were entered and analyzed using the SPSS (Statistical Package for Social Sciences version 20.0), and the level of significance (α) was set at

0.05. Frequencies and percentage distribution tables will be structured to present the demographic characteristics of participants. Mean perceived level of stress of the nurses will be computed for all the five dimensions of stress. Regression analysis will be applied in determining contribution of various dimension of stress towards perceived level of stress. To find out the relationship between perceived stresses of C.C.U nurses with the selected professional variables, One way ANOVA test will be conducted for all variables except marital status as in case of marital status, there are only two samples, hence t test can be conducted.

ETHICAL CONSIDERATIONS

The hospital ethical committee approved this study. Approval from nurses was obtained. Several strategies were utilized to protect the nurse's rights who decided to take part in this study. First, oral verbal consent of the nurses was obtained prior to the administration of the questionnaire. The nurses were informed of the purpose of the study, and that they had the right to refuse to participate. In addition, the voluntary nature of participation was

stressed as well as confidentiality. Moreover, the nurses were informed that they can abstain from answering any questions and they can terminate at any time. Anonymity of the nurses was preserved at all times.

RESULTS

Description of background variables: The background variables of the biggner CCU Nurses (Table 1) showed that the large group age of the studied sample (51%) were ≤ 25 years, around (61%) of nurses were single, and in relation to the educational level, it was found that the majority (64%) of them had nursing diploma. (66 %) of the nurses had an experience of less than one year as registered nurse. In past C.C.U experience of registered nurses, (81 %) of registered nurses were not having past ICU experience and (13 %) of them were having less than 6 Months of experience. In Weekly shift hours of mornings (57%) of nurses were posted for (1- 3) days in CCU, In Weekly shift hours of evenings (77%) of nurses were posted for (1- 3) days in ICU. On Consecutive Days of Working, in week (44%) of nurses were in less than one and (31%) of nurses were within (1-2) consecutive days of working in a week at CCU (Table 1).

Table 1: Frequency and percentage Distribution of the background variables of biggner CCU nurses

	1 - 2	77	31

Distribution of nurses according to their exposure to CCU stress factors: Table -2, illustrated that (38% and 27 %) of nurses were suffering from severe stress and moderate stress respectively regarding thinking on direct patient care, and (26 % and 34 %) of nurses were suffering from severe stress and moderate stress respectively regarding inadequate knowledge and skill. Regarding lack of support, it was found that (22 % and

27%) of nurses were suffering from severe stress and moderate stress respectively. For Interpersonal conflict with nurses, it was found that (17 % and 24 %) of nurses were suffering from severe stress and moderate stress respectively. Regarding Management of unit, it was found that (39 % and 37 %) of nurses were suffering from severe stress and moderate stress respectively (Table 2).

Table 2: Number and percentage distribution of nurses according to their exposure to ICU stress indices

No.	ICU Stress factors	Severe Stress		Moderate Stress		Mild Stress		Normal stress	
		frequency	%	frequency	%	frequency	%	frequency	%
1.	Thinking on direct patient care	96	38	67	27	70	28	19	7
2.	Inadequate knowledge & skill	65	26	87	34	93	37	7	3
3.	Lack of support	55	22	69	27	98	39	30	12
4.	Interpersonal conflict	44	17	58	24	107	42	43	17
5.	Management of unit	98	39	94	37	50	20	10	4

Contribution of each dimensions of stress towards perceived levels of stress in C.C.U nurses: To find out the relationship between the perceived stress level and the dimensions of stress, regression analysis was performed between them. It is relevant to say that the dependent variable is the perceived stress level and the independent variables are the five dimensions of stress mentioned above.

The descriptive statistics of table - 3, gave the mean stress level and the mean score of various dimensions of stress of 252 nurses who had no experience of handling patients in ICUs along with the standard deviations of the scores (Table 3).

The significant of the model summary table -4 was the value of R². R² is the percentage of variance in the dependent variable explained by the collection of independent variables. R² provided an indication of the explanatory power of the regression model. In this case it was 100 (R²= 1) which was great. This implied that the dependent variable i.e. mean perceived stress level was 100% explained by the interdependent variables i.e. Thinking on direct Patient Care, Inadequate Knowledge & Skill, Lack of Support, Interpersonal Conflict and Management of the Unit (Table 4).

The ANOVA table - 5. tested the significance of the regression model. In this case the p value was 0.000 and hence p<0.05, It concluded that the independent variables not only 100% explained the dependent variable, but this relationship is also significant (Table 5).

The correlation table -6, described that there was highly positive correlation between the mean perceived stress levels of stress with all the dimensions of stress with Pearson Correlation Coefficient value more than 0.7 except the dimension “Lack of Support” where it was 0.281 still positive. Again in each case the p value was 0.000, i.e. less than 0.05; this indicated the relationship between dependent variable and independent variables were highly significant (Table 6).

The coefficient table-7, described the coefficient of independent variables in the regression model as labeled in column three as B. Hence our desired model was: Mean Perceived Level of Stress = -.002 + .231 (Thinking on Direct Patient Care) + .250 (Inadequate Knowledge & Skill) + .096 (Lack of Support) + .077 (Interpersonal Conflict) + .346 (Management of the Unit) (Table 7).

FINDINGS

Simplifying the above model we got:

$$MPLS = -.002 + .231 (DPC) + .250 (IKS) + .096 (LOS) + .077 (IC) + .346 (MOU)$$

The regression model proved that stress level of nurses without having experience of handling patient independently in CCU i.e. perceived level of stress was more dependent on “management of the unit” and less dependent on “interpersonal conflict” .

DISCUSSION

This study aimed to examine effect of various stress indices and selected background variables towards perceived stress level of novice CCU nurses. CCU nurses stress related factors have been placed in five main categories: direct patient care, inadequate

knowledge & skill, Lack of support, Interpersonal conflict and Management of unit. All categories had several subsets and they were the most important professional stressors for the CCU nurses of this study. The management of the units, thinking on direct patient care and Inadequate knowledge and skill were among the most stressful experiences that the novice ICU nurses faced with. Based on the CCU nurses experiences, the following items were some of the stress factors, which are most stressful for the nurses: “Assigned to nurse 2 to 3 patients in ICU setting”, “Listen or talk to a patient about his/her approaching death” and “Provide support/information and creating positive rapport with critically ill patient’s family members” . The highly rated actual stressful events are “Expose to health & safety hazards.”, “Handle mechanical ventilators or non-invasive ventilation.”, Prioritize your nursing care in ICU setting, Perform ABG analysis independently in ICU setting, Blame for anything that goes wrong in C.C.U”, “Work continuously for eight hours by standing in I.C.U.”, “Prepare patient(s) for specific procedure(s)/ investigation(s)” and “Participate in delivering in-service education.”.

These findings are consistent with the reports of^{10,12} have reported that the nurses faced with multiple occupational risk factors. Some studies, which have been conducted in Iran, mentioned about the sources of stress for nurses such as patient care, inappropriate treatment of the patient’s family, increasing workload, dissatisfaction with the wages, work on holidays, and lack of access to physician in emergencies. Having enough sleep and rest, lack of social acceptance, work environment, contact with contaminated objects, Many studies in other countries as well have reached to similar findings. A significant decline in the amount of nurses over 40 years of age working in CCUs can be related to the fact that these professionals, when they arise to this age, are engaged in other areas, watching for administrative positions, educational positions, or even give up the occupation¹³. The most important factors creating stress which were mentioned by the CCU nurses of the present study have been referred to the management of the unit and interpersonal conflicts. Different stress factors statistics showed that if the senior management people will develop and adopt need based stress management strategies, it would minimize the pressure and stress imposed on nurses. The nurses should also try with the development of good relations between themselves to reduce the occupational stress.

The regression model proves that stress level of nurses having experience of handling patient independently in CCU i.e. actual level of stress is more dependent on “management of the unit” and less dependent on “lack of support”. When compared to studies alike high levels of stress show a relationship between an increase in work demand as well as a poor work environment. These studies in meticulously show that targeting particular individuals or groups will be of limited use without also addressing the general work environment¹⁴. This finding points to the fact that participants who are dissatisfied with the social interaction and support in their work environment experience higher levels of stress. When compared to studies alike Stress in critical care nurses: actual and perceived, there were significant correlations between perceived life stress and the perceived severity of work stressors, as well as between actual and perceived stressful work events¹⁵.

It is observed that there is significant difference in actual perceived level of stress in CCU nurses among various age groups In conjunction a study indicated that younger age correlated with high levels of stress¹⁴. Research indicated that the non-work related causes of stress are found to be statistically highly significant when correlated with the level of stress¹⁶.

CONCLUSION

Study results have shown that the most common type of work-related perceived stress for CCU nurses were due to management of unit and Inadequate knowledge and skill followed by direct patient care. High stress levels often result in burnout and turnover of employees and change of their attitudes to work, and thus they can negatively influence the care for patients. Hence, action and strategies should be targeted for C.C.U working nurses at both individual and organizational level for managing C.C.U nurses stress. Lack of accurate information regarding perceived stressors leads to misconception about the stressors and creates the common challenge for the employees and employers. Therefore, it is essential to have an accurate orientation about different components of stressors for which we could check turn over & absenteeism.

Surveillance of *Candida Albicans* and their Antifungal Susceptibility in Oral Candidiasis

Pradeep Mallick¹, Manoj Kumar Sahoo², Priyanka Debta³, Mahesh Chandra Sahu⁴

¹Assistant Biostatistician, Department of Gastroenterology, IMS and SUM hospital; ²Reader, Department of Oral Pathology, IDS and SUM hospital; ³Professor, Department of Gastroenterology;

⁴Assistant Professor, Directorate of Medical Research; IMS and SUM hospital; Siksha "O" Anusandhan Deemed to be University, K8, Kalinganagar, Bhubaneswar, Odisha, India

ABSTRACT

Background: *Candida albicans* prevails to be the most common infection among all *Candida* infections. Due to indiscriminate, misuse and over use of antibiotics in case of fungal diseases, ICU patients, immunocompromised patients like AIDS, it reveals multidrug resistant (MDR) strains. Proper antibiograms study should be carried out for proper drug prescription.

Aim: In this study, we aimed to investigate the common isolates *Candida albicans* and their drug susceptibility test and identified the gene responsible for resistance to Fluconazole and Itraconazole antibiotic.

Materials and Method: This study was executed with routine microscopic, identification of organisms and drug sensitivity of isolates from 103 oral swab samples for a period of three months at IDS and Institute of Medical Science and SUM Hospital, Bhubaneswar, Odisha. Bacteria and fungus were identified with universal primer (16S rRNA). Bacteria having Fluconazole and Itraconazole resistant genes were identified using specific primers.

Results: From 103 oral swab samples, 100 showed significant growth. *Candida albicans* was common isolate, followed by *Candida glabrata*, *Candidatropicalis* and *Candida krusei*, In case of bacteria, *Pseudomonas* was common. Bacteria were identified using 16S rRNA primer (8F, 1541R). Drug susceptibility pattern revealed highly resistant to Colistin and Azithromycin in case of Gram negative bacteria. However, amikacin was sensitive to all. In case of Gram positive cocci, penicillin and navobiomycin remained high resistance but chloramphenicol was the most sensitive. For fungal isolates Nystatin and fluconazole remained highly resistant while Miconazole and Itraconazole showed high sensitive. By using specific primers (ERG11, CDR1, MDR1, 18srRNA) for Fluconazole, and (ERG3, NERG3, ERG11) for Itraconazole resistant genes were identified in *Candida albicans*.

Conclusion: Empirical use of antibiotic should not be practiced while prescribing drugs. Proper identification and drug susceptibility pattern of organisms should be conducted before prescribing a drug. PCR method should be implemented for early detection of antibiotic resistance patterns.

Keywords: *Candidiasis*, MDR, 16SrRNA, Fluconazole, Itraconazole and ERG11

INTRODUCTION

The oral cavity is home to many different microorganisms, including bacteria, viruses, fungi, and sometimes protozoa¹. The different, tissues and fluids in the oral cavity, as well as different types of foods that pass through oral cavity, provide a unique environment which allows various microorganisms to survive in the oral cavity¹. Most of times the organisms live in complete harmony with their host, sometimes they can

Corresponding Author:

Assistant Professor,
Directorate of Medical Research,
IMS and SUM Hospital, Bhubaneswar

cause harm in the form of dental caries, periodontitis, and other infections. The shift from harmless to harmful was described by P.D. Marsh² in the ecological plaque hypothesis.

Candida species, commonly *Candida albicans*^{3,4}, can be present in the mouth of healthy individuals without causing disease to its host body³⁻⁵. Like bacteria, fungi can be part of the natural oral microflora, a change in the balanced microflora can lead to infection and disease. Other names of oral candidiasis are oral thrush and candidal stomatitis. It is also referred to as a biofilm disease⁶. The lesion can vary in size, shape and colour, largely dependent on the predisposing factors behind the disease⁴. *Candida albicans* is the most important human fungal pathogen⁷. This includes those affected with HIV-AIDS, cancer, diabetes, infants, elderly, those who have undergone organ transplant etc are prone to develop *Candida*.

MATERIALS AND METHODE

A total of 103 Oral swab samples were collected from patients admitted to IDS department of IMS & SUM hospital, Bhubaneswar, Odisha, India, during the period 18th December 2017 to 27th January 2018. All the samples were cultured on blood agar MacKonky agar and SDA plates and incubated at 37^o C for 24-48 hours. The colonies so obtained were stained with Gram's staining chemicals and was observed under microscope. Strains were inoculated on CDA plate and again incubated at 37^o C for 24-48 hours.

Antifungal screening was done by disk diffusion method. Colonies were cultured in test tubes containing 2ml of SDB and incubated for 24 hours. Then the cultures were poured on SDA plate and spreaded using sterile cotton swab. After 5 minutes, antifungal (7) disks were placed on the plates, maintaining a distance of 30mm each. 7 antifungal disks were used such as: Amphotericin-B, Clotrimazole, Fluconazole, Itraconazole, Ketoconazole, Miconazole and Nystatin.

RESULTS

A total number of 46 colonies of *Candida spp.* were obtained. Out of which 41 colonies were *C. albicans* (green colour on CDA), 3 colonies were *C. glabrata* (white colour on CDA), 1 colony was *C. kruzei* (purple colour on CDA) and 2 colonies were *C. tropicalis* (blue-purple colour on CDA).

Antifungal screening showed variable results for all four species of *Candida*. *C. albicans*, *C. glabrata* and *C. kruzei* showed 100% resistance to Fluconazole. Again *C. albicans* and *C. glabrata* were 100% resistance to Ketoconazole. *C. glabrata* also showed 100% resistance to Nystatin. Itraconazole showed a high percentage of susceptible for *C. albicans* (87.5%), *C. kruzei* (80%), *C. tropicalis* (100%) and *C. glabrata* (60%). Amphotericin-B showed variable results in all the 4 species i.e. *C. albicans* 62.5% susceptible, *C. glabrata* 60% resistance, *C. kruzei* 80% susceptible, *C. tropicalis* 66.6% resistance. Miconazole showed resistance for *C. albicans* and *C. glabrata* by 75% and 80% respectively. But *C. tropicalis* and *C. kruzei* were 100% and 80% susceptible respectively. Similarly, Clotrimazole showed 50%, 80% and 60% resistance for *C. albicans*, *C. glabrata* and *C. kruzei* respectively. But it was 100% susceptible for *C. tropicalis*.

DISCUSSION

In recent years, *Candida* infections in all over world, hospitalised patients have been on the increase^{8,9}. This increase has been associated with different surgical interventions, intensive care and treatment, extreme of age, metabolic disorders, neutrophil dysfunction, and immunodeficiency states among others^{10,11}. This system calls for accurate identification of *Candida* species to select the most effective therapeutic strategies to control invasive fungal infections^{12,13}. The occurrence of a variety of culturable fungal species obtained from oral swab samples, which were mainly *Candida* species and a few non-*Candida* species. Among the *Candida* species, the predominant isolate was *C. albicans*, followed by *C. glabrata*, *C. tropicalis*, and *C. kruzei*. The non *Candida* species included *S.aureus*, *Enterococcus*, *Streptococcus*, *GPB*, *Pseudmonas*, *P.mirabilis*, *E.aeruginosa*, *P.aerogenes*. An important observation in our study is that the commonly isolated *Candida* species was *C. albicans* from oral swab samples, and this corroborates with findings in studies done in Brazil, China and USA^{14,15,16,17}. The predominance of this species *C. albicans* may be attributed to virulence, conferring upon its enhanced capacity for colonization and pathogenic activity for humans^{18,19}. In fact several studies have shown that *C. albicans* is the predominant species regardless of the immune status of the patient in all over world^{20,21}. Tanzanian and Iranian studies which also showed that *C. albicans* was a dominant species,

while non-albicans *Candida* species were present in lower proportions^{8,22,23}. Though exact species of non candida is undifferentiated correctly. The utilization of the Internal Transcribed Spacer (ITS) region for species identification seems to be gaining popularity, and is considered the gold standard and which is the most reliable strategy for the correct, accurate and rapid molecular method for identification of fungal species, including *Candida* species^{24,25,16}. Consistent with findings in other studies, oral swab samples was found to be the main source of the *Candida* isolates though *C. albicans* mostly occur from urine samples^{25,26,27}. Females are more prone to *Candida* colonisation due to their anatomy and *Candida* is part of the normal flora of the genitourinary tract in women^{28,27}. Wabe 2011 reported that the similar observations were made out of India in Ethiopian, Ghanaian and Nigerian studies where 60% of candida and 80% of oral yeast(fungal) isolated from immunocompromised patients, were mostly *C. albicans* because, *C. albicans* expresses several virulence factors during host infection which is the contribution of pathogenesis of *Candida* infection^{29,30,31}. Blignut 2007 reported that in South African study about 80% of oral yeast isolates from hospitalised patients were *C. albicans*^{32,33}. Kwamin 2013 reported that from sputum and HVS specimens mostly *C. albicans* were isolated and this may be attributed to its virulence^{30,31}. Many studies have also indicated that *C. albicans* is the main cause of candidaemia and sepsis, especially in immunocompromised and debilitated patients with cancer, HIV/ AIDS and diabetes³⁴. However, our findings indicate that *C. albicans* was the main species commonly isolated from oral swab samples as it is known to cause candidiasis in immunocompromised patients and neonates in intensive care units^{35,36}. The probable explanation for this is that *Candida* species appear not to be normally distributed in different parts of the world³⁷. It has been noticed that some *Candida* species are more specific to a particular region than others³⁸. This suggests that more attention should be paid to local distribution of *Candida* species than to continental distribution. For the management of *Candida* infection the antifungal susceptibility testing because it promotes accurate administration of antifungal agents, and as an aid in drug development as well as a means of tracking the development of antifungal resistance in epidemiologic studies^{39,40,17}. In this study, the majority of the *Candida* species were isolated from oral swab samples, and these were mainly associated

with drug resistance. This may be attributed to the fact that in Zambia the majority of HIV patients are given fluconazole tablets for prophylaxis against oral thrush and cryptococcal meningitis, and compliance to therapy in these patients is unknown, resulting in development of drug resistance^{41,37}. This corroborates with other studies in which similar findings were observed^{42,43}. This could be attributed to the antifungal prophylaxis which is considered to be responsible for development of resistant strains to antifungal agents used for prophylaxis^{48,42,43}. The multi-drug resistance (MDR) observed in 46 isolates of *Candida*, with *C. albicans*, being the predominant resistant, mostly to fluconazole and Other species that showed MDR patterns, and this involved the seven classes of antifungal agents tested in this study. These findings on MDR pose serious clinical challenges as they seem to suggest the emergence of MDR *Candida* strains in hospitalised patients at the IDS and SUM hospital (SOA University) Bhubaneswar, Odisha, India.

ABSTRACT

Aim: To investigate the relationship between peripheral vertigo to neutrophil to lymphocyte ratio (NLR) as an inflammatory marker.

Materials and Method: We had taken 68 patients with peripheral vertigo those attended the Otolaryngology department during January 2014 to October 2016. The systemic diseases, malignancy, neurological diseases or any inflammations in the body were excluded from our study. We recruited 68 healthy subjects those came to the hospital for routine health check up. Detail neuro-otological examination and audiological tests were done to rule out peripheral vertigo.

Results: Neutrophil to lymphocyte count was calculated in all cases and a comparison done between the vertigo patients and control groups. The mean NLR was statistically significant among the patients of peripheral vertigo than control groups ($P=0.0021$). There were no statistically significant between patients and control groups when comparing white blood cell count, hemoglobin, mean platelet volume, lipid profile, liver function tests.

Conclusion: NLR is higher among peripheral vertigo and it is statistically significant among patients than control groups. NLR is a potential marker in vertigo with peripheral origin.

Keywords: Peripheral vertigo, biomarker, neutrophil to lymphocyte ratio (NLR), inflammation.

INTRODUCTION

Maintaining balance of the body is a complex mechanism which depends on the integrity of vestibular system, vision, the somatosensory system and finally controlled by brain and cerebellum. If any system fails, lead to dizziness or vertigo¹. Controlling postural balance is the ability to maintain balance in relation to gravity and adjust the body position on the support base.

Vertigo is a common and disabling clinical symptom often associated with peripheral vestibular diseases. Vertigo is a feeling of imbalance which can be defined as a movement delusion or hallucination which is a sense of disorientation either of rotational type or non-rotational such as imbalance, instability and visual distortion. It is commonly affect more than 10% of the population and approximately 85% cases of dizziness are of vestibular causes². Common vestibular disorders seen among patients are benign paroxysmal positional vertigo (BPPV), vestibular neuritis, Ménière's disease, labyrinthitis, acoustic neuroma and perilymph fistula. Vertigo, stress and anxiety are often concomitant may be due to increased secretion of stress related hormones³. Total white blood cell (WBC) and certain WBC subtypes like neutrophil and lymphocytes are considered as inflammatory markers especially in cardiovascular diseases⁴. The WBC subtype cells like neutrophil to

lymphocyte ration(NLR) is a very good indicator of inflammation in the human body and a novel marker of inflammation in non-cardiac and cardiac diseases⁵. The NLR is a marker of systemic inflammation, an inexpensive, easily calculated, easily reproducible and widely available blood test⁶. There are numerous studies presented with high preoperative value of NLR among patients with different malignancy along with poor prognosis ⁷.There are almost no study of NLR with peripheral vertigo in this region of the world. In this study we had done comparison of NLR between peripheral vertigo patients with healthy persons.

medicine those attended for health check up and found no diseases. There were 68 control subjects including 41 male and 17 female with mean age of 37.42 years. Blood samples were collected from antecubital veins of all subjects and sent for blood glucose level, liver function tests, renal function tests, lipid profile and hemograms. The laboratory data were analyzed and compared between control groups and patients.NLR was evaluated and comparisons done between two groups. Statistical analysis was done by using chi-square test and 95% confidence interval. The significance was defined when p value was less than 0.05.

MATERIALS AND METHOD

This study was conducted in the department of Otorhinolaryngology during January 2014 to October 2016.This study was approved by our Institutional Ethics Committee. All subjects involved in the study were given their informed written consents. This is a prospective study included 68 patients. There were 38 male and 30 female patients with mean age of 35.68 years. All patients were undergone neuro-otological examinations along with audiological tests. The audiogram of patients showing moderate or severe hearing loss was excluded from our study as stress effect of hearing loss on patients. Patients of neurological disorders, malignancy or any inflammatory diseases or any systemic diseases along with vertigo were also excluded from this study. Along with vertigo patients, the age and sex matched control subjects were recruited from the department of

RESULTS

Out of the 68 patients with peripheral vertigo, 67.5% were male and 31.2% were female with mean age is 35.75 years. Out of the 68 control subjects, 68.5% were male and 31.5% were female with mean age is 33.52years. When comparing age, gender, live function tests, lipid profile, WBC count, hemoglobin, platelet, vitamin B₁₂, there were no stastically significance between patients and control groups (Table.1). The mean value of NLR was significantly more in the peripheral vertigo patients than control subjects (P<0.05).That higher value of NLR was due to high neutrophil count among peripheral vertigo patients than control subjects.(Table.1)In this study, the most common etiology of peripheral vertigo was BPPV(61.5%),vestibular neuritis(13.5%), Ménière’s disease(9.6%), temporal bone injuries(3.4%),Ramsay Hunt syndrome(2.5%) and other idiopathic(9.5%).

Table.1: Laboratory data in the peripheral vertigo and control groups

Biomarker	Vertigo group	Control group	P value	95%Confidence interval
Hemoglobin(g/dL)	12.4	12.6	0.8064	-2.66 to 2.09
Neutrophil count(10 ⁹ /L)	4.7	4.1	0.0788	0.12 to 1.3

DISCUSSION

The peripheral vestibular system includes vestibular nerve, three semicircular canals, utricle and saccule. This peripheral vestibular system is one of the three sensory components help to maintain spatial orientation and posture, whereas the other two sensory components are visual and somatosensory systems. Any disorders of these systems lead to vertigo. Vertigo is not a separate disorder, but a multisensory and sensory-motor syndrome with different etiologies and pathogenesis⁸. The pathology in the peripheral vestibular diseases are limited to either vestibular nerve or semicircular canals or utricle and saccule. The clinical manifestations in the peripheral vestibular disorders are vertigo and nystagmus. The direction of the nystagmus is always towards the side contralateral to the vestibular lesion. The nystagmus in the peripheral vestibular diseases is suppressed by visual fixation, worsens when gaze directed away from the lesion side whereas it improves when gaze is directed towards the pathology side. There are numerous causes for peripheral vestibular disorders causing vertigo. The common peripheral vestibular disorders are BPPV (52.5%), Ménière's disease (14.6%) and sudden idiopathic hearing loss (2.9%)⁹. Less commonly seen peripheral vestibular disorders are labyrinthitis (0.7%), benign paroxysmal vertigo in pediatric population (0.7%) and vestibular schwannoma (0.3%). Otosyphilis, Ramsay Hunt syndrome, delayed endolymphatic hydrops, vestibular neuritis, temporal bone trauma, cervical vertigo and epilepsy are rare lesion causing vertigo⁹. In our study, most common clinical conditions causing vertigo are BPPV, vestibular neuritis and Ménière's disease. Common symptoms presented by patients are giddiness, nausea, vomiting, sweating and bradycardia. Recovery from vertigo decreases with increasing age of the patients, increasing severity and it improves with vestibular suppressant medications. Leucocytes, particularly neutrophil and lymphocytes are inflammatory markers in the human body. NLR can be calculated from blood samples by counting neutrophil and lymphocytes. NLR is a potential biomarker of inflammatory in non-cardiac and cardiac diseases^{10,11}. NLR is an easily available biomarker which gives information for complex inflammatory process in the body¹². NLR acts as potential index for predicting bad clinical outcomes and a novel biomarker in oncology. Few authors documented the significant role of NLR as a marker in papillary microcarcinoma in goiter and also

concluded that it is significantly elevated in papillary carcinoma of the thyroid gland¹³. Jin et al. studied the role of NLR on the survival of patients among nasopharyngeal carcinoma with metastasis. They concluded that NLR is an important prognostic factor in patients suffering from nasopharyngeal carcinoma with metastasis¹⁴. Dogan et al. showed relationship between NLR and myocardial infraction with ST segment elevation where NLR was more among patients with occluded arteries causing infraction than patients with elevated ST segment myocardial infarction¹⁰. Although NLR is biomarker in cardiac diseases, it is also a significant marker in non-cardiac diseases like Bell's palsy. Ozler et al. showed a relationship between Bell's palsy and NLR where there was significant relationship between NLR value and the prognosis of Facial nerve paralysis¹⁵.

There is neurogenic inflammation in migraine where triptans help by blocking the neurogenic inflammation and acts as therapeutic medication¹⁶. Turan et al. documented that inflammatory markers are elevated during attack of migraine¹⁷.

There is a vicious cycle thought to exist between somatic symptoms of Ménière's disease and psychological stress. There is a strong co-existence between vertigo and stress. Even though stress can cause vertiginous attack; vertigo can also be the cause for vertigo. Vertigo attack in patients create fearful situation and also increase anxiety and worsens the emotional status of the patient. The anxiety of vertigo patients produce different symptoms by increasing stress related hormones³. One study documented that patient with vertigo give rises to different somatic symptoms in relation anxiety in dizzy patients. The somatic symptoms like insomnia, palpitation, headache, dyspnea, general fatigue, depression, chest pain, constipation and stress are accompanied with vertigo patients who should not be treated first but vertigo should be treated by physician by first priority¹⁸. It is proved that stress can cause inflammation¹⁹. In this study we investigated the relationship between inflammatory biomarker (NLR) and peripheral vertigo. We could not compare with other inflammatory markers like C-reactive protein, fibrinogen or myeloperoxidase as these are not studied in routine practice. Unlike other inflammatory markers, NLR is an inexpensive and readily available biomarker in clinical practice of peripheral vertigo. As NLR is a potential biomarker for influencing the patient selection

and universally available test with no additional cost in routine work up in comparison to expensive and sophisticated one, will be accepted by clinicians in day to day practice²⁰. This study is an observational single institution study with relatively small sample size, thus subject to different unaccounted confounders inherent to this data.

CONCLUSION

Vertigo cannot be dismissed as a trivial clinical symptom. Vertigo causes feeling of spinning sensation, anxiety and stress. Stress increases the inflammatory markers in the body. NLR represent features of inflammation and this ratio will be increased in peripheral vertigo as with other inflammation and acute stage. Although NLR is a simple inflammatory marker, gives a significant role in assessing peripheral vertigo. NLR can be easily calculated from the blood sample of the patients from outpatient and inpatient department. The important finding in our study is that NLR is an independent predictor for peripheral vertigo. NLR is an ease and conventionally measured inflammatory biomarker at a low cost which can be done in daily clinical practice. Again, well designed prospective studies with a large sample size and multicenter study are needed to verify our findings.

ABSTRACT

Chondrosarcoma is rare and potentially lethal neoplasm and it is even more rare in the head and neck region. It is an extremely rare clinical entity at sinonasal tract. The diagnosis of this neoplasm is based on the histopathological study showing malignant chondroid tissue proliferation. The prognostic factors for chondrosarcomas are grade of malignancy and histological surgical margins. The primary treatment of this tumor is radical surgery with wide safe margin. The other adjuvant treatment like radiation and/or chemotherapy remain uncertain. Here we present a case of chondrosarcoma of 48 year old man presented with nasofacial region mass for one year. The biopsy confirmed the diagnosis of myxoid chondrosarcoma. Clinicians should be aware of this lesion in the differential diagnosis of maxillofacial mass which prevent delayed treatment.

Keywords: Chondrosarcoma, sinonasal region, maxillofacial area, wide surgical excision

INTRODUCTION

Chondrosarcomas are rare malignancy and its origin is from cartilaginous tissue or bone derived from chondroid precursors.¹ It accounts for about 10 to 20 % of all malignant bony tumors in the body whereas its incidence is rare in head and neck region. In head and neck area it affects commonly the mandible, maxilla, nasal cavity and paranasal sinuses.² Rare location for chondrosarcomas in the head and neck region are skull base and tempormandibular joint.³ The sinonasal tract has rarely been documented in the medical literature and the maxillary sinus is the most common location to be affected but it rarely extend into the nasal cavity.

The common clinical presentations of the patients with head and neck chondrosarcomas are localized swelling, mass formation, nasal obstruction and sometimes pain. The prognosis of this disease is often variable and it is influenced by histological grading and site of origin.⁴

Here we are presenting a case report of chondrosarcoma showing a mass at nasofacial area which originating at the maxilla and extending into the nasal area and ethmoidal sinuses. Here we discuss the details etiopathology, clinical presentations and management.

Case Report: A 48 year old man attended outpatient department of Otorhinolaryngology with complaints of swelling at the left nasofacial region, left side nasal blockage and occasional nasal bleeding since 1 year. He was farmer by occupation. On examination, there was diffuse swelling involving left side of the face and lateral wall of the nose(Fig.1).The consistency of the swelling is firm and ill defined margin. The skin over the swelling was free but tense. There was no bulging in the palate during oral cavity examination. On anterior rhinoscopy, there was smooth swelling at the floor of the nose hence causing nasal obstruction. There was

blood stained nasal discharge present inside the nasal cavity. The routine hematological tests were within normal limit. Fine needle aspiration cytology showed inflammatory lesion. Computed tomography(CT) scan showed mass involving the left maxilla, left ethmoid and left side nasal cavity(Fig.2). Orbit and cranium were within normal limit. A diagnostic nasal endoscopy was done which showed firm bulging in the floor of the left nasal cavity. The left nasal cavity was narrowed due to pushing of lateral wall of the nose medially. The nasal cavity lining was reddish in look. The mucoid discharge from nasal cavity sent for fungal culture in Sabour's medium and bacterial culture. A small of tissue from bulging inside the nasal cavity was sent for histopathological examination. The fungal and bacterial culture were negative. The histopathological report was suggestive of myxoid chondrosarcoma(Fig.3).He had undergone wide surgical excision by performing left maxillectomy(Fig.4).The mass is excised with healthy margin(Fig.5).The follow up at 1 year did not show any evidence of recurrence.

DISCUSSION

Chondrosarcoma is an extremely rare malignancy at the head and neck area, represents less than 0.1% of all the tumors in this region.¹ It is a slow growing malignant neoplasm with a relatively high chance of local recurrence rate. This tumor originates from the cartilage, soft tissue and bone. Common primary bony sites for origin of chondrosarcoma are pelvic bone, long bones such as femur.⁵ The common sites in head and neck area for chondrosarcoma are mandible, nasal cavity, paranasal sinuses. This tumor mostly arises from the bony tissue of the head and neck region.¹ It is often seen in adults and rarely seen in pediatric age group. The clinical behavior of the chondrosarcoma are variable and in majority of the cases low grade malignant tumors as in our case. This tumor is relatively smaller in size at the maxillofacial regions and sinonasal tracts whereas it is typically large in axial skeleton.⁶ Computed tomography(CT) scan often shows a well-defined mass with presence of stippled calcified areas. Magnetic resonance imaging(MRI) report are quite variable. The noncalcified areas shows isointense to hypointense signal intensity on T1 weighted images and hypointense on T2 weighted images. MRI with gadolinium contrast reveals inhomogeneous enhancement. The imaging findings often shows variable calcification, lobulation, hypervascularity and destruction of bone.⁷ The cut section of the neoplasm shows blue-gray fragments, with focal hemorrhagic spots. There is biphasic pattern of well differentiated chondroid elements seen in microscopic picture. There may be myxoid degeneration and hemorrhagic necrosis may be seen. Tumor cells are

seen around the vessels with a hemangiopericytoma like pattern are often seen. In immunohistochemical study, the small round cells are mostly positive for CD99. The chondroid areas are often positive for S-100 proteins.

The diagnosis is often based on the histological study. Histologically, it is classified according to microscopic appearance into conventional, myxoid, clear cell, mesenchymal and dedifferentiated chondrosarcoma. The classical and conventional chondrosarcomas are characterized by a lobulated malignant cartilage, mitosis, nuclear pleomorphism and binucleated cells. The histological classification for chondrosarcomas is graded from grade-I to III.⁴ The differential diagnosis include small cell osteosarcoma, a small blue round cell neoplasm as Ewing's sarcoma or primitive neuroectodermal neoplasm, embryonal rhabdomyosarcoma and lymphoma.⁸ Identification of undifferentiated mesenchymal cells and chondroid matrix is crucial for exact diagnosis of this neoplasm.

The goal of the treatment is always to ensure the whole lesions should be removed. Wide local or radical resection of the tumor are the preferred treatment of chondrosarcoma. The surgery of this tumor includes surgical resection of the primary lesion with adequate margin. In case of maxillary neoplasm, maxillectomy is often required. As anatomy of the maxillary bone region is complex, complete surgical excision of the chondrosarcoma with histological clearance of the margin is often challenging.⁹ Chondrosarcoma is regarded as a radioresistant lesion. Sometimes the primary role of radiation therapy is for the treatment of un-resectable disease and in case of incompletely resected tumors. Radiation therapy is often recommended in case of postoperative adjuvant therapy for patients with high grade chondrosarcomas.¹⁰ In some cases of chondrosarcoma, preoperative and postoperative chemotherapy are helpful.¹¹

The incidence of distant metastasis is rare and often seen in more advanced stage or recurrent cases. Distant metastasis commonly occurs to the lungs, although it may occur to vertebrae. In chondrosarcoma, the incidence of distant and local metastasis is low and seen in approximately 5% of the cases.¹ Metastasis occurs mainly in late stage of the tumor. The cause of death in patients of head and neck chondrosarcoma is local recurrence with tumor invading the vital structures.¹² The important prognostic factors in head and neck

chondrosarcoma are anatomical locations, histological grading and adequate surgical excision.⁴ The most important prognostic factor in chondrosarcoma is resectability where complete excision is the single most factor for determining the prognosis. This fact is supported by the fact that the commonest cause of death in chondrosarcoma is recurrence at the primary site not due to metastasis. The surgical treatment should be aggressive even in cases of recurrence as the common pattern for recurrence is local failure and not due to metastasis. Complete excision of the primary location is of utmost importance for successful outcome. Postoperative radiotherapy is often helpful in case positive margins. The survival rate of the patients with head and neck chondrosarcoma is approximately 60% at five years and around 50% at ten years.¹³

CONCLUSION

The myxoid variety of chondrosarcoma at the nasofacial area is an extremely rare lesion and presented here because of rarity of this clinical entity. As it is a slow growing tumor and resistant to radiation therapy, radical surgical excision is a good treatment option. There is a good chance of cure if it is diagnosed early. Postoperative follow up is essential for monitoring the recurrence. Clinicians should be aware of this rare clinical entity and keep it in mind in case of differential diagnosis of maxillofacial mass so that to prevent delayed intervention.

Anti-Candidal Activity of 5 Rare Plants against Drug Resistance Candida Species

Mahesh Chandra Sahu¹, Swayamprabha Sahoo²

¹Assistant Professor Medical Research Laboratory, ²Research scholar, Medical Research Laboratory, IMS and SUM hospital, Siksha “O” Anusandhan Deemed to be University, K8, Kalinganagar, Bhubaneswar, Odisha, India

ABSTRACT

Candida species is the fourth common cause of blood stream infections all over the world which is life threatening. Invasive candidiasis leads to increased mortality and morbidity especially in immunosuppressed. The antifungal resistance pattern in high-risk patients is major concern. . The present study was to access the anticandidal activity of leaves of 5 medicinal plants against fluconazole resistant Candida species and *C. albicans* isolated from patients of IMS and SUM Hospital. Ethanol, chloroform, petroleum ether and aqueous extracts of leaves, bark and seeds of *C. fistula* linn. was evaluated against Microbial type culture collection (MTCC) Candida strains and 21 fluconazole resistant clinical isolates. Antifungal activity was evaluated by agar diffusion and broth dilution techniques. The active phytochemical component present in the ethanol extract of seeds was accessed by high performance thin layer chromatography. The docking study was done with lanosterol 14- α demethylase, the azole drug target with the predominant phytochemical from the extract having antifungal activity.

Keywords: Antifungal activity, candidiasis, medicinal plants, MIC, MFC, resistant Candida strains

INTRODUCTION

Candida genus is part of the indigenous microbial flora in humans. Candidiasis is a superficial or deep or opportunistic fungal infection with very wide clinical entities. The incidence of fungal infections has increased significantly since the 1980s¹, especially in immunocompromised patients²⁻⁶. Invasive candidiasis leads to increased mortality and morbidity in immunosuppressed, in spite of recent medical advances. Extensive and indiscriminate use of azoles has led to multidrug resistance (MDR), which poses a major hurdle in antifungal therapy. This emerging problem with the continuing emphasis on health-care costs has drawn the attention of the scientific community regarding the

search for new cost-effective, broad-spectrum drugs of natural or synthetic origin. The choice of an appropriate antifungal treatment is important, though limited to a few licensed agents⁷. Natural products for the management of fungal diseases can be considered as an alternative to synthetic fungicides due to their less toxicity, reduced cost and less adverse reactions. According to World Health Organization (WHO), more than 80% of the world's population relies on traditional medicine for their primary healthcare needs. In view of possible difficulties strong incentives are there to develop new, cost effective, nontoxic, broad spectrum natural fungicides for effective patient management. Cassia fistula Linn — “the golden shower tree” belongs to the family Caesalpiniaceae, is cultivated throughout India as an ornamental plant. In Ayurvedic medicine, the tree is known as “disease killer” because every part of the tree has medicinal properties. *C. fistula* exhibited significant antimicrobial activity and showed properties that support folklore use in the management of some diseases as broad-spectrum antimicrobial agents⁸. Evaluation of the antagonistic effect of hydro alcohol extracts of leaves of *C. fistula* against bacterial and fungal strains showed significant

Email: mchsahu@gmail.com

inhibitory effect on the growth⁹. Studies on aqueous, alcohol, chloroform and ethyl acetate extracts from the flower showed positive result¹⁰. Another experiment revealed that the minimum inhibitory concentration of methanol extract of *C. fistula* seeds ranged from 1.563—50.00 mg/mL against the strains tested¹¹. In this study, we determined the antifungal activity of medicinal plant and evaluated their MIC and MFC.

MATERIAL AND METHOD

Collection and Processing of clinical samples for isolation of fungi: A prospective cross-sectional study was undertaken over a period of 5 years, from September 2009 to April 2014, in the Department of Microbiology of IMS and Sum Hospital. Clinical samples from patients from CA source and HA sources such as, skin swabs and skin scrapings, wound swabs, nail cuttings, blood, urine, vaginal swabs, surgical wound abscesses, hair from scalp, etc., were tested for presence of fungal infections. With the prescribed safety precautions, samples were transported and processed without delay. Each sample was examined macroscopically for the presence of any caseous, purulent or bloody and necrotic material prior to further processing. The staining method was followed up with the temporary incubation of a clinical sample in 10 % KOH ordinarily, but 20 % KOH was used for nail cuttings and other hard pathological materials. The presence of fungal hyphae/spores in clinical samples was checked using a microscope.

Isolation and identification of fungi: Small portions of a clinical sample were inoculated into two sets of test tubes of *sabouraud dextrose agar* (SDA) or *potato dextrose agar* (PDA) as well as in 100 mm diameter Petri plates, which were incubated at room temperature, 25° C and in parallel at 37° C (BOD incubator, REMI), for a week. Inoculated media were checked every day following the incubation for possible growth of fungi. Plates were opened only within a biological safety cabinet to prevent any cross contamination. After a week of incubation, if there was any visible growth of fungus on SDA tube, further identification was done by gross examination of the obverse and reverse sides of the culture tube. Little lots of grown mass from samples were used for fungal identifications¹². Staining test was repeated for a little lot of grown mass by using LCB, for confirmation¹³⁻¹⁵. The following fungal species were isolated and identified with macroscopic features with obverse and reverse sides of culture tubes.

Antifungal sensitivity pattern of *C. albicans*: All the strains were screened for antifungal sensitivity test with 6 antifungal discs namely nystatin (100 units), clotrimazole (10 µg), fluconazole (10 µg), itraconazole, ketonazole and amphotericin-B (100 units) (all from HiMedia), by the disc diffusion method (Chakrabarti et al., 1995), along with the reference strain of *C. albicans*. Inocula were prepared by picking five distinct colonies of approximately 1 mm size from 24 h old culture grown on SDA at 35 ± 2° C. Colonies were suspended in 5 mL of sterile 0.85 % saline. Vortexing was done for making a suspension of the pellet of *C. albicans*, which was adjusted to a turbidity to yield 1 x 10⁶ - 5 x 10⁶ cells/mL (i.e., 0.5 MacFarland standard).

Sterile SDA plates with a depth of about 4 mm were used for carrying out susceptibility of antifungal discs against *C. albicans*. A sterile non-toxic cotton swab was dipped in the standardized inoculum (turbidity so adjusted, as to obtain semi-confluent growth on the Petri plate) and the plate was rotated with the swab for uniform distribution of the inoculum. Streaked of the entire agar surface of the plate was done with the swab three times turning the plate at 60° angle between each streaking. The inoculum was allowed to dry for 5-15 min with its lid in place. Hexagonal antifungal discs were placed on plates aseptically. After 15 min of standing, plates were inverted and incubated in the BOD incubator at 35° C; each plate was examined after 20 - 24 h of incubation. But, at 48 h only when sufficient growth was observed, size of zones of inhibition were noted. The MDR strains of *C. albicans* from those plates were maintained weekly and preserved at 4°C.

RESULTS

Identification of *C. albicans*: Isolation and identification of *C. albicans* were done basing on both microscopic and macroscopic characters. Clinical samples from patients were cultured on SDA containing 0.5 % chloramphenicol, pH 6.5, for 24 h at 37° C. Creamy moist colonies were picked up and used for presumptive identification on HiCHROM agar-Candida medium (HiMedia). Plates were incubated at 30° C for 24 h. Green colonies developed on HiCHROM agar Candida,

were identified as *C. albicans*. Germ-tube formation assay, carbohydrate assimilation test and Corn meal agar test were used as confirmatory tests. Formation of germ-tube at 37° C in serum, after 2 h of incubation indicated the germ tube test positive. In carbohydrate assimilation test, growth and fermentation profile on several sugars confirmed the fungus *C. albicans*. Formation of chlamydo spores on corn meal agar plates, at 25° C after 7 days was observed for *C. albicans*. Media components and chemicals were purchased from HiMedia. Isolates were numbered depending on the number of samples from which, they were isolated. A total number of 134 *C. albicans* were isolated during the study. Pure cultures of isolated fungi were maintained on SDA slants, at 4° C temperature. The standard strain of *C. albicans* (MTCC 3017) was used as the reference control.

Antifungal sensitivity of *C. albicans*: Among the 6 antifungal discs, the amphotericin B was the highest 92 % sensitive to screened isolated *C. albicans* and fluconazole was the highest 84 % resistant (Table 2). The MIC of the amphotericin B was range from 0.25–1.0 µg/mL and the MIC of the fluconazole was in the range 0.12-128 µg/mL (Table 3).

Antifungal activity of 5 leading plants

Antifungal activity test by agar-well diffusion method: Antifungal activities of methanol extracts of 5 plants (*Argemone mexicana*, *Alangium salvifolium*, *Butea*

monosperma, *Combretum albidum* and *Strychnos nux-vomica*) were used by the agar-well diffusion method on lawns of 19 isolates of *C. albicans* and the MTCC strain. All these 5 methanol extracts had prominent anticandidal activities (Table 4)

Kruskal-Wallis *H* test was applied to the dataset of anticandidal activity with methanol extracts of selected 5 plants. The computed Kruskal-Wallis *H* value was 72.37, when tabulated value was 13.277 at *P*= 0.01, for degree of freedom (df) 5 extracts minus 1 = 4. Since the tabulated value is far less than the computed *H* value, at *P*= 0.01, the null hypothesis that there was no difference between inhibitory zones due to methanol extracts of 5 individual plants was outright rejected. Differences in values of zones of inhibition of individual 5 methanol extracts are highly significant (Table 61). Secondly, the ‘total rank signs’ recorded in Table 61 for the methanol extract of *C. albidum* was 1769.5, against similar values due to extracts of *A. mexicana*, *A. salvifolium*, *B. monosperma* and *S. nux-vomica* were 725, 513.5, 789 and 1244.5, respectively. These ‘total rank signs’ values clearly indicated that the methanol extract of *C. albidum* was the most suitable extract for inhibition of the growth of *C. albicans* (Table 5). All 5 leaf-extracts had differential activity in the control of the fungus, in the decreasing order: *C. albidum* > *S. nux-vomica* > *B. monosperma* > *A. mexicana* > *A. salvifolium*.

Table 1: Identification of fungus by correlation of microscopic and macroscopic features of the isolated fungus from patients

Identified fungi	Macroscopic features		Microscopic features
	Obverse	Reverse	
<i>Candida albicans</i>	White colored, convex, entire margin, non-mucoid and smooth textures of cream colored pasty colonies (Figures 20a, 20b)	White colored and smooth, shiny edged (Figure 20c)	Budding yeast cell showing germ tube (Figure 20d) Chlamydo spore formation in <i>C. albicans</i> (Figure 20e)
<i>Candida</i> sp.	Off- white and smooth, shiny edged cream pasty colonies (Figure. 21a)	White colored and smooth, shiny edged (Figure 21b)	Round-oval shaped budding cells (Figure 21c)

Table 2: Antifungal sensitivity pattern of *C. albicans*

Antifungal agents	Sensitive (%)	Resistant (%)	Zone diameter in mm		
			Sensitive	Intermediate	Resistance
Amphotericin B(AP)100	92	8	≥20	19-12	≤11

DISCUSSION

Increased incidence of fungal infections with underlying conditions, drug resistance and undesirable effects of available antifungals, studies have been focused on new antifungal compounds. Researchers have been interested on medicinal plants with bioactive compounds as they are natural products, less likely to be toxic and to develop drug resistance. The antimicrobial potential of this plant extracted in different solvents (e.g. aqueous, diethyl ether, ethyl acetate, dichloromethane, methanol, ethanol and chloroform) has been evaluated against different bacterial and fungal human pathogens. Variable activities of plant parts including flowers, leaves, pods, seeds, stem bark in different solvents has been reported¹⁶⁻¹⁹. MICs of different extracts of *C. fistula* were tested against fungi and the results revealed that ethyl acetate extract had highest activity²⁰. A Study²¹ showed highest inhibitory activity of the methanolic extract of stems followed

by flowers, pods and leaves. This study was supported by pre-vious studies of Lachumy¹¹ that *C. fistula* seed methanol extracts strongly inhibited *Candida* species. All the aqueous extracts showed less pronounced activity. It may be due to insufficient quantities of active compound in aqueous extracts. Polarity of the active compounds makes them readily extractable in organic solvents. The present study is the first to report the potentiality of this plant against fluconazole resistant *Candida* species. Earlier reports with scanning electron microscopic examination of *C. albicans* cells treated with *C. fistula* seed extract showed decrease in size, irregular cell walls, ruptured cell membranes, disrupting the permeability barrier of cell membrane, unclear periplasm and dense cytoplasm without differentiated features. Actually, the anticandidal action of *C. fistula* seed extract involves the initial membrane disruption followed by accumulation of extract in the plasma membrane resulting in cell death. *C. fistula* plant parts are known to be an important source of secondary metabolites,

notably poly phenolic compounds²¹. HPTLC studies confirmed the major component as gallic acid. Earlier studies reported anticandidal activity of gallic acid²¹. Conclusion Polyphenolic compounds from plants can be used as a viable alternative against *Candida* species especially against drug resistance strains for the effective management of candidiasis. The study further emphasis the need of virtual high throughput screening of these compounds by the way of molecular docking and QSAR studies against various drug targets of *Candida* spp. to find the effective antifungal agents.

CONCLUSIONS

Medicinal plants can be used as a viable alternative against *Candida* species especially against drug resistance strains for the effective management of candidiasis. The study further emphasis the need of virtual high throughput screening of these compounds by the way of molecular docking and QSAR studies against various drug targets of *Candida* spp. to find the effective antifungal agents.

ABSTRACT

Background: To isolate causative bacteria and antibiotic sensitivity pattern for CSOM and confirmed with 16S rRNA for identification of bacteria. The ciprofloxacin resistant bacteria were identified with molecular markers.

Materials and Method: A total of 115 ear swabs of clinical suspected CSOM patients were cultured on specific cultured medium and identified the bacteria with both conventional and 16S rRNA methods. Then all the identified bacteria were subjected with specific antibiotics by the Kirby-Bauer's method to know the resistance pattern of antibiotics. With specific primers (molecular marker), we have identified the ciprofloxacin resistance bacteria.

Results: A total of 103 bacteria were isolated from 112 CSOM patients among them *P. aeruginosa* (29.17%), *Staphylococcus aureus* (22.40%), *A. baumannii*(13.80), *E. aerogenes*(18%), *C. freundii* (6.77%), *K. oxytoca* (6.25%), *P. vulgaris* (5.99%), *K. pneumoniae* (4.69%) and *P. mirabilis* (4%) were identified. From antibiotic disc diffusion methods 79.46% ESBL strains and 9.90% MBL strains were documented. Multidrug resistant strains of *P. aeruginosa* were more prevalent than those of *S. aureus* and other bacteria in ear discharges. The commonly used antibiotic ciprofloxacin was 55% resistant. The gene responsible for ciprofloxacin resistant gene were identified with synthesized molecular markers.

Conclusion: Continuous and periodic evaluation of microbiological profile and antimicrobial sensitivity pattern of bacterial is essential for optimum management of CSOM patients. Empirical use of antibiotic should not be practiced while prescribing drugs. PCR method should be implemented for early detection of ciprofloxacin resistance bacteria.

Keywords: Antibiotics, CSOM, MDR, Gram negative bacteria, Drug resistance

INTRODUCTION

Chronic suppurative otitis media (CSOM) is defined as a chronic inflammation of the middle ear and mastoid cavity, which presents with recurrent ear discharges or otorrhoea through a tympanic membrane perforation. The disease usually begins in childhood^{1,2} as a tympanic membrane perforation due to an acute infection of the middle ear, known as acute otitis media (AOM), or as a

sequel of less severe forms of otitis media (e.g. secretory OM)³⁻⁵. The infection may occur during the first 6 years of a child's life, with a peak around 2 years⁶. The point in time when AOM becomes CSOM is still controversial. Generally, patients with tympanic perforations

The sensitivity of bacterial detection in middle ear infections has been improved by PCR. It is useful for the detection of pathogens that are slowly growing, difficult to culture, or hazardous to handle in a diagnostic lab. In brief, the culture sensitivity method is a time consuming and required at least 3-5 days to give the report. But in the polymerase chain reaction, we can understand the resistance of ciprofloxacin with same day. After getting the result, the clinician may or may not prescribe these antibiotics^{7,8}.

The aim of this study was to determine the microbial profile (aerobic a) and the antibiograms of active CSOM patients among the patients attending at IMS and SUM Hospital, Bhubaneswar. Also developed a molecular marker for early detection of the efficacy of ciprofloxacin with the clinico-microbiological profile of CSOM and to analyze the susceptibility pattern of the aerobic bacterial isolates, so that an antibiotic policy can be formulated for CSOM, for better patient management.

MATERIALS AND METHOD

The ear swabs from clinically diagnosed CSOM cases were collected, during July 2016 to June 2017 with sterile cotton swab sticks. Pus swabs were cultured on blood and MacConkey agar plates that were incubated at 37 ° C overnight for pathogenic bacteria, which were identified according to the standard method used for bacteria⁹. Antibiotic susceptibility tests of isolated bacteria were done according to Clinical Laboratory

Standard Institute guidelines was carried out as described earlier¹⁰. Standard antimicrobial disks (HiMedia, Mumbai) used for isolated bacteria were amikacin 30, gentamicin 30, ciprofloxacin, amoxycylav 30, aztreonam 30, piperacillin 100, piperacillin/tazobactam 100/10, cefepime 30, cefoperazone 75, cefoperazone/sulbactam 75/30, ceftazidime 10, ceftriaxone 10, imipenem 10, gatifloxacin 30, Oxacilin and Vancomycin. The standard MTCC strains and all the clinical isolated bacteria were subjected to antibiotic sensitivity tests with antibiotics, by the Kirby-Bauer's method (disk diffusion) detailed previously¹¹.

RESULT

There are different number of mixed and pure cultures are there while in 12(10.43%) specimens there are no growth. On gram staining, gram positive bacteria accounted for 58(50.4%) specimens and gram negative bacteria 43(37.3%) specimens (Table 1).

Table 1: Correlation between Gram stain and Culture

Culture		Gram positive bacteria	Gram negative bacteria	
Pure Culture	Count	58	43	101
	% of total	50.40%	37.30%	87.80%
Mixed Culture	Count	1	1	2
	% of total	0.80%	0.80%	1.73%
Number of No Growth is 12(10.43%)				
Total	Count	59	44	103
	% of total	51.30%	38.20%	89.50%

Bacterial findings were categorized into gram negative bacteria and gram positive bacteria. The most common gram negative bacteria are identified which included *Pseudomonas* 30(26.08%), *Proteus* species 04(3.47%) and *Citrobacter* 03(2.60%). The most common gram positive bacteria identified which included Coagulase negative staphylococcus 30(26.08%) and *Staphylococcus aureus* 16(13.9%). Other organisms were identified in small numbers.

Table 2: Gram positive bacteria isolated

Names	Frequency	Percentage
Coagulase Negative Staphylococcus(CONS)	30	26.08%
<i>Staphylococcus aureus</i>	16	13.90%
<i>Streptococcus</i>	6	5.21%
<i>Enterococcus</i>	3	2.60%
Gram positive bacillus	3	2.60%
Total	58	50.04%

These are the total 58(50.4%) numbers of Gram positive bacteria which are isolated from pure culture (Table 2).

Table 3: Gram negative bacteria isolated

Gram Negative Bacteria		
Name	Frequency	Percentage
<i>Pseudomonas</i>	30	26.08%
<i>Acenetobacter</i>	2	1.73%
<i>Proteus species</i>	4	3.47%
<i>C.freundii</i>	1	0.80%
<i>E.aeruginosa</i>	1	0.80%
<i>Salmonella species</i>	2	1.73%
<i>Citrobacter</i>	3	0.80%
<i>Total</i>	43	37.30%

These are the total 43(37.3%) Gram negative bacteria which are isolated from pure culture.

Mixed cultures are 2(1.73%) of total specimens collected. These are the mixtures of Gram negative bacteria *Pseudomonas* and Gram positive bacteria *Enterococcus (Pseudomonas + Enterococcus)* (Table 3).

Gram positive bacteria are identified through biochemical tests such as Catalase test, Coagulase test, Bile esculine test. These all tests have both positive and negative results which are mentioned with frequencies and percentage details in the Table 1 on the above.

Similarly Gram negative bacteria are identified through the biochemical tests like Oxydase, IMViC.

In case of Antibiotic Sensitivity Test (ABST) different antibiotics are used for Gram positive and Gram negative bacteria. These are detailed mentioned in the next Table 4 & Table 5.

Table 4: Antibiotic Sensitivity and Resistance result of Gram Negative Bacteria

Organisms	CIP	LE	GEN	AZM	IC	LZ	AK	CLR	AMC	COT	TGC	NX	TI	CL	TE	MO
<i>Pseudomonas</i>	14(12.1%)	12(10.4%)	8(6.9%)	12(10.4%)	15(13.04%)	11(9.5%)	13(11.3%)	0(0%)	10(8.6%)	10(8.6%)	17(14.7%)	7(6.08%)	0(0%)	0(0%)	3(2.6%)	8(6.9%)
<i>Acenetobacter</i>	1(0.8%)	2(1.73%)	0(0%)	1(0.8%)	1(0.8%)	1(0.8%)	1(0.8%)	0(0%)	0(0%)	0(0%)	2(1.73%)	2(1.73%)	1(0.8%)	1(0.8%)	1(0.8%)	2(1.73%)
<i>Proteus sp.</i>	2(1.73%)	2(1.73%)	1(0.8%)	3(2.60%)	3(2.60%)	2(1.73%)	2(1.73%)	3(2.60%)	3(2.60%)	1(0.8%)	1(0.8%)	2(1.73%)	2(1.73%)	4(3.47%)	0(0%)	1(0.8%)
<i>C.freundii</i>	1(0.8%)	0(0%)	0(0%)	1(0.8%)	0(0%)	0(0%)	0(0%)	0(0%)	1(0.8%)	1(0.8%)	1(0.8%)	0(0%)	0(0%)	0(0%)	1(0.8%)	0(0%)
<i>E.aeruginosa</i>	1(0.8%)	0(0%)	0(0%)	0(0%)	1(0.8%)	1(0.8%)	0(0%)	1(0.8%)	0(0%)	0(0%)	1(0.8%)	0(0%)	1(0.8%)	1(0.8%)	0(0%)	1(0.8%)
<i>E.aeruginosa</i>	1(0.8%)	1(0.8%)	1(0.8%)	2(1.73%)	1(0.8%)	1(0.8%)	1(0.8%)	0(0%)	0(0%)	0(0%)	2(1.73%)	2(1.73%)	1(0.8%)	1(0.8%)	1(0.8%)	0(0%)
<i>E.aeruginosa</i>	1(0.8%)	2(1.73%)	2(1.73%)	3(2.60%)	2(1.73%)	1(0.8%)	1(0.8%)	0(0%)	0(0%)	0(0%)	0(0%)	2(1.73%)	1(0.8%)	1(0.8%)	3(2.60%)	0(0%)

The details result of Antibiotic sensitivity and resistance of each Gram negative bacteria with percentage are mentioned here in the Table 4 on the above.

Table 5: Antibiotic Sensitivity and Resistance result of Gram Positive Bacteria

Organisms	CIP	C	AMC	OX	CXM	CX	GEN	CTX	NX	OF	P	AK	NV	NA	VA	AZM
<i>CONS</i>	16(13.9%)	12(10.4%)	13(11.3%)	12(10.4%)	15(13.04%)	11(9.5%)	13(11.3%)	0(0%)	15(13.04%)	10(8.6%)	18(15.6%)	7(6.08%)	0(0%)	0(0%)	3(2.6%)	0(0%)
<i>S.aureus</i>	8(6.95%)	7(6.08%)	12(10.4%)	5(4.3%)	6(5.2%)	8(6.95%)	9(7.8%)	0(0%)	0(0%)	10(8.6%)	3(2.6%)	0(0%)	0(0%)	16(13.9%)	4(3.4%)	0(0%)
<i>Streptococcus</i>	2(1.73%)	2(1.73%)	0(0%)	0(0%)	0(0%)	6(5.2%)	3(2.6%)	1(0.8%)	4(3.4%)	5(4.3%)	4(3.4%)	0(0%)	0(0%)	6(5.2%)	0(0%)	0(0%)
<i>Enterococcus</i>	1(0.8%)	1(0.8%)	0(0%)	3(2.60%)	2(1.73%)	0(0%)	1(0.8%)	0(0%)	0(0%)	0(0%)	0(0%)	2(1.73%)	1(0.8%)	1(0.8%)	3(2.60%)	2(1.73%)

Similarly the details result of Antibiotic sensitivity and resistance of each Gram positive bacteria with percentage are mentioned here in the Table 5 on the above.

Now the lists of Ciprofloxacin resistance bacteria are mentioned in the next Table 6.

Table 6: Lists of Ciprofloxacin Resistance Bacteria

Organisms	Total Frequency of CIP resistance Organism	% of Total Frequency	Frequency of Resistance	% of Frequency of Resistance
CONS	30	26.08%	16	13.91%
S.aureus	16	13.91%	8	6.95%
Streptococcus	6	5.21%	2	1.73%
Enterococcus	3	2.60%	1	0.86%
TOTAL	55	47.82%	27	23.47%

The details result of Ciprofloxacin resistance bacteria with their frequencies and percentages are mentioned in the above Table 8. Here all the Ciprofloxacin resistance organisms are Gram positive bacteria. That means in this experiment the gram positive bacteria are well resulted as Ciprofloxacin resistance organisms. According to the table from total 55(47.82%) Gram positive bacteria 27(23.47%) are Ciprofloxacin resistance organisms. Their individual frequency and percentage are mentioned above in the Table 6.

DISCUSSION

CSOM is formed by chronic inflammation of the middle ear and mastoid mucosa in which the tympanic membrane intactness (perforation or tympanostomy tube) was disturbed and otorrhea is usually present¹². However there is no consensus about the duration of the symptoms. CSOM in some studies is described as otorrhea through a perforated tympanic membrane continuing for at least 2 weeks, whereas other studies accept this period lasting for 2-6 weeks. It is thought that CSOM develop after an unsuccessfully treated acute otitis media infection¹³. Dysfunction of the eustachian tubes and bacterial infection are the most relevant pathogenic factors for CSOM. The correct choice of antibiotics is essential for treatment, but the recent misuse and overuse of antibiotics has induced changes in predominant bacterial species and their susceptibility to antibiotics, making it more difficult to manage CSOM. It is nowadays common for an otologist to see discharging ears, whose bacterial flora have already been modified by prior antibiotic therapy leading often to sterile culture and hence treatment becomes a problem. This may be because of microbial resistance to these antibiotics

thereby suggesting their failure leading to continuation of purulent discharge in the discharging ear. It is hence important to know what type of bacteria taking part in event of suppuration so that appropriate antibiotics may be instituted early and effectively to prevent complications. Chronic otitis media is generally of long duration with repeated active inflammation. Thus, repeat empirical prescription of antibiotics over a long period of time can induce multidrug-resistant strains. Frequent local treatment during repetitive active inflammation also causes the spread of resistant strains from hospital to patients and vice versa. In our case, the patient also suffered from CSOM. Moreover recurrent CSOM is due to one or a combination of several factors¹⁴.

Analysis of the total 115 specimens collected revealed that pure and mixed culture growth were obtained in numbers of 103(89.56%) each while in 12(10.43%) specimens there was no growth. Figures reported by other authors vary significantly where pure cultures were isolated in more patients than mixed cultures. It is mostly seen that aerobic gram negative rods outnumber gram positive cocci organisms in COM as reported by some authors which is comparable to the findings in the present study where gram negative rods accounted for 43(37.39%) and gram positive cocci 55(47.82%) and gram positive bacillus 3(2.60%) which are included in gram positive cocci but not resulted as Ciprofloxacin resistance bacteria. So, these are considered as CIP resistance organisms.

CONCLUSION

CSOM is a common clinical entity where topical and systemic antibiotic are the main treatment. However the emergence of antibiotic resistant strains

is leading to increasing treatment failure. MDR strains of *P. aeruginosa* and MRSA were most prevalent in ear discharges of patients with CSOM. Continuous and periodic evaluation of microbiological profile and antimicrobial sensitivity pattern of bacterial is essential for optimum management of CSOM patients. For early detection of ciprofloxacin resistant from CSOM, the PCR method with corresponding antibiotic gene resistant primers should be implemented.

Oral Benign Fibrous Histiocytoma: Immunohistochemical Study of Two Cases

Juber Rahman¹, Sreepreeti Champatray², Swagatika Panda³, Neeta Mohanty⁴

¹Post Graduate Student, ²Senior Lecturer, ³Associate Professor, ⁴Professor and Head, Department of Oral Pathology and Microbiology, Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Fibrous histiocytoma is a benign soft tissue tumour that may present as a fibrous mass anywhere in the human body. The involvement of the oral cavity is extremely rare and very few cases have been reported in literature till date. We here report two cases of benign fibrous histiocytoma, one being present in gingiva and other in labial mucosa. Immunohistochemical evaluation of CD 68, CD 163 and S-100 are done to understand the pathogenesis of benign fibrous histiocytoma. The clinical, histopathological and immunohistochemical features of both cases are discussed precisely in the light of literature review.

Keywords: Oral benign fibrous histiocytoma, s100, CD 163, CD68

INTRODUCTION

Fibrous histiocytoma is a benign soft tissue tumour arising as a fibrous mass everywhere in the human body. The involvement of the oral cavity is rare. Fibrous histiocytoma can present as malignant fibrous histiocytoma or benign fibrous histiocytoma BFH and may involve soft tissue as well as bony hard tissue. The sites reported to be commonly affected by this tumour are: upper and lower limbs, orbit, retro peritoneum, pelvis, knee, head and neck¹. BFH is recently included in the so-called "fibrohistiocytic tumours of the soft tissues" that are divided into cutaneous and non-cutaneous types, and in the "fibrohistiocytic tumours of the bone"²⁻⁴. Although BFH is reported to occur at any age there is a greater predominance in male adults (2.5:1). It has been reported in males older than 25 years and with a mean age of 40

years. Oral BFH, in most cases present as painless solitary tumour, slowly enlarging, from 2 to 3 cm up to more than 10 cm, over a period of several months^{2,5,6}. Dysphagia, dyspnoea are most common symptoms with large lesions. Dysarthria is another symptom particularly when the lesion is located in the tongue. The treatment of choice to oral BFH is en-block surgical excision. The prognosis is good and the oral BFH recurs in cases with incomplete excision. There has been not a single reported case of metastasis of the oral BFH. However, a regular period of clinical follow-up is always recommended^{6,8}. The purpose of this article is to describe the clinical and microscopic appearance of two cases of BFH occurring in the oral cavity, focusing on the immunohistochemical profile.

Case 1: A 23-year-old female reported with a chief complaint of swelling in the right lower back teeth region. History revealed that patient was apparently alright 2 months back when she noticed a swelling in the same region. There was history of pain in the associated area. Her past medical and family history was non-contributory. Extra-orally, no abnormality was noticed. On intraoral examination mucosa over the alveolar ridge was normal in color and texture. On palpation, a soft tender swelling measuring approximately 1 cm × 1 cm was evident on the right side vestibule near to mental foramen region. Based on the nature of the swelling, located in posterior mandible, conditions

such as neurofibroma, irritation fibroma and BFH were considered in our differential diagnosis. The patient was operated under local anesthesia and the growth was excised using intraoral approach. Gross examination of the specimen revealed well encapsulated mass with areas of firm but non-mineralized yellow tan tissue.

Figure 1: Hematoxylin eosin stained image (10x) showing dense collagen fibres, spindle shaped fibroblasts, histiocytes and minimal inflammatory cells

Figure 2: Positive immunoeexpression of CD163

Figure 3: Negative immunoeexpression of S-100

The microscopic examination (Figure 1) revealed a well circumscribed lesional tissue predominantly composed of two cell population such as actively proliferating plump fibroblasts arranged in the form of streaming fascicles and islands of histiocytes. Occasional mitotic figures of fibroblasts were seen. Multiple endothelial cells lined branched blood vessels were

also seen in the given tissue. Few spindle shaped cells resembling neurites were seen in the stroma. Areas of hyalinization were noticed in the given section. Normal looking muscle fibers and nerve bundles were also evident in the given tissue. Minimal chronic inflammatory cells were noticed in the given section. The histopathological features were suggestive of BFH, Nodular fasciitis, neurofibroma etc. Immunohistochemical staining showed positive CD163 (Figure 2) and negative S100 (Figure 3) cells in the lesional tissue. The final diagnosis of benign fibrous histiocytoma was made. The patient has been followed up periodically, but no recurrence or other changes were noted for 6 months.

Figure 4: Hematoxylin eosin stained image (10x) showing dense collagen fibres, spindle shaped fibroblasts, histiocytes and minimal inflammatory cells

Figure 5: positive immunoeexpression of CD 68

Figure 6: Negative immunoeexpression of S-100

Case 2: 23 year male reported with chief complaint of growth in the lower lip since 8 months. He was apparently well until he developed a mucosal growth on lower lip which slowly increases in size to reach the present size. The growth was grey in colour and non-tender on palpation. Histopathologically the lesion revealed parakeratinized stratified squamous epithelium beneath which moderate to dense collagenous connective tissue stroma is seen. The connective tissue stroma shows diffusely arranged spindle shaped cells resembling neurites and round cells resembling histiocytes. Occasional storiform arrangement of spindle cells is noticed. Foamy histiocytes are also seen in focal areas. Diffusely arranged minimal amount of chronic inflammatory cells are arranged in the connective tissue stroma (Figure 4). Areas of myxoid changes and hyalinization are seen. Immunohistochemical staining showed positive CD 68 (Figure 5) and negative S100 cells (Figure 6) in the lesional tissue. A final diagnosis of benign fibrous Histiocytoma was made.

DISCUSSION

Until recently the term fibrous histiocytoma (FH) referred to both benign and malignant neoplasms. The differential diagnosis between the two entities was often difficult⁹. Although retained in the 2002 WHO classification of soft tissue tumours, it has long been recognised that these tumours have no relationship to true histiocytes¹⁰. The benign fibrous histiocytoma has a controversial diagnosis because of its uncertain histogenesis^{3,8,9}. The biphasic cell population of histiocytes and fibroblasts¹¹ are the most obvious microscopic feature of BFH. Resemblance of mesenchymal cells in BFH to myofibroblasts, primitive mesenchymal cells, and cells having intermediate or mixed features is noticed in few cases. The presence of a homogeneous population of fibroblast-like cells has also been described³. Both of our cases showed biphasic population with predominance of Histiocytic cells in first case and predominance of fibroblast-like spindle cells in second case. Multinucleated giant cells, abundant vascularity, and inflammatory infiltrate³ are other associated microscopic features previously described in literature though both of our cases did not show any of these. The main differential diagnosis of oral BFH includes nodular fasciitis, solitary fibrous tumour (SFT), neurofibroma (NF), and dermatofibroma (DF)¹². CD34 positivity is a useful aid for distinction between BFH and SFT, the former reported as usually

negative¹³. Differentiation between BFH and NF can be based on S-100 positivity, more frequent mitoses and different fascicle configuration for the latter¹²⁻¹⁴. BFH and DF show similar immunoreactivity^{12,15}. Distinction between cellular fibrous histiocytomas (FHs) with a deep component and dermatofibrosarcoma protuberans (DFSPs) can pose diagnostic problems. While CD68, CD34, and Factor XIIIa are helpful in distinguishing between these entities, none are diagnostically absolute. CD163 expression was found to be helpful in distinguishing between BFH and DFSPs¹⁶ which made us to evaluate CD163 immunoreexpression in the first case. The negativity for SMA and S-100 could differentiate the lesion from leiomyosarcoma and neurogenic tumours¹⁷.

Due to lack of specific markers for fibrohistiocytic lesions, the diagnosis of BFH is generally based on the absence of markers for cells of other lineages⁴. Immunohistochemical staining and ultrastructural examination of the tumours and cell lines derived from them has revealed features of myoblastic and histiocytic differentiation as evidence of mesenchymal origin⁴. Immunostaining for CD68 can be found in any tumour-containing lysosomal granules or phagolysosomes as in our case⁴. Factor XIIIa has occasionally been reported for BFH²⁸.

In the present study, the diagnosis was confirmed using immunostaining for vimentin CD68 (+) and S-100 (-) in one case whereas CD 163 (+) and S-100 (-) in another case.

Complete resection of tumour is the only treatment of choice for BFH with an excellent prognosis and nil recurrence rate¹⁵⁻¹⁸. Fewer than 5% of cutaneous fibrous histiocytomas recur following local excision whereas most reported cases of oral BFH featured no recurrences¹⁹ and no metastatic potential¹⁵⁻¹⁸.

CONCLUSION

Knowledge of such rare cases is necessary to broaden the horizon of diagnostic ability of pathologists as well as surgeons.

Hyperplasia of the Mandibular Condyle: A Rarity

Basanta Kumar Choudhury¹, Rashmita Sahoo², Satya Ranjan Misra³, Santosh Kumar Subudhi³

¹Assistant Professor, ²Tutor, ³Professor, Department of Oral Medicine & Maxillofacial Radiology, Institute of Dental Sciences, Siksha 'O' Anusandhan (deemed to be University), Bhubaneswar, India

ABSTRACT

Unilateral condylar hyperplasia (UCH) is one of the uncommon developmental disorders that affect the mandible. It is a disorder of unknown aetiology, generally unilateral and as the condyle is the growth centre for the antero-posterior growth of the mandible, it results in facial asymmetry and disfigurement. Although self-limiting the facial deformity may be extensive and even cause functional problems, hence the growth centre needs to be removed by partial condylectomy with the correction of the facial asymmetry by a combination of orthodontics and orthognathic surgery. We present a case of UCH in a 20-year-old male patient who had facial asymmetry and malocclusion and was treated with surgical excision of the hyperplastic condyle.

Keywords: condylar enlargement, developmental disorder, facial deformity, malocclusion.

INTRODUCTION

Hyperplasia of the mandibular condyle is a clinical condition of over-growth and development due to excessive uncoordinated cellular growth of one condyle of the mandible, causing facial asymmetry, mandibular deviation or deformity and condylar enlargement. In addition, an elongated condylar neck leads to articular dysfunction and malocclusion¹. Posterior open bite and occlusal slanting are the other important features of unilateral condylar hyperplasia (UCH). Since the condyle serves as a growth centre for the antero-posterior growth of the mandible and hence the face, with time the facial asymmetry and functional disturbances increase². This condition has to be differentiated from condylar neoplasm and facial hemihypertrophy, in both of which such facial asymmetry is observed. A rare case of UCH has been presented for documentation.

Case Report: A 19-year-old male patient reported to the dental hospital with swelling on the right side of the face since 6 years. History revealed the patient noticed a painless swelling on the right side of the face which has been gradually increasing in size. The swelling was not associated with toothache or any discharge. There was no history of trauma, any systemic diseases, infection, or surgery of the face and jaws. His medical, surgical, dental and family histories were non-contributory.

On examination diffuse swelling was seen in the sub-masseteric region and facial deformity was observed on the right side of the face with a prognathic mandible with a convex facial profile. [Figure 1a & b] Examination of the temporomandibular joint revealed swelling in the right TMJ with hypo-mobility. Intra-oral examination revealed class III molar relationship with anterior cross-bite.

Figure 1: A 19 year old male patient with swelling and facial asymmetry on the right side of the face, frontal view (1a) and profile view (1b)

A clinical diagnosis of Skeletal Class III with malocclusion was made. In the differential diagnosis Condylar Hyperplasia, Hemifacial Hypertrophy and Osteochondroma were considered.

INVESTIGATIONS

- Postero-Anterior view of mandible showed enlarged right mandibular condyle with deviation of mandibular midline towards the left side. [Figure 2a]

Figure 2: PA view of mandible showing enlarged condyle on right side with deviation of mandible towards contralateral side. (2a) Lateral view of skull showing a prognathic mandible with a concave facial profile. (2b)

- Lateral skull view revealed prognathic mandible and concave profile. [Figure 2b]
- Panoramic radiograph showed enlarged condyle on the right side with deformity in the right body of the mandible. [Figure 3]

Figure 3: Panoramic radiograph showing an enlarged mandibular condyle on the right side with bending of the body of mandible with downward growth

- Contrast enhanced computed tomography scan (CECT) coronal section revealed enlarged irregularly shaped right mandibular condyle. [Figure 4]

Figure 4: CECT scan of mandible, coronal section shows enlarged irregularly shaped left mandibular condyle with elongation and widening of the neck of the condyle

- Bone Scintigraphy revealed a hot spot in the right mandibular condyle. [Figure 5]

Figure 5: Bone scan (99Tc) of the face showing hotspot with increased radiotracer uptake in the right mandibular condyle

- Histopathologic evaluation of the excised mass revealed numerous cartilage cells with the bony trabeculae.

Treatment and Follow up: Partial condylectomy was done on the right side under general anaesthesia. The patient had been followed up 2 weeks after surgery and there was uneventful healing. [Figure 6] The patient is still undergoing orthodontic treatment.

Figure 6: Post-operative frontal (6a) and profile (6b) pictures of the patient following condylectomy of the right side

DISCUSSION

Unilateral Condylar Hyperplasia (UCH) is a rare developmental malformation in which there is a discrepancy in size and morphology of one of the mandibular condyles¹. This disorder occurs in the second and third decades of life and there is no side or gender predilection.² Due to the unilateral growth of the condyle there is elongation of the face towards the affected side with deviation of the chin to the contralateral side. UCH of the mandible leads to facial asymmetry, deviation, malocclusion and articular dysfunction. The aetiology of this disorder is debatable, with trauma, regional vascular stasis, endocrine disturbances, arthrosis have been proposed by various authors.²⁻⁴ UCH progresses as long there is growth and may be self-limiting with the growth of the individual.

UCH of the TMJ is an unusual condition first described by Adams in 1836 as overgrowth of the mandibular condyle which is not observed in other joints in the body.⁴ Since the condylar cartilage persists in adulthood, under some unknown stimulus it produces cartilage and it is ossified to form bone.⁵ UCH is considered a developmental disorder of the mandibular condyle which results in facial asymmetry when the hyperplasia occurs during the growth period and derangement of occlusion when the growth of the mandible is over. Hence it is both an aesthetic as well as functional disorder.

The aetio-pathogenesis of UCH is unknown. Different theories have been propounded, intrinsic and extrinsic factors have been considered. The condyle is the primary growth centre responsible for the antero-posterior growth of the mandible and chondrogenesis/osteogenesis in the periosteum covering the head of the condyle may occur due to trauma, local vascular disturbances, hormonal changes, abnormal loading and cartilaginous exostosis.⁶⁻⁹

Based on the clinical and radiographic features Obwegeser and Makak classified UCH into 3 types:

1. Hemimandibular hyperplasia (HH), it includes enlargement of condyle, condylar neck, ramus and body with tilting of the occlusal plane
2. Hemimandibular elongation (HE), it includes, condylar neck enlargement and variable displacement of the ramus and body without tilting the occlusal plane

3. Condylar hyperplasia (CH) of condyle alone.⁴

In CH, condylar enlargement, elongation of the neck of the condyle, on the ipsilateral side outward bending and downward growth of the body of mandible causing swelling and flattening of the face contra laterally are observed.¹⁰ There is slanting of the occlusal plane if the deformity occurs before the active growth phase of the individual as in the present case and posterior open bite if the abnormality occurs after puberty.

PA view of skull or mandible, panoramic radiography and lateral skull radiographs are the initial diagnostic radiographic procedures. CT scan helps to delineate the exact extent of the deformity in all aspects. To evaluate whether the condyle is still in active growth phase which is of paramount importance in surgical planning bone scan is performed as it is a non-invasive functional imaging technique which uses ⁹⁹Technetium phosphate radio-isotope. It identifies the active growth centre in the condyle if any.¹¹ Histological evaluation of the excised mass generally is used to exclude condylar neoplasms. Generally widening of the articular fibrocartilage with highly vascularized proliferation of large cartilage cells near the bony trabeculae are observed in CH.¹²

The treatment is surgical and is based on the bone growth. If there is no active growth centre in the condyle bilateral sagittal split osteotomies (BSSO) of the mandible are performed with or without a Le Fort I osteotomy of the maxilla depending on the maxillary compensatory growth.¹³ But if the growth was active like in the present case, the growth centre is removed by a high condylectomy.¹⁴

Adenoid Cystic Carcinoma of the Hard Palate: A Case Report

Satya Ranjan Misra¹, Ujjaval R Tripathy², Narottam Praharaj³, Rashmita Sahoo³, Shayari Niyogi⁴

¹Professor, Department of Oral Medicine & Maxillofacial Radiology, Institute of Dental Sciences, Siksha 'O' Anusandhan deemed to be University, Bhubaneswar, Odisha, India; ²Senior Lecturer, Hitech Dental College & Hospital, Bhubaneswar; ³Tutor, Post-graduate⁴, Department of Oral Medicine & Maxillofacial Radiology, Institute of Dental Sciences, Siksha 'O' Anusandhan deemed to be University, Bhubaneswar, Odisha, India

ABSTRACT

Adenoid cystic carcinoma (ACC) is an uncommon epithelial malignancy of the salivary glands that exhibit indolent growth and loco-regional invasion with recurrences observed after many years from the initial diagnosis. All salivary glands are affected, but the common site is the hard palate which is detected late with metastasis into the maxillary antrum or peri-neural invasion. Histologically it is classified into 3 types cribriform, tubular and solid; the solid type generally has a poor prognosis as compared to the other two varieties of adenoid cystic carcinoma. The treatment of choice is surgical excision with wide surgical margins followed by radiotherapy.

Keywords: *Indolent lesion, peri-neural invasion, salivary gland malignancy.*

INTRODUCTION

The Adenoid cystic carcinoma is a relatively uncommon epithelial malignancy of the salivary glands comprising of about a tenth of all salivary gland neoplasms and about 1% of all malignancies in the head and neck region. It is usually seen in elderly patients with a slight female gender predilection.¹ The disease is characterised by slow progression, local invasion, peri-neural spread leading to distant metastasis and is associated with high recurrence rates after surgery.² A case of adenoid cystic carcinoma of the hard palate is presented here for documentation.

Case Report: A 45 year old male patient reported to the dental hospital with the chief complaint of swelling and bleeding since 4 months. History revealed that the patient noticed a small swelling in the left side of the upper jaw which gradually grew in size and there was pain and nasal fullness/stuffiness since the past 2 months with bleeding from region of the swelling since 15 days.

Extra-oral examination revealed a single diffuse swelling on the left side of the face, measuring about 3x5 cm in size, ovoid in shape with ill-defined borders with mild tenderness elicited on palpation. Intra-orally diffuse swelling was seen on the left side of the maxilla, irregular in shape, of the oral mucosal colour, measuring about 3x5 cm in size, with a sinus having sanguineous discharge. The swelling was warm to touch with moderate tenderness on palpation, smooth surfaced, diffuse edges with tenderness in the surrounding bone. The base was sessile, the swelling was firm in consistency and attached to the underlying bone.

Correlating the history and clinical features a clinical provisional diagnosis of malignant growth left maxilla was made. Further Squamous cell carcinoma palate, Maxillary antral carcinoma, Muco-epidermoid carcinoma and Adenoid cystic carcinoma were considered in the differential diagnosis.

The following investigations were advised to come to a final diagnosis:

- Periapical & Occlusal Radiograph: Periapical and maxillary occlusal radiographs reveal obliteration haziness of maxillary antrum with indistinct floor of the antrum and destruction at some areas.
- Panoramic Radiograph: Panoramic radiograph reveals destruction of the antral floor and haziness in the antrum

- Occipitontental Radiograph: Paranasal Sinus radiograph reveals obliteration haziness of maxillary antrum with indistinct floor of the antrum and extensive destruction of the antrum including the orbital floor.
- Contrast Enhanced Computed Tomography Scan: Axial view of contrast enhanced CT scan reveals an irregular soft tissue lesion occupying the left maxillary antrum, causing expansion in the antrum with erosions in its walls. There is extension of the soft tissue mass into the pre maxillary space, left nasal cavity, left buccal and retromaxillary spaces. Sagittal view of contrast enhanced CT scan reveals an irregular soft tissue lesion occupying the left maxillary antrum, causing expansion in the antrum with erosions in its walls. Coronal view of contrast enhanced CT scan reveals an irregular soft tissue lesion occupying the left maxillary antrum, causing expansion in the antrum with erosions in its walls. There is extension of the soft tissue mass into the pre maxillary space, left nasal cavity, left buccal and retromaxillary spaces, features suggestive of carcinoma maxillary antrum.
- Histopathologic study with Hematoxylin-Eosin staining shows predominantly tubular pattern of tumour cells. (10x) Tumour cells are seen merging into the superficial stratified squamous epithelium. (10X) At high power (40x) Isomorphic darkly stained tumor cells showing a predominantly cribriform pattern containing a basophilic mucoid material. The patient was finally diagnosed with adenoid cystic carcinoma left side of the hard palate.

The treatment plan included left hemi maxillectomy and radiotherapy.

Figure 1: Diffuse swelling is seen on the left side of the face.

Figure 5: Occipitontental Radiograph: Paranasal Sinus radiograph reveals obliteration haziness of maxillary antrum with indistinct floor of the antrum and extensive destruction of the antrum including the orbital floor

Figure 6: Panoramic Radiograph: Panoramic radiograph reveals destruction of the antral floor and haziness in the antrum

Figure 7: Sagittal view of contrast enhanced CT scan reveals an irregular soft tissue lesion occupying the left maxillary antrum, causing expansion in the antrum with erosions in its walls

Figure 8: Axial view of contrast enhanced CT scan reveals an irregular soft tissue lesion occupying the left maxillary antrum, causing expansion in the antrum with erosions in its walls. There is extension of the soft tissue mass into the pre maxillary space, left nasal cavity, left buccal and retromaxillary spaces

Figure 9: Coronal view of contrast enhanced CT scan reveals an irregular soft tissue lesion occupying the left maxillary antrum, causing expansion in the antrum with erosions in its walls. There is extension of the soft tissue mass into the pre maxillary space, left nasal cavity, left buccal and retromaxillary spaces

Figure 10 a,b,c : Histopathologic study with Hematoxylin-Eosin staining shows predominantly tubular pattern of tumour cells. (10x) [a] Tumour cells are seen merging into the superficial stratified squamous epithelium. (10X)[b] At high power (40x) Isomorphic darkly stained tumor cells showing a predominantly cribriform pattern containing a basophilic mucoid material[c]

DISCUSSION

ACC was first described in 1853 by Robin and Laboulbene and then named ‘cylindroma’ by Billroth in 1856.^{3,4} Now it is characteristically an aggressive malignant epithelial tumour which is slow growing, spreading through peri-neural invasion and known for its local recurrence and ability to metastasize to distant sites.⁵ The World Health Organization has defined ACC as a “basaloid tumor consisting of epithelial and myoepithelial cells in various morphological configurations, including tubular, cribriform and solid patterns, having a relentless clinical course and commonly fatal outcome.”⁶

ACC accounts for about 5-10% of all salivary gland tumours, which in turn represent for 2-4% of all head and neck malignancies.⁷ The minor salivary glands of the posterior hard palate are the most common site of occurrence followed by the submandibular gland and parotid gland. It has no pathognomonic clinical features and an asymptomatic slow growing swelling is the most frequent presentation.⁸ The surface may be smooth or ulcerated and the consistency is usually firm, sometimes mimicking a cyst. Pain or paraesthesia may be associated and serve as a warning sign for peri-neural invasion. While the regional lymph node metastasis is rarely encountered, distant metastasis is seen, especially in recurrent cases, with the lungs as a common site of occurrence.⁹ The minor salivary glands carry a poorer prognosis as compared to major salivary glands as peri-neural spread as well as distant metastasis is a common occurrence in the former.¹⁰

Imaging plays a vital role in detection of the spread and magnetic resonance imaging (MRI) or a contrast enhanced computed tomography (CECT) scan is indicated specially to detect the extent and spread of the disease to aid in wide surgical excision to prevent recurrence.¹¹

Histologically, three variants of ACC have been described: cribriform, tubular and solid. The most frequent histologic pattern is the cribriform one and has been described conventionally as Swiss cheese appearance.¹² Peri-neural invasion through the cranial nerves, necrosis and peri-vascular invasion can be seen and serve as predictor for recurrence/ survival.¹³

The treatment of ACC depends on its extent at the time of detection and ranges from wide surgical

resection, radiotherapy, chemotherapy or a combination of all of these. The patients are kept on long term follow up owing to the high rates of recurrence.¹⁴

CONCLUSION

An inconspicuous, slow growing, firm swelling on the palate should be thoroughly investigated with ACC in the differential diagnosis owing to propensity of occurrence in that site and possible peri-neural spread to distant sites. Hence an early diagnosis ensures prompt surgical treatment and a favourable prognosis before local spread of the disease, thereby reducing the morbidity and mortality associated with it.

Conflict of Interest: None

Source of Funding: Self-funded

Ethical Clearance: The ethical clearance was obtained from Institutional Ethics committee, Institute of Medical science and SUM Hospital, Bhubaneswar, Odisha.

“Oral Health Related Quality of Life (OHQOL)–Perspectives of College Students of an Educational University in Bhubaneswar: Descriptive Cross–Sectional Study”

Dharmashree S¹, Sthitaprajna Lenka², Radha Prasanna Dalai³, Karishma Rathor⁴

¹Professor, Department of Public Health Dentistry, ²Reader, Department of Oral and Maxillofacial Surgery, ³Post Graduate Student, ⁴Tutor, Department of Public Health Dentistry, Institute of Dental Sciences, Siksha ‘O’ Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Background: In the recent times, OHQoL has emerged as an important parameter with wide implications for clinical practice and research in dentistry. OHQoL is a multi-dimensional construct, integrated into general and oral health.

Aim: To assess and evaluate the effect and impact of oral health on quality of life (QoL) among college students of Bhubaneswar.

Material and Method: 1200 professional college students aged between 18 – 23 years participated in the study. The OHQoL questionnaire which was self-administered consisted of 16 questions accounting for effect and impact of oral health on their quality of life incorporating dimensions and an individualized weighting system was filled by the participants. Chi-square test was applied for gender variations of their responses on OHQoL.

Results: 1058 students eventually returned the filled questionnaire with 88% response rate. 65.6% of the participants credited enhancement of their quality of life because of their oral health; 10.2% thought their quality of life reduced due to their oral health. Majority (75.8%) of the participants believed oral health has an impact in all physical, social and psychological ways. Females had a greater positive effect on their quality of life than males with respect to their oral health especially among physical and social aspects ($p < 0.05$).

Conclusion: College students believe that oral health impacts their quality of life in physical, social and psychological ways in a positive manner.

Keywords: College students, Oral Health, Quality of Life

INTRODUCTION

A new concept measuring quality of life (QoL) of individuals over the last few decades have emerged changing the perception of professionals. As dentists, it is imperative on our part to incorporate measuring oral health

affecting the patient’s QoL, apart from routine care in our daily practice and research work. Numerous indicators measuring the impact, perception and effects of oral health on quality of life have been developed for use in dentistry.

¹ Many authors have also attempted to conceptualize oral health and oral health related quality of life.^{2,3}

Some of the measures for OHQoL emphasize on oral health effecting negatively like Oral Health Impact Profile (OHIP)⁴ and Oral Impacts on Daily Performance (OIDP)⁵; some also stresses on the positive health and not merely absence of disease.^{6,7} But these instruments majorly measure only the prevalence of oral health effects on the individual’s QoL and does not capture

the overall impacts (Weighting) of oral health. With this backdrop, the aim of the study was to assess the effect and impact of oral health on QoL among Professional College Students of Bhubaneswar. Even though a younger population who have limited exposure to life was chosen for the present study, an effort is made to investigate the perception of youth.

MATERIAL AND METHOD

A cross-sectional descriptive study was conducted among 1200 college students of Institute of Business and Computer Sciences and SOA National Institute of Law, Bhubaneswar. All the students of two colleges were included in the study. Prior approval for conducting the study was obtained from the respective Heads of the Institutions. Keeping in mind hectic schedule of colleges, the study was largely organized during the lunch breaks and post college hours on the scheduled dates without disturbing the student’s routine classes and examinations. Ethical Clearance was obtained for the Institutional Review Board for conducting the study.

A pilot study among 50 participants was conducted to check the feasibility of the study before conducting the main study.

Inclusion Criteria:

- Students attending college on the day of data collection.
- Students who gave informed consent.
- Students who comprehended the questionnaire
- In the present study, a specially designed OHQoL questionnaire was used developed by McGrath C and Bedi R.⁸ The questionnaire used measures that assessed both effect and impact of oral health on QoL with the aid of 16 questions. Personal information of the participants like name, age, gender, address and college were also recorded. The OHQoL questionnaire was explained in detail to the participants and made to comprehend each question before administering the same to them. Each participant took approximately 10 to 15 minutes to fill the questionnaire. The data collection period was spread across two months.

The OHQoL questionnaire consisted of 16 items to record the “effect” of oral health. The participants were

then asked to grade the “impact” for each “effect” on a scale ranging from none-to-extreme “impact” to integrate weighting system. Each impact was thus scored on a scale of 1 to 9.

Scoring criteria for “Impacts”:

1. Bad effect of extreme impact
2. Bad effect of great impact
3. Bad effect of moderate impact
4. Bad effect of little impact
5. No impact
6. Good effect of little impact
7. Good effect of moderate impact
8. Good effect of great impact
9. Good effect of extreme impact

DATA ANALYSIS

The data obtained was entered into MS excel sheet for analysis (SPSS version 20.0). Descriptive statistics accompanied by Chi-square test was used to know the significant differences between gender on their responses to effect and impact of oral health on their QoL.

RESULTS

Table I: Profile of the study group

Age	Gender		n (%)
	Males n (%)	Females n (%)	
18 years	130 (40.6)	190 (59.4)	320 (30.2)
19 years	114 (36.8)	196 (63.2)	310 (29.3)
20 years	122 (53.9)	104 (46.1)	226 (21.4)
21–23 years	104 (51.5)	98 (48.5)	202 (19.1)
Total	470 (44.4)	588 (55.6)	1058 (100)

Out of 1200 subjects, 1058 eventually participated with an overall response rate of 88%. The remaining subjects were either absent on the day of data collection or did not give consent to participate in the study and hence excluded. The profile of the participants is given in Table-I.

Table II: Distribution of responses to OHQoL-Effects

Responses	Effects		
	Good effect n (%)	No effect n (%)	Bad Effect n (%)
Physical Aspects			
a) Eating	670 (63.3)	294 (27.6)	94 (8.9)
b) Appearance	564 (53.3)	344 (32.5)	150 (14.2)
c) Speech	660 (62.4)	292 (27.6)	106 (10)
d) General Health	672 (63.5)	268 (25.4)	118 (11.1)
e) Comfort	760 (71.8)	200 (18.9)	98 (9.3)
f) Breath odor	722 (68.2)	212 (20.1)	124 (11.7)
Social Aspects			
a) Social life	660 (62.4)	282 (26.6)	116 (11)
b) Romantic relationship	526 (49.7)	412 (39)	120 (11.3)
c) Smiling/Laughing	762 (72)	176 (16.7)	120 (11.3)
d) Work/usual jobs	780 (73.7)	200 (18.9)	78 (7.3)
e) Career	720 (68.1)	262 (24.7)	76 (7.2)
Psychological Aspects			
a) Confidence	750 (70.9)	204 (19.3)	104 (9.8)
b) Carefree	676 (63.9)	284 (26.8)	98 (9.3)
c) Sleep/ability to relax	688 (65.1)	280 (26.4)	90 (8.5)
d) Mood	740 (70)	190 (18)	128 (12)
e) Personality	748 (70.7)	192 (18.1)	118 (11.2)
TOTAL	65.6%	24.2%	10.2%

Table II shows the distribution of responses to OHQoL (Effects). Majority (65.6%) perceived oral health enhanced or improved their quality of life in all physical, social and psychological ways.

d) Mood	320 (68)	420 (71)	82 (17)	108 (19)	68 (15)	60 (10)	0.33
e) Personality	312 (67)	436 (74)	86 (18)	106 (18)	72 (15)	46 (8)	0.02

Table IV shows the gender variation of the effects of oral health on the respondent’s quality of life. Females in comparison to men were further likely to perceive their oral health having a positive effect on quality of life ($p < 0.05$) in almost all physical and social aspects, also on their personality ($p < 0.05$). With respect to romantic relationships, males felt oral health having more positive effect on their quality of life at $p < 0.05$.

Table V: Distribution of responses to OHQoL-Impacts (Gender Variation)

c) Sleep/ability to relax	134 (29)	146 (25)		90 (19)	138 (24)		106 (23)	112 (19)		82 (17)	116 (20)		58 (12)	76 (12)	0.56
d) Mood	82 (17)	108 (19)		104 (22)	156 (27)		116 (25)	116 (20)		106 (23)	128 (21)		62 (13)	80 (13)	0.63
e) Personality	86 (18)	106 (18)		114 (24)	120 (20)		118 (25)	148 (25)		92 (20)	152 (26)		60 (13)	62 (11)	0.45

Table V depicted the gender variation of oral health impacts on participant's quality of life. Males felt that only their speech and romantic relationships were impacted due to oral health ($p < 0.05$).

DISCUSSION

Although many studies were conducted to relate oral health with quality of life in the past few decades, this study is one of the few endeavors to comprehend how the youth identifies oral health affecting their quality of life with respect to their effect and impact.

Majority (75.8%) of the respondents in the present study felt their oral health having an effect on their quality of life. This is probably due to the instrument used as questionnaire recorded together positive and negative effects on the quality of life. Similar results were found in other studies also.^{8,9}

An interesting finding of the present study was that the participants perceived their oral health status enhancing their quality of life (Positive effect and impact) which was evident in the OHQoL scores that were skewed towards positive. Majority of the existing quality of life scales currently used mainly measure negative impacts of oral health on life quality, the burden of oral disease and fail to incorporate the positive perspective.^{10,11}

A large section of the respondents (65.6%) felt that their quality of life was enhanced by oral health in all aspects (Physical, social and psychological). The other studies showed that only physical aspects of oral health were affected, which was different from the present study where social and psychological aspects were also influenced. The reason might be due to the younger age group of the present study who have limited or partial exposure to life.

In the present study, variations in gender were quite apparent. Overall females were more likely to perceive the effect oral health was having on their quality of life in all aspects except romantic relationships. This might be because females are more likely to use dental services for their specific oral health needs, which could be crucial in comprehending oral health behavior, which includes dental attendance patterns. These gender variations were similar to other studies.^{9,12} But findings of a study by Kumar S et al¹³ in Udaipur found that females had poor OHQoL than males which is different from the observations of this study. This divergent result may be because the females in the present study represented a younger age group, who are bound to be conscious of the esthetic implications of their oral health.

CONCLUSION

The current study demonstrated that even though a younger population were included, they felt that oral health had a positive impact on their quality of life with females perceiving a more positive effect. The youth's perception of how oral health affected their quality of life may have future implications for designing potential oral health quality of life measures.

Further studies relating to the various socio-demographic profiles like age, ethnic origin and socio-economic status influences their oral health related quality of life are highly recommended in India.

Management of the Most Common Type of Anterior Temporomandibular Joint Dislocation: A Systematic Review

Rashmita Sahoo¹, Nihar Ranjan Sahoo²

¹Tutor, Department of Oral Medicine & Radiology, Institute of dental Sciences, Siksha 'O' Anusandhan, Deemed to be University, Bhubaneswar, Odisha; ²Assistant Professor, Department of Dental Surgery, MKCG MCH, Berhampur, Odisha

ABSTRACT

Objectives: This review describes the most common and standardized management approach for anterior TMJ dislocation in recent times.

Data: The authors used “Pubmed” to search relevant articles written in English. Several keywords like “temporomandibular joint”, “dislocation”, “anterior” “surgical management”, “conservative management”, “articular eminence” “articular disc” and “recent methods” are used for the search.

Sources: Abstracts and full articles were used to identify causes & pathophysiology, advanced procedure for conservative & surgical managements of temporomandibular joint dislocations.

Study selection: only those articles dealt with temporomandibular joint dislocations & its management were selected.

Conclusion: Temporomandibular Joint(TMJ) dislocation results when the condylar head of the mandible is displaced beyond the articular eminence anteriorly. Anterior dislocation of TMJ is more common than the superior, lateral, and posterior dislocation of the condyle. It is associated with the limitation of mobility due to pain, hence patients find it very difficult in performing the essential functions (speaking, chewing). Therefore, it is very important to reduce the dislocation as early as possible to prevent the difficulty in reduction in delayed case and to reduce the risk of recurrences. This will have negative impact on the quality of life of the sufferer and lead to subsequent damage to the TMJ in the long run.

Keywords: Temporomandibular joint; Dislocation; Glenoid fossa; Subluxation

INTRODUCTION

Temporomandibular joint (TMJ) is a bilateral synovial joint and it is formed by the condylar head of mandible and glenoid fossa of the temporal bone. It is a bi-articular hinge joint which produces various movements required for mastication, deglutition, talking and yawning. It is the maximum utilized joint in the human body and the most complex one also¹. When the condyle's head goes beyond the glenoid fossa, dislocation produced. The dislocation may be in any direction like anterior, posterior, medial,

lateral or superior direction. The principles for diagnosis and treatment of TMJ dislocation were proposed by Sir Astley Cooper and he also introduced the terms complete dislocation (luxation) and imperfect dislocation (subluxation) in 1932². TMJ dislocation («Open lock») is a painful condition in which there is complete displacement of the mandibular condyles from its articulating surface within the glenoid fossa, this displacement is not reducible by the patient, hence necessitating presentation in the hospital³. Subluxation-transiently displaced joint without complete loss of the articulating function². TMJ subluxation and dislocation though uncommon, accounting for less than 3% of all reported dislocated joint in the body² and are very unpleasant and distressing conditions to patients⁴. Despite a variety of classification systems, TMJ dislocation is most commonly divided into three categories: acute, chronic persistent and chronic recurrent⁴.

Patients with TMJ dislocation often present with inability to close the mouth, depression of the preauricular area, severe pain in the TMJ region and associated muscles, hypersalivation, elongation of facial profile, tension of muscles of mastication, amongst others². Acute condition is associated with more severe limitation in jaw functions. This is alarming to the patients prompting early presentation usually within the first day of occurrence, as seen in majority of the patients in this study. Patients with history of recurrence also presented very early probably due to an awareness of where to seek health care services. This finding is similar to reports by Ugboko *et al* which suggested that early presentation is due to the discomfort and disfigurement encountered by the patients⁴. Acute dislocations have rare long term effects if appropriate management is done⁵.

Chronic dislocations can be of chronic persistent or chronic recurrent types. Chronic persistent refer to dislocations which are not self-reduced and progress without treatment, and chronic recurrent dislocations in which patients gets frequent dislocations as a result of day to day activities for which the patient become both physically and emotionally distressing⁵.

TMJ dislocations could also be classified based on site (unilateral or bilateral) and direction of displacement of the condylar head (anterior, posterior, medial, lateral, superior). Though anterior dislocation is most common, it can occur in any direction particularly in condylar fractures^{3,6}.

Mechano-Pathogenesis: TMJ dislocation occurs when the head of the condyle is dislodged from its natural position in the glenoid fossa. Dislocation can be called subluxation when it is partial or incomplete and called luxation when it is complete. Based on the site of involvement it may be unilateral or bilateral. It can be acute or chronic according to the duration of dislocation⁷⁻¹⁷. Also, it can be superior, medial, lateral, anterior-medial, or posterior dislocation based on the direction of movement of head of the condyle and is due to either trauma or spontaneous dislocation,¹⁸⁻³⁰ forcefully opening the mouth during intubation for general anaesthesia, ENT/Dental procedures, endoscopy, and very wide mouth opening during yawning, laughing, vomiting and epileptic seizures³¹⁻⁴⁰. There may be the change in the condition of the components of the joint such as laxity of capsule, weakening of ligaments, small/short and atrophy of condyle, atrophy or elongation of

articular eminence and poorly grooved glenoid fossa. Some conditions which predispose for dislocations are Ehlers-Danlos syndrome, Marfan's syndrome and dystonic movements due to the side effects of drug used in many neuro-psychiatric diseases⁴¹⁻⁴⁶.

Figure 1: Anatomy of TMJ. a) Normal situation. b) Anterior TMJ dislocation (73)

The most common dislocations i.e. anterior dislocations occur when the condyle displaced anterior to the articular eminence. It is usually due to interrupted sequence of muscle action during closing of mouth from wide opening¹⁸. Before the lateral pterygoid muscle get relaxed the masseter and temporalis muscles elevate the mandible and hence the condyle came out of the fossa anterior to the eminence. Then spasm of the muscles result trismus and prevents the condyle from returning into the glenoid fossa¹⁸. Earlier there are many joint arthroscopy used to assess the position of condyle and meniscus in relation to fossa. They are Plain T.M.J x-rays the transcranio-oblique views, plain and contrast CT scans, i-CAT scans and MRI, linear and rotational plain digital tomograms etc. But recently the Dolphin imaging system which imports 2D facial photographs (facial wrap) on 3D stereographic images to enhance treatment simulation^{28,29} are very useful.

Management of acute Condition: All cases of acute dislocation can be reduced manually with the help of local or general anaesthesia, analgesic control with or without sedation. Several other methods also have been used in literature for the reduction of acute dislocation which include I) the wrist-pivot technique by Lowery *et al.* 2004¹⁸, II) combined ipsilateral staggering technique by Thomas *et al.* 2006³⁶, III) the extraoral technique by Chen *et al.* 2007⁴⁷, IV) Gag reflex procedure by Awang *et al.* 1987⁴⁸. In the gag reflex procedure the soft palate is rubbed with a dental probe/mirror to initiate relaxation of the lateral pterygoid muscle and thus spontaneous reduction and closure of the mouth. However, Hippocratic maneuver still has the highest success rate.

All non-traumatic TMJ dislocation should initially be reduced with manual reduction⁴. The greater the chance of success if the reduction is done early^{49,50}. Though the most frequently used method is the Hippocratic method of reduction^{3,50,51} (Figure 2a), studies show that the wrist pivot method also represents an alternative manual technique for TMJ reduction which is similar in success

rate, reduction-related pain and reduction time to that of the Hippocratic method of reduction^{6,50,52} (Figure 2b). Reduction can also be done by extraoral methods in patients with unilateral dislocation by considering the risk associated with the intraoral methods⁶ (Figure 2c). However, this method is somewhat more painful and time-consuming compared to the described intraoral methods⁶.

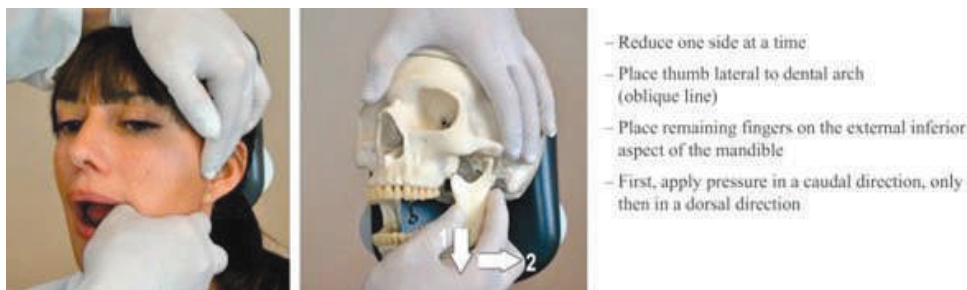

Figure 2a: Hippocratic Method of Reduction (73)

The extraoral method has a low success rate in bilateral dislocation cases (54.5% in bilateral dislocations vs 96.7% in unilateral dislocations). Hence its use is recommended only in case of increased bite or infection risks patients (for example, patients with dementia, hepatitis C infection)⁶. Figure 3 describes a flow chart of

the management of anterior TMJ dislocation. Reduction should be done with the patient in a sitting position and the patient's head stabilized using headrest^{47,52}. During intra-oral method of reduction bite blocks and gloves should be used to prevent bite injuries and associated infections^{18,52}.

Figure 2b: Wrist Pivot method of Reduction (73)

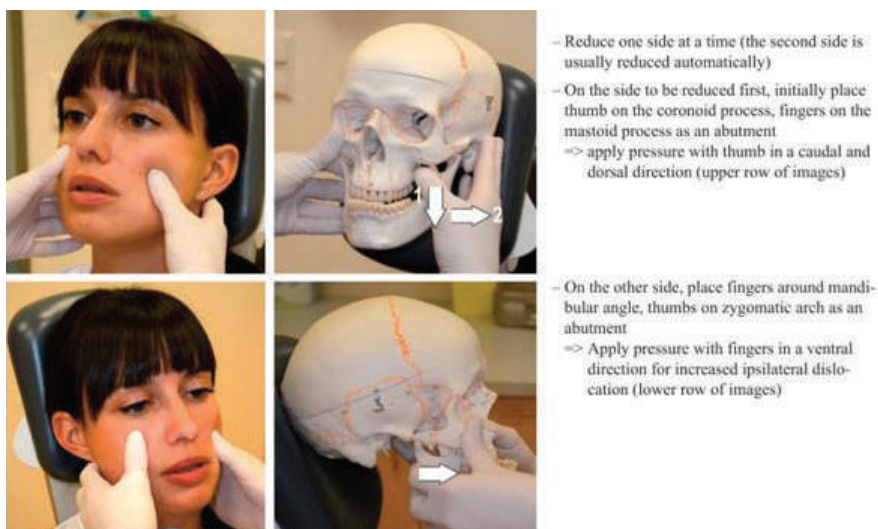

Figure 2c: Extraoral method of reduction (73)

As a general rule the physician's experience with the technique is vital to the success of the reduction and various manoeuvres can be used for the successful mobilization for reduction. Always manual reduction of an acute dislocation should initially be attempted without administration of any medications. If the attempt is painful and unsuccessful, then reduction should be attempted with medication (muscle relaxants and/or analgesics, Local / General Anesthesia).

The treatment of persistent temporomandibular joint dislocation: Approximately 30% of all TMJ dislocations are persistent dislocations types^{4,54}. When the dislocation has remained for 3 to 4 weeks, manual reduction attempts are usually no longer successful. Thus surgical reduction methods should be considered for this type of cases. The surgical methods used are Redressive methods (articular capsule opened for reduction) and more invasive techniques (eminectomy, condylectomy, special osteotomy techniques, endoprosthesis)^{3,53,54}.

The treatment of recurrent temporomandibular joint dislocation: There are at least 22% recurrent dislocations after initial dislocation⁴. Chronic recurrent dislocation cases can be treated by conservative methods like injecting sclerosing agents, autologous blood or platelet rich plasma into the lax pericapsular tissue and superior joint space weekly over a period of 6 weeks^{11,13}. The sclerosing agents used are either sodium psyllate or sodium tetradecyl sulphate. Some have also injected steroids into and around the capsule. The main role of these injections is to induce fibrosis. Moore & Wood and some other authors stated that in case of dislocation due to tardive dyskinesia and dystonias, injection of Botulinum A toxin into the lateral pterygoid muscle is done. It is a protein catalyst and prevents release of acetylcholine at the neuromuscular junction^{38,57}. It reversibly inactivates the protein that binds synaptic vesicles with the cell membrane. If it spreads to adjacent tissues, causes dysarthria, nasal speech, nasal regurgitation, painful chewing and swallowing, myasthenia gravis-like syndrome. It is contraindicated in pregnancy and lactating mothers.

Minimally invasive techniques (botulinum toxin injection, autologous blood injection, prolotherapy) for the treatment of recurrent temporomandibular joint dislocation are primarily indicated in patients with reduced compliance or increased surgical risk⁵⁷. However, long-term outcomes are often not satisfactory

and eventually invasive surgical management is required^{2,51}. Studies show that after single or multiple injections of botulinum toxin into the lateral pterygoid muscle, there are no further dislocations over a period of at least 5 months^{57,60,61}.

It is assumed that injection of autologous blood into and around the TMJ will reduce the mobility of the articular head in the long term, thus preventing recurrent dislocations. In many case studies, MRI follow up has been done after autologous blood injection. It showed that even though the development of fibrosis was not confirmed—if it were as postulated, TMJ mobility is restricted in the midterm so that the rate of recurrence of dislocation is reduced or the patient experiences no more recurrences at all. Yet, the exact underlying pathohistological mechanism remains unclear. Several studies also reported that approximately 80% of patients become symptom-free for the next 12 months and aggravation of symptoms as a complication has also not been reported^{59,62,63}. In case of prolotherapy (syn. sclerotherapy) similar assumptions are made as for treatment with autologous blood and also reported that 91% of patients experienced no recurrence of dislocation over a period of 6 months after the treatment using prolotherapy⁶⁴.

In recurrent dislocations cases, after the failure of conservative and/or minimally invasive procedures, open surgical treatment should be indicated^{59, 62}. Eminectomy, blocking or sling procedures and capsular ligament complex surgery are the most commonly used surgical techniques. Among all eminectomy procedures are the best documented and most successful techniques^{2, 49, 58}.

Lewis et al. used the Gillie's temporal approach used for zygomatic bone elevation to push the condyle into position with the help of Bristow's elevator by extending the incision to the preauricular region³⁴.

When recurrent dislocation is due to lax capsule, surgical capsulorraphy is preferred in which a wedge of the capsule is removed and the tissue repaired (capsular placcation). It restitutes and reinforces the lax capsule, in situations where the articular eminence is low and can be augmented or reconstructed with screws, plates or implants to improve the height.

Some surgeons have improved self-reduction of chronic recurrent dislocation that cannot be easily

self-reduced due to elongated articular eminence by doing total eminectomy described by Myraugh in 1951⁶⁵. Others have restricted the condylar movement by detaching the lateral pterygoid tendon via an open or closed condylotomy below the attachment of lateral pterygoid^{17, 66-69}. Recurrence is more in case of myotomy than condylotomy due to fibrosis or re-union. Another method of restricting the condyle by the use of Fascia lata, Mersilene tapes (Dacron) anchored around the zygomatic arch and passed around the condyle. Fascia lata can be easily harvested and treatment is cheaper but accompanied with many post-operative complications like pain, swelling, minor gait disturbance and movement of the lower limb⁷⁰.

In order to produce a mechanical obstacle to the condylar path, Dautery and his colleagues performed an osteotomy of the zygomatic arch and displaced the anterior segment downwards and inward to serve as a stop to the forward and upward movement of the condylar head⁷⁰. It is contraindicated in elderly patients due to the brittleness of the bone. Artificial materials like silicone wedge blocks and coralline hydroxyapatite blocks have also been used but complications like looseness, displacement and immune reactions are there for silicones.

Norman and his colleagues took bone grafts from the iliac or calvaria and placed the gap created in the middle of the articular eminence without using wires or plates for fixing the segments called interpositional eminoplasty⁴¹. On the other hand, Dautery used an onlay eminoplasty by adapting a graft (fixed with wires) directly on the eminence to increase the height⁷¹. Both procedures are used to create mechanical obstruction. The grafts must extend medially to prevent medial escape.

Dislocation due to altered disc morphology and position meniscoplasties and menisectomies are used. Total joint replacements should be considered when all appropriate treatments fail in chronic protracted and chronic recurrent dislocations and with associated degenerative joint diseases^{14, 42, 72}.

CONCLUSIONS

Small sample size, inhomogeneous study design and very short follow up are the main reasons of unreliable epidemiological data on various treatment approaches. Nevertheless, good success rates of some treatment approaches have been established as generally accepted standards on an international level. The treatment of

TMJ dislocation should be started as early as possible to limit degenerative changes or their progression and to increase the success rate of conservative/minimally invasive treatment methods. Conservative treatment approaches should be utilized appropriately before proceeding for the more invasive surgical procedures as the more complex and invasive procedures may not necessarily offer the better success. Individualized treatment approach is the best approach for selecting the treatment procedure for an individual as the success of any procedure is multifactorial. The factors include pathogenesis, age of patient, secondary diagnoses, compliance, treatment goal, and care structures, etc.

ABSTRACT

Dental caries is multifactorial disease with varying presentation and severity. If identified and corrected at an early age it can reduce the morbidity as well as health and financial burden. However planning and implementing preventive and corrective measures depends on the baseline data of caries status, which is lacking in our state.

Aim: To assess the prevalence of dental caries among preschool children of 3-5yrs in Bhubaneshwar, Odisha.

Materials and Method: A descriptive cross-sectional survey on randomly selected sample of total 780 preschool children aged 3-5yrs in Bhubaneshwar city, Odisha.

Results: The overall caries experience was found to be 31.5% in boys and 59% in girls. Incidence of caries was higher in maxillary arch in both the genders. Right side was showed higher prevalence mainly in girls.

Conclusion: The mean prevalence of caries in clearly shows the uprising caries prevalence among preschool children that indicates towards the need of implementing dental health awareness programs and planning of preventive and corrective procedures.

Keywords: dental caries, preschool children, prevalence

INTRODUCTION

Despite advances in science dental caries still remains as widely persistent vulnerable global health concern since many decades. No geographic area around the globe is spared by this. It affects all the races, sexes, socioeconomic status and every age group. In children it is the second most common reason of pain and morbidity¹

According to WHO, working definition of dental caries is “the localized posterruptive pathological process of external origin involving softening of the hard tooth tissue and proceeding to formation of dental caries. Dental caries being microbial mediated process leads to chemical dissolution of tooth structures leading to frank cavitation.²

Apart from damaging the tooth structures this disease effects every system of the body thereby negatively impacting on overall growth and development of children. The burden of caries is increasing day by day attributed to change in lifestyle and dietary pattern as well.³

Owing to sufficient scientific literature that caries is preventable, along with preventive programs and strategies implemented many developed countries have recently reported with declination in prevalence of caries among children, however in developing countries it still exists as a grave matter of concern. Global survey of WHO revealed the prevalence of dental caries 40-52% in childhood, out of which 23-40% comprised of early childhood caries.⁴

Left untreated it not only causes pain and discomfort but also affect the growth and development of dental, psychological, somatic and overall growth of children along with increase in absent from school per se. ⁵

The prevalence and pattern of dental caries have been widely studied in various parts of our country to aid in formulating a preventive population targeted specific approach. However very few scattered reports are available in our scientific literature for Odisha. Thus keeping the lacunae in mind the present study was done to evaluate the prevalence of dental caries in preschool children in Bhubaneshwar, Odisha.

MATERIALS AND METHOD

The cross-sectional study was carried out among 3-5yrs old preschool children in Bhubaneshwar city. Institutional ethical clearance and written informed consent was taken from the parents.

Inclusion criteria were children under the age of 5 years of both sexes and obtaining written informed consent from parents. Any children beyond this age group, having any systemic or congenital illness and

without informed consent from parents were excluded from the study.

The sample was selected randomly and a total of 780 children were examined by a single calibrated examiner using sterilized mouth mirror and probe in natural day light. The caries experience of primary dentition was recorded using def index (Gruebbel 1944)

The data thus obtained were computed and evaluated statistically using SPSS (version 20.0) program with significance level fixed at 5%.

RESULTS

The prevalence study was conducted among 780 children aged 3-5 yrs. Out of total subjects 400 (51%) were boys and 380 (49%) girls. The mean age of study population was 4.34±0.64 yrs. The overall prevalence of dental caries in boys was found to be 31.5% and 59% in girls.

The mean def score of total population was 2.12±1.96 and showed increase in trend with age. Significant difference was found in caries experience was found in regard to age with p-value =0.04. (Table 1)

Table 1: Prevalence of Dental Caries in Children Aged 3-5 Years

Age (in yrs)	Gender	N (%)	Children with caries	Mean def ± S.D	p-value
3-4 yrs	Boys	128 (46 %)	46 (36%)	1.094 ± 1.96	0.02
	Girls	150 (54%)	63 (42%)	1.461± 2.34	0.04
4-5 yrs	Boys	272 (54%)	144 (53%)	2.021 ± 2.14	0.05
	Girls	230 (46%)	110 (48%)	2.422 ± 1.98	0.02

Interarch comparison showed significant differences between maxillary (34.5%) and mandibular arch (27%) involvement in case of boys. However among girls there was similar bilateral distribution across both arches. (Table 2)

Table 2: Interarch Comparison of Distribution of Dental Caries

Gender	N (%)	Caries in Maxillary arch	p-value	Caries in Mandibular arch	p-value
Boys	400 (51%)	138 (34.5%)	0.02	108 (27%)	0.03
Girls	380 (49%)	200 (52.6%)	0.01	181 (47.6%)	0.05
Total	780	330 (43.3%)	0.05	289 (37 %)	0.04

Irrespective of the gender, there was increased predilection towards involvement of caries on right side with p-value =0.004 in boys and p=0.02 in girls. (Table 3)

Table 3: Distribution of Dental Caries on Sides of Oral Cavity

Gender	N (%)	Caries on Right side	Caries on Left side	p-value
Boys	400 (51%)	162 (40.6%)	88 (22%)	0.004
Girls	380 (49%)	201 (53%)	72 (36%)	0.01
Total	780	363 (46%)	160 (20.5%)	0.01

DISCUSSION

Epidemiological studies from across the world unanimously proclaimed that dental caries still exists as a serious chronic disease despite advances in scientific technology and advancement. Presently oral health is a constituent part of global and overall health care of an individual. With increasing evidence based practice and emerging concept of minimal intervention and prevention, there has been marked reduction in caries in developed countries. However in developing countries like India the burden of caries on society and financially is yet to be resolved which requires not collective effort from society, government and individuals⁶

In the present study the mean caries experience was 31.5% among boys and 59% in girls. The result obtained is though contrasting to previously documented scientific literature which showed higher predisposition of caries in boys in comparison to girls.⁷

However similar results were reported by Vinay K Chugh 2018 and Khatib N et al 2013. In Asian countries distribution of caries showed similar results in Srilanka 38% and Pakistan 51 % caries prevalence. Meena K et al also reported similar range of caries prevalence from 44-67%.^{3,4,8-11}

The mean def score in the present study was 2.12±1.96 in the present survey, which is in consensus with earlier studies by Prakasha Shrutha S et al (2.03), Virjee and Aradhya (2.3-2.9) and Mahejabeen et al (2.7). Contrasting higher mean score were reported by Dixit et al (3.50) and Singhal et al (3.74). The observed def score could be related to extended exposure in oral cavity, limited oral health awareness and underutilization of oral health care services.¹²⁻¹⁶

Evaluating the gender differences the present survey revealed higher prevalence with significantly higher def score in girls as compared to the boys. These results are in consensus with studies by Singhal et al, Rosenblatt A and Chugh VK et al.¹⁶⁻¹⁷

The higher mean def score is mere reflection of societal gender biasing as well as under utilization of dental care and deficient preventive strategies.¹⁸

Interarch comparison delineate distinct relationship wherein mandibular arch was more involved in girls but maxillary arch was more involved in case of boys. Similar findings were obtained by previous researchers illustrating higher propensity towards mandibular caries. However the gender based difference in the present study could be rooted back to nutrition and feeding practices and parent dependent oral hygiene practices.¹⁹

Regardless of gender and age, right side manifested significant proclivity (in boys 40.6% and 53% in girls) with p-value < 0.05, which was contrary to earlier studies. The observed data could be ascribed to habits as well as manual dexterity among children.²⁰⁻²¹

The present study was a field survey intended to gather baseline data for assessment of severity and according planning and implementation of preventive strategies. Being a field survey there are certain limitations as well such as nominal instruments with compromised day light, lack of confirmatory diagnosis with radiographs, higher probability of underdiagnosis of initial dental caries and proximal surface lesion, which in turn could led to misconstrue the real extent of severity.

CONCLUSION

Within the limitation of study it can be well concluded that noteworthy prevalence of caries exists among preschool children of age 3-5 years. It also indicates towards remarkable segment of population being ignorant about deleterious effects of untreated dental caries in children encompassing. Unmet consequences lead to wide array of complications ranging from pain, swelling, space infections, loss of teeth, nutritional deficiencies, and overall psychosomatic growth and development of a child along with loss of school hours. However further elaborative descriptive studies are

required to identify, control or eliminate risk factors and determinants of dental caries and also to increase oral health awareness and improving utilization of dental care services.

Conflict of Interest: None

Surgical and Aesthetic Management of Severe Dental Fluorosis Associated with Chronic Generalised Periodontitis: A Case Report

Gatha Mohanty¹, Anurag Satpathy², Rinkee Mohanty²

¹Senior Lecturer, ²Professor, Department of Periodontics and Oral Implantology, Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Developmental disturbance of enamel such as dental fluorosis is caused by excessive fluoride on ameloblasts during amelogenesis. Patients are mostly concerned about their aesthetic appearance due to discoloration and loss of tooth structure. These cases are often complicated by poor management of periodontal disease, presenting a challenge during treatment. This case report describes a combination of surgical and aesthetic procedures in management of a severe case of dental fluorosis with brown surface discoloration and small defects combined with chronic generalised periodontitis.

Keywords: dental fluorosis, periodontitis, discoloration, amelogenesis, aesthetics

INTRODUCTION

Fluoride has long been identified and used in the prevention and control of dental caries ¹. However, there are several endemic areas in India which have high water fluoride content and ² excessive fluoride may lead to dental fluorosis, skeletal fluorosis and non-skeletal fluorosis ³. Patients with dental fluorosis report with discoloration and cavitation of tooth surface and are mostly concerned about their facial aesthetics. Recently, even periodontal disease has been shown to be in association with fluorosis⁴.

Various geographical belts in Odisha such as Bolangir, Nayagarh, Angul, Dhenkanal, Jajpur, Kendrapara, Khurda, Kalahandi, Nuapada, Nowrangpur and Puri districts have considerable high fluoride content in water ⁵. The fluoride levels in the worst hit areas of Bolangir range from 1.5 ppm to 3.0 ppm. Bolangir area has people with poor socioeconomic status and minimal to no dental care available.

Though the effect of fluoride on reduction of dental caries is well established, its effect on periodontal tissues is very obscure. Similarly, in contrast to effect of fluorides, role of dental plaque is well understood. However, there is limited evidence of cases reported on the periodontal status of subjects living in high-fluoride areas. This case report describes a combination of surgical and aesthetic procedures to manage a severe case of dental fluorosis with chronic generalised periodontitis.

Case report: A 28 year male patient reported to the OPD with the chief complaint of deposits on tooth surface and discoloration of teeth. He was concerned for his compromised smile and facial aesthetics and wanted to get it corrected. Additionally, he complained of gum bleeding while brushing with intermittent pain and discomfort. He was apparently alright until he observed discoloration and surface defects on his teeth 6 years back which increased gradually to its present status. He was economically weak and hailed from Bolangir District of Odisha. His medical history was non contributory. No similar complaint was present among his parents and siblings.

Fig. 1: Pre operative view

Fig. 2: Periodontal probing

Fig. 3: Aberrant mandibular frenum

Patient was cooperative, brushed with a toothbrush and toothpaste and had no tissue abuse habits. No abnormality was detected during his extra-oral examination. Intraoral clinical examination revealed soft and oedematous gingiva with generalised bleeding on probing. Miller's Class II gingival recession was seen in relation to 31 and Miller's Class I recession in 32, 33, 34, 35 respectively (Fig1). He maintained a very poor oral hygiene with abundant plaque deposit and presence of supra and subgingival calculus. There was a presence of purulent discharge with marked halitosis (McCulloch's Grade IV). Periodontal probing was painful and was done under topical anaesthesia and was found to be around 5-6 mm in all teeth (Fig 2). However, there was no associated mobility. There was an inadequate width of attached gingiva with an aberrant labial frenum in the lower anterior region (Fig 3).

Clinical assessment of hard tissues revealed presence of 29 non-carious teeth with only one mandibular third molar. There was generalised attrition of mandibular teeth with marked attrition in 33. Molar relation showed Angle's class I occlusion associated with anterior deep bite. There was presence of dental fluorosis (Deans Index) ⁶ with evidence of severe enamel defects and brownish discoloration

Fig. 4: Panoramic Radiograph

Panoramic radiographic view showed generalised horizontal bone loss with more than two third of remaining bone support (Fig4). Routine haematological parameters were within normal range. A provisional diagnosis of mild chronic periodontitis was made taking CAL into consideration (8). The patient was explained about the condition in detail with possible plan of treatment.

Considering his young age and his concern for aesthetics, a more conservative and cost effective treatment was proposed that didn't involve significant removal of tooth structure. The patient was explained the importance of oral hygiene and the cause of gingival recession and also the need to prevent inflammation and improve the gingival status before the formal aesthetic treatment.

The proposed treatment was based on a combined approach of periodontal management and aesthetic management of the enamel surface respectively.

Fig. 5: Post scaling

Fig. 6: Epithelial Undermining

Fig. 7: Suturing

Fig. 8: Healing

Phase 1 therapy was completed and oral hygiene instructions were given. The patient was recalled after 4 weeks and showed satisfactory healing of gingiva (Fig 5). Since frenal fibres radiated into marginal gingiva producing retraction or localized gingival retraction of 31 region, Conventional and classical type of frenectomy was planned (Archer 1961, Kruger 1964). After administration of local anaesthesia by infiltration, the lower lip was extended and frenum was clamped with small hemostat to the depth of vestibule. Incision was made with Bard Parker blade #15C and the triangular frenum tissue was excised. Underlying fibrous attachment to the periosteum were released. Epithelial edges were undermined (Fig 6) and the mucosal extent of incision was sutured with a continuous modified type of interlocking suture with 4-0 mersilk (Fig 7). Sutures were removed after 7 days and healing was found to be satisfactory (Fig 8).

Fig. 9c: Fig 9b: Periodontal Surgery-3rd Quadrant

Objective of periodontal therapy was to restore the health and function of the periodontium. A full mouth periodontal surgery was carried out Kirkland flap 1931 (Fig 9 a,b,c). It included intracrevicular incisions and retraction of full thickness flaps followed by debridement. The surface defects were observed to be confined to enamel only and did not extend on to the radicular surfaces. Exposed radicular surfaces were cleaned to remove of any local deposits. Root surfaces were therefore root planed and flap was sutured by simple interrupted sutures. Necessary post surgical instructions were given. Healing was found to be satisfactory in all four quadrants.

Fig.10: Enamel microabrasion

Fig. 11: Acid etch

Fig. 12: Post etching

Fig. 13: Post Restoration

A combined approach of enamel abrasion, and composite resin infiltration for aesthetic correction was proposed for managing the enamel surface defects after 3 months. A Vita Classical shade guide (Zaharfarbnahme, Germany) was used to match the colour. Clear field was maintained throughout the procedure with help of cotton rolls, salivary ejectors, and retraction cords respectively. A chamfer finish line was used for preparing the facial surfaces (Fig 10). Prepared surfaces were acid etched with 35% phosphoric acid gel for 15 seconds, then rinsed for 10 seconds and dried (Fig 11, 12). 1100 mW/cm² intensity light cure unit was used to cure the two component adhesive system self-etch for 10 seconds, followed by a stratified layering technique that filled the tooth with micro-hybrid resin composite. Finishing and contouring was completed with finishing burs. Polishing disk, polishing paste, polishing points and

cups were used for polishing the restoration (Fig 13). Thus, correction of contour and removal of discoloration was done with a direct composite restoration which was considered as a conservative and economic alternative to full jacket crowns. Strong emphasis was given on oral home-care regimen.

The patient was satisfied with the final aesthetic result of maxillary arch. However, he was advised for similar procedure in the mandibular arch for complete and balanced aesthetics.

DISCUSSION

Dental fluorosis is a condition where cleavage and removal of enamel proteins are disturbed. Retention of the proteins and water lead to varying degrees of subsurface porosities. These porosities attract extrinsic stains causing enamel discoloration and hamper facial aesthetics. Also, the porosities are nidus for plaque and calculus accumulation leading to inflammatory periodontal disease. In addition, the fear of loss of tooth structure impedes good oral hygiene maintenance on the patient's part and results in poor oral hygiene maintenance⁷. To the best of our knowledge this is the first time a case with dental fluorosis and periodontal disease as its sequelae along with its management has been reported.

Therapy for chronic periodontitis aims to reduce etiological factors below the threshold level that is capable of producing a breakdown of disease progression and resolving inflammation⁸. Therefore, phase I therapy that includes scaling and root planing combined with motivated personal plaque control is beneficial⁹. However, for areas with attachment loss and inaccessible deep pockets need surgical attention to achieve stability of clinical attachment levels¹⁰.

While periodontal therapy will improve the periodontal support only a restorative work will be able to correct the white esthetics. Bleaching, micro-abrasion, veneering and crowning are few of the treatment options in Fluorosis. According to Thylstrup et al¹¹ more severe the enamel fluorosis, the more deep-seated are the subsurface porosities. According to Akpata et al¹², conservative management of dental fluorosis includes micro-abrasion at first and if found to be ineffective, laminate veneers can be used. In the present case, patient being young, composite resin was used. Initially, mega-

abrasion was selected to clear the superficial layer of fluoridated enamel. This eliminated deeper stains in the tooth surface and subsurface enamel was exposed to air. Low viscosity and lower enamel contact angles, with high surface tension of resin helps to penetrate porosities and rapidly occlude the pathways. Moreover similar refractive indices of resin and enamel improved the white opaque appearance of pores and reduced the original contrast between pores and enamel thereby enhancing aesthetic appearance of enamel. This technique was much cost effective than conventional treatment.

More invasive procedures such as full jacket ceramic crowns can arrest the destruction of tooth at an early age with fracture resistance, wear resistance and colour stability but are also expensive and sometimes beyond the affordability of the patient.¹³ Further fluorosis affects the bond strength of all enamel adhesive systems. Etch-and-rinse systems provide the highest bond strength to fluorosed enamel. Separate steps of etching and rinsing are required with self-etch adhesive in the case of moderate and severe enamel fluorosis¹⁴.

CONCLUSION

Dental fluorosis in endemic areas when combined with chronic generalised periodontitis can be challenging to treat. Successful non surgical and surgical phases of periodontal therapy were carried out before proceeding to restorative phase. Direct composite technique was applied to improve the structure and colour of the teeth using direct composites. The post operative outcome was found to be encouraging. However regular follow ups are needed to control the disease process.

ABSTRACT

Aesthetic outcomes have become key elements that are crucial in defining success of the implant restorations. Long-term studies demonstrated that single or multiple implants are highly predict able with high survival rates. However, in the anterior maxillary zone, the aesthetic achievement of implant therapy is as important as the implant survival rates. Several factors contribute to this “success” and can be objectively evaluated. These include the patient’s healing capabilities, the level and condition of the existings of t and hard tissues, and the provisional and final restorations. In addition to these objective factors, Implant positioning also plays a significant role in achieving this“success.”This special issue contributes to the growing body of existing literature by examining several important issues related to the aesthetic aspects of maxillary implants and their increasingly important role in implant dentistry. These include implant positioning, surgical techniques for tissue augmentation, and the aesthetics offinal implant-supported restorations.

Keywords: *Aesthetic zone, implant dentistry, implant position, emergence profile*

INTRODUCTION

Aesthetic implant therapy in the present-day scenario aims to provide asuperlativesemblance and functional treatment outcome within the provided edentulous area. With the advances in the techniques of simulating the pink and the white, which results in healthy peri-implant tissues resisting mechanical forces and bearing the masticatory load.

Dentistry has seen a significant increase in the elective treatment for better aesthetics. The success of a restoration depends on sound mechanical, biological and aesthetic principles which can be planned by optimising the health, functions and the aesthetics of the patient. It is important to undertake the treatment in the sequence where health is first, followed by function and lastly aesthetics.¹

In an aesthetically challenging situation, we have to keep in mind shape, size, position and colour of the prosthetic toothmatches perfectly with the contralateral tooth and also develop a healthy peri implant soft tissue. These factors are important in the anterior maxilla; also known as the —aesthetic zone of the oral cavity. When rehabilitation of multiple missing anterior teeth is concerned, then it possesses a challenge of deficiency of both hard and soft tissue.^{2,3} This article presents the guidelines of how to diagnose and plan an ideal implant position in the aesthetic zone.

Diagnosis and treatment planning: The first step in aesthetic treatment is communication with the patient. Each patient has certain expectations from the treatment which needs to be discussed in detail and a thorough examination should be done. Various techniques described to do a consultation for an aesthetic rehabilitation treatment include pre-op and post-op patient photographs, waxed up diagnostic casts, direct composite resin mock-ups and CBCT reports and other imaging simulations. Of the mentioned options the computer-imaging simulations offer the best idea to the patient regarding the treatment outcomes⁴.

Facial and the periodontal status should also be evaluated for the patient. A facial assessment gives insight

into general aesthetic parameters such as occlusal plane orientation, support and symmetry of the lip, gingival contour and smile line. evaluation of the edentulous site in three dimensions, provides knowledge about the occlusion, contralateral tooth and inter-arch relationships and presence of diastema. For a functionally acceptable result, a thorough periodontal investigation, home care assessment of gingival tissues and radiographic analysis should be done routinely.⁵

Assessment of the gingiva and gingival biotype:

Aesthetics in the anterior zone depends on how healthy and keratinized the gingival tissue is, which is required in both the natural dentition and implant supported prosthesis. The marginal gingiva, interdental papilla and colour and texture of the keratinized mucosa together contributes for an aesthetically pleasing implant supported prosthesis.⁶ Thus, the gingival biotype should be evaluated to determine the risk factors involved after the implant surgery.^{7,8} Two variants of gingival biotype is seen among the common masses that is the thin scalloped biotype (15%) and the thick flat biotype (85%)⁹. And when the implant placement in the anterior aesthetic site is considered, it is ideal to have a thick flat gingival biotype which exhibits less tissue shrinkage postoperatively. But if the patient presents with a thin gingival biotype which is friable with a narrow band of attached masticatory mucosa, then there are high chances of trauma while raising a flap and also this gingival biotype exhibits more chances of gingival recession both facially and inter-proximally. Thereby, thin gingival tissue biotype creates a challenging scenario when implants has to be placed in the aesthetic site where we have to keep in mind that minimum amount of trauma and laceration occurs to the gingival tissue so that a symmetrical soft tissue contour is achieved as that of the contralateral tooth and thus preventing the gingival recession over that area.

Furthermore if recession and resorption occurs, this leads to a flat gingiva between the roots exposing the implant marginally.¹⁰ So in such cases of minimal gingival thickness a soft tissue augmentation procedure is highly recommended in order to prevent the risk of aesthetic failure.¹¹ The longevity of the peri-implant soft tissue is dependent upon the amount and quality of soft tissue present not only in vertical direction but also in buccolingual direction.¹² A adequate volume and healthy soft tissue helps in providing a good emergence profile

which gives the rehabilitated tooth an appearance like a natural tooth which emerges from within the gingiva masking the metal part of the implant through the gingival cover around it.¹³

Implant Placement: The Concept Prosthetically Driven Implant Placement states that implant should be considered as the apical extension of the restoration for which prior planning of the design and location of the prosthetic part is mandatory for the surgical placement of the implant.¹⁴ Tischler came up with certain guidelines for the rehabilitation in the aesthetic zone. According to him, the surgeon should¹⁵

1. Conservative and atraumatic flap design
2. The prevalent bone and soft should be carefully evaluated.
3. The timing of the Placement of the implant has to be decided correctly.
4. The three-dimensional positioning of the implant has to be visualized prior to the implant placement
5. The healing time should be given much importance before implant loading has to be done
6. The emergence profile has to be kept in mind, if required soft tissue augmentation procedure should be performed in order to create the emergence profile around the implant after the implant placement.
7. The definitive abutment and the prosthesis should be carefully designed, if required a customised abutment design can be planned for better aesthetic result.

The Four positional parameters to look forward while planning the implant placement in the aesthetic zone are Buccolingual Position, Mesiodistal position, Apicocoronally position and Implant angulation which is of utmost importance for the treatment¹¹

Buccolingual position: If an implant is placed way too buccally, this creates occurrence of dehiscence in the buccal cortical plate which further increases the incidence of gingival recession. This placement also complicates the process of attachment of the prosthetic part over the implant. However, if implant is placed more in to the palatal aspect, then a ridge lap prosthesis is preferred in order to accommodate the excess buccal contour which results in a prosthesis that is both unhygienic and un-aesthetic.^{16,17,18}

The adequate buccolingual position of implant aids in creating a good emergence profile around the tooth, thereby helping in maintenance of oral hygiene. The thickness of the buccal wall should be maintained at least 1mm in order to prevent the gingival recession and improvising the aesthetics. Spray et al reported in their case study that as the thickness of bone approached 1.8-2mm, gradually the bone loss was also decreased.¹⁹ Thus, the implant should be placed in such a way that prosthesis that shall be provided should create a delusion of a natural tooth²⁰. In order to achieve this, the centre of the implant should match or positioned at the centre of the tooth that the implant replaces²¹

Mesiodistal position: The medio-distal position of an implant is strategically planned keeping in mind the adjacent tooth and the soft tissue surrounding the implant. Basing upon the size and edentulous site spacing, the implant position is planned mesiodistally. If the implant placed too near to the nearby tooth or implant, it will lead to the forfeit of the interproximal bone and papilla. So, a minimum distance of 1.5-2mm is mandatory to be maintained between implants and the adjacent teeth. When multiple implants have to be placed in a large edentulous area, 3-4mm of gap is highly recommended between the implants.^{22,23} When replacement of a Maxillary Central Incisor is planned, it is placed somewhat distal to impersonate the natural asymmetry of the gingival contour which is generally found anatomically with this tooth.

Apicocoronal position: Apical placement of the implant is denoted as the Countersink. For desirable aesthetic result, the metallic part of the implant should not be visible for which countersinking of the osteotomy site is required. The amount of countersink required depends solely upon the diameter of the implant planned to be placed.²⁴ If a wider implant is selected, then less countersinking of the osteotomy is required. This distance measured from the platform till the gingival margin is implied as "Running Room". The countersink which shall be performed should provide sufficient running room that helps in a steady shift between the implant platform and the contour of the definitive prosthesis that has been planned.¹¹

Howsoever, there shall be more amount of crestal bone loss when the implant-abutment interface is placed too apically in order to establish the healthy peri-implant biological width.^{25,26} The crestal bone that has been lost is re-established 1.5mm apical to the implant-abutment

interface which is called as Micro-Gap. Determining the pico-coronal position helps to maintain a balance between the health as well as meets the aesthetic demand in the anterior zone by creating an adequate emergence profile.

Implant angulation: Ideally, implants that are placed should have an abutment, that provides the prosthesis a natural tooth like appearance. When a screw retained prosthesis is planned, due to angulation error in the implant placement, the screw access hole location can impede the aesthetics in that zone.²⁷ Under these circumstances an angled or customised abutment should be planned for the patient where the normal alignment of the abutment and the prosthetic part is not possible. Furthermore, prefabricated surgical stents reduces the angulation error. In the maxillary central incisor region, palatal placement of the implant is advised in order to increase the bulk of the labial soft tissue and elude the glitches associated with the thin buccal walls.

Timing of implant placement: It is one of the most crucial aspect to be considered while placing implant in the anterior aesthetic zone. Garber categorised the three different timings for implant placement²⁸:

1. Placing the implant immediately following an atraumatic extraction
2. Implant placed 8 weeks after the extraction
3. Implant placed 3-4 months after the extraction

Broadly the timing of the implant placement is described under two situations firstly, immediate extraction and placement of the implant and the other is delayed placement of the implant after certain time interval.

Immediate implant placement at the time of surgery:

Following a tooth extraction, a substantial amount of alveolar ridge collapse occurs due to the bone resorption process. Around 3 to 4 mm of bone loss occurs during the first 6 months following an extraction which drastically reduces the amount of bone available at the site of implant placement. These defects can be corrected through complex regenerative procedure which adds on to the cost of the treatment and also increase the duration of the treatment procedure. To avoid such circumstances, immediate placement of implants is being opted now a days following a tooth extraction. This technique not only helps in the preservation of the hard and soft tissues but also remarkably reduces the treatment time.

Initially longer and wider implants were used for primary implant stability, which derived its support by engaging in to the apical and palatal portion of the socket.¹¹ Since through immediate implant placement the soft tissue hard tissue contour can be maintained by preserving the tooth emergence profile, hence this treatment modality is considered while placing implants in the aestheticsite. However, sometimes due to poor treatment plan and surgical catastrophe, deteriorated aesthetic resultsshould be expected following immediate placement of the implant.It can be done following an Atraumatic Extraction. After a thorough inspection of the tooth to be extracted both clinically and radiographically, it is extracted such that minimal trauma is caused to the buccal bone and surrounding soft tissue. To achieve minimal trauma instruments such as Peristome, is introduced in to the PDL space, to split the PDL from the tooth to be extracted. Thus, to protect the integrity of the socket, the tooth to be extracted is sectioned in to 2-3 parts and then each fragment is carefully removed without damaging the soft tissue surrounding the tooth.²⁹ The major aspect of a traumatic extraction is that the surgeon should defer reflecting a flap as much as possible so that the vascular supply and the periosteum that covers the bone is safeguarded thereby preventing bone resorption in the implant site.The extraction socket is debrided and evaluated carefully once the extraction is completed.³⁰

If immediate implant placement is planned, following factors should be kept in mind ¹¹:

1. No acute non-contained infection should be present;
2. Initial primary stability should be achieved; and
3. The quality and quantity of bone should be adequate

When a pathological infection is present in an extraction socket, then implant placement is deferred until 3 weeks until the infection has resolved completely with adequate amount of soft tissue healing.¹⁵ The socket wall when intact at both horizontal and vertical level after extraction, then immediate implant placement can be done. The initial primary implant stability can be obtained using a long implant which engages both apically and palatably. Even tapered implants or wider diameter implants are preferred as they better engage in to the bony walls.¹¹

1mm of buccal plate is required in order to enhance longevity of the implant and decrease the gingival recession. Along with-its soft tissue augmentation procedure may be required for the patient with a friable and thin gingival biotype to that prevents buccal bone resorption and gingival recession

Delayed implant placement (implant placement in edentulous sites): When an implant is planned to be placed in an edentulous site, the site should be carefully evaluated. A classification of such sites has been proposed by Garber ³¹

Garber Class I: Ideal positioning of implant is preferred, when adequate amount of bone and soft tissue present both horizontally and vertically. In a thin gingival biotype cases, along with implant placement a soft tissue augmentation procedure is planned.

Garber Class II: Bone expansion is done using serial osteotomes in those implant sites, where no vertical bone loss is present but horizontal bone loss of 1-2mm is present. This procedure was described by Summers.³² In this technique, expansion of the bony ridge is done horizontally by compressing the maxillary bone.

Garber Class III: Implant placement can be done in those cases with no vertical bone loss but a horizontal bone loss greater than Class -II. For such cases Guided Bone Regeneration has to be done mandatorily.

Garber Class IV: When there is significant amount of horizontal bone loss present in the implant site, but no vertical bone loss can be seen, then a staged implant placement approach has to be followed where the bony ridge is widened with guided bone regeneration technique. Then after a healing period of 4-6months, implant placement has to be done. Autogenous bone graft is the graft material of choice in such cases.

Garber Class V: In cases with apico-coronal bone loss, placing implant becomes challenging. There are no predictable and well documented surgical records available to determine the success of the treatment. In certain case reports, a guided bone regeneration using a non-resorbable membrane and delayed implant placement.³³ Some investigators suggested the use of submerged implant as device that helps in making space under the membrane.³⁴ Distraction osteogenesis procedure is used in order to increase the ridge height, but no follow up cases and clinical data is available regarding its use.³⁵

Flap management plays a pivotal role in the treatment success of the aesthetic site. For the preservation of the blood supply to the flap, proper incision design and flap design should be done prior to the start of the treatment. The main idea is to have anatraumatic extraction site for the implant placement with intact buccal bone plate and adjacent walls. For example, a papilla sparing incision preserves the blood supply to the interdental papillae and minimizes postsurgical recession.¹¹

CONCLUSION

Aesthetic zone is an important part of the dentoalveolar segment which comprises of the teeth, gingiva and the lips. This altogether determines the smile and aesthetics of the patient face. Thus, aesthetic implant therapy not only helps to achieve a perfect smile for the patient but also addresses the need of impairment and disability resulting from the aesthetic deficiency. There is inadequate scientific data proclaiming the success of the techniques used in implant placement in the anterior aesthetic zone despite improvement in clinical practice. Still standard surgical and prosthetic protocol should be followed during and after the implant placement in order to achieve required clinical outcome.
