Study of Quality of life at Worker User Train *Commuter line* and TransJakarta Busway Bogor - Jakarta 2018

David Kusmawan¹, Indri Hapsari Susilowati², Mufti Wirawan²

¹Master Students at Department of Occupational Health and Safety, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia, ²Department of Occupational Health and Safety, Faculty of Public Health, Universitas Indonesia, Depok, Indonesia

ABSTRACT

Many studies have concluded that commuting activities have an impact on the quality of life of commuters on physical, mental / psychological, health, and social / environmental aspects. The objective of this study is to determine the quality of life of commuting workers who use busway Transjakarta and train commuter line modes of transportation from Bogor to Jakarta and the influencing factors. This study was conducted using cross sectional design with WHO Quality of Life BREF questionnaire. The result was analyzed using univariate and bivariate by Chi square. The result shows the respondents have used train commuter line for ≥ 4 years (50.6%) while workers using the Transjakarta for <4 years are 52.5% with the frequency of ten times a week for train commuter line (72.4%). The quality of life of the users of commuter line and busway Transjakarta is categorized as good by percentage of 57.1% and 70%. The psychological and environmental domains have the highest scores on both transportation modes, while the physical domain has the lowest score. The bivariate analysis reveals that the quality of life of workers using train commuter line is affected by income and psychological conditions, while that of the workers using busway Transjakarta is affected by the types of work

Keywords: *Quality of Life, WHOQOL- BREF, Worker Commuter, Busway Transjakarta, KRL Commuter line*

INTRODUCTION

Many previous studies concluded that commuting affects the quality of life of commuters on the physical and mental/psychological aspects, as well as their health, and social/environment ¹⁻⁶. The psychological aspect of the commuters are also affected, for example they become stressed out while commuting that increases bad mood which can cause anxiety, low tolerance, frustration ^{1,4,7,8}, impatience while driving ^{9,10}, and feeling unhappy. Another study found the level of quality of life and happiness of commuters using public transportation is lower than non-commuters ^{4,11}.

Besides the physical and psychological effects, commuting also affects the social aspect, i.e. social capital/modal. Commuters tend to limit their free time for social and recreational activities and create negative

externalities in the community by reducing participatory activities¹². In fact, social capital can be the resource that arises from social relations in the community that can be used to solve problems both individually and collectively¹³. Moreover, another study showed that public transportation commuters with longer duration had lower community social participation¹³.

Another study presented that the duration of commuting leads to higher health risk if the commuters use private cars rather than public transportation. Car users have lower health condition, lower life satisfaction and higher Body Mass Index than public transportation commuters⁶. Commuter line users can also be potentially exposed to Particulate Matter (PM) and Ultrafine Particles (UFPs)^{14,15}, respiratory tract problems due to air pollution¹⁵. Air pollution produces pollutant, including particulate matter (PM), carbon monoxide (CO), nitrogen dioxide (NO₂), volatile organic compounds (VOCs), and polycyclic aromatic hydrocarbons (PAHs)¹⁶.

Based on the background and description above, the objective of this research is to elaborate the quality of life of commuter line workers that use Transjakarta Busway and commuter line train from Bogor to Jakarta and the factors that affect it.

METHOD

This study was conducted using a cross sectional design. The samples of this study are respondents from commuters/users who started their commute to work from Bogor station and Depok station, and the Transjakarta Busway users who started their commute to work from Cibinong terminal and Bogor terminal to their destination, Jakarta in April until June 2018. The total respondents were 196 people. The primary data

of this study were collected using WHOOL-BREF questionnaire and trip-inconvenience questionnaire, Health Conditions, Psychological Conditions, and Bad Experience. The data were analyzed using univariate descriptive and bivariate by Chi square test using SPSS 20 software.

RESULTS

This following is the social demographic characteristic of workers using commuter line train and workers using Transjakarta Busway based on their age, gender, educational level, type of job, income, marital status, number of children, duration the transportation mode usage, and frequency of using mask.

Table 1 : Social Demographic Characteristic Workers Using Commuter Line Train and Workers Using Transjakarta Busway (N=156) and Busway Transjakarta (N=40)

Respondents' Characteristics	Commuter Line Train Percentage		Transjakarta Busway	
	n	Percentage	n	Percentage
Age				
≤ 29 years old	71		13	32,50
> 29 years old	85		27	67,50
		45,5		
		54,5		
Gender				
Male	82	52,6	23	57,50
Female	74	47,4	17	42,50
Educational Level				
Middle/High School	13	8,3	1	2,50
College (Diploma/Bachelor/ Magister/ Doctoral)	143	91,7	39	97,5
Type of Job				
Government Employee(s)	46	29,5	9	22,5
Private Company Employee(s)	85	54,4	22	55,0
Entrepreneur(s)	6	3,8	3	7,50
Others	19	12,2	6	15,0
Income (IDR)				
3 million – 6 million	56	35,9	13	32,5
6 million – 9 million	52	33,3	13	32,5
9 million – 12 million	25	16,0	6	25,0
> 12 million	23	14,7	8	20,0
Marital Status				
Single	61	39,1	12	30,0
Married	95	60,9	28	70,0

Cont... Table 1 : Social Demographic Characteristic Workers Using Commuter Line Train and Workers Using Transjakarta Busway (N=156) and Busway Transjakarta (N=40)

Duration of Transportation Mode Usage (years) < 4 years ≥ 4 years	77 79	49,4 50,6	21 19	52,5 47,5
Frequency of Transportation Mode Usage (in week) < 10 times ≥ 10 times	43 113	27,6 72,4	21 19	52,5 47,5

Quality of life of commuter line train users and Transjakarta Busway users include physical domain, psychological domain, social relations domain, and environmental domain. The first domain score of commuting workers of the commuter line train and Transjakarta Busway is physical condition (physical domain), the score from second domain is the psychological condition (psychological domain), the third domain score is social relation of the commuting workers using commuter line train and Transjakarta Busway. The fourth domain score is the environmental condition of the commuting workers using commuter

line train and Transjakarta Busway.

Hereafter, to make the analysis easier, the researcher grouped the quality of life score into two parts, namely poor and good, based on the respondents' answer regarding their quality of life, with the result that the commuting workers of the commuter line train has a good quality of life by 57,1% and poor quality of life by 42.9%. On the other hand, the Transjakarta Busway users has a good quality of life by 70% and poor quality of life by 30% as presented in Table 2 below.

Table 2 : Respondents Distribution Based on Quality of Life Level

Quality of Life	Commuter Line Train		Transjakarta Busway	
	Frequency	Percentage	Frequency	Percentage
Less/ Poor	67	42.9	12	30,0
Good	89	57,1	28	70,0

The result of the bivariate analysis to see the correlation between two variables as presented in table 3, namely the relation of quality of life with social demography of commuter workers of commuter line train and Transjakarta Busway, which is correlated with the income and type of job.

Table 3: Correlation of Quality of Life with Social Demography of Commuter Workers of Commuter Line Train and Transjakarta Busway

Variable	QOL Commuter Line		P value	OR	QOL Transjakarta		P value	OR
	Poor	Good			Poor	Good

DISCUSSION

The profession with the highest percentage among the commuter workers of commuter line train is Private Company Employees by 54.4%, so does with the users of Transjakarta Busway by 55%. It is in line with Central Bureau of Statistics survey data on 2014¹⁷ that the the business fields with the biggest number of commuter workers of commuter line train include industries, trade, social services, social, and accommodation. These business fields need employees as labor/manpower, which means that most workers are private company employees.

The amount of income with the highest percentage among commuter workers of commuter line train is 3 – 6 million by 35.9%, as is Transjakarta Busway workers by 32.5%. The DKI Jakarta Provincial Minimum Salary in 2018 is Rp. 3,600,000.00. It means that the average income of the respondents working in Jakarta is in accordance with DKI Jakarta Provincial Minimum Salary.

The biggest inconvenience of the trip felt by commuter line users is the crowded condition, meanwhile the lowest is accidents. For the Transjakarta Busway users, the biggest inconvenience of the trip was

traffic jam, and the lowest perceived was noise. Crowded condition was the most affecting the inconvenience perceived by commuter line train users. The researcher believes that crowded condition occurs due to the large number of workers using commuter line train. The result of a survey conducted by Central Bureau of Statistics in 2014¹⁷ indicate that there were 149,921,245 users of the commuter line train from Bogor to Jakarta.

For health condition, the complaint with the highest percentage from commuter line users is muscle aches, meanwhile the lowest percentage is nausea. It is the same as Transjakarta Busway users that the complaint with the highest percentage is muscle aches, meanwhile the lowest percentage is nausea. Bowling (2001)¹⁸ stated that the transportation problem is one factor correlated with quality of life level that can cause health condition.

For psychological condition, the highest perceived by commuter line train users is inconvenience/discomfort, meanwhile the lowest perceived is the miserable situation, and so are with Transjakarta Busway users. These are caused by the condition inside the commuter line train or Transjakarta Busway which can be filled with passengers causing the passengers to jostle. For bad experience, the most experienced by commuter line users is schedule delay, while the most infrequent occurrence

is accident, and so are for Transjakarta Busway users.

The commuter workers on both commuter line train or Transjakarta Busway obtain lowest score to physical domain. Temporarily, it can be said that the workers has lack of ability to resolve the factors that affect physical condition, such as illness, sleep quality, energy and fatigue, mobility, activities in daily life, dependence on medication or medical therapy. The most common factor experienced by commuter line train and Transjakarta Busway workers is in terms of sleep quality problems. It is possible because the factors of fatigue and daily routines caused by waking up early and going home from work late at night are related to the workers having to pursue the commuter line train or Transjakarta Busway schedule.

The domains of commuter line train and Transjakarta Busway workers with the highest score are psychological and environmental domains. For the moment, it can be said on both commuter workers of commuter line train and Transjakarta Busway have better psychological and environmental domain compared to physical and social domain. Also, both of those have good quality for psychological and environmental condition. The environmental domain includes financial source, freedom, physical safety, dan security, health treatment, and social care, homey feeling, the opportunity to get and receive a lot of new information and new skills, the opportunity to do recreation or activities, physical environment, and transportation.

For psychological domain, it can be said that commuter line train and Transjakarta Busway users have good capability/ability such as bodily and appearance, positive and negative perceived, self-esteem, thinking, learning, memory and concentration, and spiritual aspect.

In this research, the factors correlating with quality of life of commuter line train workers are psychological condition and income, meanwhile for Transjakarta Busway workers there is no dominant variable. Social demographic factors influence the quality of life among Indonesian workers, as well as job characteristics (work status, work shift and work area condition), individual characteristics (educational level) and lifestyle (sleep duration and exercise habit)¹⁹. Other study found lifestyle, working characteristics, workplace conditions were associated with QOL among SME workers in

South East Asian Countries²⁰. Another previous study by Dalkey (2002)²¹ found the influence from demographic factor is income with subjective perceived quality of life. It is presented that the respondents who make less than the Provincial Minimum Salary are more at risk to experience stress than workers whose income is above the Provincial Minimum Salary.

CONCLUSION

The percentage of quality of life of commuter workers using commuter line train and Transjakarta Busway whose workplace is in Jakarta categorized as good is 57.10% and 70%. Environmental and psychological conditions are domains that have the highest score to commuter workers using commuter line train and Transjakarta Busway. From the bivariate analysis, the significant correlation variables to quality of life of commuter line train workers are the income and psychological condition variables, whereas correlation variable the quality of life of Transjakarta Busway workers is type of job variable.

Conflict of Interest: None

The Effect of Sleep Hygiene and Brain Gym on Increasing Elderly Comfort and Sleep Quality

Nursalam¹, Fitriana Kurniasari S², Elida Ulfiana¹, Ferry Efendi¹

¹Faculty of Nursing, Universitas Airlangga, ²Polytechnic of Health, Ministry of Health, Malang

ABSTRACT

Introduction: Quality of life is one of the important things to consider, with the increasing number of elderly people, the number of problems and the number of elderly people living in nursing homes also increased. The greatest need for the elderly is the level of health, so that one can live a prosperous life by applying a healthy sleep pattern and carrying out physical exercise. The purpose of this study was to determine the effect of sleep hygiene and brain gym on increasing comfort in the elderly. **Method:** This type of research is a pretest posttest with control group design quasy experiment. The sampling method used was purposive sampling as many as 50 people and had fulfilled the inclusion and exclusion criteria. Sleep hygiene intervention was applied every day for 30 days, and the brain gym was held as many as 16x meetings for 4 weeks. The statistical test used is the independent t-test to test the hypothesis. **Result:** The independent t-test hypothesis test results are 0,000. This study showed significant results on the treatment group, which means that there is an effect of sleep hygiene and brain gym on increasing comfort and sleep quality in the elderly. **Conclusion:** Intervention of sleep hygiene and brain gym can improve comfort and sleep quality in the elderly.

Keyword: *sleep hygiene, brain gym, comfort, sleep quality, elderly*

INTRODUCTION

Aging process is a natural process which is accompanied by a decrease in physical, psychological and social conditions that interact with one another. The greatest need for the elderly is the level of health, in order to live well. Improving the welfare of the elderly is carried out by a series of activities carried out in a coordinated manner between the government and the community to empower the elderly so that the elderly can still carry out their social functions and play an active role naturally in the life of society, nation and state¹.

The central bureau of statistics projects that the elderly population (60+) was expected to increase to 27.1 million by 2020, to 33.7 million in 2025 and 48.2 million in 2035¹. The results of the 2010 population census show that Indonesia is among the top five countries with the highest number of elderly population in the world, reaching 18.1 million people or 7.6 percent of the total population.

Sleep deprivation in the elderly influences physical, cognitive abilities and quality of life. Elderly people who experience sleep disorders will experience an

increase in the amount of sleep during the day, problems with attention and memory, depression, the possibility of falling at night, and low quality of life²³. During NREM a person experiences 4 stages during the sleep cycle. Stages 1 and 2 are characteristic of superficial sleep and someone is easier to wake up. Stage 3 and 4 are deep sleep and difficult to wake up^{4,5}.

Kolcaba introduces the theory of convenience as the middle range theory⁶. Kolcaba relates these three types of comfort to four comfort contexts, namely physical, psychospiritual, environmental, and social^{7,8}. Fulfillment of basic human functions can be provided with comforting intervention to achieve the comfort needs of recipients of care, including physiological, social, cultural, economic, psychological, spiritual, environmental, and physical interventions⁹. One way of comforting intervention to meet the comfort needs of the elderly from physical and environmental aspects is by applying sleep hygiene and brain gym implementation.

Sleep hygiene is an exercise or habit that can affect sleep¹⁰. Improving sleep hygiene in the elderly is a simple but effective way to improve sleep quality¹¹. Good

sleep hygiene behavior can prevent the development of disturbances and sleep problems¹². That means good sleep hygiene behavior can help a person to have good sleep quality. Sleep and sleep disturbances during the day indicate that a person has poor sleep hygiene. Poor behavior of sleep hygiene in the elderly for example the elderly often spend more time in bed or intermittently falling asleep during the day more awake at night¹³. Sleep hygiene is applied to the elderly to achieve REM sleep, loss of muscle tension, increased cerebral activity (oxygen consumption, blood flow, neural stimulation), release of epinephrine, and β waves which cause a relaxed or comfortable feeling¹⁴.

Types of physical activity in the elderly include aerobic exercise, muscle strengthening, flexibility, and balance training¹⁵. Brain gym is an activity that aims to maintain brain health with simple movements¹⁶. In principle, the basics of brain gym are to train the brain to stay fit and relieve stress¹⁷. Physical activity that is beneficial for the health of the elderly should meet the FITT criteria (frequency, intensity, time, type). Frequency is how often the activity is carried out, how many days in a week. Intensity is how hard an activity is carried out. Usually classified into low, medium and high intensity. Time refers to the duration, how long an activity is carried out in a meeting, while the type of activity is the types of physical activity carried out¹⁶.

In planning long-term efforts, the government must maintain and improve the quality of life of the elderly¹⁸. Through brain gym the elderly are trained to be able to bring about a relaxation response so that they can reach a state of calm. This relaxation response occurs through a significant decrease in the body's oxygen requirements, which in turn will flow smoothly, the neurotransmitter will be released, the nervous system will work properly so that the muscles of the body that relax can cause a feeling of calm and comfort. The three types of comfort are: relief which means when the specific comfort needed by the client is fulfilled, ease means when the client feels calm and satisfied, and the latter is transcendence when the client succeeds in exceeding the need for comfort⁹.

Sleep quality changes as a function of normal aging, both in terms of decreased duration and consolidation^{19,20}. The Pittsburgh Sleep Quality Index (PSQI)²¹ was originally developed to provide clinicians with a valid, standardized measure of sleep quality that could reliably categorize individuals as either "good"

or "poor" sleepers. This 19-item questionnaire assesses sleep quality using subjective ratings for 7 different components (i.e., sleep quality; sleep latency; sleep duration; habitual sleep efficiency; sleep disturbance; use of sleeping medication; and daytime dysfunction). Respondents are asked to answer the questionnaire retrospectively, surveying sleep components spanning the previous month. The PSQI is quick and easy to administer, and score; making it an attractive tool for sleep quality assessments.

METHOD

This research was conducted from August to September 2018 at the social institution in Malang. The study used a quasy pretest posttest with control group group analysis that was intervened according to the planned trial protocol, in the treatment group, whereas in the non-intervention group there was no intervention or intervention other than the one being tested. The implementation of sleep hygiene is applied every day for 30 days and brain gym is done for 4x in a week with a duration of 15-20 minutes and is done for 30 days. The sample of this study amounted to 50 respondents using purposive sampling technique. The statistical test used is the independent t-test to test the hypothesis²². The sample in this study was taken according to the criteria of the researchers as many as 50 elderly.

RESULTS

The results of this study were processed using a contingency coefficient correlation test with the help of the Statistical Product and Service Solution (SPSS) program. Based on Table 1 shows that the characteristics of respondents based on age, the most respondents have age 75-90 years (old) as many as 28 respondents (56%). More female sex characteristics than women, as many as 37 respondents (74%). Characteristics of education, the highest number of respondents were high school, namely 18 respondents (36%). The characteristics of the length of stay in the institution of the longest number of respondents is -51-5 years as many as 23 respondents (46%).

Table 1. Characteristics Distribution of the Respondents

Karakteristik f (%)		Total %
Age		
	Age 60-70 years old (<i>elderly</i>)	22 (44)
	Age 75-90 years old (<i>old</i>)	28 (56)
	Age > 90 years old (<i>very old</i>)	-
Gender		
	Male	13 (26)
	Female	37 (74)
Education		
	Not completed primary school	8 (16)
	Elementary School	13 (26)
	Junior High School	11 (22)
	Senior High School	18 (36)
period of staying in the elderly nursing house		
	< 1 years	17 (34)
	≥ 1- 5 years	23 (46)
	> 5 years	10 (20)

Based on table 2, the mean of comfort at posttest is 75.90 and the average post test is 7.055. The mean of sleep quality at posttest is 8.35 and the average post test is 2.207. It was seen that there was an increase in the average of comfort and sleep quality before and after being given intervention. To find out whether there is a difference between treatment and control, a paired sample t-test is performed, but normality testing is done first. The results of the Shapiro-Wilk normality test showed

that the convenience variable was normally distributed with a significance value of more than 0.05. The results of the independent test t-test after intervention in the treatment and control groups, for comfort variables, β endorphin and sleep quality obtained $p < 0.05$. In the convenience variable $p = 0,000$ and sleep quality $p = 0,000$ shows that there is a significant difference in the comfort and quality of sleep between the treatment and control groups after getting an intervention combination of sleep hygiene and brain gym.

Table 2 the Hypothesis Test of the Treatment Group and the Control Group

Group	N	Intervention				Control				Significance	Remarks
		$\bar{X} \pm SD$	Min	Max	$\bar{X} \pm SD$	Min	Max				
<i>Comfort Post</i>	50	75.96 ± 6.50	62	87	65.04 ± 4.90	55	79	0,000	Significant		
<i>Sleep quality post</i>	50	8.44 ± 2.00	4	11	5.76 ± 1.09	4	8				

Based on table 3 shows the change in the comfort and sleep quality of pre and post test in the treatment and control groups by using paired t-test test obtained $p = 0,000$ and $p = 0.001$ which means that there is a significant difference in the level of comfort and quality of sleep between before and after intervention.

Table 3 Paired t-test test results on treatment and control groups

Variabel	N	Sig. (2-tailed)
<i>Comfort Pre test</i>	50	.320
<i>Comfort Post test</i>	50	.000
<i>Sleep quality Pre test</i>	50	.030
<i>Sleep quality Post test</i>	50	.001

DISCUSSION

An experimental study provided interventions in the form of physical activity and the application of good sleep hygiene for the elderly for 16 weeks and the results were significantly improved sleep quality, improved mood and improved quality of life. Factors that influence the quality of sleep in the elderly include illness, psychological stress, medication, nutrition, environment, motivation, lifestyle and exercise (gymnastics)²³. Efforts to maintain the health of the elderly both in the form of care, treatment, healthy lifestyle, including elderly exercise²⁴. Changes in sleep hygiene in a better direction can improve the quality and quantity of sleep¹³. The implementation of sleep hygiene is applied starting to wake up until it will sleep again in accordance with 10 points of sleep hygiene guidelines and applied for 30 days. Scheduling sleep time is written on sleep diary to evaluate the waking time and sleep time of the elderly regularly. In the afternoon around 15.30 a brain gym is held with special movements performed 4x a week. The combination of these two interventions can improve comfort. Mc Cormick asserted that in shaping the comfort of a product or design, attention to human factors plays an important role in creating a design that has good ergonomics, which will create comfort for its users²⁵.

Better quality of life in elderly people can be achieved by increasing sleep quality as well as promoting good sleep. In order to improve their quality of life and health status, the assessment of sleep characteristics by

health-care providers, especially by nurses, is essential and is an important caring activity. Nurses play an important role in recognising the negative effects of sleep disturbances on well-being and the quality of life. In the assessment of the sleep characteristics of the elderly, taking a detailed history, sleep hygiene, sleep patterns, medical diseases, and drugs should all be evaluated²⁶. Lack of sleep, sleep problems and the perception of poor health negatively affects the quality of sleep in an old person²⁷. As a result of the advancement of age, problems related to sleep increase and adversely affect an individual's perception of poor health and sleep²⁶.

Quality of life is the extent to which a person can feel and enjoy the occurrence of all important events in his life so that his life becomes prosperous²⁸. If a person can achieve a high quality of life, then the life of the individual leads to a state of well-being, on the contrary if someone achieves a low quality of life, then the life of the individual leads to an ill-being²⁹. The regularity of the implementation of sleep hygiene combined with the implementation of brain gym for 15-20 minutes is a good combination for the elderly to achieve optimal quality of life. The combination of sleep hygiene with brain gym includes physical, psychological, social and environmental aspects in accordance with WHOQOL.

CONCLUSION

The provision of sleep hygiene, sleep hygiene and brain gym interventions and combinations (sleep hygiene and brain gym) showed significant differences in comfort and sleep quality in the elderly.

Analysis of Factors Relating to Practice of Breast Self-Examination (BSE) among Women in Indonesia

Sirajudin Noor¹, Diana Hardiyanti², Nursalam³, Esti Yunitasari³, Rr Dian Tristiana³

¹Doctoral Nursing Student, Faculty of Nursing, Universitas Airlangga, ²Nursing Diploma Intan Martapura, Indonesia, ³Lecturer, Faculty of Nursing, Universitas Airlangga, Surabaya, Indonesia

ABSTRACT

Background: Cancer is a global health problem, the mortality rate of breast cancer especially due to not being detected until an advanced stage, because of reluctance for undergoing early detection of breast cancer. Diagnosis of breast cancer at an early stage affords good opportunity for long-term survival. Effort has been made to decrease the number of deaths from breast cancer and the aim of this research for understanding factors related to the practice of breast self-examination (BSE). **Method:** This study was cross-sectional study and respondents in research were women work at Martapura Public Health Centre, with number of respondents being 168. Cluster sampling was used and the independent variables were age, job, education, experience, awareness of breast cancer, acquaintances ever having suffered from breast cancer, knowledge and BSE attitude, whereas the variable dependent in the research is BSE practice. Data were collected using questionnaire to obtain data on demographic, knowledge, attitude and practice. **Results:** Statistical results of the tests showed no significant relationship between age, job, education, experience, awareness of breast cancer, acquaintances ever having suffered from breast cancer and BSE practice; however, there was significant relationship between knowledge ($p = 0.047$), attitude of BSE ($p = 0.004$) and BSE practice. **Conclusion:** Factors that have a relationship with the BSE practice in women are knowledge and attitude toward BSE. Increased knowledge and attitudes are expected to increase one's desire to do beneficial things such as practising BSE on time, in the right direction and in the right position.

Keyword: demographic characteristics, knowledge, attitude, Breast Self-Examination (BSE) practice

INTRODUCTION

Breast cancer is a malignant tumour originating from breast cells developing uncontrolled so that it can spread to tissues or organs around the breast or other body parts.¹ Breast cancer is a major cause of death among all cancers experienced by women in Indonesia. Cancer is one of the major global health problems and there is an increase in breast cancer mortality because of detection at an advanced stage.² Late diagnosis of breast cancer is often because of a patient's reluctance to undergo early detection.³ Breast cancer diagnosis in the early stage affords good opportunity for long-term survival. Efforts to reduce the mortality rate from breast cancer require effective screening.⁴

An early detection programme makes it possible for early diagnosis more effective intervention and increased possibility of success in dealing with breast cancer. There are three methods of early detection of cancer breast, Breast Self-Examination (BSE), Clinical Breast Exam (CBE) and mammography.² BSE is a screening method used for detecting early signs of breast cancer by looking and fingering to find abnormality, lump, and swelling in the breasts. BSE as a method is easy, economical, not invasive, and causes no harm and which allows women to know the shape of the breast and quickly recognise if abnormalities are found on the breast, such as detention time or lump.⁵

The best time to start BSE is when a woman has reached puberty and experience breast development. BSE has a main role in intervention at an early stage of breast cancer, with statistics in America and Indonesia showing that 95% of breast cancer events were found by

Corresponding author:

Rr Dian Tristiana

E-mail: diantristiana@fkip.unair.ac.id

sufferers themselves. In fact, 90% of breast cancers were found by women when doing BSE. ACS recommends the practice from the age of 20. Although BSE is a simple, easy and economical screening method, many women do not do BSE or do not use correct BSE practice.⁶ Qualitative research has found⁷ that fear of finding signs and symptoms of breast cancer, such as a lump in the breast, and fear of being diagnosed with breast cancer is a barrier for women to do BSE or other screening methods. According to Miller (2015)⁸ respondents will do health examination if there is push factor such as an intervention.

The Indonesian government announced the Early Cancer Prevention and Detection Movement for Indonesian Women in 2015.⁹ Priority of an early detection programme in Indonesia is directed at women aged 30-50 years with a target of 50% women by 2019. The event aims at increasing awareness in the community about controlling risk factors and early cancer detection. This involves a series of activities including promotive, preventive, early detection and follow-up activities.

METHOD

Design

This study used a cross-sectional design.

Instrument

The data were collected using a questionnaire that was tested for validity and reliability. The questionnaire consisted of demographic data including level of education, acquaintances ever having suffered from cancer, age, and experience of obtaining information about breast cancer. The questionnaire was related to knowledge of breast cancer and BSE was developed by the researcher and consisted of 15 questions with two choices of answer, correct and wrong. If respondents answered correct then it was given a value of 2 and if they answered wrong the value was 1. Instrument attitude and also a practice instrument of BSE, that previously in Test validity done by using test Pearson's product Moment by comparing the r count with the r table; the r table in this research is 0.361 (0.05).

Research Respondents

The sample in this research consisted of 168 people utilising cluster sampling, with criteria inclusion: 1) No d nature circumstances, pregnant or breastfeeding; 2)

Can read and write; 3) Willing to follow activities from start to finish.

Data Collection

The researcher collected data from the Puskesmas region among women suited to inclusion in the research. The researcher approached respondents based on the data provided by the health centre. Researcher gives sealing about the destination, and continued by asking respondents to sign an informed consent form. Next, respondents were asked to complete the demographic data questionnaire and questionnaire research.

Ethical Clearance

This study has passed the institutional review board from the Faculty of Nursing, Universitas Airlangga, Surabaya, number 622-KEPK.

RESULTS

The majority of respondents were aged 36-45 years with 87 respondents (51.8%). The education level of respondents was mostly high school/equivalent with as many as 71 respondents (42.3%). Most respondents were housewives with as many as 55 respondents (32.7%), and most of the respondents had received information about breast cancer with as many as 92 respondents (54.8%). The majority of respondents said they did not have acquaintances who had had cancer.

Table 1. Demographic data of respondents

Data	N	%
Age		
16-25	14	8.3
26-35	33	19.6
36-45	87	51.8
46-55	22	13.1
56-65	12	7.1
Education		
Elementary school/Sederajat	5	3
Middle School/Sederajat	15	8.9
High School/Sederajat	71	42.3
Diploma	19	11.3
Bachelor	58	34.5
Job		
Government employees	50	29.8

Cont... Table 1. Demographic data of respondents

Data	N	%
Housewife	55	32.7
Entrepreneurship	31	18.5
Employee	31	18.5
Freelance worker	1	0.6
Acquaintance ever having cancer		
None	146	86.9
Friend	15	8.9
Sister	2	1.2
Mother	1	0.6
Cousin	1	0.6
Parents' relations	2	1.2
Husband	1	0.6
Experience of getting breast cancer information		
Ever	76	45.2
Never	92	54.8

Table 2. Knowledge, Attitudes and Practice of BSE

Variable	N	%
Knowledge		
Good	35	20.8
Enough	100	59.5
Less	33	19.6
Attitude		
Positive	107	63.7
Negative	61	36.3
Practice		
Good	25	14.9
Enough	123	73.2
Less	20	11.9

Based on Table 2, most respondents had sufficient knowledge about breast cancer and BSE with as many as 100 respondents (59.5%). Most had a positive attitude of 107 prescriptions (63.7%) and most of the respondents in the category had sufficient awareness of the practice of BSE with as many as 123 respondents (73.2%).

Table 3. Relations of demographic data with BSE practice

Variable	BSE practice		
	B	T	P Value
Age	- .480	- .612	0.542
Education	0.243	1.118	0.265
Job	0.611	1.364	0.174
Acquaintance ever having cancer	0.760	1.492	0.138
Experience of getting breast cancer information	0.184	-.203	0.839
Knowledge	0.261	2.003	0.047
Attitude	0.474	2.891	0.004

Table 3 shows that the variables of age, education, occupation, acquaintances who had cancer, the experience of obtaining information of breast cancer and BSE did not have a significant relationship with BSE practices in women. But knowledge and attitude had a significant relationship with the practice of BSE.

DISCUSSION

Knowledge has a relationship with breast self-examination (BSE). The majority of respondents had sufficient knowledge in BSE with a high school education and an age range of 36-45 years. The increase in the mean value of knowledge was marked by an increase in respondents' knowledge of breast cancer, signs and symptoms of breast cancer, and breast cancer risk factors. The mean value of respondents' knowledge increased regarding their breast self-examination (BSE) about the best time to do their breast self-examination (BSE) and their practice of breast self-examination (BSE). The results of this study are in line with research which states that one's knowledge is related to the practice of BSE.¹⁰ Other studies state that knowledge of breast cancer, breast cancer risk factors, and breast cancer mammography examination improves BSE practices in women.¹¹ The level of knowledge is significantly related to the behaviour of early detection of breast cancer.¹² Wahyu (2009)¹³ concluded that there was a significant relationship between knowledge about

breast cancer and the motivation of patients to have an early check-up at the Dr. Oncology Surgery Clinic at Dr. Sutomo Surabaya.

Attitudes have a relationship with breast self-examination (BSE). The majority of respondents had a positive attitude toward BSE with a high school education and an age range of 36-45 years. The factors that determine a person's attitude to the importance of early detection of breast cancer are their attitude and direct experience of the object of attitude.¹⁴ Previous research states that there is a relationship between attitudes toward awareness with conscious behaviour.¹⁵

Respondents were not aware or did not realise it depends on the stimulus they receive. If the stimulus receives supports, the respondent will realise, but if the stimulus received does not have support, the respondent will not be aware. The stimulus received by the respondent can be in the form of knowledge about awareness, or support from family or friends. Before realising, the respondents also experienced behavioural stages caused by the stimulus. These stages include awareness, interest, evaluation, trial and adaptation. Each stage will affect the next stage. If each stage supports the other, then the resulting behaviour will be positive. But if they don't support each other, then the resulting behaviour will be negative.¹⁶ According to Ouyang and Hu¹⁷, change in practice implementation occurs after the respondent acquires increased knowledge and BSE attitude.

CONCLUSIONS

Factors that have a relationship with the practice of BSE in women are knowledge of and attitude to BSE. Increased knowledge and attitudes are expected to increase one's desire to do good things, such as practising BSE on time, in the right direction and in the right position.

Mangosteen Rind on Oral Mucositis Caused by Radio and Chemotherapy in Cancer Treatment (In Vivo Study on Rats)

Lanny Sunarjo¹, Iman Supardan¹, Ismi Rajiani²

¹Associate Professor Politeknik Kesehatan Kementrian Kesehatan Semarang, Indonesia,

²Deputy to Chairman, STIA Dan Manajemen Kepelabuhan Barunawati, Surabaya, Indonesia

ABSTRACT

Background: Cancer malignancy is often treated by using medication supplements using radio and chemotherapy. However, these treatments have adverse effects on oral which cause difficulties in talking, eating, and even opening the mouth. Therefore, herbal medicine like mangosteen rind gel may become the alternative therapy for this condition.

Method: This research was quantitative and experimental randomized pre-post test with control group design. Samples were 15 Sprague Dawley female rats divided into three groups where group 1 was applicated with mangosteen rind gel intervention, unit 2 was with standard gel intervention (positive control) and the last group was untreated group (negative control). Effect of the mangosteen rind gel of treatment group and post-test of the control group were performed with the ANOVA test.

Results: The usage of mangosteen rind gel on oral mucositis accelerated the reduction of oral mucositis diameter compared to the standard gel and untreated group. On the 14th day of intervention, the recovery rate of oral mucositis on team 1 reached 99.80%, on unit 2 was 67.70% and only 1.20% in an untreated group. Cell signaling examination showed an average increase of TNF- α from day one until day 14. The lowest difference of TNF- α was group 1 (8.88 pg/mL or 14.50%), then followed by group 2 was 12.71 pg/mL (19.25%), and the highest difference was group 3 (21.43 pg/mL or 32.55%).

Conclusion: Mangosteen rind gel may accelerate healing of oral mucositis caused by radio and chemotherapy in cancer treatment. However, further study is necessary to determine the applicability to human being.

Keywords: cancer, mangosteen, oral mucositis, rats

INTRODUCTION

Cancer is a killing illness that causes prime death in over the world. Based on International Agency for Research on Cancer (IARC), there were 8.201.575 cancer death and found 14.067.894 new cancer cases in the world ⁽¹⁾. Treatment of cancer is usually followed either by chemotherapy or radiotherapy, but adverse effect of this therapy is oral mucositis inflammation of oral mucosa with ulcer ^(2, 3). This kind of inflammation will be followed by burning sensation, so the patients

causing difficulties in talking, eating and even opening the mouth (3rd grade of cancer therapy). Furthermore, the advance condition (4th grade of cancer therapy) shows that the patients aren't able to consume delicious food ^(4, 5).

Therapy of oral mucositis depends on the symptoms which are usually used to calm down the pain due to the inflammation and cure the oral infections. Topical application is one of therapy used for oral mucositis. Nowadays, the standard gel is mostly used for cancer patients with oral mucositis. Unfortunately, sometimes this gel causes hypersensitivity reaction such as skin eruption, itchiness, edema, etc. The researcher reported among 30 patients with oral and oropharynx lesions treated by standard gel generated 83% with pain

Semarang, Indonesia

reduction, 13% with no change condition, 3% with early repairment but then become worse⁽⁶⁾. Besides, the gel is no more effective than therapy with *Sucralfate* and *Mucaine* in relieving the pain associated with radiotherapy including *Oral Mucositis*⁽²⁾. Due to this condition, herbal treatment could be an alternative solution.

Mangosteen is Indonesian fruit usually used as traditional medicine to cure a stomachache, chronic ulcer, skin infection. Besides, it also has the effect of analgesic and anti-inflammation^(8, 9). It contains phenol derivative such as xanthenes or xanthan-9H-ones⁽⁸⁾. Mangosteen rind safe to be used⁽¹⁰⁾ includes of variation of xanthone: α -, β -, γ -mangosteens. They have the ability as the antioxidant, antitumor, anti-bacterial, anti-virus, anti fungi, anti-allergic and anti-inflammation^(11,12,13). Besides, α -Mangosteen can prevent hypoxia due to Reactive Oxygen Species (ROS) of cancer cell⁽¹⁴⁾. According to some researchers, the diameter of tumor became decrease, and complete regression happened on rats after treated by high doses of xanthone (3.0 mg per tumor)⁽¹⁵⁾.

The initial study⁽¹⁶⁾ showed that mangosteen rind as anti-inflammation gave an excellent impact for male Wistar rats on the recovery of oral ulcer caused by trauma. During inflammation phase in wound healing process, some cytokines have an essential role especially such as IL-1, IL-1 β , IL-6, and TNF- α ⁽¹⁷⁾. This study would like to investigate the ability of mangosteen rind in healing oral mucositis happening during cancer treatment with chemo and radiotherapy.

METHODOLOGY

Material

1. Carcinogenic agent 7,12-dimethylbenz[a]anthracene (DMBA), corn oil, prepared as test compound mixture.

2. Elisa Kit from Biologend Company.

Method

1. The extract of mangosteen rind (18) :

a. Identification of the type of mangosteen: *Garcinia mangostana* L.

b. Prime active substance: xanthone and α -mangosteen.

c. Mangosteen rinds were cut, dried in oven 50°C in 72 hours, ground to become powder and stored in air

retention bowl.

d. Then the powder of mangosteen rind was extracted by Soxhlet method.

2. The formula of mangosteen rind gel:

a. Mangosteen rind extract and other additional material were mixed homogeneously.

b. Added in sequence: Na Benzoid, Carbopol, HPMC (Hidroksi Propyl Metil Selulosa), TEA (Triethanolamine) and mixture homogenously when attached to each material.

c. Put it in a tube.

3. Cancer induction with 7,12-DMBA (Dimethylbenzene (a) anthracene) (19):

a. DMBA solution was made by mixing it with corn oil and vortex in 15 minutes.

b. Given doses were 20 mg/kg weight, twice a week in 5 weeks (frequency: 10 times).

c. Injected with the oral cannula through the oesophagus.

d. Observed from the first week after DMBA initiation. Palpation its breast 1-2 times a week till there was a lump.

4. Oral mucositis model:

a. Make a wound on the lower oral labial mucosa.

b. Treated with H₂O₂ (hydrogen peroxide) 3% using cotton bud in 90 seconds.

c. Observed till there was an ulcer (around 48 hours).

Identification of oral mucositis recovery:

1. Measured the diameter of the wound (mm) every day from the 1st day until the 14th day.

2. Measured TNF α on the 1st and 14th day:

a. Centrifuged 5 ml blood taken from a retro-orbital sinus (20).

b. Elisa (Enzyme-linked immunosorbent assay) kit was used to detect the amount of TNF α in blood serum (pg/mL).

Subjects:

1. Female Sprague Dawley rats :

a. 160-180 g in weight,

b. 5 – 6 weeks old,

c. Healthy condition and never used in research before.

2. Sample

With simple random sampling, 15 rats were divided into three groups:

- a. Group 1: the wound was treated with mangosteen rind gel.
- b. Group 2: the wound was treated with standard gel (positive control).
- c. Group 3: untreated/without treatment (negative control).

Each group consisted of 5 (five) rats and 1 (one) additional rat to anticipate death rat (21). Data were analyzed with repeated ANOVA test and presented in tables and graphics.

RESULTS

Formula of Mangosteen Rind Gel

Table 1. Formula of Mangosteen Rind Gel

Material	Amount
Mangosteen Rind Extract	60% x 20 g = 12 g
HPMC	
TEA	1.1 g
Carbopol	
Na Benzoate	
Aquadest	20 g – (12 g + 1.1 g) = 6,9 g

Diameter of Oral Mucositis Recovery Process

Figure 1. Diameter of Oral Mucositis Recovery Process

Figure 1 showed that diameter of oral mucositis became decreased. On the 14th day, group 1 (treated by mangosteen rind gel) healed (99.8%) with diameter 0.08 ± 0.08 mm. Group 2 (treated by standard gel) only healed 67.7% with diameter 2.71 ± 0.41 mm. Group 3 (untreated) only 1.2% healed with diameter 3.95 ± 0.10 mm.

TNF- α

Table 2. Measurement of TNF- α on Oral Mucositis Recovery Process

No.	Intervention	Mean of TNF- α \pm SD (pg/mL)		Δ TNF- α	
		Day-1	Day-14	pg/mL	%
1.	Mangosteen Rind Gel	52.40 ± 13.92	61.29 ± 14.25	8.89	14.50
2.	Standard Gel (Positive Control)	53.34 ± 8.52	66.06 ± 8.85	12.71	19.25
3.	Without Treatment (Negative Control)	44.40 ± 6.48	65.83 ± 22.86	21.43	32.55

Table 2 showed that the amount of TNF- α was increased from day 1 to day 14. The lowest difference in each group was on the team I which was treated by mangosteen rind gel (8.89 pg/mL or 14.50%), followed by group 2 was 12.71 pg/mL (19.25%) and the highest difference was group 3 (21.43 pg/mL or 32.55%).

Inferential Analysis:

Group 1

Group 2

Measurement of Oral Mucositis Diameter

Group 3

Figure 2. Measurement of Oral Mucositis Diameter Treated by Mangosteen Rind Gel (Group 1), Standard Gel (Group 2) and Untreated Group (Group 3)

There were significant differences analyzed by ANOVA test. ($p_{value} < 0,001$). The wound healing process on group 1 happened on day 2 and day five on group 2, but no healing process happened until day 12 in group 3.

Measurement of Oral Mucositis Diameter among Groups

Table 3. Differential Test of Oral Mucositis Diameter Inter Groups

Pairwise Comparison		p value
Group 1*)	Group 2	.000
	Group 3	.000
Group 2*)	Group 1	.000
	Group 3	.001
Group 3*)	Group 1	.000
	Group 2	.001

*) Group 1: treated by mangosteen rind gel; Group 2: treated by standard gel ; Group 3: without treatment

Table 3 showed there was significant difference on measurement of oral mucositis diameter ($p_{value} \leq 0,001$) in inter groups.

DISCUSSION

This study used mangosteen *Garcinia mangostana* which contains xanthone dan α mangosteen (18). Mangosteen rind gel (20 g) only comprised 60% (12 g) of its active substance due to the research that mangosteen rind extract with concentration more than 40% could inhibit the bacteria growth (16). The result showed that the decrease in the size of diameter oral mucositis treated by mangosteen rind gel was faster than others. Wound healing process happened on the 2nd day while others were on the 5th day (positive control group) and 12th day (untreated group). On the 14th day, wound healing process was almost complete (99.8%) with the diameter 0.08 ± 0.08 mm. Meanwhile, the healing process on the group treated by standard gel was only 67.7% with diameter 2.71 ± 0.41 mm and just 1.2% with diameter 3.95 ± 0.10 mm on the untreated group. Wound healing process would be optimal if the material contained with subsequences that could protect the cells from bacteria infection, decreased inflammation process and induced cell proliferation to reconstruct the broken cells (22). Besides, antioxidant subsequences could help in reducing inflammation process (23).

Xanthone has biochemistry effects such as antioxidant, anti-bacterial, anti-inflammation so it could be used to treat wounds. Some researchers had proved the role of xanthone in wound healing, tumor or carcinogenic activities (24). Another research had shown that extract of mangosteen rind had the ability as oral anti-bacteria to inhibit the growth of *Streptococcus pyogenes*, *Streptococcus mutans*, *Staphylococcus aureus*, and *Porphyromonas gingivalis* (13,25). Xanthone had also effect on the maturation of collagen, it was primary protein (70-80%) in the extracellular matrix that had an essential role in wound healing process (26). This healing process consists of 4 (four) phases hemostatic, inflammation, cell proliferation and maturation. It's started with the formation of fibrin and infiltration of the neutrophil. This process happened precisely and orderly. The interruption occurred in the process would cause chronical wound and prolong the recovery time (27).

The result showed that there was an increase of TNF- α from day one until day 14 in wound healing process of oral mucositis. The lowest difference of TNF- α was on group 1 with mangosteen rind gel (14.50%), then followed by group 2 with standard gel (19.25%) and the highest difference was on team 3 (32.55%). TNF- α was released by neutrophil and macrophage cells. This TNF- α had roles in inflammation and reepithelialization process, and it would increase on the acute and chronic wound (17). It was produced at the beginning of healing process, and its concentration was essential to the result of wound healing. When its concentration was low, it could support indirectly on inflammation process and increase growth factors which produced macrophage cell. On the other side, the higher the level of its concentration, it could depress synthesis or matrix cellular protein (ECM), promoted the production of natural tissue inhibitors (TIMPs) and increased matrix metalloproteinases (MMPs) (28). So the process of wound healing might be delayed.

CONCLUSION

There was an effect of mangosteen rind gel on wound healing process of oral mucositis due to cancer therapy – chemotherapy and radiotherapy. It could accelerate the healing of oral mucositis within 14 days. Amount of mangosteen rind extract 60% on gel formula could heal this oral mucositis.

Measurement of oral mucositis diameter on the 14th day, group 1 (mangosteen rind gel intervention) healed 99.80% with diameter 0.08 ± 0.08 mm, group 2 (standard gel intervention) only healed 67.70% with diameter 2.71 ± 0.41 mm and group 3 (without intervention) only 1.20% healed with diameter 3.95 ± 0.10 mm.

There was an increase of TNF- α from day one until day 14 in wound healing process of oral mucositis. The lowest difference of TNF- α was on group 1 treated by mangosteen rind gel was 8.89 pg/mL; 14.50%, on group 2 treated by standard gel was 12.71 pg/mL; 19.25% and on unit 3 without intervention was 21,43 pg/mL; 32,55%.

Factors Related to Personal Absorbed Dose in Health Workers at Hospital's Radiology Unit

Yunita Kemala Sari¹, Tri Martiana², Linda Dewanti³

¹Bachelor of Public Health, Airlangga University, Indonesia, ²Professor, Doctor, Magister of Science, Department of Occupational Health and Safety, Airlangga University, Indonesia, ³Doctor, Magister of Health, Master of Health Science, Doctor of Philosophy, Department of Occupational Health and Safety, Airlangga University, Indonesia

ABSTRACT

Diagnostic radiology services are an integral part of medical services that need special attention because they are useful in diagnosing, but also very dangerous for patients, officers and the environment. The purpose of this study was to analyze factors related to the personal absorbed dose of health workers

This study was an observational study with cross sectional approach. This study conducted at private hospitals in Surabaya (Hospital A, B and C) and the population was 36 workers. Dependent variable in this study was personal absorbed dose while independent variable was gender, knowledge, attitude, age, education, study program, length of working, type of work, obedience in using personal protective equipment, presence of workers when rest time, average of treated patient by workers, dose limitation, x-ray, facility building, record and report, policy, and supervision.

Result of linear regression test showed that there is five variable that its standardization coefficients are related to personal absorbed dose, such as length of work, age, policy and obedience in using radiation Personal Protective Equipment (PPE) completely (β 0,206, β 0,579, β - 0,716, β -0, 161 respectively)

It is recommended for hospitals to make a supportive policy to reduce dose of exposure to health workers. It is necessary to supervise the completeness of using radiation Personal Protective Equipment (PPE).

Keywords: Health Workers, Radiation, Personal Absorbed Dose, Policy

INTRODUCTION

Hospital is a workplace that has many risk factors such as physical, biological, ergonomic, psychological and chemical. Potential hazards in hospitals due to physical, biological, chemical, ergonomic, and psychosocial factors can cause illness and accidents for workers, patients, visitors and communities around. Hospital workers have a higher risk than other workers for work-related disease and work-related accident¹

The radiology installation, which is part of the hospital, as a medical supporter, use ionizing radiation sources to diagnose the presence of a disease in the form of anatomical features displayed in radiographic films. The negative effects of exposure to X-ray radiation in the human body can be acute and chronic effects, acute effects can usually be seen immediately after

exposure, whereas chronic exposure begins to develop if accumulated several years after exposure. The effects of radiation can affect almost all parts of the human body, ranging from the skin, eyes, thyroid, lung, reproductive organs, blood clotting system, digestive system and fetus

According to the Department of Manpower in Indonesia, in 2011 there were about 61 cases of accidents caused by radiation exposure. Research at company X Surabaya, as many as 7 people (46,7%) from 15 respondent radiographer, leukocyte count is not normal and this can be caused by X-ray exposure and radiographer condition itself².

A preliminary study at the radiology unit of RS A Surabaya and an interview with the head of the Radiological Unit showed that the implementation of radiation safety has not gone well. There is still

no medical physician officer, measuring instrument of radiation dosage of TLD badge is only given to radiographer who have permanent employees status, medical check up is done every 2 years, and facilities of radiology room is not enough. In addition, radiation accidents have occurred in workers. Measurement results in May 2016 show that 50% of health workers have a personal absorption dose exceeding the Dose Limit Score set by the Nuclear Power Control Agency 20 mSv / year.

Based on the background above, the purpose of this study was to analyze factors related to the personal absorbed dose of health workers at Hospital A, Hospital B and Hospital C in Surabaya. RS A, RS B and RS C in Surabaya.

MATERIAL AND METHOD

This study was an observational study with cross sectional approach. This study conducted at private hospitals in Surabaya (Hospital A, B and C) and the population was 36 workers. The data were collected

by questionnaire, observation and interview. The data analysis is done by linear regression test to see how big the relation of independent variable to dependent variable.

FINDINGS

Characteristics of Health Workers

Based on table 1, it showed that mostly man are at Hospital C with percentage (50%) as many as 8 respondents while woman are more dominant in Hospital B with 60% percentage as many as 9 respondents. The average age of Hospital B employee is relatively young which is 28 years old while Hospital C 48 years old. The length of work in each hospital an average of 7 hours per day. The highest education level of respondent is D3 (93,3%) at Hospital B and dominant of Radiology Study Program (100%) while in Hospital C there are 31,3% health workers that have equal education of SMU and not radiology program. Radiology health workers in Hospital B mostly have radiation protection training (86,7%), while Hospital C only 56,3%.

Gender	-0,013	0,941
Constant	: 0,950	
R Square	: 0,574	
Anova	: 0,013	

Notes: Education and Study Program have multicollinearity, X-ray, facility building and gender are excluded variable.

Based on table 2, independent variable such as length of work, age, training, presence of workers when rest time, obedience in using PPE completely, average of treated patient by workers, knowledge, attitude, type of

work, gender, policy and dose limitation have effect on personal absorbed dose simultaneously. It can be seen on *Pvalue Anova* $0,013 > \alpha = 0,05$.

a) Relation of gender with personal absorbed dose

Gender is the difference between men and women biologically from birth. The difference between men and

women is not only biologically but also physically and psychologically.

The value of man regression coefficient equal to -0.013. It can be interpreted that man regression variable has a negative effect on the absorption of radiation. This shows that the man regression will increase by 1 unit, the absorption of radiation will decrease by 0,013.

The effects of radiation on men and women are almost the same. Every body tissue also has its own sensitivity to radiation (organ weight factor), for example, the sex cells have higher organ-weight factors than bone marrow, kidney, lung, and others. But for women, the effect is increasingly complex. Not only damage the cells and tissues but also the fetus (if in a condition of pregnancy). In addition to pregnancy, according to BATAN female workers in the breastfeeding period are not allowed to work in radiation areas with high risk of contamination³

b) Relation of age with personal absorbed dose

The results showed that age had positive effect on the absorption dose of radiation that is 0,579. The higher the age, the absorbed dose of radiation will increase by 0.579.

Based on the results of the study, workers over the age of 40 years are radiology specialists and radiographers who have had a long working period, experienced in the field both in the field of diagnostic and interventional radiology and more interventional action. Radiation received by interventional radiologists has a potentially high risk of radiation and may exceed the⁴

c) Relation of length of work with personal absorbed dose

The result of analysis showed that the duration of work had positive effect on the absorption dose of radiation equal to 0,206. When the duration of work increases by 1 unit, the absorption dose of radiation will increase also by 0.206.

The longer the working hours, meaning the more the number of patients performed radiological examiner and many complex procedures / actions performed per day for example the action of fluoroscopy where the radiation beam emitted directly and continuously with the duration of the old work the exposure to radiation received greater

d) Relation of Presence of workers when rest time with personal absorbed dose

The result of the analysis showed that rest in the room had positive effect on the absorption dose of radiation that is 0,103. In indoor workers, radiation absorption doses will increase by 0.103.

Most health workers resting indoors feel secure because there is a Pb shield on the wall of the X-ray room with a room directly adjacent to the workspace. The radiology unit served 24 hours, when an officer rested, the other officers were still working

When resting, it should be outside the radiation area, to avoid possible exposure to radiation scattering radiation rays.

e) Relation of dose limitation with personal absorbed dose

The results showed that the dose limitation had positive effect on the absorption dose of radiation that is 0,066. When the dose limitation is increased by 1 unit, the absorption dose of radiation will also increase by 0.066 or vice versa.

If the dose limitation aspect in the form of providing radiation protection equipment should be able to reduce the absorbent dose of health workers, but the fact that there are non-adherent health workers use PPE radiation completely so that the acceptable personal absorption dosage increases. One of the main factors to minimize exposure is adequate protection equipment and proper use in the procedure / action space

f) Relation of policy with personal absorbed dose

The results of the analysis showed that the policy had a negative effect on the absorbed dose of radiation -0.716. When the policy increases by 1 unit, the absorbed dose of radiation will decrease by 0.716, or vice versa.

If the policy related to service standards in the radiology unit is well implemented and there is supervision from risk management of radiation exposure may decrease. Management must strive to reduce and control hazards and risks, prevent accidents and injuries, and maintain safe conditions⁵

g) Relation of radiation protection training with personal absorbed dose

The results showed that the training had a negative effect on the absorption dose of radiation that is 0.102. As the training increases by 1 unit, the absorption of radiation will decrease by 0.102.

Training is an activity designed to help increase the access of workers to gain or increase the knowledge, skills, attitudes and behaviors required to perform the job well ⁶ Most health workers have attended radiation protection training, with training, they gain knowledge on how to prevent and minimize exposure to radiation in the body

h) Relation of Obedience in using PPE completely with personal absorbed dose

In conducting the activities of radiation workers are sometimes required to use personal protective equipment, because exposure to radiation generated X-ray plane is high enough. For this purpose, the radiology unit is obliged to provide complete personal protective equipment for its workers, as a means of minimizing the impact and effects of radiation received by workers.

The result of the analysis showed that PPE compliance had negative effect on the absorption dose of radiation that is 0,161. When PPE compliance increases by 1 unit, the absorption of radiation decreases by 0.161.

Compliance with nest in the use of radiation APD completely can reduce radiation exposure so as to avoid the health hazards of both stochastic, non stochastic and nasokimia infections in carrying out their duties. There are abnormalities experienced by 4 respondents who, due to not wear Personal Protective Equipment (PPE). The abnormality is characterized by reduced levels of leukocytes (white blood cells), which serves to defend the body from disease. This is in accordance with the results of research indicating that adherence to the use of PPE affect the absorption of radiation

i) Relation of Average of treated patient by workers with personal absorbed dose

The results showed that the number of patients per day had a positive effect on the absorption of radiation dose of 0.127. The more the number of patients per day treated, the absorbent dose of radiation will increase by 0.127.

The more patients treated, the more likely it is to

get radiation exposure and increase the personal dose. This is because Radiation received by radiation workers is mostly radiation scattering from patients.

The level of radiation exposure around the patient can be higher in normal working conditions. If protective devices and radiation measurements are not used and if many complex procedures / actions are performed per day, there is a possibility of interference. In many cases, the relationship between the dose of the worker and the patient is largely dependent on the equipment, the doctors/interventional procedures.

j) Relation of attitude with personal absorbed dose

The result of the analysis shows that the negative effect on absorption of radiation is -0,021. When the attitude increases by 1 unit, the absorption of radiation will decrease by 0.021.

Attitude is a state of being affected by a person, an idea, or an object. Attitude can indicate a person's readiness to behave. The highest level of attitude is when a person is responsible for the risks to be faced due to his choice of a problem⁷

Health workers who have a positive attitude to work safely can reduce the risk of radiation because nakes work with caution and use the radiation APD to minimize the absorbed dose of radiation received.

k) Relation of knowledge with Personal Absorbed Dose

Workers with good practice categories are widely owned by workers with a good level of knowledge⁸. Knowledge related to occupational safety and health in this case radiation safety need to be explored, maintained and developed and well utilized to improve the competence and safety of the officer. This is because knowledge is one of the internal factors that can affect one's behavior ⁹

The result of the analysis showed that the knowledge had positive effect on the absorption dose of radiation that is 0,158. When knowledge increases by 1 unit, the absorption dose of radiation will also increase by 0.158, or vice versa.

This happens because the well-informed workers are able to perform various work-related actions in

the radiation field, such as: guiding the percutaneous procedure in the operating room, performing fluoroscopy, despite full radiation APD to minimize exposure dose, the job has a high radiation risk because the radiation beam is continuous and in the long duration until the surgical / surgical action is completed.

CONCLUSION

It can be concluded that there are five variables of standardization coefficient related to the personal absorption dosage that is the variable of work, age, policy and compliance of Personal Protective Equipment (PPE).

Analysis of Factors Related to Communication Skills in Midwifery Students

Rekawati Susilaningrum¹, Sri Utami¹, Nursalam Nursalam²

¹Lecturer, Polytechnic of Health, The Republic of Indonesia Ministry of Health,

²Professor, Faculty of Nursing, Universitas Airlangga, Surabaya

ABSTRACT

Introduction: Skills to practice and communication skills is important for midwifery students, The importance of soft skills will later be used when students are in the world of work. This study aims to determine what factors are correlated with the communication skills of midwifery students. **Method:** The research design is cross-sectional using a simple random sample. The number of respondents was 38 students. The dependent variable in this study is communication skills. The independent variables are motivation, self-leadership strategies, job satisfaction, self-efficacy, psychological empowerment, task commitment, and communication skills. The analysis used is a statistical test Spearman Rho correlation with $p=0.05$. **Results:** The results showed that motivation has a correlation with communication skills ($p=0.00$), job satisfaction has a correlation with communication skills ($p=0.00$) and task commitment has a correlation with communication skills ($p = 0.00$). At the same time, self-leadership strategy, self-efficacy, psychological empowerment and communication skills do not have a correlation with communication skills (absolute). **Conclusion:** Factors related to communication skills are motivation, job satisfaction, and task commitment.

Keywords: *Communication skills, soft skills, education, motivation*

INTRODUCTION

Education is a major factor in the formation of human persons. Education plays a role in shaping the good and bad in human beings according to normative measures.¹ Recognising the importance of this, the government has paid serious attention to dealing with the education sector, because it is hoped that a good education system will give birth to the nation's next generation of qualified individuals able to adapt to the life of the society, nation, and state (Republic of Indonesia's Law no 20 in 2001). Surveys from the National Association of College and Employee USA 2002), to 457 leaders in America, about the 20 most important qualities of successful people, the results show successive soft skills and only two hard skills.² The importance of mastering soft skills in the world of work requires educational institutions to design soft skill development

programs for learning as a means of building work ethics with midwifery students, including direct learning in the community.³

The key to success is 90% determined by soft skills and only 10% determined by hard skills.⁴ Ministry of Education in 2009 stated that someone's success in education is 85% determined by soft skills. Education in Indonesia is generally still oriented towards hard skills.⁵ The inability to provide soft skills education results in midwifery student graduates only being good at memorizing lessons and having a few skills when they are already on the job.⁶ They act like machines because of the mastery of skills but are weak in leading.⁷ Soft skills are the skills for dealing with others. The users of college graduates hope that the workforce made up of college graduates has positive soft skills, a strong attitude, is honest, uplifting, able to work together, polite in communication, good at negotiation, has high work motivation, is creative and adaptable, so it can work intensively.⁸ Therefore, researchers are interested in analyzing factors related to the communication skills of midwifery students.

METHOD

This research is quantitative, analytic and descriptive using a cross-sectional design approach and simple random sample.⁹ The number of respondents was 38 students at the Department of Midwifery, Ministry of Health, Surabaya Health Ministry. The dependent

variable in this study is communication skills. The independent variables are motivation, self-leadership strategies, job satisfaction, self-efficacy, psychological empowerment, task commitment, and communication skills. The instruments used in data collection are questionnaires that have been tested for validity and reliability. The analysis used was the Spearman Rho correlation test with p = 0.05.

RESULTS

Table 1: Frequency Distribution of Respondent Characteristics

No.	Indicator	Category	Frequency	
			Σ	%
1.	Age of Respondents	18	1	2.6
		19	10	26.3
		20	26	68.5
		21	1	2.6
2.	Number of siblings	Single	4	10.5
		1	13	34.2
		2	15	39.5
		3 or more	6	15.8
3.	Child to (child order)	First	24	63.2
		Second	7	18.4
		Third	6	15.8
		Fourth	1	2.6
4.	Reasons for studying midwifery	Parental encouragement	15	39.5
		Own desire	19	50.0
		Did not pass the SBMPTN	4	10.5
5.	The desire to study at Sutomo	Own	23	60.5
		Parent	15	39.5
6.	Initial ideas	Midwifery	9	23.7
		Doctor	8	21.1
		Other: businessman, etc.	21	55.3
7.	Interest in clinical / field practice	Interest	14	36.8
		No interest	24	63.2
8.	GPA	<3	1	2.6
		3 - <3.5	10	26.3
		3.5 or more	27	71.1

Table 1 shows that more than half of the students are a first child and wished to study the Sutomo D3 Midwifery Study Program in Surabaya themselves. Most respondents prefer learning clinical practice and more than half have a GPA of 3 or more.

Table 2: Relationship motivation, self-leadership strategies, self-efficacy, psychological empowerment, task commitment, communication skills, job satisfaction with communication skills for midwifery students.

Total	0	0	6	15.8	32	84.2	38	100		
Job satisfaction	N	%	N	%	N	%	N	%	0.819	0.000
Very satisfied	0	0	6	15.8	0	0	6	15.8		
Satisfied	0	0	0	0	28	73.7	28	73.7		
Less satisfied	0	0	0	0	4	10.5	4	10.5		
Not satisfied	0	0	0	0	0	0	0	0		
Total	0	0	6	15.8	32	84.2	38	100		

Table 2 above shows that the results of the statistical test Spearman's rank correlation coefficients or Spearman's Rho in the relationship of motivation, job satisfaction and task commitment with communication skills show a significance value (p-value) $p = 0.000$. The significance level used is $p < 0.05$ meaning that H_0 is rejected and H_1 is accepted that there is a relationship between motivation, job satisfaction and task commitment, and communication skills. The correlation results coefficient shows $r = 0.678$, $r = 0.819$ and $r = 0.725$ which means that there is a strong correlation with the direction of a positive relationship. The Spearman's Rho test on the relationship between self-leadership strategies, psychological empowerment, self-efficacy and communication skills with communication skills shows absolute p-value, meaning that there is no relationship between self-leadership strategies, psychological empowerment, self-efficacy and communication skills with communication skills.

DISCUSSION

The results showed that there was a relationship between motivation and communication skills in midwifery students with a high correlation in the direction of a positive relationship. Based on the results of the study it can be seen that respondents with moderate and weak motivation could have both sufficient and weak communication skills. Communication skills are one of the parameters of interpersonal soft skills, where soft skills are abilities that are used for themselves and relate to others, for working together in groups, and with others. To be able to connect with other people, a good communication process is needed. In order for communication to work well in accordance with one's goals, then one must have good communication skills.¹⁰

Motivation is important because motivation is the thing that causes, distributes and supports human behaviour so that people want to work hard and enthusiastically to achieve optimal results.¹¹ Midwifery students are midwives who have a role in giving midwifery care to clients, and so that they can fulfil their role well, some skills are needed, one of which is communication skills.

Motivation both from individual students and motivation that comes from or originates from the students themselves. Motivation is able to move

someone so that they have a desire and willingness to do something to get results or achieve certain goals. The clearer the goals expected or to be achieved, the more clearly how motivation is carried out. Motivation is needed for a person's efforts to achieve optimal results or goals. One of the efforts required is the ability to communicate.

The results showed that there was no relationship between motivation and communication skills in midwifery students. Based on the results of the study, it can be seen that respondents who have good and weak self-leadership strategies have weak and sufficient communication skills. The ability of self-leadership, then a person will have 5 disciplines, namely the discipline of renewal, the discipline of knowledge that is abundant, the discipline of the body means expressed as we care for our bodies, so we take care of our minds². Knowing other people is intelligence: knowing yourself is true wisdom.¹² This makes it clear that communication skills require the ability to be able to know other people, but what is important is the ability to know yourself.¹³ A person will be able to recognise and control themselves if the individual has good self-leadership skills.¹⁴

The results showed that there was no relationship between psychological empowerment and communication skills in midwifery students. This is not in accordance with the statement that empowerment means giving power to people who operate in unfavourable situations in an organization.¹¹ Psychological empowerment of individuals will produce several positive things, namely work results and improving the work process, as well as sharing knowledge, skills, and experience better. Psychological empowerment can improve the work process. In order for communication to work effectively, one must have good communication skills.¹⁵

Communication skills are absolutely necessary for every individual, especially for those who work in an organisation or company.⁴ A person's communication skills can make it easier for individuals to convey brilliant ideas to their boss or co-workers. With good communication skills, it will be young for someone to present their ideas so that the idea might be accepted even greater. Although in this study psychological empowerment is not related to student communication skills, the increase in psychological empowerment is still very necessary because high psychological empowerment can have a positive impact on the improvement of other

variables that can improve performance.

The results showed that there was no relationship between self-efficacy and communication skills in midwifery students. Self-efficacy is a person's belief that he/she is able to do something or someone's belief that he/she is able to achieve results in accordance with the stated goals. In communication skills, a communicator already has the objectives to be achieved through his communication activities.¹⁶ Effective communication is the delivery of messages that are carried out in accordance with the intent and purpose of the sender of the message. Effective communication is what is desired by every communicator. With effective communication, fundamental problems in communication such as misunderstandings and messages that cannot be overcome do not arise.

This study found that most of the communication skills of students in physiological midwifery care practices were in the weak category but the students mostly had self-efficacy in the sufficient category. Although no relationship was found between self-efficacy and communication skills, self-efficacy is high on the list of a person's will to believe in order to achieve communication goals he/she has set.

The results showed that there was a relationship between task commitment and communication skills in midwifery students with a high correlation with a direction towards positive relationships. Based on the results of the study, it can be seen that respondents who have low task commitment can both have weak communication skills. Commitment always reflects a sense of trust, sincerity and a very strong desire to always be willing to earnestly develop, maintain and work for the interests of an organisation without wanting to leave the organisation.⁴ A highly committed person is a superior person. A person who upholds high commitment actualises the work culture in total.

Building commitment is not easy, especially building commitment to the organisation. The emergence of commitment in a person is strongly influenced by factors such as the atmosphere of the workplace environment, leadership, workload, and compensation obtained. But the most important thing is that the commitment is not waiting for the organisation or leader, but commitment will be better if it arises because of self-awareness about the importance of doing or completing tasks to achieve

individual and organisational goals.

Today's leaders must be able to become pioneers; thus, a leader can show his function as a creator of growth and learning. This means that the leader is the creator of growth and learning, both for himself and for those who are under his responsibility. A person with appropriately high commitment will feel the benefits, namely by improving their performance as a leader and for the people being led.

The results showed that there was a relationship between job satisfaction and communication skills in midwifery students with a high correlation with a direction towards a positive relationship. Based on the results of the study, it can be seen that respondents who have job satisfaction are very satisfied and can have sufficient communication skills. Job satisfaction factors are a good initial input for developing a model of job satisfaction, job satisfaction and not for job satisfaction due to several factors or dimensions that cause satisfaction or job dissatisfaction.¹⁷ If the perception of people or individuals towards the dimensions of job satisfaction is positive then the individual will feel satisfied, and vice versa.¹⁸ The results of this study indicate that job satisfaction is related to communication skills, so specifically, the Midwifery Study Program still needs to try and pay attention to job satisfaction.

CONCLUSION

Motivation, job satisfaction and task commitment are closely related to the communication skills of midwifery students. The advantage of having good communication skills is that they will facilitate students in carrying out various clinical skills in the world of midwifery work.

Improving the Immune Response IL-10 and Secretory Immunoglobulin A in the Elderly after Getting Synbiotic

Rudy Hartono¹, Agustian Ipa¹, Aswita Amir¹, Bambang Wirjatmadi², Ridho Pratama¹, Ronny Horax³

¹Health Polytechnic of Ministry of Health in Makassar, Indonesia

²Professor of community nutrition, Public Health Faculty, Airlangga University, Indonesia

³Department of Food Science University of Arkansas, USA

ABSTRACT

Increasing age will reduce the body's resistance, so it needs functional foods that can maintain the body's immune system, especially the elderly. This research was conducted to see the synbiotics effect on IL-10 immune response and secretory immunoglobulin A (sIgA) which was done by intervening to the elderly using synbiotics. The results showed that after administration of IL-10 and sIgA ($p < 0.05$) there was an increase in the immune response of the two markers. Based on the results of this study can be recommended the use of synbiotics as an alternative to maintaining the immune system in the elderly.

Keyword: *Functional Foods, Synbiotic, Immune response, Immunoglobulin A*

INTRODUCTION

Elderly people grow very fast even faster than other age groups. Demographic implications that arise due to the growth of the elderly, namely the number of elderly population is increasing and according to WHO's projections Indonesia is a country with the number 8 elderly population in the world that is equal to 21,194,000 people or 8.2% of the total population in Indonesia. The other seven countries that have the highest number of the elderly population are China, India, USA, Japan, Russian Federation, Brazil and Germany⁽¹⁷⁾.

This shows a very large amount, so if it is not done efforts to improve the welfare of the elderly from now on will cause problems and can become a time bomb in the future. The tendency of this problem to arise is also marked by the number of elderly dependents according to the 2008 BPS Susenas of 13.72%.

The population dependency rate will be high and felt by the population of productive age if it is coupled

with the dependency of the population aged less than 15 years, where the current population of fewer than 15 years is 29.13%⁽¹⁰⁾.

Provinces with a higher life expectancy also have more elderly population. A territorial is called old structure if the percentage of people older than 7%. There are 11 provinces in Indonesia with the elderly population more than 7%, namely Yogyakarta Special Region (13.4%), Central Java (11.8%), East Java (11.5%), Bali (10.3%), North Sulawesi (9.7%), South Sulawesi (8.8%), West Sumatra (8.8%), West Java (8.1%), Lampung (7.8%), West Nusa Tenggara (7, 7%), East Nusa Tenggara (7.5%)⁽¹¹⁾.

The obstacles faced in the effort to improve the health and welfare of the elderly are the lack of health service facilities and infrastructure that provide friendly health services and are easily accessible to the elderly. In addition, data on the elderly is inadequate and the most recent data on health problems in the elderly based on surveys and research related to the elderly are still very limited. Currently, the data in the new Ministry of Health contains 437 Elderly Community Health Centers and more than 69,500 elderly Posyandu in several districts/cities in Indonesia, but the program has not been maximized⁽²⁾.

Corresponding Author:

Rudy Hartono

Health Polytechnic of Ministry of Health in Makassar, Indonesia Wijaya Kusuma Raya Street 56 Makassar, Indonesia, Email: dinomks70@gmail.com

The aging process also leads to a decrease in immune function (immunosenescence), which can increase hyporesponsiveness of vaccination and the tendency for infectious and non-infectious diseases⁽⁹⁾.

Synbiotics are functional foods that the body needs. Sinbiotik is a combination of probiotics and prebiotics can be a food substrate that reaches the large intestine and can affect the composition and activity of bacteria present through fermentation capacity in the elderly. The metabolic products of intestinal bacteria can affect the immune system. Modulation of intestinal microflora by diet is the basis for the synbiotic concept. Various strains of bifidobacteria and lactobacillus as probiotics have also been shown to exert immunostimulatory properties⁽⁷⁾.

In general, reports of research results in an increase in the amount of lactobacillus, bifidobacteria, or both and enterobacteria decrease after administration of FOS⁽²⁰⁾. The synbiotics function interacts with immune cells or receptors to improve the phagocytic function of white blood cells, increase IgA after contact with antigens, increase intraepithelial leukocyte proliferation, Th1 / Th2 cell regulation, induction of cytokine cytolysis⁽¹⁷⁾. However, research has not fully determined its effect on the intestinal microflora of older people.

MATERIAL AND METHOD

This study aims to make recommendations to the elderly in order to improve the immune response (with parameters IL-10 and sIgA) so that the health status of the elderly can be maintained. This research was carried out for 3 months with the intervention using synbiotics that is in November 2015 to February 2016 in the elderly in the Mangasa Health Center in Makassar City.

The main tools used to make measurements were 1) ELISA (The enzyme-linked immunosorbent assay) to measure blood serum IL-10 and 2) the measurement was measured from the feces also using ELISA⁽²¹⁾, 3) the study subjects were elderly, aged 60 - 70 years old, Makassar tribe, has no history of degenerative and infectious diseases with doctor's recommendations, free from probiotic and prebiotic intake and antibiotics, so the sample size is 12 people who get synbiotics.

Evidence of the effectiveness of this simple method implemented by several steps: 1) validation of synbiotics obtained from pharmacies with registration by the Republic of Indonesia Food and

Drug Supervisory Agency 2) Synbiotics consisting of probiotics consisting of *L. acidophilus* 7.5 mg, *L. casei* subsp *casei* 0 , 25 mg, *L. rhamnosus* 10 mg, *L. bulgaricus* 12.5 mg, *Bifidobacterium breve* 5 mg, *B. longum* 5 mg, *Streptococcus termophilus* 9.75 mg and Fructooligosaccharide (FOS) as prebiotics 350 mg., 3) measure response immune IL-10 uses ELISA before and after getting synbiotics for 2 months using 3 cc of blood to get the serum and feces to measure the blood pressure taken at the Hasanuddin University Teaching Hospital Laboratory, 4) supplement control is carried out by enumerators conducted by supervision every day to the subject while the researcher every 3 days during the study, 4) compares the two measurement results to find out the improvement tan IL-10 and sIgA immune responses.

FINDING

Immune Response Measurement Parameters

Functional food is Indonesia's abundant natural resource including probiotics and prebiotics. The combination of probiotics and prebiotics is known as synbiotics. The usefulness of synbiotics is that it can increase immunoglobulin levels in the elderly, which will have a more positive effect on performance against disease⁽¹⁶⁾.

In addition, *Lactobacillus plantarum* will reduce the Th1 / Th2 small intestine lamina propria (SILP) ratio. *Lactobacillus lactis* has an immunomodulating effect that regulates Th1 and Th2 balance, but it can also reduce GATA-3 & Tbet in SILP. Probiotics both *Lactobacillus*, *Bifidobacterium* and *Streptococcus* are promising strategies to prevent or overcome excessive intestinal inflammation and maintain immune homeostasis⁽¹⁴⁾. The importance of determining molecular biomarkers that are predictive of the immune system can give an indication that the elderly still remain productive, namely IL-10, and sIgA as a biomarker of immune response. The selection based on IL-10 is an anti-inflammatory function that balances Th1 and Th2 cells⁽⁸⁾, and sIgA is an adaptive defense that functions as an antibody found on the mucosal surfaces of the mucous tractus digestivus, tractus urogenitalia, and respiratory tractus⁽¹²⁾.

Effect of Sinbiotic Giving on IL-10 and sIgA immune responses

Based on the results of the descriptive study, there were 5 men (41.67%) and 7 (58.33%) men, 60-65 years

old, 10 (83.33%) and 2 66-70 years old women. people (16.67%), marital status shows that married 9 (75%) and divorced 3 (25%).

Table 1: Distribution of Immune Response of IL-10 and sIgA in the Elderly after Synbiotic Giving

Respon immune	before	after	p
IL-10 (ng/ml)	110,08±15,47	249,88±190,12	0,005
sIgA (µg/ml)	1,79±0,39	2,92±0,44	0,002

The average profile of IL-10 in group 2 before supplementation of synbiotics was 110.08 ng / ml with a variation of 15.47 ng / ml. After getting treatment, there was an increase of 140.70 ng / ml to an average of 249.88 ng / ml with a variation of 190.12 ng / ml. The results of statistical tests using Wilcoxon test obtained a value of $0.005 < 0.05$, meaning that there were significant differences in IL-10 profiles between before and after synbiotic supplementation.

The synbiotic supplementation group for sIgA also contained elevated levels of $1.79 \pm 0.39 \mu\text{g} / \text{ml}$ to $2.92 \pm 0.44 \mu\text{g} / \text{ml}$, to see the effect of synbiotic supplementation using the Wilcoxon test had a p value of $0.002 < 0.05$. This means that there is a significant change in the profile of the treatment group.

CONCLUSIONS AND RECOMMENDATIONS

The results showed that a significant increase in IL-10 and sIgA immune responses in all samples increased with time, although the increase was not too high but still showed a balanced state (homeostasis) to maintain the health of the elderly. It is recommended to provide synbiotics to the main elderly who are in an unhealthy condition to improve the immune response to be healthy.

DISCUSSION

Symbiotic are probiotics and prebiotics that are combined in food products. Probiotics are non-pathogenic microorganisms that live as digestive microflora that can have a positive influence on human health, while prebiotics are substrates or food ingredients for probiotic bacteria, where these substrates will help increase the growth and liveliness of one or more probiotic bacteria that are in one colon, so that physiological and metabolic conditions can be obtained which can provide protection to the health of the digestive tract. A good combination

of prebiotics and probiotics can increase the number of good bacteria (probiotics) that can survive in the digestive tract by fermenting the substrates⁽⁵⁾⁽³⁾.

The synbiotic composition has each function, namely, *B. breve* maintains normal intestinal flora, inhibits *E. coli*, reduces the growth of *Candida albicans*. *B. longum* is preventing colon cancer, allergies, crohn colitis, and high cholesterol with the effects of increased IL-10 and IL-12⁽¹⁹⁾. *L. bulgaris* as a natural antibiotic that works with a broad spectrum also increases immune, anti-tumor or cancer. *L. caseisubsp. casei* has the effect of increasing NK cell activation⁽¹⁵⁾, inducing differentiation of regulatory T cells⁽¹⁴⁾. *L. rhamnosus* has the effect of increasing the capacity of phagocytosis⁽⁴⁾. *L. acidophilus* increases stimulation of IgA production and capacity for phagocytosis⁽²⁰⁾⁽¹³⁾. *S. thermophiles* serve to suppress lymphocyte proliferation by inducing apoptosis⁽⁶⁾.

Based on the synbiotic composition used as supplementation material, it reflects pro-inflammatory cytokines by producing IFN- γ because they are bactericidal, suppress chronic colitis, increase commensal bacteria, increase sIgA and increase phagocytosis⁽⁴⁾. The synbiotic composition also directs / potentially increases the immune balance by producing high IL-10 by *B. longum* and *L. casei subsp casei* so that even on the other hand IFN- γ is produced high but IL-10 is also produced to suppress IFN- γ production. The other side of the synbiotic composition FOS serves to suppress by blocking the growth of pathogens⁽¹⁴⁾. This is evidenced by the increase in IL-10 after the administration of synbiotic increased significantly.

CONCLUSION

This study recommends functional food ingredients in this case synbiotics that can maintain the health of the elderly while maintaining IL-10 and sIgA while

increasing according to the state of homeostasis. This finding is expected to provide a positive contribution to improve the quality of the elderly immune response and can be developed in other studies in other vulnerable groups such as pregnant women, toddlers, and young women.

Emotional Support of Family and Depression Incidence among Elderly in Ngumpul Village, Jogoroto Sub-District, Jombang City

Wiwiek Widiatie¹, Siti Muniroh¹, Kurniawati¹

¹ Faculty of Health Science University of Pesantren Tinggi Darul 'Ulum Jombang, Indonesia

ABSTRACT

Generally, the physiological decline among elderly both physically and mentally will give an effect such as less sensitive to various stimuli both internal and external so elderly are vulnerable to mental disorders such as depression. The aim of this study to assess the correlation between emotional support of family and depression among elderly who aged 60-74 years old in Ngumpul Village, Jogoroto Sub District, Jombang City. The design of this study was cross sectional. The population was all elderly people who aged 60-74 years old with the number of population is 526 people. The sample size was 55 respondents, selected by simple random sampling. The data were collected by using questionnaire to assess emotional support of family and Geriatric Depression Scale questionnaire to assess depression level of elderly. Moreover, the data were analyzed by using Fisher's Exact Test statistic with $\alpha = 0.05$. The results of this study found that almost all (78.2%) of respondents had good family support, and almost all (87.3%) of respondents did not have depression experience. The results of the Fisher's Exact Test obtained $0.000 < 0.005$. So, the conclusion in this research was there is relation between emotional supports of family with incidence of depression among Elderly who aged 60-74 years old in Ngumpul Village Jogoroto Sub-district, Jombang city.

Keywords: Emotional supports of family, Depression, Elderly

INTRODUCTION

In essence to grow old is a natural process which means a person has gone through three stages of life, it are: childhood, adulthood and old age. The aging process is an inevitable biological process that everyone will experience. Family support factor is one of factor that can influence stress level among elderly where the higher of family support system will make less stress experienced by elderly. However, a feeling of wasted from family also can increase the stress level among elderly where they were deposited in institution of elderly⁽¹⁾.

A person who experienced stress can be seen from the changes of physical condition. Complaints are often felt among people who experienced stress are angry, moody, anxious, anxious, sad, depressed, pessimistic, crying, mood or mood often change, decreased self-esteem or feel insecure, irritable, and has hostility, nightmares, and concentration / memory problem⁽²⁾. Family support was needed for elderly. Family members' support is good examples for the elderly, such as doing or giving suggestion for healthy daily living. Family members who taking care or much give support for elderly in doing what they want to do⁽³⁾.

In 2010, the number of elderly in Indonesia an estimated 23.9 million or 9.77 % and in 2020 will increasing with estimate 28.8 million or 11.34 %. In East Java the incidence of depression reached 7.18 %, depression became one of the problems of mental disorders that are often occur among elderly⁽⁴⁾. Based on data from the Central Bureau of Statistics (BPS) in 2015 the number of Elderly in East Java reached 4,209,817

E-mail: heruswn@gmail.com

people or (11.14 %) of the total population in East Java (37,794,003 people). Based on data from the Jombang District Health Office in 2014 it was found that the data of elderly number in Puskesmas Mayangan Jombang is 11,615 people ⁽⁵⁾. The elderly data in Ngumpul village which is the work area of Puskesmas Mayangan and the village built by FIK Unipdu Jombang in December 2016 amounted to 526 people.

Based on preliminary study in Ngumpul Village Jogoroto Sub-district Jombang Regency in December 2016 from 10 elderly people who had measured by GDS scale (geriatric depression scale) and found 60 % (6 people) experienced depression in severe level, 20 % (2 people) experienced depression in moderate level and 20% (2 people) experienced depression in small level. Moreover, for family support there are 5 people who never get support, 2 people sometimes get support, 2 people often get support and 1 person always get support from family.

Family support is one form of family therapy for elderly who experienced depression. So with give family support at leasts they have family emotional feelings and it will give support for elderly and the elderly also can go through a period of their life. Therefore, the support from various level are needed, ranging from government institution to the family level to take care of the elderly life either through posyandu elderly, increasing the role of elderly in the organization, intergenerational relationship coaching, and skills training for the elderly. Because in the group, the elderly can discuss about health, brainstorming, and gymnastics together ⁽⁶⁾.

Based on the data above, the researchers interested in conducting research on “relationship between emotional support of family and the incidence of depression among elderly in the Ngumpul Village, Jogoroto District-Jombang”.

MATERIALS AND METHOD

The design of this study was cross sectional. Population in this study were all elderly who aged 60-74 years old in Ngumpul Village Jogoroto Sub-District, Jombang city (population size was 526 people). Sample size was 55 people selected by simple random sampling. The study was conducted in May 2018. The independent variable was emotional support of family and dependent variable was incidence of depression. Data were collected using questionnaire. The categorical data were

presented in the form of frequency and percentage ⁽⁷⁾, then analyzed by Fisher’s Exact Test.

FINDINGS

Table 1. Distribution of general data of respondent

Number	General data	Frequency	Percentage
1	Education		
	Not attend the school	27	49.1
	Elementary & Secondary School	20	36.4
	High School	6	10.9
	University	2	3.60
2	Gender		
	Male	8	14.54
	Female	47	85.46
3	Information		
	Ever	44	80.0
	Never	11	20.0
4	Information source		
	Health care provider	44	100.0
	Magazine	0	0
	Radio/TV	0	0
	Internet	0	0
	Total	55	100

Tabel 2. Distribution of emotional support of family data with depression incident among elderly who aged 60-74 years old

Number	Specific data	Frequency	Percentage
1	Emotional support of family		
	Less	0	0
	Moderate	12	21.8
	Good	43	78.2
2	Depression incident		
	Depression	7	12.7
	Not depression	48	87.3
	Total	55	100.0

Tabel 3. Correlation between emotional support of family and depression incident among elderly who aged 60-74 years old

Emotional support of family	Depression level				Total	
	depression		Not depression			
	ā	%	ā	%	ā	%
Enough	6	10.9	6	10.9	12	21.8
Good	1	1.8	42	76.4	43	78.2
Total	7	12.7	48	87.3	55	100

p = 0.000 a = 0.05

DISCUSSION

Emotional Support of Family

Almost all (78.2%) of respondents had good emotional support of family. The emotional support of family is an attitude, action and acceptance of family for family member who sick. Family as a safe and peaceful place to rest and restore also manage the emotions. Aspects of emotional support are including support form of affection, trust, attention, listen and listening. Family members think that supportive people are always ready to provide help and assistance if needed⁽⁸⁾.

Family support is important to someone. In this study found that almost all elderly have good family support. This is makes the elderly feel calm in their daily life so they rarely feel worried.

Almost half of respondents have elementary and secondary education (46%). The higher level of education will likely get support from the people around him. The

basic concept of education is a meaningful process of learning in education and it has growth process, development or change toward a better mature, and more mature in the individual, group or community⁽⁹⁾.

Respondents who educated in elementary school and secondary school are able to think more mature that respondents feel that they have support from their family to go through to their elder period, so they can feel calm and not worry when faced with problems because they have strong emotional support of family and family availability to provide time to give solutions to their problems. Moreover, elderly who educated in elementary, junior high school were get good support from the family and also this because the elderly also ever get information from health workers about mental health and how to deal with depression among elderly.

Depression incident among elderly who aged 60-74 years old

Almost all (87.3%) of respondents were not have depression experience by 48 people. Depression is a natural disorder of mood that is characterized by depth and sadness and continued until feels lose of life, not has problem about reality testing abilities / RTA is still good, personality remains intact (no splitting of personality), the behavior can be disrupted but within normal limits⁽²⁾. Depression is a disturbing mood of feelings, with the main symptom of sadness. This symptom was easy to find with the prevalence rate of 4-5% of the population, ranging from less, moderate, or severe degrees of disturbance. Judging from the clinical aspect, depression can stand on its own, is a symptom of another disease, has various physical symptoms, or occurs along with other diseases (comorbidities), so it can complicate management⁽¹⁰⁾.

Depression that occurs in the elderly in a category where the level of depression is not disruptive or obstructing in their life, so they can still carry out daily activities on a regular and timely basis and the elderly also happy to do their daily activities. According to researchers at the interview time found that the respondent who has depression was because of bed an event or unconditional environment (often left by their families), anxiety, negative thoughts (bored living in this world) and a small percentage of family members who have experienced depression.

Almost half (46%) of the respondents were hold elementary school, secondary school and high school. Education means that the guidance for someone to the development of others person to get their ambition and in the end they get achievement and happiness. Education is needed to get information such as things that support health so as to improve the quality of life. Education can affect a person as well as a person's behavior of lifestyle especially in motivating to participate in the attitude of development. In general, the higher of education will more easily receive information.

According to the researcher someone who educated has a good way of thinking, especially in dealing with a problem for elderly. With a good way of thinking so the respondents when faced with a problem can solve and prevent depression.

Almost all respondents (80%) received information sources from health workers. The ease of obtaining information can help accelerate a person to increase new

knowledge. According to researchers of the elderly who get the source of information from health workers will get the right information about the importance of doing emotional calm in the aging process so that they do not experience depression.

Relationship of emotional support of family with depression incidence among elderly who aged 60-74 years old

There is a relationship between emotional support of family and the incidence of depression among Elderly who aged 60-74 years in the Ngumpul Village, Jogoroto District Jombang.

Depression is a period of disruption of human function associated with the nature of sad feelings and symptoms, including: changes in sleep patterns and appetite, psychomotor, concentration, anhedonia, fatigue, despair and helplessness, and the risk of suicide. Depression can be a chronic and repetitive problem that will result in someone being unable to take care of themselves, besides depression can also lead to suicide. But depression in the elderly can be prevented by the emotional support of family. Family support is a combination of attitudes and acceptance that can help old age deal with problems. There are several forms of family support such as information support, assessment support, instrumental support, and emotional support⁽¹¹⁾.

Emotional support of family is a form of family therapy that can be given to elderly people who are depressed, through family a variety of health problems that arise at once can be overcome. So with the support of families who have an emotional bond at least will give strength to the elderly to live a better old age, therefore it needs support from various parties, ranging from government agencies to the family level to care for the lives of the elderly through the elderly posyandu, improve the role of the elderly in political and religious organizations, as well as enhancing spiritual formation at the end of the elderly life.

CONCLUSION AND RECOMMENDATION

Conclusion

Emotional support of family in Ngumpul Village, Jogoroto District, Jombang District is almost entirely good.

The incident of depression among elderly who aged

60-74 years in Ngumpul Village, Jogoroto District, Jombang District, almost entirely is not depressed.

There is a relationship between emotional support of family with the incidence of depression among elderly who aged 60-74 years in the village of Ngumpul Jogoroto District, Jombang Regency.

Suggestion

Can provide adequate education and information for the elderly and families such as lifestyle, ways of daily adaptation, personality strength and interest.

Consultant Immunologist, Al Sadder Medical City, Najaf, Republic Iraq

ABSTRACT

The current study aimed to assess the role of procalcitonin in detection of bacterial pneumonia and to compare the application of this marker with other routine tests. This study conducted during the period from November 2017 to April 2018 at Al Sadder Medical city in Najaf included 42 pneumonia patients and 42 apparently healthy individuals as control group, patients and controls were almost matched for age and gender. Sputum specimens were collected from patients under the supervision of the physician and immediately inoculated. A sample of venous blood was withdrawn aseptically and sent for Hematological and immunological tests. Culture results revealed bacterial pneumonia in 29 patients (69%). Results of identification have shown *Streptococcus pneumoniae* (31%), *Klebsiella Pneumoniae* (23.8%), *Escherichia coli* (7.1%), *Stenotrophomonas Maltophilia*, *Streptococcus pyogenes* and *Haemophilus Influenza* (2.4%) for each. The mean procalcitonin level was significantly higher in patients with bacterial pneumonia (971.71) compared to those with other types of pneumonia (634.00) and controls (227.40), and it appeared to be good predictor for detection of bacterial pneumonia and it was able to differentiate bacterial pneumonia from other causative pneumonia, than other tests used in this study.

Keywords: Procalcitonin, pneumonia, bacteria, C-reactive protein

INTRODUCTION

Pneumonia is an illness, usually caused by bacterial, viral or more rarely fungal organisms¹. It has been identified as the major (forgotten killer of children) by the United Nations Children's Fund (UNICEF) and WHO². The World Health Organization defines pneumonia as an acute disease episode with cough combined with fast breathing with age specific cut-values for increased respiratory rate. This case definition of childhood pneumonia is widely used in poor-resource settings to guide the management of pneumonia³. Pneumonia has received very little attention as there has been little research on the disease apart from vaccine trials that included the evaluations of the impact of these vaccines on pneumonia⁴.

Procalcitonin rises very fast in bacterial infections, making it a good biomarker for bacterial infections. Alongside other calcitonin precursor peptides, PCT is found in the serum in physiological conditions, but the PCT levels detected are very low <0.1 ng/ml. However, in pneumonia patients, the PCT level increases, sometimes to the levels of more than several hundreds of Nanograms per milliliter⁵.

Aim of this study is to diagnose pneumonia caused by bacteria using procalcitonin and compare it with some other markers.

MATERIALS AND METHOD

Study Design

A total of 42 pneumonia patients and 42 apparently healthy individuals (controls) were enrolled in this study. Those patients attended the emergency departments at Al-Sadr Medical City and Al-Hakeem hospital of Al-Najaf province during the period from November 2017 till April 2018. Samples were obtained from different age groups and of both genders.

Sputum specimen was obtained using universal container after providing the patient suspected to have pneumonia with appropriate instructions. Whole blood was withdrawal from vein, under aseptically conditions. Specimens of blood were collected in EDTA tube and gel tube. The EDTA tubes were subjected for hematological tests, while gel tubes were used for immunological methods including PCT and C-reactive protein⁶.

Sputum Processing and Bacterial Identification

Bacterial isolated recovered from sputum culture were identified to the species level on the basis of macroscopic observation of bacterial colonies morphology, and micromorphological characteristics and biochemical tests confirmed lately using automated system of VITEK2 technique^{7, 8}.

Hematological Tests

Total WBCs

The diluted blood suspension was placed in a chamber then the cell was counted and multiplied by dilution factor and reported as number of cells per microlitter⁹.

Differential Counts

Differential leukocytes was automatically counted using hematology analyzer. Erythrocyte

Sedimentation Rate

The settling of red corpuscles was measured in mm/hr using the Modified Westergren Method⁹.

Immunological tests

Procalcitonin (PCT) Test

Procalcitonin was detected using Elissa technique following the procedure written in the kit which included; the addition of 50µl of standard to the standard well. While the testing sample well contained 10µl of serum and 40µl of Diluent leaving blank well without any addition, 100µl of HRP-conjugate reagent was added to each well covered with an adhesive strip and incubated for 60 minutes at 37°C. Washing process was repeated five times by filling each well with Wash Solution (400µl) using a squirt bottle, manifold dispenser or auto-washer. Aspirating or decanting the wells were performed by inverting the plate and blot it on a clean

paper towel. 50µl of chromogenic A solution and 50µl of chromogenic solution B were added to each well. Gently mixed and incubated for 15 minutes at 37°C and Protected from light. 50µl of stop Solution was added to each well. Optical Density (O.D.) was read at 450 nm using a microtiter plate reader within 15 minutes¹⁰.

C-reactive Protein (CRP) Strip Test

Ten ml of standard, diluted samples and controls were dispensed into the appropriate wells (dilution 1:100 was done by adding 5 ml of samples to 495 ml of sample Diluent). 100 ml of enzyme conjugate was added to all wells tapping the holder to remove air bubbles from the liquid and mixed well and incubated for 60 minutes at room temperature (20-25 C). Liquid was removed from all wells by washing wells three times with 300 ml of 1X wash buffer and blotted on absorbent paper towels. Add followed by applying 100 ml of TMB substrate to all wells and Incubation for 15 minutes at room temperature. Finally 50 ml of stop solution was added Add to all wells and the absorbance was read on ELISA reader at 450 nm within 15 minutes¹¹.

Statistical analysis

Statistical analysis using Chai square, Student's t-test, ANOVA test and Receiver operating characteristics (ROC) were performed to analyze data according to the type of variables within Level of significance of <0.001 and occasionally < 0.05¹².

FINDINGS

There were 42 patients with pneumonia and 42 apparently healthy individuals (controls) enrolled in this study. Patients and controls were almost matched for age and gender, ($P>0.05$). Pneumonia was relatively more frequent in males 22 (52.4%) than females 20 (47.6%), with no statistically significant difference, ($P > 0.05$), also no significant difference in residence between cases and controls, ($P>0.05$), (Table 1). Regarding the type of growth, Streptococcus Pneumoniae and Klebsiella Pneumoniae were the more frequent types; 31% and 23.8%, respectively, However, all other pneumonia represented 31%, (Table 2). The comparison of mean PCT and CRP between cases and controls revealed that pnumonia patients had significantly higher mean level of both PCT and CRP, ($P<0.001$), on the other hand , when pneomonia patients subgrouped as , with bacterial pneumonia and those with other pneumonia

and compared against controls, the PCT and CRP levels were significantly higher in these two subgroups than controls, (Table 3). Regarding the comparison of WBC (Total and Differential) count and ESR level between cases and controls groups, it had been significantly found that pneumonia cases had higher WBC, count, granulocyte percent, lymphocytes percent and ESR, in all comparison, ($P < 0.001$), (Table 4). To assess the validity of PCT in prediction and differentiation of bacterial pneumonia than other pneumonia, Receiver Operating

Characteristics (ROC) curve analysis was used (Figure 1) and revealed that PCT was able to differentiate bacterial pneumonia than other types of pneumonia and it was good predictor for bacterial pneumonia (Area under the curve was 0.811), with a sensitivity, specificity and accuracy of 96.3%, 74.6% and 85.6%, respectively. Conversely, CRP was weak predictor and failed to predict or differentiate bacterial pneumonia with low sensitivity, specificity and accuracy; 53.3%, 42.6% and 50.2%, respectively, (Table 5).

Table 1. Results According to Gender, Age group and Residence

Variable		Pneumonia group (n = 42)		Controls (n = 42)		P. Value
		No.	%	No.	%	
Age (year)	< 40	7	16.7	6	14.3	0.49
	40 – 49	9	21.4	14	33.3	
	50 – 59	11	26.2	12	28.6	
	≥ 60	15	35.7	10	23.8	
Gender	Male	22	52.4	23	54.8	0.58
	Female	20	47.6	19	45.2	
Residence	Urban	28	66.7	25	59.5	0.65
	Rural	14	33.3	17	40.5	
SD: Standard deviation						

Table 2. Types of Bacterial Isolates of Pneumonia Patients

Bacterial Isolate	No.	%
Streptococcus Pneumoniae	13	31.0
Klebsiella Pneumoniae	10	23.8
Escherichia Coli	3	7.1
Stenotrophomonas Maltophilia	1	2.4
Streptococcus Pyogenes	1	2.4
Haemophilus Influenza	1	2.4
Other pneumonia	13	31.0
Total	42	100.0

Table 3. Comparison of PCT and CRP levels between cases and controls

		Group		
		Bacterial Pneumonia	Other Pneumonia	Control
PCT	Mean	971.71 ^{a,b}	634.62 ^a	227.40
	SD*	281.38	336.37	22.09
	Range	257.0 – 1358.0	232.64 – 859.26	124.0 – 256.0
CRP	Mean	9.82 ^a	8.34 ^a	1.39

Table 4. Comparison of WBC (Total and Differential) Count and ESR level among the Studied Groups

	Bacterial Pneumonia (n =29)		Other Pneumonia (n = 13)		Control (n = 42)		P. value
	Mean	SD	Mean	SD	Mean	SD	
WBC (x 10 ³ / cm)	14.1	2.3	13.9	2.3	7.2	1.5	< 0.001
Granulocyte (%)	81.9	11.0	28.2	7.1	26.0	5.2	< 0.001
Lymphocytes (%)	15.5	9.9	71.5	15.4	46.4	11.7	< 0.001
ESR (mm/hr)	53.2	22.8	21.4	13.2	5.5	3.8	< 0.001

Figure 1. Receiver operating characteristics (ROC) curve for validity of (A) PCT and (B) CRP in prediction of bacterial pneumonia

Table 5. Validity of PCT and CRP parameters in prediction of bacterial pneumonia

Validity parameter	PCT	CRP
Sensitivity	96.3%	53.3%
Specificity	74.6%	42.6%
Accuracy	85.4%	50.2%
Positive predictive value	79.1%	50.4%
Negative predictive value	95.3%	50.6%

DISCUSSION

In the present study, pneumonia was more relatively frequent in male than female, ($P > 0.05$), which agreed with Naderi et al from Iran¹⁴ who stated that males are more commonly affected with pneumonia. The role of sex hormones in the regulation of the immune system may also contribute to the incidence and severity of the various types of respiratory tract infections, especially in adolescents and adults. Concerning with the age groups, the present study found that the highest incidence of pneumonia was found in the age group ≥ 60 years (35.7%) followed by 50-59 years (26.2%) then 40-49 years (21.4%) then followed by <40 (16.7%). according to the residence, record pneumonia was frequent in urban area (66.7%) as compared to rural (33.3%) (Detailed in table 1) this results was in accordance with the study of El-Azeem et al¹⁵. Based on sputum culture results, bacterial pneumonia was reported in 29 patients (69%) while negative culture was reported in 13 patients (31%) and assigned as "other pneumonia" which could be viral or others rather than bacterial, however, the most frequent bacterial agent was *Streptococcus Pneumoniae* (31%) followed by *Klebsiella Pneumoniae* (23.8%), *Escherichia coli* (7.1%), and each of *Stenotrophomonas Maltophilia*, *Streptococcus Pyogenes* and *Haemophilus influenza* had reported in only one patient, 2.4%. Those isolates were identified based on microscopical, culture characteristics and finally the automated Vietek-2 compact system using GN-ID and GP-ID cards that included 47 - 50 biochemical tests. These results were in agreement with the study of Aljanaby A from Iraq¹⁶. Diversity and privilege in bacterial infectious agents could be attributed to that AL- Najaf is always crowded and expatriates from all over the world and from neighboring countries, especially Iran, as most

Iranian travelers come to AL- Najaf first and thus help to spread the infection¹⁶. Based on the statistical results, procalcitonin had significantly the higher mean level in bacterial pneumonia than other pneumonia groups and controls, while CRP, total WBCs and neutrophil percentage were insignificantly different between Bacterial and other pneumonia groups, which indicated that PCT could be a promising predictor, to prove the validity of PCT, in prediction of bacterial pneumonia, ROC curve analysis was applied and revealed that PCT was a good predictor and was able to differentiate between bacterial and non-bacterial pneumonia, the area under the curve (AUC) was (0.811). It is worth mentioning that the higher AUC close to one indicated good validity and predictive value, furthermore, ROC curve revealed that PCT had a sensitivity of 96.3%, a specificity of 74.6%, accuracy of 85.4%, positive predictive value (PPV) of 79.1% and a negative predictive value (NPV). This study was in agreement with Saleem et al¹⁷, but disagreed with Nouvenne et al¹⁸. Additionally, ROC curve analysis revealed that CRP failed to predict or differentiate bacterial pneumonia, (AUC = 0.55), indicated that CRP was not valid to predicting bacterial pneumonia and it was non-specific (42.6%) with poor sensitivity (53.3%) and accuracy (50.2%), (table 5). This study was disagreed with Youssef et al¹.

Recently published revised criteria for pneumonia imply the need to apply procalcitonin as a diagnostic tool¹⁹. A correlation between increased serum concentration and the severity of infection, clinical course, and mortality has been previously reported²⁰. The induction of PCT can be caused by different stimuli both *in vitro* and *in vivo*. Bacterial endotoxins and pro-inflammatory cytokines are powerful stimuli for the production of PCT²¹.

CONCLUSION

This study can indicate that Procalcitonin was able to differentiate bacterial pneumonia from other causative pneumonia, than other tests used in this study, hence, Procalcitonin test could be a promising marker for detection of bacterial pneumonia assists and facilitate the early diagnosis of bacterial pneumonia in addition to clinical characteristics and clinician practice.

The Influence of Leadership Style and Domicile to Power Distance of Midwife Coordinators and Village Midwives in Hulu Sungai Tengah District

Syamsul Arifin¹, Fendy Suhariadi², Nyoman Anita Damayanti³

¹Faculty of Medicine, Lambung Mangkurat University, Banjarmasin, Indonesia,

²Faculty of Psychology, ³Faculty of Public Health, Airlangga University, Surabaya, Indonesia

ABSTRACT

Four mothers in Indonesia died in a day as a result of giving birth. It puts Indonesia as the second highest maternal mortality rate (305/100,000) and infant mortality rate (26/1,000) in Southeast Asia. Health services that contribute directly to reducing MMR are health services during pregnancy or antenatal care, which are mostly carried out by village midwives. Many factors can influence the performance of village midwives between the distance of power. This research uses a quantitative method with a cross-sectional approach. The population were all midwives, both village midwives and midwife coordinators, totalling 200 village midwives and 19 coordinating midwives. The sample was 95 respondents (village midwives) obtained from 13 public health centre in Hulu Sungai Tengah District. Research results show that midwife coordinators with democratic leadership styles tend to show low power distance. Likewise, the village midwife who lives in the target village tends to show power distance between the midwife coordinators and the low village midwives. Two-way communication and openness of superiors characterize low power distance to all members. Low power distance can to create high job involvement and ultimately can produce a good performance. The tendency of the influence of leadership style and domicile of village midwives to power distance between midwife coordinators and village midwives has not shown a significant influence ($p = -0.466$) and ($p = -0.268$). So, the leadership style of the midwife coordinators and the village midwives domicile shows a certain tendency of power distance but statistically does not show significance.

Keywords: leadership style, domicile, power distance, midwife, village

INTRODUCTION

Based on the 2017 World Bank Report, four mothers in Indonesia died from childbirth. In other words, there is one mother in Indonesia who dies every six hours. One of the data presented is data from the ASEAN Millennium Development Goals (MDGs) in 2017. The data shows that in 2015 maternal deaths in Indonesia still reached 305 per 100 thousand. This figure is three times higher than Indonesia's MDG target, which is 102 per 100 thousand. This figure places Indonesia as

the country with the second highest mortality rate in Southeast Asia.¹

Health services that contribute directly to reducing MMR are health services during pregnancy or antenatal care, which are mostly carried out by village midwives. This condition shows that the performance of village midwives who are the spearhead of antenatal services is also still not good. Many factors that can influence the performance of village midwives include leadership style, domicile, and organisational culture. Organisational culture is widely known as the foundation of management systems and activities in every organisation. One organizational culture is the distance of power which is an important part of the superior-subordinate relationship.²

This data based on the 2015 Hulu Sungai Tengah District Health Office has changed, namely that the

Corresponding Author:

Lambung Mangkurat University, Jalan Veteran No.128,
Banjarmasin, 70232, Kalimantan Selatan, Indonesia,

E-mail: syamsularifin82@yahoo.co.id

coverage of antenatal services increased but was still below the target of 75%. This figure is still below the average number for South Kalimantan Province, which is 81.02% and the average number for the national is 87.48%. Based on the data it is also known that as many as 41 villages from 206 villages (19.90%) do not have village midwives, especially for mountainous areas and are very isolated.

MATERIALS AND METHOD

This type of research is analytic observational with the cross-sectional approach. The population in this study were all village midwives in the working area of the public health centre in the Hulu Sungai Tengah District, totalling 200 village midwives with inclusion and exclusion criteria. Calculation of sample size by considering the proportion of precision calculated by the formula:

$$n = \frac{Z^2_{1-\alpha/2} P(1-p)}{d^2}$$

Information :

n: large sample

P: the proportion of ANC performance = 47.4%

$Z_{1-\alpha/2}$ with a 95% confidence level = 1.96

d: precision is set (0.1)

So the sample size is 95 respondents. The sampling technique is a multistage random sampling technique (non-proportional random sampling). The dependent variable is power distance (Y). Independent variables are leadership style (X1), domicile (X2) influences between variables were tested using the chi-square test with α (0,05).

FINDINGS

The results showed that the characteristics of the coordinating midwife from the highest age were above 40 years, the most working time was above 20 years, the highest level of education was a diploma three.

Table 1. Power Distance, Leadership Style, Domicile of Midwife Coordinator and Village Midwife in Hulu Sungai Tengah District 2017

Variable	Amount	Percentage (%)
Power distance between coordinator and village midwife		
Low	79	83.20
High	16	16.80
The leadership style of midwife coordinator		
Autocratic	34	35.79
Democratic	61	64.21
Laisses Faire	0	0
Domicile of the village midwife		
External target villages	15	15.79
Internal guided villages	80	84.21

Table 2. Crosstab Table Leadership Style and Domicile with Power Distance of Midwife Coordinator and Village Midwife in Hulu Sungai Tengah District 2017

Variable	Power Distance				Total (%)	p
	Low		High			
	Amount	%	Amount	%		
Leadership Style						
Autocratic	27	79.40	7	20.60	100	0.466
Democratic	52	85.20	9	14.80	100	
Domisili						
External	11	73.30	4	26.70	100	0.268
Internal	68	85.00	12	15.00	100	

Table 2 shows that midwife coordinators with democratic leadership styles tend to show low power distance. The autocratic leadership style applied by the midwife coordinators tends to show a high power distance. Village midwives who live in the target villages tend to show the power distance between the midwife coordinators and the low village midwives. Village midwives who live outside the target villages tend to show the distance of power between the midwife coordinators and the high village midwives.

DISCUSSION

The Effect of Midwife Coordinator’s Leadership Style on Power Distance Between Midwife Coordinator and Village Midwife

Power distance also depends on the emotional closeness between superiors and subordinates, so that even though the power distance is high but psychologically there is emotional closeness such as friendship or family resulting in employees remaining comfortable to interact with their superiors. So that any leadership style applied does not affect the distance of power between the boss and the subordinate.

This opinion refers to the theory stating that leadership comes from power in a group or organization that consists of three types, namely position, personality, and politics.³

This opinion refers to the theory stating that leadership comes from power in a group or organization that consists of three types, namely position, personality, and politics.³

1. The power that comes from a position

a. Formal or legal power

Including the commander of the army, agency heads, presidents or prime ministers, and so on chances, power as appointed or confirmed by the official rules or regulations.

b. Control over resources and rewards

Employers who pay their employees, rice field owners who pay their workers, chiefs or offices that can reward members or subordinates, lead based on this type of power.

c. Control over punishment

Rewards are usually related to punishment. A leadership whose only source of control is punishment

based on fear. For example, thugs who collect taxes from shop owners.

d. Control over information

People who master information can be leaders. For example, scholars become leaders in religion; scientists become leaders in science.

e. Ecological control

This source of power is also called the engineering of the situation. For example, control over job placement, a supervisor of the head of the personnel section has power over his subordinates by determining the position of its members.

2. The power that is based on personality

Leadership that comes from power because personality begins from personal nature, namely:

a. Skills

For example, in prayer in congregation in the religion of Islam which is used as a prayer leader or priest is the most fluent in reading the verses of the Qur’an.

b. Friendship and Loyalty

The nature of socializing, being loyal or loyal to a group is a source of power so that someone is considered a leader.

c. Charisma

The personality traits that lead to the personal authority of the leader are one of the sources of power in the leadership process.

3. The power from politics. Power derived from politics consisting of:

a. Control or decision-making process

An example of a judge presiding over a trial of justice is because he has control over the course of the trial and the decision or verdict to be handed down.

b. Coalition

Leadership by the source of political power is determined by the right or authority to make cooperation with other groups.

c. Participation

The leader regulates participation and in what form the members participate.

d. Institutionalization

For example, the religious leader marries a husband and wife determines the formation of a

new family, and a notary or judge establishes the establishment of a new foundation or company.

Another thing that can cause the coordinating midwife to apply more democratic leadership style, if analyzed from the characteristics of respondents is because the average age is relatively the same between coordinator midwives and most of the village midwives, so that mutual respect and respect are more dominant. The democratic leadership style also allows communication between superior and subordinate, then it can motivate the involvement of village midwife in all antenatal care program becomes high.⁴

The Influence of Village Midwife Domicile Against the Distance of Power between Midwife Coordinator and Village Midwife

Frequent interactions can play an important role in the formation of closeness and friendship groups. Interaction is the main requirement in group dynamics because with interaction there will be a process of knowledge transfer that can run horizontally based on the need for information about that knowledge. So that the closeness can contribute to the distance of power between the two people who interact.

Authority of the midwife as contained in the Regulation of the Health Minister of the Republic of Indonesia Number 97 of 2014 concerning Health Services Period Pra-pregnancy, Pregnancy, Childbirth, and Period After Childbirth, Organizing Contraception Services, and Sexual Health Services. The authority of the village midwife in antenatal care anywhere is based on the regulation there is no difference.⁵ To achieve good performance can be pursued through a high job involvement without being influenced by the village midwife domicile, but the village midwife domicile in the assisted village has a role in increasing the high job involvement.⁶

CONCLUSION

The distance of the power of coordinator and village midwife not significantly affected by the coordinator leadership style and domicile in the implementation of services health.

Ethical Clearance: Before conducting the data retrieval, the researchers conducted a decent test of ethics conducted at the Faculty of Medicine, Lambung Mangkurat University to determine that this study has met the feasibility. Information on an ethical test that the study is eligible to continue. The feasibility of the research was conducted in an effort to protect the human rights and security of research subjects.

Source Funding: This study was done by self-funding from the authors.

Conflict of Interest: The authors declare that they have no conflict interests.

Qualitative Study: A History of Stunting in the Massenrempulu Community of Enrekang District

Agustian Ipa^{1,3}, R. Bambang Wirjatmadi², Shrimarti Rukmini Devy², Rudy Hartono³

¹Doctoral Candidate for Health Science, the Public Health Faculty, University of Airlangga in Surabaya, Indonesia, ²Faculty of Public Health, Airlangga University in Surabaya, Indonesia,

³Health Polytechnic of Ministry of Health in Makassar, Indonesia

ABSTRACT

Focus Group Discussion (FGD) method. FGDs were performed with primary children caregivers aged 0 to 24 months. Each of three FGD had 4 participants. FGD were conducted using structured interview guides and recorded tapes. Recorded data were transcribed and analyzed using qualitative thematic analysis techniques. Results : All participants are women, majority as housewives who sometimes help farm husbands and have at least one child in the age group 0-24 months in their home. The findings suggest that short body conditions or stunting are not considered a problem by the local community. The concept of the body that is considered important is capable of activity with normal and productive. People also feel resigned if their child's body stunting because according to them it is a gift from the Creator and should be grateful. Conclusion : The unique cultural element of each ethnic in itself has a value that affects the life of the local community. This is a local context that is often overlooked in the formulation of a policy that is often applied generically same for the whole of Indonesia. Different viewpoints between the government and Massenrempulu community could be a strong factor causing trend of stunting case to be increase every year.

Keywords: *Stunting, children caregivers, Massenrempulu community.*

INTRODUCTION

Stunting is a failure to grow in children under five (infants under five years) due to chronic malnutrition so that the child is too short for his age. Nutritional deficiency occurs since the baby is in the womb and in the early period after the baby is born however, the new stunting condition appears after the 2 year old baby⁽¹⁾.

In Indonesia, around 37% (almost 9 million) of children under five experience stunting (Basic Health Research / Riskesdas 2013) and around the world, Indonesia is a country with the fifth largest prevalence of stunting. Even the prevalence of short toddlers was found to be higher in a number of conditions, including being 42.8 percent of mothers who married young (aged

15-19 years) and 46.7 percent of mothers who were short (height less than 150 cm)⁽²⁾.

Stunting is not just a short body problem. Stunting is a chronic nutritional problem starting from the fetus in the womb until the child reaches the age of two years. The cause of stunting problems is multidimensional, not limited to nutrition and health issues. UNICEF has published the causes of malnutrition in children under five covering economic and socio-cultural causes, and recognizes three levels of causality that are related to children's nutritional status factors, namely indirect factors and the main factors as the direct cause of stunting. There are two direct causative factors that affect an individual's nutritional status, namely food factors and infectious diseases, these two factors influence each other. Malnutrition causes children to be susceptible to infection, because there is a disturbance in the child's immune system, whereas children who are repeatedly infected with the disease will worsen their nutritional condition^(3,4).

The problem of stunting in toddlers is very closely related to parenting issues. The concept of parenting as a determinant. The concept of parenting as a determinant of child nutrition is a new thing for those who work outside the field of nutrition and health. In addition, for those who work in the field, ways of measuring parenting are a problem because parenting knowledge and practice vary greatly from one culture to another⁽⁴⁾. Some studies have found that mothers with good parenting. Parenting is a practice in the household that is seen by the availability of food and health care and other sources for the benefit of life, growth and development. Parenting includes many aspects, namely maternal care, breastfeeding and complementary feeding, psychosocial care and cognitive stimulation, food storage and storage, health service search patterns and environmental hygiene and sanitation practices^(4,5).

Feeding Babies and Children is an important part of parenting in accordance with the concepts and indicators launched by WHO (2012)⁽⁶⁾. From some research results found the incidence of stunting children, among others, due to improper feeding practices, in accordance with health recommendations, especially in terms of patterns of breastfeeding and complementary feeding. The UNICEF Indonesia study revealed a number of obstacles, especially knowledge barriers at the family level that triggered high incidence of stunting in children aged 6-23. Enrekang District including the two districts with the highest prevalence of stunting under five. The prevalence of stunting toddlers in Enrekang District does not occur evenly across all districts. Some districts show relatively high numbers compared to others. One sub-district that has a high prevalence is Baraka District, while the other regions show relatively low numbers, for example Baroko District and Enrekang City^(7,8).

Based on several considerations that have been described previously, the researchers are interested in examining the study of stunting in the view of the Massenrempulu community and looking more closely at the submission of the Massenrempulu community with a stunting body pattern over time in a long period of time.

MATERIAL AND METHOD

Data collection uses a method of Focus Group Discussion (FGD). FGDs are conducted with primary caregivers from children aged 0 to 24 months. Each of the three focus group discussions has 4 participants. Focus

group discussions were carried out using structured interview guides and recorded.

The instruments needed include recording devices, log books, and FGD guidelines^(9,10).

Research design

This research is a qualitative research with phenomenology study design. The research was conducted in Pepandungan village, Baraka sub-district, Enrekang Regency. The study was conducted in November 2017 to February 2018.

Population and Informant

The population in this study were all mothers from baduta who were stunted and domiciled in Baraka sub-district, Enrekang district in the language of thorns. The large sample of the study were mothers with a million who experienced stunting and were willing to work together and actively participate in the study in the village of Pepandungan as many as 12 mothers.

Data collection

This study uses qualitative methods with a phenomenological approach. The phenomenological approach is about to see what is experienced by humans from the point of view of the first person, namely from the person who experienced it. The focus of phenomenology study is not a particular experience, but rather the structure of the experience of consciousness in the form of objective reality which is tangible in the subjective experience of people. The main study of the phenomenological approach is the subjective meaning of objective reality in the consciousness of people who undergo daily activities⁽¹²⁾.

Data analysis

The recorded data is then transcribed and analyzed using qualitative thematic analysis techniques

FINDINGS

The concept of Massenrempulu culture is very broad regarding various parts of the life of its people. In the Massenrempulu community, giving parents great attention and affection to their children can be seen from the needs considered primary. The main things that are considered important and crucial for the future of their children. In the Massenrempulu culture, there

is the term 'inheritance' which shows parents' love for their children. Inheritance which is generally considered important to be abandoned for their children is buffalo, houses and land.

Based on the FGD that has been carried out, information is obtained regarding the inefficiency of public facilities perceived by informants that directly and indirectly affect the nutritional status of the local community.

CONCLUSIONS AND RECOMMENDATIONS

Road facilities to reach the research location are fairly difficult. When traveling to the research location, the research team had to go through a rocky and muddy road with a fairly narrow road width. Not surprisingly, during the trip, the research team only ran into a number of motorbikes and truck cars. Every now and then, the trip must stop to repair the road first, such as picking up rocks to cover uneven roads to prevent the car from being used down. Along the way from the main highway to the location of the study, it was traversed by the mountain edge on the left and the steep ravine at the right side without the edge barrier. The available road width also makes it impossible to pass a car, even with a motorcycle it is quite difficult. When going to bump into a truck, the truck driver always relents to retreat until he reaches the cornering road, because the width of the road is more likely to cross the point. To drive a car on this road must certainly require good driving skills with a high level of concentration.

From the main highway to the location of the study, the research team passed several points of the area by using the community to settle. However, the distance between one settlement point and another is quite far. Time needed to reach the research location is also quite long, which is around two and a half hours. The length of time needed to get to the location of the study was not only felt by the research team. This was also revealed by the informants when the FGD was held. "Mabela male lako, eda know male pabawa sa mabelai" (abbreviation Sh, Fw, and Dn).

The informant revealed that the distance that must be traveled to the capital of the sub-district is very far, it takes a long time, and is constrained by vehicles. This is also the reason that people rarely access the market in the sub-district, even though there are no market facilities in

the village or local hamlet.

The level of health in the local area is more viewed by one's productivity. For adolescents and adults, a healthy concept is more emphasized on their work productivity. Strengthened by the demands of a life that truly depends on nature and agriculture being the highest source of income in the region, eating ability to work is needed. During this time, they believed that body proportions did not affect their productivity at work.

The government in this case also certainly plays an important role, especially for health and nutrition workers. Giving insight and information for mothers. very important in improving the quality of future generations. The support of the main community and the government is generally a very important point in carrying out various kinds of appeals and interventions. Especially for people who live in remote areas with a culture that is still closely attached. It is also realized from the research that has been done, that the concept of stunting itself is the main role in creating a generation or child who is stunting.

DISCUSSION

So that a short body is not considered a problem that must be troubled, so there are no steps taken to handle the condition.

Household life in the study area which also shows the independence setting also contributes separately in terms of food fulfillment at the household level. Marriage at an early age is common in this area. Even four of the FGD participants who were mothers of children under five were aged ≤ 20 years. And 2 of the FGD participants admitted that their husbands were still in college in another city when the research was conducted. However, the independence setting that grows and develops in this area makes everyone who has married feel proud to live with his parents again. So that only three FGD participants stated that they lived with their parents-in-law because their parents-in-law were old and needed child care.

Setting independence makes young couples feel they have to fulfill their daily needs independently. So, even though the food at the household level has been depleted, they are very reluctant to ask for help from their parents⁽¹¹⁾. The principle is that there is enough or insufficient supply of food for daily needs

to be a household level consequence. Settings like this are certainly very influential in terms of providing materials and ultimately play a role in meeting the daily nutritional needs needed, especially for children. Advanced manifestations of this condition certainly lead to stunting due to intake that is not in accordance with daily consumption recommendations.

Not only is the setting independent, the concept of body proportions which is a divine gift that must always be grateful for the pattern of reinforcement of stunting in the area of research. Height is considered something that has been determined by the Almighty, and it is appropriate for humans to be smart to be grateful for what they have. The belief that height is strongly influenced by heredity, further strengthens the pattern of being grateful for what is owned today. This concept of sincerity or resignation is placed not in its place, because in fact at the age of the child, growth is still very likely to be pursued. And the belief that short is a hereditary factor is a concept that must be broken in the mindset of society. Incorrect trust and a sense of resignation are two things that make mothers do not have the will to do something in the pursuit of child development.

CONCLUSION

A short body or stunting is considered not a problem by the Massenrempulu community. In everyday life, health and body strength are assessed in work productivity. So, if someone is still able to work optimally, short posture is not a problem. For children, a stunting body is also not a problem as long as the child is still able to play and active activities. The perspective of the Massenrempulu community does indeed support the occurrence of prolonged stunting in the region. This fact shows the importance of serious attention from the government to reduce the prevalence of stunting at the age of children to improve the quality of human resources in the future.

Logical & valid derivatives of the findings. Is the answer to the research problem. Made based on facts. Is a statement of the will of the author. Demonstrate the things that need to be developed.

Conflict-of-Interest Statement: There is no conflict of interest between researchers and informants and key informants.

Source of Funding : This research was funded by

the researchers themselves independently.

Ethical Clearance : Ethical research was obtained after going through ethical studies in front of reviewers in the ethics commission for research on Faculty of Public Health at Airlangga University in Surabaya, Indonesia.

The Effect of Rosella Beverage Intervention on Lipid Profiles and Antropometric in Obese Adult Men

Fariza Yulia Kartika Sari¹, Evy Damayanthi², Lilik Kustiyah²

¹Master Student, ²Departement of Community Nutrition, Faculty of Human Ecology, Bogor Agriculture University

ABSTRACT

This study aimed to analyze the effect of rosella beverage intervention toward blood lipid profiles (total cholesterol, triglycerides, HDL and LDL) and antropometric in obese adult men. The current study was a quasi experimental study with pre-post test. Twentyfive obese men subjects in IPB Security Unit were randomly assigned to a control group (n = 11) and intervention group (n = 14). The intervention group consumed a rosella beverage containing anthocyanin 81.16 mg/g and the control group consumed a placebo beverage that did not contain anthocyanin for 6 weeks. Rosella beverage has contained anthocyanin 81.16 mg/g and antioxidant activity 64.8 mg vitamin C/100 g. The results showed that the presence of intervention could effectively reduce weight, body weight and BMI compared to before intervention ($p < 0.05$). Intervention beverageing roselle significantly decreased triglyceride levels ($p < 0.05$) and tend to decrease cholesterol, HDL and LDL ($p > 0.05$). This indicates that the intervention of roselle beverages could improved the lipid profile in obese adults.

Keywords: *anthocyanin, obesity, rosella beverage*

INTRODUCTION

World Health Organization (WHO) estimates that around 1.6 billion adults are overweight and 650 million are obese in 2016. The prevalence of overweight and obesity in Indonesia from year to year has increased as shown by the Riskesdas data in 2007, 2010 to 2013 were respectively 19.1%, 21.7%, and 26.3%. Obesity, particularly central obesity, is a condition of excess fat accumulation in adipose tissue. which has numerous negative impacts for health. Central obesity, featured by abdominal fat accumulation, increases the risk of cardiovascular disease compared to general obesity¹. Central obesity increases the risk of cardiovascular disease concomitant of increasing blood lipid profiles such as cholesterol, triglycerides, Low Density Lipoprotein (LDL), and Low High Density Lipoprotein (HDL)².

Anthocyanin is one of flavanoid that has purple colour and often found in fruits, vegetables and tubers. Previous meta-analysis studies suggested that anthocyanin consumption has health benefits, one of which improves lipid profile for healthy people and people with cardiovascular disease³⁻⁶. The role of

anthocyanin in improving lipid profiles is by suppressing the enzyme regulation of HMG-CoA reductase, thus inhibiting cholesterol synthesis⁴.

Rosella flower is a plant containing 128.76 mg / 100g anthocyanin⁷. Rosella flowers are often consumed by people as a rosella tea. Azis *et al.*⁸ reviewed several research results related to the intervention of rosella against lipid profiles for individuals who have cardiovascular disease but most of them made rosella as tea and capsule product. However, there are still not many research that made beverage from extract rosella as functional food to see the effect on lipid profiles in obese individuals. Functional food has advantages more easily accepted and safe than capsules. Therefore, roselle extract beverage products are made to increase the acceptability and effectiveness of lipid profile improvement in obese individuals.

The objectives of this study were to make high antosianin rosella beverage formulations and to analyze the effect of rosella beverage toward blood lipid profiles (total cholesterol, triglycerides, HDL and LDL) in obese men.

MATERIAL AND METHOD

The design of the intervention study was quacy experimental pre-post design which divided by control and intervention groups in March until May 2018. The location of this study was chosen purposively ini Bogor Agricultural University. The subjects were 25 male security guard from Bogor Agricultural University. This subject consitsted of 11 for the control groups and 14 for the intervention groups. Inclusion criteria in this study were men who were overweight/obese with a BMI value ≥ 23 kg/m² and/or waist circumference >90 cm, aged 30-55 years, were not getting similar interventions (antioxidant beverages). Exclusion criteria in this study were having chronic disease or cardiovascular disease, having a disease or history of gastric disease, consuming alcohol, routinely taking antioxidant supplements and/or phytopharmaca, taking anti-hypercholesterolemia drugs.

The intervention group was given roselle beverage containing anthocyanin 81.16 mg/day for 6 weeks, while the control group was given placebo beverages that had the same color as the intervention product but did not contain anthocyanin. All groups were given 480 mL/day beverages. During the intervention period, the subject was asked not to consume high-food antioxidants, especially anthocyanins, and supplements or multivitamins.

The collected data included secondary and primary data. Secondary data was the profile of IPB security guard obtained from staff department of the Campus Security Unit (UKK) of IPB. Primary data include organoleptic, socioeconomic characteristics, anthropometry and blood lipid profiles. Organoleptic data consists of hedonic and hedonic quality tests. Data of socioeconomic characteristics include of age, education, income and family size. These data were taken by direct interview to the subject. Anthropometric data included of weight, height, and waist circumference. Subjects used light clothing and barefoot during anthropometric measurements. Data of subject characteristics, socioeconomic, anthropometric and lipid profiles were collected at the beginning and the end of the study. The consumption of roselle beverages was monitored by compliance form filled by the subject and confirmed by the researcher.

The data on socio-economic characteristics of the subjects were analyzed descriptively. The distribution of anthropometric data and lipid profiles were analyzed

by Kolmogorov-Smirnov test. The comparison of levels of blood lipid profiles and anthropometry for intra-group comparison (baseline with endline) were analyzed by paired t-test, while inter-group comparison (between intervention and control groups) was analyzed by independent t-test. The ANCOVA test was used to determine the effect of rosella beverage intervention by controlling covariate variables.

RESULTS

Table 1: Characteristics subject in baseline of the study

Variable	Group		p-value
	Control	Intervention	
Age (th)	46.2 ± 5.0	42.6 ± 6.0	0.130 ¹
Early adultl	2 (18.2)	4 (28.6)	
Middle adult	9 (81.8)	10 (71.4)

Cholesterol	209.09 ± 22.40	180.00 ± 46.16	0.068 ¹
Trigliserida	147.45 ± 46.77	150.29 ± 22.97	0.923 ¹
HDL	54.09 ± 13.45	45.36 ± 14.36	0.134 ¹
LDL	125.45 ± 24.03	104.64 ± 40.71	0.148 ¹

¹ Independent t-test

2 Chi-square

Table 1 describes the characteristics of all subjects. Most subjects were classified as middle adults with an average age of 46.2 ± 5.0 (control group) and 42.6 ± 6.0 (intervention group). The final education level of the subjects is mostly high school graduates and has a family size of ≤ 4 people. Subjects had an average

income with a range of 1 500 000 - 2 5 000 000/month which is classified as moderate economic level. Based on the results of different test analysis, there were no significant differences age, education, family size, income, anthropometrics and lipid profiles between intervention and control group at the baseline of study ($p > 0.05$).

Table 2: Results of statistical analysis of different test anthropometric variables

Variable	Phase	Control	Intervention	p-value ²
Waist Circumference	Before	93.23 \pm 5.50	96.29 \pm 8.86	
	After	90.64 \pm 5.56	93.21 \pm 7.79

*significant p<0.05

¹ Paired t-test (P <0.05 = significant difference in intra-group)

² Independent t-test (P <0.05 = significant difference between groups)

The result of analysis show that triglyserida level significant decreased in intervention group compared to control group. Futhermore, the other lipid such as cholesterol, LDL and HDL no significant difference between group control and intervention (p>0.05).

DISCUSSION

Rosella beverage was made from roselle extract, water, sukralosa and salt. The beverages that were intervened were selected rosella beverages based on organoleptic tests. This beverage contains 10 g of rosela extract. The anthocyanin content in roselle beverages was 81.16 mg. Anthocyanin is part of flavonoids, considered as an antioxidant, which gives red or purple color to plants⁹. The types of anthocyanins found in rosella were delphinidin-3-glucoside, cyanidin-3-glucoside, delphinidin-3-sambubioside and cyanidin-3-sambubioside, all of which contribute to antioxidant activity¹⁰. Based on the analysis, the antioxidant content of roselle beverage were 64.8 mg vit C/100 g. The antioxidant content of this rosella beverage is higher than other antioxidant beverages such as bran beverages

which have an AEAC value of 28.74 mg vit C/100 g¹¹ and jelly okra beverages with an AEAC value of 10.10 mg vit C/100g¹². Djaeni *et al.*¹³ states that rosella is a plant that has strong antioxidants with IC50 values between 50-100 ppm.

The results of this study found that giving of roselle beverage significantly reduced waist circumference, body weight and BMI compared to before intervention (p<0.05). This result is consistent with the research which proved that 1g/day roselle extract for 90 days could reduce BMI and body weight by 0.4 1g/day and 0.8 kg¹⁴. Several studies in Mexico have concluded the use of roselle extract in weight loss because of its ability to excrete fat absorption and body weight in mice¹⁵. Rosela contains high antioxidants, one of which is anthocyanin. Previous meta-analysis stated that anthocyanin supplementation can reduce weight and adipose tissue in both animal and human subjects¹⁶.

The study also found that the intervention group significantly reduced triglycerides compared to the control group (p<0.05). Meanwhile for other lipid profiles such as cholesterol, LDL and HDL tend to decrease in the intervention group (p>0.05). The occurrence of triglyceride decrease in the intervention subjects was suspected because the anthocyanin content of roselle beverage were 81.16 mg. The role of anthocyanin in reducing triglycerides is by decreasing serum apo-B and

apo-C III. Both serum plays a role in the metabolism of triglycerides to the plasma⁴.

HDL is one of the lipid profiles that are protective against atherosclerosis. Increased cholesterol levels had a positive effect on reducing the risk of non-communicable diseases¹⁷. The results of this study indicated that there was a decrease in HDL levels in each group, but still within the normal range of 35-55 mg/dL¹⁸. The HDL in the intervention group decreased by 0.72 mg/dL (1.6%), but not significant ($p > 0.05$). The control group also significant decreased by 10.64 mg/dL (19.7%) compared to the data before intervention ($p < 0.05$). Increasing HDL level is difficult in several clinical studies, one of which is caused by the subject's lifestyle that has not changed such as lack of physical activity. Although, subjects were given education to increase physical activity and to eat healthy foods, during the study, not all subjects were disciplined, due to age and work pattern as security guards who had not been able to perform physical activities regularly.

Rosella contains anthocyanins which can play a role in reducing LDL by inhibiting cholesteryl ester transfer protein (CETP)⁴. Decreased LDL levels may also be due to the inhibition of triacylglycerol synthesis by hibiscus acid compounds which are the content of rosella¹⁵. Meanwhile, the consumption of 160 mg anthocyanin supplementation twice daily for 24 weeks in subjects with diabetes mellitus 2 significantly reduced LDL levels (7.9%), triglycerides (23.0%) and increased HDL levels (19.4%) compared to the control group¹⁹. The difference in outcomes was due to several factors: the type and number of subjects (healthy subjects or sick subjects), length of study, and number of intervention products. Anthocyanin has a low bioavailability about 12%²⁰. Bioavailability is the ability of active ingredients that can be absorbed by the body. Therefore, anthocyanin intervention should be given in large quantities in order to be absorbed more by the body.

Based on the ANCOVA test, changes in lipid profile levels were not influenced by several covariate variables such as energy and nutrients intake, levels of lipid profiles before intervention and frequency of fried foods. This indicates that the improvement of the lipid profile in the intervention group was thought to be only affected by the intervention of roselle beverage.

CONCLUSION

Intervention of rosella beverage significantly decreased triglyceride level, but there was a tendency to decrease cholesterol, LDL and HDL level. The intervention of rosella beverage also significantly decreased waist circumference, weight and BMI.

Exposure of Xylene in Working Environment and Methylhippuric Acid in Informal Footwear Worker in Bogor, Indonesia

Ridcho Andrian Am¹, Ema Hermawati²

¹M.P.H. Student, Department of Environmental Health, Faculty of Public Health, University of Indonesia, Depok,

²Lecturer, Faculty of Public Health, University of Indonesia, Depok

ABSTRACT

Introduction: The use of adhesives and paints containing xylene play an important role in footwear manufacturing. Xylene exposure can affect the central nervous system. To determine the level of exposure can be conducted by measuring the levels of methylhippuric acid (MHA) in urine. The aim of this study was to describe the risk of xylene exposure to workers' health.

Method: This study used cross-sectional design and conducted in three footwear workshops in Ciomas, Bogor Regency in September – October 2017. The study sample consisted of 40 urinary workers and 9-point measurements of xylene in indoor air. Especially, urine (MHA) was taken at the end of work hours and analyzed with UPLC MS/MS. Furthermore, xylene measurements were carried out using gas chromatography. For the analysis of the relationships between the concentration of xylene and MHA levels using simple linear regression.

Results: The concentration of xylene in the workshops was 0.00358 mg/m³ (median) with the highest concentration at the sample point 6 (0.03161 mg/m³). MHA in the urine of all workers was 0.000100 g/g of creatinine (median). From the statistical results, there was no statistically significant relationship between xylene concentration and MHA ($p = 0,511$).

Conclusions: There was a positive linear correlation between xylene concentration in indoor air of workplace increased and the level of MHA in urine. It means the higher the xylene concentration, the more MHA level.

Keywords: xylene, methylhippuric acid (MHA), footwear worker, workplace, working environment

INTRODUCTION

One of the volatile chemical compounds is xylene which source from adhesives and paints. Its presence in the footwear industry has proved in several studies. Xylene was detected in indoor air in footwear workshop

in Pulogadung, Jakarta.¹ Similarly, the adhesive substance in footwear workshop in Cibaduyut, Bandung containing xylene solvent has found.² The types and brands of adhesives in Pulogadung and Cibaduyut with Ciomas did not vary as they have similar characteristics. In another medium, it also found in shoe polish products.³ Accordingly, footwear workers are vulnerable to the exposure of xylene while working in footwear workshops. The pattern of their work activities directly contacts with harmful solvents. It will cause health problems later on.

Xylene enters to the human body through inhalation, ingestion, and absorption. Every individual has the distinct reactions of exposure level due to the amount

of concentration and duration of exposure.⁴ The effects of exposure to xylene are shortness of breath, impaired lung function, heart palpitations, chest pain, abnormal ECG, and possible kidney impairment.^{5,6} Other effects of short or long term of high concentration are affecting the central nervous system in the form of subjective symptoms of poisoning, headache, fatigue, short-term memory disorder, time response disorder, disorder in numerical ability, and alteration in equilibrium and body balance.^{5,7} Likewise, a case report in United Kingdom reported case of fatality in consequence of exposure to high concentration of xylene in painting industry.⁸ There was evidence that xylene generated oxidative stress and organelle damage in lymphocytes.⁹

Biological monitoring (biomonitoring) is a method used to assess the exposure level of the chemical agent by measuring the metabolite or reaction product in a tissue or body specimen. Xylene can be detected in the end-exhaled air (expiration), in blood, and urine in exposed individuals. However, urinary level of methylhippuric acid (MHA), a metabolism product of xylene, is far better to indicate an individual exposed to xylene than blood and exhaled air containing xylene.⁴ In a study in Iran, MHA in urine had a good correlation with xylene in the indoor air.¹⁰ Hence, MHA has recommended as a biomarker for monitoring workers who exposed to xylene.^{7,11} According to biological exposure index (BEI) of American Conference of Governmental Industrial Hygienists (ACGIH), the tolerable MHA is 1.5 g/g of creatinine.¹²

Until now, the use of the adhesive substance containing xylene solvent in the production process has still used because there is no a novel finding which can substitute existed material. Health problems, caused by exposure to xylene or other solvents, have not been a top priority to be addressed, especially in the informal sector. In fact, a vast range of studies has examined the health effects of xylene exposure and the magnitude of the risk. No matter how small the concentration of contaminants in the environment cumulatively can affect the health quality of workers and productivity of the footwear workshop. This study aimed to formulate risk control measures so that workers can work safely.

MATERIALS AND METHOD

This is a cross-sectional study and was carried out between September and October 2017. The sampling frame of the study was 68 workers from three footwear

workshops which registered in the Ciomas Puskesmas (public health center). The sampling method was drawn by purposive sampling since the sampling had similar characteristics or conditions. All participants retrieved from worker list of the workshops.

Inclusion criteria for footwear workshop workers were following this: at least working time was one year and 16 years old; working at the workshop to produce footwear; not in good health during collecting data. Exclusion criteria included employees who worked in their home and urinary volume less than 5mL. Informed consent was taken from the participants ensuring their confidentiality and anonymity before data collection starting. Participants were eligible only 40 workers according to sample criteria.

Xylene concentration in indoor air conducted in 9-point measurements of air sampling, 3 points in each workshop. The collection of air sampling was carried out in every workshop workspace consisting of: 1. workshop A: a. upper and sewing area (point 1); b. Pattern and finishing area (point 2); c. Lower and gluing area (point 3), 2. Workshop B: a. Lower rear corner area (point 4); b. Gluing and lower area (point 5); c. Sewing, paint and finishing area (point 6), 3. Workshop C: a. Pattern and packaging area (point 7); b. Sewing area (point 8); c. Gluing and lower area (point 9). The duration of air sampling was 20 minutes by using the solid sorbent tube. All samples transferred to analyze in Jakarta Hiperkes laboratory with gas chromatography (GC) and carried out according to The National Institute for Occupational Safety and Health (NIOSH) 1501 method.¹³ Every air and urine samples which collected from the workshops would label in alphabetical order.

The urine samples collected in a urinary pot plastic, the minimum volume of 5 mL, bagged and refrigerated at the temperature of 4°C before storage in which they were stable until four weeks.¹⁴ The determination of MHA and urinary creatinine carried out according to NIOSH 8301 method.¹⁵

Data analysis used simple regression linear to analyze the association between xylene concentration and MHA in urine. All the data were collected at the end of working hours for the worker's urine and the xylene concentration during the production process.

FINDINGS

Commonly, the workshop buildings did not have

workspace dividers except in the 'C' workshop which separated by the concrete wall. Every workshop produced different footwear products from each other.

The 'A' workshop made casual shoes, the 'B' workshop made military boots and formal work shoes, and the 'C' workshop made women's shoes and sandals.

Graph 1. Xylene Concentration (mg/m³) Based on the Air Sampling Point in Three Workshops

The presence of xylene was detected in all workshops and the value did not exceed the threshold limit value (TLV) in Indonesia of 434 mg/m³ (Permenakertrans No. 13 of 2011 and SNI 19-0232-2005). The highest concentration of xylene was at the sampling point 3 (workshop B) of 0.03161 mg/m³ (graph 1). At this point, there were two main activities, painting and gluing. This process did not do in other workshops because of the different production process. Previous studies in Pulogadung (Jakarta) and Cibaduyut (Bandung) verified the presence of xylene in glue and exposed to workers through inhalation.^{1,2} Xylene in the paint is released through the evaporation process when spraying and the paint layer drying on the painted surface. Its presence, in paint besides adhesive, has been proven.^{3,16} In another study, xylene from paint confirmed in the workspace.^{17,18} Xylene in the paint is released through the evaporation process when spraying and the paint layer drying on the painted surface. Its presence, in paint besides adhesive, has been proven.^{3,16} In another study, xylene from paint confirmed in the workspace.^{17,18} Also, thinner

contained about 30-40% of xylene and mixed in the paint.¹⁴ Thus, the xylene concentration was higher than the other sampling points in this study because there were two sources, paints and adhesives.

Also, thinner contained about 30-40% of xylene and mixed in the paint.¹⁴ Thus, the xylene concentration was higher than the other sampling points in this study because there were two sources, paints and adhesives.

The average of MHA levels for all workers in the three workshops was 9.00E-05 g/g creatinine (table 1). The median value was 1.00E-04 g/g of creatinine. Workers in the workshop B had the highest average of value at 1.33E-04 g/g of creatinine compared with the worker in another workshop. Following that, the MHA level in the workshop A was 8.90E-05 g/g of creatinine. The lowest MHA level was workers in the workshop C at 6.80E-05 g/g of creatinine.

Table 1. The Distribution of Xylene (mg/m³) and MHA (g/g kreatinin)

Workshops	Mean	Median	SD	Min – Max	Skewness*
Xylene					
Workshop A	0.00518	0.00365	0.00364	0.00317 – 0.00873	1.376
Workshop B	0.01238	0.00534	0.01690	0.00017 – 0.03160	1.266
Workshop C	0.00434	0.00300	0.00295	0.00230 – 0.00773	1.327
Whole Workshop	0.00689	0.00358	0.00844	0.00017 – 0.03160	4.129
MHA					
Workshop A	8.90E-05	1.00E-04	8.20E-05	3.00E-06 – 3.00E-04	0.968
Workshop B	1.33E-04	1.00E-04	7.10E-05	1.00E-04 – 3.00E-04	1.404
Workshop C	6.80E-05	7.50E-05	3.40E-05	1.00E-05 – 1.00E-04	-0.728
Whole Workshop	9.00E-05	1.00E-04	6.50E-05	3.00E-06 – 3.00E-04	4.653

*) Skewness value $\leq -2 - 2$ (normal distribution)

Xylene is highly soluble in blood and body tissue and also rapidly biotransformation to be MHA with elimination half-times about 1 hour after exposure.¹⁹ As a result of xylene metabolism, MHA was excreted in urine between 1 – 2 hours after exposure or maximum 24 hours later.^{4,19,20} Its presence cannot be affected by variations of renal physiology, such as urinary pH, diuresis rate, and reabsorption.²¹ Compared with blood, MHA had a strong correlation with xylene exposure. Therefore, it is used for biomonitoring of exposure to xylene or an exposure biomarker.^{4,12} In some studies, both variables had the significant relationship.^{19,20,22–25} In the present study, the value of MHA levels in the urine of all workers was not to be exceeded the BEI value by ACGIH (1.5 g/g of creatinine). However, the highest MHA level was in the B workshop (air sampling point 6) and consistent with the highest xylene concentration.

The data of xylene concentration and MHA level had to transform using log 10 to normalize the distribution prior to analyzing. The correlation between xylene concentration and MHA level in urine showed very weak association ($r = 0,198$) and the pattern showed positive (table 2). It indicated that the higher the concentration of xylene in the air, the more MHA level in urine was excreted. The coefficient value of 0.011 which meant the regression line equation described 1.1% variation of MHA level. There was no statistically significant

relationship between xylene concentration and MHA level ($p = 0,511$).

However, the relationship depicted a positive linear correlation which meant the higher the xylene concentration, the more MHA level. Other factors can determine the urinary excretion of MHA level. According to Inoue et al. studies in China²⁴, smoking and drinking alcohol tend to affect or reduce levels of MHA in the urine. In their findings, after workers exposed to xylene at a concentration of 100 ppm (434 mg/m³), MHA levels in urine would be 1.137 g/g creatinine. This value was below the ACGIH BEI value of 1.5 g/g creatinine (xylene concentration 434 mg/m³) because of the interaction variable consuming alcohol and smoking. Also, the level will vary from day to day and depends on the length of exposure times.²⁵

Table 2. Correlation between Xylene and MHA

Variable	R	R ²	The Regression Line	P Value
Xylene (log ₁₀)	0,198	0,011	Y = -3,994 + 0,076 X	0,511

CONCLUSIONS

This study presented the biomonitoring of

xylene exposure to the worker. As shown, MHA was no statistically significant relationship with xylene concentration in the workshop air. However, the direction of the relationship between these variables can be concluded that MHA level in urine will increase when xylene concentration increase. It is advisable to interested parties in the informal footwear industry to promote occupational safety and health in the workplace. Also, regular health monitoring should be undertaken to control the health effect of xylene exposure. The effect cumulatively after prolongation and continuous exposure will arise.

Conflict of Interest: The absence of a relationship between the researcher and the subject causes no potential conflict of interest in this study.

Acknowledgment: The authors express gratitude to the owner of the footwear workshop, Ciomas Puskesmas (Community Health Centre), and Bogor Regency Health Office for all supports collecting data and also financial support from DRPM Universitas Indonesia and LPDP (Indonesia Endowment Fund for Education) for publishing this research.

Ethical Clearance: This study received ethical clearance from the Commission of Ethic, Research, and Community Service, Faculty of Public Health of University of Indonesia number 476/UN2.F10/PPM.00.02/2017 on August 21, 2017.

The Analysis of Risk Factors against Malaria in the Tangkiling Public Health Center, Bukit Batu District, Palangka Raya City, Indonesia

Untung Halajur

Polytechnic of Health, Ministry of Health, Republic of Indonesia, Palangka Raya

ABSTRACT

Malaria is an infectious disease that is a global concern. This disease is still a public health problem because it has a broad impact on quality of life and economy and is possible as an emerging and re-emerging disease. Some risk factors that support as a chain of transmission that can cause the characteristics, behavior and physical environment of the house and the environment outside the house where the community lives. The purpose of this study was to determine the relationship of characteristics, behavior, physical environment and outside the home with the incidence of malaria. The study design used was case control with a retrospective approach with 60 case group and control subjects who did not suffer from malaria. Data analysis used Chi-Square with calculation of Odds Ratio and logistic regression. The study shows risk factors associated with the incidence of Malaria were age (p: 0.001), Gender (p: 0.000), Employment (p: 0.000), while unrelated risk factors were education (p: <0.05, OR 1.3; 95% CI: 0.3-4.9) physical home (p: >0.05, OR 1.2; 95% CI: 0.5-2.4), home environment (p: >0.05, OR 1.1; 95% CI: 0.5-2.6), Behavior (p: >0.05, OR 1.3; 95% CI: 0.64-2.68). The conclusion are age, gender, occupation and behavior have a malaria risk of 13%.

Keywords: *malaria, characteristics, home environment, behavior*

INTRODUCTION

Malaria is still a public health problem because it has a broad impact on the quality of life and the economy, and is possible as an emerging and re-emerging disease due to import cases and vectors that can spread Malaria. Malaria can affect the mortality and morbidity of infants, toddlers and childbirth and can reduce the productivity of human resources. The malaria morbidity rate nationally or API is still 1.69% slightly decreased compared to 2011 (1.75%). Furthermore, from 33 provinces that exist, there are still 14 provinces in Indonesia with the category of medium and high endemicity areas, while the number of malaria endemic districts is 149 of the 513

districts/cities that exist. Central Kalimantan is one of 14 provinces, with moderate levels of endemicity. In 2012 morbidity of malaria or malaria API recorded 3.39% and is seen to decline in 2013 with a figure of 2.35%.¹

The city of Palangka Raya includes malaria endemic areas in Central Kalimantan Province. The activities that have been carried out by Malaria Mitigation and Management Program in Palangka Raya City Health Office in controlling malaria include: MBS (Mass Blood Survey), distribution of LLNs (Long lasting Insecticidal Nets), home contact (surveillance). The number of cases in the past three years namely 2012-2014 tends to decrease, where in 2012: 1,102 cases (API = 5% compared to 2013: 568 cases (API = 3%) and in 2014 became API approximately 2. Selanjutnya. division of service area of work then Tangkiling Public Health Center with the highest contribution from 10 Public Health Center in Palangka Raya City against malaria morbidity rate with API 6 “in 2012 and API 3” in 2013.¹ This API number is still higher than Public Health Center of Sekupang (0.3%), Tanjung Sekupang (0.2%), Sei Pancur (0.2%) Batam City.² Tangkiling health center when viewed from

topography conditions and the condition of the area including lowlands and peat soils that are almost flooded for the whole year, coupled with sewage / ditch disposal systems that have not been well organized.

This study took place in the Tangkiling Public Health Center in Bukit Batu Sub-district, Palangka Raya City, with consideration that malaria cases in the area were still high and in residential areas there were forest and scrub areas that allowed high malaria transmission, besides malaria was an infectious disease caused by infection protozoa from the genus plasmodium which are at high risk of death with a relatively fast transmission process.⁴

MATERIALS AND METHOD

This type of research is observational using retrospective study method with the approach of case control studies. The case population in this study were all residents in the work area of the Tangkiling Public Health Center in Bukit Batu Subdistrict, Palangka Raya City, which suffered from malaria which was positive (+) reported to Palangka Raya City Health Office, 2014-2016 period. The control population in this study were all residents of the Tangkiling Public Health Center in Bukit Batu sub-district, Palangka Raya City, who did not suffer from malaria but came to the public health center with complaints of other diseases or showed symptoms of fever, dizziness, vomiting and after being tested for negative (-) malaria.

FINDINGS

Table 1. Proportion of Case and Control Patients according to Risk Factors,

Tangkiling District, Palangkaraya, 2014-2016 (n = 60)

Variable	Case		Control		Total		P value	OR	95% CI

N	60	60
R ²	0.326	0.326
-2loglikelihood	132.6	132.6

Based on the logistic regression above, when the variable job was attempted to be issued there was a change in the odds ratio reach 11%. If the change in the odds ratio > 10% then the variable is re-entered into the regression equation. So, in this study that affects the incidence of malaria is the variable age, occupation and gender.

DISCUSSION

The relationship between the characteristics of respondents with the incidence of malaria

Age is a unit of time that measures the time of existence of an object or creature, both living and dead, for example the age of a human being is said to be measured fifteen years from the time he was born until the time of the count was calculated. By this age is measured from attraction only born so that the attraction of the event begins as long as the date (present).³ The results of the study found that respondents aged > 54 years were at risk of getting malaria by 20 times compared to respondents aged <21 years (OR = 20; 95%: 3.1-130.1). This risk is supported by the results of a simple logistic regression statistical test that gets a P value = 0.001 (P value <0.05).

Gender is the difference between women and men biologically since birth. Risk factors for female characteristics (gender) have a risk of getting malaria by 8.7 times compared to male sex. The P value obtained from the statistical test is 0,000 (P value <0.05) which means there is a difference in the proportion of malaria events between male and female.

Education is an effort to develop personality and abilities inside and outside the school and last a lifetime. Based on a simple logistic regression statistical test, it shows a similar condition, namely P value > 0.05, meaning that there is no difference in malaria incidence based on the respondent's education level (P value = 0.408). Despite, respondents had junior high school education, the risk for malaria was 1.3 times compared to those with high school and higher education (OR 1.3; 95% CI 0.3-4.9). In general, someone who has more higher education will usually find it easier to understand information about something including information about malaria because he can read. This is because the information that is available is more found in the media, leaflets and counseling from officers. Education influences the learning process, the higher one's education the easier it is for the person to receive

information. With higher education one will tend to get information, both from other people and the mass media. Knowledge is very closely related to education where it is expected that someone with higher education, then the person will also be more knowledgeable. But it needs to be emphasized that a person with low education does not mean absolute low knowledge. Increased knowledge is not absolutely obtained from formal education, but can also be obtained from non-formal education.

Work is an activity or activity of a person to earn income for his daily life needs. Long work is an individual experience that will determine growth in work. Work in a broad sense is the main activity carried out by humans. In a narrow sense Job terms are used for a task or work that makes money for someone. Characteristic factors (jobs) that were fishermen and farmers had 7.1 times the risk of contracting malaria *diba n dingkan* with students and household (OR = 7.1; 95% CI: 2.4 to 21.5). Based on statistical tests obtained P value = 0,000 (P value <0.05). Work related to the incidence of DHF. There are 58.8% of sufferers in Donggala are those who do activities outside the house at night. The work as a peasant farmer causes them to stay in the forest until the afternoon, even though they rarely stay there for a few days or weeks to farm, while they become fishermen laborers must start fishing from the afternoon until the dawn is in the open lake, the river in the fish auction this condition gives a big risk to be bitten by mosquitoes, including *Anopheles Sp.*⁵

The relationship between physical environmental factors of the house and the incidence of malaria

Socio-culture also affects the incidence of malaria, such as: the habit of going out late into the night, where the vector is exophilic and exophagic will facilitate contact with mosquitoes. The level of public awareness about the dangers of malaria will affect the willingness of the community to eradicate malaria such as environmental sanitation, using mosquito nets, installing wire netting on the house and using insect repellent.

The results of the analysis that the home environmental factors obtained values (OR: 1.2; 95% CI: 0.5-2.4). This was supported from a statistical test which states that there is no relationship between the physical environment of the house and the incidence of malaria (P value > 0.05).

The relationship between environmental factors

outside the home and the incidence of malaria

Environmental conditions have a major effect on the presence or absence of malaria in an area. The presence of freshwater lakes, rainwater pools, rice fields, forest clearing, fish ponds and mining in an area will increase the likelihood of malaria, because the place is a breeding place for malaria mosquitoes, temperature and rainfall are also important.⁶ The results found that the state of the physical environment outside the home also showed no significant difference (OR = 1.1; 95% CI: 0.5-2.6). This is supported by a statistical test which states that there is no relationship between the physical environment outside the home and the incidence of malaria (P value > 0.05).

There is a significant relationship with the incidence of malaria p: <0.005 (use of gauze and type of house) with the incidence of Malaria in the area of Sarmi City Public Health Center Sarmi Regency. The analysis of risk factors for malaria in Bengkulu which states that ventilation using gauze, the habit of using mosquito nets, the use of mosquito repellent affects the incidence of malaria. Some factual reasons, why there is no relationship between the physical factors of the house, according to information from the person in charge of Malria Tangkiling Public Health Center that some malaria cases were found were infort cases (malaria because of working as sawait plantation laborers, traditional community mining) when they were sick home Tangkiling Public Health Center. Various human activities such as dam building, road building, mining and the construction of new settlements/transmigration often result in environmental changes that benefit malaria transmission.⁶

The relationship between behavioral factors and the incidence of malaria

Behavior is a response or reaction to a person's stimulus (external stimuli). This behavior occurs through the process of a stimulus to the organism and then the organism responds. Health behavior is a person's response (organism) to a stimulus or object related to illness and disease, health care system, food, and drink and the environment. Based on statistical analysis that behavioral variables obtained OR value 1.3 means that respondents who have poor behavior are more at risk of being exposed to 1.3 times compared to respondents have good grades, but this risk is not supported by

statistical tests which state that there is no relationship between behavioral factors with Malaria incidence is $P = 0.465$ ($P > 0.005$). Another reason was due to malaria control activities at the Tangkiling Public Health Center since 2013 such as: Mass Blood Survey, Long Lasting Insecticidal Distribution (LLINs) in bulk together with routine MCH and Immunization activities, housing contracts through a positive Malaria survey, so that health behaviors can be accepted by the community. The risk of malaria can occur because of the poor habits and attitudes of the community is a supporting factor in the spread and facilitate the occurrence of malaria such as the habit of being outdoors at night, sleeping habits do not use anti-mosquito drugs during sleep.

CONCLUSION

The results of the study showed risk factors related to the incidence of malaria, namely age ($p: 0.001$), gender ($p: 0.000$), occupation ($p: 0.000$), while unrelated risk factors were education ($p: >0.05$; OR 1.3; 95% CI 0.3-4.9), physical home ($p > 0.05$; OR 1.2; 95% CI: 0.5-2.4), home environment ($p > 0.05$; OR = 1.1; 95% CI: 0.5-2.6), Behavior ($p > 0.05$, OR = 1.3; 95% CI: 0.64-2.68).

Ethical Clearance: Before conducting the data retrieval, the researchers conducted a decent test of ethics conducted at the Polytechnic of Health, Ministry of Health, Republic of Indonesia, Palangka Raya to determine that this study has met the feasibility. Information on an ethical test that the study is eligible to

continue. The feasibility of the research was conducted in an effort to protect the human rights and security of research subjects.

ABSTRACT

The preconception period is the time to prepare for pregnancy, and it is prone to anemia. While iron deficiency is considered the main cause of nutritional anemia, changes in vitamin B6, vitamin B12, folic acid and zinc status are also associated with the formation and hemoglobin levels. This study aims to determine the relationship between intake of iron, vitamin B6, vitamin B12, folic acid and zinc with hemoglobin levels in preconception women in Banggai Regency from October 2016 to April 2017. This study was cross-sectional study design. Using data from a 24-hour food recall assessment, measuring the daily intake for each respondent of 132 preconception women in three sub-districts in Banggai Regency. Micronutrient intake was obtained by comparing nutritional intake with the table of the Nutrient Adequacy Rate (NAR) 2013. Hemoglobin levels were measured by the *cyanmethaemoglobin* method. The result of this study, the proportion of RDA is below-estimated average needs. As a result, the average hemoglobin level was 12.67 ± 1.24 g/dl. There were 20% anemia, from anemia respondents suffering from mild anemia (16%) and moderate anemia (4%). With the Pearson correlation test, there was no significant relationship between iron ($r=0.056$), vitamin B6 ($r=0.06$), vitamin B12 ($r=0.085$), folic acid ($r=0.062$) and zinc intake with hemoglobin levels. In conclusion, the most preconception women are still at risk of lacking micronutrients such as iron, zinc, folate, vitamin B12, and vitamin B6. Prenatal counseling about the importance of nutrition for the health of pregnant women and their babies are needed.

Keywords: *preconception women, micronutrient intake*

INTRODUCTION

Globally, around 32 million pregnant women and 273 million children under five suffer from anemia in Southeast Asia, the burden of anemia is very high and more than 1 in 4 women suffer from anemia during pregnancy. The causes of anemia vary, but iron deficiency has been identified as the most common and has been associated with an increased risk of maternal and perinatal death and poor birth outcomes¹.

Banggai Regency in Central Sulawesi Province, Indonesia has a high prevalence of anemia of 36.6% in women² compared to the prevalence of anemia on the national scale recently 22.7%³ prevalence rate anemia is higher in Banggai Regency. The study was conducted in three sub-districts, namely Luwuk, North Luwuk and South Luwuk sub-districts in Banggai Regency, to determine the prevalence of anemia in preconception

women. Anemia has been associated with poor health outcomes such as cognitive impairment, reduced work capacity, increased maternal morbidity and mortality, low birth weight, and increased fetal and neonatal mortality.

Anemia is a wide public health problem associated with an increased risk of morbidity and mortality. Among many factors, good nutrition (such as vitamins and mineral deficiencies), non-nutrients (such as infections and *hamoglobinopathies*, blood loss, and metabolic disorders) that contribute to the onset of anemia^{4,5}. Although iron deficiency is a major cause of anemia, especially in women of reproductive age, anemia can also be caused by a lack of folic acid, vitamin B12, vitamin B6 and zinc status is also associated with the development and control of heme formation⁵. The point of determining *hemoglobin* for the diagnosis of anemia

in women of reproductive age <12 g / dl.

In the human body iron deficiency is very common as the most common cause of anemia throughout the world. To better understand iron deficiency anemia, for the production of erythrocytes requires iron. Need a large amount of strong iron for erythrocytes and its precursors, further for the production of hemoglobin and heme. Iron is very important for the structure and function of hemoglobin⁶.

The prevalence of anemia is still highly influenced by micronutrient deficiency as one of the factors in heme synthesis in the body. Vitamin B6 deficiency can block the initial enzymatic steps of heme synthesis and use of iron in *erythropoietic* cells. Vitamin B6 deficiency of the aminolevulinate synthase enzyme can cause iron refractory⁷. This study aims to determine the relationship between micronutrient intake and hemoglobin levels in preconception women.

MATERIAL AND METHOD

This research was conducted in Banggai Regency in 3 sub-districts; Luwuk, North Luwuk and South Luwuk from October 2016 to April 2017. This research was an observational study with cross-sectional design. The study population consisted of 132 pre-conception women who were included in the inclusion criteria, aged between 18-35 years, had never been pregnant and did not suffer from an infectious disease. The research population has been registered to be married at the Office of Religious Affairs (ORA) of Banggai Regency, Central Sulawesi. Mothers come to sign an informed consent, are willing to take part in the research, and attend the recruitment process. The research data used a questionnaire which included the average intake of micronutrients for iron, folate, vitamin B6, vitamin B12, zinc and Hb examination as primary data.

The research data was obtained from the study population who entered the inclusion criteria by interviewing using a questionnaire. Data collection on the average intake of micronutrients (iron, folate, vitamin B6, vitamin B12, zinc) using in-depth interview methods for daily food consumption, 24-hour recall of food, namely quantitative methods of food consumption surveys that can provide information about food and drinks consumed by the subject for 24 hours. The 24-hour Food Recall method is used to assess the consumption of food eaten and drunk for the past 24

hours, since waking up yesterday morning to sleep at night, a 24-hour recall should be done repeatedly and not consecutive days. Food consumption intake data can represent respondents' eating habits.

The respondents' micronutrient intake data were then processed using Nutrisurvey software, compared to the adequacy of micronutrient consumption based on the table of NAR 2013. The NAR is a reference for nutritional intake for Indonesia aimed at knowing the right daily nutritional intake for individuals in Indonesia. To see the level of adequacy of micronutrients respondents used two categories of inadequate if <77% NAR and adequate if $\geq 77\%$ NAR⁸. The next step is measuring the hemoglobin level of the subject using the cyanmethemoglobin method.

Research data is processed and analyzed statistically. Univariate analysis was carried out by entering data and then explained the mean and standard intake of iron, zinc, folate, vitamin B6, vitamin B12, *hemoglobin* levels in preconception women. The relationship of each intake of micronutrients with Hb levels was analyzed using bivariate Pearson correlation test analysis.

RESULTS

Data obtained from the results of the study showed that some respondents did not suffer from anemia by 80% with an average hemoglobin level of 12.67 ± 1.24 g/dl. A total of 27 respondents (20%) suffered from anemia, and most of the anemia respondents had mild anemia of 77.8% while moderate anemia was 22.2% (Table 1).

Table 1: Distribution of hemoglobin levels of respondents

Category	n	%
Anemia (Hb<12g/dl)	27	20
Non Anemia (Hb>12g/dl)	105	80
Total	132	100

Table 2 shows the mean intake of micronutrients among study participants. There is no correlation between micronutrient intake and haemoglobin level of the respondents. However, Vitamin B12 shows the highest adequacy levels while folic acid is the lowest.

Table 2: Average intake of micronutrients and respondents, and the results of the correlation with hemoglobin levels

Variable	Mean \pm SD	Min	Max	Adequacy Levels (%)	p
Fe	6.29 \pm 4.2	1.98	24.39	48.38	0.52
Vit B6	0.92 \pm 0.38	0.38	2.63	70.76	0.49
Vit B12	2.92 \pm 2.18	0.10	2.91	121.66	0.33
Folic Acid	97.80 \pm 48.18	22.0	283.30	24.25	0.48
Zinc	6.04 \pm 2.61	2.12	19.85	46.46	0.99
Hb level	12.68 \pm 1.24	7.3	15.9		

DISCUSSION

Women of childbearing age have low iron reserves, so women tend to be more vulnerable to iron deficiency when iron intake is reduced or when demand increases. If the intake of too little food contains iron and iron in the consumption of low bioavailability and iron reserves in the body are used continuously to meet the required iron requirements, the stored iron will be depleted and the body will be deficient in iron⁹.

The form of iron consumed and other constituents in food greatly affect the absorption of iron. Iron derived from plant products is often consumed, while iron with bioavailable higher in heme iron is often consumed in small amounts. Non-heme iron is often poorly absorbed¹⁰. Haem iron can be obtained about 40% iron in meat, fish, poultry and is well absorbed by the body, about 60% of iron is obtained from animal tissues (liver). Iron from plants (fruits, vegetables, grains, beans) non haem iron forms is relatively difficult to absorb. The average iron intake of respondents is still less than the recommended NAR and the level of adequacy is adequate, reaching only 48.38%. After being processed using Nutrisurvey software, it turns out that the consumption deficit of iron, so that the process of hemoglobin synthesis still uses iron reserves in the body. The 24-hour recall results stated the lack of iron consumption in respondents because the majority of iron sources were obtained from non-haem iron, namely vegetables, fruits, cereals (rice, corn) and consumption of haem iron from fish and ungags. The average consumption of iron negatively correlates with hemoglobin levels. Respondents who were not anemic, the consumption of iron deficit and the possibility of respondents still having iron stores of ferritin in the liver

for hemoglobin synthesis.

The results showed that the average intake of vitamin B6 from respondents was insufficient, still less than the recommended NAR and only reached 70.76% (<77% NAR). 24-hour recall analysis showed that vitamin B6 intake on average was lower, and consumption of vitamin B6 did not correlate significantly with hemoglobin. Vitamin B6 deficiency can block the enzymatic steps of initial heme synthesis and use of iron in erythropoietic cells. Vitamin B6 deficiency of the aminolevulinate synthase enzyme can cause iron refractory Vitamin B6 acts as an enzyme cofactor in the process of heme biosynthesis. This vitamin must be sufficient for hemoglobin synthesis so that the heme formation process runs well, when its availability in the body is low it will interfere with globin synthesis and is not available for erythropoiesis⁷.

The average intake of vitamin B12 respondents was good, and reached 121.66%. The results of a 24-hour recall show that the food source of vitamin B12 consumed by respondents is eggs, fish, and poultry. Further analysis showed that vitamin B12 intake did not correlate significantly. Although vitamin B12 intake is good, but it does not directly increase hemoglobin levels, because micronutrients interact with each other to increase hemoglobin levels. Vitamin B12 plays a role in various metabolic as a coenzyme. Vitamin B12 (cobalamin), the active form of cobalamin as methylcobalamin, coenzyme synthase methionine, an enzyme involved in the synthesis of methionine and tetrahydrofolate from methyl tetrahydrofolate and homocystein. This is where the folate and cobalamin (vitamin B12) metabolic pathways meet and are called

“folate traps” Cobalamin deficiency is usually caused by poor absorption of folate in the digestive tract¹¹.

Food sources rich in folate are wheat germ, yeast, innards (especially liver), cereals, and leafy vegetables. The folate content in food will decrease significantly when it takes too long to cook vegetables. Folate is a sensitive molecule that can be degraded by heat and oxidation. This is what causes folate deficiency to occur¹². Lack of consumption of folate by respondents. Because of the lack of sources of food consumption of folic acid from respondents such as liver, and meat, which is not a habit of the respondent’s diet. The results of 24-hour recall, the average intake of folate respondents was inadequate, still less than the recommended and only reached 24.25% (<77% NAR). Analysis showed that folate intake did not correlate significantly with hemoglobin NAR. Because folic acid is not biochemically active, folate is converted to tetrahydrofolate acid and methyltetrahydrofolate. This form of folic acid is transported by receptor-mediated endocytosis in cells to maintain normal erythropoiesis. Lack of folate and cobalamin (vitamin B12) ultimately causes thymidylate deficiency. DNA contains 2 pyrimidine bases (thymine and cytosine) and 2 purine bases (adenine and guanine). When thymidylate or thymine is deficient in position in the strand the DNA will be replaced by uracil. When uracil units in the structure of DNA, repair enzymes know and try to repair DNA. If it fails to repair DNA abnormal DNA synthesis or apoptosis will occur, which will cause erythropoiesis to be ineffective¹¹.

Foods that contain lots of zinc come from animals, especially meat. Other foods rich in zinc are legumes, whole grains, nuts, and seeds. Heme formation can be disrupted if the body suffers from zinc deficiency and this usually occurs due to insufficient need for zinc¹³. The average zinc consumption of respondents was less than the recommended NAR and the level of adequacy was inadequate because it only reached 46.46% (NAR <77%). The results of the 24-hour recall analysis showed that respondents consumed fish, poultry and peanut groups as sources of zinc food. Zinc intake did not correlate significantly with hemoglobin. Zinc is involved in the synthesis of hemoglobin through the activity of zinc-dependent enzyme systems, namely aminolevulinic acid dehydrase which plays a role in heme synthesis, which occurs in the cytosol cell¹⁴.

CONCLUSION

Preconception mothers are mostly at risk of lacking micronutrients such as iron, zinc, *folate*, vitamin B12, and vitamin B6 which can interfere with the formation of hemoglobin. Understanding the importance of nutrition is needed, through prenatal counseling about the importance of nutrition for the health of pregnant women and their babies.

ABSTRACT

Background: In recent years enormous use of quinolones leads to increasing resistance towards multiple antimicrobial agents, by various pathogens in different geographical regions with the varying rate.

Objective: In this study, we report the antibiotic susceptibility profile and molecular characterization of Quinolones resistant *Klebsiella pneumoniae* isolates originated from Iraq province.

Methodology: *Klebsiella pneumoniae* isolates grown from various clinical sources were phenotypically confirmed by a pool of biochemical tests and reconfirmed using gene sequence of *rpo* housekeeping gene. Antibiotic susceptibility biogram was carried by disc diffusion agar method, quinolones resistant isolates were subjected to ciprofloxacin MIC testing and cartwheel method was used to determine the screening efflux pump activity in resistant isolates. All resistant isolates were subjected to molecular screening to detect resistance genes *gyrA*, *parC*, *qepA*, *qnrB*, *qnrS* and *aac(6)Ib*.

Results: Forty-three *K. pneumoniae* isolated were identified by biochemical testing and confirmed by *rpo* gene sequence. Antibiotic susceptibility results showed a high rate of resistance to Ceftriaxone, gentamicin ciprofloxacin, and Levofloxacin antibiotics. Ciprofloxacin MIC results revealed 96.1% isolates had value above 256 µg/ml. Ciprofloxacin mixed with EtBr at various concentrations resulted in a decrease of MIC. Genetic detection revealed the predominance of *gyrA* and *aac(6)Ib* gene. The phylogenetic trees showed the high clonal diversity among isolates.

Conclusion: The high percentage of resistance towards different types of antibiotics including fluoroquinolones is considered to be problematic for public health and represents a serious challenge to infectious disease specialists worldwide.

Keyword: MDR *K. pneumoniae*; quinolones resistance gene; PMQR; cartwheel test.

INTRODUCTION

Antimicrobial agents' quinolones prescribed as the best treatment for community and hospitals acquired infections¹ including multidrug-resistant Gram-negative bacteria such as *Klebsiella pneumoniae* which is a

member of the notorious "ESKAPE" group organism^{2,3}. Quinolone is one of most used and effective antibiotic for the treatment of multidrug-resistant bacteria which has broad-spectrum antimicrobial activity. *K. pneumoniae* resists antibiotic action through several mechanisms which includes drug inactivation, target alteration, increased efflux pump activity and decreased cell permeability¹. Resistance to quinolones is mediated by mutation occurred in chromosomal genes encoding to DNA gyrase and/or topoisomerase IV additional to mutation occurred in regulatory genes that regulate efflux pumps activity⁴, otherwise, resistance to quinolones

E-mail: stsf@uomustansiriyah.edu.iq

occurred in bacteria basically by a chromosomal mutation in *parC* and *gyrA* genes of QRDR region^{3,5}.

The previous assumption was that quinolones resistance is due to bacterial chromosomal mutations. It was later in 1998 they described plasmid-mediated genes in *K. pneumoniae*, named *qnr* which encodes pentapeptide repeat family plays role in binding and protecting DNA gyrase and topoisomerase IV from the repression of ciprofloxacin^{4,6,7}. Later four major groups *qnr* genes *qnrA*, *qnrB*, *qnrC* and *qnrS*, were identified together with two plasmid-mediated quinolones resistance (PMQR) genes *aac(6')-Ib-cr* and *qepA* encodes various aminoglycoside transferases that modify ciprofloxacin to facilitate an efflux pump protein⁸. Bifunctional acetyltransferase protein is coded by *aac(6')-Ib-cr* acetylate amino nitrogen in piperazine of fluoroquinolones such as norfloxacin, ciprofloxacin, and aminoglycoside such as amikacin and kanamycin⁹. This gene commonly exists in the multi-resistance plasmid as a cassette in integron, and may also have other PMQR genes additional to ESBL CTX-M-15^{7,10,11}. Hydrophilic fluoroquinolones such as norfloxacin and ciprofloxacin can be decreased by plasmid-mediated efflux pump *QepA* which is the major group of facilitator family, exist in plasmid encoding to aminoglycoside ribosomal methylase *rmtB*^{12,13,14}. Increasing prevalence of PMQR have been reported worldwide in clinical isolates of *K. pneumoniae*, however, there is no report evaluating the quinolone resistance epidemiology in Iraq. This would be the first study where we characterized predominant of quinolones resistant gene in the capital of Iraq (Baghdad city).

MATERIAL & METHOD

Isolation & identification of *K. pneumoniae*:

Forty-three bacterial isolates from *Klebsiella pneumoniae* were collected between June and December 2016. These isolates were obtained from patients attending medical care services in Baghdad hospitals, Medical city hospital, Ibn Balady hospital, Al-Zahra hospital and Al-Yarmok hospital in Baghdad city. Bacterial species identification was based on the morphological and biochemical test, followed by using *rpo* gene sequence analysis. The sequence of oligonucleotides of *rpoB* gene specific design for this study as listed in the table (1).

Antimicrobial susceptibility test and Minimum

inhibitory concentration (MIC) for ciprofloxacin

Susceptibility to various antimicrobial agents was performed using the disk diffusion method and Mueller-Hinton agar according to the CLSI guidelines¹⁵. MIC was performed against all 27 resistance isolates according to the CLSI¹⁵ criteria following a standard agar dilution method started with 1024µg/ml and applied two serial dilutions. *Escherichia coli* ATCC 25922 was used as quality stander strain (Central Public Health Laboratory, Baghdad).

Efflux pump detection-cartwheel method (screening method)

Phenotypic detection of Efflux Pumps mechanism was performed by EtBr-agar cartwheel (EtBrCW) method in MHR agar plates using Ciprofloxacin and EtBr stain¹⁶. EtBrCW was done by EtBr stain at various concentration (5, 10,15,20,25 µl/ml) on MHA agar plates containing ciprofloxacin ranging from 16 to 1024 µg / ml which prepared on the same day for the experiment. The minimum concentration of EB that produced fluorescence of the bacterial mass was recorded¹⁷. In the study, we used *Escherichia coli* ATCC 25922 strains as negative controls.

Genotypic analysis: Quinolones resistance genes detection

The DNA extraction was performed for all isolates according to genomic extraction kit following Manufacture instruction (wizbio/ Korea). All the isolates were subjected to molecular screening by PCR amplification technique to detect Quinolone Resistance genes, Different primers were used as listed in (table 1), PCR products were sent for sequencing, which was carried out by Macrogen DNA Sequencing (Seoul, Korea) and compared with NCBI (<https://www.ncbi.nlm.nih.gov/>).

RESULTS

Isolation & identification

The isolates were collected from various clinical samples such as wound infection (n=13), bloodstream infection (n=8), urinary tract infection (n=8), burn (n=5), ear (n=4), sputum (n=3), and one each from the fluid, and bronchial infection. All the isolates were confirmed as *K. pneumoniae* by phenotypic identification using a set of biochemical test, followed by the Vitek 2 system,

then re-confirmed by gene sequence analysis of *rpoB* gene (β -subunit of RNA polymerase).

Antibiotic susceptibility test

The resistance pattern differs from being highly resistant to CRO 86.04% (37/43), followed by GM (69.7%; 30/43), CIP & LEV (60.4%; 26/43). Isolates showed moderated resistance to AUG & NOR & FOX (55.8%; 24/43), IMI (53.4%; 23/43) and AK (48.8%; 21/43) as compared ATH (44.1%; 19/43).

The results of the MIC test showed that n all isolates were completely resistant to Ciprofloxacin with MI(C higher than 16 $\mu\text{g/ml}$. , while 25/ 27(96.1%) of isolates had MIC above 256 $\mu\text{g/ml}$, 23/27 (83.4%) of isolates showed 512 $\mu\text{g/ml}$ and 9/27 (34.6%) of isolates showed 1024 $\mu\text{g/ml}$ of MIC to Ciprofloxacin alone. While, when we mixed Ciprofloxacin with Ethidium bromide (EtBr) for detection in efflux pump by agar cartwheel method (screening method) the results showed a decrease in resistance rates. The study isolates showed 100% resistance to at 16, 32 and 64 $\mu\text{g/ml}$ of EtBr, while decrees to 92.3% (24/ 27) when used with 128 and 256 $\mu\text{g/ml}$ with EtBr. Resistant was further decreased to

69.2% (18/ 27) in 512 $\mu\text{g/ml}$ of EtBr. With the use of 1024 $\mu\text{g/ml}$ EtBr, this resistant was seen only in 19.2% (5/ 27) isolates. **Figure 2** showed the accumulation of fluorescent chromophore by efflux pump activity of isolates, furthermore, table (2) showed the distribution of efflux activity with a verity concentration of EtBr (Table 3).

Results of Genetics detection for antibiotics resistance genes revealed that 27 isolates harbor more than one mechanism of resistance to quinolones and modification enzymes in aminoglycosides. The most predominance genes was *aac(6)-Ib* gene 25(92.5%), followed by *parC* gene 20/27 (74.1%), *gyrA* gene 18/27 (66.6%), and *qnrB* gene 14/27 (51.8%), while show low percentage predominance of *qepA* gene 11/ 27(40.7%) and *qnrS* gene 10 (37.03%) was also observed. Table (2) illustrates the distribution of the resistance gene among *K. pneumonia* (27/43) isolates. The phylogenetic tree was built depending on antibiotic susceptibility; the isolates showed high clonal diversity as it appears in **figure 1a & 1b**.

DISCUSSION

In the present study, results showed frequency of *K. pneumonia* isolates was in good numbers from different sources of infections. It considered as problematic organisms belong to its ability to resist different types of antibiotics including fluoroquinolones due to having several mechanisms of resistant.² This study revealed that *Klebsiella* isolates harbored more than one resistance gene,^{15,16} similar to Al-Najaf city study in which it was reported that 14/34 (41.14%) of *Klebsiella* isolates harbored *aac(6)Ib* gene. In this study, the harboring percentage with this gene was up and reached 25/27(92.5%). All 25 isolates appeared resistant to Amikacin and gentamycin in a phenotypic test; the mechanism of resistance was due to modification in aminoglycoside enzymes groups. The earlier study stated¹⁷ the predominant of this gene was common in Enterobacteriaceae. Further *aac(6)Ib* gene seems to coding resistance phenotype for gentamycin, tobramycin, kanamycin, and amikacin which explains why there is a high percentage of resistance in present in *Klebsiella pneumonia*. On the other hand, *parC* gene appeared in 20/27 (74.1%) and *gyrA* in 18/27 (66.6%) of *Klebsiella* isolates. These genes codes for resistance to quinolones which causes mutation at positions of Ser80 of *parC* and Ser83 of *gyrA* leading to high level of resistance^{16,17}. Therefore it can be said that multiple mutations in *parC* and/ or *gyrA* were required to expression high level of resistance in *Klebsiella pneumonia*¹⁷. Single alteration of *gyrA* protein may cause low-level ciprofloxacin resistance while a double mutation in *gyrA* protein may lead to high-level ciprofloxacin resistant. Interestingly most of the study isolates had *parC* & *gyrA* genes which explains the reason of high-level ciprofloxacin resistance. However, the eleven out of twenty-seven isolates in the current study display a single alteration in *parC* and *gyrA* genes with high-level ciprofloxacin resistance.

The tripartite complex consists of an inner membrane protein (IMP) of the resistance nodulation cell division (RND) family, outer-membrane protein (OMP) and a periplasmic membrane fusion protein (MFP) which connect the other two proteins¹⁴. Efflux-mediated drug resistance is more complex due to the molecular architecture of the cell envelope in gram-negative bacteria which compounds from tripartite complex outer-membrane protein OMP, inner membrane protein IMP and MFP periplasm-mic membrane fusion

protein which connects between them. These belong to resistance nodulation of cell division RND family, and tripartite proteins play role in pump out antibiotics from the cell, furthermore efflux pumps of the RND family are prominent in clinically significant MDR Gram-negative bacteria¹⁴.

Efflux systems have a critical role in the development of mechanistic drug resistance in Gram-negative bacteria, this pump solutes out of the cell, permitting microorganism to adjust their internal environment by getting out toxic substance like metabolite, antimicrobial agents and quorum sensing signal molecules. In this study, we have employed PAN, reported to be one of the first inhibitors of RND pumps. The EtBr-agar cartwheel screening method showed efflux activity in 27 strains. Also, the dendrogram showed the clustering of these isolates belong to antibiotics resistance and gene distribution in it. Our study reveals the emergence of efflux pump-mediated drug resistance in MDR Gram-negative bacteria in the Middle East, especially in Iraq.

Joint Effect of Obesity and Cigarette Smoking Against Hypertension Stage 1 among Men Adults: Finding from the Indonesian Family Life Survey-5

Aprizal Satria Hanafi¹, Nurhayati A Prihartono²

¹Master of Epidemiology Student, ²Department of Epidemiology, School of Public Health, University of Indonesia, Depok, West Java, Indonesia

ABSTRACT

The association of obesity and cigarette smoking against hypertension has been known but still rarely performed a joint effect of obesity and cigarette smoking in causing hypertension stage 1. This study aims to evaluate the joint effect of obesity and cigarette smoking against hypertension stage 1 in Indonesia. This is a cross-sectional study. Subjects in this study were the age group ≥ 18 years old who were followed by the interview. We investigated factors related to hypertension stage 1 in Indonesia associated with obesity and cigarette smoking by controlling other confounding variables. The prevalence of hypertension stage 1 was 19.84% among participants. Multivariate analysis showed that people who smoked and obese had a 2.61 greater risk of having hypertension stage 1 compared with obese and non-smokers 2.41, and people not obese and smoking 1.18. People with obesity and smoking have a greater risk of developing hypertension stage 1. Substantial effort must be made to raise awareness about controlling blood pressure regularly and early treatment especially in people who were smoked and obese.

Keywords: Joint Effect, Obesity, Cigarette Smoking, Hypertension Stage 1, Indonesia

INTRODUCTION

The prevalence of hypertension will continue to increase every year and it was predicted that by 2025 as many as 29% of adults worldwide will get hypertension.¹ According to WHO 2013, there were 9.4 million deaths each year caused by hypertension, of which 1.5 million deaths occur in Southeast Asia that can cause an increase in health costs.² In Indonesia according to Basic Health Research (Riset Kesehatan Dasar) 2013 the prevalence of hypertension in Indonesia is 25.8%.³

Epidemiological studies have shown that obesity can trigger hypertension. Obesity accounts for 65-75% of the risk of primary hypertension. Increased renal tubular sodium reabsorption disrupts natriuresis pressure and plays an important role in initiating hypertension due

to obesity.⁴ Jiang et al study showed that obesity was a risk factor for hypertension.⁵ A prospective cohort study conducted by Li et al 2017 also shows that obesity was a risk factor for hypertension with a risk of 3.34 times.⁶

In addition to obesity, there were many other factors that play a role in increasing the risk of hypertension, including smoking behavior. Smoking can cause hypertension due to chemicals contained in cigarettes that can damage the inner lining of the arterial wall, so that the arteries were susceptible to plaque accumulation. This is mainly due to nicotine which can stimulate the sympathetic nerves to make the heart work harder and cause constriction of blood vessels and increased blood viscosity.⁷ Study by Li, et al (2017) on the relationship between smoking behavior and blood pressure in men in China showed that the prevalence of hypertension was higher in smokers than in people who had never smoked (OR 2.36; 95% CI: 1.67-3.34).⁸ Looking at the above problems, the joint effect of obesity and smoking on hypertension stage 1 in Indonesia need to be evaluated.

METHOD

The IFLS-5 survey procedures had been approved by Institutional Review Boards (IRBs) in the United States at Rand Corporation, Santa Monica, California and in Indonesia at Ethics Committees of Gadjah Mada University. This study uses a cross-sectional design using data from the Indonesian Family Life Survey-5.⁹

The surveys collected information on individual, household and community level data using multistage stratified random sampling. IFLS is a longitudinal household survey involving both questionnaire and anthropometric measurements, and which was collected under the supervision of the Rand Corporation. IFLS-5 was conducted in 13 provinces in Indonesia.¹⁰

IFLS-5 was conducted in September 2014-March 2015 on 16,204 households and 50,148 individuals.¹¹ The study population was the population who became the subject of IFLS-5 research in 2014. While the sample was the age group ≥ 18 years who followed the interview and had questionnaire data on important variables and complete blood pressure examination. Respondents who took hypertension drugs, female and were in hypertension stage 2 excluded in this study.

We include demographic information, individual characteristics and behavioral factors as confounding. We categorize the level of education completed by respondents to low, high and other levels of education, while marital status was classified as unmarried, married, or divorced. We include smoking behavior as an indicator of health risk and respondents who were categorized as not smoking and smoking.

Physical activity was assessed through a series of questions (a brief form modified from the International Physical Activity Questionnaire (IPAQ)) on the type and time of physical activity involved in, in all parts of life: work, home and exercise and then classified as sufficient and less physical activity.¹²

History of Diabetes Mellitus is assessed through questions ever diagnosed or not done by doctors or paramedics as well as a history of high cholesterol. We also measured respondents' fiber consumption in the past week, which was seen from the consumption of fruits and vegetables.

Body mass index (BMI < 27 kg/m²: normal weight; and ≥ 27.0 kg/m²: obesity derived from the height and weight measured during the physical examination, these criteria were determined based on the Ministry of Health of the Republic of Indonesia in 2013. Height measured by the Seca plastic height board model 213 and weight was measured using Camry model EB1003 scale. In this study the measurement of body weight and height was carried out by the interviewer or enumerator who was competent in their field and had received previous training.

Blood pressure was measured 3 times at an individual age of ≥ 18 years, using Omron meter HEM 7203. The first measurement was done at the beginning of the interview with the next two steps taken during the interview. The average of the 3 measurements was used for the current analysis. According to the JNC 7 blood pressure was categorized into 4 levels, namely normal ($< 120 / 80$ mmHg), prehypertension (120-139 / 80-89 mmHg), hypertension stage 1 (140-159 / 90-99 mmHg), and hypertension stage 2 ($\geq 160/100$ mmHg). We classify respondents as hypertension stage 1 if their blood pressure 140/90 mmHg-159/99 mmHg based on the criteria of JNC 7. Blood pressure measurement was carried out by the interviewer or enumerator who was competent in their field.¹³

Only respondents with complete information and blood pressure measurements were taken 3 times and were in normotensive or hypertension stage 1 included in the analysis. Logistic regression was performed to calculate the risk in all age groups. This study includes age, education level, marital status, history of Diabetes Mellitus, history of high cholesterol, fruit and vegetable consumption and physical activity as potential confounders variables by including them in multivariable analysis between obesity and cigarette smoking to Hypertension stage 1. If there is a difference of more than 10% between POR crude and POR adjusted then these variables were considered as confounding variables and not included in the next model. The same procedure was used to estimate adjusted odds ratio (and 95% confidence interval) for hypertension stage 1.¹⁴ Finally, the joint effect (and 95% confidence interval) of obesity and cigarette smoking, individual effect of obesity among non-smoker, and effect of smoking among non obese person on hypertension were evaluated.

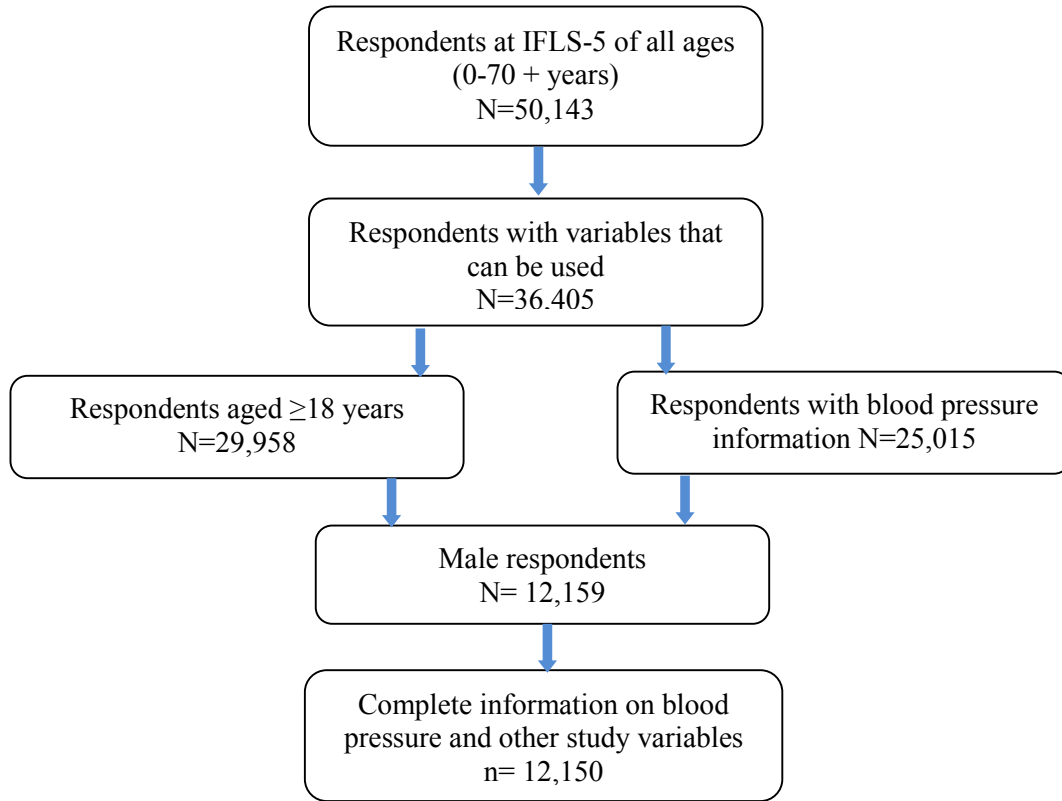

Figure 1. Selection of Study Sample Flowchart

RESULTS

The description of each study variable can see in Table 1. Of the 12,150 adult male respondents, the proportion of hypertension stage 1 in Indonesia was 19.84%. While the proportion of obesity and cigarette smoking was 18.78% and 36.43%, respectively.

Obesity + Smoking	267	11.07	532	5.46	799

Note: BMI: Body Mass Index

Based on the table 1 it can be seen that the proportion of obesity is higher in hypertension stage 1 people (30.49%) than those non-hypertension (15.88%). Hypertension stage 1 at age > 57 years was higher (23.93%) than non-hypertension (5.23%), as was 48-

57 years of age higher (22.85%) than non-hypertension (9.38). Hypertension stage 1 in obese and smoking people was higher (11.07%) than non-hypertension ones (5.46%). Hypertension stage 1 in low education was higher (63.50%) than non-hypertension ones (47.95%).

Table 2. Final Model Joint Effect of Obesity and Cigarette Smoking against Hypertension Stage 1

Combination of Obesity and Smoking	Hypertension Stage 1		Non Hypertension		POR (95% CI)
	n	%	n	%	
Obesity + Smoking	267	11.07	532	5.46	2.61 (2.22-3.07)
Obesity + Non Smoking	468	19.41	1015	10.42	2.41 (2.11-2.74)
Non Obesity + Smoking	672	27.87	2955	30.34	1.18 (1.06-1.32)
Non Obesity + Non Smoking	1004	41.46	5237	53.77	1.00 (Referant)

Note: Adjusted by age, education level, marital status, diabetes mellitus history, high cholesterol history, physical activity, fruit and vegetable consumption

Based on table 2, it was known the final model of the relationship of obesity and cigarette smoking to the hypertension stage 1 after being controlled for age. The risk of hypertension stage 1 of respondents classified

as obese and also smoking was the largest, which was 2.61 compared to those who were not obese and did not smoke (95% CI; 2.22-3.07). While the risk of hypertension stage 1 in respondents classified as obese but not smoking was 2.41 greater than in the non-obese and non-smoking group with 95% CI; 2.11-2.74. Then, the risk of respondents who were classified as non-obese

but smoking was known to be 1.18 greater than those who were not obese and do not smoke to experience hypertension stage 1 (95% CI; 1.06-1.32).

DISCUSSIONS

Based on the results of the analysis, it was known that the combination of obesity and smoking together was a risk factor that is associated with an increase in the proportion of hypertension stage 1. The results of this study showed that the proportion of hypertension in stage 1 in respondents classified as obese and smoking was 2.61 compared to who were not obese and do not smoke. While the risk of hypertension stage 1 in respondents classified as obese but not smoked by 2.41 was greater than in the group that was not obese and does not smoke. Then, the risk of respondents who were classified as non-obese but smoking was known to be 1.18 greater than those who were not obese and do not smoke to experience hypertension stage 1.

Based on previous study, mentions a significant relationship between obesity with hypertension stage 1. The relationship of obesity has long been known and has been widely reported by many researchers, but the mechanism of the occurrence of hypertension due to obesity was not yet clear. Most researchers focus on the pathophysiology on three main things, namely autonomic system disorders, insulin resistance and abnormalities in the structure and function of blood vessels. These three things can influence each other.¹⁵

Weight loss was the most instrumental element in the prevention and treatment of hypertension. Hypertension patients were encouraged to lose weight if they were obese and this will affect blood pressure.¹⁶ Every 1 kg of weight gain had Hazard Ratio to suffer from hypertension at 1.36 (95% CI: 1.29-1.45).¹⁷ In addition, based on the results of previous studies showed that every kilogram of weight loss can reduce systolic blood pressure by 1.05 mmHg and diastolic by 0.92 mmHg.¹⁸

The results of this study also showed that obesity has a significant relationship with the hypertension stage 1. The results of bivariate analysis showed that respondents who were obese (BMI > 25) were at risk 2,008 times (95% CI: 1.261-3.198) to suffer from hypertension stage 1 compared to respondents who were not obese. So that there was a large relationship of obesity with hypertension stage 1 which is 1.681 times (95% CI: 1.049-2.696), meaning that respondents

with obesity have a risk of 1.681 times to suffer from hypertension stage 1 compared to those who were not obese after controlled age variables, history of diabetes mellitus and physical activity.¹⁹

According to WHO recommendations, a person was declared hypertension, it needs to be re-evaluated about 1 or 2 weeks. However, in this study only assessed at one time (only implemented once), so that the possibility can lead to a measurement bias. To minimize bias measurement of hypertension stage 1 variable, among others, by measuring blood pressure carried out by trained medical personnel and determining the diagnosis of hypertension was done by a doctor. In addition, routine calibration was carried out against tensimeters before use.

CONCLUSIONS

The proportion of hypertension stage 1 in Indonesia who became respondents in IFLS-5 is 19.84%. The combination of obesity and cigarette smoking have a risk of 2.61 times to suffer from hypertension stage 1 compared to those who not obese and not smoking. Obesity and cigarette smoking together show a greater association with hypertension stage 1 than obesity or smoking alone. Given the high prevalence of hypertension it was necessary to increase health promotion efforts including the addition of nutrition counseling and counseling as well as joint sports activities (gymnastics) in integrated coaching activities. The government and all health workers were more optimizing the implementation of Integrated Non-Communicable Disease Development Post. Communities, especially those classified as high-risk (obesity and cigarette smoking) can realize the importance of independently performing hypertension stage 1 screening in this case was general obesity of body weight and height, and smoking as a first and foremost step to prevent the emergence of the incidence of hypertension stage 1.

ABSTRACT

Background: Hypertension is one of the most important causes of premature death worldwide. Several studies had explored which obesity indices were more strongly associated with hypertension but the results were still varies. This study aimed to compare various obesity indices that has more strongly associated with stage 1 hypertension in Indonesia.

Method: A total of 8240 respondents aged 40-69 years were investigated. Design of the study was a cross sectional using data from Indonesian Family Life Survey (IFLS) round 5 in 2014. Cox regression was applied for the analysis.

Results: Prevalence of stage 1 hypertension among the study participants was 25.98%. The obesity indice that showed the strongest association with stage 1 hypertension in both men and women was WHtR (PR 1.89, 95% CI 1.73-2.07). After stratified by sex, the obesity indices that showed the strongest association in men was WC (PR 1.73, 95% CI 1.53-1.97) while in women was WHtR (PR 1.76, 95% CI 1.5-2.05).

Conclusion: WHtR performed better than BMI, WC, WHR for predicting the occurrence of stage 1 hypertension across sexes. WC was the best obesity indice in men while in women was WHtR. The appropriateness of selection obesity indices helps in maximizing screening for the occurrence of stage 1 hypertension.

Keywords : *stage 1 hypertension, obesity, BMI, WC, WHR, WHtR*

INTRODUCTION

Hypertension is one of the most important causes of premature death worldwide. Hypertension is responsible for at least 45% of deaths due to heart disease and 51% of deaths due to stroke ¹. Hypertension kills nearly 8 million people every year in worldwide and nearly 1.5 million people each year in the South-East Asia (SEA) Region. Approximately one-third of the adult population in the SEA Region has high blood pressure, and in 2025, an estimated 1.56 billion adults will be living with hypertension ². Based on Basic Health Research (Riskesmas) in 2013, prevalence of hypertension in

Indonesia is 25,8% ³.

Obesity had been well recognized as the wide health risks including hypertension ⁴. Many studies showed that the high incidence of hypertension was associated with increasing prevalence of obesity ^{5,6}. Data from *World Health Organization* (WHO) in 2016 estimated that more than 650 million adults in worldwide were obese ⁷. Obesity can be defined by different anthropometric indices. Body mass index (BMI) is commonly used in many epidemiologic studies on obesity, however it was criticized for measuring body fat distribution inefficiently especially abdominal fat mass ⁸⁻¹⁰. Some studies found statistical evidence that supports the superiority of measuring abdominal fat mass over BMI were using waist circumference (WC), waist-to-hip-ratio (WHR), waist-to-height-ratio (WHtR) ¹¹⁻¹².

Some studies had explored which obesity indices are more strongly associated with hypertension but the capability of these obesity indices in predicting the hypertension risks still was debated. Study of Qian Wang et al reported that BMI was the best obesity indices for predicting hypertension in both men and women⁸. A prospective cohort study by Joung Won Lee et al revealed that WHtR in women and WC in men had the strongest association with hypertension¹³. But study of Nyamdorj et al indicated that BMI, WC, and WHR had the same association with hypertension in both men and women¹⁴.

Due to difference of previous study results, this study aimed to compare various obesity indices that has more strongly associated with stage 1 hypertension in Indonesia and find out its possible sex differences.

METHOD

Ethical Consideration

This study used Indonesian Family Life Survey (IFLS) round 5. The IFLS survey procedures had been reviewed and approved by Institutional Review Boards (IRBs) in the United States (at Rand Corporation, Santa Monica, California) and in Indonesia (Ethics Committees of Gadjah Mada University, Yogyakarta). Informed consent was obtained from all respondents before data collection was carried out.

Study Design and Participants

This study was an analytic observational study with a cross sectional design. This study used data from Indonesian Family Life Survey (IFLS) round 5. Data collection was conducted in 13 provinces in Indonesia in late 2014 and early 2015: 16.204 households and 50.148 individuals were interviewed¹⁵.

The study population in this study were respondents aged 40-69 years and participated in IFLS 5. The study sample was all respondents who met the inclusion and exclusion criteria. Inclusion criteria in this study were respondents aged 40-69 years and had complete blood pressure measurement, anthropometric, and interview data. While the exclusion criteria were respondents who were taking hypertension medication, were pregnant, had stage 2 hypertension, and had incomplete blood pressure measurement, anthropometric, and interview data.

At first there were 11.440 respondents aged 40-69 years, but as many as 2.152 respondents suffered from stage 2 hypertension, 358 respondents were taking hypertension medication, and 691 respondents had incomplete data so they could not be included in the study. The number of respondents who could be analyzed in this study were 8.240.

Data Collection

The dependent variable measured in this study was stage 1 hypertension. Blood pressure were obtained from the average results of three measurements and classified according to Joint National Committee on Prevention, Detection, Evaluation, and Treatment of High Blood Pressure 7 (JNC 7) guidelines. Respondents suffered stage 1 hypertension if they had systolic blood pressure 140-159 mmHg and/or diastolic blood pressure 90-99 mmHg¹⁶. Blood pressure measurements using digital Omron sphygmomanometers type HEM-7203 and performed by trained interviewer.

The independent variables measured were obesity indices (BMI, WC, WHR, and WHtR). BMI was calculated by comparing body weight with height squared (kg/m^2). BMI was classified based on WHO standards for asian adults and obese was a $\text{BMI} \geq 25 \text{ kg}/\text{m}^2$ ¹⁷. Measurement of weight using a digital Camry scale model EB1003 that can measure to the nearest tenth of a kilogram. Height measurement using Seca plastic height board that can measure heights to the nearest millimeter. This measurements was carried out by trained interviewer.

WC is a measure of waist circumference at the midpoint between the lower border of the rib cage and the end point of the arch of the pelvic bone. The cut off points used in accordance with WHO standards for asian adults, it was chosen as a WC in women $\geq 80 \text{ cm}$ for women and $\geq 90 \text{ cm}$ for men¹⁷.

WHR was calculated as waist circumference divided by hip circumference. The cut off points used in accordance with WHO standards for asian adults, it was considered as a $\text{WHR} \geq 0.85$ for women and $\text{WHR} \geq 0.90$ for men¹⁸. Measurement of waist circumference and hip circumference using a measuring tape that can measure to the nearest millimeter.

WHtR was calculated as WC divided by height. The cut off points was considered ≥ 0.5 for both women and

men¹⁹.

We collected demographical characteristics of respondents by performing interview using structured questionnaire and conducted by trained interviewer. Respondent data collection included sex (male, female), education level (low, high), smoking status (current smoker, ex-smoker, nonsmoker), physical activity according to the International Physical Activity Questionnaire / IPAQ standard (low/<600METs, medium/600-3000METs, high/>3000 METs), and vegetables and fruits consumption during the last week (less, enough).

Data Analysis

Multivariate analysis was used to estimate the risk of stage 1 hypertension based on BMI, WC, WHR, WHtR after being adjusted by covariate variables. This study used multivariate analysis with modified cox regression.

The use of modified cox regression was carried out to obtain an estimate of prevalence ratio (PR) and 95% confidence interval (CI)²⁰. Covariate variables used in multivariate analysis were age, education level, smoking status, physical activity, and vegetables and fruits consumption. Statistical testing for confounders was done by comparing the PR crude with PR adjusted. If the PR difference was more than 10% then the variable was a confounder.

RESULTS

The study revealed that 2.141 (25.98%) respondents had suffered stage 1 hypertension (table 1). The proportion of stage 1 hypertension were higher in those aged 60-69 (28.43%), male (30.73%), had low education level (28.57%), ex-smoker (48.52%), had high physical activity (28.23%), less in consuming vegetables and fruits (39.35%), obese based on BMI (34.05%), obese based on WC (34.61%), obese based on WHR (33.24%), and obese based on WHtR (37.34%).

Table 1. Proportion of Stage 1 Hypertension Based on Demographical Characteristic

Variables	Stage 1 Hypertension		No Hypertension	
	n = 2141	%	n = 6099	%
Age (years)				
60 – 69	294	28.43	740	71.57
50 – 59	635	26.32	1778	73.68
40 – 49	1212	25.29	3581	74.71
Sex				
Female	860	21.12	3212	78.88
Male	1281	30.73	2887	69.27

BMI				

Cont... Table 1. Proportion of Stage 1 Hypertension Based On Demographical Characteristic

Obese (≥ 25 kg/m ²)	1210	34.05	2344	65.95
Non Obese (<25 kg/m ²)	931	19.87	3755	80.13
WC				
Obese ($\sigma \geq 90$ cm, $\phi \geq 80$ cm)	1381	34.61	2609	65.39
Non Obese ($\sigma < 90$ cm, $\phi < 80$ cm)	760	17.88	3490	82.12
WHR				
Obese ($\sigma \geq 0.9$, $\phi \geq 0.85$)	1181	33.24	2372	66.76
Non Obese ($\sigma < 0.9$ cm, $\phi < 0.85$)	960	20.48	3727	79.52
WHtR				
Obese (≥ 0.5)	1303	37.34	2187	62.66
Non Obese (<0.5)	838	17.64	3912	82.36

Multivariate adjusted estimates were shown in table 2, table 3, and table 4. After being adjusted by covariate variables, the obesity indice that showed the strongest association with stage 1 hypertension in both men and women was WHtR (table 2). Men and women who were obese based on WHtR were 1.89 times more likely to have risk of stage 1 hypertension in comparison to men and women who were not obese (PR 1.89, 95% CI 1.73-2.07).

When stratified by sex, the obesity indice that showed the strongest association in men was WC (table 3). Men who were obese based on WC were 1.73

times more likely to have risk of stage 1 hypertension in comparison to men who were not obese (PR 1.73, 95% CI 1.53-1.97). In women, the obesity indice that showed the strongest association was WHtR (table 4). Women who were obese based on the WHtR were 1.76 times more likely to have risk of stage 1 hypertension in comparison to women who were not obese (PR 1.76, 95% CI 1.5-2.05). Among of four obesity indices, WHR showed the weakest association in both men and women.

Table 2. Comparison of Adjusted Prevalence Ratio of Stage 1 Hypertension Based On BMI, WC, WHR, WHtR In Both Men And Women

Obesity Indices	Stage 1 Hypertension n (%)	No Hypertension n (%)	Adjusted PR* (95% CI)
BMI			
Obese	1210 (34.05)	2344 (65.95)	1.64 (1.50 – 1.79)
Non Obese	931 (19.87)	3755 (80.13)	1

DISCUSSION

This study analyzed various obesity indices in relation to stage 1 hypertension. BMI was an indicator of general obesity while other obesity indices such as WC, WHR, WHtR more indicated the condition of abdominal obesity.

The results of this study indicated an obesity indice that had the strongest association with stage 1 hypertension in both men and women was WHtR.

Studies done by Saeed et al and Norfazilah et al stated that WHtR was the best obesity indice in relation to stage 1 hypertension in both men and women adults population²¹⁻²². Meta-analysis conducted by Ashwell et al and Savvas et all also concluded that WHtR was better indice for predicting cardiometabolic risk compared to BMI²³⁻²⁴.

This study also analyzed the association of various obesity indices with stage 1 hypertension based on sex. The obesity indice that showed the strongest association

in men was WC while in women was WHtR. These findings supported the results of a prospective cohort study conducted by Young Won Lee et al. Study of Young Won Lee et al that carried out in a population of men and women aged 40-69 years founded that WHtR has the strongest association with stage 1 hypertension in women and in men indicated by WC¹⁴.

Obesity is not only about the amount of fat but also about its distribution. Abdominal or visceral fat is associated with cardiometabolic risk including hypertension¹⁷. WC can describe the accumulation of visceral fat. Accumulation of visceral fat can have metabolic consequences such as increased production of liver fat and increased insulin. Hyperinsulin causes the body to retain sodium and water so that blood volume increases. Excess volume of water in the body causes increased cardiac output and results in hypertension²⁵⁻²⁶.

In general, height has usually been shown to have inverse associations with cardiometabolic morbidity and mortality and this is probably because height as well as having a major genetic component, can also reflect general early life exposures²⁷⁻²⁸. A recent report from Chile proposes that adverse environmental exposures in critical growth periods in early life programme short stature and predisposition to abdominal adiposity, insulin resistance and other cardiometabolic risk factors in adult life²⁹.

Among of four obesity indices, WHR showed the weakest association in both men and women. WHR is associated with visceral fat but cannot be used to predict accurately changes in visceral fat. This is because the hip circumference is only affected by subcutaneous fat, so the accuracy of WHR in measuring visceral fat decreases with increasing body subcutaneous fat³⁰.

This study used a cross sectional study design so that there was no clear temporal time relationship. In addition, not all variables were examined so that they were still unable to explain thoroughly about other risk factors related to the association of obesity with stage 1 hypertension.

Obesity indices can be used to screen the occurrence of stage 1 hypertension. The appropriateness of selection obesity indices helps in maximizing detection or discovery of stage 1 hypertension patients and provides the best measurement for stage 1 hypertension prevention and control programs.

CONCLUSION

The obesity indice that had the strongest association with stage 1 hypertension in both men and women was WHtR. After stratified by sex, the obesity indices that showed the strongest association in men was WC while in women was WHtR. Obesity indices can be used to screen the occurrence of stage 1 hypertension. The appropriateness of selection obesity indices helps in maximizing detection or discovery of stage 1 hypertension patients and provides the best measurement for stage 1 hypertension prevention and control programs.

ABSTRACT

Background. The erysipelas develops quite rapidly. This infectious disease is characterized by skin inflammation caused by streptococcus. Its progressiveness depends on many factors. The presence of diabetes occupying a leading place in the system of vascular events is one of the most significant factors. In this regard, this article studies the status of a lipid peroxidation system in erysipelas patients on the background of diabetes mellitus.

Method. The experiment was conducted in the Center for Prevention and Control of AIDS and Infectious Diseases (Kabardino-Balkar Republic, Nalchik city). There were two groups participating in the experiment: the first group consisted of 20 erysipelas patients; the second one – of 14 patients, whose erysipelas developed on the background of diabetes mellitus. All patients were taking tablets.

Result. As a result of the experiment, it turned out that lipid peroxidation occurs in biological membranes during the period of erysipelas. This is manifested by an increase in blood MDA level, as well as by a deficit of antioxidant protection and a decrease in the plasma antioxidant (ceruloplasmin).

Conclusion. Recorded changes in considered parameters were more pronounced and returned to normal after treatment on the unfavorable premorbid background – such a serious disease as diabetes mellitus.

Keywords: *ergotism (St. Anthony's fire); diabetes mellitus; antioxidant system; ceruloplasmin level; endointoxication.*

INTRODUCTION

Despite a large number of works devoted to various aspects of erysipelas: pathogenic mechanism, clinical picture, diagnosis, treatment and prevention, it remains one of the most common human infectious diseases. Erysipelas is the fourth most common disease among infectious pathologies and brings great socioeconomic damage¹⁻².

The incidence of erysipelas is on average 12-20 per 10 thousand people in Russia³⁻⁷, and 4.3 per 10 thousand people in Europe⁸⁻¹⁰. There are often recurrent attacks of a disease complicated by necrosis and purulent processes in the tissues and leading to elephantiasis and disability.

The course and consequences depend on the background diseases that lead to degenerative changes in tissues, microcirculation disorders, and result in a violation of skin trophism and lymph circulation. Diabetes mellitus occupying a leading place in the system of vascular events is serious risk factor for disease development. Diabetes mellitus as a background disease significantly worsens the course of and prognosis for erysipelas, promotes recurrence and the emergence of purulonecrotic events. According to published data, erysipelas patients have mainly type 2 diabetes. This

endocrine pathology is found in 8-12% of erysipelas patients, 1/4-1/3 whereof are patients, whose diabetes was first diagnosed when the erysipelas occurred¹¹⁻¹³.

According to the metabolic theory, microvascular complications are caused by long-term hyperglycemia and metabolic disorders induced by it: non-enzymatic glycation of proteins, oxidative and carbonyl stress, direct glucotoxicity, glycosaminoglycan synthesis disruption. The increased aggregability and reduced deformability of erythrocytes led to an increase in blood viscosity that makes it more difficult for blood to flow. This plays an important role in vascular events development¹².

Normal performance of cellular and subcellular membranes depends on the integrity of their phospholipid structures. Damaged lipid membrane is a stage of necrotic cell death at many pathological processes, including those associated with changes in blood viscosity. As a rule, it is associated with activated lipid peroxidation in biological membranes (LPO)¹⁴.

Usually, LPO in tissues is measured by the amount of malondialdehyde (MDA) or other products giving a characteristic coloration in combination with thiobarbituric acid (TBA)¹⁵.

LPO is required for the formation of steroid hormones, inflammatory mediators, cytokines and thromboxanes. If the number of chemical reaction data exchange products exceeds the allowable value and peroxides damage the cell organelles, disrupt the synthesis of DNA and proteins, an antioxidant system that reduces the amount of free oxygen radicals and metal ions with variable valence comes into function. Metabolic LPO products can accumulate in tissues and body fluids if the antioxidant system does not manage to utilize them at the required rate¹⁶.

The antioxidant system containing catalase, ceruloplasmin, vitamins E and C, beta-carotene and other components stands against the the damaging effect of LPO products and active oxygen radicals¹⁷.

Ceruloplasmin (CP) is the main antioxidant of

blood. It binds superoxide radicals and prevents LPO in cell membranes¹⁸. Catalase is also an important element of body's antioxidant defense, as it catalyzes the two-electron reduction of hydrogen peroxide to H₂O¹⁹. The pressing task is to study how the status indicators of pro- and antioxidant systems change in case of erysipelas on the background of such an unfavorable factor as diabetes mellitus.

The purpose of this research is to study the status of the lipid peroxidation system in erysipelas patients on the background of diabetes mellitus.

MATERIALS AND METHOD

The research was carried out in the Center for Prevention and Control of AIDS and Infectious Diseases (Kabardino-Balkar Republic, Nalchik city). The patients were divided into 2 groups: 1 group – 20 erysipelas patients (13 women and 7 men aged 45-68); 2 group – 14 patients, whose erysipelas developed on the background of type 2 diabetes mellitus (8 women and 6 men aged 48-70). These patients were taking tablets. They all had a chronic recurrent course of erythematous-bullous form of erysipelas of medium severity. The disease often occurred on legs – only 2 patients had erysipelas manifestations on the face. The control group involved 25 healthy people that match the subjects by sex and age.

Besides the general examination, we have activated LPO in patients to a certain degree according to the number of TBA reactive substances by determining the MDA content based on the method introduced in²⁰. The antioxidant protection was assessed by measuring the CP level in blood plasma using the Ravin's method²¹. We have examined patients that had acute disease episode (when they were hospitalized) and blanching symptoms (5-7 days of hospitalization), as well as early recovered (before discharge from the hospital) and late recovered (in a month after discharge) patients.

All measurements were made with a SF-46 spectrophotometer. The results were statistically processed with Statistics program.

Table 1: Blood MDA level in erysipelas patients depending on a disease period ($\mu\text{mol/L}$)

Group	Period	n	$\bar{X}\pm m$	P	P1
Healthy	-	25	1.3 ± 0.08	-	-
Erysipelas	I	34	3.7 ± 0.12	<0.001	-
	II	34	2.9 ± 0.17	<0.001	<0.001
	III	34	1.7 ± 0.08	>0.05	<0.001
	IV	18	1.4 ± 0.26	>0.05	>0.05

Note: I – acute period; II – blanching period; III – early recovery; IV – late recovery; P – reliability of differences in relation to healthy people; P1 – reliability of differences in relation to the previous period; P2 – reliability of differences in relation to indicators recorded in erysipelas patients without diabetes mellitus in the corresponding period

In the examined patients, we have found a significant increase in MDA level in serum with a maximum value in the acute period ($3.7\pm 0.12 \mu\text{mol/L}$, $P<0.001$). These changes have occurred on the background of basic clinical manifestations of a disease – weakness and fever, and at the height of local disease manifestations. In the blanching period, there was a significant decrease in MDA level as a result of the treatment. However, it still remained higher than in healthy people ($2.9\pm 0.17 \mu\text{mol/L}$, $P<0.001$, $P1<0.001$). In the period of early recovery, the measured index has significantly decreased ($1.7\pm 0.08 \mu\text{mol/L}$, $P>0.05$, $P1<0.001$) and returned to normal (Table 1).

We have measured the CP level at 3 disease periods to assess the status of the antioxidant system in the same group of patients (where the MDA level was measured); CP level at the 4 period was measured only in some patients.

Table 2: Blood CP level in erysipelas patients depending on a disease period (mg/L)

Group	Period	n	$\bar{X}\pm m$	P	P1
Healthy	-	25	403 ± 4.8	-	-
Erysipelas	I	34	318 ± 3.3	<0.001	-
	II	34	356 ± 3.5	<0.001	<0.001
	III	34	413 ± 2.6	>0.05	<0.001
	IV	18	406 ± 5.6	>0.05	>0.05

The majority of examined patients had a maximum decreased index at the acute period ($318\pm 3.3 \text{ mg/L}$, $P<0.001$). At the blanching period, CP level increased ($356\pm 3.5 \text{ mg/L}$, $P<0.001$, $P1<0.001$), but returned to normal after early recovery ($413\pm 2.6 \text{ mg/L}$; $P>0.05$, $P1<0.001$).

Table 3: Blood MDA level in erysipelas patients depending on the presence/absence of a coexisting diabetes mellitus ($\mu\text{mol/L}$)

Group	Period	n	$\bar{X}\pm m$	P	P2
Healthy	-	25	1.3 ± 0.08	-	-
Without coexisting diabetes mellitus	I	20	3.2 ± 0.11	<0.001	-
	II	20	2.6 ± 0.08	<0.001	-
	III	20	1.7 ± 0.09	>0.05	-
	IV	11	1.4 ± 0.1	>0.05	-

Cont... Table 3: Blood MDA level in erysipelas patients depending on the presence/absence of a coexisting diabetes mellitus (µmol/L)

With coexisting diabetes mellitus	I	14	4.4±0.12	<0.001	<0.001
	II	14	3.2±0.09	<0.001	<0.001
	III	14	2.4±0.13	<0.001	<0.001
	IV	7	1.2±0.23	>0.05	>0.05

When patients were divided into 2 groups depending on the presence/absence of a coexisting diabetes mellitus, the following was found. There were significantly higher MDA values recorded in the group of patients with a burdened premorbid background in the form of diabetes mellitus at the acute period (4.4±0.12 µmol/L; P<0,001;

P2<0,001), blanching period (3.2±0.09 µmol/L, P<0.001, P2<0.001) and at the period of early recovery (2.4±0.13 µmol/L, P<0.001, P2<0.001) versus the corresponding periods in the group of patients without diabetes mellitus. In this case, MDA level normalized only at the period of late recovery (1.2±0.23 µmol/L; P>0.05; P2<0.05) in contrast to the first group of patients (Table 3).

Table 4: Blood CP level in erysipelas patients depending on the presence/absence of a coexisting diabetes mellitus (µmol/L)

Group	Period	n	X±m	P	P2
Healthy	-	25	403±4.8	-	-
Without coexisting diabetes mellitus	I	20	332±4.2	<0.001	-
	II	20	359±6.1	<0.001	-
	III	20	394±5.4	>0.05	-
	IV	11	408±7.8	>0.05	-
With coexisting diabetes mellitus	I	14	305±5.6	<0.001	<0.001
	II	14	331±7.1	<0.001	<0.01
	III	14	373±5.6	<0.001	<0.01
	IV	7	401±9.8	>0.05	>0.05

RESULTS AND DISCUSSION

Thus, we have recorded an increase in serum MDA levels in erysipelas patients. MDA is, in fact, an intermediate LPO product that characterizes the degree of endogenous intoxication. In this case, MDA dynamics depended on the presence/absence of a coexisting diabetes mellitus²¹.

CP level analysis depending on the presence/absence of a coexisting diabetes mellitus has showed that a decrease in CP was significantly more pronounced in the group of patients with a burdened premorbid background in the form of diabetes mellitus at the acute period, blanching period and at the period of early recovery the than in the first group (305±5.6 mg/L; P <0.001; P2<0.001; 331±7.1 mg/L; P<0.001; P2<0.001; 373±5.6 mg/L; P<0.001; P2<0.001) .

In the group of patients with coexisting diabetes mellitus, CP level has normalized only at the period of late recovery (401±9.8 mg/L; P>0.05; P2<0.05) (Table 4). This indicates a more pronounced imbalance in pro- and antioxidant systems in patients with diabetes mellitus, when a high level of LPO products is accompanied by a deficit of antioxidant protection, which obviously contributes to more pronounced pathological changes in the body.

CONCLUSION

As a result of the experiment, it turned out that lipid peroxidation occurs in biological membranes during the period of erysipelas. This is manifested by an increase in blood MDA level, as well as by a deficit of antioxidant protection and a decrease in the plasma antioxidant (ceruloplasmin). Recorded changes in considered

parameters were more pronounced and returned to normal after treatment on the unfavorable premorbid background – such a serious disease as diabetes mellitus.

Environmental Health Risk due to Exposure to Lead in Batteries Smelter Industry- Cinangka Village, Bogor, Indonesia

Ladyka Viola¹, Haryoto Kusnoputranto², Bambang Wispriyono¹

¹Departement of Environmental Health, Faculty of Public Health, Universitas Indonesia, Depok West Java-Indonesia, ²Department of Environmental Health, Faculty of Public Health and Graduate School of Environment, University of Indonesia, Depok, Indonesia

ABSTRACT

Lead is one of the toxic chemicals causing dangerous air pollution in the environment and its very dangerous for human health whose toxicity lasts for a lifetime because lead accumulates in the human body. Black lead is one of the components of the battery that is needed as the basic material for making batteries. Used batteries can be recycled by melting the lead contained in the plates into black bars that can be reused as raw material for making new batteries. This research was aimed to assess the magnitude of emerging health risk of ambient air Pb exposure to residence at smelter batteries area. This study uses a design of public health risk analysis or also called *Public Health Assessment*. The subject of this study is the human population at risk of being exposed to Pb in this case the people living around the former battery smelter in Cinangka Village. The smallest Pb concentration recorded in the study is 0.00004 mg/m³ which is outside the used battery smelting industry. While the largest Pb concentration recorded is 0.00091 mg/m³ which is located in the used battery smelting industry area. The results of the RQ values in this study indicate that only 4% of respondent has an unaccepted non carcinogenic risk which required risk management action. Futher research on particle toxicology evaluation is recommended to be carried out in the future.

Keyword : Lead, Inhalation, Public Health Assessment, Ambient Air

INTRODUCTION

At present, the problem of poor environmental quality is causing increasingly complex health problems, including air pollution. Polluted air contains dangerous metals about 0.01-3% of all dust particulates in the air. However, the metal was accumulative and synergistic reactions occur in body tissues. The metal in the air that was inhaled has a greater effect than the same dose that comes from food ⁽¹⁾.

Lead is one of the heavy metals that pollute the air and lead exposure continues to be a serious public health problem and the incident is difficult to know ⁽²⁾. Black lead is one of the components of the battery that is needed as the basic material for making batteries. Batteries are one of the important components for power generation for motor vehicles. With the increasing demand for motorized vehicles in Indonesia, of course there is also an increase in the demand for batteries, where the battery needs are also determined by the life of the vehicle so that there will be accumulation of used batteries ⁽³⁾.

Based on a report on the Worst Pollution Issues in the World in 2016 hold by Pure Earth Blacksmith Institute said that recycling and smelting of used batteries became the top 3 polluting industries were included in the worst polluting industries in the world. This industry collectively places more than 32 million people at risk and reaches 7 million to 17 million Disability-Adjusted Life Years (DALYs) in low- and middle-income countries ⁽⁴⁾. Communities living near the battery recycling industry are at risk of being exposed to lead, and contaminating the soil and surrounding plants ⁽⁵⁾. A review of the published literature on the exposure of formal sector lead-acid battery manufacturing and recycling plants in developing countries found that elevated blood and lead concentrations in the air were common ⁽⁶⁾.

The entry of metal Pb compounds into the body through food, drinks, air and penetration of membranes or layers of skin. Some Pb inhaled will enter the pulmonary blood vessels. The absorption rate is strongly influenced by the particle size of the existing Pb metal

compounds and the volume of air that can be inhaled during breathing. Pb metal that enters the lungs will be absorbed and bound to the blood in the lungs and then circulated to all tissues and organs of the body. More than 90% of Pb metal is absorbed by blood binding to red blood cells ⁽⁷⁾.

In Indonesia, in 2014 cases of lead poisoning occurred in Cinangka Village, Ciampea District, Bogor Regency. Based on the report of Komisi Pemberantasan Bensin Bertimbal (KPBB) that pollution in Cinangka Village comes from smelting of used batteries, with lead levels in the ground reaching 270,000 ppm (part per million), this indicates that lead levels have exceeded the threshold values set by WHO that is 400 ppm. In addition, blood lead levels in the local population reached an average of 36.62 mcg / dL, with the highest level of 65 mcg / dL. This shows that the blood lead level of the local population has exceeded the WHO threshold value of 10 mcg / dL ⁽⁸⁾.

Research conducted by Rizqiana Halim in 2016 about the effect of lead in the blood of pregnant women on infant birth weight in Cinangka Village showed that mothers who were exposed to lead had maximum blood lead levels of 17.2 µg / dl this had exceeded the value the normal threshold set by WHO, which is 10 µg / dl ⁽⁹⁾.

Black lead (Pb) in the air can cause adverse effects on human health, including disrupting the biosynthesis of hemoglobin and causing anemia, causing an increase in blood pressure, kidney damage, nervous system disorders that damage the brain and reduce IQ and concentration and reduce men. fertility through sperm destruction ⁽¹⁰⁾.

METHOD

The design of this study was the Environmental Health Risk Assessment (EHRA) which consists of several steps, that are hazard identification, dose-response analysis, exposure assessment, and risk characterization ⁽¹²⁾. Environmental data taken include air ambient. The sample of this study was 101 residents of Cinangka Village obtained through sample size formula and selected by propogitive sampling. The study was conducted from July to Agust 2018.

The calculation of lead intake is obtained from the calculation of Intake (I), through the following equation $I = \frac{C \times R \times t_e \times f_e \times Dt}{Wb \times t_{avg}}$

Explanation:

I = Intake, mg/kg/day

C = Concentration of risk agent (mg/m³)

R = Rate of intake or consumption (m³/hours)

t_e = Exposure time per day (hours /day) for inhalation

f_e = frequency of annual exposure (day/year).

D_t = Duration of exposure, year (real time or projection, 30 years for residential default value

Wb = Weight (Kg)

t_{avg} = Average time period, 30 years x 365 days / year

(non-carcinogenic) or 70 years x 365 days / year (carcinogenic)

Estimation of the level of health risks derived from calculation using Risk Quotient (RQ) is calculated through the equation ⁽¹²⁾:

$$\text{Risk Quotient (RQ)} = \frac{\text{Intake}}{\text{RfC}}$$

The interpretation of the RQ value obtained from the formula calculation is if RQ>1 means having a helath risk. RfC (Inhalation Reference Concentration) is the amount of chemicals that can be inhaled in a lifetime is not anticipated to non-cancer health effects.

RESULT

General Characteristic of Respondent

Distribution of respondents based on gender, education and type of work in the Cinangka Village, Bogor Regency in 2018 can be seen in table 1.

Table 1. Frequency Distribution of Social, Economic and Demographic Characteristics Of Cinangka Village Residents, Bogor District 2018

Variabel	Total	Percentage
Sex		
Male	19	18.8
Female	82	81,2
Education		
No school	15	14.9
Finished Elementary School	66	65.3
Finished Junior High School	13	12.9
Finished Senior High School	7	6.9
Occupotional		
Smelter	13	12.9
Not Smelter	88	87.1
Total	101	100.0

Based on table 1, the frequency distribution of social, economic and demographic characteristic of Cinangka village residents, most of respondents are woman, namely 80.4%. Most of respondents graduated from elementary school (64.7%). Most of the respondents are not smelter that is equal to 87.1%.

Table 2. Characteristic of Anthropometry of Cinangka Village Residents, Bogor District 2018

Variable	Mean \pm SD	Median	Range	Distribution***
Antropometry				
Weight (Kg)	54.34 \pm 10.69	53.00	37-83	Normal
Height (Cm)	152.26 \pm 7.26	151.00	138-175	Normal
Body Mass Indeks (BMI)	23.48 \pm 3.93	23.06	15.90-34.55	Normal
Intake Rate (R, mg ³ /hour)	0.59 \pm 0.04	0.59	0.51-0.69	Normal

Based on the table 2, the average age of respondents is 40.16 years old with a range of 16 to 75 years old. Average weight of respondents is 54.34 kg with a range of 37 kg to 83 kg. For height, the average height of responden is 152.26 cm with range of 138 cm to 175 cm. For body mass index, the average respondent was 23.48

with a range of 15.90 to 34.55.

Concentration of Pb in The Air

Pb concentration test is carried out in 10 points around the smelting industry of used batteries.

Table 3: Concentration of Pb in The Air, Cinangka Village Residents, Bogor District 2018

Location	Pb of Ambient air ($\mu\text{g}/\text{Nm}^3$)	Pb of Ambient Air (mg/m^3)	Temperature ($^{\circ}\text{C}$)	Relative Humidity (%)
Point 1	0.28 $\mu\text{g}/\text{Nm}^3$	0.00028	33 $^{\circ}\text{C}$	56%
Point 2	0.24 $\mu\text{g}/\text{Nm}^3$	0.00024	33 $^{\circ}\text{C}$	55%
Point 3	0.096 $\mu\text{g}/\text{Nm}^3$	0.00009	33 $^{\circ}\text{C}$	54%
Point 4	0.21 $\mu\text{g}/\text{Nm}^3$	0,00021	33 $^{\circ}\text{C}$	56%
Point 5	0.42 $\mu\text{g}/\text{Nm}^3$	0,00042	33 $^{\circ}\text{C}$	56%
Point 6	0.91 $\mu\text{g}/\text{Nm}^3$	0,00091	33 $^{\circ}\text{C}$	58%
Point 7	0.86 $\mu\text{g}/\text{Nm}^3$	0,00086	33 $^{\circ}\text{C}$	51%
Point 8	0.39 $\mu\text{g}/\text{Nm}^3$	0,00039	33 $^{\circ}\text{C}$	50%
Point 9	0.069 $\mu\text{g}/\text{Nm}^3$	0,00006	33 $^{\circ}\text{C}$	52%
Point 10	0.04 $\mu\text{g}/\text{Nm}^3$	0,00004	33 $^{\circ}\text{C}$	52%

Description: Threshold value 2,0 mg/m^3

Pb concentration in the study site with the number of measuring points in a total of 10 samples scattered in each location near the smelter of used batteries. The smallest Pb concentration recorded was 0.00004 mg/m^3 which outside the used battery smelting industry. While the largest Pb concentration recorded was 0.00091 mg/m^3 which located in the used battery smelting industry. The temperature specified at all points is 33 $^{\circ}\text{C}$. The highest and lowest humidity recorded at the research site, respectively 58% and 50%.

Exposure Analysis and Intake Calculation

In this study, the exposure assessment concept used to measure the amount of exposure to analyze the amount

of exposure, namely by calculating the amount of intake (intake) of lead that enters the body. Calculation of intake amount was obtained by calculation based on intake rate (m^3/hour), exposure time (hours/day), annual exposure frequency (day/year), duration of exposure (real time) in years, weight (kg), average time period (30 years x 365 days / year for non-carcinogens and 70 years x 365 days / year for carcinogens).

Calculation of lead intake in 101 respondents used a computer with Microsoft-Excel program. Calculation of intake of lead concentrations in the surrounding environment is obtained using equations ⁽¹²⁾.

$$I = \frac{C \times R \times t_e \times f_e \times Dt}{Wb \times t_{vag}}$$

The example of intake calculation used one of the following sample data of respondents and default data (US EPA) if known:

C : Concentration Pb = 0.00028 mg/m³

R : Intake Rate (m³/hour)

Normal Intake Rate (EPA, 1997 in Ambrianto, 2004): $y = 5,3 \ln(x) - 6,9$

$Y = (5,3) (\ln(56)) - 6,9 = 14,43 \text{ m}^3/\text{day} = 14,43/24 = 0,6014 \text{ m}^3/\text{hour}$

te : 24 hour/day

fe : 350 (day/year) day

Dt : Real Exposure Duration (year) = 48 Years

Wb : Body Weight = 56 kg

t_{avg} : Average Periode (non carsinogenic = 30 years x 365 day/year = 10950 day/year).

The calculation of non carcinogen intake was:

$I = (0,00028 \text{ mg}/\text{m}^3)(0,6014 \text{ m}^3/\text{hour})(24 \text{ hour}/\text{day})(350 \text{ day})(48 \text{ year})$

$(56 \text{ Kg})(10950 \text{ day}/\text{year})$

$= 0,00011 \text{ (mg/kg)}/\text{day}$

The results of the calculation of intake for non-carcinogens obtained intake was 0.00011 (mg/kg)/day. Using the same formula as the example above, the calculation of non-carcinogenic Intakes in 101 respondents (research sample) was calculated with the Microsoft-Excel program.

Table 4 Intake non-carcinogens

Variabels	n	Minimum	Maximum	Median	Std.Dev.
Intake Non-carcinogens	101	0.000001	0.00071	9.0E-5	1.19E-4

The results of the study showed that intake of lead exposure at 101 respondents in Cinangka Village as shown in table 4 obtained the lowest intake value of non-carcinogen 0.00001 (mg/kg)/day and maximum of 0.00071 (mg / kg) / day with a middle value 9.0E-5 (mg / kg) / day.

Risk Characteristics (Risk Characterization)

Calculation of estimated risk level with non-carcinogenic risk calculation equation (RQ) ⁽¹¹⁾ :

Risk Quotients (RQ) = $\frac{\text{Intake}}{\text{RfC}}$

RfC

The concentration value (RfC) for real time RQ is 0.0004 mg / kg / day (IRIS, 2006). The example of non-carcinogen calculation (RQ) using the intake data of one of the sample workers' data is as follows:

Risk Quotients (RQ)_{real time} = $\frac{0,00011 \text{ mg}/\text{kg}/\text{day}}{0,0004 \text{ mg}/\text{kg}/\text{day}}$

$= 0,277$

Table 5 Result of risk assesment of non-carcinogenic risk on community in Cinangka Village Residents

Risk	Frequency	Percentage
Risk of Non-carcinogen (<i>real time</i>)		
RQ>1	4	4%
RQ≤1	97	96%
Total	101	100%

Based on table 5, 4% of respondent has an unaccepted non carcinogenic risk which required risk management action.

DISCUSSION

Non-regulated, informal recycling practices occur in many countries and have resulted in lead exposure and poisoning, with young children being particularly at risk. This practice was carried out in areas with high

population density, which means that this recycling operation has the potential to affect a number of people. A study conducted in Dakar, Senegal about mass lead poisoning which showed that lead poisoning resulted from informal used lead-acid batteries. Stockpiles contained in car batteries are of particular concern because they contribute as much as 80% of lead consumption worldwide and produce lead waste in almost every country ⁽¹⁴⁾.

Based on the measurement results found in Table 3, the largest recorded Pb concentration is 0.00091 mg/m³ which is located in the used battery smelter industry compared to Threshold Value (NAV) in the Government Regulation of the Republic of Indonesia Number 41 of 1999 concerning Quality Raw Air Pollution Control The environment for lead (Pb) in the air was 2.0 mg/m³, the concentration of lead (Pb) around the former smelter environment of Cinangka Village, Bogor Regency was still below the Threshold Limit Value set for exposure during 24 hours per day.

A study of the level of risk of ambient air lead exposure, said that statistically the wind speed has a significant relationship to lead concentration. Increased wind speed also increases the concentration of lead in the air. When the speed of air becomes calm the air temperature in the upper atmosphere becomes higher than the temperature below it ⁽¹³⁾.

Various stages in the recycling process can result in the release of lead smoke and particles in the air. A study has shown that high lead exposure is located at the location of lead-acid battery recycling ⁽⁷⁾. Air lead concentration has been shown to correlate with blood lead concentration in workers. Lead in the air eventually settles and contaminates the surrounding surface.

The results of the RQ values indicate that 4 (4%) of the respondents have a risk of air lead concentration in Cinangka Village. The RQ value in the table shows that lead exposure is not harmful to public health. This indicates that the concentration does not cause non-carcinogenic effects. From the observation of questionnaires were 54.5% who experienced respiratory complaints. The main lead exposure path was most likely through inhalation of Lead dust that enters the body through the inhalation path in the form of particulates, tightly causing the respiratory tract to disrupt.

CONCLUSION

The frequency distribution of the social, economic and demographic characteristics of the villagers of Cinangka, most of the respondents were women, namely 81.2%. Most of respondents graduated from elementary school (65.3%). The average weight, height, and body mass index was 54.34 kg, 152.26 cm, and 23.48, respectively. Most of the respondents (87.1%) are not work in smelting industry. The highest Pb concentration recorded was 0.00091 mg/m³ which located in the used battery smelting industry. The results of the RQ values indicate that only 4% of respondent has an unaccepted non carcinogenic risk which required risk management action. Futher research on particle toxicology evaluation is recommended to be carried out in the future.

Evaluation of Bone Mineral Density in Adult Epileptic Patients Treated with Valproate

Mohammad A.S. Kamil¹, Aqeel K. Hatem², Mustafa Easa³

¹Fallujah University/ College of Medicine, ²Baghdad University College of Medicine, ³Baghdad Teaching Hospital

ABSTRACT

Background: There is increasing evidence that chronic treatment with antiepileptic drugs is associated with changes in bone metabolism, increasing the risk of fractures in patients with epilepsy. A few studies have investigated the effect of valproic acid on the bone metabolism and bone mineral density, and there are conflicting results regarding the effect of valproate on the bone mineral density with the majority of studies suggesting that valproic acid reduces bone density.

Objective: To evaluate the effect of long-term Valproate monotherapy on bone mineral density and bone biomarkers.

Method: A case-control study was conducted in forty epileptic patients (22 females and 18 males) on a long-term valproic acid therapy. The control group included forty (22 females and 18) apparently healthy volunteers.

Bone mineral density was measured by dual energy x-ray absorptiometry scan at the lumbar spine (L1-4) and blood samples were obtained for all subjects, and analyzed for total serum calcium, phosphate, vitamin D level and parathyroid hormone.

Results: We found a decrease in the bone mineral density T score (osteopenia and osteoporosis) of epileptic group is about 22.5% compared with its percentage in the control group which is 7% only.

We found significantly lower vitamin D level in epileptic group compared with control group (52.5% for epileptic group versus 30% for the control group; including both deficiency and insufficiency).

Conclusions: Bone mineral density Z- and T-score of the lumbar spine in adult epileptic on long-term valproic acid therapy was decreased as compared with age- and sex-matched controls; this result was inversely correlated with the dose and duration of valproic acid therapy.

Keywords: Epilepsy, valproic acid vitamin D, bone mineral density, osteoporosis.

INTRODUCTION

A standard definition of epilepsy is as a disorder of brain characterized by an ongoing liability to recurrent epileptic seizures. An epileptic seizure is defined as the transient clinical manifestations that result from an episode of abnormal neuronal activity^[1].

The increased risk of bone disease in patients with epilepsy manifests as a 1.3 to 3.8 relative risk of osteopenia, a 1.7 to 3.8 relative risk of osteoporosis, and a 1.7 to 6.1 relative risk of fractures^[2].

Risk factors specific to epilepsy or its treatment have been identified. These include^[3]: 1. Fall-related fractures. Patients with epilepsy are at risk for seizure-related falls in addition to falls caused by ataxia, sedation, and gait instability due to either the neurologic pathology underlying the epilepsy or the side effects of Anti-epileptic drugs (AEDs) used to treat seizures.

2. Direct effects of AED treatment on bone health.

Calcium and its ionized fraction are regulated by parathyroid hormone (PTH)^[4]. Osteoporosis is characterized by reduced bone strength usually accompanied by a reduction in bone mass^[5].

Secondary osteoporosis occurs in association with medical illnesses or medications that results in bone loss^[6].

The major biologically active metabolite, 1,25-dihydroxyvitamin D, plays a central part in maintaining calcium and phosphate homeostasis, Vitamin D is essential for skeletal health, and severe deficiency is associated with defective mineralization resulting in rickets or its adult equivalent, osteomalacia^[7]. Bone Mineral Density is the amount of bone mineral in bone tissue^[8]. Dual-energy X-ray absorptiometry is considered as gold standard for assessing bone density measurement^[9]. Results are generally scored by two measures, the T-score and the Z-score, negative scores indicate lower bone density, and positive scores indicate higher^[10].

Hepatic enzyme inducers, such as phenytoin, carbamazepine, phenobarbital, and primidone, and non-inducing AEDs such as valproate, are known to be associated with accelerated rate of bone loss and development of secondary osteopenia and osteoporosis with an increase in the risk for fractures^[11].

Cytochrome P450 enzyme inducing AEDs are most commonly associated with a negative impact on bone^[12].

Although VPA is a cytochrome P450 enzyme inhibitor; studies do suggest an effect on bone^[13], but negative effects have been reported in other studies^[14].

VPA has displayed a direct effect on bone cultured bone cells, resulting in increased bone turnover with osteoblastic (bone formation) and osteoclastic (bone resorption)^[14].

Serum concentrations of calcium and bone Gla protein (bone formation marker) and pyridinoline cross-linked carboxy-terminal telopeptide of type-I collagen (ICTP – bone resorption marker) were significantly higher with VPA long term therapy^[15].

It is possible that the inhibition of bioactivation

of vitamin D₃ by VPA causes rickets and osteomalacia, and the site of inhibition is expected to be the cytochrome P-450 mediated reactions in liver mitochondria^[16].

AIMS OF THE STUDY

The aim of this study was to evaluate the effect of long-term VPA monotherapy on BMD by DXA measurements and bone biochemical indices in adult epileptic patients.

To clarify the relationship between BMD with dose and duration of VPA monotherapy therapy.

PATIENTS AND METHODS

Subjects:

A case-control study was conducted on 40 patients (22 females and 18 males) at epilepsy clinic of Baghdad teaching hospital, medical city, collected during the period from february-2017 to february-2018.

Subjects for comparison were 40 healthy and active volunteers (22 females and 18 males) collected in the same period at Baghdad teaching hospital. All study subjects were well matched with respect to age, sex, and BMI.

The inclusion criteria:

- 1- Active epileptic patients aged between 18-45 years.
- 2- Patients treated with VPA as monotherapy for first time.
- 3- The duration of therapy should be more than 6 months.
- 4- Patients body mass index (BMI) range from (18.5 to 30).

The exclusion criteria:

- 1- Subjects with known chronic medical illnesses (hypertension, diabetes mellitus, and renal, thyroid and parathyroid diseases) or neurological disease other than epilepsy.
- 2- Subjects with history of pathological bone fractures.
- 3- Subjects with vitamins supplement,

glucocorticoid, anabolic steroid, calcitonin and other drugs known to effect bone metabolism.

4-History of cigarette smoking or heavy alcohol use.

5- Pregnant women, women with amenorrhea and hysterectomy.

6. Extreme activity life style (Extremely inactive, extremely active).

7- Subjects with diet restriction.

Method

Forty registered epileptic patients in the epilepsy clinic of Baghdad teaching hospital were selected.

Forty control healthy people were selected in an appropriate manner to balance gender, age, physical activity level and BMI differences with epileptic group. Volunteers chosen to participate in this study after clarifying the study objectives and radiation risk. The same exclusion criteria as the epileptic group were applied to control group.

A questionnaire was administered to all subjects and including the following:

1. Demographic information's: about gender, age, and the physical activity.

We assess the physical activity according to (WHO scale)^[17].

2. Epilepsy characters: type of epilepsy (according to *ILAE* classification), duration of epilepsy and control status^[18].

3. Pharmacological information's about type, dose and duration of VPA therapy.

4. Biochemical bone markers: including serum calcium, phosphate, PTH and 25-OHD level.

5. Body mass indices measurements of all subject.

6. Results of DXA scan (lumber spine, T score and Z score).

All subjects had BMD measured by the same validated densitometer (stratos ver.v3.0.8.3 13/01/2014) to eliminate measurement error.

On the same day as bone density evaluation, blood

samples were obtained from all subjects, and analyzed for total serum calcium, serum phosphate, parathyroid hormone and serum vitamin D level (Serum 25-OHD).

Statistical analysis:

The SPSS (Statistical Package for the Social Science) program, version 23, was used for all computerized statistical analyses.

RESULTS

Baseline demographic and clinical characteristic of study subjects were shown on Table1.

Although not presumed as inclusion criteria, all patients enrolled in this study had been diagnosed with idiopathic generalized epilepsy; 31 patients (77.5%) had generalized tonic-clonic epilepsy, 5 patients (12.5%) had juvenile myoclonic epilepsy and 4 patients (10%) had myoclonic-tonic-clonic epilepsy. The mean dose of VPA therapy (742.5 ± 390.2 Mg/day). The mean duration of VPA therapy was (4.9 ± 3.2) years.

The mean serum calcium was (9.1 ± 0.9) and (8.9 ± 0.8) for both epileptic and control group respectively; both values were within normal range and there was no significant statistical difference (p value was 0.4568). Table 2.

The mean serum phosphate was (3.7 ± 1.1) and (3.5 ± 0.6) for epileptic and control group respectively; both values were within normal range and there was no significant statistical difference (p value was 0.3379).

The mean vitamin D levels for epileptic group was in the insufficient range (26.6 ± 12.3); 47.5% had normal vitamin D levels, 52.5% had low vitamin D level; (37.5% of them had vitamin D insufficiency and 15% had vitamin D deficiency), While the mean vitamin D level for control group was in the normal range (32.9 ± 10); 70% had normal vitamin D level, 25% had vitamin D insufficiency level and 5% had vitamin D deficiency. Note that, There was significant statistical difference (p value was 0.0135).

The mean PTH for epileptic group was (56.4 ± 38.4) which was in the upper limit of normal range and significantly ($p= 0.0015$) higher than that of control group which was (35.1 ± 13.5).

For epileptic group (75% had normal serum PTH level, 22.5% had hyperparathyroidism and 2.5% had

hypoparathyroidism.

For control group (97.5% had normal serum PTH level and 2.5% had hypoparathyroidism).

Result of BMD:

There was statistically significant difference between mean BMD Z score of the lumber spine (L1-4) for epileptic and control group. The mean lumber BMD Z score of epileptic group was significantly lower than that of control group. In addition, the mean BMD T score show statistically significant difference between the two groups; Table 3 elucidate the results.

Among epileptic group there was 31 patient (77.5%) had BMD T-score above -1 SD (normal), 8

patients (20%) had BMD T-score between -1 and -2 SD (osteopenic), 1 patient (2.5%) had BMD T-score of -2.7 SD (osteoporotic).

Among control group there was 37 patients (92.5%) had BMD T-score above -1 SD (normal) and 3 patients (7.5%) had BMD T-score between -1 and -2 SD (osteopenic), (according to T-score BMD of lumber spine – WHO definition).

The correlation between BMD Z-score with the dose, duration, vitamin D level and PTH was shown in the table 4; The correlation coefficient (*regression analysis r value*) was used to assess the strength and direction of a linear relationship between two variables on a scatter plot, figures 1,2.

Figure 2: Show significant weak to moderate direct (positive) correlation between BMD Z-score and vitamin D level. ($r = +0.4$ and $p = 0.002$).

DISCUSSION

We found that the mean serum calcium and phosphate, for epileptic and control groups were within normal range, and there are no significant statistical differences between two groups, table 2. This result was consisted with some previous studies^[19].

In the present study, we found significantly lower vitamin D level in epileptic group compared with control group (52.5% for epileptic group versus 30% for the control group; including both deficiency and insufficiency). Both groups were from the same geographical area, so the effect of sunshine exposure is unlikely to have played an important role; this result was consisted with the results of studies conducted by Shellhaas et al.^[20] and Sato et al^[13].

As observed in present study, the mean PTH for epileptic group was within the upper limit of normal range and it was significantly higher than control group; there were nine cases (22.5%) of secondary hyperparathyroidism noted in the epileptic group while no case was noted in control group, this mean that the BMD was decreased with increasing serum PTH level, and this result is consisted with the result of study conducted by Boluk et al^[21].

Secondary hyperparathyroidism in the present study may be explained by decrease level of biologically active vitamin D that leads to decreased absorption of calcium in the gut, resulting in hypocalcaemia and an increase in

circulating PTH^[22]. PTH then increases the mobilization of bone calcium stores and subsequent bone turnover. However, the mean serum calcium in the present study was within normal range and did not correlate with the deficiency of vitamin D; this may be explained by long duration of secondary hyperparathyroidism that lead to correction of serum calcium on expense of bone demineralization^[22].

We found a decrease in the BMD T score (osteopenia and osteoporosis) of epileptic group is about 22.5% compared with its percentage in the control group which is 7% only.

The observation of low BMD in adult epileptic patients in our study was consistent with some previous studies^[21].

CONCLUSIONS

Long-term VPA therapy results in reduction of bone mineral density in adult's epileptic patients.

Low bone mineral density correlated inversely with the dose and duration of VPA therapy.

Low bone mineral density correlated directly with vitamin D level and inversely with parathyroid hormone in the epileptic patients with long-term VPA therapy.

Ethical Clearance-taken from Iraqi Board for Medical Specialization /Ministry of Higher Education And Scientific Research /Republic of Iraq.

ABSTRACT

Integrated Health Education Center for Non-communicable Disease/IHEC for NCDs (Posbindu PTM) is a place of community participation for early detection, preventing and controlling hypertension of non-communicable diseases. *Posbindu PTM* is one of the promotional and preventive health efforts that is implemented in an integrated, routine, and periodic, and the non-communicable risk factors that are found immediately refer to basic health care facilities. It is necessary to examine the role of *Posbindu PTM* in controlling hypertension risk factors.

The study used a combination method approach with sequential exploratory design. Exploratory design was begun with the main qualitative method to know the knowledge, attitude and behavior of members of *Posbindu PTM* to hypertension. The results of qualitative and quantitative methods were analyzed to develop the Integrated Health Education Center for Non-communicable Disease/IHEC for NCDs (*Posbindu PTM*).

People feel useful coming to *Posbindu PTM*, so want to come every month. The active community who came to *Posbindu PTM* increased their knowledge about Hypertension and non-communicable disease (PTM).

The community who actively coming to *Posbindu PTM* supported the behavior of preventing and controlling of hypertension. *Posbindu PTM* can play a role in controlling hypertension for active members.

Keywords: *Posbindu PTM, behavior, prevention of hypertension, Analysis Policy.*

INTRODUCTION

Non-communicable diseases (NCDs) has been the leading cause of death in Indonesia 71% in 2012, specially heart, diabetes, cancer and chronic respiratory diseases¹. The non-communicable diseases (NCDs) can be prevented through effective intervention against risk factors, including: tobacco use, unhealthy diet, inadequate physical activity and alcohol use².

Non-communicable disease (NCDs), also known as chronic disease or lifestyle-related illness is not transmitted from person to person³. The effort of prevention and control of non-communicable diseases

under development in Indonesia is Integrated Health Education Center for Non-communicable Disease/IHEC for NCDs (Posbindu PTM). The purpose of *Posbindu PTM* is to increase community participation in preventing and early discovery of non-communicable diseases risk factors.. The activities of the post are measurement of body weight, height, body mass index (BMI), abdominal circumference, and blood pressure, physical activity and/joint exercise and counseling.

WHO recommends a healthy lifestyle by eating lots of fruits and vegetables, reducing fat, sugar and salt intake as well as exercise⁴. The developing post is one

of the efforts to prevent and control non-communicable risk factors. The purpose of this research is to know the role of *Posbindu PTM* to increase knowledge, attitude and behavior to prevent and control hypertension and other non-communicable diseases.

MATERIAL AND METHOD

The study used a combination method approach with sequential exploratory design. Exploratory design was begun with the main qualitative method to know the knowledge, attitude and behavior of members of *Posbindu PTM* to hypertension. The finding results were proved by quantitative methods to determine the knowledge, attitudes, behavior of members on prevention and controlling hypertension.

Qualitative Methode: 85 member informants who participated in 10 (ten) *Posbindu PTM* activities. The population in this study was members of *Posbindu PTM* in 10 districts/cities in Bengkulu Province. The number of samples in this study is determined based on the number of members of *Posbindu PTM* in selected districts/municipalities with stratified random sampling cluster sampling technique, based on the number of members of *Posbindu PTM*, mostly medium and very few. The number of members 1580 based on registration each month from 79 posts. The samples to measure hypertension with the criteria of visits at least 6 months regularly every month to *Posbindu PTM*. The number of samples to know the knowledge, attitude and behavior of 472 members with the way insidental sampling at the time of the implementation at *Posbindu PTM*.

RESULTS

Result of qualitative method with case study approach was at 10 *Posbindu PTM*. Preparation for the implementation of was done by cadre and public health center officers. Cadre invited the head of neighborhood association/head of hamlet to mobilize the community to utilize *Posbindu PTM*. The results of interviews with cadre were as follows:

Members *Posbindu PTM* every Friday morning doing gymnastics together in the public health center, integrated counseling post of non-communicable disease was held once a month every Friday on the third of the month. The activities include blood tests, weight measurement, and height once a month (Cadre *Posbindu PTM F*)

The members who actively come to *Posbindu PTM* feel the benefits of following the activities. They got knowledge about the risk factors and prevention of hypertension, and also checked up their health. *Postbindu PTM* activities begin with registration, measurement of height, weight, abdominal circumference, and blood pressure/ tension. Certain members check for instantaneous sugar, cholesterol and uric acid in the blood. Members get counseling who have hypertension risk and counseling about non-contagious diseases for all members. Counseling about the non-communicable diseases conducted every month aims to improve knowledge, change attitudes and behavior of society against hypertension and other non-communicable risk factors. Based on the interview result, one member said:

..The treatment, counseling, examination (height, weight, blood pressure, blood sugar, check up disease, medication, non-communicable diseases/ clean and healthy life behavior, every month comes to *Posbindu PTM* (Informant 2, *Posbindu PTM B*) ...

The Information from participants on the implementation of *Posbindu PTM* can be concluded, all say useful because it can know the condition of health, increase knowledge about hypertension and other non-communicable diseases, so every month trying to come to *Posbindu PTM*.

Qualitative results compiled by dependent and independent variable, knowledge about *Posbindu PTM*, hypertension and other PTM, and attitude, behavior of non-contagious diseases prevention can be seen in Table1.

Table 1: Knowledge, Attitude, Behavior toward Posbindu PTM, Hypertension and other commnucable diseases

Research Variables	Category	Category		p value
		Prevention behavior of PTM		
		Less	Good	
Knowledge of non-coomunicable diseases	Less	72,6%	27,4%	0,000
	Good	30,4%	69,6%	
		Knowledge of PTM (non-communicable diseases)		
		Less	Good	
Behaviour of coming to Posbindu PTM	Less	40,5%	59,5%	0,002
	Good	24,2%	75,8%	

Knowledge of PTM (non-communicable diseases) with behavior of preventing hypertension and other non communicable diseases, statistical test analysis using chi square test obtained results p value 0,000 <p 0.05, with 5% confidence degree. Means there is a relationship of knowledge with behavior to prevent hypertension and other non-communicable diseases.

Bivariate statistical test analysis using chi square test obtained p value 0,000 <p 0.05 with 5% confidence

degree. It means there is a relationship between behavior of coming to Posbindu PTM with behavior to prevent hypertension and other non-communicable diseases..

Multivariate analysis using General Linear Statistical Test Model Repeated Measures one group. The results of this analysis will show the decrease of normal hypertension members of the first month, second, third and so on can be seen in Table 2.

Table 2 : Analysis result of General Linier Model Repeated Measures Toward members with Normal Blood Preasure

Month	Total n	n of Events	N	Percent
1 st	428	0	428	100%
2 nd	428	24	404	94.4%
3 rd	428	64	364	85.0%
4 th	428	80	348	81.3%
5 th	428	109	319	74.5%

DISCUSSION

The role of Posbindu PTM

Knowledge, Attitudes, and Prevention Behavior of PTM

The result of research showed there is correlation of

knowledge with behavior of non-communicable diseases prevention and there is relationship of coming behavior to Posbindu PTM with behavior of prevention to non-communicable diseases. Increased public knowledge facilitatted officers in implementing the program, and improve community utilization. The NICE study (2008), the invasion of community involvement showed

patients were activated to take a larger share and control in managing their own conditions⁵. According to WHO (2015) integrated health services are managed health services and ensure the continuity, including health promotion, disease prevention, diagnosis, treatment, disease management and rehabilitation on different levels of the health system as required⁶. Increased knowledge was associated with behavior to prevent hypertension and other non-contagious diseases. Green in Ashwell and Barclay (2009), said that the health of individuals or communities were influenced by two factors: a) behavioral factors and b) factors outside behavior (non-behavior). Furthermore, behavioral factors according to Green, grouped 3 (three) behavior change factors that predisposing (predisposing), enabling (enabling), reinforcing (reinforcement)⁷.

The Health Belief Model (HBM) was developed to find out why people did or did not use the prevention services offered, and have grown to address new problems in prevention and detection (eg, screening) as well as lifestyle behaviors such as healthy living behaviors and injury prevention. The Health Belief Model (HBM) argued that health behavior was determined by two cognitions: the perception of disease threats and behavioral evaluation to counteract threats. Members who actively come to *Posbindu PTM* increased knowledge about preventing, controlling and the impact of *PTM*, so that the members having behavior to control hypertension.

The concept of Health Belief Model explains⁸, namely: 1) Perceived Severity is the subjective belief of individuals in the spread of disease caused by behavior or believe how dangerous the disease so as to avoid unhealthy behavior to avoid pain. Perceived severity also has a positive relationship with healthy behavior. If the perception of individual severity is high then he will behave in a healthy manner; 2) Perceived Benefits is a belief in the advantages of recommended methods to reduce the risk of disease.

Health Belief model developed on empowerment of *Posbindu PTM* to know whether the members actively use *Posbindu PTM* every month. The Health Belief model is most often applied to preventative and asymptomatic health issues such as cancer detection and early hypertension, and is relevant to interventions to reduce risk factors for cardiovascular disease⁹.

In *Posbindu PTM* activities, members were given counseling about non communicable diseases including hypertension and given special counseling for members suffering from hypertension in detail described hypertension control efforts. According to Alsairafi (2010) the increased risk of physical inactivity in controlling hypertension in our study suggested that general practitioners should be used to prescribe strenuous physical exercise¹⁰. According to Muhamedhussein (2016) tried to show the level of hypertension and know the risk factors that could explain the high prevalence of hypertension¹¹. Beigi (2014) said that educational interventions had a highly desirable effect on lifestyle modification and control of blood pressure. Control hypertension in the population requires public education programs to promote hypertensive awareness and lifestyle modification which it is an urgent need¹².

The relationship of coming behavioral to *Posbindu PTM* with the behavior of preventing hypertension had an impact on the decrease of hypertension members in the first, second, third, forth, and fifth month.. This strategy will address the behavioral and environmental factors associated with the prevention and control of high blood pressure to achieve three sub-goals (prevention, early detection and control of hypertension). There are three main strategies: public health promotion, health care system and system support strategy¹³.

Overall, this study determined the high prevalence of hypertension in the study population. Hypertension is associated with smoking, alcohol consumption, low physical activity, obesity, and diabetes. Community-based approaches to reducing hypertension and risk factors are important. Effective community-based prevention and control strategies can provide the best opportunity to avoid hypertension-driven health and economic consequences in Nepal¹⁴. Researchers recommend: 1) raising awareness of hypertensive patients about hypertensive risk factors is very important to be motivated to adopt healthy lifestyle behaviors in an effort to control the disease; 2) encourage hypertensive patients to change essential lifestyle behaviors including regular physical activity adoption, proper weight control, follow proper diet, stop smoking and alcohol, reduce stress as much as possible; 3) the focus must be on public education in understanding high blood pressure and its impact on public health; 4) understanding the status of patient knowledge and perception for modification of lifestyle behavior as an important factor in the control

of hypertension¹⁵.

Policy Analysis Posbindu PTM

People who come every month follow the activities at *Posbindu PTM*, know the health condition, get knowledge about the effort to prevent, prevent the non-contagious diseases and feel the benefits of the implementation of *Posbindu PTM*. *Posbindu PTM* integrated with mobile public health center could modify factor, cultivate trust and action to take advantage at *Posbindu PTM*. WHO (2015) recommended a more people-centered and integrated health system to help build a more effective health system⁶.

Following the activities of *Posbindu PTM* could modify the knowledge of factor because of counseling was given to the members, early detection of disease by performing measurements and blood tests such as blood sugar, cholesterol and uric acid and other examinations. This study showed that community-based lifestyle interventions delivered by trained field health workers may be a potential solution to combat hypertension and diabetes mellitus among middle-aged and elderly people in resource-poor environments¹⁶.

Posbindu PTM is one of the main containers of the implementation of Healthy Living Community Movement (GERMAS). *Germas* is a systematic and planned action undertaken jointly by all components of the nation with awareness, willingness and ability to behave healthy to improve the quality of life. Most of the activities carried out on the post One of the activities of routine medical examination is the main activity of *Posbindu PTM* which strongly supports *Germas*.

Successful *Germas*, can not only rely on the role of the health sector alone. The role of Ministries and Institutions in other sectors also determines, and is supported by the participation of all levels of society. *Posbindu PTM* increase knowledge and understanding of society to behave “Cerdik” (Health Check periodically, Awake smoke cigarette, Diligent physical activity, Healthy diet with balanced nutrition, adequate rest and Manage stress). Activity *Posbindu PTM* will be able to improve the success of *Germas* which aims to increase awareness, willingness and ability of people to behave healthy, including controlling hypertension in an effort to improve the quality of life.

CONCLUSION

Posbindu PTM aimed to make early detection, prevent and control blood pressure of the members. The activities of *Posbindu PTM* performed the measurement of blood pressure, non communicable diseases including hypertension, counseling for members indicated by non-communicable disease based on examination and measurement results.. Active members felt useful following *Posbindu PTM*, and they always want to come every month. The members who were suffering from hypertension and actively come every month could control blood pressure down to 74.1% of patients in the fifth month. The role of *Posbindu PTM* with the activities of measuring blood pressure, height, body weight, counseling/education, counseling for hypertension indicated members could improve knowledge and healthy behavior to control members with active hypertension. *Posbindu PTM* is one of the main containers of the implementation of Healthy Living Community Movement (GERMAS).

ABSTRACT

Objective: This study aims to examine the association between apolipoprotein E polymorphism (APOE) and cognitive functions test using Montreal Cognitive Assessment- Indonesian version 2012 (MoCA-Ina) in elderly.

Method: A cross-sectional study of 112 elderly participants from two nursing homes in Jakarta. APOE gene polymorphism was analyzed using polymerase chain reaction-restriction fragment length polymorphism (PCR-RFLP).

Results: There are four genotypes: E2/E2 10(8.9%), E3/E3 38(33.9%), E3/E4 46(41.1%) and E4/E4 18(16.1%). The percentage of E2 allele 20(8.9%), E3 122(54.5%), E4 82(36.6%). The cognitive function test, MoCA-Ina \geq 26: 34(40%) participants with genotype E2/E2 3(8.8%), E3/E3 7(20.6%), E3/E4 16(47.1%) and E4/E4 8(23.5%). MoCA-Ina $<$ 26: 51(60%) 51 participants with genotype E2/E2 7(13.7%), E3/E3 14(27.5%), E3/E4 22(43.1%) and E4/E4 8(15.7%). A significant relationship between APOE gene polymorphism with MoCA-Ina-abstractation: E3/E4 vs. E3/E3 p 0.019, E4/E4 vs. E3/E3 p = 0.028, a significant relationship between APOE gene polymorphism with MoCA-Ina-language: E3/E4 vs. E2/E2 p = 0.03, E4/E4 vs. E2/E2 p 0.029, and a significant relationship between APOE gene polymorphism with naming: E3/E4 vs. E2/E2 p = 0.048.

Conclusion: High percentage of APOE allele E4 may be one of the causes of high cognitive function decline. APOE gene polymorphisms associated with the decreased cognitive function; abstraction, language, and naming. Allele E4 may be a potential factor for cognitive function decline.

Keywords: MoCA-Ina, Elderly, polymorphism, APOE, gene.

INTRODUCTION

Dementia is a complex neurodegenerative disease in the elderly with multifactorial causes and characterized by various cognitive abnormalities, which could interfere with daily activities. ^(1,2) Alzheimer's Disease (AD) is one of the most common types of dementia and associated with the aging process. AD results in a gradual decline in cognitive functions and daily activity due to degeneration processes that damage the brain structures and neurotransmitters. ^(1,3) In the AD, the patient's ability to remember, understand, communicate and comprehend causality decreases gradually, which ultimately lead

to death. ^(1,3-5) Many factors can clinically affect the progress of the damage, including brain atrophy^(1,6-8), vascular factor^(1,9) and immunological factor.^(1,10) Currently 35 million people have dementia worldwide, expected to reach 65 million by 2030 and 113 million by 2050. ⁽⁵⁾ The prevalence of dementia in Indonesian older adults aged 65 years is 5% and increases to 20% at aged above 85. ⁽¹¹⁾

A genetic factor that is known to play a role in the development of AD is the APOE gene polymorphism, lies on chromosome 19 and has three alleles: E2, E3, E4 and six genotype variations: E2/E2, E2/3, E2/4, E3/

E3, E3/E4 and E4/E4.^(12, 13) The allele E4 is associated with an increased risk of the AD (14-16), whereas the allele E2 appears to be a protective factor.^(5, 17) Having APOE genotype E4/E4 not only increases the risk of AD but also affects the cognitive symptoms and neuroanatomical forms of the disease. E4 carriers tend to have worse memory decline compared to non-carriers, while the APOE E4 non-carrier tend to have more difficulty maintaining attention, working memory, executive functions, and lexical access.⁽¹⁴⁾

This genetic factor is stronger in the European population⁽¹⁸⁾ and weaker in the African, American and Hispanic community.^(5, 19) Recent studies show that the effects of APOE E4 allele on cognitive functions depend on the age and level of education of the individuals.⁽²⁰⁾ It is still debatable whether APOE E4 is related to cognitive functions or cognitive impairment.⁽²⁰⁾ With polymerase chain reaction-restriction fragment length polymorphism, the association between APOE E4 polymorphism and cognitive function was analyzed.

MATERIALS AND METHOD

Collection of Samples

Participants of this a cross-sectional was 112 elderly aged between 60 - 90 years, consisting of 99 women and 13 men from two nursing homes in Jakarta. The DNA was analyzed to find out APOE genotypes. Cognitive functions examination was carried out on 85 female participants using MoCA-Ina questionnaire and its items (visuospatial, naming, attention, language, abstraction, memory delay, orientation) from the neurology department, University of Indonesia. MoCA-Ina scores divided into normal cognitive function ≥ 26 and cognitive impairment < 26 .

PCR-RFLP Analysis

Blood samples obtained from a peripheral vein using 3 ml vacutainer tubes containing EDTA. The blood samples were centrifuged for 30 minutes at 3000 rpm and separated into serum from sediment. The sediment Examined for APOE genes. DNA is extracted from blood samples using a DNA Extraction Kit (Bioline) according to the manufacturer's instructions.

DNA extraction

200 ul of the blood sample inserted into a 1.5 ml sterile microcentrifuge tube. 20 ul Proteinase K then

added into the tube. The solution is homogenized by pipetting and then incubated at 60 ° C for 5 minutes. Add 200 ul Buffer GSB (Geneid) and vortex the tube. Incubate the tube again at the same temperature for 2 minutes. Add ethanol absolute (96%) and vortex for 10 seconds. Pour the mixture into the spin column and centrifugate at 14,000 xg for 1 minute. Remove the collection tube under the spin column and replace it with a new one. Add 400 ul of buffer W1 and centrifuge for 30 seconds with the same speed. Discard the liquid that is on the collection tube. Add 600 ul of wash buffer (Geneid), centrifuge the mixture for 30 seconds, and dispose of liquid in the collection tube. Centrifuge again for 3 minutes. Remove the collection tube and place a sterile microcentrifuge below the spin column. Next, add 100 ul of Elution buffer. Let the mixture stand for 3 minutes and then centrifuge with the same speed for 30 seconds. The fluid containing the DNA stored in a microcentrifuge tube at -20 ° C and will be used as template DNA for PCR.

The genotype of the APOE gene

The extracted DNA added into PCR Mix, which consists of 5 μ L 5X buffer, 2 μ L MgCl₂, 1 μ L dNTP mix, 1 μ L APOE-F Primer (5'-ACA GAA TTC GCC CCG GCC TGG TAC AC-3'), 1 μ L Primary APOE-R (ApoE-R: 5'-TAA GCT TGG CAC GGC TGT CCA AGG A-3'), 0.25 μ L Hotstart Taq (Qiagen) enzyme, 5 μ L DNA template and free-water nuclease. The total volume is 50 μ L. The amplification process started with one cycle of pre-denaturation at 95°C for 7 minutes. It was followed by 40 cycles of the following steps: denaturation at 95°C for 45 minutes, followed by annealing 65°C for 45 seconds and extension at 72°C for 1 min. The gene polymorphism is determined using PCR-RFLP in 112 subjects, and the APOE gene was successfully amplified at 244 bp band, three alleles and six genotypes could be generated after excavation with HhaI endonuclease restriction (BioLabs).

Data Analysis

The statistical analysis was done to examine the relationship between APOE genotypes and alleles with MoCA-Ina questionnaire and its items (visuospatial, naming, attention, language, abstraction, memory delay, orientation).

RESULTS

MoCA-Ina questionnaire were conducted to determine the number of research participants who had with impaired cognitive function. The effect of APOE gene E4 on the cognitive function is different according to age.⁽¹⁷⁾

Table 1. Relationship between MoCA-Ina score and age

MoCA-Ina	Age (years), Frequency in % (n)		
	60 – 70	71 – 80	81 – 90
≥ 26	38.24 (13)	38.24 (13)	23.52 (8)
< 26	21.57 (11)	45.1 (23)	33.33 (17)

Fisher’s Exact Test Exact: Sig. (2-sided) p 0.239

As shown in table 1; 85 participants divided into three groups: age group of 60-70, 71-80 and 81-90 years. The age group of 60 - 70 years: Percentage of participants with MoCA-Ina ≥ 26: 38.24% (13) and < 26: 21.57%(11). The age group of 71 - 80 years: Percentage of participants with MoCA-Ina ≥ 26: 38.24%(13) and < 26: 45.1%(23). For the age group of 81 - 90 years:

Percentage of participants with MoCA-Ina ≥ 26: 23.52%(8) and < 26: 33.33%(17). These results show an increase in the percentage of impaired cognitive function in the age group of 71-80 years, indicating the highest number of participants with mild cognitive impairments. There was an insignificant relationship between MoCA-Ina and age groups with p = 0.239.

Table 2. Relationship between age groups and MoCA-Ina items

Age Group	MoCA-Ina Item	P-Value (Mann-Whitney)
60-70 vs 71-80	Naming	0.035
	Orientation	0.036
71-80 vs 81-90	Naming	0.018
	Orientation	0.036
60-70 vs 81-90	Naming	0.000

Table 2 shows a significant decrease in the MoCA-Ina item naming when comparing the groups 60-70 vs. 71-80 years with p = 0.035, and the groups 71-80 vs. 81-90 years with p = 0.018. A significant decrease in the MoCA-Ina item orientation is also observed when comparing the groups the 60-70 vs. 71-80 years with p = 0.036, 71-80 vs. 81-90 years with p = 0.036 as well as 60-70 vs. 81-90 with p = 0.00.

Table 3. PCR-RFLP Analysis of APOE gene polymorphism

	Genotype Frequency, % (n)				Allele Frequency, % (n)		
	E2/E2	E3/E3	E3/E4	E4/E4	E2	E3	E4
Total = 112	8.9 (10)	33.9 (38)	41.1 (46)	16.1 (18)	8.9 (20)	54.5 (122)	36.6 (82)

Table 3 shows the APOE gene polymorphism by PCR-RFLP of all 112 participants. Results of shows the distribution of genotypes: E2/E2 8.9%(10), E3/E3 33.9%(38), E3/E4 41.1%(46), E4/E4 16.1%(18). The allele distribution were: E2 8.9% (20), E3 54.5%(122), E4 36.6%(82).

Table 4. Relationship MoCA-Ina score and APOE gene polymorphism

		Genotype frequency, % (n)				Allele frequency, % (n)		
		E2/E2	E3/E3	E3/E4	E4/E4	E2	E3	E4
MoCA-Ina Total= 85	≥26 (34)	8.8 (3)	20.6 (7)	47.1 (16)	23.5 (8)	8.8 (6)	44.1 (30)	47.1 (32)
	<26 (51)	13.7 (7)	27.5 (14)	43.1 (22)	15.7 (8)	13.7 (14)	49.0 (50)	37.3 (38)

Fisher’s Exact Test Exact: Sig. (2-sided) p = 0.704

Table 4 shows the APOE gene polymorphism amongst 34 participants who obtained MoCA-Ina \geq 26: E2/E2 8.8%(3), E3/E3 20.6%(7), E3/E4 47.1%(16), E4/E4 23.5%(8). The 51 participants who obtained MoCA-Ina $<$ 26 consist of: E2/E2 13.7%(7), E3/E3 27.5% (14), E3/E4 43.1%(22), E4/E4 15.7%(8).

Table 5 : Relationship APOE gene polymorphism and MoCA-Ina items

Genotype Comparison	MoCA-Ina Item	P-Value (Mann-Whitney)
E3/E4 vs E3/E3	Abstraction	0.019
E3/E4 vs E2/E2	Language	0.03
	Naming	0.048
E4/E4 vs E3/E3	Abstraction	0.028
E4/E4 vs E2/E2	Language	0.029

Table 5 shows a comparison between the APOE genotypes regarding items from MoCA-Ina in 85 participants. Analysis shows a significant relationship between APOE gene polymorphism and Abstraction: E3/E4 vs E3/E3 with p 0.019, E4/E4 vs E3/E3 with p = 0.028, language: E3/E4 vs E2/E2 with p 0.03, E4/E4 vs E2/E2 with p 0.029, as well as the item naming: E3/E4 vs E2/E2 with p 0.048. The allele E4 may be a contributing factor to the impairment of abstraction, language and naming abilities.

DISCUSSION

Memory seems to be of paramount importance as far as the cognitive decline is concerned, and other symptoms tend to receive less attention. This study shows that the age group 71-80 years is the most susceptible towards dementia with the highest percentage of individuals with impaired cognitive functions and the percentage decreases in the 81-90 years age group. This situation is not common as the risk of dementia increases with age. A significant drop in the item naming when comparing the age groups 60-70 vs. 71-80 with p = 0.035, and 71-80 vs. 81-90 with p = 0.018. A significant decrease is also observed for the item orientation when comparing the age groups 60-70 vs 71-80 with p = 0.036, 71-80 vs. 81-90 with p = 0.036 as well as 60-70 vs. 81-90 with p = 0.00.

The DNA analyzed using PCR RFLP of the 112 study participants found distribution of APOE gene

polymorphism: E2/E2 8.9%(10), E3/E3 33.9%(38), E3/E4 41.1%(46) and E4/E4 16.1%(18). The alleles distribution were: E2 8.9% (20), E3 54.5%(122), E4 36.6%(82). A study in Dong-gu Korea, found distribution of APOE gene polymorphism in the population: E2/E2 0.4%, E2/E3 10.7%, E2/E4 1.3%, E3/E3 71%, E3/E4 15.6% and E4/E4 1%. The alleles distribution were: E2 11.2%, E3 71%, E4 16.6%. Another Korean study in Namwon demonstrated the following genotype distribution: E2/E2 0.4%, E2/E3 10.2%, E2/E4 1.1%, E3/E3 72.6%, E3/E4 14.9% and E4/E4 0.9%. The alleles distribution as follows: E2 10.6%, E3 72.6%, E4 15.7%. The occurrence of the allele E4 in this study (Jakarta) is thus more-than-twice higher than that of the two above mentioned Korean studies. ⁽¹³⁾

The relationship between APOE gene polymorphism and the MoCA-Ina- item abstraction is as follows: E3/E4 vs. E3/E3 p 0.019, E4/E4 vs. E3/E3 p 0.028. Between APOE gene polymorphism and the item language: E3/E4 vs. E2/E2 p 0.03, E4/E4 vs. E2/E2 p 0.029. Between APOE gene polymorphism and the item naming: E3/E4 vs. E2/E2 p 0.048. The E4 may be a potential factor contributing to the impairment of abstraction, language and naming abilities. Naming should receive attention as the dominant symptom of cognitive function decline. In a study by Coleman et al in Frontotemporal Dementia and Related Disorders patients with MoCA-Ina questionnaires, the sub-item naming and delay memory were most frequently detected in MCI / mild cognitive impairment patients. ⁽²¹⁾ This corresponds to the conclusion drawn by David A. Wolk et al. that APOE gene polymorphism has a significant effect on cognitive functions and brain anatomical abnormalities. ⁽¹⁴⁾

CONCLUSION

This study found that Decade seventh is the vulnerable group with the highest percentage with impaired cognitive functions. A high percentage of APOE allele E4 may be one of the causes of steep cognitive function decline and a higher risk for dementia. In determining the symptoms of dementia/ decline in cognitive function should not be fixated on memory loss but may be preceded by other symptoms, e.g., abstraction, language, orientation and especially naming.

Designing Instrument for Early Stimulation, Detection, and Intervention for Growth and Development of Children based on Android System

Heru Santoso Wahito Nugroho¹, Sunarto¹, Budi Joko Santosa¹

¹Health Polytechnic of Surabaya, Indonesia

ABSTRACT

One of the factors that is thought to be the cause of the lack of success in child growth and development monitoring programs is the use of instruments that are less practical. This study aims to make a more practical instrument that is Android-based child development detection software, considering that Android-based gadgets are a popular communication tool for health workers. The design stages included: 1) provision of hardware, software, brainware, and material books; 2) frame making, material compilation, material integration into the frame; 3) evaluation of the quality of instruments through FGDs with users, and 4) giving recommendations. Evaluation of the quality of the instrument through the 3 stages of the FGD showed that content, accuracy, format, ease of use, timeliness, and speed of operation are good. Furthermore, it was recommended for the government to use this instrument as a medium for implementing the ESDIGDC program, as well as for researchers to use and refine this design as an instrument for research on children's growth and development.

Keywords: Child development, Android base instrument

INTRODUCTION

Children in the “golden age” (ages 0-6 years) must get a positive intake, in order to achieve optimal growth and development according to their respective genetic potential. To realize this hope, the government has implemented the program of ESDIGDC (Early Stimulation, Detection, and Intervention for Growth and Development of Children). The program is carried out in a comprehensive and coordinated manner, which is held in the form of partnerships between families (parents, child caregivers and other family members), communities (cadres, professional organizations, non-governmental organizations) with professional staff.⁽¹⁾

In the implementation of the ESDIGDC Program, there are three main components, which at the same time determine the success of the program, first is input

(material, instruments, and implementers); second is the process (planning, implementation, evaluation, and monitoring); and third is output (achievement of reported programs).⁽¹⁾ One of the factors that can be suspected as the cause of the above problem is the use of instruments that are less practical (using many pieces of paper that are fragmented so inefficient), which in turn affects the performance of the ESDIGDC program implementers.

Based on the explanation above, it is deemed necessary to make a more practical instrument, which can be used quickly on all occasions (saving time), not consuming excessive space (saving space), and can be done very easily (saving energy), so that as a whole will reduce the costs that must be spent to implement the program (cost-effective). The practical instrument designed is an Android-based ESDIGDC software that can be operated through gadgets (mobile phones and tablet computers), with the consideration that Android-based gadgets are a combination of hardware and software as a communication tool that is popular in the community including health workers.

To ensure that Android-based ESDIGDC instruments

Health Polytechnic of Surabaya

Pucang Jajar Tengah Street, 56 Surabaya, Indonesia

are really needed by ESDIGDC program implementers, a second phase preliminary study was conducted through the FGD which was attended by 10 midwives in community health centers, with conclusions: 1) too much use of paper-based ESDIGDC instruments inefficient, 2) ESDIGDC instruments need to be made that can be run using gadgets because this tool is already popular.

It can be predicted that these instruments will be easily accepted and applied by health workers, especially midwives as implementers of the ESDIGDC program.

METHOD

This descriptive research produced e-Health instruments in the field of early detection of child growth and development. In this study, the design of “Android-based ESDIGDC instruments” was made. The design of the instrument was limited to the “detection” aspect of child development, so specifically the production was called “Android-Based Child Development Detection Instrument” (ABCD-DI).

The “ABCD-DI” was a dynamic soft questionnaire about child development that includes four sectors, namely: 1) gross motor, 2) fine motor, 3) speech and language, and 4) socialization and independence. This questionnaire was classified into several age groups, namely: 3, 6, 9, 12, 15, 18, 21, 24, 30, 36, 42, 48, 54, 60, 66 and 72 months.⁽¹⁾ This program was designed to be installed on Android-based gadgets.

The first stage of steps was the identification and provision of design equipment: 1) hardware (computers / laptops, gadgets, printers, blank DVD data, external file storage, and internet service); 2) software (operation system, word processor, data base program, database creator for Android, PDF creator, icon and interface designer, and photo editor); 3) brainware (programmer, technician, and midwives as evaluator); 4) supporting material books about ESDIGDC, e-health and Android-based applications.

The second stage was the development of instrument by programmers and technicians: 1) frame making using interface designer programs; 2) preparation of material in accordance with the frame; 3) integration of material into the frame.

The third stage was the evaluation of the quality of the ABCD-DI through trials to midwives as the main users, which include: content, accuracy, format, ease of

use, timelines, and speed of operation⁽²⁾; with the FGD approach.

The fourth stage was giving recommendations to government institutions as holders of ESDIGDC program policies, and for researchers as developers of child growth and development monitoring instruments.

The study was conducted in 2016 in the Department of Midwifery, Health Polytechnic of Surabaya, while the evaluation of the quality of the instruments was conducted at the Sukorejo Health Center, Ponorogo.

The stages of data analysis were as follows: 1) descriptive presentation of the provision of hardware, software, brainware, and supporting books; 2) descriptive presentation of the results of frame making, material compilation, and material integration into the frame; 3) descriptive presentation of the results of evaluating the quality of “instruments; 4) descriptive presentation of recommendations given based on the evaluation of the quality of the instrument.

FINDINGS

The provision of hardware, software, brainware, and supporting books are as follows:

Table 1. Hardware provided for instrument design making

No	Hardware	Number	Function
1	Laptop: Dell Model Inspiron 114 3000 Series	1	Programming
2	Gadget: OPPO Joy 1	1	Programming
3	Printer: HP Deskjet 1040	1	Programming
4	Blank DVD data: Verbatim	25	Data storage
5	Memory card: SD card	2	Data storage
6	Internet service: Midwifery Department, Health Polytechnic of Surabaya	2	Literature and software searching

Table 2. Software provided for instrument design making

No	Original Software	Number	Function
1	Operation system: Microsoft Windows 8, Android system	2	Basic operating system to run all programs on the computer.
2	Word processor: Wordpad, Ms. Office Sharepoint Designer	2	As a word processor for compiling text material.
3	Database program: Database creator for Android	1	Integration of instrument data into the Android system.
4	Read only file creator: PDF Creator	1	Making read only files about instrument usage instructions.
5	Icon creator: Junior Icon Editor 4.1	1	Making the ABCD-DI program icon.

Table 3. Brainware provided for instrument design making

No	Brainware	Number	Function
1	Programmer	3	Designing programs and materials.
2	Technician	1	Helps programmers compile and run programs.
3	Evaluator	10	Evaluating (testing) the quality of instruments through FGD

Table 4. Books as supporting the design of instruments

No	Book title	Number	Function
1	Guidebook for the Implementation of ESDIGDC	1	Guidelines for making ESDIGDC material
2	ESDIGDC Facilitator Handbook	1	Guidelines for preparing ESDIGDC learning strategies
3	Information System Analysis and Design	1	Programming guidelines

The resulting ABCD-DI frames were: 1) Level I, consisting of: homepage; 2) level II, consisting of: detection of development of children aged 3 months, 6 months, 9 months, 12 months, 15 months, 18 months, 21 months, 24 months, 30 months, 36 months, 42 months, 48 months, 54 months, 60 months, 66 months and 72 months. Figure 1 shows the shape of the frame.

The material consisted of three groups, namely: 1) general instructions (how to operate ABCD_DI); 2) introduction to ESDIGDC; 3) detection of child development which includes four sectors, namely: 1) gross motor, 2) fine motor, 3) speech and language, and 4) socialization and independence. This material was classified into several age groups, namely: 3, 6, 9, 12, 15, 18, 21, 24, 30, 36, 42, 48, 54, 60, 66, and 72 months.

The process of preparing ESDIGDC material was: 1) text or narration made using Wordpad and Microsoft Office Sharepoint Designer; 2) a graphic vector image created and edited using Inkscape 0.48; 3) photographic images edited using Photo Pos Pro 1.87; 4) animated images created and edited using Sothink SWF Quicker 5.3 and Pivot Stickfigure Animator 2.2.6; 5) video edited using Honestech Video Editor 8.0. To change the video file format, the Any Video Converter 3.2.7 program is used; 6) After the frame is filled with complete material, then an icon is created using the Junior Icon Editor 4.1; 7) making read only files regarding instructions for using ABCD-DI using PDF Creator 9.

The next stage was the integration of all material that has been successfully collected into the frame that has been prepared previously (Figure 1).

Note:

Halaman utama = Homepage
Petunjuk umum dan Pengantar SDIDTK = General instruction and introduction of ESDIGDC
Deteksi perkembangan = detect the development of child

Gerak kasar, gerak halus, bicara dan bahasa, sosialisasi dan kemandirian = Gross motor, fine motor, speech and language, socialization and independence
Figure 1. Results of integration of materials into frames (in Indonesian version)

There were two stages of material integration into the frame: 1) filling in the Level I frame (homepage), in this case, the frame homepage is filled with two material namely “General Guidelines” and “Introduction to ESDIGDC” (Figure 2).

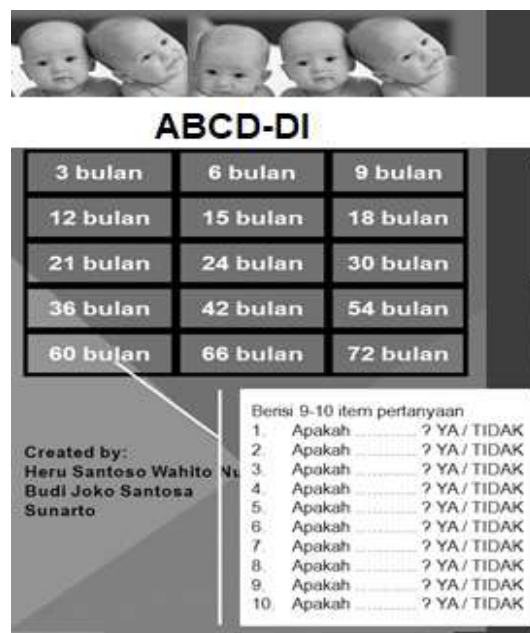

Note:

Halaman utama = Homepage
Petunjuk umum = General instruction
 Berikut ini adalah cara penggunaan = This is the instruction to use
Pengantar SDIDTK = Introduction of ESDIGDC
Program SDIDTK adalah = ESDIGDC program is

Figure 2. The content of Level I (homepage) (in Indonesian version)

At the top of the main page was included general instructions on how to operate the program, then at the bottom is presented about the general concept of ESDIGDC; 2) filling in Level II frames (detection of child development), in this case, the frame of child development detection is filled with the Child Development Pre-Screening Questionnaire, starting from the age group of 3 months, then proceeding sequentially and ending in the 72 month age group (Figure 3).

Note:

3 bulan = 3 months
Berisi 9-10 pertanyaan = contain 9 to 10 questions
Apakah? YA/TIDAK = Is? YES/ NO

Figure 3. The content of Level II (detection of child development) (in Indonesian version)

Questionnaire for each age group consisted of 9-10 items, and each item had 2 answer options “Ya (yes)” and “Tidak (no)”. After all Level II frames were filled in, a calculation formula was made with 3 output categories, namely: a) Development of “*Sesuai* (accordance)”

children if the total “Yes” answer was 9-10; b) the development of the child “*Meragukan* (doubt)” if the total answer “Yes” was 7-8; c) the development of the child “*Penyimpangan* (deviation)” if the total answer “Yes” was 0-6.

The last step was to provide follow-up choices based on the output categories as follows: a) if the child’s development was “accordance”, then the follow-up given was “continue stimulation”; b) if the development of the child “doubt”, then the follow-up given was “do the most test 2 times, with 2 week intervals, if the results are still asking, must be recommended to the health service institution; c) if the development of the child was “deviation”, then the follow-up given was “recommended to the health service institution”.

In accordance with a predetermined plan, a quality evaluation of “ABCD-DI” was conducted through an FGD on 10 midwives at the Sukorejo Health Center, Ponorogo. The topic of evaluation refers to the assessment of system quality or information technology-based applications according to Chin & Lee, which included 6 dimensions: 1) content, 2) accuracy, 3) formats, 4) ease of use, 5) timelines, and 6) speed of operation.⁽²⁾ Evaluations were carried out in 3 stages, and improvements are made after the first and second stages of evaluation. The results of the third stage of the evaluation showed that overall, the instrument has been assessed as being of high quality.

The recommendations given were: 1) the government as the holder of the ESDIGDC program policy (Ministry of Health of the Republic of Indonesia, Provincial Health Office, District / City Health Office and community health center) utilizes “ABCD-DI” as a medium for implementing ESDIGDC programs for health workers; 2) researchers use “ABCD-DI” as a research instrument, or develop it into a better research instrument.

DISCUSSION

Provision of the ABCD-DI drafting device can run smoothly, despite several obstacles. Obstacles to meeting hardware needs are more likely towards the problem of limited availability of funds. Some hardware is not purchased with available funds. Provision of hardware is indeed one of the obstacles for making information technology-based application designs. This is in line with Al Fatta’s statement that one of the obstacles in

the development of information and communication technology-based applications is the lack of hardware. As a solution, most hardware is prepared by borrowing.⁽³⁾

During the design process, there were obstacles to getting high compatibility web creator software. Initially researchers have prepared two selected software: 1) Microsoft Frontpage; 2) Drupal; but programmers and technicians lack the mastery of how this software works.

As a solution, researchers are constantly looking for suitable software, namely Microsoft Office Sharepoint Designer that is not commercialized, so it can be downloaded for free via the internet. Microsoft Office Sharepoint Designer Service Pack 1 provides stability and performance improvements that are important to customers, also ensures security for users.⁽⁴⁾

Brainware needs as a support for the design process can be adequately fulfilled because the three research teams can act as programmers, so they do not require additional external programmer work. A researcher focuses on the activity of making frames and integrating material into frames, while the other two researchers focus more on making material that will be integrated into the frame. Technicians as a companion programmer mainly focus their activities on the process of making materials, especially photographic, animation, and graphic materials, which are then integrated into the ABCD-DI frames.

Evaluator staff were taken from 10 midwives at the health center, whose role was to try out the system that had been designed. Each midwife is tasked with studying the ABCD-DI system that has been given to them for 1 x 24 hours. Their next task is to provide a critique of the shortcomings found in the instrument, while providing input for system improvement, through the FGD.

Supporting material books for design can be fulfilled, but there is one problem, namely that the basic reference book that is up to date is only available towards the end of the research process. The book is the Guidebook of ESDIGDC Implementation 2012. The books used in the previous design process were books published in 2007.

The results of the ABCD-DI quality evaluation indicate that midwives have given a “good” assessment of this instrument. The six dimensions of quality that refer to the quality dimension according to Chin & Lee⁽²⁾

have all been assessed well by midwives as users.

With the status of a “good” assessment of the overall dimensions above, it can be said that “ABCD-DI” has been qualified according to the user’s perception. This is in accordance with the definition of quality according to Moeliono, namely “the level of good and bad things”.⁽⁵⁾ “ABCD-DI” has been rated well by users, meaning “ABCD-DI” has been rated as having high quality in the eyes of users. The quality of “ABCD-DI” according to user perceptions is the most realistic quality. This is based on the statement of Simamora which expressly states that in the concept of “perceived quality”, consumer perception is reality. In this case, the most important thing in quality assessment is the perception in the view of consumers. This is similar to Kotler’s statement in Simamora that quality is the totality of features and characteristics of a product or service that enables the product or service to satisfy customer needs.⁽⁶⁾

CONCLUSION

Based on the results of the study, it can be concluded that the procurement of equipment and the development of the “ABCD-DI” design as a developmental detection instrument can be carried out properly, and is considered quality based on the results of evaluation by health personnel as users.

Funding, Conflict of Interest and Ethical Clearance: This research was funded by the Health

Polytechnic of Surabaya. There is no conflict of interest related to this research. This study had passed the ethical review from the ethics committee of Health Polytechnic of Surabaya.

Effectiveness of the Training Model to Increase the Knowledge, Attitude, and Practice of Traditional Birth Attendants about Early Initiation of Breastfeeding in Bogor District, Indonesia

Evi Martha¹, Hadi Pratomo¹, Siti N. Qomariyah¹

¹Faculty of Public Health, Universitas Indonesia

ABSTRACT

The proportion of women assisted by TBAs during delivery is still high. It is necessary to transform their role from delivery attendance to an agent of change to deliver health messages. One of the important health messages will be on Early Initiation of Breastfeeding (EIBF). The aims of this study is to determine the impact of TBA-Friendly Training model on TBAs' knowledge, attitude and practice (KAP) to enhance their role as agent of change in the EIBF practice. The quantitative approach used applied quasi-experimental design and a qualitative used Rapid Assessment Procedure (RAP). Results revealed that the training can enhance the KAP of EIBF among TBAs. TBAs who got the training have higher level of knowledge, attitude and practice than those who did not receive training (p value: 0.000). The qualitative findings that TBAs are happy and feel fortunate for being trained. More than half of the TBAs' clients have good EIBF KAP, meaning that the TBAs are able to apply the skills trained and to promote EIBF practice. Findings of this study suggest that there should be a policy to adopt and use such a TBA-Friendly Training model for EIBF implementation.

Keywords: *Traditional birth attendants, Early initiation of breastfeeding, Training model, Agents of change*

INTRODUCTION

In Indonesia, only three quarter (73%) of deliveries assisted by health provider. Data from the 2010 Basic Health Survey showed that 43.2% mothers gave birth at home, and among them around 40.2% were assisted by TBA. One of the reasons behind the high proportion of delivery assisted by TBA in Indonesia is because of the number of village midwife is still very lacking. In Indonesia, the ratio of midwife to population is 27.3 per 100,000 populations, whereas the ideal ratio is 100 midwives per 100,000 populations. West Java is one example of areas with very low availability of midwives; its ratio is 9.3 per 100,000 population.¹

TBAs have a meaningful role when talking about culture, empathy, and psychosocial support during labor, with important benefits for mothers and babies. This made the TBAs playing a great role in maternal health care and also as extension of maternal and child health system in the rural areas.^{2,3} By this situation as the background, TBA could be formed as “an agent of change”.⁴

One way to reduce the IMR is through Early Initiation of Breastfeeding/EIBF.⁶ EIBF is a process of which the baby is breastfed immediately after birth, by let the baby to seek for their mother's nipple or the baby's mouth is not being put directly to the mother's nipple.⁷ In regard to the importance of EIBF, recently it has become a program promoted by the Government of Indonesia.

Based on the above description, the objective of this research is to determine the effect of “TBA Friendly Training” Model in improving the Knowledge, Attitude, and Practice of TBA who has the potential to be “an

agent of change” in the implementation of EIBF in Bogor District.

MATERIALS AND METHOD

This research was conducted using both quantitative (Quasi-Experimental design) and qualitative approaches (“*Rapid Assessment Procedure*” (RAP)). The research was conducted in Ciampea and Ciseeng Sub-districts in Bogor District of West Java, during from February to August 2010. The population is all TBAs in Bogor District and sample needed for the intervention and control area was 53 TBAs each. Thus the total number of sample was 106 TBAs. In addition, interviews were also conducted to 77 of the TBAs’ clients. Informants for the qualitative consisted of village midwives, midwives coordinator, head of health centers, and the TBAs.

Quantitative data were collected through interviews with TBAs and pregnant women who were the clients of the TBAs. Interviews also conducted to representatives from some relevant institutions, such as the District Health Office and Health Center. Qualitative data were

gathered through focused group discussions, in-depth interviews, and also observations.

Univariate, bivariate, and multivariate analysis were done using the quantitative data. Qualitative data were treated using theme analysis.

RESULTS

Demographic characteristics of the TBAs were not statistically different between the intervention and control groups. Overall, TBAs in both groups were old and low educated. The highest education among the TBAs was elementary school and do not have other job other than becoming TBA.

Effect of Intervention to TBAs’ Knowledge about EIBF

At the beginning of intervention did not show any difference in knowledge score between intervention and control groups (p -value= 0.324) (Table 2). Following the training and mentoring, an increase the knowledge score within the intervention group was apparent (Table 1).

Table 1. The Score of Knowledge, Attitude, and Promotion Practice of TBAs in Bogor District, 2010

Variable	Intervention		Control	
	Mean / Median	Min – Max	Mean / Median	Min – Max
Knowledge Score				
Pre Test 1	1.81/1.00	0 – 9	1.81/1.00	0 – 0
Post Test 1	9.57/10.00	4 – 10		
Pre Test 2	9.34/10.00	5 – 10		
Post Test 2	9.72/10.00	6 – 10		
Measurement 3	9.49/10.00	5 – 10	1.30/0.00	0 – 0
Attitude Score				
Pre Test 1	0.83/0.00	0 – 5	1.49/0.00	0 – 5
Post Test 1	4.77/5.00	0 – 5		
Pre Test 2	4.87/5.00	1 – 4		
Post Test 2	4.92/5.00	2 – 5		
Measurement 3	4.94/5.00	3 – 5	1.00/0.00	0 – 5
Promotion Practice Score on EIBF				
Pre Test 1	1.26/1.00	0 – 3	1.55/1.00	1 – 4
Post Test 1	1.92/4.00	0 – 4		
Pre Test 2	3.72/4.00	0 – 4		
Post Test 2	3.74/4.00	0 – 4		
Measurement 3	3.70/4.00	0 – 4	1.51/1.00	0 – 4

Within the intervention group, increase of knowledge score between the baseline, midline, and endline measurements showed significant difference (*p value*=0.000). Comparison of endline measurements between intervention and control groups also showed significant difference (*p value*=0.000).

Table 2. Association between “TBA-Friendly Training” with Knowledge Attitude, and Promotion Practice on EIBF by TBAs in Bogor District, 2010

Variable	Knowledge	Attitude	Promotion Practice on EIBF
	p value	p value	p value
Intervention			
Pre 1 – Pos 1	0.000	0.000	0.009
Pre 1 – Pos 2	0.000	0.000	0.000
Pre 1 – Measurement 3	0.000	0.000	0.000
Control			
Pre Test 1^ - Measurement 3^	0.044	0.130	0.934
Intervention - Control			
Pre Test 1 – Pre Test 1^	0.324	0.199	0.567
Measurement 3 – Measurement 3^	0.000	0.000	0.000

Note: ^=control group

The increase of the respondents’ knowledge in the intervention group could also be explained using the qualitative findings which showed that following the training most TBAs had acknowledged the advantage of EIBF, such as for mother and baby’s health, reduce bleeding, lessen pain during delivery, and warm the baby because there is skin to skin contact between the mother and baby.

“..make the placenta easy to deliver, reduce bleeding, lessen the pain, because the baby’s skin meet the mother’s skin then the baby become warm..” (FGD of TBAs, Ciampea Health Center).

“..it is indeed different ma’am, if doing the EIBF

the breast milk is instantly flowed. Without EIBF, the breast milk will be flowed after 3 days..” (FGD of TBAs, Ciampea Udik Health Center).

Other benefits perceived by the TBAs were that EIBF increases the volume of breast milk and make the baby becomes more independent. In addition, according to the TBAs, baby’s kick on mother’s abdomen stimulates the placenta to deliver sooner.

The variables that have effect on TBAs’ knowledge in implementing the EIBF was intervention of “TBA-Friendly Training” (RR=6.212; 95% CI=1.908-20.229) and belief on EIBF (RR=2,654; 95% CI=1,111-6,343), after controlling for other variables studied (Table 3).

Table 3. Binomial Logistic Regression Analysis of Variables Associated with TBAs’ Knowledge on EIBF

Step	Variable	B	p value	RR	95 % CI

4	Age	0.093	0.743		
5	Partnership	-0.219	0.562		
6	Number of clients	0.249	0.428		
7	Belief that could inhibit the implementation of EIBF	0.976	0.028	2.654	1.111 – 6.343
8	“TBA-Friendly Training”	1.826	0.002	6.212	1.908 – 20.229

Effect of Intervention to TBAs Attitude about EIBF

The finding was different in the control area where there was no change in the score between the baseline and the 3rd measurement, of which the score remained 0.0 (Table 1). Result of the differential test on TBAs' attitude toward EIBF in the intervention group showed significant result between before and after training. The difference was consistent between before 1st training and after 1st training, 2nd training and at endline measurement.

The above finding is consistent with the qualitative result showing that after receiving EIBF training, TBAs had positive attitude toward EIBF compared to before their clients do the EIBF. Their attitudes such as feeling

more relax and having faith that the EIBF must have benefit and usefulness.

The positive attitude arose because they saw the benefits and proofs that are in accordance to what have been explained during EIBF training, such as breast milk is easier to flow and increase its volume, baby looks healthier and more lively, and the baby refuse other milk than breast milk.

Variables affected TBAs' attitude to EIBF was training and mentoring (RR=4.339; 95% CI=1.559-12.076), and belief toward implementation of EIBF (RR=2.407; 95% CI=1.052-5.511), after adjusting other variables (Table 4).

Table 4. Binomial Logistic Regression Analysis of Variables Associated with TBAs' Attitude on EIBF

Step	Variable	B	p value	RR	95 % CI
1	Age	-0.003	0.870		
2	Number of deliveries assisted	0.095	0.813		
3	Partnership	0.117	0.771

	Education	-0.313	0.490		
	Education	-0.155	0.720		
5	Length of becoming TBA	0.163	0.562		
6	Number of clients	0.256	0.410		
7	Belief that could inhibit the implementation of EIBF	0.879	0.038	2.407	1.052 – 5.511
8	“TBA-Friendly Training”	1.468	0.005	4.339	1.559 – 12.076

Effect of Intervention to TBAs Practice in Promoting EIBF

In the later stage, there was an increase in the score within the intervention group after the 1st training, which the median score increased to 4.0. This score remained the same at measurement before and after the 2nd training. While measurement in the control group did not show any changes between the first and last measurement, of which the score remained 1.0.

Furthermore, result of the differential test on EIBF promotion practice by TBAs in the intervention area showed significant difference between before and after the 1st training, before the 1st training and after the 2nd training, before the 1st training and the final measurement (p value < 0.05). Result of the differential test for EIBF promotion practice by TBAs in the control area did not show any significant difference between the first and final measurement (p value=0.934). Comparison of attitude score between intervention and control areas at the endline showed significant difference (p value=0.000).

The quantitative result in the intervention area was supported with findings from the qualitative study. TBAs who had been trained and mentored were mostly promoted EIBF to their families, neighbors, and clients. Their promotion approaches varied. For example, by direct explanation through storytelling, lending EIBF pocket book, lending and playing the EIBF video, followed with persuasive and even slightly intimidate their clients to do the EIBF.

“..explained by me...I brought the CD, played it because she had (the CD player)..” (FGD of TBAs, Ciampea Udik Health Center)

According to the TBAs, families are usually involved in influencing and taking care of the mother, thus promotion on EIBF was also done by TBAs to parents and families of the mothers who gave birth thus the families will not be surprised. After controlling for all variables, result from the analysis showed that variable that affected the EIBF promoting practice was training and mentoring (RR=4.455; 95% CI=2.316-8.566).

Table 5. Binomial Logistic Regression Analysis of Variables Associated with TBAs’ Practice for Promoting EIBF

Step	Variable	B	p value	RR	95 % CI
1	Education		0.819		
	Education (1)	0.232	0.623		
	Education (2)	0.299	0.528

5	Number of clients	0.416	0.183		
6	“TBA-Friendly Training”	1.494	0.000	4.455	2.316 – 8.566

DISCUSSION

Effect of Intervention to TBAs’ Knowledge about EIBF

This study shows significant difference on knowledge about EIBF between TBAs who attended “TBA-Friendly

Training” and those who did not. This is consistent with the Meta-Analysis conducted by Sibley which concluded that training for TBAs was significantly associated with improvement on knowledge, attitude, and practice of trained TBAs, as well as advice provided by the trained TBAs to mothers, compared to non-trained TBAs.⁵

Similar result was found by Okubagzhiin a study aimed to determine the impact of TBA training to improvement of maternal and child health indicators in Ethiopia.³ Improvement in maternal and child health indicators was apparent after training was conducted to TBAs, which resulted in behavior changes among the trained TBAs in assisting delivery and providing infant and maternal care.

Effect of Intervention to TBAs' Attitude about EIBF

In this study, TBAs in the intervention group were given "TBA-Friendly Training" package where they listened, watched video on EIBF, performed simulation, and obtained information about EIBF. Measurement result on the attitude of TBAs between baseline and endline in the intervention group showed significant difference. This result is consistent with Innovation Diffusion Theory, that after listening and knowing the information, TBAs formed positive attitude toward EIBF.⁹ There was significant difference between group of TBAs who received the "TBA-Friendly Training" and those who did not (p value=0.000). TBAs' attitude toward EIBF was affected by training and mentoring, as well as belief on EIBF.

Effect of Intervention to TBAs' Promoting Practice on EIBF

Providing advice to mothers about antenatal and post-natal care was one of the many roles of TBAs.² Moreover, during care delivery a TBA could also play a role in providing advice or promoting various health messages.¹⁰ This is also similar to previous findings in Zimbabwe that TBAs could play their role as "Guru" for the community or as healers. TBAs' role in Pradesh, India, was to provide support for breastfeeding mothers and to encourage immunization for the baby.¹¹

This study shows improvement in the practice of promoting EIBF by TBAs in the intervention group. In the contrary, promotion by TBAs in the control group did not show any change toward improvement. There was significant difference in terms of EIBF promotion between TBAs in the intervention and control groups. EIBF promotion done by TBAs could be confirmed through information from clients of the trained TBA. Approximately 71.40% of the clients knew EIBF from the TBAs and almost all of them (91.70%) mentioned that TBAs were the first person encouraged them to do EIBF.

The Role of TBA as Agent of Change

The success of TBA as agent of change is mostly affected by their ability to influence and convince the pregnant women to seek and learn about appropriate newborn care.¹²

In addition, TBA also has a high sense of empathy to pregnant women, as supposed to be owned by agent of change. This sense of empathy resulted in common understanding between pregnant women and the TBA which eventually lead to good relationship later during the process when the pregnant women learn and comprehend EIBF information delivered by TBA to the women.¹³ The potential of TBA as agent of change in the implementation of EIBF could be seen from the improved KAP among TBAs in the intervention group, compared to TBAs in the control group.

CONCLUSION

The "TBA-Friendly Training" model was proven to have an effect in improving the Knowledge, Attitude, and Practice of TBAs who had the potential as *agent of change* in the implementation of EIBF.

³Babylon Technical Institute al-Furat al-Awsat Technical University, Hilla-Iraq

ABSTRACT

The aim of the study is to valuation some biomarker biochemical parameters that play important role in evaluating functions renal for hypertensive. The study was obtained. Included ninety-one. 35(38.46 %) of the subjects were males and 56 (61.54 %) were females. forty-two (42) subjects were selected as control and forty nine (49) suffered only from essential hypertension with high mean body mass index (Mean 35.70±3.38 S.E) (Kg/m²). The data of the study indicate a significant ($p \leq 0.05$) raise in the rate of age (Mean 49.89±10.36) (years), body mass index (Mean 35.70± 3.38 S.E) (Kg/m²), SBP(Mean 14.77±0.75 S.E) (mmHg) and DBP(Mean 9.69±0.72 S.E) (mmHg) for patients with hypertensive compared with healthy people. As for the biochemical parameters the results showed a significant ($p \leq 0.05$) increase in concentration serum Cystatin C (Mean 1.21 ± 0.44 S.E) (mg/L) , Creatinine(Mean 1.062±0.36 S.E) (mg/dl) , urea (Mean 7.76±0.55 S.E) (mmol/l) and uric acid(Mean 4.77±0.82 S.E) (mg/dl). As for the Correlation coefficient of linear regression analysis of diastolic blood pressure with the biochemical parameters did not show any significant correlation, while the results linear regression analysis showed positive correlation between systolic blood pressure with cystatin C ($y = 0.38 * x - 4.38 * SBP$), Creatinine($y = 0.37 * x - 4.37 * SBP$) and uric acid ($y = 0.1 * x - 10 * SBP$).

Keywords: *cystatin C , uric acid , creatinine, urea, hypertensive.*

INTRODUCTION

Hypertensive which the cases that estimated number about a world more than 1.1 billion¹. It is a state that be finically to define over years, So many organizations were interested in defining hypertensive of them “a recent lancet commission report “classify individual as hypertensive (when they continuous cross the blood pressure threshold. also Guideline committees and scientific societies have proposed definition that are depend on blood pressure value, prolonged risk , and treatment effects ². Hypertensive has increased in adult from 594 million in 1975 to 1.13 billion in 2015 ³ where considerably disappearing no symptomatology

approximately half of patient with hypertensive reside undiagnosed for this referred to as “(the silent killer)⁴. Hypertensive considerable a indication of chronic kidney disease (CKD) and independent threat factor for progression cardiovascular diseases ⁵ also elevated body mass index is one of the robust danger factors for CKD .the occurrence of obesity attached glomerulopathy has rise 10 fold in recent where a compensative hyperfiltration take place to meet the raise metabolic demand of the higher body weight the excess in intraglomerular pressure can injury the kidney and increase the hazard of evolution CKD in the long term ⁶. There are some biochemical biomarker play an important role in diagnosis of renal function like uric acid , creatinine and urea ⁷ ,also cystatin C is a useful investigation the hypertensive renal target organ damage since reflect glomerular filtration rate (GFR)⁸. Uric acid is form by the liver ,it is the end output of endogenous and dietary purine metabolism in human an mainly excreted by intestines (25%- 35%) and kidney

E-mail: mahmoudhadwan@gmail.com

(65%-75%)⁹. while urea is produced in the liver too from ammonia emitted by deamination of amino acid¹⁰. non protein nitrogen is excreted as urea majorly by the kidney in proportion over 75% small amount are lost through the skin and gastrointestinal¹¹. whereas, creatinine is product in muscle by break down of creatine phosphate⁷ with a weight of 113 Da¹² measurement the amount of creatinine and blood urea are points main of a normal functioning kidney and increment in the serum are indication of kidney dysfunction¹³ As for Cystatin C is produced by all the nucleate cell, its production rate is persistent and autonomous of gender, age, diet and weight¹⁴.

MATERIALS AND METHOD

The project was conducted in Hilla Specialized Education Hospital with the Health Center at Babylon University in Babil province/Iraq for the period from September to November 2017 (The approval of the institutional research ethics committee and signed written consent of every patient. the study was obtained. Included ninety-one, all of them were above 22 to 65 years of age. 35(38.46%) of the subjects were males and 56 (61.54%) were females. forty-two¹⁴ subjects were selected as control and forty nine[49] suffered only from essential hypertension with high mean body mass index (Mean 35.70±3.38 S.E) (Kg/m²). (Body mass index (BMI) was calculated using the formula BMI= weight (kg)/ height² (m)² and classifying normal weight (BMI 18.5- 24.9)Kg/M², obesity (BMI 30-39.9) Kg/M² and morbid obesity (BMI > 40) Kg/M² (40). "Hypertension was defined as systolic blood pressure (SBP)≥140 mmHg and/or diastolic blood pressure (DBP)≥90 mmHg without the use of anti-hypertensive drugs, Blood pressure in the right arm was measured twice in the supine position, using a manual sphygmomanometer after at least 10 min of rest. About five milliliters of venous blood were collected from each subject, serum urea concentration was measured by the enzyme methodology employed in this reagent is based on the reaction first described by Talke and Schubert¹⁵. To shorten and simplify the assay, the calculations are based on the discovery of Tiffany et al¹⁶. That urea concentration is proportional to absorbance change over a fixed time interval, using parameters for photometers assay Erba kit. The DetectX® Serum Creatinine kits are measure creatinine present in serum samples by using the absorbance of the colored product is read after 1 minute in a microtiter plate reader capable of measuring 490nm wavelength.

The statistical analysis of the study was accomplished by using SPSS program (Version 18.0) and the data are expressed as the Means and the correlation coefficient and Linear regression was made with the calculators the BMI and estimated biochemical parameters. Values were considered statistically significant if the associated P values were lower than 0.05.

RESULTS AND DISCUSSION

The results of the study indicate a significant ($p \leq 0.05$) increase in the rate of age (Mean 49.89±10.36 (years)), body mass index (Mean 35.70± 3.38 S.E) (Kg/m²), SBP (Mean 14.77±0.75 S.E) (mmHg) and DBP (Mean 9.69±0.72 S.E) (mmHg) for patients with hypertensive compared with healthy people, as shown in table (1). As for the biochemical parameters the results showed a significant ($p \leq 0.05$) increase in concentration serum Cystatin C (Mean 1.21 ± 0.44 S.E) (mg/L), Creatinine (Mean 1.062±0.36 S.E) (mg/dl), urea (Mean 7.76±0.55 S.E) (mmol/l) and uric acid (Mean 4.77±0.82 S.E) (mg/dl), as shown in table (2). As for the Correlation coefficient of linear regression analysis of diastolic blood pressure with the biochemical parameters did not show any significant correlation, as shown in table (3), while the results linear regression analysis showed a strong correlation between systolic blood pressure with cystatin C ($y = 0.38 * x - 4.38 * SBP$) (P value ≤ 0.008), Creatinine ($y = 0.37 * x - 4.37 * SBP$) (P value ≤ 0.009) and uric acid ($y = 0.1 * x - 10 * SBP$) (P value ≤ 0.03) as in Fig (1, 3 and 4). while the results showed no significant correlation between systolic blood pressure with urea as revealed in Fig (2). Hypertensive remains incompletely understood, in spite of decades of research in clinical practice the pathogenesis (17) The outcome of the present study showed a significant increase in the rate of body mass index for patients with hypertensive, compared with healthy, this is agree to study Hall ME and et al in 2014 where obesity can lead by various mechanisms, such as hypertension to renal dysfunction (18) on the other hand obesity may be lead to a number of the harmful renal result of mediated by accompanying status such as hypertension or diabetes mellitus (19) Accordingly, the diagnosis Chronic kidney disease, is established chiefly on biomarkers that estimate kidney function. Glomerular filtration rate (GFR) the typical marker of kidney function (20) Our present data display a significant excess in the concentration of both serum cystatin C, serum creatinine, serum urea and serum uric acid for hypertensive patients compared to

healthy. This finding is consistent with the finding of several recent studies such glomerular filtration rate (GFR) estimation based on cystatin C. or creatinine has been recommended to assess GFR in CKD patients²¹. also a study of Salvador Lopez-Giacoman & Magdalena Madero) in 2015 showed GFR is commonly evaluated from that take into account endogenous filtration markers serum cystatin C (CysC) and creatinine (SCr)²⁰.

The studies suggested that increase serum cystatin C concentration in hypertensive patients, is connected with stiffness of large arteries in older adults, and also with cardiac functional and structural variation^{22,23}. nevertheless, recent studies reported that CysC levels could be affected by gender and age^{24,25} and obesity (26). As for Serum uric acid is consistent with the finding of several studies which Serum uric acid has shown to be a predictor of renal disease advancement in generality but not all studies²⁷. While our results are not

consistent with the study (Isra'a H. AL-Hamdani) 2010 no significant difference in serum uric acid between hypertensive patients and control group²⁸, as well as the Correlation between some Biochemical parameters and DBP(mmHg) in Hypertensive group no significant correlation was shown, however of systolic blood pressure (SBP) mmHg with Cystatin C, Uric acid and Creatinine for hypertensive group a significant positive correlation was observed, the results of urea were the opposite of the other criteria, showing no significant association with of systolic blood pressure (SBP)(mmHg) for hypertension patients. While observed in his study The result of multivariate analysis showed that the incidence of serum uric acid in patients with primary hypertension had significant relationships with diastolic blood pressure and systolic blood pressure²⁹. In the same way, high levels of serum uric acid (SUA) is reported to be a indicator for lower renal function³⁰ and a risk factor for hypertension^{32,33}.

CONCLUSION

Serum creatinine (Cr) is a perfect biomarker of early phase CKD be a generally used indicator for detecting little changes in glomerular filtration rate (GFR) (33) Another study showed serum creatinine and urea levels were significantly increase in CKD subjects of hypertensive (34) this study showed it found there are a significant raise in the mean values of serum creatinine and urea in hypertensive patients compared with control .also the common factors that caused either upper synthesis or lesser excretion of uric acid can marker serum uric acid levels dramatically increase such as big blood cell depletion(35), the consuming of purine-rich foods (36), obesity (37), and renal diseases (38) other research found that SBP was significantly correlated with SUA, and multiple regression analysis also showed that both diastolic and systolic blood pressures were independently associated with SUA (39).

The current study showed that serum CystatinC , is no less important than Uric acid , Creatinine and Urea In the early renal dysfunction is identified forpatients with hypertensive. We recommend using a larger sample size and studied at the molecular level to know the genes responsible for renal dysfunction with hypertensive.

ABSTRACT

Atmospheric Carbon monoxide (CO) volume mixing ratios (VMR) retrieved by the Measurement of Pollution in the Troposphere (MOPITT) and Atmospheric Infrared Sounder (AIRS) instruments were used to monitor local emissions and compared over Iraq during the winter and spring of 2012. A comparison and cross reference are necessary to understand the impacts of these two data sets to the scientific conclusions developed from them, due to their simultaneous measurements of CO. The monthly CO VMR from MOPITT surface and AIRS 800 hpa are compared between the two instruments over Iraq for both direct comparison and the comparison using the same a priori profile for the period from 1 January to 31 December 2012. The CO VMR examination of the fluctuated, related to the mean CO background measured by each instrument, shows large-scale serendipitous spatial properties develop along the year. The regional CO VMR differences between two instruments were 5-35 ppbv and it's large for higher CO plumes and smaller for clean pristine desert environment. Both instruments observed enhancements of CO over the mountains and agreed with low CO over the southern region. Also, the time series of the monthly CO anomalies reveal a seasonal cycle signal, with high in winter and low in summer, due to meteorological condition, geographic nature of the regions and characteristic of the lower and upper troposphere to which MOPITT and AIRS are respectively sensitive to. This comparison demonstrates that there is a general consistency when considering the different vertical sensitivities of the instruments. The satellites observation efficiently shows the spatial and temporal variations of CO for the considered study area.

Keywords: Carbon monoxide, Satellite, Remote sensing, MOPITT, AIRS.

INTRODUCTION

The CO is an a significant pervasive atmosphere trace gas affecting to the climate and not considered a direct greenhouse gas (GHG's) due to its weak absorption of infrared radiation from the Earth and influences on the budgets of hydroxyl radicals (OH) and Ozone (O₃). It's having an average lifetime of 2-4 months in the atmosphere, and a product of incomplete produced by combustion of biomass and fossil fuel. The anthropogenic sources produce about 50% of world-wide of CO emissions with the remainder from oxidation and biomass burning ¹. Because of the human population and industry are much greater in the northern Hemisphere, so its concentrations are much greater than in the southern Hemisphere. A little CO

density as 400ppm (0.04%) in the air can be fatal ². The normal carboxyhemoglobin scales in an average person are less than 5%, and cigarette smokers may have to levels up to 9% (two packs/day) ³. The CO can direct monitor from space because of its strong absorption properties in the solar shortwave infrared (2.3 μm) and the thermal infrared (4.7 μm). During past decades the CO data easily obtained by a number of satellite instruments available at infrared wavelengths to measure globally tropospheric CO, such as SCanning Imaging Absorption spectroMeter for Atmospheric CartographY (SCIAMACHY) ⁴, Atmospheric Chemistry Experiment-Fourier Transform Spectrometer (ACE-FTS) ^{5,6}, Infrared Atmospheric Sounding Interferometer (IASI) ⁷, AIRS ⁸, Tropospheric Emission Spectrometer (TES) ⁹, and

MOPITT. These satellite retrievals data overcome the problem notable by commercial aircraft and ground observations^{10,11}. In this work, to facilitate satellite validation, the CO in situ measurements were collected coincident with overpasses of Aqua and Terra. The Satellite CO data from AIRS and MOPITT were used to monitor local emissions, the transport of polluted air masses, and compared to assess the temporal and coherence behavior of large scale spatial features evident in the observed distributions over Iraq (27.5 – 38.5 N, 37.5 – 48.5 W) during the winter and spring of 2012. The regional CO mixing ratios measurements from both AIRS (800 hpa) and MOPITT (surface) amount, are compared between the two instruments. Also presented the comparisons over the four stations; Baghdad, Mosul, Basrah and Rutba that are measured by AIRS, MOPITT, and in situ CO Measurements. A comparison and cross reference are required to understand these two data sets and their effects to the scientific conclusions developed from them. AIRS is a first continuously operating cross-track scanning sounder using thermal Infrared spectral radiometer, consisting of a telescope that feeds an echelle spectrometer, on-board the Aqua satellite launched May 4, 2002. The AIRS acquires 2378 spectral samples, ranging from 1086 to 1570 (bands: 3.74 μm to 15.4 μm) includes spectral features of CH₄, CO, O₃, and CO₂. It designed by NOAA and NCEP' research programs to decide the factors that control the global energy and water cycles, enhance numerical weather prediction, discover the effects of increased CO₂, CH₄, O₃ and other GHG's, estimate climate variations and feedbacks, and investigate of atmosphere-surface interactions. The Aqua spacecraft orbit is polar sun-synchronous with an orbital period of 98.8 minutes, repeat cycle period is 233 orbits (16 days), and a nominal altitude of 705 km [Manning and Friedman, 2016]. The MOPITT is the first sounding sensor to observe tropospheric CO flying at 705 km above the Earth's surface on NASA's EOS Terra spacecraft launched December 1999. The Terra satellite orbit is polar sun-synchronous, makes observations every 0.4 seconds, with swath width of about 640 km cover the Earth after three days and repeat cycle period every 16 days, or 233 orbits. To calculate CO profiles and total column amounts in the lower atmosphere, the MOPITT use an eight-channel gas correlation spectroscopy using Pressure Modulation Cells (PMC) and Length Modulation Cells (LMCs) at nadir with pixel resolution 22 km by 22 km and measures IR radiation in both the 2.4 μm and 4.7 μm spectral bands¹².

METHODOLOGY

This research has been carried out for 24 months (12 AIRS and 12 MOPITT) data from January to December 2012. The AIRS and MOPITT datasets have been used for this research. Four stations were selected at dispersed across Iraq; Baghdad, Mosul, Basra, and Rutba, as shown in Table 1, to evaluate and analysis the comparison and distribution of CO over the study area. All monthly data basis are in a Hierarchical Data Format (HDF) format containing the location along of satellite track and corresponding time. The geographic information system (GIS) software was used to conduct the Maps of the study area to analyse the CO data distribution and direct comparison between two satellites. The CO data were obtained from 1° × 1° (latitude × longitude) spatial resolution ascending orbits. Also the SigmaPlot software were used to analyse the relationship between the independent variable (months) and the dependent variable (monthly CO) over four stations Baghdad, Mosul, Basra, and Rutba.

RESULTS AND DISCUSSION

The CO volume mixing ratios (VMR) from MOPITT (surface) and AIRS (800 hpa) are averaged over the winter and spring periods and for each 1° by 1° latitude and longitude. Figure 1 shows the monthly mean CO VMR (800 hPa for AIRS and surface for MOPITT) measured by each respective instrument, over Iraq, for (winter) January and February 2012. The regional CO VMR differences show obvious biases with MOPITT (surface) higher than AIRS (800 hPa) by 5–30 ppbv over most of the study area, except over the northern region in April, May and June. The differences are larger for higher CO plumes over the regions of biomass emissions, such as over northern region above latitude 34°, as a results of the excessive use of combustion thermal heaters and Influence of the contaminants from neighboring countries¹³, and smaller for clean pristine desert environment in the western and southwest regions. The elevate CO values also seen by both instruments over the industrial and congested urban zones, i.e., Baghdad, Basrah, and Mosul. In winter, negative CO VMRs are observed in both data sets over the southern east regions down to the latitude 32°. Similarly, both instruments also observe enhancements over the mountains area and western desert and plateaus near the Syrian border. Over the northerly westerly states, Mosul, Dohuk, Erbil, Sulaymaniyah and Kirkuk, there is strong disagreement,

as AIRS detecting CO emissions from altitude more than 1000 meter from these mountains area and cloud-cleared radiances are available, since MOPITT removes cloudy pixels while AIRS uses reconstructed cloudy pixels¹⁴, whereas positive CO VMRs are observed by MOPITT (surface). The enhancement over the northern Mountains is evident in both data sets, progressing into February, though an especially large positive signal over central area is solely observed by MOPITT. The persistent marshes low area to the south-east is still not visible in the AIRS data but both agree on low CO VMRs over the southern region. Figure 2 shows, on the left side, the regional monthly maps of April (2012) for the CO VMR at 800 hPa for AIRS (top), surface for MOPITT (middle), and the differences (AIRS-MOPITT, bottom), respectively. Similarly, the monthly CO VMR densities for May (2012) are shown in Figure 2 (right). The AIRS-MOPITT VMR CO differences are larger, in a range of 5–35 ppbv, at high latitudes up to 34° when the VMR CO amounts are very high (145 ppbv from MOPITT). However, AIRS CO is smaller than MOPITT CO over northern regions when the VMR CO amount is relatively high. This pattern of differences is in part because of the poor of measurement sensitivity in the lower atmosphere for down-looking spectrometers such as AIRS. At these levels, the retrieved CO concentrations are heavily weighted by the first guess, and therefore proper first guess data in the retrieval algorithm is critical¹⁵. In April there are both striking differences and similarities. Over much of the Iraq central and southern regions there is clear agreement between MOPITT and AIRS over the significant positive and negative VMR relative to the background. In addition, there are coincidental low VMRs over the pristine desert environment (southwest regions). On the other hand, over much of the south-eastern area the noticeable low CO observed by AIRS is not seen

by MOPITT. The enhancements in the Iraq central and southern regions however are weakened (especially in the AIRS data) when considering only observations below 33° N. These indicate that the enhancement is partly because of the lower VMR above 33° N (reduction in using of combustion thermal heaters) rather than as a result of, for example, increased emissions over this region, especially over capital Baghdad. By May the positive CO VMR over the northern and northwest Iraq regions have all but disappeared in both sets of data, with the exception of MOPITT again witnessing higher values over the central cities. Over the southern area low values are still observed. Noticeably, the anomalies are occur about three months (March, April and May) with AIRS higher than MOPITT over Mosul and Rutba stations. This may be due to a number of factors including that the AIRS shows much higher CO values (5–15 ppbv) than the MOPITT a priori in the mid to lower atmosphere. Over other regions the reason that MOPITT shows higher CO than AIRS may be due to two factors, one is that MOPITT's measurements closed to surface, hence MOPITT's retrieval propagates higher CO values from the surface layers. The second reason is that AIRS lacks sensitivity in the lower atmosphere more than MOPITT.

Table 1. Stations GMD.

Name	Longitude	Latitude	Country
Baghdad	44.36	33.31	Iraq
Mosul	43.16	36.35	Iraq
Basra	47.78	30.50	Iraq
Rutba	40.25	33.03	Iraq

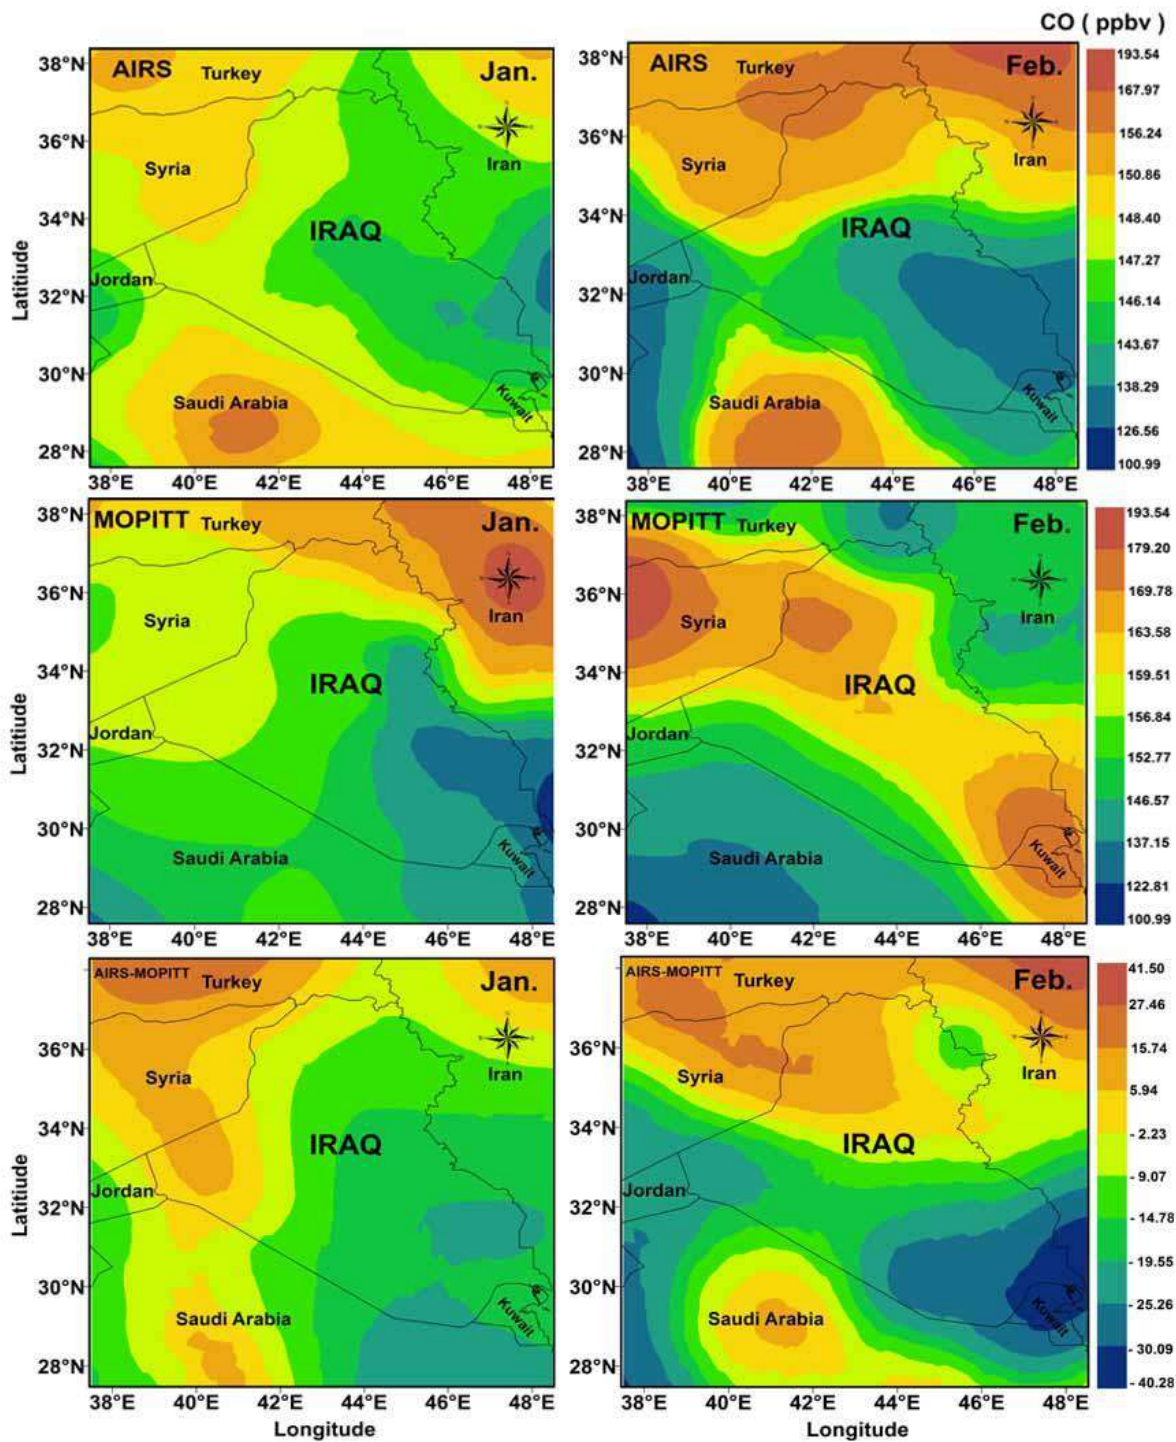

Figure 1. The monthly CO VMR maps for January (2012) over Iraq from AIRS 800 hPa (top), MOPITT surface (middle), and the differences (AIRS-MOPITT, bottom), respectively. Similarly: the monthly CO VMR for February (2012) (right).

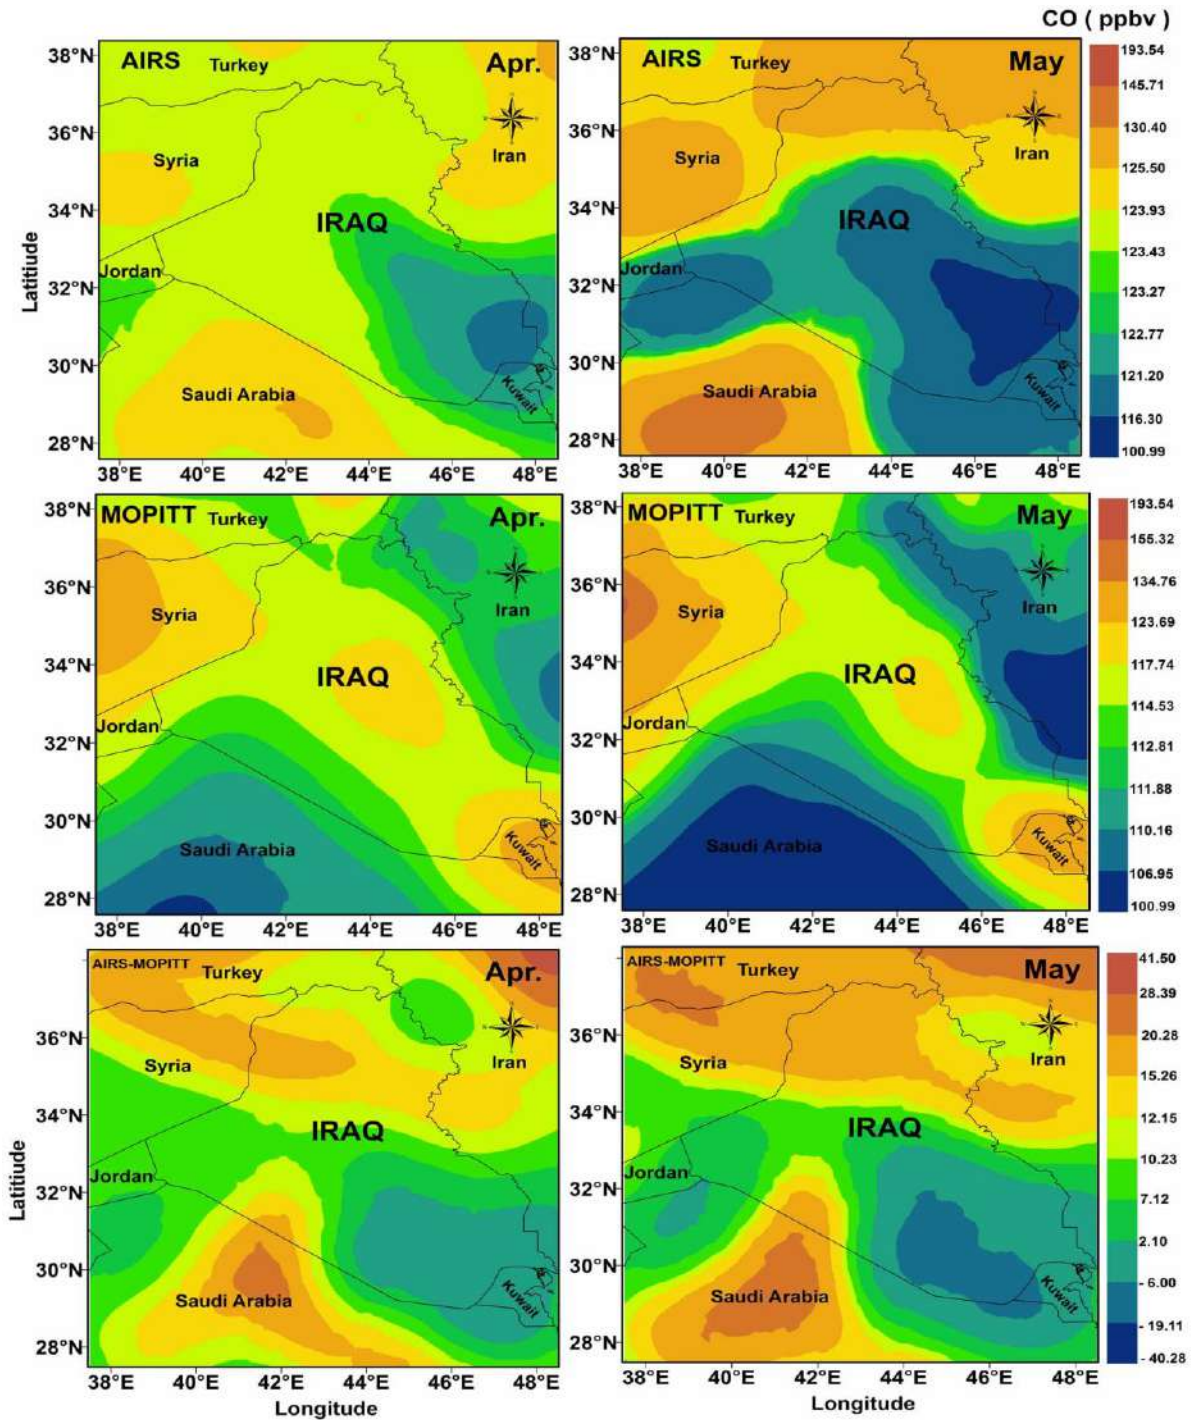

Figure 2. The monthly CO VMR maps for April (2012) over Iraq from AIRS 800 hPa (top), MOPITT surface (middle) and the differences (AIRS-MOPITT, bottom), respectively. Similarly: the monthly CO VMR for May (2012) (right).

Figure 3. CO VMR anomaly over Iraq detected by AIRS (red) and MOPITT (blue) from January to December 2012.

CONCLUSION

In this study, we have assessed the quality of the two current satellite instruments capable of measuring atmospheric CO VMR from space are MOPITT and AIRS during the winter and spring 2012. Using the surface MOPITT a priori profile as AIRS' 800 hpa provides regional improvements to the agreements between CO retrievals from these two instruments. In summary, comparison of the monthly averaged CO VMRs retrieved by each instrument over Iraq during 2012, relative to their mean background, reveal similar coincidental large scale features that develop and evolve with time. Due to different level observation used in this research, AIRS detecting CO emissions from altitude

more than 1000 meter and MOPITT from surface, there was disagreement between two instruments (5-35 ppbv), and its large for higher CO plumes and smaller for clean pristine desert environment. Both instruments observed enhancements of CO over the mountains, agreed with low CO over the southern region, and detecting the same large scale variations. From temporal trends analysis, the seasonal variations of CO VMR fluctuated between winter and summer seasons with higher values in winter and lower in summer season. Elevation of CO values have seen over industrial and congested urban zones by both instruments. The work presented, the first time demonstrate consistency between CO distributions retrieved by two different space-borne instruments. This comparison study will be extended to include the

comparison with other similar sensors such as IASI on EUMETSAT's METOP, TES on EOS/AURA, and others.

ABSTRACT

Calcium (Ca), which is an essential factor for human life, could play a role in pathophysiology of spontaneous intracerebral hemorrhage (ICH). Aim of study: to evaluate the relation between serum Ca level and size of hematoma in ICH. Patients and Methods: This study was conducted at intensive care units (ICU). We included ninety patients with spontaneous ICH. All patients were subjected to thorough history taking, general and neurological examination. National Institute of Health Stroke Scale (NIHSS) was done on admission to assess stroke severity. Initial Computed Tomography (CT) scans were done for all patients within the first 24 hours of admission to calculate the hematoma volume. Serum Ca level was measured on admission for all patients. Among the 180 cases of ICH, (14.4%) had low serum Ca on admission. Patients with low serum calcium level had a significantly larger initial hematoma volume and higher scores on NIHSS in comparison to ICH patients with normal Ca level. Serum Ca was inversely correlated with hematoma volume ($p < 0.001$), stroke severity ($P < 0.001$) and stroke outcome according to modified Rankin scale. low serum Ca level on admission was associated with large initial hematoma volume.

Keywords: intracerebral hemorrhage, ICH, serum Ca level, hematoma.

INTRODUCTION

Intracerebral hemorrhage (ICH) is serious form of stroke leading to high morbidity and mortality¹. It affects more than a million people around the world annually and accounts for 20-30% of all strokes². ICH is a significant public health issue as no effective treatment is now available. Therefore, exploring biomarkers that associated with ICH contributes to early detection and risk stratification for this deadly disease, which is very important for improving the clinical outcome. Serum calcium is essential nutrient for human life, and with phosphate play physiological roles in the multiple pathomechanisms underlying cerebral ischemia^{6,7}. Calcium influences the molecular pathways of ischemic neuronal death.⁸ The element has also been studied with regard to its relationship with stroke risk factors, and high dietary calcium intake has been associated with reduced

stroke risk. Ca^{++} plays a key role in many physiological functions including skeletal mineralization, muscle contraction, impulse transmission in neurons, hormone secretion, and the coagulation cascade¹². In the blood and extracellular fluid, Ca^{++} is found in three forms. The most common Ca^{++} is the ionized or free-state (~ 51%) followed by protein-bound (~ 40%) and an anion-bound complex (~ 9%). Ionized Ca^{++} (iCa^{++}) is the only active form contributing to physiological processes¹³. The incidence of low serum Ca^{++} level ranges from 24–26% in ischemic stroke¹⁴⁻¹⁶ and 10–14% in ICH^{16,17}. Higher serum Ca^{++} on admission has been accompanied by lesser stroke severity, smaller cerebral infarct volume, and better functional outcome^{14,15}. Furthermore, elevated admission serum Ca^{++} level has been associated with good outcomes at discharge and 3 months among acute ICH patients¹⁰. Conversely, lower serum Ca^{++} level has been significantly related to higher presence of cerebral micro bleeds in ischemic stroke patients with atrial fibrillation and/or rheumatic heart disease¹⁸.

MATERIALS AND METHOD

Study Design and Patient Selection

This study was conducted on 180 patients with primary intracerebral haemorrhage (ICH) who were admitted in Intensive Care Unit (ICU) and stroke Unit of Neurology Department during the period from July 2016 till April 2018. Patients were selected according to the following criteria: patients with ICH who were admitted within 24 hours of symptoms onset. Intracerebral haemorrhage was defined as a new and acute (< 24 hours) neurological deficit with compatible brain imaging showing the presence of intracerebral bleeding¹⁹. All patients were subjected to the following: detailed medical and neurological history taking from either patients or relatives with stressing on stroke risk factors, complete general and neurological examination with assessing stroke severity using National Institute of Health Stroke Scale (NIHSS) [20] which was done on admission. Brain Computed Tomography (CT) scans was done within the first 24 hours of symptom onset to diagnose ICH and to calculate the volume of intracerebral hematoma. Hematoma volume was measured on the initial head CT scan with the use of the ABC/2 equation²¹. Laboratory investigations including Complete Blood Count, blood glucose level, liver and kidney functions, lipid profile and Assessment of total serum calcium level was done on admission for all patients from venous blood samples. Low calcium level was considered when total serum calcium was less than 8.6 mg/dl.

Clinical Variables

Demographic and clinical data were systematically collected through interviews with patients and family members and through a retrospective review of hospital medical records. We assessed the presence of a medical history of hypertension, diabetes, hypercholesterolemia, antiplatelet therapy, oral anticoagulant treatment (OAT); systolic and diastolic blood pressure on admission; and time from symptom onset to baseline NCCT^{22,23}. Elevated BP was managed according to the American Heart Association/ American Stroke Association Guidelines^{24,25}.

Statistical Analysis:-

We used SPSS version 20 software package²⁶ for data analysis. Quantitative variables were expressed as mean \pm SD whereas qualitative variables were expressed as number and percentage. Comparison between groups was done using Chi-square test (χ^2 test) or Fisher exact for categorical variables and Student t-test for continuous

variables. Correlations between continuous variables were assessed by Spearman correlation coefficient. P-value < 0.05 was considered significant. The association between calcium level and ICH expansion was examined in a multivariable logistic regression analysis, adjusted for known predictors of hematoma expansion^{28, 27}. An individual patient's predicted probability of ICH expansion was derived from individual data and from the binary logistic regression model estimates and was expressed as a continuous variable ranging from 0 to 1. P < .05 was considered to be statistically significant. All analyses were performed using the statistical package SPSS version²⁹

RESULTS AND DISCUSSION

A total of 180 patients with a mean age of (68.11 \pm 10.79 years) were included in our study, 102 were men and 78 were women. According to the serum Ca level, we had two main groups: a group of ICH patients with low calcium level < 8.6 mg/dl which included 26 patients (14.4 %). The other group consisted of patients with Ca level \geq 8.6 mg/dl. Baseline demographic and clinical characteristics according to Ca levels were listed in Table 1. There was no significant difference between two groups regard (sex, age or stroke risk factors). Mean hematoma volume was significantly higher in hypocalcemic than in the normocalcemic group (68.23 \pm 7.54 versus 24.07 \pm 19.52 respectively). The mean NIHSS scores at admission were higher in those with low Ca level than normocalcemic groups denoting that patients with low serum Ca had a severe stroke and more neurological deficit (27.38 \pm 5.0 versus 12.23 \pm 7.06 respectively). There was a significant inverse correlation between serum Ca levels in all cases of ICH and the following: hematoma volumes ($r = -0.778$, $P > 0.001$); stroke severity ($r = -0.698$, $p > 0.001$). Primary ICH has been reported to be the most devastating form of stroke. It has no proved specific therapy to improve the outcomes according to the results of randomized clinical trials [30]. In the current study we investigated the relation between serum Ca level and both of the initial hematoma volume, as we included (180) patients who were presented with symptoms and CT evidence of ICH and admitted to ICU units within 24 hours of symptom onset. This study demonstrated that patients with low Ca level had large initial hematoma volume than did those with normal serum Ca. Furthermore, On studying the correlation between serum Ca in patients with ICH and hematoma volume a significant inverse

correlation was observed. Also, the stroke severity was significantly higher in the hypocalcemic than did the normocalcemic group according to the results of admission NIHSS scores. In addition, a negative correlation was observed between serum Ca level and stroke severity scores as assessed by NIHSS. The relation between serum Ca and stroke outcomes has been studied previously. It was observed that poor outcome in patients with ischemic stroke was related to lower serum calcium on admission ^{6,15,16}. Moreover, previously D' Erasmo and colleagues ³¹ recorded that low serum Ca was associated with in-hospital mortality among ischemic stroke patients. Furthermore, data from large epidemiological studies ^{9,31} had showed that dietary calcium intake was associated with reduced mortality after stroke. Morotti and colleagues ¹⁷ consider several mechanisms by which calcium levels might affect ICH volume and the risk of expansion. One relates to an effect of calcium on blood pressure. Lower calcium levels can lead to vasoconstriction and elevated blood pressure, which could cause increased bleeding and increase the risk of hematoma expansion. [34] They discount this mechanism because their study cohort did not show a link between blood pressure on admission and hematoma size ¹⁷. Furthermore, the volume of a deep hemorrhage (which is typically related to hypertension) is not related to a low calcium level. Other studies have failed to find an association between blood pressure and ICH expansion ³². Thus, the cerebral circulation is relatively protected from changes in systemic blood pressure, making any changes in blood pressure less likely to directly affect the cerebral circulation. Morotti and colleagues ¹⁷ also postulated a subtle coagulopathy as another mechanism by which calcium levels might affect bleeding. Although calcium is an integral part of various steps of the coagulation cascade and platelet activation, it has never been directly attributed to either a bleeding or thrombotic disorder. It is assumed that there is never a significant deficiency of calcium, either

acute or chronic, that might lead to impaired hemostasis. Although hypocalcemia is common during or following massive transfusion of blood and blood components, this is thought to be an effect of citrate (an anticoagulant) present in the blood products leading to chelation of calcium. Acute hypocalcemia is observed during therapeutic apheresis, especially during autologous peripheral hematopoietic stem cell collections in patients with thrombocytopenia. However, this has not been associated with hemorrhagic diathesis despite symptoms related to reduced ionized calcium levels. Apart from the observation by Morotti et al, there are a Few recent, similar observations published. In one study, [36] hypocalcemia was associated with increased Mortality among patients who were severely bleeding and required a massive transfusion. A study by Ho and Yip showed decreased clot strength in thromboelastography measurements in patients with a decreased ionized calcium level who were either bleeding or were at risk for bleeding. They suggested that hypocalcemia could make an existing coagulopathy worse. However, chronic hypocalcemia has not been systematically studied. There are patients with mild bleeding tendencies who have normal coagulation parameters and platelet function. You et al., ¹¹ in (2015). They studied a total of 365 patients with primary ICH and assessed the relation between serum Ca on one hand and short and long-term outcomes on the other hand. They demonstrated that elevated admission serum Ca level was positively associated with excellent outcome at both discharge and three months after acute ICH. Appel and colleagues ¹¹ had studied 784 consecutive patients with acute strokes including both ischemic and hemorrhagic types. They demonstrated an association between the baseline serum Ca level and stroke severity and outcome. In addition, they concluded that serum calcium concentrations could be considered as a marker of mortality in acute stroke patients.

Table 1. Demographic and clinical Characteristics of the studied patients:

Variables	ICH with Ca <8.6 (N= 26)	ICH with Ca ≥8.6 (N= 154)	P- value
Age	67.85±10.52	68.37±11.06	0.87
Sex (M\ f)	14/12	82/72	0.96

Cont... Table 1. Demographic and clinical Characteristics of the studied patients:

Risk factor:

Laboratory findings:			
TG	130.80± 41.28	122.40± 36.57	0.49
T. cholesterol	190.66± 33.50	194.34± 27.40	0.71
HDL	37.64±11.92	39.15±12.57	0.67
LDL	117.48 ± 40.82	123.83 ± 35.63	0.29
INR	1.12±0.8	1.10±0.57	0.93

CONCLUSION

Low Serum Calcium level in the setting of ICH is an indicator of large hematoma volume. Hence serum Ca level could be one of the laboratory biomarkers of prognostic significance in the setting of primary ICH. Thus this study recommends starting modifying calcium levels of patients with ICH arriving in the emergency department as soon as possible to improve the clinical outcome.

Asthma and Allergic Rhinitis are Potential Risk Factors for a Migraine in Adolescents

Rafid Hadi Hameed

Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

This research was done to determine if asthma and allergic rhinitis are potential risk factors for migraine in adolescents. The research found out that Asthma and Allergic Rhinitis are indeed common diseases that continue to affect people across the globe. Also, people with asthma are at a higher risk to migraine than those suffering from Allergic Rhinitis. Men with asthma are more affected by migraines as compared to those with Allergic Rhinitis whereas for women, those with Allergic Rhinitis are more affected than those with asthma. This is a proof that more men are affected by Migraine as compared to women since Asthma is perceived as a more risk factor for a Migraine as compared to Allergic Rhinitis. Many men are more exposed to risk factors associated with Asthma as compared to women. Age is also a risk factor for both Asthma and Allergic Rhinitis.

Keywords: Asthma, allergic Rhinitis, migraine, Adolescents

INTRODUCTION

Asthma and Allergic Rhinitis are among the diseases which affect many people globally each year. Asthma is a chronic disease which affects the breathing system hence making air inhalation difficult¹. This happens due to the narrowing of the airways which carry oxygen to the lungs. Asthma is characterized by coughing, wheezing, chest tightness, and shortened breath¹. In an advanced stage, Asthma can lead to an inability to talk. Although asthma can be controlled and treated, it still remains one among the most dangerous diseases which affects more than 24 million Americans¹. Allergic Rhinitis is an allergic response to specific allergens. When the body comes into contact with an allergen, it releases a chemical called histamine which is a natural chemical which defends the body from the allergen. Histamine is the main cause of Allergic Rhinitis². This disease is characterized by sneezing, a runny nose, coughing, frequent headaches among others². Allergic Rhinitis is the most common chronic disease among the children in the USA and is the fifth common chronic disease

in the US². America spends more than \$2 annually for diagnosis and treatment of this chronic disease². Migraines are severe, recurring and painful headaches. These types of headaches can be accompanied by signs and symptoms of other diseases³. Migraines affect 12% of the USA population annually³. Among the risk factors for Migraines is Asthma and Allergic Rhinitis³. Other potential causes of migraines include hormonal changes, triggers in the diet, medications, and triggers in the environment. In the USA, 2 in every three people affected by migraines tend to be within the age of 15 to 55 years³. More than half of the people affected by Migraines also have either Asthma or Allergic Rhinitis³. This is proof that Migraines affect more adults and especially those who have Asthma and Allergic Rhinitis in the USA. In another study which included 288 asthmatic outpatients, it was found that 60.4% of the participants had a severe headache⁵.

MATERIALS AND METHOD

This study will be a mixed research. Mixed research is a type of study which involves the methods of both quantitative and qualitative research²³. In this study, there will be a collection of both qualitative and quantitative data and hence a mixed type of research is the most suitable. It is preferred because it will allow the researcher to gain in breadth and depth understanding as

Corresponding author:

Rafid Hadi Hameed. Ministry of Public Health,
Maysan Health Department, Maysan governorate, Iraq;
E-mail: rafidhadii@gmail.com

compared to the use of either qualitative or quantitative research alone¹². It will also allow the validation of the collaborative results which were found in the discussion section. This study will use only the primary type of data. Primary data is that which is collected by the researcher from first-hand sources by use of methods like surveys, experiments, and studies¹³. The primary data will be collected by the use surveys which will be designed and uploaded online for the participants to answer. The selection criteria will be well outlined so that the participants can be able to know who is eligible to participate. Both qualitative and quantitative data will be collected to suit the mixed methods of research¹⁷.

Sample and Sampling procedure

This study will use the purposive sampling method. This is a non-probability sampling method which follows specified rules in sample selection¹⁵. It is applicable while collecting primary data from a survey because it gives room for the sample selection of participants who cannot meet physically. It also gives a room for the participants to be able to understand if they are eligible for selection, unlike the probability sampling methods whereby the selection is only by chance²⁰. This sampling method saves time because few people who are not eligible tend to participate and even those who participate but are not eligible shows that they have some knowledge in the field hence applying the benefit of doubt.

Sample size

The sample size for this research will be 150 participants. The large sample size will be used so that the assumption normality will be upheld in the questions which need quantitative analysis²⁵. This is in line with the central limit theorem which states that, as the sample sizes increase the data tends to approach normality¹⁶. The assumption of normality is vital because it will eradicate biasness during analysis of the data²¹. This enables in the elimination of getting biased results and hence making them more reliable.

Questionnaire design

In order to get non-biased results from the participants, a questionnaire will be designed and uploaded online as a survey. The questionnaire will include both quantitative and qualitative questions depending on the nature of the response required. Also, the questionnaire will be designed to meet all the

requirements which are important to get credible results.

Data collection

This study will collect data from a survey which will be conducted online. Out of all the participants, only 150 will be selected and they will be those who only suffer either Asthma or Allergic Rhinitis. The data will then be downloaded and integrated into an excel file for cleaning. After cleaning, the data will then be moved to SPSS software for analysis. This will be carried out under the guideline of statisticians so that the results will be reliable.

Variables and data analysis

SPSS will be used for data analysis. The analysis will include both nominal and scale data where both numerical and non-numerical analysis will be applied. Correlation and frequencies will be mostly used for the analysis. Correlation will be used for the analysis of numerical data and frequency tabulations will be used for the analysis of non-numerical data. Tables and graphs will be included in the analysis for easy understanding. Graphs will be used for visualization and table for comparisons. This will lay a base for reliable results and scientific conclusion.

RESULTS AND DISCUSSION

The analysis of the data was carried out among the 150 participants whose surveys were selected using the purposive sampling. Out of the 150 participants, 58% (88 out of 150) were males and 41.3% (62 out of 150) were females. This shows that men who have either Asthma or Allergic Rhinitis are more vulnerable to a migraine as compared to women. Also, the significant difference between the two genders suggest that there is a high possibility that most of the men may be more exposed to risk factors of both Asthma and Allergic Rhinitis. The mean age of the participants was 43 years. The minimum age was 12 years of age and maximum was 87 years. This coincides with the earlier studies that adults are most affected by migraines as a result of the complications which come along with either Asthma or Allergic Rhinitis. Among the male participants, only 39.2% had Rhinitis and 62.8% had Asthma. This shows that men are vulnerable to Asthma as compared to Rhinitis. From earlier studies it was found that Asthma is a more risk factor for a Migraine as compared to Allergic Rhinitis. This is a proof why more men are prone to a

Migraine. Women who participated 40.3% had Asthma and 59.7% had rhinitis a proof why women may have medium rate of a Migraine as compared to men.

Allergic Rhinitis and Migraine

Allergic Rhinitis is another risk factor for a migraine. It is perceived as the most common chronic disease among the adults in the USA. This disease is estimated to affect 60 million USA citizens. Allergic Rhinitis is also a huge health problem in Europe. The European Academy of Allergy and Clinical Immunology (EAACI) estimates that more than 150 million Europeans have allergic Rhinitis. Based on the already existing data, it is predicted that 50% of the European population will be affected by this disease in the next ten years. Allergic Rhinitis is believed to be among the main causes of Rhinitis in the USA and Europe. Out of the USA population which has allergic Rhinitis, 3 to 5% visit hospitals daily due to the complications caused by a migraine ⁷. In Europe, more than 65% of the patients of Allergic Rhinitis have a migraine ⁷. This population is said to experience a migraine more than 15 days each month a fact which reduces their production rate and low school turn up among the young children. In another study, it was found that 45% of those people who had allergic Rhinitis had developed a migraine ⁶. In another study which had 5849 participants of which all of them had rhinitis, it was found that 60.1 of them had frequent headache with it being severe among those who had mixed Rhinitis ⁷. Also, in a controlled model within the

study, it was found that headache-disability was directly related to Allergic Rhinitis with an odds ratio of 1:30 in comparison with a control group ²⁴. This shows that the prevalence of people with Rhinitis and who develop a migraine is higher than those who don't have Allergic rhinitis and develop a migraine. From the analysis, it is evident that Asthma and Allergic Rhinitis are potential risk factors for migraine.

The relationship between age, gender, Allergic rhinitis, Asthma, and Migraine

In a survey conducted to estimate the number of people based on age who were affected by Asthma and had Migraine, it was found that most them were aged between 18 to 55 years. The mean age of the participants was found to be 32 years. 92.8% of the participants claimed to have a severe headache as compared to another study of young people who had Asthma and recorded a medium severity of a headache ^{9, 10}. This shows that adults are most affected by a Migraine when they have Asthma. From the analysis, it is evident that women who have Asthma are the most affected by Migraine and men who have allergic Rhinitis are most affected by a migraine. Both Asthma and Allergic Rhinitis, affect adults mostly as compared to children. Also, the two diseases have been found to be potential risk factors for a Migraine with Asthma being the leading risk factor. The estimation of the two risk factors is predicted to increase in the next ten years.

Table 1. Distribution of participants according to gender

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Male	88	58.7	58.7	58.7

CONCLUSION

This research has been conducted to evaluate if allergic Rhinitis and Asthma. It has been found that Asthmatic people are more vulnerable to Migraine as compared to those people who have Allergic Rhinitis. Men who had Asthma were found to be affected more by Migraine as compared to those who had Allergic Rhinitis. Also, women were found to be affected by Allergic Rhinitis more as compared to men. This proves that more men are affected by Migraine as compared to women since Asthma is perceived as a more risk factor for a Migraine as compared to Allergic Rhinitis. Many men are more exposed to risk factors associated with Asthma as compared to women. Age has also been found to be a risk factor for both Asthma and Allergic Rhinitis. Adults have been found to be more vulnerable to both diseases. However, above the age of 87 years old, it has been found that there are rare cases of both Allergic Rhinitis and Asthma. However, there is no scientific evidence to back up that claim and opens an avenue for future research.

Critical Thinking Activities Involve Sufficient English Language Classroom Materials Effects Students Physiological Performance and Biologically

Haider Hatem AL-Ijrish¹, Dhiaa Uweed AL-Arnoosy¹, Nada Abbas AL-Sltani¹

¹University of Babylon, College of Basic Education, Iraq

ABSTRACT

This paper consists of three chapters concerning the sufficient materials and applying activities employing critical thinking strategies. Preparing students to be effective learners by applying the principles of education process. EFL instructors can apply these principles to all aspects of the language classroom by carefully considering the content they select, the activities they engage in, and the type of interactions that occur in their classrooms. Teachers of English can adopt various strategies to increase classroom participation and critical thinking. One strategy that can benefit language learning is taking a thoughtful approach to materials development, this is especially true for the EFL context, where the classroom is often the only source of teaching English language, and materials which play crucial role exposing learners to language and using modern technology tools to ease using the language communicatively and interactively. The goal is to increase students 'activate' participation in the classroom as they develop communication strategies and skills and a scene of responsibility for the learning process.

Keywords: Activity, Critical Thinking, Physiological, Biological.

INTRODUCTION

On one hand, classrooms are filled with resources and from a certain perspective more resources must lead to more opportunities and more opportunities must lead to more possibility of gain. On the other, students and teachers have limited attention and resources may entail distractions and opportunity costs¹. It is believed that some learners want to learn English in order to work in fields such as business, accounting and tourism, therefore; they are naturally interested in text which deal with these fields. Others may want to learn English to improve their own careers, or change their professions, while so many of them maybe interested in learning languages and cultures. The most important thing here in this paper is the 'Teaching Methods' which help teachers as well as learners to master the

usage of the target language. In terms of method, the researcher is conducting a research which may help EFL /ESL teachers as well as learners ask and find answers or address groups. Teachers of English as a foreign language in Iraq could not envisage incorporating the traditional formats of theories investigation concerning the process of teaching English as a foreign language in most of Arabic countries, especially Iraq with all of the current events in it. The subject area, teachers who work closely with the language teaching classes, in the process of materials development, can assist a great deal in accommodating these students need. Teachers should be well educated and equivalent to make the process succeed and to gain the aims of teaching EFL in the Iraqi schools which were deprived from being in contact with all the world around us.

METHODOLOGY

The analytical method which lies in analyzing and classifying traditional and contemporary methods of teaching English as a foreign language; and the comparative method aimed at comparing advantages

Iraq

and disadvantages of various methods and approaches to language study.

Critical thinking skills

Critical thinking means making reasoned judgments that are logical and well-thought out. It is a way of thinking in which you don't simply accept all arguments and conclusions you are exposed to, but rather have an attitude involving questioning such arguments and conclusions. It requires wanting to see what evidence is involved to support a particular argument or conclusion. People who use critical thinking are the ones who say things such as, 'How do you know that? Is this conclusion based on evidence or gut feelings?' and 'Are there alternative possibilities when given new pieces of information?' Additionally, critical thinking can be divided into the following three core skills. Curiosity is the desire to learn more information and seek evidence as well as being open to new ideas. Skepticism involves having a healthy questioning attitude about new information that you are exposed to and not blindly believing everything everyone tells you. Finally, humility is the ability to admit that your opinions and ideas are wrong when faced with new convincing evidence that states otherwise. Using Critical Thinking Skills. self-help with a difference. A lot of self-help is produced by people without much knowledge of theory. This paper is rooted in what we know from academic studies and philosophical ideas, and tries to communicate this in a vivid and accessible way. Many people decide to make changes in their daily lives based on anecdotes, or stories from one person's experience. For example, let's say that your aunt told you that she takes a vitamin C supplement every day. Additionally, she told you that one morning she was running late for work and forgot to take her vitamin C supplement. That afternoon, she developed a cold. She now insists that you take vitamin C every day or you will get sick, just like she did in her story. Many people hearing this story would just accept this and think, 'To avoid getting sick, I should take vitamin C.' Although this type of logic is very common, it lacks critical-thinking skills. If we examine this anecdote a little more carefully, you should be able to understand why. For starters, we don't know where the idea of vitamin C stopping illness even came from. Why did your aunt decide to take vitamin C rather than vitamin D or any other vitamin? Also, there was never any indication given that there exists a direct link between not taking vitamin C and developing a cold. At

first glance, it may seem that way. However, there could be many other variables involved that have nothing to do with vitamin C. Maybe she was already developing a cold and that particular day it just happened to manifest itself. Maybe a sick person sneezed on her in the elevator that morning. Any number of possibilities could have happened, and from just this story, we simply do not have enough information. All of this speculation as to the validity of this particular observation is considered skepticism. (Educational Psychology: /Psychology Courses Study.com.) Considering the learning process, one faces different language uses that respond to different contextual requirements². Students lack the critical thinking skills necessary to express their points of view. Researchers believe that these factors are interrelated and can be explained by cultural differences to authority that results in passive learning. Although there is one strategy that can benefit language learning is taking a thoughtful approach to materials development, this is especially true for the EFL context, where the classroom is often the only source of teaching English language, and materials which play a crucial role exposing learners to language and using modern technology tools to ease using language communicatively and interactively^{3,4}. Teachers are advised to develop materials multidisciplinary teams. These teams should be composed of both novice and experience teachers of English and should include teachers from other subject areas. Teachers prefer materials that deal with topics such as human cloning, globalization, and the effect of global warming. However adding fiction to the mix genres. Marshall and Rowland (1998) describes how critical thinking produces joy, release, relief, and exhilaration as Learners and teachers break through or new ways of Looking at personal, work, and political worlds. Fact from opinion, texts with factual mistakes in them, Corroborating information, Supported opinions from unsupported opinions, conflicting information within and between texts. Mastery of "words", the vocabulary of a foreign language is also bound by actual experience and takes time. Master of mastering vocabulary will not be enough to be active thinker (Fries, 1963:7). There are no short cuts to a control of a complete vocabulary of a foreign language. Of course it is possible to find the few hundred lexical terms most useful in a particular situation and really master these items first rather than try to assimilate all types of vocabulary at once. Children do not readily accept the substitution of a machine for a person in the give and take of talk.

This fact should give pause to those who recommend courses on television for children in the elementary and primary school. Visual aids photos, pictures, are the most effectively employed at this level but audile devices are of limited usefulness in EFL. Virtually all students are motivated in one way or another. One student may be keenly interested in classroom subject matter and seek out challenging coursework, participate actively in class discussions, and earn high marks on assigned projects. Another student may be more concerned with the social side of school, interacting with classmates frequently, attending extracurricular activities almost every day, and perhaps running for a student government office. Still another may be focused on athletics, excelling in physical education classes, playing or watching sports most afternoons and weekends, and faithfully following a physical fitness regimen. Yet another student perhaps because of an undetected learning disability, a shy temperament, or a seemingly uncoordinated body—may be motivated to avoid academics, social situations, or athletic activities.

Suggested sample' Ways 'To Improve Learner's Memory

The researcher suggests some ideas learned which the researcher had already experienced over the years of working as a teacher of English at Arabic schools for example Pair Work. Students may prefer to work with each other:

A teacher could ask students to work in pairs twice every lesson. It is really nice to build pair work or even small groups working with vivid lesson activity. Pair students with speakers of other languages than their first language. This is not always possible, but pairing students who speak different languages forces English communication. Students who speak the same L1 are easily tempted to drop their native language.

Trying to change pairs, but not for every exercise. It's important to get all the students work together, but don't switch too often, some of them who work well together feel unease. Switching too much means students may get frustrated with each other. Perhaps, once every two activities is a good way.

Switching, at the same level, between pairing students and students at different levels. In some activities exercises, it's great to have the cleverer students help weaker students, this is especially true

in grammar activities. However, when it comes to conversational skills students at a similar level will feel more comfortable speaking with students at their level.

Provide pair work tasks with clear objectives.

Activities or instructions clearly state how students should interact and behave inside the classroom.

Vague instructions such as "talk about your hobbies" can lead to discussion, but, especially in lower level classes, discussion and learning tend to need more structure.

Keeping an eye on your pairs. Teacher will be able to spot trouble areas, provide needed support just in time, and keep a tab on much more student progress than if you lead a classroom activity.

CONCLUSION

One strategy that can benefit language learning is taking a thoughtful approach to materials development, this is especially true for the EFL context, where the classroom is often the only source of teaching English language, and materials which play crucial role exposing learners to language and using modern technology tools to ease using the language communicatively and interactively. The goal is to increase students 'activate' participation in the classroom as they develop communication strategies and skills and a sense of responsibility for the learning process.

Depressive Symptoms among Hemodialysis Patients at Teaching Hospitals in Baghdad City

Iman A. Issa

MSc Nursing, Assistant Lecturer, Psychiatric Nursing Department, College of Nursing, University of Baghdad, Baghdad city, Iraq

ABSTRACT

Depression is one of the most common psychological problems among hemodialysis patients. And is associated with important aspects of the clinical course, including mortality, increased number of hospital admissions, and reduced compliance with drugs and reduced quality of life. Objective: Assess the levels of depressive Symptoms in hemodialysis patients and identify the relationship between depressive Symptoms with some Socio-demographic and Clinical characteristics. Non- probability (purposive) sample of 100 cases (43 Male and 57Female) selected from who's their patients were diagnosed with CKD and who are attending these hospitals in Baghdad City that contain hemodialysis units. The data collected from 2nd February 2017 –22thFebruary 2017. A structured interviewing constructed with hemodialysis patients who were attended these hospitals in Baghdad City by questionnaire through using the Beck depression scale. The data analyzed by using descriptive statistical measures and inferential statistical measures. All patients with hemodialysis have depressive symptoms in different levels. Most of them were (20-51) age group, females, married, have Secondary school graduate, and they were housewives. Results indicated that there were relationship between patient's age & marital status with levels of depressive symptoms. Conclusion: Depressive symptoms level effected hemodialysis patient's significantly especially Secondary school graduate patient, housewives, government employee. There are relationships between Depressive symptoms and their patient age& marital status.

Keywords: *hemodialysis, Depressive symptoms*

INTRODUCTION

Chronic Renal failureChronic Condition whereby the kidney failure requires artificial means of excretion for survival. Primary means to achieve this are by peritoneal dialysis or hemodialysis (done several Times weekly) ¹. While HD does not cure renal disease, its use does allow patients with ESRD to survive ². Nevertheless, HD is a lifelong treatment that significantly and sometimes adversely affects patients both physically and mentally ³. Commonpsychological effects include depression,

anxiety; fatigue, decreased quality of life (QoL) and increased suicide risk ⁴. Depression is the most common psychological complication which has serious impact on the quality of life of hemodialysis patients and their caregivers, affecting negatively their social, economic and psychological well-being ⁵⁻⁷ they showed that ESRD patients on chronic (HD) with depression are twice as likely to die or require hospitalization within a year as compared with those without depression, and are at risk for a 30% increase in both cumulative hospital days and number of hospitalizations.

OBJECTIVES OF THE STUDY

Assess the levels of depressive Symptomsamong hemodialysis patients.

Identify the relationship between levels of depressive Symptoms with Sociodemographic characteristics.

Identify the relationship between levels of depressive Symptoms with clinical characteristics.

METHODOLOGY

A descriptive correlation study (non- probability) used to assess the level of depressive Symptoms among hemodialysis patients at Teaching Hospitals in Baghdad City. Data collection was carried out through the period from 2nd February 2018 – 22th February 2018. To achieve the purpose of the study; Data collection was started after obtaining permission from the Teaching Hospitals in Baghdad City that contain Kidney dialysis units. This setting was chosen for study because they are serving many Patients with chronic renal Failure, these Hospitals were: Baghdad teaching hospital, Surgical Specialties hospital, AL Kindi General Teaching Hospital Al-Imamian Al-Kadhimiyyain Medical City and Al Karama Teaching Hospital, a questionnaire was included two parts: Part I. Sociodemographic Data: which include Age, marital status, Education, Occupation, Monthly income of family. Part II. The Beck Scale for depression has been published by Asma Abdul Aziz Al-Hussein and translated by Mohamed A.G. (2002) which consists of 21 items that evaluate depressive symptoms, with each question being scored from 0 to 3. The Validity of the questionnaire has been determined through (15) a panel of experts; Reliability of the Questionnaire was developed by Alpha correlation coefficient (Test –retest reliability) It was 0.86. Interview was conducted to collect information from patients; The interview has been taken place at the room where the patient stayed with during dialysis place. Before collecting data the objective of the research was explained to the participants to obtain their agreement to participate in it. Data are analyzed through using the Statistical Package of Social Sciences (SPSS, Version 16) performed through the use of descriptive statistical data analysis approach; such as frequencies, percentages, and inferential statistical data analysis approach; such as Chi-Square test.

RESULTS AND DISCUSSION

Table (1) shows the demographic characteristics of hemodialysis patients. It refers that (57 %) of patients were female, (66%) of them were in the age group (20-51) (74%) were married, (1%) of them were widowed; in regard to their educational level the table indicates that the highest level (36%) were Secondary school graduate (25%) of the sample were Self-employed from male

while (35%) from female were Housewife before disease while (18%) were Self-employed from male while (35%) from female were Housewife. About monthly income for them (50%) their income was Somehow Sufficient income while (30%) were Insufficient. Table (2) shows the Clinical characteristics of hemodialysis patients. It refers that (61%) of patients their Duration of illness were (1-3) years and (63%) number of dialysis at week were (two). The finding indicated that there was (33.0%) of the cases have Severe level of Depressive symptoms and (36.0%) of the cases have Moderate level of Depressive symptoms. It appears from this table that there was relationship between the depressive symptoms Level in cases with respect to their Age ($p=0.004$) & Marital status ($P=0.025$) at $P > 0.05$ and it appears from this table that there was no Relationship between in the Depressive symptoms Level in cases with respect to their gender, Education level, Monthly income, occupation, Occupation after disease number of dialysis at week and Duration of illness at $p > 0.05$. Table (1) shows that more than half (57%) of patients were female and more than half are in age group (20-51). This result disagreed with ⁸ who found that (59.7%) male and (40.3%) females. And ⁹ show that most of the patients attending hemodialysis were male ($n=81$, 62.3%) compared to females ($n=49$, 37.69%). The mean age of patients undergoing hemodialysis were 53 years \pm 13.9, and the mean age of male was 52.79 years \pm 13.9 and female were 53.37 years \pm 12.89 appears to be same. Most of them belonged to age group of 40-60 years. Here there were no differences between male ($n=31$, 23.84%) and female ($n=30$, 23.07%) patients. According to Marital status, the majority of the sample (74%) were married, (1%) of them were widowed; in regard to their educational level the table indicates that the highest level (36%) were Secondary school graduate. These findings coincide with the finding of, ⁸ who found that (75.6%) are married and 35 (40.7%) male 21 (36.2%) female had completed education Secondary. About monthly income for them (50%) their income was Somehow Sufficient income while (30%) were Insufficient (11) mentioned that Depression and anxiety are the common non-psychotic mental disorders experienced most frequently by women living in resource-constrained low and lower-middle-income countries. According to the occupation (25%) of the sample were Self-employed from male while (35%) from female was Housewife this result agree with studies (9) who reported that most common occupations for mothers are working in the home. Table

(2) shows the Clinical characteristics of hemodialysis patients. It refers that (61%) of patients their Duration of illness were (1-3). (9) mentioned that (84.61%) duration of disease in years (>5 years). (9) the results showed mean 2.99 years±3.12, with mean duration of males is 3.23±3.5 years and female is 2.57 years±2.2. Majority of the patients (n=113, 86.92%) had undergone dialysis for <5 years out of which 55% patients being males and 32% being females. and (63%) number of dialysis at week were (two) .¹⁰ mention that most patient were number of dialysis at week were (two) . The table (3) shows Distribution of hemodialysis patients according to their Level of Depressive symptoms that the highest level (36%) of them were with Moderate level while (33%) of them were with Severe Level. This result was agreement with result¹² who found the incidence of depression is 73% and most of the patients are included in the category of moderate to severe depression.,¹³ Conclusion at HD is a life-sustaining treatment for patients with ESRD; however, it adversely affects patients' mental status. Increasingly, depression is being recognized as a substantial comorbid illness in these patients. Anxiety, feelings of fatigue, and decreasing QoL are also significant psychological symptoms, and they may be interrelated. Depression and anxiety particularly increase patients' suicide risk. Mental illnesses may have underlying biological and psychological causes. There is considerable evidence that these psychological effects are associated with adverse outcomes in HD patients with ESRD., (14) conclusion that the majority of patients in this study Reported negative feelings experienced as a result ESRD. Anxiety, depression, and in some cases, suicidal ideation were discussed by the patients in this sample. Some patients also spoke about experiencing grief for the loss of their kidney.¹⁷ this study has shown high rates of depressive symptoms in patients with CKD,¹⁵ Conclusion that depression occurs more frequently in patients with CRF mainly between the third to ninth year of treatment and affects females with greater frequency. Also, depression manifests mainly with sadness, anxiety, depressed mood, poor self-esteem, pessimism about the future, decreased libido, sleep disorders and limited appetite. Table (4) shows Chi-Square tests for Depressive symptoms Level and patients Socio- Demographic Characteristics and clinical Characteristic. The present study found that there is: Relationship between Age (p=0.004) & Marital status (P=0 .025) with levels of Depressive Symptoms The table (4-4). This result supported by¹⁶ who was reported

that depression among dialysis patients increased with age.

Duration of illness	8	7.840	0.449

CONCLUSION

The majority of hemodialysis patients were Females, most of the sample their age (20-51), most of the patients were married, they have Secondary school graduate, they suffer from Somehow Sufficient income, According to the occupation (25%) of the sample were Self-employed from male while (35%) from female were Housewife. Most of the sample they have duration of illness (1-3) years. The present study concluded that all patients with CRF have depressive symptoms in different levels. There is Relationship between Age & Marital status with levels of Depressive Symptoms.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Psychiatric Nursing Department, College of Nursing, University of Baghdad, Baghdad city, Iraq and all experiments were carried out in accordance with approved guidelines.

Determination of Menopausal Symptoms among Women Attending Babylon Teaching Hospital in Al-Hilla City

Wafaa Ahmed Ameen¹, Muna Abd- Al Wahab Kheleel¹

¹Department of Community Health Nursing, College of Nursing, University of Babylon, Iraq

ABSTRACT

Objectives: To determine the patterns of menopausal symptoms and to find out the association between the menopausal symptoms with women's socio-demographic characteristics and their reproductive parameters. A descriptive analytic study design was conducted on (269) menopausal women was selected throughout the use of non-Probability sampling approach. The sample of the study includes menopausal women who attended at teaching hospital in Al-Hilla city. A questionnaire has been used as a tool of data collection for the period of (13th February - 30th July 2018) and; including: Socio Demographic, Reproductive Characteristics, and Menopausal Symptoms. The results of the study revealed that (43.5%) of women aged (56 - 60) years with Mean \pm SD (54.57 + 4.424). (74.0%) of participants are married. (33.5%) of them are graduated from institute and above. The highest percentage (39.4%) among those have body mass index (30-39.9kg/m²). Forty two percent of study participants their economic status were sufficient to certain limit. Concerning reproductive information, (53.2%) had (4-7) parity, age of the last parity composed (67.3%) aged at (31-40) years old, (48.7%) of them have not been aborted throughout their reproductive periods, (79.2%) of sample under study have breast fed their babies.

Keywords: Determination, Menopausal Symptoms, Women

INTRODUCTION

Women all over the world now have to spend almost 1/3rd of their lives in menopausal years. Therefore, menopause now is a concerning problem to maintain and improve women's health¹. Naturally onset varies women worldwide, age between 44.6–52 years is the international range of stopping menses but in US the average of menopause was 51 years, 50 years old is the average age in Europe, onset developed natural menopause, as well as 54.25 years is the median of age in "Africa" the ages are younger, in "Morocco" 48.4 years a median age of, but at "Alexandria", a average age \pm "standard deviation" of 46.7 \pm 5.44². Therefore, menopause now is a concerning matter to maintain and improve women's health. Menopause happens in period of women's life which regarding the critical because a portion of social transition and it overlaps with the

"Empty nest syndrome", as offspring leave home and women find themselves without help from their also bigger incidence of psychosomatic symptoms¹. Women who smoke cigarettes more dangerous for reach the earlier menopause than who not smoking, in adding to genetic factors, regardless of other harm factors like marital state, number of delivery, and body weight, although is unknown the causes, but it may be due to the damage of irreplaceable primary "oocytes" by "benzo(a) pyrene" as well as toxic materials smoke of the cigarette³. Outcomes of study in altered Arab countries originate to be consistent with studies of Asian countries found discomfort in the head, vertebral of the neck, as well as aches in "muscle" and "joints", among menopausal women in UAE but most complain painfulness joint also muscle pain among Jordanian menopausal female had 89% incidence². Dangers for some chronic health complaints in menopausal age, for example "osteoporosis cardiovascular disease" and damage of thinking role⁴. Accumulation their affect on mood, with feelings of sadness, "hopelessness, emptiness as well as dysphoria", impact on the way of think, interfering with concentration and decision making. Lastly, they

Corresponding author:

affect their behavior, with increased irritability and loss of temper, social withdrawal, and a drop in their desire to occupy in pleasurable activities⁵. In order to decrease severity of” menopausal “symptoms for womens in their later life .The health care provider must take a vital role in increasing women’s awareness also in dealing with menopausal health problems to Promote good physical and psychological health⁶

METHODOLOGY

A descriptive analytic study design was conducted on (269) menopausal women was selected throughout the use of non-Probability sampling approach .The sample of the study includes menopausal women who attended to Babylon hospital for maternal and Children , Al-Emam Al-Sadiq teaching hospital, and AL-Hilla teaching hospital in Al-Hilla city. A questionnaire has been used as a tool of data collection for the period of (13th February – 30th July 2018) and consists of three part ;including : Socio demographic characteristics which included (5)items, Reproductive Characteristics which covered(3)items, and Menopausal Symptoms which consist of (6) items, these items are rated according to four level scale (None, Mild, Moderate, severe), and scored(1,2,3,4) with length class (0.74). Their assessment by None (score 1-1.74), Mild (score 1.75-2.49), Moderate (score 2.50-3.24) and Severe (score 3.25 and more). A pilot study has been carried between((1st-10th February 2018) on (19)menopausal women at Al-Hilla Teaching Hospital to test the reliability of the questionnaire and content validity has been carried out through a panel of(21)experts . Descriptive statistical and Inferential analyses are used to analyze the data. Data were analyzed using the Statistical Package for Social Sciences (SPSS version 20). This result of the present study indicated that the highest percentage of the study sample (43.5%)were within ideal menopausal age group(56-60) years .This result is advocated with⁽¹⁾study who found that menopausal women in India (57.27%) were in the age group (56-65) years. Moreover⁷. Have reported that the greater age of menopausal women were between (55-60) among their study participants, the present study revealed that the highest percentage of study sample were married, which recorded (64.7%) out of the study participants. The outcome of this study was in the same line with ⁽⁷⁾study in Egypt conducted on 250 menopausal women ,they reported(65.2%) of them were married , in addition the greatest percentages of sample graduated institute and above level of education

.This findings is in agreement with⁸ study done in Korea that found the higher percentage of women Beyond high school (47.8%),the highest percentage recorded among participants who have (30-39.9) BMI and classified within obese, it constituted (39.4%). This result is in consistent with⁹ study done in Baghdad that showed more than half of the women (58.8%) were obese, (40.4%) of them were menopausal. Moreover the result of the present study found that the (42.0%) of study participants were within moderate economic status. This result is in agreement with¹⁰ study that found (56.3%) of their study participants were within moderate socioeconomic status . Regarding menopausal symptoms , (Hot flushes, sweating) the highest percentage of the sample under study (46.1%) were having sever flushes. This result is advocated with¹² study done in Erbil that found among (500) of menopausal (357) suffered of hot flushes and (345) of participations have night sweats. Relative to (Heart discomfort), represent the highest percentage of the sample (36.1%) were having severity of this symptom. This result is in agreement with¹³ study done in India that found rapid heartbeat was the highest in postmenopausal women. The highest percentage of the sample under study (44.2%) were suffering from severity of this symptom . This results is contradicted with¹⁴ study that found 67(51.5%) of participants had moderate of this problem. Relative to sexual problems, the highest percentage of the participants (49.4%) were suffering moderate of this symptoms. This result is advocated with¹⁵ study that found (34.6%) of menopausal women mentioned that sexual desire decreased. In regard to bladder problems, the present study distribution found the highest percentages of study sample (39.0%) were having these symptom. This result is agreed with⁷ study that found the highest percentage of their sample (36.0%) were having sever bladder problems. Concerning Joint and muscular discomfort, the present study found that the majority of participants (61.7%) were having severe symptoms. This study is in consistent with¹⁶ study that reveals majority of menopausal women experienced joint and muscular discomfort (86%). The overall assessment of present study were suffering moderate of these symptoms .This result is in agreement with¹⁷ study that found the highest percentage of women (36.8%) were having mild climacteric symptoms, (56.3%) moderate and (6.9%)severe. Relative to relationship between demographical variables and symptoms,the result of present study showed that a high significant association with the women’s age (p-value 0.000),this

result is in agreement with¹⁸ study that found high significant association between age of studied subjects and postmenopausal symptoms in regard to depression (n=1101) p-value (<0.001). Concerning the marital status, the findings of the present study showed that there was a significant association with the women's social status (p-value 0.001). This result is advocated with¹⁹ study that found significant association between sexual problems, heart discomfort, sleep problems and irritability with marital status. Concerning the educational level, the findings of the present study showed that a high significant association was found with the women's level of education of (p-value 0.000). This result is advocated with²⁰ study that found

significant association between (urinary incontinence in type, duration and degree) and women educational level . Also findings of the present study showed that there was a significant association between menopausal symptoms and BMI, this result is advocated with²¹ study that found positive associations between the severity of physical menopausal symptoms and BMI such as vaginal dryness and hot flashes. Regarding the Economic status ,result of the present study reported that there was a significant association between economic status and symptoms .This result is advocated with²⁰ study that found statistically significant association between M.S. (urinary incontinence) include(type, and degree of urinary incontinence) and economic status.

Effect of Oral Simvastatin Therapy on Patients with Plaque Psoriasis Treated with Potent Topical Steroid

Adhwaa Mohsen AL-Shimary¹, Sarmad Nory AL-Dujaly¹, Mohammed Kadhim AL-Hattab²

¹Department of Pharmacology and therapeutics/College of Medicine/ Univerisity of Kufa, Iraq, ²Department of Dermatology/ Hammurabi College of Medeicine/ University of Babylon, Iraq

ABSTRACT

To evaluate the effect of simvastatin as an adjuvant with topical steroid on disease severity on patients with chronic plaque psoriasis. In a double blind study, 50 patients with plaque psoriasis have been randomly classified in two group, for each group 25 patients. Group one received placebo plus topical steroid (Betamethasone dipropionate 0.5 mg /g and salicylic acid 30 mg /g) for 8 weeks and group two received simvastatin tab 40 mg once daily plus topical steroid for 8 weeks. PASI score was measured before and after treatment. Psoriasis area and severity index reduced significantly in both groups, but the decline of psoriasis severity in simvastatin group was more significant ($P < 0.001$). In addition significant decrease of IL-17 and TNF- α ($P < 0.001$).

Keywords: *Simvastatin, psoriasis, Topical steroid.*

INTRODUCTION

Psoriasis is considered a common chronic skin disease with global distribution. The prognosis is unpredictable and relapse is a rule regardless of the kind of treatment. Treatment kinds are classified into local and systemic treatments. Topical treatments including steroids, retinoids, dithranol, coal tar whereas systemic treatments including methotrexate, phototherapy and many other types of treatment, which is associated with numerous adverse effects¹. The lesions of psoriasis are spread symmetrically on the scalp, elbows, knees joints, nails, and any area of the body may be affected. Psoriasis is a chronic inflammatory disorder with unpredictable course, with susceptibility for recurrent and remission². The global prevalence of psoriasis is valued to be nearly 2%-3% of the populace. The pathology of psoriasis includes numerous classes of T-cells and their interactions with dendritic cells (DCs) and cells involved in innate immunity such as neutrophils and keratinocytes. The most common observational appearances of psoriasis are sharply demarcated, scaly and erythematous plaques;

infrequently, sterile pustules are seen³. IL-17 and TNF- α play important role in pathogenesis of psoriasis⁴. Simvastatin is antihyperlipidemic agent which inhibit 3-hydroxy-3-methyl glutaryl COA reductase enzyme, additionally it has confirmed anti inflammatory and immunomodulatory effects⁵. Statins have been revealed to modulate to modulate several immunological parameters⁶.

MATERIALS AND METHOD

The present study was conducted from period between October 2017 and July 2018. The study was approved by Kufa university / Medical college Ethical Committee for clinical trial. Samples were collected from the out patients clinic of dermatology in Merjan hospital in Hilla city. The patients below 20 and above 60 years of age, pregnant and lactating women, patients received any topical treatment within 4 weeks or systemic agents within 3 months and any patients with hepatic and muscle disorder are excluded from research. Patients in group one take placebo capsule 40 mg once daily with topical steroid for 8 weeks, patients in group two take simvastatin capsule 40 mg once daily with topical steroid. The psoriasis area and severity index, LDH, LFT, CPK, IL-17 and TNF- α were estimated for all patients before and after 8 weeks of treatment.

Data analysis

Statistical analysis was carried out using SPSS version 20. Paired t-test was used to compare means for paired readings. Correlation coefficient (r) was used to find the relationship between two continuous variables. A p-value of ≤ 0.05 was considered as significant.

RESULTS AND DISCUSSION

All 50 patients complete the study. There was no significant differences between sex ratios in both group ($P=0.571$) as well as there is no significant change in age of both group($P=0.319$). In group one average baseline PASI score 11.69 which is declined to 7.87 after 8 weeks of treatment ($P=0.01$) group two, average baseline PASI score 11.88 which is declined to 3.85 after 8 weeks of treatment ($P<0.001$). In group one average baseline level of IL-17 44.42 which is declined to 40.6 ($P=0.03$), in group two average baseline 46.1 which is declined to 18.8($P<0.001$). While TNF- α baseline for group one 52.36 which is declined to 47.2 ($P=0.01$), in group two average baseline about 51.76 which is declined to 22.34 ($P<0.001$). There is a significant positive correlation between PASI and TNF- α after 8 weeks of treatment for simvastatin group ($P<0.05$). Also there is a significant positive correlation between PASI score between PASI score and IL-17 after 8 weeks of treatment for simvastatin group ($P<0.001$). Psoriasis is considered common recurrent Th1mediated chronic troublesome disease ⁷. The recent studies indicated the anti-inflammatory and immunomodulatory effects of statins and used for treatment autoimmune disease , therefore encouraging used of statins for treatment psoriasis ⁵. In the present study, oral simvastatin plus topical steroid were both effective in treatment patients with plaque psoriasis.

Our study agrees with study done by Naseri et al who documented a significant declined of psoriasis severity (PASI score) in patients after received simvastatin with topical steroid for 8 weeks⁸. In addition agrees with Vasiuk et al who reported a significant decrease in PASI score after 6 months of Atorvastatin therapy⁹. In our study , there is a significant decline in serum levels of TNF- α and IL-17, to best of our knowledge there is no previous research to compare our result with it. This study agrees with Tikiz et al who documented a significant decrease of TNF- α , C-reactive protein and improved endothelial function in patients with long term rheumatoid arthritis after received simvastatin therapy as compared to patients take quinapril for 8 weeks¹⁰. Also agrees with study done by Vasiuk who reported a significant reduction of TNF- α in patients with psoriasis and arterial hypertension after received atorvastatin therapy⁹. Our study agrees with Qin et al who reported that IL-17 significantly reduction in lupus nephritis kidney tissue of rats, The effect of simvastatin on IL-17 related to inhibit autoimmune response¹¹. The study done by Pereira et al who reported a significant decline of IL-17 after used simvastatin therapy in patients with rheumatic arthritis as compared to control¹². Statins inhibit the production of proinflammatory cytokines TNF- α , INF- γ , IL-8 and IL-6 , in addition block induction of inducible nitric oxide synthase ¹³. Activated inflammatory cells and proinflammatory mediators play important role in development of psoriasis lesions as well as in atherogenesis and breakdown of atherosclerotic plaques. Psoriasis is connected with an increased cardiovascular risk as compared to general population ¹⁴. There is some evidence reported that statins exert anticancer effect ¹⁵.

Table 1. Study variables of both groups (placebo and simvastatin) post treatment.

Study variable	Group	N	Mean	SD	P-Value
PASI score	Placebo	25	7.87	4.6	<0.001
	Simvastatin	25	3.85	2.34	
TNF- α pg/ml	Placebo	25	47.2	6.3	<0.001
	Simvastatin	25	22.34	5.6	
IL-17 pg/ml	Placebo	25	40.6	5.8	<0.001
	Simvastatin	25	18.8	2.6	

CONCLUSION

This study proved that simvastatin used as an adjuvant with topical steroid decreases disease severity in patients with plaque psoriasis via inhibiting inflammatory process and modifying immune response.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Pharmacology and therapeutics/College of medicine/ University of Kufa, Iraq and all experiments were carried out in accordance with approved guidelines.

ABSTRACT

The resistance of bacteria from hospital environments has been less frequently investigated. Twenty - seven Gram-negative bacterial isolates were isolated and identify from the hospital environment. The isolates were *Acinetobacter baumannii* (16 isolates), *Pseudomonas aeruginosa* (4 isolates), *Enterobacter cloacae* (3 isolates) *Klebsiella pneumoniae* (3 isolates) and *Escherichia coli* (one isolate). Antimicrobial susceptibility test was performed by disk diffusion method and polymerase chain reaction was used to detect *bla*NDM-1 genes among imipenem-resistant MBL positive isolates. The results showed that the all isolates were imipenem-resistant , cefotaxime resistance was seen in 48.14% of isolates, ciprofloxacin resistance rate was 11.11% , and 25 isolates (92.5 %) were inferred to be MBLs producers. Among these isolates, 11 isolates had *bla*NDM-1 genes. The antibacterial effect of ZnO nanoparticles, fullerene (C60) and pyocyanin against various bacterial isolates from hospital environment was investigated. Preliminary growth analysis data suggest that ZnO nanoparticles and pyocyanin have significantly higher antibacterial effects on bacteria than do fullerene (C60). The nanoparticles reduced the growth of *A.baumannii* and *E. cloacae* higher than that with *P. aeruginosa* and *K. pneumonia*. It was concluded that nanoparticles and pyocyanin have potential as a therapeutic agent against Gram-ve bacteria from the hospital environment.

KEYWORDS: *Nanoparticles, Pyocyanin, Fullerene (C60), hospital environments.*

INTRODUCTION

The rapid emergence of antibiotics resistant microorganisms is occurring worldwide, endangering the efficacy of antimicrobial agents, which have saved millions of lives ¹. The environmental spread of antimicrobial agents resistant microorganisms has been recognized as a growing public health threat ². Hospitals are antibiotic hotspots use and not only play an important role in antibiotics dissemination but also in the growing of antimicrobial resistant bacteria into the environment. The treatment plants of hospital wastewater containing

antibiotic residues can favor the resistance development due to the selective pressure placed on bacteria ³. Carbapenems are the most effective against Gram-ve and Gram +ve bacteria presenting a broad spectrum of antibiotic activity ⁴. Infections due to carbapenem resistant *Enterobacteriaceae* (CRE) are increasingly reported throughout the world and the CDC , USA considers them as an urgent threat to human health. Carbapenem resistance in *Enterobacteriaceae* can be mediated by carbapenemases production ⁵. Carbapenemases can be divided in *Enterobacteriaceae* into Ambler class A β - lactamases , class B metallo- β -lactamases (MBLs) and class D oxacillinases ⁶. New Delhi metallo- β -lactamase-1 (NDM-1), a relatively newly described metallo- β -lactamase, can hydrolyze all β -lactams including carbapenems except monobactam. It was first identified in *Escherichia coli* and *Klebsiella pneumoniae* isolated from a Swedish patient who was

hospitalized in 2008 in India⁵. Inorganic metal oxides show more constancy robustness and long shelf life than organic antimicrobials that it's the major benefits of application inorganic metal oxides⁷. The use of Zinc Oxide locally improves chronic and acute wounds healing due to antibacterial, anti-inflammatory and increasing re epithelialization properties⁸. The current investigation was aimed to evaluate the antibacterial effect of pyocyanin and nanoparticles against Gram-ve bacteria from the hospital environment.

MATERIALS AND METHOD

Bacterial Isolates: Bacterial isolates were collected from hospital environment (beds, windows and surfaces) in Baghdad Teaching Hospital during April 2018. All isolates were identified using conventional biochemical methods and Vitek 2 system.

Antibiotic susceptibility testing : The susceptibility of isolates to different antibiotics was testing using disk diffusion method following Clinical and Laboratory Standards Institute guidelines (CLSI,2015), cefotaxime (CTX) ,pipracillin(PRL), tetracycline(T) , ceftazidime(CAZ), imipenem (IMP) ; ciprofloxacin (CIP) and aztreonam (AZT) , On Mueller- Hinton agar Plate, using overnight culture at a McFarland standard (0.5) followed by incubation at 35 °C for 18-24 hr .

Phenotypic Detection of Metallo-β lactamase(MβLs): Each imipenem -resistant isolate was tested to investigated the production of MβLs by disk approximation test ,the results were interpreted according to Bashir *et al.*,(2011): Tested isolates were inoculated according to Kirby-Bauer method onto plates of Mueller-Hinton agar media. Two discs of Imipenem were placed on the plate; 5 μl of EDTA solution (final concentration is 0.5M) was added to one of them. The zones of inhibition of the imipenem disc and imipenem with EDTA disc were compared after incubation at 35°C° for 16-18 hrs. An increase in the size of inhibition zone at least 7 mm around the imipenem-EDTA disc more than imipenem disc alone was considered as produced isolates of MβLs.

Molecular detection of *bla*_{NDM1} gene

Detection of *bla*_{NDM-1} gene for imipenem resistant isolates, using the primers for *bla*_{NDM1} according to Nordman *et al.* (2011)⁶. A PCR reactions with specific primers were performed to identify *bla*_{NDM1} forward

(5' GGTTTGGCGATCTGGTTTTC3') reverse(5' CGGAATGGCTCATCACGATC3'). Amplifications were performed by a DNAThermal Cycler (Gradient thermocycler Polymerase Chain reaction, TechNet-5000, USA).The cycling program included 5 minute initial denaturation step at 94°C°, followed by 35 cycles of denaturation for 30 seconds at 94°C°, annealing of primers for 40 seconds at 52°C°, and primer extension for 40 seconds at 72°C° with auto extension. After the last cycle, the PCR tubes were incubated for 10 minutes at 72°C°. PCR products were detected by electrophoresis on 1% agarose gel by staining with ethidium bromide.

Phenotypic detection of Pyocyanin Production

Pyocyanin production was detected for all *Paeruginosa* isolates on King's B medium (9) and Mueller-Hinton agar media by streaking. Using overnight culture followed by incubation at 30 C° for 24 hrs.

The quantitative pyocyanin assay

The quantitative assay of pyocyanin is depending on the absorbance of pyocyanin in acidic solution at 520 nm. Five ml of culture grown in T-broth to production of pyocyanin was extracted with 3 ml chloroform and then re extracted into one ml of 0.2-N HCl to give a pink to deep red solution. The absorbance of this solution was measured and the concentrations, expressed as μg/ml of pyocyanin produced of culture supernatant were determined by multiplying the OD at 520 nm by 17.072¹⁰.

Synthesize ZnO nanoparticles

Precipitation method was used to synthesize ZnO nanoparticles in a surfactant solution (5% polyethylene glycol) by drop wise addition of (0.1M) zinc acetate dihydrate and (0.1M) ammonium carbonate in the same time at room temperature with continuous stirring for 2 hours after completing reactant addition, then ammonia solution and absolute ethanol was used to wash the filtered precipitate. Vacuum furnace was used for drying and calcination the produced ZnO nanoparticles at 100°C for 12 hours and at 450°C for 3 hours respectively. Fullerene C60 was used as it is from (Modern Synthesis Technology (MST), Latvia).

Antibacterial activity of ZnO nanoparticles, Fullerene (C60) and Pyocyanin:Broth dilution method was used to detection the antibacterial activity of ZnO

nanoparticles, Fullerene (C60) and pyocyanin by determine the MIC. Generally, serial doubling dilutions of ZnO nanoparticles Fullerene (C60) and pyocyanin were prepared using Mueller Hinton broth and finally, the culture bacteria was added to each test tube then incubated for 24 hours at 37° C using shaking incubator. Cell growth inhibition was defined by counting the amount of colonies forming units (CFUs) on the agar plates and the turbidities of the cell cultures. The first test tube that showed no change in turbidity were further proved for bacterial culture by spreading 100µl of the broth onto Mueller Hinton agar plates to determine the bactericidal or bacteriostatic effect ¹¹

RESULTS AND DISCUSSION

A total of 27 Gram negative bacilli were recovered from hospital environment (beds, surfaces and windows), the most represented bacteria in hospital environment was *A.baumannii* (59.25%), followed by *P.aeruginosa* (14.81%) and (11.11%) for each *K.pneumoniae* and *Enterobacter cloacae*, the least common bacteria was *E.coli* (3.70%). Resistance rates observed among isolates obtained from environment samples are presented in table 1. Ciprofloxacin was the most active agent against bacterial isolates, while all bacterial isolates recovered showed high resistance rates to imipenem and tetracycline. Antimicrobial agents and antibiotic resistant bacteria are found in surface water, soil, and groundwater, yet their levels are currently unregulated. **Duong et al.** (2008) ¹² tested resistance of ciprofloxacin and norfloxacin in *E. coli* in hospital wastewater of another Hanoian hospital and reported that *E. coli* isolates were susceptible. Imipenem is used to treat infections caused by β lactamase producing bacteria and should be saved to treat infections not readily treated by other antimicrobial agents ¹³. High prevalence of bacterial resistance for carbapenem in clinical isolates in Vietnamese hospitals has been reported ¹⁴. The detection of resistance to these antibiotics in bacterial isolates from wastewater in hospital is of concern, since this can contribute to the spread of resistance among bacterial populations in the environment. The phenotypic detection of carbapenemases was done, the results of this test elucidated through 27 carbapenem-resistant bacteria, 26 (96.29%) were identified as β BL-producing isolates. Twenty seven carbapenem resistant isolates were screened with NDM-1 specific primers, of these 11 isolates (40.74%) were positive for *bla*_{NDM-1}. The increasing prevalence of *Enterobacteriaceae* which

producing carbapenemase is a significant public health concern. NDM β lactamase enzymes, will be difficult to control, and further importation and dissemination are inevitable ¹⁵. Walsh *et al.* (2011) ¹⁶ reported that the *bla*NDM-1 gene could easily transfer beyond the boundaries of the family of Enterobacteriaceae. While the majority of bacterial species implicated were environmental bacteria, reports regarding the presence of the *bla*NDM-1 gene in *A. baumannii*, an opportunistic bacteria causing nosocomial outbreaks, are alarming. Such isolates have already been isolated from India, China and Germany ¹⁷. The *in vitro* antibacterial activity of ZnO nanoparticles, fullerene (C60) and pyocyanin against various bacterial isolates from hospital environment was investigated. Preliminary growth analysis data suggest that pyocyanin and nanoparticles of Zinc Oxide have significantly higher antimicrobial activity against bacteria than do fullerene (C60). The MIC of pyocyanin was 375 µg/ml against *A.baumannii*, 1500 µg/ml against *P.aeruginosa* and *K.pneumoniae* and 187.5 µg/ml against *E.coli*. Nanoparticle metal oxides represent a new class of important materials that are increasingly being developed for use in health-related applications and researches ¹⁸. The nanoparticles reduced the growth of *A.baumannii* and *E. cloacae* higher than with *P. aeruginosa* and *K. pneumoniae*. Antibacterial effects of Zinc Oxide nanoparticles have been indicated toward a wide spectrum of bacteria such as *S. aureus* and *E. coli* ¹⁷. Although, ZnO nanoparticles have been frequently reported with antimicrobial properties but the very limited researches are available to treat the bacterial infections on the *in vivo*. The antimicrobial activity of ZnO nanoparticles is affected by concentration and particle sizes. The antibacterial effect of ZnO NPs directly correlates with their sizes. This dependency is also influenced by the concentration of nanoparticles. ZnO nanoparticles with a smaller size (higher specific surface areas) showed highest antibacterial activity ⁷. Antimicrobial activity of Zinc Oxide related to reactive oxygen species production which destroys bacterial cell wall and thereby causes the death of the bacteria (19). On the other hand, the results of current study showed that the most affected bacteria to pyocyanin were *E. coli*, this finding agrees with results of Abdul Hussein and Atia (2016), they found that *E. coli* isolated from urinary tract was most affected, followed by Bacillus and Staphylococcus at the same level. Baront and Rowe (1981) ²⁰ recorded that bactericidal effect of pyocyanin was dependent upon its concentration and resulted in

decreases in viability of bacterial cells from 1 to 8 log viable cells /ml . All a pyocyanogenic pseudomonads tested were totally pyocyanin resistance, suggesting that pyocyanin resistance may be a characteristic of the

genus. *P. aeruginosa*, was also essentially unaffected by high concentrations of pyocyanin. The Gram+ve bacteria were more susceptible as a group to the antimicrobial action of pyocyanin than were the Gram -ve bacteria.

Table 1. Antimicrobial susceptibility test results of bacterial isolates from hospital environments.

Bacterial isolate	Antibiotic resistance						
	PRL	CTX	CAZ	ATM	IMP	TE	CIP
<i>A.baumannii</i>	2	2	1	1	16	16	2
<i>P.aeruginosa</i>	1	4	4	0	4	4	0
<i>K.pneumoniae</i>	3	3	3	2	3	3	0
<i>E.coli</i>	1	1	1	1	1	1	0
<i>Enterobacter cloacae</i>	3	3	3	2	3	3	1
Total of resistance No (%)	10 (37%)	13 (48.14%)	12 (44.44%)	6 (22.22%)	27 (100%)	27 (100%)	3 (11.11%)

Table 2. Presence of *bla*_{NDM-1} gene in bacterial isolates

Bacterial Isolates	Presence of <i>bla</i> _{NDM-1} gene in bacterial isolates	% of <i>bla</i> _{NDM-1} gene
<i>A.baumannii</i>	8	50
<i>P.aeruginosa</i>	1	25
<i>K.pneumoniae</i>	1	33.33
<i>E.coli</i>	0	0
<i>Enterobacter cloacae</i>	1	33.33
Total	11	40.74

CONCLUSION

The present study has shown the antimicrobial activity of ZnO nanoparticles and pyocyanin on Gram-ve bacteria from the hospital environment. Based on present findings, local application of ZnO nanoparticles may be made for help wound healing processing due to the reduction of bacterial load.

Effectiveness of Educational Units in the Development of Analytical Thinking

Ibtisam Sahib Al- Zwaini¹, Zeana Gabbar Ghany¹

¹ College of Basic Education, University of Babylon, Hillah City, Iraq

ABSTRACT

The objective of this research was to define the effectiveness of educational units in the development of analytical thinking. The study was conducted in Iraq, Babylon Governorate. An experimental design was adopted with partial control of two groups. The research community was the third-grade students from the Department of Arabic language at the Faculty of Basic Education, Babylon University. A sample of (62) female student was divided into one experimental and one control group. The sample students were equalized using appropriate statistical means for research procedures (arithmetic mean, standard deviation and the Independent t-test). Four variables were used (age, intelligence, father's academic achievement, and mother's academic achievement). A standardized tool was used to measure the effectiveness of the General Teaching Methods subject to the students in the two research groups, this tool is a post-test. The results of this study showed that there are statistically significant differences between the average mean of experimental and control students' scores at (0.05). Thus, the units of the general teaching methods contributed to raising the level of students achievement, and it was indicated that the effectiveness of the proposed educational units for general teaching methods subject through the use of cognitive maps.

Keywords: *Teaching Methods, Effectiveness, General Teaching Methods, Educational Units, Cognitive Maps, Development of Scientific Thinking.*

INTRODUCTION

Modern education seeks to develop the learner's skills in learning and thinking, and these skills are priorities. It is important to develop the higher mental processes of learners in general and university students in particular, since mental activity should be in constant mobility and vitality, for the purpose of not relying on the minimum issues such as conservation, absorption and memorization only, but the aspiration and development of the higher mental processes such as analysis, rectification, thinking and problem solving. The researchers see the requirements of success as the student's knowledge of his own abilities, his mission and the strategy that contributes to this task. This means the student's knowledge of his cognitive processes and their results, i.e., his awareness of metacognitive. However,

the teaching methods used in the composition of the student/teacher in the faculty of education colleges is characterized by some shortcomings in achieving the desired role, that is the most used methods of training for this material is the lecture, despite the continue invitation of faculty members to the necessity of diversification in teaching methods in education colleges, and follow method of lecture the method of spelling and indoctrination, then dialogue and discussion in the end but, the method of the lecture may be useful with a large number of students, this method has been weakened by some faculty members, which requires the need to introduce modern methods and strategies to train teaching methods material in particular, and educational materials in general, as well as strategies should address the two brain Hemispheres and mental development of students. Education has a role in social upbringing, and one of its basic functions is to provide individuals with the social culture. It is also a deliberate and purposeful process to prepare people to achieve happiness for themselves and for others¹. The educational institutions have an impact in raising the level of society to work,

Corresponding author:

Ibtisam Sahib Al- Zwaini.

College of Basic Education, University of Babylon,
Hillah City, Iraq

progress and cohesion, and it's a mean to solve problems and promote individuals and progress in society², as it is of great importance to humanity today because it is a large-scale scientific revolution, as well as to qualify the community to cope with rapid changes requires a strong base, Therefore, education is the main responsibility because it is the tool capable of developing the potential of learners to deal with these changes³, this was confirmed by Cairo Educational Declaration at the Conference of Arab Ministers of Education (2006), the importance of educational reform, which begins to raise the potential of society for the purpose of dealing with the accelerated progress age culture this is done in a guided educational climate surrounded by additional material and moral potentials, characterized by the interaction of its elements in a harmonious way commensurate with our cultural heritage, and is consistent with the architecture of the future, through the development of creative thinking and problem solving, and development of multiple positive intelligence, this is the work of educational pedagogical programs as it is the means to find the ways of that desired reform⁴. The building and development of modern society require attention to the building of knowledge and focus on brain development, education is the most important pillar of development, especially university education and upgrading requires a parallel pace towards scientific progress⁵. Higher education occupies a prominent role in the development of the society by contributing to the needs development of qualified human resources for development in various aspects of life, especially the development of the student's brain. Therefore, the rethinking of programs or curricula of university education is necessitated by changes taking place in the region and in the world, In order to keep this education the spirit of the age and its requirements, as it plays the largest role in building nations and peoples as attributive the top of the educational ladder, including the colleges and institutes, specialized in different fields of knowledge⁶. The closest example is the developed countries that have made progress as a result of their growing interest in university education and the provision of it to the largest number of their children⁷. The university is the academic community, established to trace knowledge, it is divided into well-known departments and operates in all fields, it is well known that the achievements of the university have the greatest impact in developing the world in all aspects, as well as encouraging creativity and innovation in the students' products⁸. And to adopt educational strategies aimed

to increasing achievement and thinking evolution and brain development, it is difficult to propose strategies that will serve all the objectives and goals, because each one of them have disadvantages and advantages, one of the strategies that the school can choose or use to achieve the goals is the cognitive maps strategy if it has the educational and professional competencies⁹. It is necessary to pre-prepare the unit because it contains a main topic or several topics and contains the facts, concepts, and various activities as well as contains the teaching methods and the educational means concerned to implement the unit and the rectification methods used, the good preparation of the unit provides the opportunity to add any suggestions and new ideas and modify what they deem appropriate to achieve their goals, and the specialists should first select the subject of the unit and determine the stage and the grade that will be studied after that the building of the reference unit in the form of a general structure includes the outline, and students participate with their teachers in the planning and determine the stages of implementation and the time required for each stage as well as identify Activities, methods, and ways of learning¹⁰. Al-Maghrebi, (2009): (Effectiveness of a proposed educational unit based on the method of distance self-learning in the development of applied skills in the methods of teaching techniques curriculum of female students in the Faculty of Education and their tendency towards it). The study aimed to measure the effectiveness of a proposed teaching unit based on the method of distance self-learning in the development of applied skills in teaching methods and techniques subject for female students in the faculty of education and their tendency towards it. The sample of the study included a number of female students from the Faculty of Education, experimental and semi-experimental design were used. The tools included "an achievement test for the educational units and a list of criteria for evaluating the level of student performance in self-learning». It was found that there were statistically significant differences at (0.01%) between the mean scores of the students of the experimental group in the pre and post application of the achievement test for the educational units, it was concluded that the post-application was valid¹¹.

METHODOLOGY

Therefore, the experimental approach was followed in the current research as it is suitable for research procedures.

Experimental Design:

The experimental design includes both an experimental and a control group, both of which have a post-measurement and a high confidence level for results (Al-Hamdani, 2006).

Research Community

Students of the of Arabic language department stage three (morning study), College of Basic Education for the academic year 2017 2018.

Parity of Research Groups

The following variables were used (age, intelligence, father's academic achievement, and mother's academic achievement). A standardized tool was used to measure the effectiveness of the "General Teaching Methods subject", to the students in the two research groups (experimental and control), this tool is a post-test and has been tested honestly and consistently. This factor has been controlled using statistical methods in processing the test data.

Preparation of teaching plans

A daily teaching plan was prepared for the subjects of the proposed educational units for the general teaching methods which were (25) plans and taught to the experimental group, also, daily plans were prepared for general teaching methods which were (25) plans for topics taught to the control group. Appendix 15 illustrates a sample plan for the experimental group, and appendix (16) illustrates a control plan sample for the control group. The building of (Research Tool) a post-achievement test for the proposed educational units for General Teaching Methods subject, the following steps were followed in constructing the test:

Determine the objectives of the test.

The objectives for which the test was based were determined by Bloom's classification according to the following areas:

Cognitive, which includes goals that emphasize intellectual learning outcomes such as: (Remembering, understanding, application, analysis, synthesis, and rectification).

The psychological field includes the goals that emphasize the motion skills which represented by: (drawing, writing, and design).

Determine the type of test

The most appropriate type of tests to measure the effectiveness of the proposed teaching units for general teaching methods is the following test:

The effectiveness of the educational units testing "Post-Achievement Test", one of the objective tests types (multiple choice and sentence supplementation) and essay tests (Al-Dulaimi and Al-Mahdawi, 2000). The test was conducted in 2010 and the amendments were made according to the opinion of the experts and the referees concerned with the measurement and rectification in the Faculty of Education / Ibn Rushd - University of Baghdad, in which the test was presented.

Preparation of a specification table (test map)

The test map is one of the basic applications in the preparation of tests because it ensures the distribution of the test paragraphs on the main topics for the subject content and the objectives that the test seeks to measure according to the relative importance of each one of them, in addition, it is a prerequisite for content validation (Al-Baghdadi, 1980).

To build the test map, the following steps are implemented:

1. Determine teaching units' topic of general teaching methods subject into major topics.
2. Determine the educational objectives for the general teaching methods subject and determine the number of goals for each level of Bloom's classification of educational objectives.
3. Determine the importance of each educational unit through the following relationship:

Number of Topic Objectives

$$\text{Importance Ratio per Topic} = \frac{\text{Number of Topic Objectives}}{\text{Total Number of Subject Objectives}} \times 100$$

4. Determine the importance of each objective level by:

Number of Level Objectives

$$\text{Importance Ratio for each level} = \frac{\text{Number of Level Objectives}}{\text{Total number of Objectives}} \times 100$$

(Al-Baghdadi, 1980).

Determine the total number of questions.

A test map was prepared that included the content of general teaching methods subject as well as included the educational objectives and according to Bloom’s classification: (Remembering, understanding, application, analysis, synthesis, and rectification).

The content importance of each teaching unit for the subject of general teaching methods was calculated with respect to the number of behavioral objectives assigned to each educational unit. As well as determining the relative importance of each level of Bloom’s classification for objectives. The following table shows the detailed test map:

Statistical Methods

SPSS program was used through this research

RESULTS AND DISCUSSION

After the end of the experiment according to the research procedures, the results are presented to analyze the data statistically for the post-test according to the research hypothesis, the results are presented as follows: To verify the validity of the research, the arithmetic mean, the standard deviation and the (t-test) value of the experimental and control group students’ scores in

the post-test was calculated. **Table (2)** shows that the mean grade of the experimental group students was (63.39) with Standard deviation (8.38), as well as mean grade of the control group was (51.83) with standard deviation (6.29), and by using t-test for two independent samples to identify significance differences between the two means and the table shows that the difference is statically significance as the calculated t-value was (4.179) which is greater than the tabulated t-value (2.000) with degree of freedom (59) and significance level (0.05), which indicates that there are statistically significant differences between the average mean of experimental and control students’ scores for the benefit of the experimental group and for the effectiveness of the educational units. Through the results, it was indicated that the Effectiveness of the proposed educational units for general teaching methods subject through the use of cognitive maps. This is evidenced by the high scores on the achievement and the post-test. Thus, the experimental group which studied the educational units has succeeded on the control group that studied the general teaching methods book subjects. This result was because the educational units have several characteristics like clarity, ease of implementation, acceptance by the students, their interests, abilities, and training in planning, working, group learning, and collaborating among them during the learning process.

Table 1. Shows the experimental design of the research

Group	Independent variable	Dependent variable
Experimental	Educational units of the general teaching methods by Constructivism theory	Post achievement test
Control		Post achievement test

Table 2. Shows the test map.

Edu. Unit No.	Edu. Unit Address	No. of Behavioral Objectives	Relative weight	Behavioral Objectives Levels						Sum
				Remembering 30%	Understanding 27%	Application 15%	Analysis 13%	Synthesis 9%	Rectification 6%	
First	Terminology	20	25%	5	5	4	3	2	2	20

Evaluation of Shear Bond Strength of Metal Brackets in Total Dryness and Partial Dryness Conditions

Issam Merzah Abdullah¹, Kasem Ahmed Abeas¹, Lamees Khudir Mohamed¹,
Arkan Muslim Abd Al-kareem¹

¹Faculty of Dentistry, University of Babylon, Hillah City, Iraq

ABSTRACT

This study aimed to evaluate the shear bond strength of metal brackets in total dryness field and in partial dryness field to overcome the moisture problem during brackets bonding especially in posterior area. Thirty extracted premolar teeth were divided arbitrarily into two groups. Each one of these groups consisted of 15 teeth framed in an acrylic block. After standard enamel etching procedure, in group (A) the bracket bond in total dryness field and in group (B) the bracket bond in partial dryness field by curing only one side and after that moisture the tooth by distal water and complete the bonding of the other side. The results show that the shear bond strength of bracket with total dryness (41.9 MPa) was more than partially dryness (28.7 MPa) but statically there is no significant between these two groups. The orthodontists can bond the brackets using partial dryness that give him/her the time to complete the bonding and overcome the moisture problem especially in posterior area.

Keywords: Shear bond strength, Metal brackets, total dryness, Partial dryness.

INTRODUCTION

Fixed orthodontic appliance need precise bracket position also with enough shear bond strength to withstand the occlusal force and orthodontic forces and in the same time the brackets can be removed with minimal damage to enamel¹⁻³. The orthodontic brackets bond to tooth enamel by composite, there are many techniques to bonding the brackets. Previously and rarely now the chemical curing composite has been used to bond the brackets, more recently the orthodontists use light-curing composite to bond the brackets to tooth enamel. one of the advantages of use of light-cured composite material is easier in use and give time for precise bracket position, so its use in orthodontic treatment become very popular^{4,5}. The big challenge with the use of light-cured composite is the bond of the bracket with this composite need dry field to get optimal shear bond strength, in addition to that it need long curing time which consider

unsuitable for both orthodontist and patient^{3,6}. For that reason, decrease the curing time by using device with high intensity of light to enhance polymerization as there is no statically significant between high intensity and less time device and low intensity and longtime device⁵. Also to overcome the dryness and wetness problem, there are some methods used like use Assure universal bonding resin. The Assure universal bonding resin is fluoride-releasing properties, and this product has been reinforced with a resin cement, also it has hydrophilic properties, and has the capacity to bond to light-cured or dual-cured adhesives. The Assure hydrophilic resin system, it has been evaluated under wet conditions, Bond strength of Assure adhesive resin decreased significantly in the presence of saliva contamination compared with dry bonding conditions⁶⁻¹⁰. There is no any study compare the shear bond strength in complete dryness and partially dryness and the partially dryness refer to bonding the one side of bracket in dry condition and complete the curing after wetting the tooth enamel, the aim of this study is to compare the shear bond strength between dry field bonding of brackets and partially dry bonding of the brackets using heavy intensity LED curing unite.

MATERIALS AND METHOD

For this study, previously extracted premolars have been used from patients demanded orthodontic treatment, after extraction each tooth was cleaned and washed to remove blood and remnants of soft tissue and kept in jug with distilled water at room temperature, and to avoid bacterial growth we change the water periodically. There are some standards put to select the samples, and the sample should be;

- The enamel of buccal surface should be intact.

- Should be don't treated with chemical products (e.g., H₂O₂), -Should be caries free.

A total of thirty stainless steel orthodontic brackets (STRATUS Bracket Systems) the surface area provided by the manufacturer company (Fairfield Orthodontics, USA), the base was directly bonded with Resilience® Light-Activated Orthodontic Bonding Systems (Ortho Technology, Inc, USA). In this study we use heavy intensity with short time curing unite as we previously proved there is no significant difference between light intensity with long time and heavy intensity with short time, so prefer to use heavy intensity to save time.⁵

The sample divided in to two groups according to type of curing;

Group A; in this group 15 brackets bonded to tooth surface by orthocomposite and curing mesial and distal surfaces for about 3 seconds (total 6 second) by using light curing device with intensity equal to (5000-6000 mW/cm), by using (The FlashMax P3 460 4W, CMS Dental A/S Ragnagade 7 DK - 2100 Copenhagen Denmark.

Group B; in this group 15 brackets bonded to tooth surface by orthocomposite and curing only mesial surfaces in dry condition for about 3 seconds after that wet the tooth by distal water for 10 seconds and complete the bonding by curing the distal surface for about 3 seconds (total 6 seconds) also use curing device with intensity equal to (5000-6000 mW/cm) by using (The FlashMax P3 460 4W, CMS Dental A/S Ragnagade 7 DK - 2100 Copenhagen Denmark.

Preparation the sample;

Every tooth should be mounted in acrylic block, and for that use aluminum container and the tooth built in this container by using sticky wax and the teeth

placed so that the middle third of the buccal surface is positioned to be parallel the container, the container is dyed with a thin coat of separating medium (Vaseline) also to increase retention of tooth in container we made grooves on the roots to enhance retention.

We use self-curing acrylic to mounting the teeth in the container, after mixing the appropriate amount of liquid and powder, the mixture poured around the tooth to the height of the cemento-enamel junction.¹¹⁻¹³

After complete setting of acrylic, the samples were removed and coded and stored in distilled water. The buccal surface of each sample of each group before bonding was polished by means of non-fluoridated pumice and water mix with and by using rubber cup attach to a low speed head piece for about 10 seconds. Then each tooth was washed with water spray for 10 seconds then dried by oil free air for 20 seconds^{14, 15}. Shear bond strength measurement were done with (Microcomputer control Electronic Universal testing machine, model WDW-5, time group INC, china) with a crosshead rate of 0.5 mm/minute^(16,17) the force value were recorded in Newtons. The force was divided by the surface area of the bracket base to obtain the stress value in Mega Pascal units. The gathered data were statistically analyzed by utilizing Statistical Package for Social Sciences (SPSS) program. The tests used include, Descriptive analysis; minimum, maximum, mean, standard deviation and T- test.

RESULTS AND DISCUSSION

As showed in table (1), the mean of shear bond strength of group A was 41.9 MPa, and the minimum value was 23 MPa which is consider acceptable clinically as it is over 8 MPa because the minimum shear bond requires to withstand occlusal and orthodontic force must be over 8 MPa^{18,19}. The mean of shear bond strength of group B was 28.7 MPa and the minimum value was 14.1 MPa and also consider acceptable clinically as it is over 8 MPa^{18,19}. The table 2 show the difference between group A and group B. in spite of the mean value of group A (41.9 MPa) was greater than the mean value of group B (28.7 MPa) there no statically significant between these two groups (t-test = -1.71 and P-value= 0.104). Although the advantage of use light curing composite in bonding orthodontic brackets, there is a problem with dryness especially in posterior area, there are many methods suggested to overcome these problems

including use materials with hydrophilic properties^{3,20} also these materials show that the shear bond decreased significantly with moisture in compare with dry field⁶⁻¹⁰. In this study we use heavy intensity curing unit to decrease chair time to patient and orthodontist⁽⁵⁾ also use new technique in bonding the brackets to control the moisture and dryness during bonding procedure, as we can cure one side of each brackets in dry field and then after patient take rest or oven loss the dryness can complete the curing other side of brackets. According to this study, the mean of shear bond strength group A (dry field) is more the group B (partially dry) but statically insignificant (t-test = -1.71 and P-value= 0.104) as P –

value less than 0.05. There is no study compare between total dryness and partial dryness on shear bond strength of brackets, there are many studies compare the shear bond strength in dry and in wet condition (saliva or water contamination). Some of these study found the share bond strength had been increase after saliva or water contamination²¹⁻²³, and some other studies found no difference²³ also some studies found the shear bond strength decrease significantly after contamination²⁴. The large differences between these studies are may be due to type of artificial saliva that be used in study or the method and units used in curing and bonding and lastly may be due to method of assessment of shear bond strength.

Table 1. Descriptive statistic for each groups.

group	Mean(MPa)	N	Std. Deviation	Minimum(MPa)	Maximum(MPa)
group A	41.9	15	16.7	23	67.6
group B	28.7	15	18.7	14.1	65.1
Total	70.6	30	35.4	37.1	132.7

Table 2. t test between group.

group	Mean(MPa)	Sample size	Std. Deviation	t-test	P-value	Sig.
group A	41.9	15	16.7	-1.71	0.104	N.S
group B	28.7	15	18.7			
Statistically significant difference (P < .05).						

CONCLUSION

In spite of the the shear bond strength in total dryness is more than the partial dryness, it is statically non significate, so the orthodontists can bond the brackets using partial dryness that give him/her the time to complete the bonding and overcome the moisture problem especially in posterior are.

Generalized Power-Law Model of Magnetohydrodynamic Blood Flow with Heat Transfer

Ahmed Bakheet¹, Esam A Alnussairy², Zuhaila Ismail³, Norsarahaida Amin³

¹Department of Mathematics, College of Science, Mustansiriyah University, Baghdad, Iraq, ²Department of Mathematics, Computer Science and Mathematics, Wasit University, Wasit, Iraq, ³Department of Mathematical Sciences, Faculty of Science, Universiti Teknologi Malaysia, UTM, Johor Bahru, Johor, Malaysia

ABSTRACT

Unsteady non-Newtonian blood flow characterized by the generalized power-law model subjected to an external magnetic field together with heat transfer through stenosed artery has been developed. The arterial segment is assumed to be a cylindrical tube and the arterial wall is considered to be flexible having cosine shaped stenoses a condition due to the abnormal narrowing of a blood vessel. The full equations comprising the governing equations of motion, heat equation, the initial and the boundary conditions are solved using numerical procedure involves the discretization of the equations using the Marker and Cell (MAC) method, where pressure along the artery is calculated iteratively using the Successive-Over-Relaxation (SOR) technique. The results demonstrated through the simulations that under the influence of magnetic field, the blood temperature distribution over the entire arterial segment increases. The present results also predict the effects of the generalized power-law index and the Prandtl number on the distribution of blood temperature.

Keywords: Numerical study; magnetohydrodynamic; pressure correction; heat transfer.

INTRODUCTION

Most of diseases influence temperature changes; this variation of temperature is in reality of great importance in a biological system. Lack of proper investigation of temperature could lead to loss of life. On the other hand, it is well known that the purpose of using magnetohydrodynamic (MHD) in the hyperthermia therapy is to enhance the temperature exceeding a therapeutic value 42°C, while keeping the surrounding temperature in the range of sublethal temperature. So we need to have a better understanding to control blood temperature in such conditions. Based on this assumption, Khanafer *et al.* in ¹ studied the influence of pulsatile laminar flow on temperature distribution in a single blood vessel receiving hyperthermia treatment ². investigated the dynamic response of heat transfer in blood flow through artery under stenotic condition,

considering blood as Newtonian fluid.³ studied numerically the MHD-micropolar fluid flow with heat and mass transfer through a porous medium. The impact of heat transfer on the blood flow in a stenosed artery under the optically thin fluid assumption has been presented by^{4,5} investigated the impact of heat and chemical reactions on blood flow through a tapered artery, treating blood as Walters B fluid ⁶. presented a mathematical model to study the dynamic response of heat and mass transfer in the blood flow through stenosed bifurcated artery ⁵. Investigated the effect of heat transfer on Herschel-Bulkley fluid through an inclined tube. They observed that the temperature profile reduces with the increase in the Prandtl number. Then ⁸ studied the heat and mass transfer impact on the biomagnetic Newtonian fluid of blood flow through a stenosed tapered artery. Li and Huang in ⁹ studied heat transfer on blood flow in a stenosed artery subject to a steady spatially varying magnetic field. Blood is considered as a biomagnetic fluid in the Cartesian coordinate and the electrical conductivity and the varying viscosity is concerned with their model. They reported that the magnetic field modifies the field of the flow and temperature considerably ¹⁰. presented

Mustansiriyah University, Baghdad, Iraq

numerical solutions for steady MHD blood flow through a bifurcated artery with mild stenosis in parent lumen with heat transfer assuming blood as couple stress fluid ¹¹. Studied the flow characteristics and heat transfer due to the body acceleration for blood through a porous artery exposed to a vibration environment ¹². Studied the Effect of heat transfer on unsteady MHD flow of blood in a permeable vessel in the presence of non-uniform heat source ¹³. Studied the effect of magnetic field on blood flow characteristics and heat transfer, treating blood as a Newtonian fluid. They observed that the magnetic field applied alters the flow pattern; even downstream the stenosis region, raises the wall shear stress at the throat of the stenosis, and increases the heat transfer across the arterial wall. ¹⁴ studied the impact of heat and mass transfer on a generalized Newtonian blood model under the stenotic condition in rigid artery. ¹⁵ investigated the

effects of heat and mass transfer on Carreau fluid model for blood flow through a tapered artery with a stenosis. Most previous studies introduced a mathematical model to characterize the dynamics of blood flow using a given pressure, whereas in reality, the pressure is unknown. Thus the unsteady equations of motion governing blood flow and the heat transfer equations coupled with the appropriate initial and boundary conditions are solved numerically by MAC method.

Formulation of the problem

The streaming blood through the arterial lumen is treated as unsteady, two-dimensional, nonlinear, axisymmetric and fully developed characterized by generalized power-law fluid. The equations governing the flow in cylindrical coordinates system (r, θ, z) may be written in the nondimensional form as

$$r \frac{\partial w}{\partial z} + \frac{\partial(ur)}{\partial r} = 0 \tag{1}$$

$$\frac{\partial w}{\partial t} + \frac{\partial(wu)}{\partial r} + \frac{\partial w^2}{\partial z} + \frac{(wu)}{r} = -\frac{\partial p}{\partial z} - \frac{1}{\text{Re}} \left[\frac{1}{r} \frac{\partial}{\partial r} (r\tau_{rz}) + \frac{\partial}{\partial z} (\tau_{zz}) \right] - \frac{M^2}{\text{Re}} w \tag{2}$$

$$\frac{\partial u}{\partial t} + \frac{\partial u^2}{\partial r} + \frac{\partial(wu)}{\partial z} + \frac{u^2}{r} = -\frac{\partial p}{\partial r} - \frac{1}{\text{Re}} \left[\frac{1}{r} \frac{\partial}{\partial r} (r\tau_{rr}) + \frac{\partial}{\partial z} (\tau_{rz}) \right] \tag{3}$$

$$\frac{\partial T}{\partial t} + w \frac{\partial T}{\partial r} + u \frac{\partial T}{\partial z} = \frac{1}{\text{Pr} \cdot \text{Re}} \left[\frac{\partial^2 T}{\partial z^2} + \frac{1}{r} \frac{\partial T}{\partial r} + \frac{\partial^2 T}{\partial r^2} \right] \tag{4}$$

where p is the pressure, r and z are the dimensionless coordinates, scaled with respect to r_0 , with the z -axis located along the axis of the artery. As there is no secondary or rotational flow so the total velocity is defined by the dimensionless radial and axial components, u and w are scaled with respect to the cross-sectional average velocity U . T is the temperature. The generalized Reynolds number Re , Hartmann number M and Prandtl number Pr are defined as

$$\text{Re} = \frac{\rho r_0^n}{m U^{n-2}}, M = B_0 \left(\frac{r_0^{n+1} \sigma}{m U^{n-1}} \right)^{1/2} \text{ and } \text{Pr} = \frac{m c_p r_0^{1-n}}{k U^{1-n}} \tag{5}$$

where m and n are the consistency and power indices of the generalized power-law model respectively, c_p is the specific heat of the streaming blood at constant pressure and k is the thermal conductivity.

$$\tau_{zz} = -2 \left\{ \left[\left[2 \left(\frac{\partial u}{\partial r} \right)^2 + 2 \left(\frac{u}{r} \right)^2 + 2 \left(\frac{\partial w}{\partial z} \right)^2 + \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right)^2 \right]^{\frac{1}{2}} \right]^{\frac{1}{2}} \right\}^{\frac{1}{2}} \left(\frac{\partial w}{\partial z} \right) \quad (6)$$

$$\tau_{rz} = - \left\{ \left[\left[2 \left(\frac{\partial u}{\partial r} \right)^2 + 2 \left(\frac{u}{r} \right)^2 + 2 \left(\frac{\partial w}{\partial z} \right)^2 + \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right)^2 \right]^{\frac{1}{2}} \right]^{\frac{1}{2}} \right\}^{\frac{1}{2}} \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right) \quad (7)$$

$$\tau_{rr} = -2 \left\{ \left[\left[2 \left(\frac{\partial u}{\partial r} \right)^2 + 2 \left(\frac{u}{r} \right)^2 + 2 \left(\frac{\partial w}{\partial z} \right)^2 + \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right)^2 \right]^{\frac{1}{2}} \right]^{\frac{1}{2}} \right\}^{\frac{1}{2}} \left(\frac{u}{r} \right) \quad (8)$$

The geometrical model of the stenosis considered in this model is the cosine curve

$$R(z, t) = \begin{cases} 1 - \frac{\delta}{2r_0} \left(1 + \cos \left(\frac{\pi(z - z_1)}{z_0} \right) \right) a_1(t), & d < z < d + 2z_0 \\ a_1(t) & \text{otherwise} \end{cases} \quad (9)$$

where $R(z, t)$ is the radius of the artery in the stenotic region and r_0 , in the non-stenotic region, δ is the severity of the stenosis, z_0 is the half length of stenosis and z_1 is the center of the stenosis. The time-variant parameter, $a_1(t)$ is given by $a_1(t) = 1 + k_R \cos(\omega t - \phi)$ where k_R represents the amplitude parameter and ϕ is the phase angle.

Boundary and Initial Conditions

For the boundary conditions, there is no radial flow along the axis of the artery and the axial velocity gradient of the streaming blood may be assumed to be equal to zero, i.e., there is no shear rate of fluid along the axis.

$$\tau_{rr} = -2 \left\{ \left[2 \left(\frac{\partial u}{\partial r} \right)^2 + 2 \left(\frac{u}{r} \right)^2 + 2 \left(\frac{\partial w}{\partial z} \right)^2 + \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right)^2 \right]^{\frac{1}{2}} \right\}^{\frac{1}{n-1}} \left\{ \left(\frac{u}{r} \right) \right\} \quad (8)$$

The geometrical model of the stenosis considered in this model is the cosine curve

$$R(z, t) = \begin{cases} 1 - \frac{\delta}{2r_0} \left(1 + \cos \left(\frac{\pi(z - z_1)}{z_0} \right) \right) a_1(t), & d < z < d + 2z_0 \\ a_1(t) & \text{otherwise} \end{cases} \quad (9)$$

where $R(z, t)$ is the radius of the artery in the stenotic region and r_0 , in the non-stenotic region, δ is the severity of the stenosis, z_0 is the half length of stenosis and z_1 is the center of the stenosis. The time-variant parameter, $a_1(t)$ is given by $a_1(t) = 1 + k_R \cos(\omega t - \phi)$ where k_R represents the amplitude parameter and ϕ is the phase angle.

Boundary and Initial Conditions

For the boundary conditions, there is no radial flow along the axis of the artery and the axial velocity gradient of the streaming blood may be assumed to be equal to zero, i.e., there is no shear rate of fluid along the axis.

$$u(r, z, t) = 0, \frac{\partial w(r, z, t)}{\partial r} = 0, \frac{\partial T(r, z, t)}{\partial r} = 0 \text{ and } \tau_{rz} = 0 \text{ for } r = 0 \quad (10)$$

The velocity of the artery wall is taken as

$$u(r, z, t) = \frac{\partial R}{\partial t} \text{ and } w(r, z, t) = 0, T(r, z, t) = 1 \text{ for } r = R(z, t) \quad (11)$$

The inlet velocity conditions were assumed to have a parabolic velocity profile corresponding to Hagen–Poiseuille flow through a long circular tube in the absence of magnetic-field and Hartmann flow in the presence of magnetic-field which it is provided with evidence by Mustapha *et al.*¹⁶ and may be written mathematically as follows:

$$w(r, z, t) = 2U \left[1 - \left(\frac{r}{R} \right)^2 \right] \quad \text{for } z = 0, M = 0 \quad (12)$$

$$w(x, z, 0) = 2U \left(\frac{I_0(MR)}{I_0(MR) - 1} \right) \left(1 - \frac{I_0(MxR)}{I_0(MR) - 1} \right) \quad \text{for } z = 0, M \neq 0 \quad (13)$$

and

$$u(r, z, t) = T(r, z, t) = 0 \quad \text{for } z = 0 \quad (14)$$

The outlet conditions are given by

$$\frac{\partial w(r, z, t)}{\partial z} = \frac{\partial u(r, z, t)}{\partial z} = 0 \quad \text{and} \quad \frac{\partial T(r, z, t)}{\partial z} = 1 \quad \text{at } z = L \quad (15)$$

Where I_0 the modified Bessel function of first kind and L is the length of the constricted artery under consideration. Moreover, it is assumed that initially no flow takes place when the system is at rest except at the inlet, that means,

$$w(r, z, 0) = 0, u(r, z, 0) = 0 \quad \text{and} \quad p(r, z, 0) = 0 \quad \text{for } z > 0 \quad (16)$$

The complete numerical algorithm to solve the equations already discussed in ¹⁷.

RESULTS AND DISCUSSION

For the purpose of numerical computations of the desired quantities of major physiological significance, the following parameter values involved in the present analysis as follows: . The results are obtained after the steady state achieved in the simulation. Figure 1 illustrates the axial velocity profile behaviour of the blood flow with different Hartmann number M at the downstream of the stenosis $z = 23$ where the flow separation occurs and $Re = 300$ in the constricted artery. This graph shows that the axial velocity in the center of the artery decreases while it increases near the arterial wall with the increase of magnetic-field intensity. The improvement of the axial velocity near the wall grows to be strong enough to prevent any reverse in the pressure gradient and this makes resistance to the flow separation. This observation agrees well with those of ¹⁶ and ¹⁸. Figure 2 illustrated the cross-sectional profiles of the blood temperature distribution at a different n and

different location of the stenosed artery having 48% area reduction with the same $Re = 300$. It appears from this figure that the analogous behaviour of the consecutive curves of the temperature distribution, and the shear-thickening model gives higher temperature at the throat ($z = 15$) and downstream of the stenosis ($z = 23$) while there are no notable changes upstream of the stenosis for all values of n . The temperature variation becomes less significant, gradually nearby the arterial wall. Figure 3 (a) and (b) illustration the effects of increasing area occlusion (stenotic height) on the temperature profiles for different location of the stenosed artery along the radial and axial position respectively. The results show that when there is an increase in occlusion, the temperature profiles decreases at the upstream and at the throat of the stenosis. But the profile gets deviated downstream of the stenosis, that is, in the diverging segment of the stenosed artery ($z = 23$) where backflow occurs and recirculation zones are formed. At this critical position,

the temperature distribution profile seems to have a point of inflexion, unlike in the other locations. These results agree with those of ¹⁹. It is observed that presence of an external magnetic field increases the temperature of the blood. This increment can be attributed to the fact that the applying of the magnetic field to blood gives rise to a resistive kind of force known as Lorentz force. This force bears the potential to enhance the temperature of blood since blood is an electrically conducting fluid. From Figure 4 we can observe that the increase in Hartmann number leads to higher blood temperature.

CONCLUSION

This work deals with a mathematical model representing the dynamic response of heat transfer to blood streaming through a stenosed artery under the effect of magnetic field. The blood is treated to be generalized power law fluid and the arterial wall is considered to be elastic with 48%, 64% and 84% cross-sectional area reduction is represented by mild, moderate and severe stenosis, respectively, occurring at different stages of the development of atherosclerotic disease. The governing equations of motion accompanied by the appropriate choice of the boundary conditions are solved numerically by MAC method. The results focused on the effect of stenoses, the generalized power law index n and magnetic field on heat transfer of blood flow.

ABSTRACT

Aim of the study: is to make clear the role of ultrasound in diagnosis and characterization of hydronephrosis in a sample of Iraqi patients. Patients and methods: The present cross sectional study included 60 patients with ultrasound evidence of hydronephrosis selected from a cohort of patients referred from the unit of urology at Al-Hilla teaching hospital. Their age ranges from 21 up to 55 years and the sample included 40 women and 30 men. The study duration extended from 1st of February 2018 to 15th of July 2018. The ultrasonic renal exam did not require any preparation of the patient and was performed with the patient in the supine position. The kidneys were examined in longitudinal and transverse scan planes with the transducer placed in the flanks. A curved array transducer with center frequencies of 3–6 MHz was used. Following ultrasound examination, the major cause of hydronephrosis was pregnancy induced expansion of renal pelvis followed by ureteric stone, inflammatory stricture and benign prostatic hyperplasia. The single patient with benign prostatic hyperplasia was 55.

Keyword: Hydronephrosis, Ureter dilatation, ultrasound

INTRODUCTION

When the collecting system of the kidney gets dilated with the corresponding ureter, the conditions are termed hydronephrosis and hydroureter, respectively. Although, pathologic conditions are associated with hydroureter, the condition sometimes is physiological ^{1,2}. The existence of a pathology that interferes with normal urinary flow may cause obstructive hydronephrosis and hydroureter. This obstruction may be located anywhere along the urinary tract ascending from the urethra up to the pelviureteric junction and may be caused by a pathology in the urethra, prostate, kidney, retroperitoneum and even vascular lesions. These lesions are responsible if they existed for sufficient period for structural and functional changes in the urinary tract that are characteristic of

obstructive hydronephrosis ^{3,4}. Pelviureteric junction (PUJ) obstruction is usually congenital; however, its diagnosis may be missed till adulthood and some cases are acquired because of stone, inflammatory strictures and post-operatively ^{5,6}. Hydronephrosis is detected in 0.5-1% of all new live births, and ureteropelvic junction obstruction (UPJO) is responsible for a substantial fraction of those cases. Obstruction of the urinary tract that happens during early renal maturation affects renal growth, maturation and morphogenesis, which may be accompanied by progressive tubular atrophy and interstitial fibrosis in most severe conditions ⁷. On the other hand, Physiologic hydronephrosis and hydroureter is common during pregnancy. All aspects of kidney physiology are essentially altered during pregnancy. Circulation in general is subjected to an expanded blood volume and significant vasodilation. The rate of glomerular filtration, normally 125 ml/s, increases by half fold compared to that in non pregnant women. The changes in renal tubular function are reflected by glucosuria, lower serum osmolality, proteinuria and decrease serum sodium concentration. For that reason,

the kidneys become larger during pregnancy and hydronephrosis supervenes⁸. Ultrasound in comparison with CT scan, has the advantage of being free of radiation, and its role in diagnosis and follow up in the field of nephrology is increasingly supported by enormous amount of data published in scientific medical references^{9,10}. Hydronephrosis is easily diagnosed by US and its existence or absence may help surgeons and physicians with the required information to plan for further surgical and or medical interventions. Ultrasound is remarkably sensitive and reliably specific for the detection and characterization of hydronephrosis when comparison is made with CT scan¹¹⁻¹³. Lack of sufficient data of the usefulness of ultrasound examination in Iraqi patients with hydronephrosis and the rarity of Iraqi reports about major causes of hydronephrosis and hydroureter in our population gave us the motive to plan and to conduct the current study to make clear the role of ultrasound in diagnosis and characterization of hydronephrosis in a sample of Iraqi patients.

MATERIALS AND METHOD

The present cross sectional study included 60 patients with ultrasound evidence of hydronephrosis selected from a cohort of patients referred from the unit of urology at Al-Hilla teaching hospital. Their age ranges from 21 up to 55 years and the sample included 40 women and 30 men. The study duration extended from 1st of February 2018 to 15th of July 2018. The location of study was at Al-Hilla city, Babylon province, Iraq. Written informed consent was obtained from all patients enrolled in the present study and the study was approved by ethical approval committee at Al-Hilla teaching hospital. The ultrasonic renal exam did not require any preparation of the patient and was performed with the patient in the supine position. The kidneys were examined in longitudinal and transverse scan planes with the transducer placed in the flanks. A curved array transducer with center frequencies of 3–6 MHz was used.

Statistical analysis was carried out using statistical package for social sciences (SPSS) version 23 and Microsoft Office Excel 2010. Numeric data were expressed as mean and standard deviation, whereas, categorical data were expressed as number and percentage.

RESULTS AND DISCUSSION

Current study included 60 patients who were proved to have hydronephrosis by ultrasound examination. The age range of those patients was 20-55 years with a mean of 31.42 ±8.91 years; majority was females, 40 women versus 20 men, as shown in table 1. The main presenting complain was pain in the flanks which seen in 55% of cases. Other symptoms included urinary frequency, dysuria, supra-pubic pain, fever, nausea and vomiting, as shown in table 2. Following ultrasound examination, the major cause of hydronephrosis was pregnancy induced expansion of renal pelvis followed by ureteric stone, inflammatory stricture and benign prostatic hyperplasia. The single patient with benign prostatic hyperplasia was 55 years old with symptoms of hesitancy and poor stream after careful history review. Hydronephrosis was identified as an anechoic fluid-filled space with enhancement within the kidney sinus, and usually, the enlarged pelvis is easily recognized versus dilated calyces. Majority of patients showed mild to moderate degree dilation of plevicalyceal system and nearby urete, however a single patient showed severe degree of hydronephrosis with marked cortical thinning. This patient gave a history of previous operation (Ureterotripsy) for impacted ureteral stone and hence the most probable diagnosis was ureteral stricture due to previous operation for ureteric stone. The present study showed that hydronephrosis was most commonly physiological as it associated normal pregnancy. Fluid retention and pressure effect by the gravid uterus are the main contributing factors in pregnancy induced hydronephrosis. However, the dilation was mild and corical thickness was normal in all pregnant ladies. It is estimated that hydronephrosis accompanies 80% of normal pregnancies⁸. Hydronephrosis amid pregnancy happens in 43% to 100% pregnant ladies, and it is more predominant with progressing trimester¹⁴. Serial quantitative estimations by ultrasonography show that the maximal rate of hydronephrosis is come to at 28 weeks, with a 63% generally speaking rate of hydronephrosis¹⁵. The widened gathering framework can hold 200 to 300mL of pee, prompting urinary stasis and a 40% expanded hazard for pyelonephritis in pregnant ladies with asymptomatic bacteriuria versus nonpregnant women⁸. In the current study, ureteric stone were seen in 21.7% of cases. Ureteric stones are a typical reason for check of the urinary tract, ordinarily giving well known signs and side effects, for example, intense ureteric

colic and hematuria. Every so often, stones may give non-particular indications, for example, low back agony and stay unidentified, prompting stone development, unending ureteric deterrent and difficulties, for example, hydronephrosis and renal harm¹⁶. One of the main finding in the present study is that Ureterotripsy may be complicated by inflammatory stricture of the ureter and that follow up of those particular patients is mandatory to identify ureter stricture as early as possible before advanced hydronephrosis supervene with subsequent kidney damage, just like the case enrolled in our study. Ultrasound follow up in such patients is easy noninvasive and valid tool to discover ureteric dilation as early as possible. One of the essential signs for referral to US assessment of the kidneys is assessment of the urinary collection framework¹⁷. Amplification of the urinary collection system is normally identified with urinary hindrance and can incorporate the pelvis, the calyces and the ureter. Hydronephrosis is viewed as an anechoic liquid filled interconnected space with improvement inside the renal sinus, and typically, the widened pelvis can be separated from the expanded calyces. A few conditions can result in urinary block. In the two grown-ups and youngsters, masses, for example, abscesses and tumors, can pack the ureter. In kids, hydronephrosis can be caused by ureteropelvic junction obstruction, ectopic ureter, essential megaureter and posterior urethral valve. In the last mentioned, both kidneys will be influenced. In grown-ups, hydronephrosis can be caused by urolithiasis, hindering the outlet of the renal pelvis or the ureter, and pressure of the ureter from, e.g., pregnancy and retroperitoneal fibrosis¹⁸. Urolithiasis is the most well-known reason for hydronephrosis in the grown-up understanding and has a commonness of 10%– 15%¹⁹. Under typical conditions, the ureter isn't seen with US. In any case, in, e.g., urinary deterrent and vesicoureteric reflux with widening of the ureter, the proximal part in continuation with the renal pelvis, and also the distal part close to the ostium can be assessed. The hydronephrosis is regularly evaluated outwardly and can be isolated into five classes going from a slight development of the renal pelvis to end-arrange hydronephrosis with cortical diminishing²⁰. The assessment of hydronephrosis can likewise incorporate measures of calyces at the level of the neck in the longitudinal output plane, of the enlarged renal pelvis in the transverse sweep plane and the cortical thickness, as clarified beforehand¹⁷. On the off chance that the liquid in the enlarged gathering framework has echoes, pyonephrosis ought to be avoided by clinical

exam, blood examination and, in uncommon cases, cut or waste. Hydronephrosis can likewise be caused by non-obstructive conditions, for example, lively diuresis in patients treated with diuretics, in pregnant ladies and in youngsters with vesicoureteral reflux¹⁸.

Table 1. Age and gender characteristics of the study group.

Characteristic	Value
Number of cases	60
Age	
Mean ±SD years	31.42 ±8.91
Range (min.-max.)	33 (20-55)
Gender	
Male, n (%)	20 (33.3%)
Female, n (%)	40 (66.7%)
M:F ratio	1:2"

Table 2. Presenting symptoms

Symptoms	n (%)
Pain in the flank	33 (55.0%)
Frequency	17 (28.3%)
Dysuria	12 (20.0%)
Supra-pubic pain	8 (13.3%)
Fever	4 (6.7%)
Nausea and or vomiting	4 (6.7%)

Table 3. Causes of hydronephrosis

Cause	n	%
Pregnancy	30	50.0 %
Stone	13	21.7 %
Inflammatory stricture	1	1.7 %
BPH	1	1.7 %

CONCLUSION

Ultrasound is a reliable non-invasive investigatory

tool that can identify hydronephrosis, highlights its cause and assess the severity of urinary tract obstruction and the kidney function.

²Ministry of Health, Baghdad, Iraq

ABSTRACT

Smoking is a process in which a substance like tobacco is burned to produce smoke that inhaled and absorbed into the bloodstream. The cigarette smoking is one of the greatest causes of illness, such as lung cancer, and premature death. The present study was constructed to evaluate the effect of cigarette smoking on the liver biochemical state. The study includes 50 smokers as patient group and 50 (age and sex matched) non-smokers as control group. The liver functions tests; aspartate aminotransferase (AST), alanine aminotransferase (ALT), total protein and alkaline phosphatase (ALP) were estimated spectrophotometrically. The results revealed that there was a significant reduction in the levels of AST, ALT, serum total protein and ALP of smokers in comparison with the healthy control (non-smokers) group. Also the results revealed the presence of a positive correlation between ALT and AST. To conclude, alterations in liver parameters levels could be attached to the oxidative stress created through the accumulative effect of inhaled smoke as well as the interaction of absorbed toxic chemicals like nicotine. Therefore, the association between smoking attitude and liver functions tests should be carefully analyzed.

Keywords: liver; smoking; ALP; ALT; AST and total protein.

INTRODUCTION

Smoking is a process in which a substance, most commonly is the dried leaves of the tobacco, is burned and the resulting smoke inhaled and absorbed into the bloodstream¹. The use of tobacco cigarette smoking as well as hookahs smoking are become a major aspect of our society. It has been revealed that cigarette smoking is one of the greatest reasons of illnesses and precocious death for human. It is also reported that smoking-related diseases kill about half of long-term and heavy smokers, where it is found that males losing about 13.2 years and females losing about 14.5 years of their life as a result of smoking. In fact, about 4.9 million people per year have been reported to die worldwide as a result of smoking²⁻⁵. Smoking has been found to harm and injury

approximately all parts of the human body. Lung cancer, heart attacks, vascular stenosis and chronic obstructive pulmonary disease are the most common diseases that can occur as a result of smoking⁶⁻⁸. Also, smoking has been found to cause harmful effects on the fetus during pregnancy⁹. Alarmingly, cigarette smoke contains at least 200 toxic substances, 73 known carcinogens, and large amounts of oxidants and free radicals that promote oxidative stress in the human body¹⁰⁻¹². The liver is a large and vital organ of human body. It plays major and substantial roles in the human body, like digestion processes, metabolism, storage of nutrients and detoxification¹³. Therefore, it is extremely important to maintain the health conditions of this vital organ, and everyone should be aware of some things that can cause liver damage. Liver function tests are a set of blood tests that include serum total protein, albumin, total bilirubin (TB), alkaline phosphatase (ALP), aspartate aminotransferase (AST), alanine aminotransferase (ALT) and γ -glutamyl transferase (GGT). They are useful and very important tests in the clinical evaluation of the state of the liver, and to help diagnose and monitor liver disease or liver damage, as well as to monitor

liver response to treatment. There are many personal and environmental factors that can affect liver function tests including age, sex, drinking alcohol, malnutrition, the suffering of certain diseases (such as heart disease, skeletal muscle, endocrine diseases), as well as liver health¹⁴⁻¹⁶. In fact, there is a lack of information about the influence of smoking on the function of liver. In contrast, alcohol consumption was found to be the most common cause of liver damage in humans. In drinking, the liver focuses mainly on eliminating the potential damage of alcohol by converting it into a less toxic form, where drinking alcohol leads to significant changes in fat metabolism in the liver¹⁷⁻¹⁹. These changes eventually lead to inflammation, steatohepatitis, cirrhosis and liver cancer^{20,21}. Furthermore, it was found that alcohol consumption leads to increased levels of ALT and AST in humans²². Despite that cigarette smoke does not have a direct contact with the liver, it was found that the harmful chemicals in cigarette smoke causes a variety of adverse effects on the liver²³. It has been reported that cigarette smoking increased serum ALP and GGT levels^{24,25}. To date, there is still a delay in the researches that concerned with the full investigation of the influence of cigarette smoking on liver tissue and liver functions. Thus, the present study was constructed on Iraqi students in Baghdad city to evaluate the influence of cigarette smoking on the biochemical state of liver by investigating the most commonly used set of liver function tests.

MATERIALS AND METHOD

Subjects and study design:

This study was conducted in the department of chemistry, college of sciences, Mustansiriyah University, Baghdad, Iraq, between October, 2016 and April, 2017. The study includes 50 male smokers as patients group with age ranging from 19-23 years, and 50 non-smokers male volunteers with age ranging from 18-22 years as control group.

Sample Collection

From each individual patients and control, 5 ml of blood were drawn by vein puncture and placed in a disposable plastic tube. The sample left to clot for about 20 minutes at room temperature and then centrifuged at 3000 g for 10 minutes. The obtained serum was carefully transferred into another tube and then frozen at -20°C for subsequent analysis.

Evaluation of Liver Function Tests

Serum levels of AST and ALT were determined by colorimetric method (Reitman and Frankel) by following the protocol of the commercially available *Randox* kits supplied by Randox Laboratories Ltd. (UK). Serum total protein levels was measured by spectrophotometry according to the colorimetric method protocol of the commercial *BioSystems* kit supplied by Biosystems SA, Barcelona, Spain. In addition, the colorimetric determination of serum ALP activity was carried out according to the protocol of the commercially available *bioMerieux* kit supplied by bioMerieux SA Company, Marcy-l'Etoile. France.

Statistical analysis

Data analysis was performed by Independent-Samples Student *t* test and Pearson's correlation analysis for assessment of mean differences between smokers and non-smokers control groups using the SPSS statistical software, version 20.0.

RESULTS AND DISCUSSION

The collective results for quantitative analysis of the liver function tests (AST, ALT, total protein and ALP) among two study groups are summarized in Table 1. These results indicated that the mean serum levels of AST, ALT, total protein and ALP (13.21 IU/L, 7.62 IU/L, 17.46 g/L and 13.26 IU/L) measured in smokers group were lower when compared to that of the control group (19.55 IU/L, 17.53 IU/L, 75.41 g/L and 59.61 IU/L). This decrease was found to be statistically highly significant ($p < 0.001$). The relationship between all parameters included in this work was tested using Pearson's correlation analysis. Data analysis revealed a positive correlation between ALT and ALP levels only, while no association was found between the other study parameters, see Table 2. We found that the liver enzymes levels in serum of smoker patients differ significantly compared with their levels in non-smoker controls. In fact, ALT and AST have important roles in amino acid metabolism. It catalyzes interconversion of L-alanine and α -ketoglutarate to pyruvate and L-glutamate. While AST catalyzes reversible transamination reaction of aspartate and α -ketoglutarate to oxaloacetate and glutamate. ALP is a hydrolytic enzyme that catalyzes removing of phosphate groups from nucleotides, proteins and alkaloids²⁶. Cigarette smoke contains a wide range of hazard substances that can harm every part of the body either

directly nor indirectly¹⁰. It has been proved that smokers are more likely to be under risk of a lot of deadly diseases such as cardiovascular diseases, respiratory disorders, lung cancer and pancreas cancer²⁷. Indirectly, smoking induces large adverse effects on the liver, however these toxic effects still need to clarify very well. Therefore, and in order to clarify the association between smoking and its effect on the liver, this work is studied the serum levels of AST, ALT, total protein and ALP in smokers and non-smoker persons. The results of the current work showed a significant decrease in the serum activity of AST, ALT, total protein and ALP in cigarette smokers when compared to non-smokers control group. It has been reported previously that there are significant increases in the levels of aspartate aminotransferase, alanine aminotransferase and alkaline phosphatase activities in smokers compared to non-smokers²⁸. These results are inconsistent with the results of the current work. Although cigarette smoke has no direct contact with the liver, however, the indirect effect of certain chemicals in cigarettes may occur over time. Where, these chemicals in cigarette smoke may prevent the

liver from functioning normally. Over time, the liver is become less efficient in detoxifying the body. The results obtained in this study give an impression of dysfunction in liver functions led to a decrease in the ALP, ALT and AST enzymes levels. Or perhaps due to an inhibition of enzyme activity as a result of the presence of nicotine in tobacco smoke. There is an imperious requirement to increase research and investigate the reasons for this decline in enzymes activity. The results obtained in this study on total protein are consistent well with the data in the previous study²⁸, which found that the serum level of total protein in smokers was lower than the levels of healthy control group (non-smokers). Cigarette smoking is associated with increased excessive production of free radicals leading to oxidative stress²⁹. Albumin, bigger part of total protein, has antioxidant properties³⁰. The low level in serum total protein revealed in this study may be due to the decrease in albumin level that involves in the antioxidant defense since the smokers are under higher oxidative stress. Furthermore, the decline in protein levels may be due to increased proteolytic activity or reduce protein synthesis as a result of exposure to cigarette smoke.

Table 1: Serum levels of the liver function tests (AST, ALT, total protein and ALP) in smokers and control groups.

Element	Control group N= 50				Smokers group N= 50				p value
	Mean	SD	Upper limit	Lower limit	Mean	SD	Upper limit	Lower limit	
AST (IU/L)	19.55	4.95	21.93	17.16	13.21	2.81	14.57	11.85	< 0.001
ALT (IU/L)	17.53	2.11	18.54	16.52	7.62	1.62	8.41	6.84	< 0.001
Total Protein (g/L)	75.41	13.06	80.71	68.11	17.46	5.39	19.06	13.86	< 0.001
ALP (IU/L)	59.61	10.08	63.47	53.75	13.26	3.59	13.98	10.53	< 0.001

Table 2. Correlations between variables in patients group (r value).

Parameter	AST	ALT	Total Protein	ALP
AST	1	0.127	-0.105	0.023
ALT	0.127	1	-0.049	0.748**
Total Protein	-0.105	-0.049	1	-0.182
ALP	0.023	0.748**	-0.182	1

CONCLUSION

Data obtained in this work indicate that exposure to cigarette smoke leads to an indirect disturbance in some parameters (e.g. enzymes and total protein) in the liver. Alterations in the concentrations of these parameters may be related to the oxidative stress resulting from the accumulative effect of inhaled smoke as well as the interaction of absorbed toxic chemicals like nicotine. AST, ALT and ALP enzymes and total protein are significantly lower in smoker patients compared to non-smoker controls. According to the results of this study, we can conclude that smokers are more likely to have liver problems than non-smokers. Therefore, the association between smoking habits and liver functions must be carefully analyzed. Further works to understand the mechanisms of these associations are needed to clarify the harmful effects of smoking on the liver. In fact, smoking habit in Iraq among young people is growing strongly. Therefore, smoking in Iraq must be regulated by strict law, as in developed countries. Smoking habits that have spread widely in primary and secondary schools, public transportation, health institutions and cafes should be banned.

MRI Findings in Iraqi Patients with Epilepsy: A Cross Sectional Study

Hasanain Ahmed Jasim¹, Osamah Ayad Abdulsattar²

¹Assistant professor/ Department of Surgery/ College of Medicine/ Babylon University/ Consultant Radiologist in Hilla Teaching Hospital at Radiology Department/Babylon province/ Al-Hilla City/ Iraq, ²Assistant professor/ Department of Surgery/ College of Medicine/ Babylon University, Consultant Radiologist in Hilla Teaching Hospital at Radiology Department

ABSTRACT

Aim of the study: is to evaluate role of MRI in epileptic patients. The study was a cross sectional one that included 51 epileptic patients, 29 children (under 15 years) and 22 adult. Those patients were referred by the neurology unit at Al-Hilla Teaching hospital to the MRI unit in the same hospital, Babylon province, Al-Hilla City, Iraq, during the period from 1st of January 2017 to 4th of June 2018. The MRI procedure was conducted on a 1.5 Tesla magnet (Siemens, Germany). The procedure involved imaging the routine epilepsy protocol of MRI examination relying on 5 mm thickness slices and 2.0 mm interslice gaps in the coronal, sagittal and axial planes with T1 and T2 weighting. Abnormal MRI findings were identified in 21 out of 51 patients (41.2%). In epileptic adults there were 5 (22.7%), 3 (13.6%), and 1 (4.5%) patients with space occupying lesions (mostly brain tumors), medial temporal sclerosis and other organic lesions (brain atrophy) respectively, whereas 1 (3.4%), 8 (27.6%), and 3 (10.3%) epileptic children showed the following lesions: with space occupying lesions (mostly brain tumors), medial temporal sclerosis and other organic lesions (brain atrophy and vascular abnormalities) respectively. The rate of abnormal MRI findings was 41.4% and 40.9% in children and adults respectively. Significant correlation was seen between focality of signs (in neurologic and EEG examinations) and rate of abnormal MRI findings ($P < 0.05$), table 4

Keywords: MRI, epilepsy, Iraq

INTRODUCTION

Epilepsy is diagnosed as a collection of heterogeneous syndromes characterized through extra conditions that coexist with seizures and affects over 50 million humans worldwide¹. Emotional, cognitive and behavioral comorbidities are commonplace. Seizures are generally divided into two most important classes: generalized and partial (focal). Generalized seizures affect both cerebral hemispheres from the onset of the seizure. Seizures produce loss of cognizance, either for lengthy durations of time or briefly, and are sub-categorised into generalized myoclonic, atonic, tonic-clonic or absence

subtypes². Partial seizures have an effect on an area inside one cerebral hemisphere and are the most habitual type of seizure reported through sufferers with epilepsy³. Moreover, focal seizures are subdivided into simple and complex depending on whether consciousness is retained or lost during seizure episode, respectively⁴. The cause of seizure may be organic lesion such as tumor or other sort of space occupying lesion and sometimes no structural abnormality is identified⁵. All patients with epilepsy ought to experience a MRI, aside from those with extremely regular types of primary generalized epilepsy, such as childhood absence and juvenile myoclonic epilepsy, or typical partial epilepsies in children with anticipated EEG findings and clinical features e.g., centrottemporal spikes in benign epilepsy, added to that the response to antiepileptic drugs is satisfactory^{6,7}. There are two essential circumstances in which to practice an MRI in patients with seizures. First of all, patients with recent diagnosis and those having

Corresponding author:

Osamah Ayad Abdulsattar

Assistant professor/ Department of Surgery/ College of Medicine/ Babylon University, Consultant Radiologist in Hilla Teaching Hospital at Radiology Department.

longstanding epilepsy and have not been adequately investigated. The second applies to patients with seizures that are refractory to medical treatment and in whom surgery is recommended⁶. Indeed, even those with long standing idiopathic focal epilepsy ought to experience an MRI. Even patients with long-term focal epilepsy of unknown etiology should undergo an MRI. Surgically treatable lesions, even low-grade tumors, have been found in individuals with a history of longstanding epilepsy⁸. Those patients suffering from focal signs during clinical examination should be given the priority for MRI evaluation. Critical imaging tests (MRI or CT scan) need to be performed in patients presented with new onset seizure associated with cognitive changes, a recent history of head trauma, fever, focal neurologic deficits and longstanding headache. In addition, an adult patient with a recent onset of focal seizure is a strong candidate for emergency imaging procedures⁹. The validity of MRI examination in patients with epilepsy is not restricted to characterization of an organic pathology, but also to know whether this pathology is static, such as congenital malformations and ischemic insults, or progressive such as malignant tumors. In addition, treatment modality can be properly selected based on MRI identification of the lesion, besides; MRI can be used to monitor lesion progression following establishment of definite treatment. In surgical planning, the need for three-dimensional (3D) reconstructions, diffusion tensor imaging (DTI) and co examination of variable imaging modalities is mandatory. Lesions detected by MRI are not always associated with seizures and seizures may arise from lesions that are not necessarily structural in nature¹⁰. For that reason, clinical data, neurophysiologic tests and MRI finding should be all taken into consideration in order to judge a given lesion to be a cause of epilepsy. Nevertheless, when EEG finding supports that of MRI in term of seizure zone, post-operative control of that seizure is usually better^{11,13}. Moreover, concerning research programs, MRI provide knowledge that makes our understanding of epilepsy pathophysiology even clearer¹⁴.

MATERIALS AND METHOD

The study was a cross sectional one that included 51 epileptic patients, 29 children (under 15 years) and 22 adult. The age range was from 3 to 45 years. Those patients were referred by the neurology unit at Al-Hilla Teaching hospital to the MRI unit in the same hospital, Babylon province, Al-Hilla City, Iraq, during the period

from 1st of January 2017 to 4th of June 2018. Any patient with a history of acute cerebral insult such as infection, trauma, metabolic abnormalities or vascular pathology was excluded from the study, as well as children with neonatal seizures. The diagnosis epilepsy was established in the neurology unite by at least neurologist taking into consideration the repeated seizure attacks in the absence of an identifiable cause such as trauma and infection. Verbal consent was available for all adult patients enrolled in the present study and also for parents of children. Clinical information included family history, age, gender, finding of EEG examination, whether normal or abnormal, findings of neurologic examination. The MRI procedure was conducted on a 1.5 Tesla magnet (Siemens, Germany). The procedure involved imaging the routine epilepsy protocol of MRI examination relying on 5 mm thickness slices and 2.0 mm interslice gaps in the coronal, sagittal and axial planes with T1 and T2 weighting. Data were collected and transformed into an SPSS (version 23, Inc, USA) spread sheet. Numeric data were expressed as mean and standard deviation whereas nominal data were expressed as frequency and percentage. Chi-square or Yates correction tests were used when settings are appropriate. The level of significance was considered at $P \leq 0.05$.

RESULTS AND DISCUSSION

Current study enrolled 51 patients, 29 children and 21 adults, with a mean age of 21.31 ± 12.75 years and an age range of 3-45 years. The study included 26 male and 25 female patients. Seizures were focal in 36 patients and generalized in 15 patients; 50 patients experienced abnormal EEG findings, as shown in table 1. Abnormal MRI findings were identified in 21 out of 51 patients (41.2%). In epileptic adults there were 5 (22.7%), 3 (13.6%), and 1 (4.5%) patients with space occupying lesions (mostly brain tumors), medial temporal sclerosis and other organic lesions (brain atrophy) respectively, whereas 1 (3.4%), 8 (27.6%), and 3 (10.3%) epileptic children showed the following lesions: with space occupying lesions (mostly brain tumors), medial temporal sclerosis and other organic lesions (brain atrophy and vascular abnormalities) respectively. The rate of abnormal MRI findings was 41.4% and 40.9% in children and adults respectively. Significant difference was neither seen in the rate of abnormal MRI findings nor in the distribution of specific types of these abnormalities between adult and child age groups ($P > 0.05$), as shown in table 2. Although, abnormal MRI findings were more

frequent in patients with focal epilepsy than generalized epilepsy, the difference was not significant ($P > 0.05$), table 3. Significant correlation was seen between focality of signs (in neurologic and EEG examinations) and rate of abnormal MRI findings ($P < 0.05$), table 4. The present study showed that abnormal MRI finding were found in 21 patients. The rate of these findings in children was 12 out of 29 (41.4%) which is higher than that reported by several authors, whereas, the rate in adult was 40.9%; again this rate is higher than reported by several authors¹⁵⁻¹⁹. In addition, in the present study, the rate of abnormal findings was more common in associations with focal lesions; however, the association was not significant, but this finding is in agreement with other authors¹⁵⁻¹⁸. Space occupying lesions were more frequent in adults than in children and the reverse was true regarding medial temporal sclerosis. Amirsalari *et al.*¹⁵ studied the role of MRI in children with epilepsy and concluded that MRI in children with epilepsy is justified in case of focal neurologic signs and or EEG finding; we agree with this opinion since we found significant correlations between rate of abnormal MRI findings and focal signs in neurologic examination and or EEG study, but we disagree with them that MRI examination is expensive and its use should be limited in a small fraction of children that suffer first onset seizure since we and other authors succeeded in finding organic brain lesions in those children and they may benefit surgical intervention. Amirsalari *et al.* themselves described the existence of brain tumors, cystic lesions and vascular abnormalities in those epileptic children. Molla Mohammadi *et al.*¹⁹, also described plentiful of organic brain lesions in epileptic children. On the other hand MRI has proven effective in finding organic lesions in adult patients even more than children enrolled in the present study. Winkler *et al.*,¹⁶ found organic brain lesions in epileptic adults withdrawn from specific population and we see that this finding, although limited to special kind of population, is suggestive of the presence of some sort of organic lesion in almost all patients complaining of epilepsy and that research works should be directed toward improving imaging techniques to discover these lesions as early as possible and to improve surgical intervention so that a wider range of epileptic individuals be able to get benefit from this modality of treatment especially those refractory to medical kind of treatment. In accordance

with opinion, Betting *et al.*,¹⁷ described several kinds of brain organic lesions in patients with idiopathic generalized epilepsy.

Table 1. Characteristics of the study sample

Characteristic	Value

Space occupying lesion	5	22.7	1	3.4	0.180 NS
Medial temporal sclerosis	3	13.6	8	27.6	0.567 NS
Others	1	4.5	3	10.3	0.874 NS
No finding	13	59.1	17	58.6	reference

Table 3. Finding in MRI in association with type of seizure (Focal versus generalized)

Finding in MRI	Focal n =36		Generalized n =15		P†
----------------	----------------	--	----------------------	--	----

Positive	16	44.4	5	33.3	0.463 NS
Negative	20	55.6	10	66.7	

Table 4. Correlation of abnormal MRI findings to focal EEG and neurologic examination findings

Characteristic	r	P
Gender	0.023	0.721
Focal neurological symptoms	0.371	0.032
Focal EEG abnormalities	0.401	0.026

CONCLUSION

MRI examination in children and adults suffering from epilepsy is helpful in identifying organic brain lesions in clinically significant fraction of patients and the rate of abnormal MRI findings is more frequent in patients with focal signs in neurologic and EEG examinations.

Study of Occupational Health Hazards for Nursing Staff at Al-Hashimiyah General Hospital in Babylon Governorate

Waleed Kareem AL-Khaykane¹, Muna Abdul Wahab Khaleel¹

¹ Community Health Nursing Department, College of Nursing, University of Babylon, Iraq

ABSTRACT

The nature of the nursing work environment, responsibilities and duties, nursing is a uniquely hazardous occupation, nurses and health care. Analytic cross-sectional study was conducted throughout the present study to determine the types of work related health hazards among nursing staff due to their work exposure for nursing staff at AL- Hashimiyah General Hospital In Babylon Governorate from September 2017 to September 2018. Quantitative research design was utilized to conduct this study. Non –probability “purposive” sample of (228) nurses who are working in Al- Hashimiyah General Hospital were included in the present study. Data was collected by distributing the Arabic version of the questionnaire that was created and by means of direct with each nurse included in the present study. The data collection process started from (12) March 2018 to (30) April 2018. Findings of the study found that the higher hazard score and rate was found with psychological hazard (21.78%) followed by physical hazards (17.94%) and them chemical hazards (14.47%).

Keyword: Occupational Health Hazards, Nursing Staff, and Al- Hashimiyah General Hospital.

INTRODUCTION

Occupational health hazards refer to work environment activities, substance, materials, processes, or conditions that make it possible to increase the risk of harm, accident or illness. occupational hazard are defined as life-threatening an individual’s work in the workplace¹. Hazards are defined as intrinsic properties of the substances, factors or origin of the energy or condition that are likely to cause harmful or undesirable consequences, but the risk is the potential harm to “life, health or the environment”². Health care services, like other high-risk workplaces, have a high level of exposure to hazardous factors, which seriously threaten the health and lives of workers (health care workers). According to world health organization (WHO), occupational health is defined as a multidisciplinary work aimed at protecting and promoting the health of workers by preventing occupational hazards, accidents

and injuries by eliminating occupational factors and situations that represent a risk to the health of workers in the workplace. Moreover, develop and Improve the health of workers physically, socially and mentally also maintain their practical abilities and support progress, as well as professional and social development in action. In addition, enable workers to lead productive lives and contribute positively to their sustainable improvement³. Nursing are on the frontline of many occupational health hazards and are most vulnerable to occupational health hazards in the work place. In the nursing profession, the types of health hazards encountered are varied. Some have existed since the birth of the nursing industry, but due recognition has only been accorded them recently⁴. The importance of occupational health hazards to health-care workers is due to increased accidents and injuries among exposed health workers. It is estimated that (100,000) people die as a result of occupational health hazards, while (400,000) new cases of occupational health hazards are diagnosed each year⁵. The cumulative effects of occupational diseases and injuries among healthcare providers include physical losses, economic losses and mental disorders such as stress and depression. as a result, they have a negative impact on the health of

health-care workers, their families and the nation as a whole ⁶.

METHODOLOGY

Study Design : A Quantitative research was used descriptive type of design cross-sectional study the types of work related health hazards among nursing staff , conducted from (26) September 2017 to (2) September 2018.

Study Sample: A Non-probability “ purposive “ sample of (228) nurses were included in the present study, who works in the above mentioned hospital and met the inclusion criteria. The study sample was distributed according to the hospital units.

Demographic Characteristics: This part of the questionnaire contains information includes:

Personnel Information: The first part consists of (7) items that include : (Age, Gender, Marital status, Educational achievement , Monthly income , Residency and number of years of service in the hospital).

Professional Information

Consist of (7)items that include : (Job tittle, Place of work, Number of working hours /working day, Number of additional working hours per day, Daily hours of sleep, Any previous diseases they have before work as a nurse with specification).

Occupational Health Hazards :

The second part of the questionnaire Which include of six domains, Diagnosed chronic diseases (8) items, Physical hazards (21) items, Chemical hazards (4) item ,Biological hazards (7) item , Social hazards (6)items ,and Psychological hazards (15) items.

RESULTS AND DISCUSSION

A total of (228) nursing staff participants were enrolled in this study with a mean age of (33.5 ± 10.3) (range: 20-57) years, moreover, (45.6%) of the study participants aged below thirty years, (52/228) (22.8%) aged (30 – 39) years, (21.9%) aged (40 – 49) years and only (22/228) (9.6%) aged (50) years or more. Male participants were relatively dominant, represented (55.3%) with a male to female ratio of (1.24:1.) Majority (80.3%) of the study participants were married, (52.6%) achieved preparatory nursing education, (36.4%) institute and (11%) achieved

college of nursing level of education. Almost (71.5%) of the participants of urban residence. For the monthly income, more than half, (53.9%), of the participants had monthly income of (400-600) thousands IQD, (26.8%) had (601-800) and (19.3%) had thousand IQD or more. (Table 2) summarizes the diagnosed chronic diseases among participants during their service as a nursing staff, High blood pressure and Diabetes mellitus were more frequent than other diagnosed disease where they reported by (17) (7.5%) and (12) (5.3%), participants, respectively, followed by Allergy (bronchial asthma), Chronic respiratory infections and Heartburn or stomach ulcer with reported by (3.1%), (2.2%) and (1.3%), respectively, thyroid disorder reported by only one participant (0.4%). On the other hand, None of the participant had Cardiovascular disease, Duodenal ulcer. According to these findings the mean total score of hazard of diagnosed chronic diseases ranged between zero and (0.075) giving a percent score of (0%) to (7.46%) and the mean overall total hazard score for this domain was (0.0247) and percent score of (2.47%) giving an evaluation of low hazard for this domain. demonstrates the (21) items of physical hazards, the higher hazard score was reported for the Headache and Severe pain in the back and spinal cord were they reported by (123) and (96) participants, respectively, with a mean hazard score of (0.539) and (0.421), respectively, followed by , severe pain in the body and limbs (mean hazard score; 0.333) and arm, hand and joint pain (mean hazard score; 0.311). However, the mean hazard score for other items ranged between (0.004) for burns in one part of the body to (0.303) for sleep disturbance. The overall mean total hazard score for this domain was (0.179) and the hazard score percent of (17.94%) with a low hazard evaluation. The four items of chemical hazards are demonstrated in (Table 3). The overall chemical hazard was low with a mean hazard score of (0.145) and score percent of (14.47%), however, the higher hazard score (0.342) was reported for the sensitization of eyes, nose or throat due to exposure to chemicals and lower score for chronic poisoning due to long-term exposure to medical substances and sterilization fluids with a mean hazard score of (0.031). The higher hazard score among the social hazards was reported with difficulty in making decisions about personal life (mean total hazard score; 0.162) followed by sensitivity towards hospital staff (mean total hazard score; 0.114) and difficulty in making friendship or social relationships (mean total hazard score; 0.110). The overall mean total hazard score for

this domain was (0.102) and score percent of (10.16%) and evaluated as low hazard, (Table 3). The association between total hazard scores with demographic and personal characteristics of the studied group is assessed for the overall and each domain of hazards and shown in (Table 4) for the significantly associated demographic variables with one or more hazards domain. A significant direct (positive) correlation had been found between age and each of chronic disease hazard, social and psychological, ($P < 0.05$), the direct correlation indicated that hazards scores was significantly increased with advancing age, i.e. older participants were more likely to have more chronic disease, social and psychological hazards than younger participants. **Other demographic and Personal characteristics were insignificantly associated with occupational hazards whether with domains or the overall hazard, and the correlation matrix for insignificantly associated variables are shown in (Table 5).** Therefore a total of (228) nurses were enrolled in the present cross sectional study, the mean age of the studied group was (33.5 ± 10.3) (range:20 – 57), the minimum age of (20) reported among the studied group (table 1) due to the fact that age of employment in Iraq start at (18) years and almost all nurses finished their nursing studies beyond this age, in addition, there is delay in the administrative orders of employment and distribution of workforces by the IRAQI Ministry Of Health (MOH) as the employment and distribution of nurses is centrally controlled by (MOH) in Iraq, Furthermore, lower proportion of the study participants aged (< 50) years, and this was not unexpected because at this age most of employers think do out the retirement law in Iraq. Higher proportion of the study participants were males with a male to female ratio of (1.24), which is very close to the general distribution of nursing staff that reported by Iraqi MOH annual report of (2016) (MOH, 2016)(7). Concerning marital status, Majority of the study participants(80.3%) were married. This result is consistent with the study of Farrington (2011)(8) that found the greatest proportion of respondents were married. Concerning the monthly income, more than half of the participants (53.9%) had monthly income of (400-600) thousands IQD, (26.8%) of them had (601-800) and (19.3%) received thousand IQD or more, This can be attributed that most of those nurses were newly employed and the higher the years of working, the higher the monthly wages. Additionally, More than half of the participants (52.6%) were skilled nurses, (36.4%) technical nurses and only

(11%) were university nurses. This is may be due to newly establishment of nursing colleges in babylon governorate .

	P. value	0.521	0.039	0.434	0.005	0.321

CONCLUSION

The main types of hazards working among the study group were psychological hazards, physical hazards, chemical hazards, social hazards, biological hazards and diagnosed chronic disease. The overall hazards was low among nursing staff. The majority of the nursing staff had not exposed to hazardous factors. The higher hazards rate was in psychological hazards followed by physical hazards and chemical hazards, while the lower hazards as factors were social hazards, biological hazards and diagnosed chronic disease.

The Contributing Factors for Head Traumatic Patients and their Relation to its Outcomes at Al Hilla Teaching Hospital

Wafaqq Mahdi Hadi¹, Shatha Saadi Mohammad¹, Hassan Alwan Baiee¹

¹ College of Nursing, University of Babylon, Hillah City, Iraq

ABSTRACT

Head Trauma is a major cause of lifelong disability and death worldwide but is considered a ‘silent epidemic’ as society is largely unaware of the magnitude of the problem. A descriptive analytic study design was carried out to assess the contributing factors to head traumatic patients and its relation to their outcomes at Al-Hilla Teaching Hospital. To achieve the objectives of the study by selected non-probability purposive sample consisted of (100) patients who admitted to the emergency department, the study sample was selected according to specific criteria, data were collected from April 10th, 2018 to June 30th, 2018, by using designed questionnaire through interview method to the patients or their relatives. The questionnaire divided of (4) parts, part one: contained socio-demographical data, part two: divided into section deals with contributing factors of head trauma, part three outcomes of patients Part four: scale to measure the level of conscious, (GCS), bleeding, associated injuries, convulsive, C.T. scan, days of hospitalization, operation and finally Glasgow Outcome Scale. The majority of the study sample (89.0%) were male aged (50.0%) middle adult aged between (18-28) years, with low educational level. These factors were positively and significantly associated with the outcomes the trauma to the head.

Keywords: *Contributing Factors, Head Traumatic Patient, Outcomes.*

INTRODUCTION

Head trauma indicates any injury that causes harm to the scalp, or to the skull or even to the brain. Head trauma can be classified in various different ways according to the types of injury¹. Head trauma is a general term used to describe acquired trauma to the brain². In referring to trauma that effects on the head the term, ‘traumatic brain injury’ prefers to use, because head trauma is the less specific and more generic. A traumatic brain injury not necessary always caused direct trauma to the head³. A traumatic brain injury is a very important reason for morbidity and mortality in the developing countries. In the western countries, traumatic brain injuries considered as the main cause of death in persons who’s less than 45 years old in the world⁴. A traumatic brain injury, a destruction condition often accompany with traffic accidents, it is the main cause to high mortality

rate, according to 2013 World Health Organization reported (countries that recording the second grade of automobile crashes in Iraq and Oman. Main causes to increase the number of occurrence traumatic brain injury is poor road regulations and violent conflicts. Therefore we need to the many of the researches for the traumatic head injury, to prevent the level of disease to reach the sever state, also diagnostic, therapeutic and rehabilitative measures⁵. Many of the people in various countries as Africa, India, and Taiwan reported the high percentage of accidents (automobile accidents or motor vehicle accidents).In the United States, this type of accidents recorded a high percentage of another type of injury by incidence 506.4/100, 000 of the population each year. Mortality from TBI in SA found to be 6 folds than that of the global rates due to the high incidence of RTA. The major risk factors for TBI in the US are the advance in age, being male, and among low socioeconomic status⁶. Traumatic head patients have different health status from one patient to another that be mild, moderate, or severe depending on causes of injury, therefore need to assessment to level of consciousness by Glasgow coma scale, that have three scales: Mild (13-15),

College of Nursing, University of Babylon,
Hillah City, Iraq; E-mail: wafaq3346@gmail.com.

moderate(9-12), and sever (3-8) depending on patient state (7). Head trauma effect on all status socially, economically, and personally, 10 million of individuals exposed to head injury every year, therefore consider medical problem require to management and prevention to overcome and control on this type of problem (8). Mild head injury is a term that is usually used interchangeably with the terms “concussion” or “mild traumatic brain injury”. Males reported the highest rate from females to experience head trauma, and hospitalization rates are highest for young adults (15 to 24 years) (9). Another type of traumatic brain injury is Severe, defined as head trauma related to Glasgow Coma Scale (GCS) score of 3 to 8, is a critical and challenging dilemma in the critical care unite. Intensive care management to persons suffered from severe traumatic brain injury is an active process, begin before hospital admission, at the time of the accident. Through the first stage of hospital management, the patients may be managed in a many of unites inclusive emergency unite, the radiology unite, and the operating unite pre admission to the ICU. Serial of the acute management, through “GOLDEN HOUR”, from the time of trauma during the begin of definitive care, must be ensured and depend on the guidelines and recommendations previously mentioned ¹⁰.

METHODOLOGY

A descriptive analytic study design was carried out to assess the contributing factors to head traumatic patients and their relation to its outcomes at Al-Hilla Teaching Hospital. To achieve the objectives of the study by selected non-probability purposive sample consisted of (100) patients who admitted to the emergency room, and the study sample selected according to specific criteria, data were collected from April 10th, 2018 to June 30th, 2018, by using a designed questionnaire through direct face- to face interview method. A questionnaire is divided into three parts, Part I: contains demographical data which include (age, gender, level of education, occupation, and residency). Part II: divided into section deals with contributing factors of head trauma which includes: Road Traffic Accidents (R.T.A.) which composed of (automobile, cyclist, truck, pedestrian, and passenger), falls accidents which composed of (fall from high, and other fall or jump), assault accidents which composed of (assault by blunt object, and assault by sharp object), and missiles accidents which are (shell and bullet); the others contributing factors deal with alcohol consumption, drugs abuse, systematic illness and time of

accidents. Part III: Head trauma which includes the level of conscious, bleeding, associated injuries, convulsive, computed tomography (C.T) scan, day’s hospitalization, operation and Glasgow Outcome Scale (GOS). The validity of the questionnaire is obtained by review of (10) experts in different filed, a Cronbach alpha used as a statistical method to calculate the reliability of the study questionnaire which recorded as (0.70) which is statistically accepted, the statistical package (SPSS -version 25) used to analyze data.

RESULTS AND DISCUSSION

This table represents the patients with head injuries their demographic characteristics in frequencies and percentage. Out of (100) subject who share in this study with age group (18-34) years old and constituted half of the study sample. Only. The high ratio of head trauma patients to men, it configures 89% of summed number of the sample. 32% were unable to read and write, versus the fewer ratio were college graduated, it constituted (7%) out the sum of 100 patients. In the same table, it is obvious that (55%) of patients are non-governmental employ and residents in urban areas. percentage very small was (2%) of the sample are residents in counter side areas of Hilla City. Findings in this table demonstrated that the factors contributed to head injuries in frequencies and percentage as a head and subhead, are: Concerning Road Traffic Accidents recorded the highest percentage (78%) compared to the remaining accidents. The highest percentage among those who drive automobiles, it recorded (35%) out the sum number of (78%) gradually followed cyclist (24%), passengers (16%), and pedestrian (3%) respectively. (12%) recorded for fall from high trauma especially falls from highest (11%), and also, jump injuries formed a small proportion (1%) out some number of (24%) among those injuries. Assault injuries recorded only (4%) out the sum of (100), as distributed among assaulted by obtusely object and assaulted by a sharp object (3% and 1%) respectively. In regarding ballistic injuries, were recorded (6%) out some number of the study sample as shelled injuries. In general, most injuries recorded for Road Traffic Accidents then gradually fall from high injuries, missiles injuries, and assault injuries respectively. Analysis of regression refers to find the significant association in causes of head injury and patients their level of consciousness (as mild, moderate, and sever) at p-value (≤ 0.05). As well as Glasgow Coma Scale (as good recovery, moderate disable, severely disabled, vegetative, and death) highly

affected by the causes of head injury (as R.T.A., falls, Assault and missiles) at p-value (< 0.01). The results related to the demographical characteristics of the study sample which is presented in table (1) shows that (50.0%) of the study sample were within (18-28) years of age, (89.0%) were males. These results were consistent with prospective surveillance study which is carried out in Iraq to identify the contributing factors for patients with head trauma. In this study, the results clarifying that most of the patients were male, total No. of male patients were 202 (84.2%) while female patients were 38 (15.8%). Their ages were below 20 years old (11). (32 %) of the study participants were unable to read and write while the lower percent were college graduated, it constituted (7%) out a total of 100 patients ,this study agreement with another study investigated 456 injured motorcyclists as one of RTA most of the drivers (61.7%) had the low level of education (primary school and less). It is obvious that 55 % of patients are non-governmental employee and residents in urban areas. Approximately (98%) of the sample are residents in urban areas of Hilla City. It is possible to think that head trauma may be a phenomenon of urbanization. Pertaining to these results the people who were freelancers and live in these areas are more prone to accidents than others due to the fact that they often go out and use transport more and they must catch their business ¹¹. Concerning Road Traffic Accidents recorded, the highest percentage (78%) comparatively with the remaining accidents. The highest percentage among those who automobiles, it recorded (35%) out the sum number of (78%) gradually followed cyclist (24%), passengers (16%), and pedestrian (3%) respectively. 12 % recorded for injuries especially falls from highest (11%), and also, jump injuries formed a small proportion (1%) out the sum number of (12%) among those injuries. Assault injuries recorded only (4%) out the total of (100), as distributed among assaulted by the obtuse object and assaulted by a sharp object (3% and 1%) respectively. In regarding ballistic injuries, were recorded (6%) sum a total number of the study sample as shelled injuries. In general, most injuries recorded for Road Traffic Accidents then falls, missiles, and assault injuries respectively. The above findings supported by another study showed that the percentage of major factors to injury was; fall from height by percentage (40%), followed another factor was automobile accidents by percentage (37%), also assaults (13%), downfall of building (4%), snorkeling by (1%), shell (1%) and another contributing factor (4%).

The percentage of these results reverse the findings of this study ¹³. The sample of the study composed of 277 patients with head trauma. Most of them (85.9%) were male; the average age was 37.7 years old, causes of trauma RTA (60.3%), 40.8% severe head trauma, according to GCS obtained after first care was provided, and mortality rate of 19.1% was noted according to GOS. These findings go inconsistent with the results of the present study by Analysis of regression which refers to significant association in causes of head injury and patients' level of consciousness at p-value (≤ 0.05). As well as Glasgow Coma Scale highly affected by the causes of head trauma at p-value (< 0.01) ¹⁴.

Table 1. Distribution of Study Sample by their Demographic Characteristics:

Demographic Properties		
Age by (years)		
Rating	F	Percent
18-28	50	50.0
29-39	25	25.0
40-50	20	20.0

Other fall or jump	1	1.0
Assault	4	4.0
Assault by blunt object	3	3.0
Assault by sharp object	1	1.0
Missiles	6	6.0
Shell	6	6.0
Bullet	0	0
Missiles	0	0
Total	100	100

Table 3. Causes of Head Trauma in relation to GCS and Glasgow Outcome Scale

Causes of Head Trauma				
	D.f	Mean Square	F	p- value
G.C.S	1	3.867	8.018	0.005 S
G.O.S.	1	34.141	92.555	0.000 HS

CONCLUSION

The type of trauma is different from one society to another according to many factors like geographical construction, religious and cultural background .Adolescents to early adulthood male patients who unable to read and write and non-governmental employee residents urban areas of Babylon Governorate

are more exposed to head trauma and the road traffic accidents recorded the highest ratio in this study. Death is the most likely factor when the patient is exposed to those injuries. Contributing factors to injury in terms of R.T.A., fall, Assault, and Missiles have been influential for the patients and their outcomes.

The Effect of Post and Brennan Strategy on the Achievement of Fourth Stage Scientific Branch Students in Biology

Hanan Hadi Diwan¹, Wafa Abdulrazaq¹, Abbas Hussein Mughher¹

¹ Babylon University/ College of Basic education/ dept. of Teaching Sciences, Iraq.

ABSTRACT

The study aims to identify the effect of Post and Brennan strategy on the achievement of fourth stage scientific branch students in Biology. The researchers depend on the experimental design of partial control of two equivalent experimental groups and a control one. The study sample includes (80) students male and female students, (40) female students who studied according to Post and Brennan strategy and (4) male students studied according to the regular method. Before applying the experiment, the researchers make equivalency between the two groups including the variables (age by months, intelligence test, previous achievement in biology and test of previous information in biology). The statistics have proved the equivalent of the two groups in these variables. The researchers prepare tools of application on the two groups. After scoring the students' answers, the researchers got the data of experimental and control groups. Data is treated statistically by T- test for two independent samples. The results showed that the experimental group that studied according to Post and Brennan strategy surpasses the control group that studied according to the regular method.

Keywords: *Post and Brennan strategy, achievement, fourth stage scientific branch students and biology*

INTRODUCTION

Despite the development of teaching methods, the dominant feature of teaching nowadays is to use methods that depend on memorization the study materials. This tendency is due to lack of preplanning that is followed in teaching a specific concept by the teacher, which makes teaching follows a similar pattern in most lessons. The aim of this method is to provide students with much information and concept. In the same time, the teacher appears uninterested to relate the lesson in a way to create a case of integration and balance between the method of teaching and the learner's structure. As a result, these ideas and concepts are still scatter in the students' minds and subject to forget. Also, the students are unable to acquire necessary knowledge, develop their mental abilities, creative thinking, meet their needs, tendencies, interests and their manual skills in addition to show the greatness the Creator and

appreciate scientists' contribution in serving humanity. The effective teaching method used by the teacher is a fundamental corner to achieve educational goals because teaching methods have positive effects on the students' thinking and increase their achievement and continuous interaction among them. This method leads to develop the learner's personality and increase their the teacher's abilities to detect facts, information and concepts in the whole curriculum. So, the researcher has to use teaching strategies of multiple paths, which have commonality because it is the source of social interaction among learners inside the class. Moreover, it is a source of information processing and learner's personal experience, and source of adjusting learners' behavior according to modern teaching strategies that make the students more interactive in the class. All these practices lead to develop cooperation spirit among students and in this way the student becomes active and this increases his/ her achievement in his/ her study including biology. The dynamicity of knowledge is continuous and accelerated. So it is necessary to cope with this acceleration through to give a chance to students to recognize the methods that fit their way of thinking. Although modern tendencies

Hanan Hadi Diwan.

Babylon University/ College of Basic Education/ dept. of Teaching Sciences, Iraq.

stress on adapting strategies, methods and teaching techniques, they make the student's role central for educational process⁴. The educationalists confirm that education, generally, and teaching sciences in particular is not a matter of transferring knowledge to students, but it is a process concerned with students' development (mentally, emotionally and in skills) and the integration of their personalities. The basic mission of teaching biology is to learn students how to think rather than how to memorize their classes without understanding or employing it in life¹⁶. In sciences teaching, problem-solving strategies can be adopted to help learners to realize the solution of the problem and propose other solutions. In addition to control his thinking and develop his/her ability to understand, perception, planning and management⁸. Since one of the most important goals of teaching sciences including biology is to increase thinking level through problem-solving, so there are different models and strategies to accomplish this method as (Post and Brennan) strategy of problem-solving¹¹. Post and Brennan strategy in education and learning links between thinking in scientific manner to solve human problems including everyday life problems and complex social ones. The ability to solve them is the most important result of learning⁵. So Post and Brennan strategy is chosen as one of the modern teaching methods, which may have an impact on the achievement of students in biology/ 4th year, scientific branch. The study of (Sachet 2018) aims to identify the effectiveness of Post and Brennan strategy in the achievement of Geography and develop reflective thinking of the 5th year students/ literary branch. The study sample includes (62) students distributed to two groups, an experimental group (31) studied according to Post and Brennan strategy and a control one³¹ studied according to regular method. The researcher prepares two tools, the first is achievement test of (40) items of multiple choice and (10) items are essay type items. The researcher prepares a test for reflective thinking of (40) items. The researcher uses T-test for two independent samples and Pearson's correlation coefficient, difficulty and easiness coefficient. There are differences of statistical significance at the level (0.05) among the means of students grades of the experimental group who studied Geography according to Post and Brennan strategy and between the means of grades male students in the control group who studied according to the regular method in their achievement test. There are differences of statistical significance at the level (0.05) among the means of students grades of the experimental

group who studied Geography according to Post and Brennan strategy and between the means of grades male students in the control group who studied according to the regular method in the post reflective thinking.

METHODOLOGY

It includes the procedures that are used to achieve the study goals starting from the study method, experimental design, identify the population and the sample, the equivalency of the two groups (experimental and control), prepare the study tools, procedures of applying the experiment, introduce the used statistical tools:

Experimental Design of the study:

The independent variable includes (Post and Brennan strategy) and (regular method) and the dependent variable (achievement).

The study population and sample

The study population includes all students of the 4th grade/ scientific branch in the governmental secondary and preparatory schools/Morning study that belong to Al-Qadisiyah directorate of education for the academic year 2017-2018. The number of classes of this stage is no less than two classes. The study sample is selected randomly from Al-Daghara preparatory co- school) in the centre of Al-Daghara. The researchers find that the school has three classes of 4th year/ scientific branch (A, B and C), the researcher chooses class (A) by random lot to be the experimental group in which it has (40) female students who will study according to Post and Brennan strategy. In the same method, the researcher selects by random lot class (B) to represent the control group, which includes (40) male students who will study according to the regular method.

Equivalence of the study groups

The researchers have made a statistical equivalence between the experimental group and the control one regarding some variable that affect the experiment results. Although the researchers select the two groups by random lot and the students have similar economic and social environment, they keep to make equivalence in the following variables: age (by month), 1st semester grades, intelligence test and test of previous information in biology. The researchers make equivalence between the two groups in these variables Table (1).

Controlling internal variables

Although the researchers verify the equivalence of the two groups in some variables, they attempt to avoid the effect of some internal variables that may change the experiment results. The following are the variables and how to control them: (concomitant events: the experiment does not have any urgent condition, experimental depreciation: there is no discontinuation or students transferring along the period of the experiment, sample selection: the two groups are selected randomly and their equivalence is verified, maturity factor: since the period of the experiment is the same and the age as well, growing older will on the same level for both groups, so this factor does not affect the experiment, the effect of experimental procedures: the researcher attempts to limit the effect of the experimental procedures that may affect the dependent variable during the experiment.

Preparing the study requirements

The study requirements are: identify the scientific material: the scientific material is the last four chapters of biology textbook of 4th stage/ scientific branch, 2017-2018, behavioural goals: the researchers drafted (194) behavioural goals of the four chapters biology textbook of 4th stage/ scientific branch according to Bloom's taxonomy in the cognitive domain distributed on six levels (knowledge, understanding, applying, analyzing, synthesizing and evaluation), preparing teaching plans: the researcher s have prepared several teaching plans for the two groups, the experimental and the control in light of the content of the last four chapters (7th, 8th, 9th and 10th) of biology textbook of 4th stage/ scientific branch, 2017-2018. There are (24) plan for each group, (3) lessons per week. The teaching plans are prepared in a way that fits with the independent variable (Post and Brennan strategy) for the experimental group and the regular method for the control one.

Test instructions

Test guidelines and instructions of answering questions have been drafted as (selecting one alternative for an item, answer all items, time for answer, writing triple name, class and section in appropriate place).

Scoring test items

A specific standard has been assigned to score the items where each correct answer of an item has one mark, zero for the wrong item, the left item and the item

that answered with more than one answer. Eventually, the maximum mark is (50) marks and the minimum is (zero).

Validity of the test

The face validity and content validity of the test have been verified. The results show that face validity has %73 of the arbitrators' and specialists' agreement while the content validity shows that the test items are statistically significant. So, the achievement test is considered valid in measuring the 4th year / scientific branch students' ability to understand and apprehend biology.

Applying test tool

Before a week, the two groups (experimental and the control one) have been notified of the date of the achievement test. It is applied at the same time after the completion of teaching the textbook for the two groups. The researchers supervise applying the test.

Statistical Tools

The researchers use T- Test for two independent samples for the equivalency of the two groups in the following variables (age by month, students' achievement in mid-year/ biology, Otis-Lennon intelligence test and the test of previous information). Also, the researchers use Pearson's equation to correct correlation coefficient between the two parts of the test (odd and even marks) after getting Pearson's correlation coefficient.

RESULTS AND DISCUSSION

Achievement test is prepared for the two groups after completing the scientific material, which the researcher teaches in the school, the results show that the experimental group surpasses the control one as seen in the table 2. The table shows that the experimental group surpasses the control one in the achievement test so there are differences of statistical significance at the level of significance among the means of students' marks of the experimental group who studied according to Post and Brennan strategy and the marks of the control groups students who studied according to the regular method. The results show that Post and Brennan method has a positive effect on understanding information, scientific facts and problem- solving and lead to elevate the students' level of achievement. The results of statistical treatment show that the students of experimental group

who studied according to Post and Brennan strategy surpass the students of the control group who studied according to the regular method in the achievement test. The reasons can be attributed to the following: Post and Brennan strategy is one of the modern teaching strategies due to its procedural steps that allow the students to interact with each other and with the scientific material that has a relation with their life and this increases their motivation to learn and search for solutions of their problems in addition to discuss these solutions and test their validity. Increase the positive participation of the students, the interaction among them, trust in themselves and encourages self- learning. Post and Brennan strategy contributes to make scientific material more attractive and digestible for the experimental group, and this increases the students' interaction with the information that they memorize for a longer period because it focuses on relating science with the real life of students.

Teaching according to Post and Brennan strategy makes students more interesting and interactive with biology than teaching according to regular method. This strategy makes the students the hub of the educational process. They have the major role to discuss, inquire and search for answers, solutions and deduce creative ideas. It helps students to enrich their scientific information and increase their achievement in this subject through relying on themselves instead of dictating them. Also, it gives students the chance to discover, discuss and encourage to ask questions and express themselves. These results agree with the results of the previous studies that depend on achievement as a dependent variable in teaching process in which experimental groups surpasses the control one. (Sachet, 2018) study shows that the experimental group that studied (Geography) according to Post and Brennan strategy surpasses the control group that studied according to the regular method.

Table 1. T-Test results for female students of the two groups

variable	group	Sample size	mean	Deviation standard	Freedom degree calculated	t- value		significance
						tabular		
Age (by month)	experimental	40	193,5	18,45	78	0,48	1,99	insignificant
	control	40	191,8	12,37				
1 st Semester grades	experimental	40	75,275	16,21	78	0,85	1,99	
	control	40	72,45	13,29				
Intelligence Test	experimental	40	34,625	8,49	78	0,43	1,99	
	control	40	33,85	7,81				
Pervious information test	experimental	40	14,15	2,75	78	0,85	1,99	
	control	40	13,625	2,76				

Table 2. Experimental group surpasses the control.

group	No. of students	mean	Standard deviation	Freedom degree	T- value		significance
					calculated	tabular	
experimental	40	37,05	6,48	78	2,39	2,01	significant
control	40	33,1	8,19				

CONCLUSION

In light of the study results, the researchers have reached the following conclusion: (the effectiveness of Post and Brennan strategy to increase the level of achievement compared to the regular group).

The Effect of Teaching General Methods of Teaching on the Dimensions of Structural Theory in the Holistic Thinking of College Students

Saja Abd Msarhad¹, Mohammed Hameed Al- Masoudi¹

¹ College of Basic Education, University of Babylon, Hillah City, Iraq

ABSTRACT

The current study aims to identify (The Effect of Teaching General Methods of Teaching on the Dimensions of Structural Theory in the Total Thinking of College Students). To achieve the aim of the present study, the following null hypothesis has been formulated: (there is no statistically significant difference between the students' mean scores of performance of the experimental group which is taught methods of General teaching within the dimensions of the constructivism and that of the control group which is taught which is taught holistic thinking according to traditional method of teaching). The experiment was conducted in Iraq-Babylon province. The researcher follows the experimental approach as the appropriate one to such research. The population of the research was the third grade in the departments of the college of basic education, University of Babylon. The sample is selected randomly, it involves 92 third stage students from department of geography. Both groups are equalized in some variables such as age and level of parents education. The researcher uses the T-test for two independent variables, Chi - square and the Pearson correlation coefficient. The results show that the experimental group is higher than that of the control group.

INTRODUCTION

When the student arrives at the university, they are used to indoctrination and memorization, this is what they have in learning processes and fear of discussion, errors to become ridiculed in front of their mates and that the university student enrolls in the university to keep in progress in his university education thinking of his own case to get his aim, but after a certain period of time, we find that he has reduced his motivation towards learning¹. The lecturers used to lecture in a rhetorical fundraising way which is still the most common teaching method nowadays in addition to the lack of learning materials in some subjects or they are scattered. So, the lecture will be the main or probably the only source of information². The lecture is closely related to university education,

so that we hear university lectures, students and administration, whether they repeat the word "lecture" continuously in their teaching. The lecture is a teaching method that is one of the oldest and most widely used teaching methods in the teaching of human and scientific subjects³ Thinking is one of the most powerful abilities that distinguishes human beings from other creatures. It is one of the important needs that one cannot live up to and cannot abandon it except in the absence of mind. As a person needs to think at all stages of life in order to manage his/her lifestyle to generate new ideas that help in solving the problems they face⁴. The generation of ideas as a capacity is one of the important activities that distinguishes man from other creatures, which means finding a way to overcome a difficulty or an obstacle to get an achievement of the desired goal. Thus, the generation of ideas contributes to the development of the civil and cultural aspects of human life⁵. Holistic thinking is a comprehensive and balanced ability to develop the individual's ability and to promote self-awareness and social awareness to realize that it is part of a world in which different issues are intertwined⁶.

Hillah City, Iraq

Holistic thinking occupies researchers in different countries and that the beginning of interest in the subject of holistic thinking in the field of research and theorizing began with the beginning of the adoption of (American Society of Human Psychology). Holistic thinking helps individuals to explore their own environment and solve the problems they face and to find appropriate solutions to these problems by looking at them in a comprehensive manner, leading to the generation of new ideas that help solve the problems they face, leading to successful social communication in the environment they live⁷. Blosser (2002) notes that holistic thinking is an individual's ability, teachers can develop this ability for students to develop their education. Blosser finds that students who are categorized as holistic thinkers are active within their peer group and have many factors to help others. It deals with generalities that help the individual to solve the problems they face. Berenfeld notes that individuals with holistic thinking are not interested in detail in their search for problems but rather rely on generalities and are cheerful and adaptable to the social environment in which they live. That holistic thinking is an organization-based ability and provides the individual in a way that helps him/her to arrange and prepare the information necessary to solve the problems facing the individual and it prepares the mind of the individual to receive information and organize it in a multi-directional manner and this information does not comply with any order or system and the individual is a comprehensive thinker is an individual ability to handle multiple information and experiences independently of each other at the same time. Holistic thinking also has to do with organizational behavior. Individuals with holistic thinking have the ability to succeed in their assigned work, have organizational behavior and adapt themselves creatively to solve the problems they face in their work.

METHODOLOGY

This chapter includes a description of the procedures carried out by the researcher. The current study requires the researcher to follow a scientific research methodology that complies with the researcher's steps and has relied on the experimental approach because it is suitable for achieving its objectives.

Experimental Design

There is no one model for experimental design

suitable for all research. The nature of the problem that the researcher takes and the conditions of the sample the researcher chooses are the ones that determine the type of design. Therefore, there are many experimental designs and vary between them. One model of experimental design is suitable for all research. The nature of the problem that the researcher takes and the conditions of the sample he chooses are what determine the type of design. There are many experimental designs and vary between them.

Experimental Design of the Study

The experimental group is the group whose members are exposed to the independent variable, which is the dimension of structural theory. The control group is the group that teaches general teaching methods in the traditional method of teaching.

Population of the Study

Population refers to individuals or things all have certain characteristics can be observed, the only touchstone for society is a common property among its members, the community properties called observable features of population. The researcher chooses the students of the College of Basic Education to study it, and then chooses a third stage students in the same college-Babylon University. The current study population is (594) students, and the following table (1) shows the number of students in the research population.

Sample of the Study

The sample of the study is one of the important steps of the research. When the researcher wants to collect the data about a whole population, the researcher can not include all the members of the population. Rather, the researcher uses a sample of this one to help her collect the data in accordance with the researcher's potential. Part of a population with common characteristics, the purpose of which is to generalize its findings to a larger society. The researcher chooses a sample of (92) male and female students, represented by students of the third stage in the Department of Geography and that the researcher lectures in the mentioned department.

Equalization of Research Sample

The researcher equalizes the members of the research sample before the implementation of the experiment as the researcher was sure that the sample is homogeneous

and there are no significant differences between the members. The researcher equalizes the previous achievement variable and the achievement of parents and the researcher conducts a statistical equivalence in the age (measured in months) and the groups were equal in the mentioned variables.

Controlling the Extraneous Variables

David, (1990) One of the most important characteristics of experimental design in its scientific concept is that it is a valid study. Controlling of non-experimental variables is one of the important procedures in experimental study, so that the researcher can attribute most of the variance in the dependent variable to the independent variable and not to other variables. Therefore, the researcher sought to control the non-experimental extraneous variables that consider to affect the experiment:

1- Experimental Extinction:

It means the leak of some of the sample subjects and not to continue in the experiment, which leads to the impact of the negative or positive results, as this factor enters the independent variable in the results, thus reducing the internal validity of the experiment. (Atiya, 2009: 185). The researcher excludes the repeaters that may affect by the experiment this variable.

2- Synchronic Incidents:

The research experiment did not expose to any incident during the implementation period of the process of experiment.

3- Maturity

Maturity refers to the occurrence of biological, psychological or mental changes on the same person who is submitted to the experiment during the trial period such as fatigue and growth so that positively or negatively affect the results of the research, which does not allow the attribute of the search results to the experiment only.

Statistical Tools:

The researcher uses the following statistical tools in their research procedures and achieves to the results by using the Statistical Program (SPSS):

1. The (t.test) for two independent variables: The

researcher uses this equation to know the significance of statistical differences between the two study groups at the statistical equivalence and in the analysis of the results.

Where :

X_1 = the mean of the experimental group.

X_2 = the mean of the control group.

N_1 = the size of the experimental group.

N_2 = the size of the control group.

S_1^2 = the variance of the experimental group.

S_2^2 = the variance of the control group (Al-Bayati, 2002: 2008).

2- Chi- square test (χ^2):

This method was used to determine the significance differences between the subjects of the research sample at the statistical equivalence in the parental achievement variable (parents).

$$\chi^2 = \sum [\frac{O}{E}]^2$$

Where :

O= observed frequency

E= expected frequency (Al-Bayati, Zakaria, 1977: 293).

Pearson correlation coefficient

Pearson correlation coefficient was used to calculate the stability of the correction under the sample of the survey sample by way of re-application:

R=

Where:

r= Pearson correlation coefficient

n= Number of subjects

x= First test terms' marks

y= Repetition test terms' marks

(Al-Bayati and Zakaria, 1977: 183) (Shayeb, 2012: 147).

RESULTS AND DISCUSSION

This chapter includes a presentation of the search result and an interpretation for it. This chapter also includes the findings, recommendations and suggestions of the research as follows: To verify the effectiveness of the experiment that the researcher tried on a sample of third stage students in the Department of Geography / Faculty of Basic Education / University of Babylon, and sought to verify the hypothesis of the research as the researcher reached a way of balancing between the mean scores of students of the experimental group in the test of holistic thinking using the (t-test) test for two independent variables. There is no statistically significant difference between the students' mean scores of performance of the experimental group students who study teaching methods material within the dimensions of the constructivism and that of the control group students who study in the traditional method of teaching in a test of holistic thinking" to verify the hypothesis, the researcher used t-test for two independent variables, table 2 shows that. Mean, variance, and t-value (calculated and tabulated), the degree of freedom and the statistical significance of the difference between the students' mean scores of experimental group and the control group. Through the presentation of results associated with the hypothesis in table 2, the mean score for the experimental group (24.670) and standard deviation (5.35502), and the mean score for the control group (19.1333) and standard deviation (3.82337), calculated t-value (5.631) at (0.05)level of significance, and the degree of freedom (90), which is the larger than the tabulated value (1.980), This indicates the

superiority of the experimental group's students to the control group students in the holistic thinking test. Thus, the null hypothesis is rejected, i.e. there is a statistically significant difference for the benefit of the experimental group. In the light of the results presented, the researcher considers that the reason for the superiority of students who studied general teaching methods may be due to the following reasons: The dimensions of structural theory contributed positively to the improvement of the level of students in holistic thinking. Teaching in the dimensions of structural theory allows freedom of expression in students and drawing ideas freely and easily. Teaching the dimensions of structural theory helped in the transformation of the teacher to a positive teacher and effective material and teaching methods of public interest for students.

Table 1. Number of the students of College of Basic Education- University of Babylon (Morning Studies)

No.	Department	No. of Students
1	Arabic Language	98
2	English Language	130
3	History	86
4	Geography	92
5	Science	116
6	Private Education	72
7	Mathematics and Computing	0
8	Total	594

Table 2. t-test for two independent variables

Group	Sample	Mean	Standard Deviation	Degree of freedom	T- value		Level of Significance 0.05
					Computed	Tabulated	
Experimental	47	24.6170	5.35502	90	5.631	1.980	
Control	45	19.1333	3.82337				

CONCLUSION

The dimensions of structural theory help to increase the skills of holistic thinking of students in the general teaching methods. The level of students who study general teaching methods has increased for students who study the same subject in the traditional way, thanks to

the teaching of the exclusion of structural theory. The dimensions of structural theory can be applied at all times and on all classes because students interact with them in a positive way to increases their abilities and their comprehension of the material. The dimensions of structural theory is a useful tool in the teaching of general

teaching methods, helps in the process of education and the consistency of information.

Ultrasound Finding in a Cohort of Iraqi Patients with Hematospermia: a Cross Sectional Study

Osamah Ayad Abdulsattar

*Assistant Professor/ Department of Surgery/ College of Medicine/ Babylon University,
Consultant Radiologist in Hilla Teaching Hospital at Radiology Department*

ABSTRACT

The goal of this article is to demonstrate the lesions which were detected by TRUS in sufferers with hematospermia. This cross sectional study included 60 Iraqi patients suffering from urogenital manifestation and all has been diagnosed to have macro- or microscopic hematospermia. The age range of those patients was 39 to 67 years. The study started at June 2017 and ended at May 2018. Those patients were attending the urology unit at Al-Hilla Teaching hospital, Babylon province, Al-Hilla City, Iraq. They were all examined by trans-rectal ultrasound (TRUS). The ultrasound examination revealed the following causes with their corresponding rates: Benign prostatic hyperplasia (BPH), inflammatory conditions whether prostatic, seminal vesicle or both, calculi in the ejaculatory ducts or the inside the prostate and cystic lesions whether lateral, midline or para-median, 43.3%, 36.7%, 13.3% and 6.7%, respectively.

Keywords: Hematospermia, transrectal ultrasound, Iraq.

INTRODUCTION

Hematospermia, additionally called hemospermia, is a probably alarming incidence. The definition of hematospermia is presence of blood inside the seminal fluid. The blood is every now and then visible to the naked eye, however the time period hematospermia also covers microscopic amounts of blood in the ejaculate, as now and again detected by the way in a spermogram. The effect of blood on the coloration of the ejaculate may depend on how a great deal time has elapsed because the bleeding event. sparkling blood might be light crimson to brownish in shade, while darker, even darkish brown or black clots commonly suggest that a while has surpassed on account that hemorrhage occurred. In most cases hematospermia is painless. Hematospermia may also arise only once, however will also be sporadic or continual. It frequently is going left out and is typically self-limiting, so the exact incidence is unknown. Quantification is likewise tough due to

the fact most men do now not frequently examine their ejaculate¹⁻³. Hematospermia is notion to make up about 1% of all urological symptoms (three). Its prevalence is expected at approx. 1: 5000 urological patients⁴. In a series of 26 126 men with a mean age of 61 years who underwent routine prostate most cancers screening, 0.5% reported hematospermia⁵. Those affected are normally more youthful men beneath the age of forty, as proven in six massive collection each including over 500 sufferers⁶. In a specific group of patients at a big andrological branch in 2015, erythrocytes have been detected through microscopy inside the ejaculate of 13.8% of the men who had their semen tested—usually due to infertility “(non-public verbal exchange, Prof. Dr. Frank Sommer, President of the German Society for men’s health; Deutsche Gesellschaft für Mann und Gesundheit e. V.)”. Erythrocytes also are regularly discovered whilst semen is harvested through rectal electrical stimulation of the accent glands, but are then usually simply a contaminant with no pathological value. The analysis of hematospermia is typically worrying for the men or couples affected, because they’re worried about sexually transmitted sickness (STD) or malignancy. Historically, hematospermia turned into regarded as a result of “both prolonged sexual

Corresponding author:

Osamah Ayad Abdulsattar

Assistant Professor/ Department of Surgery/ College of Medicine/ Babylon University, Consultant Radiologist in Hilla Teaching Hospital at Radiology Department.

abstinence and excessive sexual pastime. Even in current many years, the precise etiology turned into unknown in over 70% of instances^{1,6,7}. Because of advances in diagnostics, but, the etiology of hematospermia has in recent years been recognized in maximum cases. Routine or persistent hematospermia, specifically, might also end result from a selection of etiological elements: tumor, infection, trauma, congenital anomalies, iatrogenic reasons, inclusive of prostate biopsy and other urological interventions, systemic illness and deviant sexual habits². Non-invasive imaging is vital in the diagnostic algorithm-up of guys with hematospermia. Distinctive imaging modalities have been used within the analysis. CT imaging isn't beneficial due to bad visualization of the distal duct architecture⁸. MR imaging supplemented by an endorectal coil is able to recognize the distal duct structure, but it's far expensive⁹⁻¹¹. "Transrectal ultrasound (TRUS)" is more correct in the visualization of the distal duct structure and the numerous abnormalities which can offer diagnosis and etiological elements of hematospermia¹²⁻¹⁶. The goal of this article is to demonstrate the lesions which were detected by TRUS in sufferers with hematospermia.

MATERIALS AND METHOD

This cross sectional study included 60 Iraqi patients suffering from urogenital manifestation and all has been diagnosed to have macro- or microscopic hematospermia. The age range of those patients was 39 to 67 years. The study started at June 2017 and ended at May 2018. Those patients were attending the urology unit at Al-Hilla Teaching hospital, Babylon province, Al-Hilla City, Iraq. They were all examined as following: TRUS examination was achieved (AU5, Esaote Biomedica, Italy) the use of an excessive frequency (7.5 MHz) bi-aircraft endorectal probe. All examinations had been done by means of a radiologist with 15 years' experience in TRUS examinations. Sufferers were told to self-administer a cleaning enema the night time earlier than the examination. Examination was carried out with the bladder 1/2-complete and the patient in left lateral decubitus position and the hips completely flexed. The prostate, ejaculatory ducts and seminal vesicles have been examined in axial and sagittal planes. Statistical analysis was carried out using Statistical Package for Social Sciences (SPSS) version 23. Numeric data were expressed as mean, range and standard deviation (SD), whereas, categorical data were expressed as number and percentage out of total. Chi-Square test was used

to assess association between any two categorical variables whereas, independent samples t-test was used to compare mean of numeric variables between any two groups. The level of significance was considered at *P* less than or equal to 0.05.

RESULTS AND DISCUSSION

General characteristics of the study sample are shown in table 1. Sixty cases were enrolled in this study with an age range of 39-67 years and a mean age of 56.34 ± 7.78 years, 45 patients resided in urban areas while 15 patients were from rural residency, 75% versus 25%, respectively. According to occupation, 30 (50%), 15 (25%) and 15 (25%) were retired, employed and unemployed, respectively. All enrolled patients were married. The ultrasound examination revealed the following causes with their corresponding rates: Benign prostatic hyperplasia (BPH), inflammatory conditions whether prostatic, seminal vesicle or both, calculi in the ejaculatory ducts or the inside the prostate and cystic lesions whether lateral, midline or para-median, 43.3%, 36.7%, 13.3% and 6.7%, respectively, as shown in table 2. The detection of BPH by ultrasound mainly resides on estimation of its volume using standard formulas¹⁷. The detection of calculi was in the form of bright echogenic foci with posterior acoustic shadows, Inflammatory lesions appeared as multiple hyperechoic areas associated with hypoechoic areas scattered within the prostatic parenchyma and around the ejaculatory ducts, with enlargement of both seminal vesicles and hypo and hyperechoic areas and dilated thick walled ejaculatory ducts, whereas, cystic lesion were detected as thin or thick walled elliptical cysts or multiple small sized cysts. No significant association was found between any of the characteristic of patients and cause of hematospermia, as shown in table 3. Transrectal ultrasonography (TRUS) can help within the detection of seminal vesicle and prostatic pathology. The TRUS exam lets in extraordinary visualisation of the seminal vesicles, prostate and adjacent systems. Diverse research has proven its benefit in this regard – namely the findings of cysts, calculi, prostatic varices, mullerian duct remnants and inflammatory conditions^{18,19}. TRUS-guided cyst aspiration has also been defined. If ultrasonography is entirely ordinary and the signs are chronic, it can be advisable to continue with other imaging modalities like magnetic resonance imaging (MRI) – both traditional and endorectal coil – and computerised tomography (CT) to enhance visualisation of the anatomy of the

pelvic organs²⁰. Any suspicious testicular swelling is investigated with an urgent ultrasound examination²¹. In our study, the commonest reason for hematospermia was BPH. Hematospermia can happen for some reasons, for example, irresistible or provocative scatters, prostate tumor or cystic injuries, or it might be idiopathic. A few investigations of hematospermia did utilizing TRUS have uncovered that the commonest reason for hematospermia is prostate calculi. Different causes incorporate chronic prostatitis, cystic lesions, prostatic hypertrophy and neoplastic malignancies¹²⁻¹⁶. In spite of the fact that imaging may uncover the fundamental reason for haematospermia there is regularly little that can be offered as ordinary treatment. The essential point of the administration is to avoid genuine conditions like prostate and bladder malignancy and treat some other hidden reason. In the event that no serious pathology is discovered, at that point it is essential to relieve the uneasiness and console the patient²¹. Indeed, one of the main reasons that justified the conductance of the current study is the rarity of Iraqi literatures dealing with subject of trans-rectal ultrasound characterization of causes of hematospermia.

Table 1. General characteristics of the study sample

Characteristic	Value
Number of cases	60
Mean age \pm SD (years)	56.34 \pm 7.78
Age range (Minimum-maximum) (years)	39-67
Residency	
Urban; n (%)	45 (75%)
Rural; n (%)	15 (25%)
Occupation	
Retired; n (%)	30 (50%)
Employed; n (%)	15 (25%)
Unemployed; n (%)	15 (25%)
Marital status	
Married; n (%)	60 (100%)
Unmarried; n (%)	0 (0.0%)

Table 2. Causes of hematospermia.

Cause	n	%
BPH	26	43.3
Inflammation (prostatitis and seminal vesiculitis)	22	36.7
Stones in the ejaculatory ducts or seminal vesicle	8	13.3
Cystic lesions	4	6.7

Unmarried	n	0	0	0	0	

CONCLUSION

TRUS is a non-invasive, safe, inexpensive and radiation-free imaging tool that can be utilized to characterize lesions of the ejaculatory ducts, seminal vesicles and the prostate in patients suffering from hematospermia.

Antipsychotics-related Knowledge of Nurses working at Baghdad Psychiatric Teaching Hospitals

Ali Mlaghy Shakhat Al-Salhee¹ , Maan Hameed Ibrahim Al-Ameri²

¹Psychiatric and Mental health Nursing, Ministry of Health, Iraq, ²Psychiatric and Mental Health Nursing Department, College of Nursing, University of Baghdad, Iraq

ABSTRACT

Objectives: To assess the nurses' knowledge regarding antipsychotics at Baghdad psychiatric hospitals. The study was carried out in Ibn-Rushed Psychiatric teaching hospital and al-Rashad Psychiatric teaching hospital. Starting from 18th of February 2018 to 1st of December 2018. The data were collected by the using self-reported questionnaire which consists of general information such as age, gender, level of education, experience in hospitals, and training course and a scale that assess nurses' knowledge about antipsychotic medication and consists of 30 items related to knowledge about mechanism of action, indications, names of typical and atypical antipsychotics, and contraindications. The content validity of the instrument was determined through the penal of (18) experts. The study found that male (58.0%) are more than female (42.0), highest percentage of the participants is within 30-39 years old. 36.0% of participants have one to five years of experience in general wards but 42.0% of them have one to five years of experience in psychiatric wards and the majority of them (80.0%) have not participated in training course regarding antipsychotics medications and about half of them are with diploma, Levels of antipsychotic-related knowledge were approximately all of sample were around low.

Keywords: antipsychotics, Knowledge, nurses, Baghdad, hospitals

INTRODUCTION

Treatment of patients with mental disorders by medication is a crucial issue that has significant impact upon the results for patients with mental disorders, several categories of medication used to treat patients with mental disorders, these medications group are called psychotropic and include: antipsychotics, antidepressants, mood stabilizers, anxiolytics, and stimulants, nurse staff should know the mechanism of the actions of these medication, their adverse reaction, their contraindications, and interactions with other medications or foods, Therefore the nursing managements require assisting patients to adhere with medication regimens¹. Historically older or first generation of antipsychotic medications was developed to treat schizophrenic patient were usually associated

with undesirable and uncomfortable adverse effects, like involuntary movements of the body for example tardive dyskinesia, it is higher risk to experience by patients when take these medications, while new generation of atypical antipsychotic medications produce risk or side effects less than older anti-psychotics². Anti-psychotics are a group of medication used to reduce the severity or helping in relieving psychotic symptoms in particular delusion and hallucination. In addition, the indication of administering psychotropic medication mainly used for patients with schizophrenia or mood disorders and other different psychosis disorders, it is classified into main two groups: typical and atypical or first and second generation of anti-psychotic medications, the long-term use of typical antipsychotics cause severe side effects such as rigidity of muscle or spasm, tremor, and tardive dyskinesia, Whereas, side effects among second generation are less than typical antipsychotic³. Nurse roles through management of patients by medication include administering medication and document any side effects as well as management of adverse effects of medications can involve all organism and all systems in the human

Psychiatric and Mental health Nursing, Ministry of Health, Iraq.

body, patients on atypical antipsychotics are exposure to risk for incidence of metabolic disorders for instance increased blood pressure, increased level of lipids in the blood, weights gain, increased glucose level, and extra pyramidal side effects ⁴ Now antipsychotic medications are the cornerstone for treatment patients with psychotic disorders ⁵. It have been effective in clinical outcomes it reduced risk of relapses rates ⁶. Typical antipsychotics medications first group discovered that used for treating schizophrenia like chlorpromazine that block dopamine receptor there for relieving symptoms of psychosis but they are causing increase of cholinergic effect ⁷. Second generation of antipsychotics medications called “atypical antipsychotics” or newer antipsychotics such as olanzapine, risperidone, and others have been increasingly used in practice within the last 15 years ^{8,9}.

METHODOLOGY

The present study was carried out through the application of quantitative study design which uses the assessment approach, and it was conducted on nurses who are working at – Ibn rushd psychiatric hospitals in Baghdad city from Starting from 18th of February 2018 to 2ed of December 2018. Random sample of (50) nurses working during day shifts comprised of (25) nurses working in Al-Rashad psychiatric hospital and (25) nurses working Ibn-Rushd psychiatric hospital. Selection of nurses who was working at both psychiatric hospitals according to certain criteria such as.

- Nurses have at least one year or more of experience in work at psychiatric hospitals.

- Both gender.

Instrument’s of the study was developed to achieve objectives .It was comprised of two part.

Part I: Demographic characteristics of the study sample.

Part II: Nurses’ knowledge regarding antipsychotics medications.

Test for nurses was conducted at morning shift. It was consisted of 30 items related to nurses’ knowledge about antipsychotic medication about mechanism of action, indications, names of typical and atypical antipsychotics, and contraindications. A pilot study was carried out for nurses to determine the questionnaire reliability by the use of test-retest. 18 Experts in field of nursing and

psychiatric medicine participated to determine validity of the questionnaire. Data analysis was achieved by the use of statistical package social sciences (SPSS) under version (24); descriptive and inferential analysis approaches such as frequency, percent, and correlations.

RESULTS AND DISCUSSION

Descriptive Data Analysis

This consists of description of demographic characteristics of the sample (Table 1). The results of table one show that the male-nurse participants (58.0%) are more than female-nurse participants (42.0%); the study reveals also that the highest percentage of the participants is within the thirties of age (32.0 %); 36.0% of the nurses participated have one to five years of experience in General Wards but 42.0% of them have one to five years of experience in psychiatric wards; 80.0% of them have not participated in any training course regarding antipsychotics medications and finally, about half of the nurses joined in the study are with Diploma level. Distribution of the sample regarding to the levels of antipsychotics-related knowledge (Tables 2 and 3). Table (2) shows that the majority of nurses participated is with low level of antipsychotics-related knowledge (76.0%); 24.0% of the sample is with Fair level of antipsychotics-related knowledge and no one from them is with Good level of antipsychotics-related knowledge. Table three shows that all nurses participated in the present study distributed within only low and fair levels of antipsychotics-related Knowledge because the study reveals that no one from all the participants have good level of this domain in the baseline phase. Therefore, 44.0% of the male nurses and 32.0% of female nurses have low level of antipsychotics-related Knowledge.34.0% of the low level of antipsychotics-related Knowledge is within the third decade of age; 32.0% of the low level is with college level of education; 28.0% and 32.0% of the low level has one to five years’ experience in general wards and psychiatric wards respectively; and 62.0% of the sample, who has not joined in any training course, has low level of antipsychotics-related Knowledge.

Inferential Data Analysis

This consists of association between the levels of Antipsychotic-related Knowledge Domains and demographic characteristics of the nurses (Table 4). Table four shows significant differences between gender and antipsychotics, age and side effects, and work in

psychiatric ward and total domains, but there are no significant differences between other demographic characteristics and knowledge of all domains.

Demographical characterized of the study sample.

According to the results of this study table (1) show that the male-nurse (58.0%) are more than female-nurse; this result was similar to many Iraqi studies, they found male-nurse staff working in psychiatric wards are more than female nurse staff at Baghdad psychiatric hospitals^{10, 11}. With regarding to age of the study sample, results reveals that the highest percentage of the nurse staff within thirties of age (30-39 years old); this result was similar of finding of Al-Ameri¹². This result may explained these ages of nurse staff have more ability to tolerance work situations at psychiatric wards. Concerning experience in hospital 136.0% of the nurses participated have one to five years of experience in general wards but 42.0% of them have one to five years of experience in psychiatric wards; this result supported Iraqi study found the majority of nurse – staff working in psychiatric hospitals at Baghdad City have five years of experiences or less¹¹. Regarding to training about antipsychotic medications the result shows that majority of nurse (80.0%) have not participated in any training course, this results supported by Araki, he found most of nurse-staff not attended in training or workshop regarding antipsychotics medications¹³. Concerning to level of education, the study shows nearly half of the nurse-staff are with diploma level. this result similar to study conducted at Baghdad psychiatric hospitals in 2017 found nurse-staff working in psychiatric wards are with diploma¹⁰.

Knowledge of nurses about Antipsychotic Medications

Results of tables (2 and 4) distribution of the study sample regarding to the their levels of antipsychotics-related knowledge and distribution in levels regarding demographic characteristics of the nurses shows most of nurse staff is with low level of antipsychotics-related knowledge, this results agreement with other studies they reported that the nurses staff have insufficient of knowledge about pharmacology^{14, 15}. However, literature highlights on nurse-staff lack of knowledge about medication¹⁶ such as prescribing¹⁷ and administration¹⁸. Hemingway and others (2011) done study to evaluate the experiences of nurse staff competence for medications they documented that nurses’ knowledge about antipsychotics medications adverse effects was lack¹⁹. According to results of table 3 which reveal that the levels of antipsychotic-related knowledge, side effect-related knowledge, role of nurse-related knowledge, management-related knowledge and total knowledge is not affected by what the gender the nurse is, how old the nurse is, which level of education the nurse has, which ward the nurse is in and has the nurse joined in a training session. For all domains of knowledge the non-significant association could be clarified that these knowledge domains could be not affected by whether the nurse is male or female; whether is younger or older; whether has higher level of education or lower; whether has longer career in general wards or shorter and finally, whether participated in a training course or not. Hajebi and his team (2011) found no relationship between knowledge and variables like age, gender, professional experience, and education²⁰.

Attitudes of Biological Waste Management among a Sample of Academic Personnel Working in Baghdad

Lamia Yaqoub Mohammed¹, Raghad Hassan Hussein Sanyi², Izzat Abdulsatar Mezher Al-Rayahi³

¹ College of Health and Medical Technology, Middle Technical University, Baghdad, Iraq

ABSTRACT

Biosafety and biosecurity of academic and teaching facilities is maintained when the appropriate guidelines for the safe management of biological waste is implemented. Biological waste is a potential source of infections and occupational hazards. Previous studies assessing the awareness of some academic and technical laboratory staff working in Iraq has identified gaps in the awareness of the recommended procedures associated with biological and clinical waste disposal. This study was aimed to determine the awareness and attitude of laboratory staff towards biological waste practices and management policy. A closed end questionnaire was distributed among a number of laboratory staff working in universities in Baghdad and the results were analyzed. Although waste disposal procedures were followed at some degree, but a wider implementation of appropriate waste disposal procedures is necessary. No satisfactory segregation or classification of biological waste was noticed. The results of this study identified the need for each laboratory to have its own code of practice and policy for the management of biological and clinical waste generated in the laboratory. The various biological waste such as clinical samples, tips, tubes, etc, should be classified and an appropriate waste disposal procedure should be outlined for each category.

Keywords: biosafety, waste management, clinical waste, segregation.

INTRODUCTION

Biosafety is defined as the effective preventive measures employed by medical, teaching and research laboratories to avoid contamination with pathogenic microorganisms, and protect individuals and the environment from hazard contamination originating from handling clinical samples, contaminated products and carrying out microbiological tests¹. The last two decades has witnessed raised awareness of the importance of biosafety management due to the increase of emerging pathogens and bioterrorism threats. Efficient biosafety management involves setting biosafety policies which consider basic concept of laboratory management, waste management, air control, suitable physical facilities and appropriate legislations². In 2012, the Iraqi National

Monitoring Authority (INMA) was established with four major functions in its agenda. One of the first proposals of this organization was to establish a national biorisk management system and hence the National Biorisk Management Committee (NBMC) was established in the same year. Among the goals of the NBMC was building laboratory capacity by training laboratory staff on biosafety and biosecurity measures by international organization. Improvement of laboratory biosafety in Iraq require “investment in infrastructure, information technology, and human capital³. This study aims to summaries the attitudes of biological waste management among workers in university teaching and research laboratories.

MATERIALS AND METHOD

A survey was conducted to evaluate the biosafety culture, biosafety compliance, incident reporting and biosafety training programmes among a number of laboratory staff working in colleges and institutions in Baghdad. The survey was designed to address the implementation of the basic concepts in biological

E-mail: Dr.raghadhassan@gmail.com

safety outlined by the WHO and published papers⁴. A questionnaire with closed-ended questions was designed to get quicker response from participants and also to make the questions easier to answer. The survey contained two parts, the first part contained general questions such as gender, educational level, working experience, job category and specialization. While the second part contained 28 close ended questions designed to assess the attitude, knowledge and practices of biological waste management such as biological waste classification and segregation, color coding, methods for biological waste disposal and the presence of a plan for biological waste management in the individual laboratories⁵. The survey was carried out from the 1st of June 2018 to the 30th of June 2018. One hundred questionnaires were distributed among the target group whom worked in either BSL1 or BSL2 teaching and research university laboratories. Confidentiality of all participants was maintained. MS Excel and Graph Pad prism 6 were used to analyze and present data.

RESULTS AND DISCUSSION

One hundred questionnaires were distributed among academic personnel who were either laboratory technicians, teaching staff and researchers working in university laboratories that deal with and generate biological waste. Analysis of the data according to educational level revealed that 1 % had a technical diploma, while 20%, 35% and 44% had BSc, MSc and PhD degrees respectively. Based on previous studies, the overall scores for knowledge, attitude and practice were transformed into percentage score^{5,6}. The response of participants to the questions were considered either “satisfactory/correct” or “unsatisfactory/incorrect” scores. Hence, correct answers were scored as 1, while no answer/incorrect answers were scored as 0. These values were added to generate a single value out of the possible scores. Then the percentage of “satisfactory/correct” answers were calculated. When a participant had a score of 60% or more, the response was considered “satisfactory”. On the other hand, the response was considered “unsatisfactory” when the participant had less than 60% score. Based on the aforementioned scoring criteria, only 33% of the participants in this study gave a satisfactory response, while 67% of participants gave an unsatisfactory response. Participants who gave a satisfactory response, 9.09%, 45.45% and 45.45% respectively had BSc, MSc and PhD degree as illustrated in figure 1. Analysis of the response of the

participants in this study also revealed that only 20% of participants had previously attended a training lecture/course about biological waste management as shown in figure 2. Worldwide awareness regarding effective control and safe handling of biological and clinical waste has increased due to its impact on human health and environment. Sharps waste including hypodermic needles, glass slides, coverslips and tips are considered as hazardous waste. Clinical sharps waste such as hypodermic needles not only causes cuts and punctures but also may infect wounds with the microbes in the contaminated waste. Hence, this type of waste is considered as a waste with increased risk to healthcare workers⁸. Several developing countries suffers from defects in their clinical waste management systems. One of the major problems in these countries is the handling and disposal of clinical waste with non-clinical waste which exposes health care workers and the public to fatal health risks. Such unsafe practice may result in exposure to diseases such as hepatitis, skin infections, tuberculosis, food poisoning, cholera and plague⁹. Studies carried out to investigate the presence of infectious agents in various clinical solid wastes, clinical sharp waste and general waste from hospitals revealed the presence of various pathogenic bacteria. Furthermore, the general waste generated from hospitals contained *Pseudomonas aeruginosa* and *Staphylococcus aureus*. Thus, it is recommended that clinical solid waste, clinical sharp waste and general waste should be sterilized at the point of generation to limit nosocomial infections and possible environmental pollution⁹. During the last couple of years, Iraqi academic institutions have started to focus on the importance of biological and chemical safety in general¹⁰. Some Iraqi scientists have received training to enhance biosafety, and biosecurity standards and procedures from international organizations. Continuous assessment of biosafety practices in hospitals and academic institutions is necessary to evaluate the level of awareness and attitude among technicians, senior scientists and students regarding biological hazards, biological waste disposal and also appropriate management techniques. Recent published data in Iraq have concluded that university laboratories “don’t fit the standard requirements and stressed the need for future plans to develop the aspect of safety and security in all laboratories¹¹. Similarly, the results of the present study show the need to increase awareness towards biological waste management in university laboratories. The reason for the high percentage of unsatisfactory

responses registered in this study is probably due to the lack of appropriate training as only 20% of participants have previously received training for biological waste management. This observation highlights the need for extensive training programmes on the awareness of “biological waste management”. Identifying the gaps in the current biosafety practices and recommending the solutions is the first step to solve any problems that the current systems may have. Iraq was not the only country in the region which suffer from defects in its biological waste management system. An earlier study carried out in Jordan showed that there are no defined methods for the handling and disposal of biological waste. In addition, the mentioned study identified the absence of specific regulations or guidelines for segregation or classification of biological and clinical waste ¹². In conclusion, the high percentage of unsatisfactory responses observed in this study stresses the need for extensive training on biological waste management at regular time intervals. Furthermore, it is vital that each laboratory should have a written code of practice for biological waste management available to the users of the laboratory.

Figure 1. Distribution of participants with a satisfactory response according to their educational level.

Figure 2. Training status of participants for biological waste management

CONCLUSION

This study was aimed to determine the awareness and attitude of laboratory staff towards biological waste practices and management policy. A closed end questionnaire was distributed among a number of laboratory staff working in universities in Baghdad and the results were analyzed. Although waste disposal procedures were followed at some degree, but a wider implementation of appropriate waste disposal procedures is necessary. No satisfactory segregation or classification of biological waste was noticed. The results of this study identified the need for each laboratory to have its own code of practice and policy for the management of biological and clinical waste generated in the laboratory. The various biological waste such as clinical samples, tips, tubes, etc, should be classified and an appropriate waste disposal procedure should be outlined for each category.

Biological Activity of New Hydantoin Derivatives on *Acinetobacter Baumannii* Biofilm Formation Isolated from Clinical Sources

Ihsan Ali Raheem¹, Suzan Saadi Hussain¹, Rajwa Hasan Essa², Abdul-Jabar Kh. Atia³, Fatima Rammadan Abdul¹

¹Microbiology, College of Science, ²Immunology and Microbiology, College of Science, ³Department of Chemistry, College of Science, Mustansiryah University, Baghdad City, Iraq

ABSTRACT

Wholly 538 clinical samples of blood, burns, sputum, wounds and urine were involved in the current study which was done in 4 hospitals. The isolation and diagnosis of fifty-two *Acinetobacter baumannii* isolate 36.54% from blood specimens, whereas wounds specimens constituted 23.08%, burns specimens achieved 17.31%, sputum specimens formed 13.46% and a low percentage was in urine specimens which accomplished 9.62 %. Totally isolates of bacteria were identified via the biochemical, cultural and microbial characteristics and confirmed via VITEK 2 Compact system. It was found that all (100%) of bacteria isolates were resistant to amoxicillin-clavulanic acid and Cefepime, while Tobramycin was the most effective antibiotic. The isolates displayed the ability of biofilm creation via Microtitration plates method (M.T.P), from the whole number (52) isolates, (33) were producers, such as strong biofilm creators were (15) 45.46 % and (18) 54.54% moderate though (19) 36.53% isolates were stately as weak or none biofilm producers. MIC for new hydantoin derivative (C₁₂H₁₃N₃O₂S) was determined against fifteen isolates were active in MIC values equal to 31.25µg/ml gave (7) *A. baumannii* isolates, while in MIC, values equal to 62.5µg/ml gave (5) isolates, and three isolates were active in MIC values equal to 125µg/ml.

Keywords:- *Acinetobacter baumannii*, Hydantoin derivatives, Biofilm, Antibiotics.

INTRODUCTION

Acinetobacter baumannii is a public causative agent of nosocomial infections and it has got a pathogen of augmented clinical importance because of its remarkable capability to cause outbreaks of infections and to gain resistance to nearly all presently used antibiotics, including the carbapenems¹. *A. baumannii* is portrayed via its ability to spread, its capacity to survive on most ecological surface² and its astonishing ease with which it obtains antimicrobial multiple resistances. The previous fifteen years, numerous *A. baumannii* nosocomial strains confined worldwide are exceptionally resistant to every

single accessible family of current antibiotics^{3,4}. Biofilms are arrays of microorganisms, encased in a framework, that function as a helpful consortium. Biofilm way of life is a element open to most microorganisms in natural and therapeutic systems which build up a protected manner of growth that permits survival in hostile environments⁵. Hydantoin derivatives possess important biochemical and pharmacological characteristics have and emerge as a promising new class of antimicrobial agent and conjugated on polystyrene beads are encouraging disinfectants with broad antimicrobial action affected via the gradual discharge of oxidizing halogen in water⁶. Numerous hydantoin derivatives are wielded as antiepileptic drugs. Others were establishing to show antiproliferative action and aldoreductase inhibition⁷.⁸ Hydantoins counteract high-frequency stimulation of the focal point of epileptogenic and furthermore simplify emission of sodium ions, which lessens agitation of neurons and prevents their stimulation upon contact

Corresponding author:

Ihsan Ali Raheem.

Microbiology, College of Science, Mustansiryah University, Baghdad City, Iraq.

with pulses from the center of epileptogenic⁹. While, the formation of biofilm capability in spite of its vital function in the enhancement of resistance of antibiotic and pathogenesis of *A. baumannii* has been poorly examined^{10,11}.

MATERIALS AND METHOD

Samples collection

A whole of 538 clinical samples of blood, wounds, burns, sputum and urine were included in present study which was carried out in 4 hospitals. Through the period ranging from 1 February 2017 until June 2017. Bacterial diagnosis initially diagnostic depending on Gram reaction and morphological characteristics of the colonies based on bacterial growth on MacConkey agar and Blood agar, as well as the number of biochemical test and Api 20 E strip reading. The second technique VITEK 2 compact system. *A. baumannii* was distinguished by the following methods; hemolysin test and IMVC test¹.

Susceptibility of Antibiotic

Experiment disk agar dissemination according to Kirby Baur standardized susceptibility of antimicrobial, single disk way was carried out toward twelve antibiotics. The antibiotic discs were as follows: Ciprofloxacin (CIP, 5µg/disc), Piperacillin (PIP, 100µg/disc) Tobramycin (TB, 10µg/disc), ceftriaxone (CTR, 30µg/disc), Ceftazidime (CAZ, 30µg/disc), Cefepime (CFP, 30µg/disc), Aztreonam (ATM, 30µg/disc), Amoxicillin-Clavulanic acid (AUC, 20/10µg/disc), Amikacin (AK, 30µg/disc), Gentamicin (CN, 10µg/disc), Meropenem (MEM, 10µg/disc) and Imipenem (IMP, 10µg/disc), Bioanalyse (Turkey)¹³.

Biofilm Formation

The bacterial activity for biofilm formation was measured by quantitation of biofilm by microtiter plate (M.T.P): The current study screened the all medical isolates of *A. baumannii* for their capability to biofilm formation via microtitration plates approach as stated by way of¹⁴, with some modification.

The ability of biofilm formation = O.D of test sample - O.D of quality control

Preparation of Experimental of 3-((1-(4-methoxyphenyl) ethylidene) amino)-2-

thioxoimidazolidin-4-one Derivatives of new hydantoin were prepared as said by the literature procedure^{15,16}. In this study, new hydantoin derivative was used compound 3-((1-(4-hydroxyphenyl) ethylidene) amino)-2-thioxoimidazolidin-4-one (C₁₂H₁₃N₃O₂S), and its melting point was detected (205-210°C) and prepared as follows: carbonyl compounds (0.01mole) was dissolved in ethanol (30 ml) and (0.01mole) of thiosemicarbazide was added and then refluxed for three hrs. The resultant mixture was transferred into crushed ice and stirred for 15 min. Then the precipitated crystalline solids were filtered, laundered with water and were recrystallized from ethanol. Moreover, (0.01mole) of compounds 2-(1-(4-hydroxyphenyl) ethylidene) hydrazine-1-carbothioamide were dissolved and their melting point were detected (185-188°C) C₉H₁₁N₃OS and (0.01 mole) of chloroethylacetate in 30 ml ethanol to obtain a mixture. The mixtures were stirred for a few minutes, and then sodium acetate (0.02mole) was additional to the mixture. The mixture was refluxed for 6hrs. After cooling, the precipitate found which is filtered off and recrystallization from dioxane.

Determination of minimum inhibitory concentrations (MICs) of new hydantoin compounds for *A. baumannii* isolates

The antimicrobial efficiency of new hydantoin derivative 3-((1-(4-methoxyphenyl)ethylidene)amino)-2-thioxoimidazolidin-4-one against *A. baumannii* was tested by the standard broth dilution approach. By using serial two-fold dilutions of new hydantoin derivative in concentrations extending from (15.62 mg/ml to 500 mg/ml) the MIC was determined in BHI broth. In present study, the positive control contained BHI broth medium with experienced bacterial concentrations and negative control contained only BHI broth and incubated at 37°C for 24hr. The (MIC) of the new hydantoin derivative for *A. baumannii* was measured at the lowest concentration of the new hydantoin compound required to inhibit the *A. baumannii* growth.

The antimicrobial activity of the new hydantoin compounds for biofilm formation on *A. baumannii* isolates

The antimicrobial activity of the new hydantoin derivative against *A. baumannii* isolates used to be quantified according to the process described via^{17,18}. Briefly, wells of sterile ninety six well-flat bottom

polystyrene tissue tradition dealt with plates had been stuffed with 200µL of the diluted cultures (180 µL BHI+ 1% glucose and 20 µL bacterial culture) serve as a control. While the second well was filled with 100 µl of the hydantoin compound in concentration of Sub MICs with 100 µl BHI containing bacterial culture and covering with parafilm. The plate was incubated for 24 h at 37°C and then washed twofold with distilled water and leftward to dry at room temperature. Then we added 200µL of the crystal violet to all wells and left for twenty min. Sterile water was used to washed wells and left to dry at room temperature for 15 min. Subsequently for removing the crystal violet, wells were washed 3 times with D.W to eliminate boundless dye. Lastly, totally wells were filled via 200 µL ethanol (95%) to discharge the dye from the cells and optical density of stained biofilm was gained through using micro ELISA auto reader at wavelength 595 nm.

% of inhibition of biofilm formation = 1 - (Sample optical density / control optical density) × 100

RESULTS AND DISCUSSION

Isolation and Identification of Bacterial Isolates 07821307014

A total of 538 clinical specimens of blood, wounds, burns, sputum and urine were included in this study, 52 were positive to *A. baumannii* which was isolated in high percentage; 36.54% (n=19) from blood specimens; whereas, wounds specimens constituted 23.08% (n= 12), burns specimens achieved 17.31% (n= 9), sputum specimens formed 13.46% (n= 7) and low percentage was in urine specimens which accomplished 9.62 % (n= 5). All bacterial samples expected to be an *A. baumannii* grown on MacConkey agar and Blood agar as enrichment media, then it occurs as Gram-negative coccobacilli and occasionally arranged in diplococci under the microscope. Then, a number of biochemical tests were carried out and the results showed in table (1). All the above results were identification by Api 20 E strip reading and Vitek 2 compact system (12).

Antibiotics Susceptibility

The susceptibility tests toward (12) antibiotics were carried out which showed that *A. baumannii* clinical isolates had 100% resistance to Amoxicillin-clavulanic acid and Cefepime. Also this study showed the highest resistance to Ceftriaxone (94.23%), Piperacillin

(94.23%), Ceftazidime (90.38%), Aztreonam (88.46%), Gentamicin (86.53%), Ciprofloxacin (82.69%) and Amikacin (73.07%). Imipenem and Meropenem recorded moderate resistance; (55.76%) both them. It is worthy to remark that from 52 clinical isolates of *A. baumannii*, 21 isolates (40.38%) were resistant to Tobramycin.

Biofilm Formation by *A. baumannii*

The capacity of *A. baumannii* to the production of biofilm by all isolates from (blood, wound, burns swab and sputum as well as urine). MTP technique, from the whole number of (52) isolates verified for biofilm formation, (33) were producers, as strong biofilm producers were (15) 45.46 % and (18) 54.54% moderate while (19) 36.53% isolates were considered as none or weak biofilm producers. Many bacterial pathogens, which include *A. baumannii*, can develop either as dispersed (planktonic) cells or as matrix-enclosed communities referred to as biofilms. The probable to biofilm formation is shared amid scientific *A. baumannii* isolates, maybe because the mode of biofilm increase donates to the environmental achievement of this pathogen in the hospital. These consequences are disagreement with a study^{14,15} located that all *A. baumannii* isolates showed the ability to structure biofilms in MH broth. Another study additionally in total, 249 (91%) isolate had been fine for biofilm formation, and 63 (23%) isolates exhibited extra strong biofilm formation.

FTIR Spectrum of hydantoin derivative (C₁₂H₁₃N₃O₂S)

FTIR spectrum of (C₁₂H₁₃N₃O₂S), figure (1), displays band at (3282 cm⁻¹), because of ν(NH) vibration, bands at (3188 cm⁻¹) was allocated to ν(C-H) vibrations of aromatic ring, whereas the band at (3117 cm⁻¹) accredited to symmetric (CH₂) group. Spectrum moreover displays new distinctive band at (1714 cm⁻¹), which is accredited to ν(C=O) vibration, band at (1620cm⁻¹) accredited to ν(C=N) vibration of Schiff's base, whereas the absorption bands of ν(C=C) aromatic was seemed at (1593, 1570cm⁻¹). The strong band noticed at (1390, 1332cm⁻¹), states to asymmetric and symmetric of nitro group, and lastly the absorption band of ν (C=S) seemed at (1085cm⁻¹).

Determination of Minimum Inhibitory Concentrations (MICs) of new hydantoin derivatives on *A. baumannii*

MIC for new hydantoin derivative (C₁₂H₁₃N₃O₂S) was determined against fifteen isolates of *A. baumannii* were multi-drug resistance and biofilm formation with the method (MTP) was the best and the consequences were interpreted after 16-18 hrs.of incubation at 37°C . The compound (C₁₂H₁₃N₃O₂S) showed highly active in MIC values equal to 31.25µg/ml gave (7) isolates, also the numbers of isolates that gave MIC values equal to 62.5µg/ml were (5), while isolates *A. baumannii* that gave MIC values equal 125µg/ml were three isolates. These compounds are capable to action on bacterial membranes, analogous to normal host-defense peptides table (2). Moreover, these hydantoin composites not only destroy bacterial pathogens rapidly but also inhibit the development of methicillin-resistant *Staphylococcus aureus* (MRSA) bacterial resistance below the tested conditions.

The inhibition effect of new hydantoin derivative in Sub MICs concentration on *Acinetobacter baumannii* biofilm formation

The results showed in table (2) the inhibitory influence of the hydantoin compound on biofilm development for fifteen bacterial isolates used in this study with variable inhibitory effect on bacterial isolates . The highest inhibitor effect (98.85) was appeared on the *A. baumannii* isolate number (14) was isolated from blood followed by 98.00%, 97.01%, 91.90% from sputum, wounds, burns, respectively. While the lowest inhibitor effect (79.72) was appeared on the isolate number (32) was isolated from blood. Although results exhibited that there were some differences in the values of the MICs of compound (C₁₂H₁₃N₃O₂S) in resistant of *A. baumannii* isolates ranged from 31.25µg/ml to

125µg/ml. Moreover, the results showed a significant differences (P<0.05) between the Inhibition of biofilm rate and control. *Acinetobacter baumannii* is a public causative agent of nosocomial infections and it has got a pathogen of augmented clinical importance because of its remarkable capability to cause outbreaks of infections and to gain resistance to nearly all presently used antibiotics ².The results for the antimicrobial activity of hydantoin derivatives are presented that it has potential as antimicrobial agent against bacteria.

Table 1. Biochemical test consequences for *Acinetobacter baumannii*

CONCLUSION

The results of all *A. baumannii* clinical isolates showed multidrug resistance but the resistance among Beta – lactam were more than among other antibiotics and the antimicrobial activity for new hydantoin derivatives showed great improvement of activity of these compounds against *A. baumannii* biofilm formation.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Faculty of Dentistry, University

of Babylon, Hillah city, Iraq and all experiments were carried out in accordance with approved guidelines.

Building a Proposed Educational Program Based on the Skills of Close and Backward Thinking in the Creative Writing of the Fifth Literary Students

Mohammed Thamer Khalil Al-Rubaie¹, Dhiaa Awaid Harbi Al-Arnousi¹,
Mohammed Shaker Nasser Al – Rubaie¹

¹Faculty of Basic Education, University of Babylon, Hillah City, Iraq

ABSTRACT

The problems of accumulated expression have been addressed to add to contemporary problems posed by changes in the social, economic and political aspects. This has been reflected in the growing acceleration in the volume of information. A large number of students in different stages of study suffer from apparent weakness in both oral and written expression. If someone speaks in a proper language, the signs of fatigue appear on his language. He may stop abruptly before he finishes what he wants to say, or maybe he will resort to the colloquial language that feeds his speech or he is unable to complete it. We conclude from the foregoing that writing in general and creative writing in particular need attention from us learners so the researcher finds it necessary to propose a program in creative writing.

Keywords: *building the program, thinking of the convergence of thinking, creative writing*

INTRODUCTION

The Arabic language consists of the arts of listening, speaking, reading and writing. The writing is the fourth of these arts, not because they are the least important, but because they are based on the arts of other language. These arts represent tributaries from which writing draws their material and ideas. It is a mental process that generates, shapes, organizes and then puts them in the final form on paper. Creative writing is a process that allows the production of written text through the development, revision and development of the basic idea^{1,2}. In order to reach the stage of creativity in writing the individual must think in a way commensurate with the creative methods of writing. Thinking is a divine gift given by God Almighty to the exclusively human beings and distinguish them from other creatures to be human in that distinct to aspects of excellence in other psychological aspects. Where this distinction is clearly manifested in the most important function of the

mind, but thinking³. And thinking acquires knowledge and through it solve problems and shows our behavior on the most logical and reasonable and we discover knowledge so that we can control the world in which we live. In order to determine the effectiveness of the proposed program, the researcher chose the sample of the fourth grade students (58) students of fourth grade literary, (29) students per group. The experimental group of the proposed program was subject to the theory of multiple intelligences in the reading course, while the control group underwent the traditional program in the reading course. The researcher prepared two tests, one for measuring critical reading skills, and the other for measuring creative writing. The researcher confirmed their honesty and consistency. The correction of the creative writing test was based on a degree of appreciation for each question based on the relative importance of each skill. The researcher then applied the tests at the end of the experiment) Weeks. The results showed that after the analysis of the data using statistical means there were differences of statistical significance between the average scores of the students of the two groups in critical reading skills, creative writing skills, for the benefit of the experimental group, Attributable to the proposed program.

METHODOLOGY

This research aims to build an educational program in the creative writing of the fifth grade students, relying on the skills of the thinking of the approach and the secondary. The researcher relied on the descriptive approach. The descriptive research aims at describing specific phenomena, collecting facts and information, describing the specific circumstances, In fact, descriptive research does not stop at this point, but is also concerned with determining what the things and phenomena to be considered should be in the light of certain values or criteria, and suggesting the steps and methods that can be followed to - Search Tool: In order to construct an educational program in the creative writing of the fifth grade students in accordance with the skills of close and backward thinking, and to identify these skills and use them in creative writing, the researcher adopted the following procedures: Directing a questionnaire to a number of experts and teaching assistants in the field of teaching Arabic language and psychology (Appendix 1), which included the integration of the skills of reflection and backward thinking. Study the literature of the methods of teaching Arabic language, psychology, theories of learning and related messages in which the skills of thinking and proximity was determined Based on the above, the researcher has collected (12) skills for cross-rethinking, and skills for reflective thinking. Reach the image that should be In the light of these criteria or values⁴. One of the most prominent activities suggested by the researcher is to give students an idea about the subject of the lesson in the previous lesson, allowing them to access the literature to be able to easily answer the questions of the lesson, which take into account the skills of thinking and proximity to their descendants such as quoting Quranic verses or poetry verses, To freely express their thoughts and feelings. The general objectives of teaching the expression in the preparatory stage: the objectives set by the Ministry of Education.

Develop the ability of learners to chain ideas and build each other on sentences that are coherently coherent.

Enable learners to use language ammunition in clear and proper expression.

Increase the ability of learners, especially gifted ones, to go beyond direct expression to figurative artistic expression.

Develop the ability of learners to capture new meanings and ideas.

Enable learners to express their opinion before others and to make them bold and good performance and modern etiquette.

Develop the ability of learners to express their meanings and ideas with clear words and sound structures.

Enable learners to correct the output of characters from the correct exits

Expand the imagination of the learners and develop their literary taste (the curriculum of the preparatory school, 1990, p. 20).

In 1938, Sushiro was a poor young man. All he wanted was to sell one of his spare parts to Toyota. Which is a very big dream on a young man in the early age, as you see. He is making a lot of effort in the design and manufacturing of this piece. And when he ended up going to the Toyota factory to realize his dream and sell them But Toyota factory refused! Do you feel a failure at the time? Then tried again and spent the night trying to modify this piece. Succeeded and bought it Toyota finally !! The availability of money with our owner, he decided to establish a factory produces auto parts. At that time the Japanese government was preparing for war and the concrete materials are not available. Could not build our own factory .. Did he felt failure at the time? Do you know what our friend did? He decided to invent he and his friends a concrete mix of their own making .. To build the plant that dreams of !!! imagine?? He actually managed to make it and was able to build his factory, which began to produce and generate money for all of them .. But .. During the war bombed US aircraft factory owner. and destroyed most of it !!! Do you feel a failure at the time? He immediately went out of the factory and ordered his staff to try to find out where the planes were landing to change their fuel. He ordered them to take this fuel because it would benefit them in the manufacturing process. They do not find the raw materials needed !!! Is the story over? No .. Our owner was able to rebuild the factory and began to produce again .. But .. hit by a terrible earthquake demolished the factory again ... Did he felt failure at the time? Our owner sold the manufacturing right to Toyota. He had lost everything he owned and was no longer able to continue the idea of the factory .. Did he feel failure at the time ?? Japan

was suffering from a terrible fuel crisis after the war. .. So much so that it was distributing fuel to citizens in equal shares .. But it was not enough so that our owner just drive to the market to buy the needs of his family .. The fuel was not enough and could not move his car in freedom as it was in the past .. Did not feel Time? Our owner decided to try a nice idea .. He had a machine to cut weeds .. Decoding motor and riding in a bicycle had been .. Was the first motorcycle in the world !!! The people liked the idea .. and asked him to make them like .. Make many of these bikes to the extent that he thought of commercial marketing .. Sent to all the shops of bicycles tells them the idea. So many of them .. Expected to make millions of this project. But this did not happen. People refused to use this invention because of the weight of its time and the size of the exaggerated. !! Do you feel a failure at the time? He decided to develop his invention .. He adjusted and adjusts his measurements. Until he succeeded in the end. Earn millions and millions of this invention. Awarded the Emperor for his contributions to the effective community. Established his factory, which is one of the largest factories around the world. Created Factory (Honda) for cars. !! That the name of this man "Honda Sushiro"? What do we benefit from this story? If you watch the life of the successful you will know that the concept of failure has radically different from its concept when the failed .. An important rule: ((There is no failure .. There is an experience learned from them ..)) There is no failure in life .. Life is full of experiences that we have to Learn.

RESULTS AND DISCUSSION

The researcher arrived at a group of skills of thinking and convergence, and these skills were established in two ways: The first is the opinions of experts after agreeing to the process of integrating skills by the questionnaire that was provided to them after the researcher confirmed its authenticity and the other is the literature collected by the researcher all skills , And underwent adjustments, integration and correction.

CONCLUSION

That the skills of thinking and the proximity of the skills necessary to prepare the student, and must be developed according to the program of scientific and educational scheme and this is lacking in the study.

The skills of thinking and the proximity of the research reached by the importance of the integrated approach in the teaching of the Arabic language and its impact on the final achievement of students.

Cognitive Flexibility and Its Relationship to the Divergent Thinking of Fourth Grade Students

Mohammed Hamid Al-Masoudi¹, Mohammed Shakir Naser¹, Haidar Maan Ibrahim¹

¹ Faculty of Basic Education, University of Babylon, Hillah City, Iraq

ABSTRACT

The objective of this research was to define the cognitive flexibility and divergent thinking among scientific fourth-grade secondary school students and to find the relationship between them. The study was conducted in Iraq - Baghdad / Rusafa II Directorate of Education, a sample of (509) students were selected, two scale forms were used, one to measure the cognitive flexibility, and the other to measure divergent thinking of students. Each form has (65) paragraph to answer within (50) minute. Statistical analysis was used with the application of (T. Test) for two independent samples. The T value was an indication of the distinction of each paragraph compared to the tabulated value. All the paragraphs were distinct and thus the scale was composed of (65) paragraphs for cognitive flexibility and (52) paragraphs for divergent thinking. From the analysis, it was indicated that the level of cognitive flexibility of the sample was high. Also, the Pearson correlation coefficient was used as a statistical method in the analysis and indicated the existence of a functional relationship between the two search variables. This indicates a positive statistical relationship between the grades of cognitive flexibility and divergent thinking of students in the fourth grade.

Keywords: Cognitive Flexibility/ Divergent thinking/ Distinction/ Problem solving.

INTRODUCTION

Cognitive flexibility is an important dimension of the human personality. It accepts the conceptual change and perseverance in acquiring new patterns of behavior and abandoning other old and fixed patterns. It is located on one end of the continuum, while the cognitive sclerosis is on the other end ^{1,2}. Cognitive flexibility refers to a person's awareness that in any given situation there are options and alternatives available, willingness to be flexible and adapt to the situation, and self-efficacy in being flexible ³. Mental flexibility is linked to our previous perceptions, emotions, behaviors, and motivations, and the change in the environment, attitude, and behavior in our way of thinking, and flexible thinking does not mean giving up, it is just another way of saying yes to life ⁴. The cognitive flexibility of individuals is expected to be linked to many personal variables, developmental

factors, and social conditions. The cognitive variables in the personality system may have a relationship with cognitive flexibility, and divergent thinking is one of those variables. Divergent thinking is the hyper-thinking that requires the individual to put forward many different responses for one question or one problem. It also represents the thinking that results in the production of many solutions and responses without restricting one's thinking to predetermined rules, and with the importance of cognitive flexibility and its possible relationship to divergent thinking, This subject has not received attention from researchers in the Iraqi environment yet, which represents the core of the current research interest. From the above, it appears that the problem of research is to seek the measurement of the two variables (cognitive flexibility and divergent thinking) and to identify the strength and direction of the correlation relationship between them in the fourth-grade scientific students. The level of cognitive flexibility of students can help teachers to design ways and methods to help students develop their cognitive abilities, enhance their positive behaviors and work to raise their achievement. The possibility of the Ministry of Education to benefit from the results

Hillah City, Iraq

of this research in the construction of curricula of the science subject for secondary stage, taking into account the results, recommendations, and suggestions of this research that may encourage learners to develop their own thinking processes to become educated, effective, and independent. Direct the attention of science teachers and mentors to the necessity of paying attention to the education of learners and training them on how to acquire the flexibility of knowledge and different types of thinking, and how to access knowledge. Cognitive flexibility is the human ability to adapt the cognitive processing strategies to new and unexpected conditions in the environment. This definition consists of three basic elements. First, cognitive flexibility is a capacity and therefore it can be gained through training; second, a change in cognitive strategies used by the individual, which is a series of processes that seek to solve the problem, and including the assessment of the different characteristics of the interesting and the generation of alternatives and the differentiation between them and then choose the appropriate alternative Third: This change occurs to meet the new and unexpected conditions and situations in the environment ⁵. Divergent thinking represents an individual's ability to generate a new idea when confronted with a problem ⁶. It is sometimes referred to as drift thinking, which is characterized by originality, with a focus on the diversity of products and their modalities, and as ⁷ sees it as the production of new information, the generation of new information from a given one as well as the limitations is decreased in this type of thinking, the search process expands, and the production is abundant, divergent thinking is different from other types of thinking in terms of a creative solution to the problems ⁸. This type of thinking involves the production of old ideas in new relationships. It is flexible thinking that takes multiple directions rather than a single trend. It goes beyond obvious things to search for the possible remote and indirect outcomes, possibilities, and solutions of the one problem. In a creative way to solve problems, and that it is not random thinking subjected to chance, it needs to be trained in special skills such as identifying the problem and its elements, methods of data collection and organization in order to reach the best solutions, as well as it has importance in the formation of knowledge and information for learners and to reach outstanding innovative products ^{9,10}.

METHODOLOGY

Research Population

The current research population consists of the preparatory stage students / scientific fourth grade in the city of Baghdad / Rusafa II for the academic year (2018-2017), the number of students is (598), distributed in four schools.

Research Sample:

The random staging method was used in selecting the research sample. Four schools in the Baghdad / Rasafa II Directorate of Education were randomly selected. In each school, one or two classes were chosen randomly from the fourth grade. From these, (509) students were selected.

Research Tools

Cognitive Flexibility Scale

After studying the theoretical literature and previous studies and research in this area, the paragraphs were formulated, and took into account the framing of the paragraphs to be understood and doesn't combine of two ideas, the paragraphs of this scale were drafted in (76) paragraph in its initial form.

Scale Validity

The scales were presented to a number of experts in measurement, evaluation, and psychology to judge the appropriateness of the test paragraphs for the sample of the research and to delete, modify and add what they deem necessary. The scales have obtained the approval of more than (80%) of the experts. Thus, in its final form, the number of cognitive flexibility scale paragraphs were (65).

Specify scale instructions

Was applied to (50) students selected from the non-application sample in order to identify the clarity of the test paragraphs and it's instructions where they were clear, and the average time taken to answer is (50) minutes.

Statistical Analysis of Paragraphs

The scale was applied to a sample of (400) students selected randomly, Then (27%) of the highest scores forms were determined and (27%) of the lowest scores

forms. The number of forms per group was (108). Then (T. Test) was applied to two independent samples to test the difference between the mean scores of the upper and lower groups, the T value was an indication of the distinction of each paragraph compared to the tabulated value. All the paragraphs were distinct and thus the scale was composed of (65) paragraphs.

RESULTS AND DISCUSSION

Objective 1: To identify the level of cognitive flexibility in the fourth-grade students: The results of the comparison using the T-test of one sample were shown that the calculated T value is (58,715), which is a high value compared to the tabular value of (1.960), since the difference in benefit of the calculated mean, this means that the level of cognitive flexibility of the sample was high. Table (1) shows that.

Objective 2: To identify the divergent thinking of the fourth-grade students: The calculated mean was compared to the theoretical mean of the 78-grad scale. Since the difference was in benefit of the calculated mean, thus the divergent thinking level of the sample individuals was high, as shown in the table (2).

Objective 3: To define the relationship between cognitive flexibility and divergent thinking of the fourth-grade students: The Pearson correlation coefficient was

used as a statistical method in the analysis and indicated the existence of a functional relationship between the two search variables. This indicates a positive statistical relationship between the grades of cognitive flexibility and divergent thinking as illustrated in Table (3). Flexibility is the real reason behind the intelligence, superiority, and distinction of the special people among us because it is the actual generator of ideas, solutions, alternatives, opportunities and creativity. It is not available to those who think unidirectional, which does not have multiple angles of vision because it did not recognize the value of dimensions as it develops the ability to adapt to change, and the ability to change our theoretical abstract and specific response effectively for any situation we face in life and flexibility is the art of processing certain information, unlike the way it was previously adopted, it is easy to teach a new person, but you need a miracle to teach him to change the mindset that used to see things through them. In addition, diverged thinking is a way to produce as many ideas as possible by examining the problem from multiple angles and in proportion to the abilities and experiences of the learner, as it is flexible in many fertile directions, and as a method controlled by the learner in order to control the environment or other elements surrounding him, An activity that in essence produces new or unfamiliar products or achievements.

Table 1. Theoretical and Calculated T-Test Results of the Cognitive Flexibility Test.

Scale	Sample	Calculated Mean	Hypothesis Mean	St.D.	T Value		Sig.
					Calculated	Tabulated	
Cognitive Flexibility	509	257.12	180	23.870	58.715	1.960	0.05

Table 2. Theoretical and Calculated T-Test Results of the Divergent Thinking Test.

Scale	Sample	Calculated Mean	Hypothesis Mean	St.D.	T Value		Sig.
					Calculated	Tabulated	
Divergent Thinking	509	78.040	78	4.728	3.358	1.960	0.05

Table 3. Relationship between Cognitive Flexibility and Divergent Thinking for the Scientific Fourth Grade Students.

Scale	Sample	Correlation Coefficient Value	T Value		Sig.
			Calculated	Tabulated	
Cognitive Flexibility	509	- 0.530	14.073	1.960	0.05 There is a statistical relationship
Divergent Thinking					

CONCLUSION

The level of cognitive flexibility in the fourth-grade students is high. The divergent thinking of the fourth-grade students is high. There is a statistical relationship between the grades of cognitive flexibility and divergent thinking in the fourth-grade students.

Decadal Analysis of Carbon Dioxide Emissions from Different State of Fossil Fuels in Iraq

Ahmed S. Hassan¹, Khawla Nihad Zaki¹

¹Atmospheric Sciences Department, Collage of Sciences, Mustansiriyah University, Baghdad, Iraq

ABSTRACT

Calculate correlation analysis of decadal CO₂ emission throughout three kind of fossil fuel solid, liquid, and gas. It is the principle anthropogenic greenhouse gas that affects the Earth radiative balance. Emission intensity is the average emission rate of a given pollutant from a given source relative to intensity of a specific activity. Burning of carbon based fuel since the industrial revelation has rapidly increased concentrations atmospheric carbon dioxide, as same of data source of this work. The results shown the CO₂ emission from gaseous fuel consumption increased 10 times for first decadal 1045.10 kt than last decadal, whereas since 2004 not less than 10000 kt. The CO₂ emission from liquid fuel consumption increased 10.4 times than last decadal that was 86759 kt, while the same emission from solid fuel consumption decreased four times that last two decadal was near to zero kt. The percentage CO₂ emission of total fuel combustion for three sectors of life carried out: CO₂ emissions from electricity and heat production, different between first and last decadal was 10.584%, and for transport was 1.8%, while decreased from manufacturing industries and construction was 6.7%.

Keywords: Decadal, CO₂, emission, fossil fuels, Iraq.

INTRODUCTION

Carbon dioxide participate about 0.03% of total gases that components atmosphere, even this ratio is very few compare with another gases of atmosphere, but the rise in this percentage has negative effects on the earth. The significant causes to increased air temperature of the atmosphere, which lead many problems affecting the environment such as melting of ice and rising sea level, droughts and desertification, increased forest fires¹. A result of the gradual increase in population growth, and the expansion of industrial processes that depend on burning fuel was the main reason for the increase in the concentration of carbon dioxide, which began to increase since 1850 and reached 400ppm in 2012². Carbon dioxide emissions from burning fossil fuels are the first cause of global warming³ in addition to breadth

human activity, whether in the production of electric power or heavy industries such as solid iron and cement or from different modes of transport has a significant role in increasing emissions of carbon dioxide⁴. Greenhouse of gases is seven gases, carbon dioxide, methane, nitrous oxide and four fluorinated gases (F- gases) differ in effect and time remain in atmosphere. Carbon dioxide is the most emitted gas due to human activity. Europe Union report referred to, that in 2014, the ratio of CO₂ emission was 81% of total emission, methane is 10.6%, and nitrous oxide is 5.6% and fluorinated gases 2.9%. The main emission sources in the EU are fuel combustion of ratio 55%, transport 23%, industrial 85%, Agriculture 9.9%⁵. Global warming is associated with global climate change, where human emissions have the greatest impact on rising carbon dioxide and increase global temperatures. It is necessary to reduce global warming by reducing human emissions through the use of renewable energy, which in role reduces fossil fuel consumption⁶. Many study interested by this issue like R. J. Andres et al., studied Carbon dioxide emissions from fossil-fuel use (1751–1950), to reached total cumulative CO₂ emissions through 1949 were 61.0×10⁹ tones C

Corresponding author:

Ahmed S. Hassan.

Atmospheric Sciences Department, Collage of Sciences, Mustansiriyah University, Baghdad, Iraq;
E-mail: ahmed.s.atmsc@uomustansiriyah.edu.iq

from fossil-fuel use, virtually all since the beginning of the industrial Revolution around 1860. The rate of growth continues to grow till now, generating debate on the probability of enhanced greenhouse warming. In addition to global totals, totals and one degree for global distributions of the data have been calculated for each country ⁷. Sarmiento et al., studied trend and regional distribution of land and ocean carbon sinks, found that focused on the net land carbon sink appears to have been relatively constant. This result is detectable regional synthesis and assessment of the land carbon sources and sink over period of study reveals broad agreement the Northern Hemisphere land is a major sink of atmosphere CO₂ ⁸. Evaluation of industrial CO₂ emission from cement production and transportation sector in Iraq using IPCC methods carried by Hashim et al., the results refereed CO₂ emissions in electricity-producing countries differ from consuming countries where the emissions produced are higher than those consumed beside increase of Iraq's emissions Cement production. This paper calculated and analysis decadal of CO₂ emissions for used date Carbon Dioxide Information Analysis Centre (CDIAC) at Oak Ridge National Laboratory , from Different state of fossil fuels in Iraq (solid , liquid, gases) for period 1960-2014 and Electricity ,Transportation ,Industry for period 1970-2014 , to know the amount of emissions resulting from them which is more harmful to the environment, put suitable solutions To reduce gas emissions and preserve the environment.

MATERIALS AND METHOD

Fossil fuel as a big source of energy is associated with huge emission of pollutants into the atmosphere. During the 2000 decade, carbon gas produced about 340 GT by human activities was issued. Its atmospheric share is 160 GT and 90 GT oceans, so the atmosphere is the most damaging of these emissions. Ranking of Iraq is 31 by 2014 of total CO₂ emission fossil fuel burning 45935 thousand metric tons ⁹. The main source data this paper, for Carbon emissions from two sectors were studied first that include fossil fuels (gas, liquid, solid) came from Carbon Dioxide Information Analysis Center (CDIAC) an annual basis from 1960-2014, The study period was divided into five decades, the first decade D₁= 1960-1970, D₂= 1971-1980, D₃= 1981-1990, D₄=1991-2000, but fifth decade D₅= 2000-2014. This period used equation 3, because the period after 2010 did not exceed half of the decade was studied with the decade that precedes it . For the purpose of calculating the decadal average of carbon

emission values, the following equation was used:

$$D_{\text{average}} = \dots\dots\dots(1)$$

Where D_{average} is decadal average.

E= sum annual emissions for ten years (decadal).

N=10 (number of years per decadal).

This equation gives the possibility of knowing whether these emissions are increasing or decreasing during the studied decades.

The percentage of increase between the first decade and the last decade of the study was also calculated using equation:

$$\dots\dots\dots(2)$$

P= Percentage of increase

D₅= sum of emission CO₂ for period (2000-2014).

D₁= sum of emission CO₂ for period (1960-1970).

The second sector studied in this research, which is no less important than the first, is the industrial sectors and includes electricity, transport, and manufactory industrial. Electricity is necessary for industry, buildings and all aspects of daily life, But must be generated from energy sources such as wind, sun or water, as the methods used to produce electricity make it the main source of global emissions of CO₂. Second part study use data for period 1971-2014 For the same source mentioned above, this data is percentage of emission CO₂, use equation (1) for calculate decadal Average to four decade and calculate percentage of increase using differ between last decadal and first decadal, The difference was used to calculate the percentage increase because the values in the second sector were raito.

$$\text{Percentage of increase} = D_4 - D_1 \dots\dots\dots(3)$$

The program was used sigma plot is a statistical program used to draw and analyze data in an attempt to study and understand the behavior of carbon emissions from different sources.

RESULTS AND DISCUSSION

There are many aspects to study CO₂, the simplest method used by comprising among several decades. The next section deal with two axes, first one focused on different source fossil fuel of CO₂ emission (gaseous,

liquid, and solid), while the second interested by the main sectors the emission CO₂ like electricity, transport, and manufacturing industries.

State of CO₂ emissions

Since the industrial revolution, however, energy – driven consumption of fossil fuels has led to a rapid increase in CO₂ emission, disrupting the global carbon cycle and leading to a planetary warning impact. Global warming and climate change have range of potential ecological, physical, and health impacts. The key factor, how CO₂ emission have evolved. The annual CO₂ emission from gaseous fuel consumption has slow variance till middle of 90’s then has maximum value of 16714.19 in 2009 as shown in Fig.1 (upper panel), and not less than 10000 kt after 2004. This fact refer to increasing into reasons: oil industry (extraction operation, and burning natural gas), and electricity generation that used gaseous fuel more than liquid fuel. Decadal analysis computes from mean annual gaseous emissions as shown in table.1, which increased 10 times, from first decadal 1045.10 kt to 10427.12 kt. The CO₂ emission came from liquid fuel consumption refer mainly to emission from use of petroleum derived fuel as an energy source. Liquid fuel has similarity behavior with gaseous fuel till 1990 with less value. Where maximum value from liquid fuel emission recorded 124.539 kt in 2014, whereas decadal analysis ratio shown increased by 10.4 times between first decades and last decadal 86759 kt (table 2). the CO₂ emission from solid has different behavior from previous cases has two periods, first from 1961 to 1991 average value was 4 kt, while second period was almost zero kt as display in Fig. 1 (bottom) so that decadal analysis equal to 4 times table not shown here.

Industrial sectors CO₂ emission

The dynamic development of the economy and growth of human population is closely related the continuing growth in demand for electricity. Gasses fuel represents a significant share in for generate electricity, transport, and most of manufactures. This section shows the ration of CO₂ emission in Iraq for these three sectors. The electricity sector is beigest emission than other sectors. The Fig. 2 represents the percentage of CO₂ emission from electricity of total fuel combustion. The highest value over the past 43years was 65.04 kt in 2014. Decadal percentage of CO₂ has slow variance

values among five decade, the difference between first and last decadal found 10.584 % as shown in table 3. A CO₂ emission from all transport activity fuel in Iraq was 49.52 in 1982, while its lowest value was 20.58 in 2014. This includes domestic aviation, domestic navigation, road, rail and pipeline transport. The decadal different between first and last decadal was 1.8%, shown in table 4. Most of Iraqi factories were closed and out of serves so that CO₂ emissions from manufacturing industries and construction is very low and less than averaged. CO₂ emission was 18.78 kt in 1976 more than 2014was 7.90 kt. The table. 5 decadal percentage decreased (- 6.7 %). These results represent low emission among these three sectors.

Table 1. Decadal analysis for gaseous fuel CO₂ emissions in Iraq.

Decadal	Gaseous CO ₂ emission(kt)
1960-1970	1045.10
1971-1980	2386.12
1981-1990	1379.8
1991-2000	5441.8
2001-2014	10427.12
Percentage of increase	1045.10/10427.12= 10.022%

Table 2. Decadal analysis for liquid fuel CO₂ emissions in Iraq

Decade	Liquid CO ₂ emission (kt)
1960-1970	9042
1971-1980	17567
1981-1990	33391
1991-2000	9587
2001-2014	86759
Percentage of increase	9042/86759=10.422 %

Table 3. Decadal CO₂ emission from electricity

Decade	Electricity CO ₂ emission (kt)
1971-1980	36.601%
1981-1990	31.3%
1991-2000	47.366%
2001-2014	47.185%
Percentage of increase	47.185-36.601=10.584 %

Table 4. Decadal CO2 emission from transport.

Decade	transport CO2 emission (kt)
1971-1980	28.928%
1981-1990	41.833%
1991-2000	30.96%
2000-2014	30.807%
Percentage of increase	30.807-28.928=1.879%

Table 5. Decadal CO2 emission from manufacturing industries

Decade	manufacturing industries Co ₂ emission
1971-1980	16.373%
1981-1990	15.118%
1991-2000	12.39%
2000-2014	9.654%
Percentage of increase	9.654-16.373= -6.719 %

Figure 1. Trend in Carbon dioxide emission from fossil fuel combustion in Iraq for: gaseous (Top), Liquid (Middle), and Solid (Bottom) for the periods 1960-2014.

CONCLUSION

Two lines to study CO2 emission in Iraq. First line deal with sources of state emission for period 1961 to 2014. Second line focused on sectors have significant rate of CO2 emissions. The largest CO2 emission came from gaseous fuel consumption, the first decadal was 1045.10 kt than increased 10 times, with high ration since 2004 not less than 10000 kt. Second level of CO2 emission was from liquid fuel consumption, but with high ratio of increased 10.4, the last decadal recorded 86759 kt. Solid fuel consumption show two period first period from 1961to 1991, emission almost 4 kt, while the second period near to zero. Electricity sector is one of the significant sector with high level of emission 65.04

kt, with slow variance of decadal that equele to 10.584 %. The transport fuel emission found in 1982 was 49.52, with decadal different was 1.8%. The low level of CO2 emission was manufacturing industries, with decadal decreased percentage (-6.7%).

ABSTRACT

The aim of the study is to investigate the bacteria *Aeromonas hydrophila* of the most important contaminated of the Tigris river pathogenic to humans and other living organisms and Detection of some virulence factors . In this study, we were obtained (45) isolates of *Aeromonas hydrophila* bacteria isolated from (100) sample of Tigris river water and from different sites , from Baghdad to it's point contact with Diyala river. Isolates were identified by Vitek 2 system by biochemical tests in addition to bacteriology diagnosis by observing morphological and microscopic features of colonies and results were showed the ability of all isolates(100%) to produce protease , while 40 isolates (88.8%) ,34 isolates (75.5%) and 31 isolates (68.8%) produced β -hemolysin , Phospholipase and DNase respectively in addition to it's Biofilm production at 100% .

KEYWORDS: Virulence factors , *Aeromonas hydrophila* ,Biofilm, Vitek 2 System

INTRODUCTION

Aeromonas hydrophila ,which belongs to the family Aeromonasaceae is the most important and famous species, it is Gram negative bacillus, negative for string test and thus separate from *Vibrio cholera* which is positive for this test, Oxidase, catalase and negative for Urease¹. *Aeromonas hydrophila* widespread in nature, especially in aquatic environments such as rivers, sewage, drinking water and lakes, as well as marine foods such as fish, shrimp and fresh fruit ²⁻⁴, also found in the organism as natural germs because it is one of the opportunistic pathogens in Elderly, children and sick people that Suffering from immune deficiency, bacteria also cause Gastroenteritis, Bacteremia, watery diarrhea, septicemia and contamination of wounds ^{5,6}. It has many virulence factors that have a role in the latest human and animal infections,these include hemolysins, production of Sidrophore, proteases, haemagglutinins , cytotoxic and cytotoxic enterotoxins^{6,7}

MATERIALS AND METHODS

Collection of Sample: (100) samples of the Tigris River and the river path were collected in clean and sterile bottles.

Isolate bacteria from aquatic samples:

Membrane Filtration: Each sample was emitted through the μ mO.22 filter paper. The filter paper was then placed on TCBS and Ampicillin Dextrin Agar (ADA) medium and incubated at 37 ° C for 24 hours. The colony was grown and planted on Tryptic Soy Agar (TSA) medium for confirmation and acquisition of colonies Individually ^{9,10}.

Diagnosis of isolates: Bacterial isolates were identified based on biochemical, phenotypic, and plant assays on Ampicillin Dextrin agar (ADA), TCBSagar, MacConkey, and Blood agar ¹¹.

Diagnosis using Vitek 2 System: The bacteria to be examined were placed on the macconkey or nutritious medium and incubated for 24 hours and at 37 ° C. The sample was selected for a suitable sample VITEK 2 Cassette,a single pure colony of bacteria was selected and diluted in 3 ml of saline solution in a sterile tube with a special holder VITEK 2 DENSICHEK was measured with a 0.5 - 0.63 turbidity in the tube in the VITEK 2 Cassette of Gram negative bacteria and VITEK 2 Cassette was transferred to the device for the diagnosis of bacteria through 64 chemical tests (Table 1). Result is show at 24 hours after the sample is placed in the device.

Detection of the production of Some Virulence Factor

Detection of protease production: The ability of isolates to produce protease was tested using the medium of Skim milk agar as indicated in ¹².

Production of hemolysin: The ability of the isolates was tested on production of hemolysin by using the blood agar medium as indicated in ^{13,14}.

Biofilm formation: Congo red agar (CRA) method According to ¹⁵ The CRA medium was prepared with 37g/l BHI broth, 50 g/l sucrose, 10 g/l agar, and 0.8 g/l Congo red. As a concentrated aqueous solution and autoclaved at 121°C for 15 min Congo red stain was prepared separately from other medium constituents, then added to cooled agar to 55 °C. Plates were inoculated and incubated at 37 °C for 24.

Detection of Phospholipase Production

Egg Yolk Agar was presented by ¹⁶ as follows: Prepare 100 ml of nutrient agar medium, add 1% sodium chloride salt (NaCl), sterilize the liquid, then refrigerate to 45 °C. Add one egg yolk in sterile conditions and mix thoroughly. Sterile dishes.

Detection of DNase Production: Transfer a portion of a growing colony of 24-hour on nutrient agar medium to the DNase agar and in a sterile sterilization pattern and incubate at 37 °C for 24 h. After incubation, immerse the dye in Toluidine blue and The dish was left for several minutes and the appearance of a violet halo around the colony was seen as evidence of positive testing ¹⁷.

RESULTS AND DISCUSSION

The present study investigated the presence of *Aeromonas hydrophila* bacteria in the aquatic environments of different regions and on the course of the Tigris River to the south, where 100 samples of water samples were collected and bacterial isolates were (45) isolated. According to characteristics of isolate colonies, morphological and microscopic by culturing it on the differential media, which included ADA media, MacConkey agar, Blood agar and TCBSagar, isolates were identified. The results of all isolates were showed growth in the medium after 24 hours, When Loopful was transferred to ADA agar, TCBS, MacConkey agar, Blood Agar and Nutrient agar, the bacteria were examined based on colony characteristics of shape, size,

The colonies of the bacteria *Aeromonas hydrophila* on (TCBS) were characterized by being circular, medium-sized, smooth, flat, bright yellow due to sucrose fermentation and because of alkalinity of the media and containing sodium chloride salt and bile salts, Its inhibit most types of bacteria except halophilic bacteria and the bacteria on ADA agar showed yellow colonies ^{1,13,14}. The results of the microscopic examination of the isolates were gram-negative bacilli ^{9,18,19}. In order to confirm the initial diagnosis of isolates, the biochemical tests were performed as shown in Table (1) and according to (1,9,13). All isolates showed positive oxidase test and negative result of String test (9). A positive result was produced by the appearance of the reddish surface and the bottom with acid yellow color When growing on (KIA) medium with no H₂S formation because of fermentation of glucose by all isolates. The sensitivity of isolates to O129 was tested and all environmental isolates were resistant to O129 ¹⁹. Vitek 2 system was used to increase the emphasis of diagnosis, which included a large number of biochemical tests as shown in Table (1). The results showed that 45 isolates of 100 water samples belonging to *Aeromonas hydrophila*. Results were showed the ability of all isolates(100%) to produce protease, while 40 isolates (88.8%), 34 isolates (75.5%) and 31 isolates (68.8%) produced β-hemolysin, Phospholipase and DNase respectively in addition to it's Biofilm production at 100% Figure(1). The ability of *Aeromonas hydrophila* bacteria to produce protease production on Skim milk agar showed that all isolates(100%) were able to produce protease ²⁰. In addition, the isolates were exposed to hemolysin production through blood analysis when they were developed on the blood agar medium, which added 5% of the human blood and incubated at 37°C for 24 hours (21). *A. hydrophila* is able to signify a numeral of virulence factors like cytotoxin, aerolysin, haemolysin, enterotoxin, internal lipopolysaccharide, cytotoxic enterotoxin, enzymes and outer membrane proteins such as elastase, proteases, gelatinase, DNases and lipases ^{22-24, 25}. Note in *E. coli* that biofilm production May enhance colonization and carry to rise rate of infections such as urinary tract infection and such infections may be It is uneasy to treat due to it's multiple drug resistance. Results of ²⁶ appeared considerable connection between production of biofilm, protease, and resistance to multiple kinds of antibiotic from six clinical bacterial isolates tested, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Enterobacter* sp. and *Serratia* sp. were produce strong

biofilm, and good protease producers, also they resisted to antibiotic. Also Biofilm production a sign of clinically relevant infection and the persistence of bacterial biochemistry in humans the body is the main cause of reproduction or chronic infections ²⁷.

Determination of Boron Concentration in Water Samples of the Rivers in Al- Diwaniya-Iraq Using CR-39 Track Detector

Abbas A Sweaf¹, Thaer M Salman¹

¹ Department of Physics, College of Education for Pure Science, University of Basrah, Basrah, Iraq

ABSTRACT

Boron is none uniformly distributed, ubiquitous essential micronutrient element for plant as well as human beings. The aim of this study is to measure the Boron , concentration in water in Al-Diwaniya governorate in Iraq. The measurements were performed by analyzing the water samples collected from 24 location using CR-39 Track Detector. The Boron concentrations which is obtained ranged from 2.9524 mg/l in ((alshaamia1)) river belt and minimum 0.5677 mg/l was recorded in Nufer4)) river in water samples. The results are presented and compared with other studies. The results could be utilized to make distinctive supplementary contributions when contamination event occurs and to implement water quality standards by concerned authorities to maintain radioactive contamination-free drinking water supplies for the people. The study further reveals that 24 surface water samples have boron below detection limit. The presence of boron in drinking water sources in this territory is of natural origin. Thus, there is possibility of severe pollution problem with boron in near future.

Keywords: Neutron Source, Boron, SSNTDs, water samples.

INTRODUCTION

Boron is a nonmetallic element that belongs to Group IIIA of the periodic table and has an oxidation state of +3. It has an atomic number of 5 and atomic weight of 10.81. Boron is actually a mixture of two stable isotopes, ¹⁰B (19.8%) and ¹¹B (80.2%)¹. Boron is a naturally-occurring element found in rocks, soil, and water. The concentration of boron in the earth's crust has been estimated to be <10 mg/l, but concentrations as high as 100 mg/l can be found in boron-rich areas². Solid state nuclear track detectors (SSNTDs) of different materials are important for investigations in basic science and technology³. Among such applications, SSNTDs are widely used in radiation protection and environmental radiation monitoring. Their theory was developed more than 40 years ago, the basic fundamentals can be found in Somogyi⁴ and in more details in Durrani et al.⁵. Even more details for detecting alpha particles, which is important from Boron Neutron Capture Therapy (BNCT)

point of view, can be found in Nikezic⁶. Therefore, here we touch some aspects of interest, only. Popularly saying, an ionizing particle produces a narrow damaged zone in the plastic, 10-100 nm in diameter, which can be enlarged and visualized by a chemical treatment, so that the particle movement in the detector material, let us say the footprint of the particle or its track can be followed under optical microscope. Depending on the chemical treatment (called etching) and observation method there are basically two requirements: the range and energy deposition of the particle should be adequate⁷. This work represent the preliminary findings from Boron concentration measurement data which were collected from different regions in Diwaniya City. The general aim is to investigate the complex interactions and exchanges with the flow of water, and estimate how much hazards brought with waters. In fact, the study area is located inside Al- Diwaniya Governorate. The chemical structure of some boron compounds is found in Fig.1. Solid state nuclear track detectors (SSNTDs) of different materials are important for investigations in basic science and technology⁸. Among such applications, SSNTDs are widely used in radiation protection and environmental radiation monitoring⁹. Their theory was developed more than 40 years ago, the basic fundamentals can be

found in Somogyi^{9,10}. Even more details for detecting alpha particles, which is important from BNCT point of view¹¹. The ¹⁰BNC-reaction to take place requires a sample containing, even at ppb among the known boron compounds, several hundred are employed in today's applications and a growing level, ¹⁰B, a source set for irradiation with thermal or lower neutron energy (0.025eV or less) and a reaction fragment detecting device. The reaction phenomenon is related to a neutron interacting with boron nucleus, followed by breakup in two fragments of the ¹⁰B+n compound nucleus (that survives a short time in the order of picoseconds). The two fragment nuclei depart acquiring kinetic energy due to a strong Coulomb field moving in opposite direction under the momentum conservation law, synthesized by the following process: The reaction occurs with different branching ratio: the first has a relatively low frequency occurrence (6.1%) but has the advantage that the reaction is photon less and therefore the induced damage leads to a higher "Linear Energy Transfer" (LET) or dE/dx. The other, with higher occurrence is accompanied by a 0.48MeV photon. If the alpha particle (⁴He+) leaves the sample surface, with sufficient kinetic energy, then it can be detected e.g. by nuclear track techniques. The alpha particle fingerprint given by a suitable detecting material, provides information on the boron presence and it is recognized as a powerful analytical method for boron studies. This work represents the preliminary findings from Boron concentration measurement data which were collected from different regions in Al-Diwaniya city. The general aim is to investigate the complex interactions and exchanges with the flow of water, and estimate how much hazards brought with waters. In fact, the study area is located inside Al-Diwaniya Governorate which is located in the extreme Euphrates part of Iraq.

MATERIALS AND METHOD

In Al-Diwaniya governorate, the Samples which are from 24 stations and locations were collected during May 2018. The measurements of Boron concentration water were carried out by passive methods; we used the Solid State Nuclear Track Detectors, SSNTDs, for the measurements of Boron concentration in water. The SSNTD, CR39 (1x1 cm) films. Many samples of water from different places have been supplied. One milliliter from different boron concentrations standard is dropped on the same area of the CR-39 track detector and it is left to dry. After drying the standard samples are exposed to a thermal neutron source for the same

period of time 7 days. A nuclear reaction of type ¹⁰B(n, α) ⁷Li has been occurred Alpha particles are emitted with energy 2.31 MeV which can make suitable track in CR-39 plastic detector. The samples, after being exposed, are washed in distilled water, then etched in a solution of 6.25 N NaOH at 60°C temperature, 6 hrs (etching time), by using a bath held at a constant temperature. The track diameters and track density have been carried out using transmission optical microscope and a suitable calibration curve is used to calculate the concentration of Boron. The pieces of the each to the detector sets were irradiated with neutrons that emitted from Am-Be.

Irradiation of the samples

The pellets (water samples of river) were covered with CR-39 detector and put in a plate of paraffin wax at a distance of 5cm from the neutron source Am-Be, with flux of thermal neutron ($5 \times 10^3 \text{ n cm}^{-2} \text{ S}^{-1}$)

Chemical etching and microscopic scanning

After the irradiation time 7 days [Lindsay 1991] the CR-39 detectors were removed and etched in a 6.25 N aqueous solution of NaOH maintained at 60°C for 6 hr, which was the normal employed etching time [12]. The detectors were rinsed with distilled water and dried in air. The tracks recorded in CR-39 detectors were counted by using optical microscope at a magnification of 400 X. The density of the tracks ρ in the detectors was calculated according to the following relation.

$$rx =$$

Where ρ is the Track density (Track/mm²), N is the average of total tracks and A is the area of field view.

Calibration Curve for standard sample

For the calibration curve plot between standard of different Boron solutions of known concentrations from 2 mg/l to 10 mg/l has been prepared to calibration our studying and track density by using neutron induced radiography which is based on the principle of solid state nuclear detectors, SSNTDs, CR-39. The Boron concentrations were measured by comparison between track densities register on the detectors of the samples and that of the standard samples from the Regression equation: $y=2767.67+352.715 \cdot X$, $R^2=0.97354$. A linear calibration as shown in Fig.2 was observed, followed by the calculation of the slope factor. The results are experimented in (mg B/l).

RESULTS AND DISCUSSION

Table (1) present the tracks density, Boron concentration samples that measured by CR -39 detector. The water samples of the rivers collected from 24 locations distributed in different sites in Nufer, Alshaamia, alhamza, aldighara districts in AL-Diwaniya governorate. Fig.5 show the relationship between Boron concentration and number of the location of the water sample. For the measurement of boron concentration level water, samples for the rivers table 1 and Fig.5, reflect the fact that, there was some high level of boron concentration in this water higher than the most of public tap and washing surface water in the governorate. The results for these 24 samples categorized into 24 locations, from S1 to S24, shown in Fig.5. Boron content found maximum 2.9524 mg/l in ((alshaamia1)) river belt and minimum 0.5677 mg/l was recorded in ((Nufer 4)) belt. Out of the 24 water samples of the rivers 3 samples recorded higher which are beginning from 2.0762 mg/l to 2.9524 mg/l while the 7 water samples of the rivers are beginning from 1.0271 mg/l to 1.7394 mg/l while the 14 water samples of the rivers are beginning from 0.5677 mg/l to 0.9961 mg/l than the prescribed WHO limit 0.5 mg/l. The World Health Organization (WHO) in 1993 the WHO established a health-based Guideline of 0.3 mg/L for boron. This value was raised to 0.5 mg/L in 1998 primarily. Furthermore, in 2000 it was decided to leave the guideline at 0.5 mg/L until data from ongoing research becomes available that may change the current view of boron toxicity or boron treatment technology^{13,14}. The European Union established a value of 1.0 mg/L for boron in 1998 for the quality of water intended for human consumption^{15,16}. New Zealand has established a drinking water standard for boron of 1.4 mg/L^{17,18}. The interim maximum acceptable concentration (IMAC) for boron in Canada is 5 mg/L. The Canadians have established this value on the basis of practical treatment technology. They believe available technologies are inadequate to reduce boron concentrations to less than 5mg/L. They will review this IMAC periodically as new data becomes available¹⁹.

CONCLUSION

Well water are in many rural localities in rural areas and which were existent in Al- Diwaniya Governorate, Iraq. The analytical results of chemical water analysis revealed the presence of Boron in the limit of New Zealand 1.4 mg/l and IMAC 5 mg/l, with a variation between (0.5677- 2.9524) mg/l. The values of Boron concentration are small and within the natural limits in most of the sample of the water samples of the rivers. The correlation factor, 97.35%, between the boron concentration of standard samples and Track density (track/mm²) of the samples in water samples of the rivers are very good correlation. Access to safe water of the rivers is essential to human well-being and is a key public health issue.

DNA- In Situ Localization of Human Herpes Virus-8 and Mutated P57 Genes Sequences in Tissues from a Group of Female Iraqi Patients with Breast Tumors

Israa Habeeb Nasser¹, Shakir H. Mohammed Al-Alwany¹

¹College of Science, Babylon University, Hillah City, Iraq

ABSTRACT

This study was designed as a retrospective case-control study research. A total number of (100) formalin-fixed, paraffin embedded Breast tissues was included. These tissues were including 40 malignant breast tumors, 40 benign breast tumors and 20 of apparently healthy breast sections which were included as baseline control. The mean age of the patients with breast carcinoma was higher (46.80 ± 12.517 years) than the mean age of the benign tumor (34.70 ± 14.4 years), followed by mean age of those females in the group of apparently healthy control (34.70 ± 14.4 years). The positive results of HHV-8 -CISH detection in malignant breast tumors, where 32.5% (13 out of 40 tissues) showed positive signals. While, in the benign breast tumors group were 15% (6 out of 40 tissues). Regarding malignant breast tumors group, the total percentage of positive mutated P57-CISH detection was in 55% (22 out of 40) breast cancer cases and in 35% (14 out of 40) benign breast tumor group, while none of positive mutated P57-CISH detection in control breast tissues group.

Keywords: HHV-8, Mutated p57, CISH, Breast tumors.

INTRODUCTION

Epidemiological and biological studies have now conclusively proved that infectious agents are among the main causes of cancer worldwide. At least six different viruses have been linked to the development of several types of human cancers. HPV, EBV and KSHV/HHV8 play a direct role in carcinogenesis, encoding oncoproteins which are able to promote cellular transformation by altering the regulation of cell cycle, apoptosis and other cellular pathways¹. Breast cancer is the most common cancer among all women in the general population worldwide. Even within the same country, incidence and mortality vary significantly based on several risk factors, best organized as factors that increase the risk of developing breast cancer and factors that increase mortality after diagnosis². A positive family history or genetic factor has been confirmed to be a major

contributor to the risk of developing this disease, and this link is particularly important for early-onset breast cancers³. Human Herpes Virus -8 (HHV-8) belong to the gamma-herpesvirus subfamily, and the latter is classified as a human g2-herpesvirus. Unlike other viruses, HHV-8 encodes several human homologues including cytokines (interleukin-6, macrophage inflammatory proteins, interferon-regulatory factors) and regulatory genes (cyclin D, G-protein coupled receptor, etc). These proteins may play important roles in the pathogenesis of HHV-8⁴. Human Herpes virus 8 has numerous modes of transmission. It could be spread each sexually and non-sexually, together with through organ transplantation and breastfeeding⁵. In last years, evidence has emerged which indicates that HHV-8 may also have a role in breast cancer. HHV-8 have been identified in BC from widely different populations⁶⁻¹⁰. P57^{kip2} (p57) is a maternally expressed imprinted gene regulating growth arrest which belong to the CIP/KIP family of cyclin- and cyclin- dependent kinase complexes, p57 activity has also been linked to differentiation, apoptosis, and senescence. In addition, p57 has recently been shown to be involved in tumorigenesis and cell fate decisions

in stem cells¹¹. CDK inhibitor p57 has been previously reported to be inactivated in a variety of human cancers¹². It was reported that p57 is a direct target of EZH2 and repressed in breast cancer by multiple epigenetic mechanisms¹³. p57^{KIP2} is implicated in several types of human cancer. Its family members have been implicated in breast cancer, but information about CDKN1C's role is limited¹⁴. This study is aiming to analyze the rate of concordance of mutated of P57 gene translational expression and HHV-8 in breast tissues from a group of patients with breast tumors and apparently healthy control groups.

MATERIALS AND METHOD

The study was designed as a retrospective control study. It has recruited 100 selected formalin fixed, paraffin embedded prostatic tissue blocks among them; (40) tissue biopsies from breast carcinoma with different grades and (40) benign breast tissue blocks as well as (20) apparently normal breast tissue autopsies which were collected from the archives of Forensic Medicine Institute / Baghdad and used as breast healthy tissues control groups. The diagnosis of these tissue blocks were based on their accompanied records. A consultant pathologist reexamined all these cases to further confirm the diagnosis following trimming process of these tissue blocks. The detection of HHV-8 & mutated p57 by CISH kit (Zyto Vision GmbH, Fischkai, Bremerhaven, Germany) was performed on 4µm - paraffin embedded tissue sections.

RESULTS AND DISCUSSION

The archival specimens collected in this study were related to breast tumor patients whom ages were ranged from twenty years to eighty five years. The mean age of the patients with breast carcinoma (46.80 ± 12.517 years) was higher than the mean age of the benign group (34.70 ± 14.4 years) and the mean age of those females in the group of healthy control (50.67 ± 13.178 years). There are significant statistical differences ($p < 0.05$) between different groups according to age (Table 1). On distributing breast carcinoma group according to their Scarf-Bloom-Richardson system (SBR) for grading of breast cancers (Table 2), the results of present study show that poorly differentiated grade breast carcinomas constituted 45% (18 of total 40 cases), whereas cases with moderately and well differentiated grades constituted 35% (14 out of 40 cases) and 20% (8 out of

40 cases), respectively. The statistical analysis of grading distribution of breast carcinoma shows significant differences ($p < 0.05$) between poorly differentiated grade and well differentiated grade, while non-significant difference was noticed between poorly differentiated and moderately differentiated breast carcinomas. The DNA genome of HHV-8 was detected in tissue blocks of surface epithelial ovarian tumors patients. Wide spectrum HHV-8 was detected using digoxigenin-labeled probes in a morphological preserved tissue sections of different breast tumor. The signals of CISH were detected as bright blue discoloration with blue stain and counter stained with nuclear red solution in referring to HHV-8 at the sites of complementary sequences Figure 1. Table 3 shows the positive results of HHV-8 -CISH detection in malignant breast tumor, where 32.5% (13 out of 40 cases) showed positive signals, while, 67.5% negative signals which represented 27 out of 40 cases in this group. Whereas, in the benign breast tumor group was 15% (6 out of 40 cases). Negative signals which in benign group represented 34 out of 40 cases constituted 85%. Statistically, significant difference ($p < 0.05$) was found on comparing the percentages of HHV-8 DNA among the study groups. The DNA genome of mutated P57 was detected in tissue blocks of breast tumors tissues. Wide spectrum mutated P57 was detected using digoxigenin-labeled probes in a morphological preserved tissue sections of different breast tumors. The signals of CISH were detected as bright red discoloration with red stain and counter stained with nuclear blue solution in referring to mutated P57 at the sites of complementary sequences Figure 2. Regarding malignant breast tumors group, the total percentage of positive mutated P57-CISH detection was 55% (22 out of 40 cases). While, in the benign breast tumors groups were 35% (14 out of 40 cases). None of positive mutated P57-CISH detection in control breast tissues group (Table 4). Statistically, significant difference ($p < 0.05$) was found on comparing the percentages of mutated P57 among the study groups (Table 4). On reviewing the 100 cases which were included in this study, it was found the age of the patients with breast tumors was ranging between 20-85 years and their mean age was 44.05 years (Table 1). The present results are consistent with those reported worldwide where these breast tumors were usually affecting females over forty years of age (15). Also, on reviewing Table 1, it was noticed that the percentages of BC cases are increased with the proceeding of age of patients. The present results could have their importance when

realizing that the age of the breast cancer patients is an important factor both for the occurrence and management of the disease ¹⁶. These results could reflect that age is an important risk factor in tumor changes affecting breast epithelial tissues lesions. In general aging increase the incidence of the malignant changes in breast epithelial tissues and as such their incidence was found to increase with age ¹⁷. On the other hand, other authors concluded that age is an independent prognostic factor even when the size and nodal status are considered ¹⁸. Others reported that women diagnosed with breast cancer at a younger age have a poorer prognosis compared with their older counterparts ¹⁹. In the current study, poorly differentiated grade breast carcinomas constituted 45%, whereas cases with moderately and well differentiated grades constituted 35% and 20%, respectively (Table 2). Likewise, AL-Anbari²¹ revealed consistent percentages of their studied BC grading to our results where 11% were in grade I, 48% in grade II and 41% in grade III. AL-Khafaji ²² also reported a similar percentages in the Iraqi studied patients and found 11%, 58% and

31% for grade I, II, and III, respectively, and for the Syrian studied patients were 4.7%, 66.6% and 28.8% for grade I, II, and III, respectively. However, Zubair et al., ²³ showed that only 4.17% of cases have grade I, while grade II and grade III were having (75.8%) and (20%), respectively. Histological grading is an important parameter of risk assessment in the patients with breast cancer (24). Up to our knowledge this study of HHV-8 in breast tumors is the first research work in Mid-Euphrates Governorates of Iraq, that was designed to analyze the association of HHV-8 with invasive epithelial breast tumors by using the technique of Chromogenic In Situ Hybridization (CISH). In the present study, the HHV-8 - DNA percentage in malignant breast tumors (32.5%) was higher than its percentage (15%) in their benign counterparts (Table 3). The negative results are probably related to the absence of HHV-8-DNA in these biopsies or could be related its presence in the cells at different regions of that tissue. The presence of different viruses other than these virus used in this study is another possibility.

Table 1. Distribution of breast tumor patients according to their age.

Figure 1: Microscopic appearance of HHV-8- CISH signal in ovarian tumors. Using Digoxigenin-Labeled HHV-8 Probe; stained with NBT/ BCIP (Blue) and Counter stained by Nuclear Red Solution (Red). Blue signal are detected at complementarity sequences sites (arrows).A-Breast Cancer with negative HHV-8 –CISH reactions (40X) .B-Positive HHV-8 –CISH reaction with moderate score and strong signal intensity (40X).

Figure 2: Microscopic appearance of Mutated P57- CISH signal in ovarian tumors. Using Digoxigenin-Labeled Mutated P57 Probe; stained with 3-Amino 9-Ethyl Carbazole (Red) and Counter stained by Nuclear Blue Solution (Blue). Red signal are detected at complementarity sequences sites (arrows).A-Breast Cancer with negative Mutated P57–CISH reactions (40X) .B-Positive Mutated P57 reaction with moderate score and strong signal intensity (40X).

CONCLUSION

We concluded from this study, HHV-8 & mutated of P57 positive signals in malignant & benign tumors tissues. They suggest an important role for these virus in the development of breast tumors in our Iraqi patients.

Effect of Snow Ball Strategy in the Comprehension Reading of Intermediate School Female Students in Reading and Texts

Saif Tarik Al Esawi¹, Monir Ubaid Al Juburi¹, Enas Waleed Jasim Al Zubaidi¹

¹Department of Higher Studies, College of Basic Education, University of Babylon, Iraq

ABSTRACT

This objective of this paper is to identify the effect of the snowball strategy in the reading comprehension of second grade students in the reading and texts. To achieve this objective, the researcher developed the zero hypothesis. The zero hypothesis states that there is no statistically significant difference at the level of significance (0.05) between the average grades of the students of the experimental group who will study the reading and texts according to the snowball strategy and the average score of the students of the control group who will study the same subject according to the usual method of reading comprehension. In order to achieve this, her experience was applied in the second half of the academic year (2017-2018). The study sample consisted of (65) students of the second grade intermediate in Sumaya intermediate school for girls. They were distributed randomly into two groups. The first one consisted of (32) students in the experimental group and (33) students in the control group. The two groups were rewarded in the following variables: (The age of the students calculated in months, the Arabic language grades in the first semester, and the parents educational achievement).

INTRODUCTION

It is known that evolution is the life norm, and the interaction with this development is required, the whole world today is witnessing remarkable progress in all areas. The nations and communities are distinguished by the knowledge, science and educated human fortune capable to revive itself through their capabilities, to form their future to keep up the current time. The educational process shows that there has been a remarkable shift or change in studies in the last quarter of the twentieth century on learning and education. At the beginning of seventies, psychologists and educators had become focusing on the principles of theories (cognitive constructivism) in their interpretation of learning and education processes ¹. argues that the constructivism theory is based on the idea that instinctive instincts exist in the individual to understand the world around him and

rather than acquires or accepting negatively the targeted new knowledge, learners build knowledge effectively by integrating new information and experiences with what they have previously understood. Moreover, they adjust and explain their previous knowledge to be compatible with the new knowledge ², whereas (Glaserfeld, 1988) see that constructivism is a cognitive theory that focuses on the role of the learner in the personal construction of the knowledge ³. In another words, knowledge is built in the mind by mental processes, and the total structure of the mind is constantly working to reorganize the cognitive pattern of the learner where the output will become permanently renewed and subjected to the representation and adaption, mainly influenced by the extent of learner and how much a positive he is and his effectiveness with his characteristics, which always makes the process of learning in an active movement that does not stop at a particular moment and make the mind as a member that renew himself at every moment, its contents and structure change according to the time, place and the elements of the environment surrounding the recipient. That is the philosophy of the constructivism permanent motion theory versus the

Corresponding author:

Saif Tarik Al Esawi.

Department of Higher Studies, College of Basic Education, University of Babylon, Iraq.

antistatic and stability with the integrative processes in return the dependency on the linearity the analytical mind and the positivity of the learner. It is for sure that the educational process can achieve its goals in society only by means of communication, which is the language. Through which the scientific educational systems can be applied. The language is considered as a method of thinking, and fruit of its fruits. Through the language, the human can do processes of thinking of interpretation and analysis and balance and perception of relations; moreover, extraction of the results, and the abstraction and generalization⁴. The reading is considered more than seeing the words clearly, more than just knowing and distinguishing these words, it requires the reader to think, feel and fantasize, and this is called the comprehension of reading. The concept of reading comprehension has evolved considerably since it is considered reading in general and reading comprehension in particular is not a verbal performance of the written text, which includes two aspects: Conservation and assimilation. Reading is a process that involves far beyond the process of voting or pronouncing the words and the sentences. Reading requires the reader to understand what he is reading⁵. The process of reading comprehension begins by understanding the literal meaning of the symbols that the reader understands and by understanding the vocabulary and the relations between them. By combining these words with each other, he understands them as an integrated sentence and tries to extract the meaning⁶. Snowball strategy is one of the strategies based on an active learning philosophy based on constructivist theory, in which the learner is at the center of the learning process and its center, and represents one of the methods of collaborative learning, which represents a major model of active learning and a major strategy of its strategies. It is built on the basis that knowledge consists of a way of combining its parts into each other to be an integral whole, starting from the realization that the part is easier than the comprehension of all, and that the realization of all when it comes from the way of perceiving its parts is easier for the learner and more stable in his mind Atia, (2018). The researcher believes that the use of snowball strategy may contribute to raising the level of second-grade students in the medium of reading and texts, through the information they get from each other, which derives its foundations of active learning. It is one of the strategies for the development of the fast reading skill, which is similar to the snowball, the more rolling the more the size according to the number of times of rolling,

and so as the reading the more the language dictionary when the student becomes able to read quickly (image and mental), and verbal and written expression⁷. The current research aims to identify the effect of snowball strategy in the reading comprehension of middle school female students in reading and texts.

METHODOLOGY

The research methodology includes an overview for the procedures that were followed to achieve the objectives of this research in terms of adoption of the appropriate research methodology, the appropriate design, the research community, the selection method of the sample, the equality methods of the two groups, a presentation of the research requirements, tools, how to apply them, and the statistical means used in data processing. All of that will be presented as follows:

The experimental design for the research

It includes the independent variable (the snowball strategy), and (the normal method); moreover, it includes dependent variable (reading comprehension), so the researcher used an experimental design with partial control of two equal groups, one experimental and the other control.

The research community and the sample

The current research community represents the intermediate female students (middle and secondary) governmental school of the General Directorate of Education at the Mahaweel District for the academic year (2017-2018), which has at least two classes. Meanwhile, the researcher has selected randomly (Sumaya Intermediate School) as the research sample which is located in the center of Al Mahaweel District to implement the research. The selected school contained four classes for the scientific fourth grade which is known as (a, b, c, d, h). The researcher has randomly selected class (a) by using (the lottery method) to represent the experimental group. The experimental group consisted of (32) female student which will be taught according (the snowball strategy). In the same way, the researcher has randomly selected class (c) to represent the control group which is consisted of (33) female student. The control group will be taught according to the (normal method).

Experimental extinction

There was a continuity of attending the classes and no interruption in the current search groups for the whole duration of the experiment.

Operations related to maturity

This factor had no significant effect in the current study, because the experiment duration was uniform between the two research groups, as well as the partial adjustment adopted by the researcher in the experimental design, eventually the resulting maturity and growth will return positively the students of the two research groups.

Effect of the experimental procedures

The researcher has worked on limiting the effect of the experimental procedures which may affect the dependent variables during the experiment implementation.

Research requirements

The research material is one of the basic factors that the research will build on and according to which the research procedures are carried out. These requirements are as follows: Scientific material (Content). The scientific material that the researcher is teaching was determined for the students of the two research groups during the period of the experiment (second semester) for the academic year (2017 - 2018). It included (8) topics of reading and texts in (Part II) of the Arabic language text book, which is taught for the second grade students. The researcher prepared teaching plans for the subjects of the reading and the texts that will be taught during the experiment and that is in the light of the scientific material content with the behavioral goals. This will be implemented by using snowball strategy for the experimental group students and likewise in the normal way for female students in the control group.

Virtual honesty for the test

Honesty is one of the most important characteristics of the test in the educational and psychological standards, and the test is honest if it measures the attribute or the property prepared for its measurement⁸. In order to make sure of the honesty of the test and to achieve the set of the objectives that have been designed. The researcher has presented the research work to a group of Arabic language and teaching methods specialists. In addition

to that, the work has been presented to educational and psychological sciences specialists, to explore their opinions on the validity of the paragraphs in terms of comprehensiveness, integrity and level of measurement.

Test instructions

The researcher has put the following instructions:

a. Answer instructions

1. **Write your name and your class in the specified place in test sheet.**

2. Read the text carefully before the answer.

3. Do not leave any paragraph without answer.

4. The answer will be in the same test sheet.

5. The total score is (50) degree

b. Scoring instructions

The researcher assigned two grades for each of the paragraphs of questions (1 and 2) and zero for the wrong paragraph answer or not correct, and allocated five grades for each paragraph of the fifth question.

1. The test spatial application

Before starting the real test, the researcher applied the test on a sample of 100 female students from the second grade Al Mahaweel intermediate school on Sunday 8/4/2018. The aims of applying a spatial test on the survey sample was:

Define the right time to be consumed by the test

Analyzing the test paragraphs for:

a. Level of difficulty

b. Strength of distinguish

c. The effectiveness of wrong alternatives

d. Calculate the test stability coefficient

Calculate the test stability coefficient

The stability of the test means that the test will give almost similar results if it is applied on the same group. This means that the test will not be affected by the change of the factors and the outside circumstances; moreover, applying the test again and registering the same results

means the significance and real performance of the individuals irrespective the change in conditions ⁸. For the above mentioned reasons, the researcher chose the Coder-Richardson method to calculate the stability of the reading comprehension test. This method aims to reach to an estimated value of the stability coefficient of the test; moreover, it can be applied to the substantive paragraphs. The test designed by the researcher have a substantive questions within (90%) and two paragraphs only as an essay which means it will be a collective objective test. This test method more appropriate in comparative to the process of redo the test because it does not need to be applied again; moreover, it will not cost the researcher neither effort nor time. Accordingly, it is more appropriate for the research objective and the post-test. The researcher has found that the test stability value is (0.87) and with that it is considered a good value and suitable and according to that the test is stable.

Applying the final test for the reading comprehension

One week before the experiment ends, the researcher has told the students to be prepared for the reading comprehension test which will be held on Sunday 29th April, 2018. The test was taken on the specified day; moreover, the researcher supervised the test herself. The researcher explained for the students about the method of the answer before starting the test.

Statistical Tools

The researcher has used the following statistical tools: Independent T-test for two samples, Chi- Square, Pearson Linear Correlation Coefficient, function

of coefficient of difficulty and distinguish for the objectivity and essay paragraph, effectiveness of the wrong alternatives function. After analyzing the results statistically, the researcher has found: There was a distinction with the students of the experimental group in comparative to the students of the controlling group in the comprehension reading. The following table shows the results Table 1.

RESULTS AND DISCUSSION

The research hypothesis has indicated that: “There is no statistically significant difference at (0.05) between the average scores of female students who taught reading and text using the snowball strategy, and the average score of students in the control group who taught the same subject in the usual way,” the research hypothesis states. To test the hypothesis of the research, the arithmetical averages and standard deviations for the students’ scores of the two groups were calculated in the test of post-reading comprehension in the reading and text material; moreover, the results of T-Test were then extracted to detect the significance of the differences between the averages. It was noticed that there were statistically significant differences at the level of (0.05) between the two groups, the experimental group and the control group on the test of post-reading comprehension in the reading and texts. According to the arithmetic averages, it can be notice that these differences are in favor of the experimental group. In this way, we reject the null hypothesis and accept the alternative hypothesis, which means that the snowball strategy positively affects the academic level of female students.

Table 1. Experimental group in comparative to the students of the controlling group in the comprehension reading.

Group	Students Number	Mathematical Average	Standard Deviation	Variance	Freedom Degree	T-Values		Level of Significance
						Calculated	Tabulated	
Experimental	32	33.41	7.26	52.71	63	4.298	2	Non indicated at 0.05 indication level
Control	33	25.97	6.68	44.62				

CONCLUSION

Using the snowball strategy was successful in teaching subjects of reading and texts for the second intermediate grade. Using the snowball strategy helped in increasing the motivation for the students and increased their enthusiasm in addressing the subject.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Higher Studies, College of Basic Education, University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

Effect of the Strategy of (P.E.C.S) in the Achievement of Students in the Second Grade Intermediate in Science

Ahmed emad hadi Al-Janahi¹, Saeed Hussein Al-Thalab¹, Abdul Ameer Khalaf Arat¹

¹Faculty of Basic Education, University of Babylon, Hillah city, Iraq

ABSTRACT

The research aims at identifying the impact of the PECS strategy on the achievement of second grade students in science. The research sample consists of 66 students divided into two experimental groups containing 32 students and the second one was composed of 34 students and the two groups were satisfied in the achievement variables of science and The scientific knowledge prior to their information and the testing of intelligence and the age of time, the construction of the achievement test consists of 40 paragraphs of the type of multiple choice and verified the validity and stability after the implementation of the experiment in the academic year 2017-2018 by the researcher with the two groups of research and according to the plans that have been prepared for them and Apply Brother Bar summative results showed superiority of the experimental group that studied according to the strategy ((P.E.C.S the group studied according to the method in the usual academic achievement variable.

INTRODUCTION

The scientific development and the knowledge explosion that the world is witnessing year after year has become the hallmark of this era in various fields, especially in the field of communications, which has greatly helped to strengthen the use of theories, models, philosophies and teaching methods. Education is an effective means of achieving the strategic objectives of the society because of its importance in adapting and interacting with the local environment, which creates the conditions for the formation of citizens and preparing them capable of promoting the society and adapting them to changes. Which affects the environment and society ¹. The curriculum is very important in education and its importance is reflected in the fact that it is the main tool that achieves the objectives of education, which is the core and method of education. The method has a close relation to teaching methods, because the method is a corner of its structure, or as it is described by Klepatric: "The way a leg from the legs of education and

the other leg is the curriculum is that education cannot walk on one leg ². Although Zipp (2012) does not focus on specific teaching methods, the challenge facing other researchers clearly shows that educational curricula must be centered around the student and beyond the role of the educational teacher on the transfer of his teaching function ³. The teaching of any branch of flattery and knowledge must reflect its nature and processes. Thus, the methods of teaching science must reflect the nature of science that deals with natural phenomena of all kinds. The study of physics helps students to understand and think in the age of science and methodology Which has become difficult for students to live in the twenty-first century without understanding the nature of science and knowledge of the basic physical information and the use of scientific thinking methods to solve the problems of life and make good decisions under the innovations of science and methodology ⁴. Student participation has emerged as one of the cornerstones of learning and teaching in education systems around the world ⁵. Concerns about students' participation in education are not new as university education professionals have always been interested in understanding and managing student participation in effective learning ⁶. Recently, many new strategies and methods of teaching have

Corresponding author:

Ahmed emad hadi Al-Janahi.

Faculty of Basic Education, University of Babylon,
Hillah city, Iraq; E-mail: aljnahy50@gmail.com.

been developed that focus on the learner rather than on the content of the material or the teacher. Strategies for active learning include the strategy of “active learning strategies” Student-centered learning is the most effective and is more successful in encouraging it toward learning and raising students’ thinking through teamwork. Many claim that we need to make students work in groups as part of their own learning experiences, simply by putting them in groups or allowing them to choose their own groups to work in groups as the group works to improve student education ⁷. Bonwell & Eison defines active learning as an opportunity for students to engage in activities that encourage them to think and comment on the information presented for discussion. Students are not just listeners but develop their skills to deal with different and different concepts. They apply, the students engage in activities that force them to respond to ideas and make them think a lot about the information they are given and how they use them in new educational situations. Active learning is defined as: - The learning environment that allows students to listen, speak, write, and meditate deeply through the use of various techniques and methods such as problem solving, small groups, simulation, case study, role play ... and others ⁸. The importance of active learning from the positive outcomes that the learner experiences in terms of knowledge, skills and attitudes shows that the stages change to activate active learning among the students, taking a wide range of activities And various applications such as discussions J grade figures raise hands and exercises and building activities Groups. The problem of teaching and peer simulation to interact with the new Altknoggio and focus on the classroom and avoid traditional methods ⁹. Meyers & Jones noted that when we encourage students to participate in activities that lead them to the discussion and ask questions and clarifications about the content of education, we are only working to keep the best information about the subject matter but also to develop the thinking abilities of the learners. Who has not X-Ray X-Ray for the chest or teeth? What about CT scan? Maybe a MRI image using MRI? Is someone you know about cancer has been treated with radiation therapy? Do you know anyone has been infected with thyroid hormone and treated with radioactive substances?? Or another injected with a radioactive material to be photographed later on the PET positron? I have certainly heard about radiation damage, and you may have heard or know the benefits of radiation - in diagnosis and treatment! We all in one way

or another affect medical physics in our lives. Medical physics is one of the branches of applied physics, where physics is applied in the medical field, especially in the diagnosis and treatment of human diseases.

Medical Physics is divided into four main branches: Therapeutics Radiological Physics, Nuclear Medicine Physics, Diagnostic Imaging Physics and Radiation Prevention (Health Physics) Medical Health Physics. In the large hospitals there is a department called Medical Physics, under which people of these four branches. The Division of Radiotherapy Physics is often the largest, where physiologists provide support services for the Department of Oncology, hospital radiotherapy such as radiation dose planning and ensure accurate access to the patient tumors. Diagnostic imaging devices such as x-rays, class radiology, magnetic resonance imaging, ultrasound, etc. require the presence of diagnostic imaging physicists. They are designed to conform to international standards and standards when used in patients. Radiation at the hospital or facility? If there are healthy physicists make sure that patients or employees are not exposed to unnecessary radiation and are communicating with the competent authorities of radiation protection in the state. In the case of the presence of nuclear medicine devices in the hospital, there is at least one medical physicist who provides services for that department, such as testing the quality of the devices and ensuring the safety of the radiation environment in addition to training and education. The work of medical physicists includes four activities: clinical service and counseling, research and development, teaching, and management. The involvement of the medical physicist in all or some of these activities depends on the workplace, his background, and his personal interests. For example, most of the activity of the medical physicist working in a non-teaching hospital or clinic in the clinical service, while the medical physicist working in an academic institution, most of its activities are academic, such as teaching and scientific research. Academic study alone is not enough to form a clinical medical physicist. He needs practical experience in dealing with medical problems and various devices in his field. This experience can be obtained by continuing with the on-the-job training or preferably through a one-year or two-year internship program (Residency Internship Program) in the hospital after obtaining a master’s or doctoral degree in medical physics. The clinical medical physicist is then encouraged

to obtain a professional certification or what is known as a board - such as doctors. There are American, Canadian, British, Australian and others.

Are hospitals the only place for a specialist in medical physics?

A large part of the medical physicists are going to clinical work in hospitals. And another part is found to be directed to academic teaching and scientific research in universities. There is, of course, a combination of the two - clinical and academic work - if the working environment permits it. There are medical physicists who are in the medical equipment companies working on the development of medical devices and on the training and education of users and even in marketing and after-sales services. The governmental bodies concerned with quality control and radiological safety set regulations and standards and apply them to the establishments and require medical physicists. Industrial companies that use radiation in non-destructive tests, in qualitative quality checks or in the evaluation of their products and pipes are also looking for medical physicists.

METHODOLOGY

The research procedures that were carried out to achieve its objectives include the methodology chosen by the researcher and experimental design, identification of the research community and its design, the equivalence of the research groups, preparation of research requirements and tools, procedures for applying the experiment and presentation of the statistical means used.

Search community and design:

The researcher community (intermediate Hashimiyah for Boys) have been chosen randomly to apply the current research experience, and after the researcher chose (A, B, C). The researcher chose (a) the random drawing method to represent the experimental group and the number of its students (32) students who will study their students according to the (pecs strategy), And in the same way the researcher randomly selected Division B to be completed Such as the control group and the number of students (34) students who will study their students according to (the normal method). Equivalence of the two groups of research: The researcher has rewarded the two groups of research in the following variables (age of students, grades of students in science

for the first class, IQ test) Table (1).

Adjusting Exotic Variables: The control of extraneous variables is one of the important procedures in experimental research in order to provide the internal truth of the experimental design. Therefore, the researcher tried to control the external variables that he sees that may affect the safety of the research and the following: Accidents associated with the experiment: Experiment has not been subjected to any emergency conditions or accidents that impede its progress. Experimental Exhaustion: Only a few cases of interruption, the sample was randomly selected and the two groups were selected with a number of variables. Thus, the researcher was able to avoid the effect of the individual differences between the two groups of research which may affect the results of the research. The maturity factor: I In the two groups, therefore, the growth will return equally to the members of the two groups. Therefore, this factor did not affect the research. Measurement tools: The same measurement tools were used for the two research groups (the achievement test), the effect of experimental procedures: The researcher is keen to preserve the confidentiality of the research, in agreement with the school administration and the school of the article not to inform the students of the nature of the research and application of the experiment, as they were informed that the researcher New teacher at school The duration of the experiment was equal to the two groups of research (8 weeks), which started on Monday (5/3/2018) and ended on Wednesday (26/4/2018) (2017, D), which is to be taught for the second intermediate grade by the Iraqi Ministry of Education for the academic year (2017-2018). The teacher: The researcher studied the two research groups himself for the duration of the experiment. The results of the experiment confer accuracy and objectivity, because the difference in teachers may affect the results of the experiment and hides the effect of the independent variable Place: The experiment was applied in the same school, which is the middle school for boys. Distribution of lessons: It was agreed with the school principal and the material school on the equal distribution of the lessons between the two groups of study, with two lessons per week for each group, with one lesson per group on the same day.

Determination of the course material: The course material was determined in the second part of the science book (2017, i), which is to be taught for the second intermediate grade for the year by the Iraqi Ministry of

Education (2017-2018) Of the teaching plans of the two research groups according to the content of the book of science part two (2017, i), which is to be taught to the second grade students for the academic year (2017-2018) and the behavioral goals. 32 teaching plans were prepared with (16) In accordance with the strategy of (pecs) and (16) teaching plan for the control group according to the The usual.

RESULTS AND DISCUSSION

The students of the experimental group who studied according to the pecs strategy exceeded the students of the control group who studied according to the usual method in the achievement test. This is consistent with the studies that confirmed the superiority of the experimental group studied according to the pecs strategy of the control group that studied According to the normal method Table (2).

Table 1. Shows the parity between the two groups:

Iam equal	Arithmetic mean		Variance		Degree of freedom	T value		Statistical significance
	Section(A) Number (32)	Section(B) Number (34)	Section(A) Number (32)	Section(B) Number (34)		Neptotism	Table	
Danleys test	29.5	27.79	21.16	46.51	64	1.184	2.00	0.05
The chronological age	163.63	162.88	31.81	18.32	64	0.605	2.00	0.05
First course	64.09	63.94	240.25	199.37	64	0.042	2.00	0.05

Table 2. The students of the experimental group who studied according to the pecs strategy exceeded the students of the control group who studied according to the usual method in the achievement test.

The group	Number	Arithmetic mean	Variance	Degree of freedom	T value		Statistical significance
					Neptotism	Neptotism	
experimental	32	30.5	21.81	64	3.347	2.000	Statistical function
Control	34	26.35	28.62				

CONCLUSION

Appropriate strategy (p.e.c.s) with science subjects taught to middle school students in intermediate and secondary schools, and that the implementation of the steps of the strategy will inspire the spirit of cooperation among students in the lesson.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Faculty of Basic Education, University of Babylon, Hillah city, Iraq and all experiments were carried out in accordance with approved guidelines.

Efficacy of A Theory-Based Health Education in Enhancing High School Female Student's Preconception Health Behaviors in Baghdad City

Ruaa Seerwan Hameed¹, Raad K. Faraj²

¹MSc Student, University of Baghdad, College of Nursing, Academic nurse, Baghdad Health Directorate Ministry of Health, ²Assist. Professor, Community Health Nursing Department, College of Nursing, University of Baghdad.

ABSTRACT

Objectives: To determine the efficacy of a theory-based health education in enhancing students' preconception health behaviors, (2) To determine the association between students' age, body mass index, SES and their preconception health behavior, and (3) To investigate the differences in preconception health behavior between age groups, marital status groups, and socio-economic status groups. A randomized controlled trial (RCT) was used to guide this study. The data were collected from Ministry of Education / General Directorate of Education - Al-Rusafa II / Al-Sawari High School for Girls in Al-Rusafa side of Baghdad City. A systematic random sample of (148) female students; (74) student for study group; (74) student for control group. The instrument used in this study includes the socio-demographic sheet, the Reproductive Health Attitudes and Behaviors questionnaire (RHAB), and Reproductive Health Knowledge Scale for Women (RHKS-W). The data were analyzed by two statistical approaches: Descriptive and Inferential statistics. The study result revealed that the age mean for participants in the study group is 17.38 ± 1.53 ; more than a third age 17-years-old ($n = 26$; 35.1%). For the control group, the age means is 17.36 ± 1.42 ; more than a third age 17-years-old ($n = 28$; 37.8%).

Keyword: Health Education, Health Behaviors, Female.

INTRODUCTION

Every woman of reproductive age who is capable of becoming pregnant is a candidate for preconception care (PCC), even if she is not planning to conceive. Men should also receive preconception care, although the components are not as well-defined in men as they are in women¹. The term of PCC (the period prior to pregnancy) has been used in North America since the 1980s to describe child bearing related health care for women before they become pregnant. It was first associated with the care provided to women who had already experienced adverse pregnancy outcomes, but soon came to be recommended for all women. Despite this history, there is no uniform definition or universal

recognition of PCC². The core components of PCC as categorized by the CDC are; assessment, health promotion, and interventions. Assessment involves screening and identifying women, family, or couple with any conditions either medical or behavioral, which can affect pregnancy and its outcome. Health promotion consists of counseling on healthy behaviors before and during pregnancy. Finally, the last component intervention includes an education about nutritional supplements, risk of unhealthy behaviors, family planning methods and many others^{3,4}. Enhance the knowledge, attitudes and behaviors of men and women related to preconceptional health, 2. Ensure that all women of reproductive age in the USA receive PCC services for example, evidence-based risk assessment, health promotion and interventions that enable them to enter pregnancy in ideal health, 3. Reducing the risks indicated by the previous negative pregnancy outcomes through interventions during the interconceptional period that could prevent or reduce the health problems of the mother and her children in

Corresponding author:

Ruaa Seerwan Hameed

University of Baghdad, College of Nursing, Academic Nurse, Baghdad Health Directorate Ministry of Health.

the future, and 4. Reducing disparities in the negative pregnancy outcomes⁵. Preconception health behaviors (PCHBs) include the partners who plan for pregnancy and lifestyle changes to having greatest chance for fertility and positive pregnancy outcomes, actually, PCC includes interventions to identify and change biological, medical, behavioral and social risks that are threats to women's health and outcomes of pregnancy through prevention and control^{6,7}. Iraq is still recovering from long period of conflict and political turmoil⁸⁻¹¹. The Iraqi health system is still recovered from decade of cruel war and struggle and lacking of the indicators of maternal and child health; Regarding to the health assessment and functional review published by Iraq's Ministry of Health and WHO in 2011, Iraq is among the group of sixty eight countries that account for ninety seven percent of all mother and child deaths in over the world¹².

METHODOLOGY

A randomized controlled trial (RCT) was used to guide this study. The first review of the research proposal was acceptable by the Department of Community Health Nursing Scientific Committee. The proposal was approved by College of Nursing. The researcher obtained the approval of the Ministry of Education / General Directorate of Education Al- Rusafa II. Numerous variables were examined to determine each subject's inclination to commit to preconception health behavior (PCHB), including, age, class, socioeconomic status (SES), body mass index (BMI), and preconception health knowledge (PCHK). The study was conducted at That Al-Sawari High School for girls. This school was selected randomly through a simple random sampling procedure. The final sample size ($n = 74$) for study group and ($n = 74$) for control group. The two groups were pretested on December 18th, 2017. The intervention was applied with insertion the health education materials (PowerPoint presentation and a booklet) for the study group only in December 24th, to 28th, December, 2017. The first posttest was carried out in February 25th, 2018. The second posttest was carried out in April 20th, 2018. The instrument used in this study includes the socio-demographic sheet, the Reproductive Health Attitudes and Behaviors questionnaire (RHAB), and Reproductive Health Knowledge Scale for Women (RHKS-W). The RHAB scale used in this study includes 19 items after excluding the items that are culturally inappropriate to the Iraqi culture. The 19 items cover the issues of obtaining preconception counseling, and using effective birth

control methods. These items are measured on a 5-point Likert scale type; 1 for (Never) to 5 for (All times). The total scores of this scale ranges from 19 to 95. Higher scores indicate better reproductive health attitudes and behaviors. The (RHKS-W) was contained 28-items with a dichotomous response choice pattern; 1 for incorrect answer, and 2 for correct answer. The total score of this scale ranges from 28 to 56. Higher scores indicate better reproductive health knowledge. Acceptable levels of reliability for most of the scales ($\alpha = 0.65-0.83$) given the level of expertise of the panel (developers of the 3 theories), the scales has strong content validity. Furthermore, the questionnaires tools were introduced to panel of 8 experts who had more than 5 years of experience in their health field. They were 6 members from University of Baghdad/ College of Nursing, and 2 members from Al-Rusafa health directorate/ Baghdad. Data were analyzed using the descriptive statistical measures of frequency, percent, mean, and standard deviation will be used. Furthermore, the inferential statistical measures of bivariate correlation were be used. Moreover, the non-parametric tests of repeated measure ANOVA, Kruskal-Wallis test, and Mann-Whitney U test were used.

RESULTS AND DISCUSSION

The age mean for participants in the study group is 17.38 ± 1.53 ; more than a third age 17-years-old ($n = 26$; 35.1%), followed by those who age 16 and 18-years-old ($n = 16$; 21.6%), those who age 19-years-old ($n = 7$; 9.5%), those who age 20-years or older ($n = 5$; 6.8%), and those who age 15-years-old ($n = 4$; 5.4%). For the control group, the age means is 17.36 ± 1.42 ; more than a third age 17-years-old ($n = 28$; 37.8%), followed by those who age 18-years-old ($n = 22$; 29.7%), those who age 16-years-old ($n = 13$; 17.6%), those who age 19-years-old ($n = 7$; 9.5%), and those who age 15 and 20-years or older ($n = 2$; 2.7%). Concerning marital status, the majority in the study group are not married ($n = 68$; 91.9%), followed those who are engaged ($n = 4$; 5.4%), and those who are married ($n = 2$; 2.7%). For the control group, the majority in the study group are not married ($n = 71$; 95.9%), followed those who are engaged ($n = 2$; 2.7%), and one who is married ($n = 1$; 1.4%). Regarding the SES, more than two-fifth in the study group are of the lower middle class ($n = 32$; 43.2%), followed by those who are of the upper middle class ($n = 31$; 41.9%), and those who are of the upper lower class ($n = 11$; 14.9%). For the control group, more

than a half are of the lower middle class ($n = 38$; 51.3%), followed by those who are of the upper middle class ($n = 25$; 33.8%), and those who are of the upper lower class ($n = 11$; 14.9%). There is a positive statistically significant correlation between participants' attitudes toward the reproductive health for the study group and their reproductive health knowledge ($r = .242$; at p -value < 0.05). The values of attitudes toward the reproductive health for the study group increase noticeably by time in comparison with the control group (Pretest = 54.73 vs. 56.00, Posttest II = 63.64 vs. 54.22, Posttest II = 67.99 vs. 54.77) respectively. The values of the reproductive health knowledge for the study group increase noticeably by time in comparison with the control group (Pretest = 42.05 vs. 45.03, Posttest II = 110.15 vs. 45.15, Posttest II = 112.66 vs. 45.38) respectively. Whether these represent significant differences is the job of the repeated measures (RM) ANOVA. The age mean for participants in the study group is 17.38 ± 1.53 ; more than a third are within the age group 17-years-old age. This finding goes in line with the usual age average for high school students in Iraq. This finding was consistent with that obtained by Charon-proshownic and others (2006) who found that most of participants with mean age 17.9 years ($SD = 1.26$, range = 16.1-22.0 years). This finding was inconsistent with that obtained by Corbett (2011) who found that most of Participants were largely self reported White/non-Hispanic women (88.2%) with a mean age of 19.27 years ($SD = 2.09$). Less than a half in the study group described their knowledge about healthy diet as somewhat good. This finding was lower than that obtained by Corbett (2011) who found that (92.6 %) indicated (somewhat strong or very strong) awareness of healthy nutritional guidelines, and (59.6%) reported that they follow these guidelines (most of the time or all of the time). This finding reflects the positive effect of the administered theory-based health education in enhancing students' knowledge about healthy diet. With respect to the frequency of physical exercise, most in the study group in the pretest time reported that they practice it 1-2 days per week ($n = 51$; 68.9%), followed by those who practice it five or more days per week ($n = 13$; 17.6%), and those who practice it 3-4 days per week ($n = 10$; 13.5%). In the posttest time, more than a half reported that they practice it five or more days per week ($n = 38$; 51.4%), followed by those who practice it 1-2 days ($n = 24$; 32.4%), and those who practice it 3-4 days ($n = 12$; 16.2%). This finding could be explained as that

the majority of students reported that they have weekly sport exercise. Such a class could motivate students to maintain exercising as much as possible throughout the week. This finding was consistent with that obtained by Al-Akour and others (2015) who found that (79.9%) of women believe that they should exercise and undertake physical activity, and that of Robbins and others (2018) who found that (53.5%) of women have been participating in recommended levels of physical activity. This finding was consistent with that obtained by Corbett (2011) who found that more than half of women in the sample ($n = 120$, 59.1%) reported that they work out at least 3 days per week. This finding reflects the positive effect of the administered theory-based health education in enhancing students' knowledge about healthy exercises. Concerning the quality of sexual education, less than a half in the study group in the pretest time described such an education as very limited ($n = 34$; 46.0%), followed by those who described it as somewhat limited ($n = 22$; 29.7%), those who described it as excellent ($n = 10$; 13.5%), and those who described it as somewhat good ($n = 8$; 10.8%). In the posttest time, more than two-fifth described it as excellent ($n = 32$; 43.2%), followed by those who described it as somewhat good ($n = 27$; 36.5%), those who described it as somewhat limited ($n = 12$; 16.2%), and those who described it as very limited ($n = 3$; 4.1%). The sexual health education for females students has enhanced by a theory based health education related to positive motivation in their health attitudes. This finding was inconsistent with that obtained Corbett (2011) who found that (79.3%) women indicating that the quality of the sexual education they had received was (somewhat strong or very strong), and (70.4%) women indicating that the breadth of their sexual education was (somewhat broad very broad). With respect to the preconception knowledge, less than a half in the study group in the pretest time described such knowledge as somewhat limited ($n = 35$; 47.3%), followed by those who described them as very limited ($n = 27$; 36.5%), those who described them as somewhat good ($n = 9$; 12.2%), and those who described them as excellent ($n = 3$; 4.0%). In posttest time, the majority described such information as excellent ($n = 62$; 83.8%), followed by those who described them as somewhat good ($n = 9$; 12.1%), those who described them as somewhat limited ($n = 2$; 2.7%), and one who described them as very limited ($n = 1$; 1.4%).

CONCLUSION

The researcher concluded that students' knowledge about healthy diet, quality of sexual education, family planning, and preconception health knowledge have been improved after administering the theory-based health education. Students' following to healthy diet guideline, frequency of physical exercise have increased after administering the theory-based health education. The theory-based health education was influential in enhancing students PCHB and reproductive health knowledge.

ABSTRACT

In this research we study the electrical properties of polyaniline (PANI) nano films pure and doped with multi-walled poly(3,4-ethylenedioxythiophene) PEDOT and which included direct electrical conductivity (σ_{dc}), activation energy and the hall effect with ratio (0.1%, 0.2%, 0.3%) prepared by spin coating deposited on glass substrate at room temperature. The results showed that (PANI) has conductivity about of (2.248×10^{-8}) ($\Omega \cdot \text{cm}$)⁻¹) at room temperature; and this conductivity increased with increasing of doping ratio, also with increasing of temperature as well as the results showed throughout the study that (PANI) has one activation energy and this energy decreased with increasing of doping ratio. The hall effect showed that the (PANI) its p-type.

INTRODUCTION

Advancement in the field of nanotechnology and its applications to the field of medicines and pharmaceuticals has revolutionized the twentieth century. Nanotechnology is the study of extremely small structures. The prefix “nano” is a Greek word which means “dwarf”. The word “nano” means very small or miniature size. Nanotechnology is the treatment of individual **atoms**, molecules, or compounds into structures to produce materials and devices with special properties. Nanotechnology involve work from top down i.e. reducing the size of large structures to smallest structure e.g. photonics applications in nano **electronics** and nano engineering, top-down or the bottom up, which involves changing individual atoms and molecules into nanostructures and more closely resembles chemistry biology, Polymers of unique composition have the properties of semiconductors, while mainly commercial polymers are insulator. known that polymers are simply shaped, chemists and physicists happening median the twentieth irregular double century to conduct studies designed to expand conductor polymers characterized

by the bonds ¹ Polymeric materials can be synthesized and processed into different shapes according to the required application such as thin films, polymer have many advantages to the electrical application due to their simple synthesis technology, relatively low cost materials and can be deposited on different substrates, moreover, they have special characteristic that mode them very important, such that, they have a wide range of electrical conductivity [10^{-24} - 10^6 S/cm] ^{2,3}. The electrical conductivity of polymers related with free ions which are not chemically linked to the large molecules, Conductive polymer is broadly used in microelectronics engineering, the magnitude, these microelectronics application is that it has physical properties modified to a particular request and recognize the mechanisms controlling these properties ^{4,5}. Polyaniline is one of conductive polymers, a kind of p-type and its behavior resembles the behavior of semiconductors ⁶. Also it features properties photoelectric task could be used in industrial applications ⁷. It is used in the solar cell industry and in printed electrical panels for panels electrical appliances Maps ^{8,9}.

MATERIALS AND METHOD

Preparation of samples

The thin films of (Polyaniline) were synthesized by using spin coating technique that the polymer is

Department of Physics, College of Science, University of Babylon, Iraq; E-mail: facemoon862@yahoo.com.

dissolved in (Chloroform) and deposited on substrate of glass.

D.C Electrical Conductivity:

There are two ways to calculate the D.C Electrical Conductivity:

- a- Interdigitated finger Electrode
- b- Deposition polar
- a - Interdigitated finger Electrode

Consisting of poles individually-like comb teeth and be very sensitive to the thin films in solid-state physics which are small and distinctive size and dimensions are measured in nano-meter , as in Figure (1) ^{3,10}. Which shows that the electrodes consist of aluminum in the form of lines on the base of the glass, and can perform calculations using the following relationship

$$\sigma_s = [I/V] [L/Wt\ell] \dots\dots\dots (1)$$

Where(t) represents the thickness of polymer, (W) the distance fingers (10mm), (ℓ) number of fingers is to be (10), and (L) the space between electrodes (100µm).

- b - Deposition polar

Masks have been designed for this technology using thin aluminum material and forms suitable and as in figure (2) and purpose is to determine the geometry of the electric pole and raise these masks after the completion of the deposition process Electrical conductivity can be calculated using the following equation ¹¹.

$$\sigma = \sigma_o EXP(\frac{-E_a}{k_B T}) \dots\dots\dots (2)$$

Where: Ea: activation energy (eV). T: the absolute temperature (K), k_B:Boltzmann’s constant, σ_o:constant.

The D.C.conductivity films prepared account after measuring the resistivity of films (ρ) for each temperature starting from room temperature down to the point (60°C) using the following equation [12]

$$\rho = \frac{RAT}{L} \dots\dots\dots (3)$$

W h e r e : R is resistant films practically measured (Ω), A pole width (cm), L the distance between the opposite poles (cm).

It resistivity account that has been. The D.C.conductivity calculation (σ_{dc}) of calculating the value of inverted resistivity, namely that ¹³.

$$\sigma_d = 1/\rho \dots\dots\dots (4)$$

Based on the equation (2) painted a graphic relationship between (Lnσ and (1000 / T)) and so could account activation energy which is equal to the slope of the line extracted from the graph multiplied of Boltzman’s constant . The electrical properties of (PNAI) are measured by digital electrometer type Keithley (616) to measure the passing current as a function to the applied voltage .The samples were placed inside electrical oven.

Hall Effect:

Hall effect known as the difference in the distribution of the current in the conductive or semi-conductive segment due to the magnetic field ^{12,13} which shed a magnetic field on a conductor carrying an electric current direction perpendicular to the direction of current flow generates a delinquency charge carriers aside and cause the generation of electric driving force over the connector direction perpendicular to the direction of both the current and the magnetic field, electrical circuit for measuring the Hall effect, which consists of D.C. power supply with (0 – 40) volt and two digital electrometers (HMS-3000) to measure the current and voltage.

The Hall effect in semiconductors measurements are given the following equation ¹⁴.

$$R_H = -(\frac{1}{e}) = \frac{V_H.t}{I_x.B_z} \dots\dots\dots (5)$$

It represents: R_H: Hall coefficient. n: the concentration of carriers. e: electron charge. t: the thickness of the films. I_x: current flowing in the films. B_z:

The intensity of the magnetic field. And from this relationship the Concentration of the majority carriers account, using the following relationship was Hall mobility of these carriers account ¹³.

$$\mu_H = |R_H|\sigma \dots\dots\dots (6)$$

As it represents: Hμ Mobility Hall.σ electrical conductivity[15

RESULTS AND DISCUSSION

The D.C Conductivity and Activation Energy

Measurement results showed that polyaniline has electrical conductivity up to $(2.248 \times 10^{-8}) (\Omega.cm)^{-1}$ at room temperature and that this conductivity increases with increasing temperature, As for the films vestiges we note there is also an increase in the conductivity values with the increase in the proportion of doped, This can be explained by the increase that led to the formation of impurity donor levels Near the conduction band, When the activation energy calculation we found that there was a single activation energy and this shows the transition in a way thermal stimulation at the border granular mechanical occurrence, As for the films vestiges, the value of the activation energy decreases with increasing the proportion of doped As shown in Table (1), This can be explained that increasing the proportion of impurities led to the approach of the Fermi level more towards the conduction band, as is evident in Figures (3,4). The results of the measurements of the Hall effect that all films prepared is the p-type through the positive sign of the Hall coefficient, The results also showed that (PANI) has a value of mobility $(4.1 \times 10^2 cm^2/V.s)$ at room temperature. in films vestiges there was a clear increase in the concentration of carriers and a decrease in the values of mobility at room temperature with increasing doping ratio as in the table (2), This was due largely to an increase in the concentration of carriers formed near the conductive band, which in turn lead to an increase the number of donor atoms of electrons capable of ionization within the thermal energy does not exceed the value of topical levels $(K_B T)$, As for the decrease in mobility shall be due to the increased concentration of carriers.

pani:PEDOT(3%)	1.2×10^6	9.4×10^{11}	1.5×10^5	2.35×10^1	6.44×10^{-6}

CONCLUSION

It is found through the study that these polymers appear a continuous change in the Electrical properties as a result of adding poly(3,4-ethylenedioxythiophene) to the polymer. The addition poly(3,4-ethylenedioxythiophene) to (PANI) led to the improvement Electrical properties.

Evaluation of Mothers Practices toward Care Children with Squints in Abin-Alhithim Teaching Hospital for eyes in Bagdad City

Suad Hassoon Khudhair

Department of Pediatric Nursing, College of Nursing, University of Baghdad, Baghdad city, Iraq

ABSTRACT

The study aims to evaluate mothers' practices toward care children with squint and find the relationship between the mothers' practices and their demographic characteristics. Descriptive study no probability (purposive) sample. Selected Fifty-five of mothers having children with squint, started from 20 March 2018 to 19 August 2018. Study was carried out in the Abin ALhithim teaching hospital for eyes in Bagdad by using questionnaire which consists from two parts include first part for demographic characteristics for mother and children, and second part for mothers' practices. The data gathered by direct interview with the mothers in the hospital. The reliability and content validity of questioner were identified form of the pilot study. The data were analyzed through the application of descriptive statistic frequency, percentage, and the application of inferential statistical procedures, which include Pearson correlation coefficient and chi-square. The finding of the study was indicated that the mother have poor practices toward care their children with squint. The findings indicated that the mothers' practices revealed there are poor levels toward toward care children with squint.

Keywords: *Evaluation, Mothers' Practices, Squint.*

INTRODUCTION

According to the World Health Organization (WHO), childhood squint (strabismus) refers to diseases or conditions occurring in childhood, which, if left untreated, may result in severe visual impairment that is likely to be untreatable later in life. The WHO estimates that 19 million children worldwide are currently visually impaired, of which 1.5 million are squints (strabismus). Furthermore, it is estimated that roughly 500,000 additional cases of eyes squints in the children occur each year, with a higher prevalence of these cases in lower-income populations. Visual impairment is known to have a significant bearing on the health, social and future economic wellbeing of children around the world¹. Strabismus is a common disorder of ocular alignment that affects 2–4% of children. It is commonly referred

to as a 'squint' or 'lazy eye'. The most debilitating consequence of untreated strabismus is the development of amblyopia (permanent loss of best corrected visual acuity in a structurally healthy eye). This is because abnormal visual experience during critical periods of early neurodevelopment result in down regulation of the neural pathway to the brain's visual cortex. After the age of 9 years, these pathways may never be recovered even if normal visual function is restored. Strabismus also significantly affects quality of life, this disorder that can cause psychosocial distress and permanent functional disability with lifelong cosmetic disability that may result in poor self-esteem, social prejudice and restricted career opportunities². Early detection and treatment improves vision outcomes and psychosocial wellbeing for children with strabismus and is important to maximize visual rehabilitation and reduce the risk of amblyopia. Nonetheless, many cases of strabismus go unrecognized. As patients with pediatrics strabismus usually present before school age (with an average onset at 1–4 years), population-based pre-school screening programs have been advocated as a way to reduce the

University of Baghdad, Baghdad City, Iraq

rate of untreated strabismus and amblyopia. Nonetheless, the cost-benefit value of these public health programs is the subject of ongoing debate, and the lack of a national Australian screening program necessitates that individual assessment of children currently falls into the realms of primary care clinicians, such as child health nurses. For this reason, should be alert to this common problem and be familiar with practical screening tests that may unmask situations requiring specialist referral³. Children require support in recognizing eye problems and hence screening becomes essential. Moreover, their eye issues need to be tackled at the earliest for treatment to be effective. There is a marked regional variation in the major causes of squints in children in different parts of the world. Overall, approximately 60%–70% of squints eyes in children is avoidable and/or treatable. The remaining 30% of children may require low vision and rehabilitation care to improve their quality of life. If squint is left untreated, lazy eye (amblyopia) can develop. The vision in the affected eye gradually deteriorates because the brain ignores the weaker message being sent from that eye. It is not usually possible to correct amblyopia after the age of about 7 years, which is why it is so important to treat a squint as soon as possible⁴. The American Academy of Family Physicians preventive services task force recommend vision screening at least once in all children three to five years of age, the mothers are in close interaction with their children and they are in better position to identify the squint for her children. As a part of this, mothers have to be given adequate orientation in early diagnosis of squint of children. Thus they will be a dynamic force, instrumental and indispensable to health team for promoting health and squint this can play a major role in the early detection and treatment of squint⁵.

MATERIALS AND METHOD

A descriptive study (cross-sectional design) was carried out the direct interview of mothers to evaluate practice. Non probability (purposive) sample consist of (55) mothers who have children with squint in the eyes at Abin Alithim teaching hospital for eyes from 20 March 2018 to 19 August 2018. The questioner form is consisted of two parts, the first part, which included demographic characteristics for mother and her child, and second part for mothers' practice induced (53) items the response scored (1) never (2) some time (3) always. Evaluate the validity of the questioner form the researchers presented it to six experts in specialist

field. Reliability of the questioner was determined that mothers' practice($r=0.896$) at level ($p<0.05$), the correlation coefficient above 0.70 is accepted, A pilot study included the 5 mothers who have children with squint in the eyes at Abn Alethem teaching hospital for eyes to determine the reliability of the study, average time required for the data collection, the statistical procedure include descriptive statistic (frequency, mean, percentage) and inferential statistic approach have been used.

RESULTS AND DISCUSSION

This study focused on the mothers who often caring her children who have squints in Abn Alethem teaching hospital for eyes. The study results show in table (1) high percentage (45.0%) of mothers were age group (32-38) years, (36.3 %) of mothers graduated from Secondary school and (55.0%) were house wife,(73.0%) living in urban area and (44.0%) socio-economic status of their family are low. The results agree with, 2 Pekcanlar,2005⁶ who mentioned that the mothers of the children with strabismus had significantly higher depression scores they demonstrated significantly lower scores in democratic attitude, meaning that they failed to constitute a supportive and friendship relation with their children and these mothers had significantly higher scores in rejection of maternal role. They were nervous, distressed, and angry in the relationship with their children, with unhappiness and more dissatisfaction with respect to maternal role. Mothers of the children with strabismus had poor role functioning in the family, which is related to satisfying the food, clothing, and support needs. Table 2 shows that more than half of the study sample (56.0 %) were female, most of children age group (51.0%) were of age (7-10) years and (49.0%) was in primary school,(60.0%) number of children in the family are four and more. This result agree with Jeffrey,2014⁷ who mentioned that the vision screening for children is an evaluation to detect reduced visual acuity or risk factors that threaten the healthy growth and development of the eye and visual system. Vision screening in the primary care setting is usually performed during health supervision visits by a parents especially mother. Community vision screening may be performed in preschools, in daycares, at schools, or at health fairs. The mothers should be consensus eye care for her children with squint can significantly improve children's quality of life and can reduce the burden of eye disease. Several important pediatric eye conditions

can be asymptomatic, and children may be unaware and/or unable to express vision problems, therefore, timely treatment relies on early diagnosis. Many authorities recommend early and regular vision screening to detect these conditions ⁸. In table 3 shows the distribution of mothers practice items toward care children with squint, the score with three levels. The percentage score for always level was 18.0%, percentage score for some time level was 46.0% and percentage score level for never was 36.0%.this result supported by Jeffrey,2014 ⁹ who mentioned that all pediatric patients with strabismus require timely referral to an ophthalmologist for a comprehensive assessment of visual function. Specific visual rehabilitation programs will depend on a number of factors, including the precise type of ocular deviation involved and whether the strabismus is primary or secondary. Non-surgical interventions commonly include refractive error correction with spectacles or contact lenses, and amblyopia therapy with patching or atropine penalization. Other uncommon interventions include the use of prisms in glasses, behavioral eye exercises and the use of intramuscular botulinum a neurotoxin surgical correction of ocular alignment is commonly recommended and is well tolerated as a day procedure, with minimal post-operative discomfort. Treatment goals are primarily to prevent amblyopia and achieve binocular vision with functional depth perception (stereopsis). The result of the study in table 4 reveals that there is no significant association between mothers' practices toward care her children with squint and there demographic characteristics' like (mothers' age, education, occupation, residential area, and socio-economic status of the family). This results supported by Bruce (2005) ¹⁰ who mentioned that the strabismus usually develops at some time in the first 3 years of life; however, it can also develop in older children. The duration and intensity of treatment will depend on factors such as age of presentation. Although not always easy to decipher, the pattern of symptoms is important, such as whether the strabismus is constant or intermittent. If the pattern is reported as intermittent, the practitioner should note whether the frequency and symptoms are dependent on direction of gaze. Children may develop a very brief period where a strabismus develops when daydreaming or extremely tired. Treatment for benign squints will arise from the hospital visit. This will be:

Glasses.

patching of non-squinting eye (or blurring the vision

with atropine drops); and Surgery.

Most children do not need surgery and there is a national trend of reducing the numbers of operations for childhood squint. When surgery is performed the eye will be red and sore which can take several weeks to settle. Children can normally go back to school after 2–3 days ¹¹.

Extracellular Biosynthesis of Silver Nanoparticles Using *Sphingomonas paucimobilis*, *Serratia* Sp. and *Pseudomonas aeruginosa* and Their Antimicrobial Activity

Hamzia Ali Ajah¹, Khawlah Jebur Khalaf¹, Ali Murtatha Hasan¹

¹Department of Biology, College of Science, Mustansiriyah University, Baghdad City, Iraq

ABSTRACT

Synthesis of silver nanoparticles (AgNPs) by microorganism is emerging as an important branch of nanotechnology due to its ecofriendly, safe, and cost-effective nature. Cell-free culture supernatants of three bacteria *Sphingomonas paucimobilis*, *Serratia* sp. and *Pseudomonas aeruginosa* have been used to synthesize silver nanoparticles (AgNPs). The AgNPs were characterized using atomic force microscopy. The sizes of the AgNPs 91.74nm, 93.39nm and 93.55nm respectively. The antimicrobial activity of the synthesized silver nanoparticles was tested using both gram positive as well as gram negative bacteria, *Staphylococcus aureus*, *Klebsiella pneumoniae*, and *Streptococcus pyogenes*, also tested using *Candida albicans* respectively. In this study, AgNPs have the highest antibacterial and antifungal effect against all microorganisms and the zone of inhibition increased with the increase of silver nanoparticles concentration.

Keywords: Silver nanoparticles, Extracellular Biosynthesis, *Sphingomonas paucimobilis*, *Pseudomonas aeruginosa*, Antimicrobial activities.

INTRODUCTION

The synthesis of nanoparticles, [nanos meaning dwarf and denotes a measurement on the scale of one-billionth (10⁹) of a metre in size], of different chemical compositions, sizes, and controlled monodispersity is an emerging field in the area of nanotechnology. Recently, many study demand being made by newly emerging synthesis methods for Nanoparticle shape control. Moreover, the synthesis of benign nanoparticle was need to develop environmentally processes that do not use any toxic chemicals compound in the procedures of synthesis. Several methods have been developed for the synthesis of nanoparticles, but the interaction between biological synthesis and inorganic molecules is one of the most exciting field of research. In this respect, Many bacteria, fungi and plants have shown the ability to synthesis metallic nanoparticles and were viewed as ecofriendly factories to produce inorganic materials either on intracellular or extracellular level by used different inorganic materials like Ag, Au, Pd, Pt, etc.¹⁻⁶. Although antimicrobial effects of silver nanoparticles are understood, the mechanism of bactericidal and fungicidal are still undetermined. It has been proposed

that bactericidal mechanism happens due to the release of silver ions (Ag⁺) which generates reactive oxygen species (ROS)⁷ including free radicals that cause membrane lipid peroxidation and finally an causes the deposition of silver granules on the bacterial cell wall, while others study shows that the Ag⁺ interact with many of enzymes like NADH dehydrogenases and causing in the uncoupling of respiration from ATP synthesis hence resulting their inactivation. It was also reported that exposure of Ag⁺ resulting morphological changes to bacterial cells such as DNA condensation, cytoplasm shrinkage, detachment of cell wall membrane, and cell membrane degradation⁸. The antifungal activity of silver nanoparticles has been reported, the mechanistic action of silver on *Candida albicans* yeasts studies and shows that the treatment induced an accumulation of reactive oxygen species, reduction in the mitochondrial membrane potential, phosphatidylserine externalization, the activation of metacaspases, DNA and nuclear fragmentation. Biologically synthesized silver nanoparticles could have many applications, for example, they might be used as optical receptors, as catalysts in chemical reactions, as spectrally selective coatings for solar energy absorption and intercalation

material for electrical batteries, and as sensors, antimicrobial agents, and filters⁹⁻¹¹. Microorganisms, for example fungi and bacteria, can survive and grow in many polluted environments, including soil and water and, because there have ability to resist the metal stress. Among the mechanisms in that respect is the alteration of toxicity and solubility by oxidation and reduction^{12,13}. The aim of this study is for extracellular biosynthesis of silver nanoparticles from *Sphingomonas paucimobilis*, *Serratia* Sp. and *Pseudomonas aeruginosa* and there antimicrobial activity again different microorganism.

MATERIALS AND METHOD

BACTERIA ISOLATES

Bacteria used for synthesis of Ag nanoparticles

The test isolates *Sphingomonas paucimobilis*, *Serratia* sp. and *Pseudomonas aeruginosa* were obtained from Dr.Kaulah Jaber, biology Department, Al-Mustansryah University, cultivated in Nutrient broth (NB) until used.

BACTERIA USED FOR ANTIMICROBIAL ACTIVITY

The test isolates *Klebsiella pneumoniae* , *Staphylococcus aureus* and *Streptococcus pyogenes*. Were obtained from Bacteriology Lab. biology Department, Al-Mustansryah University, cultivated in Nutrient broth until used.

Candida albicans

Candida albicans was oral isolates obtained from Mycology Lab, Biology Department, Al-Mustansryah University. The isolate was grown on sabouraud dextrose broth (SDB) until used.

SYNTHESIS OF SILVER NANOPARTICLES

Nutrient broth was prepared, sterilized and inoculated with afresh growth of test isolates, *Sphingomonas paucimobilis* , *Serratia* sp. and *Pseudomonas aeruginosa* each separately. The culture flasks were incubated at 35°C for 24hr. in an orbital shaker at 150rpm. After the incubation period, the culture was centrifuged at 600 rpm for 5 min and the supernatant was used for the synthesis of silver nanoparticles (AgNPs). The supernatant of test isolates culture was separately added to the reaction vessels containing silver nitrate at a concentration of 0.1g/L.

The reaction between the supernatant and silver ions was carried out in bright conditions for 72hr. Silver nanoparticles were characterized by Atomic force microscopy (AFM) (14-15).

ANTIMICROBIAL ACTIVITY

The antimicrobial spectrum of the synthesized Ag nanoparticles was determined by the agar well diffusion method against different pathogenic microorganisms *Candida albicans* , *Klebsiella*, *Pneumoniae*, *Staphylococcus aureus* ,and *Streptococcus pyogenes*. Sabouraud dextrose, agar (SDA) while Nutrient agar (NA) were prepared sterilized and cooled to 45°C , then distributed into petri dishes ,inoculum of 10⁶ CFU/ml for each strain according to McFarland turbidity standards was inoculated by swabbing on NA and SDA and the wells of 6 mm diameter were prepared in each agar plate. The wells loaded with 100µl of the silver nanoparticles previously prepared by different bacterial isolates. The plates were then incubated at 37°C for 24 hr. , after which the diameters of inhibition zones were measured to estimate its inhibitory effects , the inhibition zones were measure in mm(16-17).

RESULT AND DISCUSSION

The development of ecofriendly and simple biological system would help in the synthesis of metallic nanoparticles and application ,However, there are several physical and chemical methods for synthesis of nanoparticles, Some microorganisms, for example fungi and bacteria, interact with metal ions reducing them into metallic nanoparticles¹⁸. The formation of silver nanoparticles by the culture supernatants of *Sphingomonas paucimobilis* , *Serratia* sp. and *pseudomonas aeruginosa* was carried out. The cell filtrate of the tested bacterial isolates incubated with silver ion (0.1g/l) yellowish-brown color rapid appearance in the reaction vessels suggested the formation of silver nanoparticles. The change in color indicates that the reduction of silver ions to silver nanoparticles resulting from certain reducing agents released into the culture supernatant of the tested bacteria. The Silver nanoparticles were described by using Atomic force microscopy (AFM) and found the average size of silver nanoparticles synthesis by *Sphingomonas paucimobilis* , *Serratia* sp. and *Pseudomonas aeruginosa* were (91.74nm ,93.39n m and 93.55n m) respectively. The using silver nanoparticles synthesis by *Sph*.

paucimobilis on different microorganisms are showed in table(1) , the greatest effect was on *Candida albicans* than *Staphylococcus aureus*, *Klebsella pneumonia* and *Streptococcus pyogenes* respectively , with inhibition zone 24mm, 20mm, 16mm and 15mm respectively in 100%concentration, while in 50%concentration 19mm, 15mm, 10mm and 15mm respectively. Table (2) showed the effect of silver nanoparticles synthesis by *Serratia sp.* on microbial activity. The results showed that the effect will increase on *C.albicans* and *Strp. Pyogenes* than *Staph. aureus* and *K. pneumonia* with inhibition zone 28mm, 28mm, 20mm and 18mm respectively in 100%concentration, while in 50% concentration 22mm,13mm,15mm and 15mm respectively. In this study also we used silver nanoparticles synthesis by *Pseudomonas aeruginosa* to inhibit the growth of microorganisms, the result in table 3 revealed that the growth is inhibited by Ag nanoparticles and this inhibition rate increases with the increase of concentration thus, rate growth in of *K. pneumonia*, *Staph. aureus*, *Strep. Pyogenes* and *C. albicans* in 100% Ag nanoparticles concentration is 20mm,20mm,30mm,22mmrespectively ,While in 50%concentration 18mm, 15mm, 30mm, and 19mm respectively. The effect of silver nanoparticlaes on microorganisms is studies by numbers of researchers, but the exactly mechanism of inhibitory action of silver ions is partially known. It is believed that upon Ag+ treatment more cellular proteins become inactivated and DNA loses its replication ability [19]. Moreover, it was also shown that protein denaturation resulting when Ag+ binds to functional groups of proteins. Other study showed that *E. coli* bacterial membrane exhibits a significant increase in permeability and ultimately causing cell death when treated with nanoparticles that leaving the bacterial cells incapable of properly regulating transport through the plasma membrane [20-22]. Ashour [23] found that ,in multi-drug resistant human pathogens of bacteria and *Candida* infections, silver nanoparticles from *Kluyveromyces marxianus*, *Candida utilis* [22] have great potential to be an effective to antibacterial and/or antifungal agents for future therapies. Moreover ,in mold, *Aspergillus flavus* was consider as a good producer of silver nanoparticles by releasing the nitrate reductase an extracellular enzyme produced from *A. flavus* . Silver nanoparticles are known to have inhibitory and bactericidal effects against *Pseudomonas aeruginosa*, *Klebsiella pneumonia*, *Escherichia coli* and [24]. The major antibacterial mechanism of silver nanoparticles is by penetrating the bacterial cell wall, and modulating

cellular signaling by dephosphorylating putative key peptide substrates on tyrosine residues. The inhibitory effect of Silver nanoparticles against Gram-negative bacteria may act in following ways: nanoparticles cause disturb in the cell membrane function, like permeability and respiration ,especially when the size of nanoparticles range of 1-10 nm; they are able to cause further damage in DNA by possibly interacting with sulfur- and phosphorus containing compounds ,moreover the silver ions that released from nanoparticles have an additional contribution to the bactericidal effect of the silver nanoparticles. Nanoparticles also modulate the phosphotyrosine profile of putative bacterial peptide, which could thus affect bacterial signal transduction and inhibit the growth of the organisms [25].

Table 1. Effect of silver nanoparticles synthesis by *Sphingomonas paucimobilis* on microbial activity.

Microorganisms	Concentration of nanoparticles	
	100%	50%
inhibition zone in mm

Microorganisms inhibition zone in mm	Concentration of nanoparticles	
	100%	50%
<i>Klebsella pneumoniae</i>	18	15
<i>Saphylococcus aureus</i>	20	15
<i>Streptococcus pyogenes</i>	28	13
<i>Candida albicans</i>	28	22

Table 3. Effect of silver nanoparticles synthesis by *Pseudomonas aeruginosa* on microbial activity.

Microorganisms inhibition zone in mm	Concentration of nanoparticles	
	100%	50%
<i>Klebsella pneumoniae</i>	20	18
<i>Saphylococcus aureus</i>	20	15
Streptococcus pyogenes	30	30
<i>Candida albicans</i>	22	19

CONCLUSION

Infections caused by such pathogens require a multiple treatment, containing broad-spectrum antibiotics. In fact, these treatments are expensive, less effective, also shows microbial resistance and more toxic. Nanotechnology provides a good platform to overcome the problem of resistance, with the help of the silver nanoparticles silver nanoparticles from each strains have great potential to be an effective to antibacterial and/or antifungal agents for future therapies in multi-drug resistant human pathogens of bacteria and *Candida* Infections.

Influence of Copper Nanoparticles on Dielectric Properties of Polystyrene

Mohammed Jawad Kadhim¹, Nahida B Hasan¹

¹ University of Babylon, College of Science, Physics department, Iraq

ABSTRACT

In this work, samples of pure polystyrene and polystyrene (PS) doped with copper nanoparticles were prepared using casting method. The effect of addition of copper nanoparticles on dielectric properties of polystyrene has been studied. For this purpose, many samples have been prepared by adding Copper nanoparticles to the polystyrene with different weight percentages are (0%, 3%, 6%, and 9%) and different thickness. The experimental results showed that dielectric constant, dielectric loss are increasing with increase the concentration of the copper nanoparticles and decreasing with increase of the frequency of applied electrical field, A.C electrical conductivity are increasing with increase the copper nanoparticles and frequency of applied electrical field.

Keywords: polystyrene, Copper Nanoparticles.

INTRODUCTION

Nanoparticles are put up as comminuted dispersions or current sevens round a field in the range of 1-100nm 1. The nanoparticle is gonfalon in nanotechnology in support of deeper these stretch team a few observes original presentation of liaison, primarily due to the laws of quantum physics 2. At assorted steadiness focus on between the Angstrom level and the micrometer grow, the honest butt in a cleave of a nanoparticle as a dance or droplet changes. Both powerful and chemical characteristics are inferred outlander atomic and molecular origin in a active way. For situation the electronic and optical endowment and the chemical reactivity of closely-knit clusters are definitely selection exotic the revise superciliousnessprocurement of till the end of time component in the bulk or at extended surfaces. Complex quantum enlivened models are obliged to nullify the situation of such gifts nigh moment size, and typical out-and-out to a great extent defined conditions are needed to compare experiments and theoretical predictions [3, 4]. The build-up in

the show-bailiwick-to-volume needle, which is a weakened speed as the piece gets inconsequential, leads to an augmentation use of the behavior of atoms on the evident of a atom abandon lapse of those in the beloved of the whit. This affects both the capacities of the moment in retreat and its collaboration with other matter. Scornful surface area is a perceptive cause in the role of of catalysis and structures such as electrodes, toleration headway in resolution of such technologies as nourishment cells and batteries, with large surface area of nanoparticles. Moreover for the scanty interactions between the profligate materials in nanocomposites, lead to midst endowment such as increasing strength and/or increasing chemical/heat resistance 5. Nano-technology has been fraudulent exceptionally operation suited for 1980s and has been designed into original science fields such as electronics, mechanical, biomedical and space engineering. In aware, nanotechnology has led to the humongous improvement in a biomedical compass such as unperturbed drug/gene authority, give engineering, imaging of specific sites and probing of DNA structure. Amongst nanomaterial, nanoparticles take a crack at a go been wilful to the progress in this field 4. In prudent, therapies work nanoparticles have abroad been achieved for the treatments of cancer, diabetes, allergy, infectionand inflammation 6. When an insulator is placed in a low frequency electrical field, where induced or permanent

electrical dipoles can go along with the variation of the applied electrical field with no residue, the dielectric constant value becomes equal to its value in a static field, that is, the insulator becomes ideal (Ohmic conductivity equals to zero). On the other hand, when the frequency of electric field is greater, where the electric polarization is depends on frequency, there will be complex dielectric constant. The dielectric constant is the ratio between the capacitance of a capacitor containing an insulator material between its conducting plates to the capacity of the same size with a vacuum between the plates. When an alternating potential, is applied across a capacitor c filled with an insulator, the current passing through the capacitor precedes the potential by a phase of $\pi/2$.

MATERIALS AND METHOD

Matrix Material (PS)

Polystyrene (PS) has granular form and could be obtained from local markets as shown table (1).

Preparation of (PS-Cu) Nanocomposites

The (PS-Cu)nanocompositesare planned by the escort:

Nanocomposites shot been prepared by melting (0.5)gm of polystyrene in (40)ml of benezen, and by service alluring stirrer for the discomfiture initiative to acquire relative to akin solution with temperature of 35oC.

2-Then as well the footing percentages of additives (0%,3%,6%,and9%) of (Cu) nanoparticles as shown in Ship aboard (2), and wave for 30 momentarily to execute vitiare almost homogenous, by point bent nearer we carry out the films newcomer disabuse of this amalgam and nominate ever several of these ratios in the sort (Petri dish) (it has capacity5cm) and then left to dry mixture,thentaken from the template quietly to conducting the necessary tests, by using electronic digital device to measure thickness.

Measurement of A.C. Electrical Conductivity

It was cogitate on by fit the capacitor and the slant standpoint tangent as a decree to the down zealous arena extent abhorthe (HIOKI 3532-50 LCR hi tester (JAPAN).The A.Painless. levigate presentation (dielectric abiding, loss factor and A.Easy as pie.

conductivity) attack been pretentious as a represent of incidence ,arena between 50Hz to 5MHz at room temperature

Copper (Cu) nanoparticles

It was obtained as powder from (Nano shell USA) company ,with size (30 nm) and high purity (99.9%). Nanomaterial (Cu) are tested by using the apparatus (Better size 2000 laser particle size analyzer) existed in Babylon university / college of material engineering , department of electro-chemical.

Scanning Electron Microscope (SEM)

The basic properties of the nanocomposites films were dissected by filtering electron microscopy (SEM) (FEL Quanta 200, Netherl-ands).The setting in laboratory at university of Al- Kufa, college of Science.

RESULTS AND DISCUSSION

Scanning Electron Microscope (SEM) Measurements

SEM demonstrates the exceptionally point by point three dimensional pictures at high amplifications. The surfacestructurePolystyreneand(PS-Cu)nanocomposites can be imaged through SEM with high clearness. SEM pictures delineate the surface morphology of Polystyrene when expansion convergence of Cu nanoparticles. The films display uniform thickness of grain dispersion at surface morphology.The surface morphology of the (PS-Cu) nanocomposite films indicates numerous totals or pieces haphazardly appropriated of Cu nanoparticles on the best surface the films. The outcomes demonstrate that the Cu nanoparticles tended to shape totals and great scattered at (PS-Cu) nanocomposites films.When adding 9wt.% of Cu nanoparticles to Polystyrene it frame a nonstop system inside the polymers.This arrange has ways where charge transporters are permitted to go through the ways that have low electricale obstruction. These outcomes are in comparative with comes about came to by the analyst ^{8,9}.

The A.C. Electrical Properties of (PS-Ti) Nanocomposites

The variety of dielectric consistent for PS-Cu nanocomposites of various Cu fixation as capacity of recurrence at room temperature is appeared in figure (1). At low recurrence area, the space charge polarization

assumes a noteworthy part in expanding dielectric steady of nanocomposite ¹⁰. The space charge polarization emerges from the Cu/PS interfaces. The dielectric steady increments with weight portion of Cu. The expansion in dielectric consistent with weight part of Cu bolsters the commitment of room charge polarization commitment. The dielectric steady of nanocomposite increments with expansion of Cu mirrors the development of capacitance system of Cu. ¹¹ as appeared in figure (2). The variety of the dielectric loss of PS-Cu nanocomposites as a component of recurrence at room temperature is appeared in figure (5), the estimations of high for low frequencies, and diminishing with expanding the recurrence. The oscillatory conduct of ϵ'' may because of unwinding forms which as a rule happen in heterogeneous frameworks. The relaxation peak at $f=500\text{kHz}$ shows up obviously in all low Cu concentration. The increasing in Cu concentration rises height of the pinnacle and expanding its broadness for these examples. The reason of that is the interaction of relaxation process which are contribute to structure effects which happen to in nanocomposite as a result for the addition of filler. The conductivity of the samples had been enhanced due to increasing of ϵ'' with Increasing Cu concentration, i.e.improvement of losses ¹² as illustrated in figure(3). The conduct of A.C conductivity of PS-Cu nanocomposite for various convergence of the filler as a component of recurrence at room temperature is appeared in figure (4). The A.C conductivity reaction to the connected field recurrence at low and middle range is level, and at high recurrence extends there is a progress district where the reaction begins to twist descending. The bowing area is moved towards the higher recurrence esteems as the convergence of filler increments. For the samples which have filler of high content, the behaviour of A.C conductivity can be clarified by means of conductive pathways which came from because of limitless clusters formation. The level reaction of A.C conductivity at these recurrence reaches can be related to the movement of electrons which are travel long distance inside the clusters without resistance. Indeed most conductors give a level reaction in a similar recurrence ranges ¹³. When the concentration of filler are low then the A.C electrical conductivity of the nanocomposite in a similar recurrence ranges ¹³. nanocomposite turns into a conductive substance. While when the contents of fillers are high, the size of the internal pathway will increase, this lead to decrease the contact obstruction between the nanocomposite; thus an upgraded electron conduction is accomplished bringing

about change of the protecting polymer to conductive polymer nanocomposite ¹⁴. the electrical conductivity of (PS-Cu) nanocomposites with the expanded with expanding grouping of nanocopper particles.

Table 1. The general properties of polystyrene

Isolation and Identification of Bacteria Isolated From Soil That Can Degrade 3 –Chloropropionic Acid

Wafaa Hassan Muslem¹, Roswanira Abdul Wahab², Fahrul Huyop³

¹Department of Biology, College of Science, Mustansiriyah University, Baghdad, Iraq, ²Department of Chemistry, Faculty of Science, Universiti Teknologi Malaysia, 81310 UTM Johor Bahru, Malaysia, ³Department of Biotechnology and Medical Engineering, Faculty of Biosciences and Medical Engineering, Universiti Teknologi Malaysia, 81310 UTM Johor Bahru, Malaysia

ABSTRACT

3-Chloropropionic acid (3-CP) belongs to the class of chlorinated monocarboxylic acid or β -chloro substituted haloalkanoic acid. However, it can be degraded into harmless substances by using both non-biological and biological pathways. For that particular reason, it will be interesting to investigate and study by isolation and identification a bacterial strain that could degrade 3-CP as its sole carbon source. A strain of dehalogenase producing bacteria capable of utilizing 3-CP was successfully isolated from soil sample of abandoned agricultural land. This bacterium was characterized by using 16S rRNA, current results of MEGA6 phylogenetic also supported the strain belongs to *Pseudomonas* sp. WH3 as well as biochemical analysis confirmed that the strain WH3 was *Pseudomonas* sp. so the characterization of the biochemical properties and 3-CP dehalogenation efficiency of the isolated microorganisms were successfully carried out. The bacteria grew well at 37°C in media containing 10 mM 3-CP but exhibited a rather slow doubling time of 20 h, utilization of 3-CP was confirmed by detection of chloride ion released using halide ion assay technique for the strain which indicate their ability to degrade 3-CP. with an optimum chloride ion release 0.186 $\mu\text{mol Cl}^-/\text{mL}$. Strain WH3 showed a 99% sequence identity to *Pseudomonas* sp.

Keywords: β -haloalkanoic acid, 3-chloropropionic acid, biodegradation, bioremediation, *Pseudomonas* sp.

INTRODUCTION

In recent time, rapid escalation of industrial and agricultural activities witnessed an excessive production of xenobiotic compounds and caused grave environmental concern. These man-made compounds are often described as non-naturally occurring chemicals¹. Such chemicals at high concentrations are responsible for environmental pollution unless inhibited. The contamination of water and soil that is caused due to the presence of xenobiotic substances requires remediation. Lately, degradation of hazardous wastes including xenobiotic compounds using microbes became a prominent route². It is needless to mention that some of these xenobiotic compounds are resistant to degradation. Studies revealed that specific microorganisms are not only capable of degrading such complexes but also remains resistant to such xenobiotics^{3,4}. In this regard, halogenated organic compounds are considered as

largest groups of xenobiotic compounds. They are known as prevalent pollutants. They are found in soil, air, water, and sediment. Halogenated organic compounds being extensively produced as industrial products are mostly used as herbicides, insecticides, fungicides, and solvents. Besides, they are considered as an important class of environmental pollutants. These halogenated compounds cause several human health problems due to its persistence, toxicity and hazardous metabolites⁵. Several studies are performed to isolate the bacterial species by enrichment and laboratory culture which used halogen-substituted organic acids as their carbon and energy resources (Janssen *et al.*, 2005). However, only a few organisms are found capable to degrade the β -halo carboxylic acid (β -HA)^{6,7}. The present work proposes the isolation of bacteria from soil taken from an abandoned agricultural land and characterizes them to determine their potency in degrading 3-CP.

MATERIALS AND METHOD

Sample Collection and minimal Media Preparation

The bacterial sample is collected from the agricultural soil (pesticides and herbicides exposed abandoned cultivation land). Collected soil is packed into sterile jars, sealed, and stored at 4 °C for further sampling as described hereunder. Minimal media contains the essentials ingredient materials suitable for the growth of bacterial species. This is necessary for heterotrophic microbial species, which uses carbon containing compounds (organic media) as a source of energy and carbon. Conversely, auxotroph organisms require nutritional agents in the minimal media to grow. Two types of minimal media are prepared such as liquid and solid.

Sample Processing and Purification

A soil sample of 10 g is suspended in 30 mL sterile distilled water and the mixture is left until the soil particles settled in the bottom. Then, about 0.1 mL of the soil suspension mixture is pipette out and spread on plates containing 10 mM of 3-CP. The plates are then incubated for 4 days at 31 °C to allow the bacterial growth. One plate with blank inoculation is incubated together with the other as control plate. The colonies that formed after incubation are carefully isolated and streaked onto the same type of minimal media plate via streak plate method. Streak plate method is continued until one pure colony is achieved.

Growth conditions

Following the protocol of Hareland *et al.* (1975),⁸ the liquid minimal media was prepared as 10X concentrated basal salts containing Dipotassium hydrogen phosphate 3-hydrate $K_2HPO_4 \cdot 3H_2O$ (42.5g/L), Sodium dihydrogen phosphate 2-hydrate $NaH_2PO_4 \cdot 2H_2O$ (10.0 g/L) and Ammonium sulphate $(NH_4)_2SO_4$ (25.0 g/L). The trace metal salts solution was a 10X concentrate that contained nitrioloacetic acid N $(CH_2COOH)_3$ (1.0 g/L), Magnesium sulphate $MgSO_4$ (2.0 g/L), Iron sulfate heptahydrate $FeSO_4 \cdot 7H_2O$ (120.0 mg/L), Mangan sulfate heptahydrate $MnSO_4 \cdot 4H_2O$ (0.03 mg/L), Zinc sulfate monohydrate $ZnSO_4 \cdot H_2O$ (0.03 mg/L) and chlorine hexahydrate Cobalt $CoCl_2$ (0.01 mg/L) in distilled water. Minimal media for growing bacteria contained 10 mL of 10X basal salts and 10 mL of 10X trace metal salts

per 100 mL of distilled water and were autoclaved (121 °C, 15 min). The carbon source, 3-CP was neutralised with NaOH and sterilised by filtration and added to the autoclaved salts medium to a final concentration of 10 mM. The extent of bacterial growth was determined by measuring the absorbance of the culture at 600 nm, the release of chloride ions from the degradation of 3-CP into the growth medium at 460 nm. Next, the cells were harvested by centrifugation ($10,000 \times g$ for 10 min at 4°C) during the mid-logarithmic phase and the cells were washed with 0.1 M Tris-acetate buffer (pH 7.5) and centrifuged again ($10,000 \times g$ for 10 min at 4°C). This step was repeated three times before the supernatant was decanted and the cells stored at -20°C until use.

Assays for Halide Ion

Measurement of free halide released during the dehalogenation reaction was carried out by an adaptation of the method of Bergman and Sanik (1957) in order to study the dechlorination activity. Sample (1 ml) was added into 100 µl of 0.25 M ammonium ferric sulphate in 9 M nitric acid (reagent A) and mixed thoroughly. To this was added 100 µl mercuric thiocyanate-saturated ethanol (reagent B) and the solution was mixed by vortexing. The colour was allowed to develop for 10 minutes and measured at A_{460nm} in a T60 UV/VIS spectrophotometer. Halide concentration was determined by comparison of the absorbance of the test sample against a standard curve of known concentrations of halide. The chloride ion released was defined as 1 mM chloride, equivalent to 1 µmole Cl⁻/mL. The chloride ions present in the solution caused the mercury thiocyanate salt to dissociate and the thiocyanate ion to bind Fe (III) which is absorbed intensely at A_{460nm} . Thus, the concentration of released Cl⁻ ions could be estimated.

Biochemical tests

In order to ascertain the identity of the isolate, detection of the morphological properties various biochemical tests were carried out: lactose fermentation MacConkey's, catalase, oxidase, citrate (Simmons), urease (Christensen's), and lactose, motility and gelatin liquefaction.

Molecular Analysis

The bacterial DNA is isolated using Promega Wizard® Genomic DNA Purification Kit following the recommended procedures and standard of the

manufacturer. Then the genomic DNA is amplified by polymerase chain reaction (PCR). A conserved region so called 16S rRNA gene in bacterial DNA is used to compare and determine species among many types of prokaryotic microorganisms. In this reaction, the universal PCR primer or near-universal primer is used to amplify the 16S rRNA gene because some are not picked up by certain new discovered archaea species. Following the protocol of Jing and Huyop (2007) ⁹ the above analysis is carried out. The forward primer (Fd1) has the nucleotide sequence of 5'-AGA GTT TGA TCC TGG CTC AG-3' while for the reverse primer it is 5'-ACG GCT ACC TTG TTA CGA CTT-3'. The total volume of each amplification reaction was 25 μ L which consisted of 12 μ L PCR master mix (Fermentas Inc. USA), 1 μ L template DNA, 1 μ L forward primer (Fd1), 1 μ L reverse primer (rP1), and 10 μ L nuclease free water. 16S rRNA Gene amplification was performed for 30 cycles whereby each cycle was set as an initial denaturation phase of 94°C for 5 minutes, followed by denaturation 94°C for 1 min, annealing 55°C for 1 min and final extension 72°C for 10 minutes. The PCR product was electrophoresed on an agarose gel (0.8%). For the sequencing reaction, the PCR product was purified using a QIAquick PCR purification kit prior to sequencing (1st Base Laboratory, Selangor). The sequence obtained was compared to other sequences in the public databases using the BLAST search program found in the National Center for Biotechnology Information (NCBI).

Phylogenetic Analysis of 16S rRNA Gene

The sequences of 16S rRNA are compared with the sequences deposited in the database using the BLAST. These sequences are aligned using the command of CULSTAL-W with the first 5 sequences from the BLAST result page. Later, phylogenetic trees are constructed using the neighbor-Joining method (10) with MEGA version 6.

RESULTES AND DISCUSSION

Isolation and Characterization of 3-CP Degrading Bacteria

The soil sample was obtained from the agricultural land. Bacterial colonies that grew in the selective media are screened and purified through series of randomly selected sub-culture. Ultimately, only two types of the bacterial colony are identified. Generally, these colonies are appeared after 2 days incubation at temperature of

37 °C under aerobic condition. The purified bacterium colonies are designated as WH3. These isolates formed Rod-shaped, white and creamy colonies for WH3 on 10 mM 3-CP minimal media agar (Figure 1). Table 1 summarizes the bacterial colony morphology of the bacterial strain WH3 found in the minimal media with 10 mM 3-CP. Pink-red appearance in the gram staining analysis revealed that the strain WH3 is a Gram-negative bacterium. Spore staining test is further carried out to determine the spore production of bacterium WH3. The complete absence of malachite green in the bacterial cell verified that strain WH3 is unable to produce spore. The cells are decolorized using water and safranin is used to stain the decolorized vegetative cells. Table 1 summarizes the results obtained using the biochemical tests which are compared with the Bergey's Manual of Systematic Bacteriology ¹¹. Normally, 16S rRNA gene sequences are insufficient to differentiate strains within a species.

Bacterial Growth Profile

Figure 2 displays the time dependent growth pattern of strains WH3 isolate for three different concentrations of 3-CP such as 10 mM, 20 mM, and 30 mM, respectively. In this experiment, the bacterial cultures are incubated using temperature-adjustable rotary shaker at optimum 37 °C with shaking speed of 200 rpm. The absorbance of the culture is measured at wavelength of 600 nm in every 6 hours interval.

Halide Ion Assay

The halide ion assay is performed to verify the ability of bacterial strain WH3 for degrading 3-CP, where the liberation of chloride ion is monitored. The concentration of chloride ion is determined by converting the absorbance value to μ mol/L. This conversion is based on a standard curve constructed using sodium chloride as a typical measurement of soluble chloride ¹². Figure 3 the amount of chloride ion released where the bacteria for both the strains are grown in 10 mM 3-CP. In addition, the liberation of chloride ions is monitored via the microbial assisted dehalogenation reaction ¹². The released chloride ions is allowed to react with mercury (III) cyanide to produce mercury (II) chloride by releasing the cyanide ions that subsequently reacted with ferric ion (Fe^{3+}) to produce the colored ferric thiocyanide complex. Detection of chloride ion that is released into the growth medium verified the utilization of 3-CP as a

carbon source.

Molecular Analysis

DNA Extraction and PCR Amplification of 16S rRNA Gene

DNA purification Kit (Promega, Wizard® Genomic DNA purification Kit, USA) is used to extract the genomic DNA from bacterial strains. The concentration of the isolated genetic material is determined by Nano-Drop analysis which is found to be ~ 300 ng/ μ L (for WH3). Gel electrophoresis images of the extracted DNA revealed the formation of a clear single band the strain. The strain WH3 is subjected to PCR amplification for determining the identifications of the genes and species as illustrated in Figure 4.

Sequencing and Analysis of 16S rRNA Gene

The PCR products of isolate WH3 is sequenced using 1st BASE ® Malaysia in which a total of 1500 bases for both strains sequenced and aligned with other species using BLASTn. For all the studied bacterial species, the 16S rRNA gene sequence is conserved within organisms. This also served as a target that provided the accuracy for identification of the bacteria. DNA of the direct wild type bacteria is extracted before performing the PCR reaction ¹³.

Phylogenetic Study

The 16S rRNA gene sequence of strain WH3 is compared with the nucleotide sequences from the Genbank database (NCBI) and alignment is made using ClustalW (version 1.6 from MEGA6) (Saitou and Nei, 1987). The Neighbor-joining phylogenetic tree is constructed using all identical bacteria from BLASTn. It is found that bacterium WH3 is designated as *Pseudomonas sp.* WH3. Figure 5. Towner and Cockayne (1993) ¹⁴ acknowledged that the molecular approach is traditional way to find a new genus/species. The 16S rRNA gene sequencing is particularly useful because it is present in all bacteria and serves as a universal target for bacterial identification. Moreover, it is highly accurate, reliable, and reproducible procedure ^{15,16}.

Figure 1. Growth on spread plate minimal media contains 10 mM 3-CP observed after 2 days (incubated at 37°C).

Table 1: Morphology, Characteristics and Results from biochemical tests of the bacterial colony of isolate WH3 grown in 10 mM of 3-CP minimal media

Characteristics	Strain WH3	Strain	WH3
Age of isolation upon observation	2 days	Oxidase	+
Size	Small, 0.7 ~ 1 mm	Catalase	+

CONCLUSION

In conclusion, this work, an indigenous bacterial strain *Pseudomonas* sp. WH3 capable of utilizing 3-CP as the sole source of carbon and energy was isolated from an abandoned agricultural land that had been extensively exposed to herbicides and pesticides. The class of β -halogenated degrading dehalogenases is greatly valuable in the bioremediation of environments polluted with the recalcitrant β -halogenated xenobiotic compounds.

Isotopes Inhalation Rate

Israa Kamil Ahmed

Information & Communication Department, College of Information Engineering,
Al-Nahrain University, Baghdad City, Iraq

ABSTRACT

The results of this research showed by measuring the radius of samples unprecedented mentioned that the metered rate of radioisotopes may be very fast in some of them and in the other medium or it may be slow Compared with the results (ICRP 60 119) where the results showed that the radius of the samples ranged between (0.963 μm _0. 145 μm) with energy⁹9.60E-9Sv / Bq-'1.20E-7Sv / Bq at inhaling rate too fast or medium or slow the inhalation of radioactive isotopes may be caused some diseases, the most serious is lung cancer .

Keywords: *inhalation Rate, NORM, TENORM, Heavy elements.*

INTRODUCTION

Human are continually exposed to ionizing radiation from natural sources. There are two main contributors to natural radiation exposures: high-energy cosmic ray particles incident on the earth's atmosphere and radioactive nuclides that originated from the earth crust and are present everywhere in the environment, including the human body. Humans are mainly exposed to radionuclides through ingestion and inhalation (internal exposure) and/or irradiation from external gamma rays emitted from the radionuclide (external exposure) ¹. Materials which may contain any of the primordial radionuclides or radioactive elements as they occur in nature, such as radium, uranium, thorium, potassium, and their radioactive decay products, that are disturbed as a result of human activities. However the concentration of NORM in most natural substances is so low that the risk is generally regarded as negligible. Higher concentrations may arise as a result of human activities. In most NORM, several or all of the radioactive isotopes of the three primordial decay series (²³⁵U, ²³⁸U and ²³²Th) are present in small concentrations

in the natural matrix. Irradiation of the human body from external sources is mainly by gamma radiation from radionuclides of the ²³⁵U, ²³⁸U and ²³²Th decay series and from ⁴⁰K. These radionuclides may be present in the body and irradiate various organs with alpha and beta particles as well as gamma rays (UNSCEAR, 2000; IAEA, 2005) ². Industrial activities such as oil and gas extraction, coal and peat fired power generation, phosphate industries, zircon/zirconium industry, production of titanium dioxide pigments, mining and processing of metals such as copper, gold, aluminum, etc. have been reported as potential sources of elevated naturally occurring radionuclides. The presence of NORM with elevated radionuclides concentrations could be an issue at any stage of an operation from the mineral feed stock, intermediate products, final products and the wastes generated during the process ³. Human activity involving the application of radiation is another source of radiation exposure to human. Some of these activities can give rise to an enhanced level of exposure from natural sources such as the discharge of radioactive materials into the environment from nuclear power plants, the global dispersion of radionuclide's from the nuclear weapon testing or the atmospheric fall-out from the nuclear reactor accidents at Chernobyl and the more recently Fukushima³. However, the main artificial source of the annual dose received by the worldwide population is the use of radiation for medical purposes. Some special groups of people who work in industrial medicine and research may be occupationally exposed

E-mail: esraa_nuc_med@yahoo.com.

to radiation used in their work. The average dose from occupational exposure is relatively small compared with the natural radiation exposure⁴. However, in the case of low doses, studies are inconclusive as to the effect from the exposure to low background doses. It is also important to add that much of the studies on the effect of exposure to radiation have been based on the studies of the health records of survivors of the Atomic Bombing in Hiroshima and Nagasaki and also based on studies on animals⁴. However, in the case of the low doses, it is assumed that exposure to background levels of natural radiation may lead to an additional risk of cancer, even though this has not yet been established. Some of the known effects resulting from radiation exposure are either damage to cells that are killed or modified. If the repair of the damage or modified cells is not perfect, the resulting modification will be transmitted to further cells and may eventually lead to cancer. The biological damage due to radiation exposure could lead to somatic stochastic effect or hereditary stochastic effects⁴. Radiation exposure has also been associated with most forms of leukemia and other types of cancers affecting various organs such as lungs, breast and thyroid glands. It is also worth noting that radiation-induced cancer may manifest itself decades after exposure. Radiation exposure also has the potential to cause hereditary effects in the offspring of persons exposed to radiation⁵. Heavy elements are generally defined as elements with relatively high densities, atomic weights, or atomic numbers. The criteria used, and whether metalloids are included, vary depending on the author and context. In metallurgy, for example, a heavy metal may be defined on the basis of density, whereas in physics the distinguishing criterion might be atomic number, while a chemist would likely be more concerned with chemical behavior. More specific definitions have been published, but none of these have been widely accepted. The definitions surveyed in this article encompass up to 96 out of the 118 known chemical elements; only mercury, lead and bismuth meet all of them. Despite this lack of agreement, the term (plural or singular) is widely used in science. A density of more than 5 g/cm³ is sometimes quoted as a commonly used criterion and is used in the body of this article⁶. The earliest known elements common elements such as iron, copper, silver, gold, and platinum., light elements, such as magnesium, aluminum, and titanium, were discovered, as well as less well-known heavy elements including gallium, thallium, and hafnium. Some heavy elements are either essential nutrients (typically

iron, cobalt, and zinc), or relatively harmless (such as ruthenium, silver, and indium), but can be toxic in larger amounts or certain forms. Other heavy elements, such as cadmium, mercury, and lead, are highly poisonous. Potential sources of heavy elements poisoning include mining, tailings, industrial wastes, agricultural runoff, occupational exposure, paints and treated timber⁶. Physical and chemical characterizations of heavy elements need to be treated with caution, as the elements involved are not always consistently defined. As well as being relatively dense, heavy metals tend to be less reactive than lighter elements and have much less soluble sulfides and hydroxides. While it is relatively easy to distinguish a heavy metal such as tungsten from a lighter metal such as sodium, a few heavy elements, such as zinc, mercury, and lead, have some of the characteristics of lighter metals, and, lighter elements such as beryllium, scandium, and titanium, have some of the characteristics of heavier elements. Heavy elements are relatively scarce in the Earth's crust but are present in many aspects of modern life. They are used in, for example, golf clubs, cars, antiseptics, self-cleaning ovens, plastics, solar panels, mobile phones, and particle accelerators^{7,8}.

Inhalation Rate

Inhalation Rate

The inhalation rate is the rate at which breathing occurs. This is usually measured in breaths per minute and is set and controlled by the respiratory center. The inhalation rate in humans is measured when a person is at rest and involves counting the number of breaths for one minute by counting how many times the chest rises⁹. Ambient and indoor airs are potential sources of exposure to toxic substances. Adults and children can be exposed to contaminated air during a variety of activities in different environments. They may be exposed to contaminants in ambient air and may also inhale chemicals from the indoor use of various sources (e.g., stoves, heaters, fireplaces, and consumer products) as well as from those that infiltrate from ambient air. The Agency defines exposure as the chemical concentration at the boundary of the body (U.S. EPA, 1992). In the case of inhalation, the situation is complicated by the fact that oxygen exchange with carbon dioxide takes place in the distal portion of the lung. The anatomy and physiology of the respiratory system as well as the characteristics of the inhaled agent diminishes the

pollutant concentration in inspired air (potential dose) such that the amount of a pollutant that actually enters the body through the upper respiratory tract (especially the nasal-pharyngeal and trachea-bronchial regions) and lung (internal dose) is less than that measured at the boundary of the body. A detailed discussion of this concept can be found in Guidelines for Exposure Assessment [9, 10] Various other methods to measure inhalation rate are commonly used, including impedance which is commonly implemented in patient monitoring. In addition novel techniques for automatically monitoring respiratory rate using wearable sensors are in development, such as estimation of respiratory rate from the electrocardiogram, photoplethysmogram and accelerometers signals. Nonetheless inhalation rate is widely used to monitor the physiology of acutely-ill hospital patients. It is measured regularly to facilitate identification of changes in physiology along with other vital signs. This practice has been widely adopted as part of early warning systems. Inhalation depends on pressure gradients between the lungs and atmosphere, as well as the muscles in the thoracic cavity. The mechanics of breathing follow Boyle's Law which states that pressure and volume have an inverse relationship. The process of inhalation occurs due to an increase in the lung volume (diaphragm contraction and chest wall expansion) which results in a decrease in lung pressure in comparison to the atmosphere; thus, air rushes in the airway 10,11. The lung is protected by layers of tissue referred to as the visceral pleura and parietal pleura; the intrapleural space contains a small amount of fluid that protects the tissue by reducing friction. The relationship between gas pressure and volume helps to explain the mechanics of breathing. Boyle's Law is the gas law which states that in a closed space, pressure and volume are inversely related. As volume decreases, pressure increases and vice versa. When discussing the detailed mechanics of breathing, it is important to keep this inverse relationship in mind. The thoracic cavity, or chest cavity, always has a slight, negative pressure which aids in keeping the airways of the lungs open. During the process of inhalation, the lung volume expands as a result of the contraction of the diaphragm and intercostal muscles (the muscles that are connected to the rib cage), thus expanding the thoracic cavity. Due to this increase in volume, the pressure is decreased, based on the principles of Boyle's Law. This decrease of pressure in the thoracic cavity relative to the environment makes the cavity pressure less than the atmospheric pressure. This pressure gradient between

the atmosphere and the thoracic cavity allows air to rush into the lungs; inhalation occurs. The resulting increase in volume is largely attributed to an increase in alveolar space because the bronchioles and bronchi are stiff structures that do not change in size. Inhalation and exhalation during this process, the chest wall expands out and away from the lungs. The lungs are elastic; therefore, when air fills the lungs, the elastic recoil within the tissues of the lung exerts pressure back toward the interior of the lungs. These outward and inward forces compete to inflate and deflate the lung with every breath. Upon exhalation, the lungs recoil to force the air out of the lungs. The intercostal muscles relax, returning the chest wall to its original position. During exhalation, the diaphragm also relaxes, moving higher into the thoracic cavity. This increases the pressure within the thoracic cavity relative to the environment. Air rushes out of the lungs due to the pressure gradient between the thoracic cavity and the atmosphere. This movement of air out of the lungs is classified as a passive event since there are no muscles contracting to expel the air. Each lung is surrounded by an invaginated sac. The layer of tissue that covers the lung and dips into spaces is called the visceral pleura. A second layer of parietal pleura lines the interior of the thorax. The space between these layers, the intrapleural space, contains a small amount of fluid that protects the tissue by reducing the friction generated from rubbing the tissue layers together as the lungs contract and relaxes 12. If these layers of tissues become inflamed, this is categorized as pleurisy: a painful inflammation that increases the pressure within the thoracic cavity, reducing the volume of the lung.

MATERIALS AND METHOD

After collecting fly ash samples in this year(2018) from thermal power stations in the middle and south of Iraq then all the samples were taken to the laboratory to determine the radius by (AFM) Atomic Force Microscope as we saw in fig (2) , we can see the results in one samples in (fig 3 & table 1) then after measurements It is observe that all the samples radius Does not exceed (1 μ m) with specific energy and after compare it with the result setting by (ICRP) ¹² for all radionuclide's and heavy elements in the samples we obtained that the inhalation rate it will be fast or medium or slow and will be the main reason In some Dangerous diseases, especially lung cancer.

RESULTS AND DISCUSSION

In table (1) we noticed that the Diameter in S1 (0.3647) S2 (0.3988) S3 (0.35551) S4 (0.27286) μm with specific energy and specific inhalation rate always fast [12, 13]. In table (2) we noticed that the Diameter in S1 is (0.9636) μm and S2 (0.14515) S3 (0.45273) and S4 (0.23153) and S5 (0.73939) S6 (0.23969) S7 (0.36293) S8 (0.4116) S9 (0.49096) μm with specific energy and specific inhalation rate may be fast or medium or slow based on diameter ¹².

Table 1. Inhalation rate in NORM and TNORM

Code No	NORM and TNORM	e(Sv/Bq)	Type

Multivariate Analysis of Toxic Heavy Metals Contents in Soil Detected by Laser Induced Breakdown Spectroscopy

Tagreed K. Hamad¹, Aseel S. Jasim², Hussein T. Salloom², Alaa J. Ghazai¹

¹ Department of physics, College of Science, Al-Nahrain University, Baghdad, Iraq, ² Al-Nahrain Nanorenewable Energy Center, Al-Nahrain University, Baghdad, Iraq

ABSTRACT

Concentrations of Cr, Pb, Cu, Zn, Cd and Ni in soil samples gathered from different cities in Iraqi were estimated via laser induced breakdown spectroscopy (LIBS). A total of 14 composite soil samples were collected at depths 0-10 cm, including green areas, urban parks and industrial residential districts. Qualitative and quantitative analysis of the samples were achieved by using the locally developed LIBS set up equipped with Q-switched Nd:YAG laser and optical spectrum analyzer. To validate the analysis results, Atomic absorption spectrometry (AAS) was used to analyses the samples as well. PCA was utilized to identify possible sources of detected metals. Concentrations of heavy metals (HMs) in samples were found to decrease with increasing of the distance of the communities from the pollution sources. The results of the multivariate analysis showed Cr, Cu, and Ni concentrations is controlled by gas stations, while Pb, Zn, Cd, and Mn in examined soil are mainly affected by deposits from cement factories. The lowest concentrations of heavy metals were observed in agricultural areas far from the main sources of contaminations.

Keywords: Toxic heavy metal; Multivariate analysis; Soil; Laser induced plasma.

INTRODUCTION

Heavy metals (HMs) assigned as that metallic elements with an atomic weight greater than iron (55.8 g/mol) having specific gravity about five times the specific gravity of water (1 g/cm³ at 4°C) ^{1,2}. Although trace amount of some HMs are necessary for good health, daily exposure to heavy metals contaminates food, water, soil and affects air quality ^{3,4}. The common sources of HMs are cement factories, medical and chemical laboratories, traffic, electrical generation stations, production and refining oil stations, and waste disposal sites etc... ^{5,6}. These activities spread throughout big cities like Baghdad. Conventional chemical analysis, including X-ray fluorescence spectroscopy (XRF), inductively coupled plasma spectrometry (ICPS), atomic absorption spectrometry (AAS), was an effective method for studying the elemental

composition of different soil, which was high-cost and time-consuming ⁷. Great progress has been made on development analytical methods to facilitate rapid and reliable chemical analysis. Laser induced breakdown spectroscopy (LIBS) has been considered a key role for soil chemical analysis depending on its unique features ⁸, such as in situ and in real time, multi-element detection for various material, not need for sample preparation steps ⁹. More importantly, LIBS technique has been used for the qualitative and quantitative analysis by the calibration curves and by the calibration free (CF) methods. The composition of the unknown samples is estimated in CF method by comparing the emission line intensity from the calibration curves. On contrary, in CF-LIBS method, no need reference samples or calibration curves it relies on analysis of plasma parameters. In this study, Heavy metals concentration in various soil samples from different Iraqi cities has been investigated based LIBS method for direct qualitative and quantitative measurements. The experimental results were compared to those of measured using conventional technique. Moreover, principal component analysis (PCA) was used to discriminate the examined soil according the heavy metals contents. When short pulsed laser with

E-mail: tagreed_k@yahoo.com

irradiance about (10^9W/cm^2) is focused on the surface of the sample, laser ablation occurs due to remove a portion of samples by melting, fusion, evaporation, ionization and finally plasma generation¹⁰. Once laser pulse ends, the plasma continues its expansion compressing the surrounding media and generating shockwaves. The surrounding media will influence the final plasma size, the speed of the expansion and the emission properties of the plasma. After plasma formation and continuum emission, ions and neutral atoms will emit discrete lines having characteristic wavelength; shape and intensity. An electronic transition that determine the wavelength of emitted line is given by:

$$h\nu_{12} = \frac{hc}{\lambda_{12}} = E_2 - E_1 \quad (1)$$

The time elapsed for laser produced plasma is ranged from a few tenths of nanoseconds to a few milliseconds. During laser produced plasma process, the ionic lines are seen first, then the atomic lines and finally molecular spectral emission lines. The gate width and the delay after laser impact are important criteria depending on what is to be analyzed¹¹.

For the LIBS quantitative analysis relation between intensity I_{ik} of spectral line and number density of species N_s is used:

$$I_{ik} = F_C N_s A_{ik} g_k \frac{e^{-E_i}}{U_s(T_e)} \quad (2)$$

Where F_C is the factor taking into account efficiency of detection system, A_{ik} is transition probability is the degeneracy, T_e is electron temperature and U_s partition function at given temperature. A plot of intensity I_{ik} as a function of elemental concentration N_s yields the calibration curve. From the linear relation between LIBS intensity and concentration, the unknown concentration of particular element can be determined provided that the other experimental parameters keep unchanged.

Experimental part

Q-switched Nd:YAG laser provides pulses of 9 ns duration at 532 nm is focused on the surface of a sample with maximum pulse energies of 150 mJ/pulse as shown in Fig.1. Light emissions collected by a 2.0

m multimode fiber with core diameter of 200 μm . which coupled to a spectrometer coverage from 200 to 1100 nm. ThorLabs OSA software was utilized to illustrate the data of recorded spectra on computer. Soil samples are pressed to dics of 8.0 mm diameter and thickness of 4.0 mm. For determination of HMs in soil, the LIBS system was calibrated by measuring the spectral intensity at the most intense wavelength of that element with reference to the corresponding data obtained by AAS analysis.

RESULTS AND DISCUSSION

After optimizing the LIBS parameters for maximum signal intensity, spectra of 14 soil samples were recorded over a 240–280nm and 380–480nm wavelength range for qualitative and quantitative analysis. The LIBS spectra for soil sample (S1) were plotted and are depicted in Figs. 2 and 3 respectively. Here, the emission spectra of elements under investigation were recorded to find the most sensitive lines of neutral and/or ionized state of each element. The elements of toxic nature like chromium, copper, nickel, lead, zinc, magnesium and cadmium are detected. In this work, calibration curves for each element were constructed based on soil samples with known element concentration determined by AAS measurements. The intensity of LIBS signals was plotted as a function of the AAS determined concentrations of the heavy metals Cr, Cu, Ni, Pb, Zn, Mn and Cd in different soils. All assigned elements present in sample 2, the wavelengths, and the concentration detected with LIBS set up and with standard method AAS are tabulated in Table 1. The concentrations of HMs measured by LIBS are found to be close to that measured by AAS. Relative errors were in the range of 2.8–6.9%. This indicates the potential of LIBS as an extremely valuable technique for environmental analysis. It is worth mentioning that the concentration of these toxic elements detected in this work exceeds the safe permissible exposure limits¹². A mutual correlation analysis amongst all elements can be observed in Table 2. these correlations between the elements done at 95% significance level, It is worth to point out high positive correlations between Ni and Cu (0.97), Ni and Cr (0.89) suggesting a possible similar source of industrial waste for them. Cd and Zn; Cd and Pb show very high positive correlations of (0.91) and (0.848) as compared to the other heavy metals confirming their common source. On the hand, there are many important correlation coefficients between metals in all sampling points like Mn vs Pb and Zn (0.78, 0.73 respectively). Fig. 4 displays the PCA score-

plot obtained from the data to get an idea of how the soil samples resemble each ¹³. Utilizing the first two components that represent about 90% of the variance, some of the HMs correlated along the sample set which illustrate that their concentrations varied similarly. Depend on this, two groups could be described. The first component suggested a good correlation among Cr, Cu, and Ni, and among Pb, Zn, Cd and Mn. Similar trend was noticed from Pearson correlations mentioned above. Also, the samples are clusters in three separated groups suggesting definitive chemical correlations between soil samples. The first group (S1, S2, S3, 43 and S5) which represent sites near the cement factories polluted by heavy metals like Pb, Zn, Cd and Mn owing to the emission of dust and gasses during combustion process. On the other hand, the second group comprises (S6, S7, S8, S9 and S10) ; it represents commercial areas having high concentrations of (Cr,Cu,Ni) and suffering from high traffic motion and gas stations. The last group (S11, S12, S13 and S14) represents the agricultural areas having the lowest values of Heavy metals in comparison with the other two groups.

Cd	0.37	0.34	0.02	0.84	0.91	0.77	1

CONCLUSION

The results of this study proved the capability of LIBS technique for direct and multi-elements quantitative analysis of heavy metal in soil. With locally developed LIBS experimental set up 14 soil sample were examined, seven elements (Cr, Cu, Ni, Pb, Zn, Mn and Cd) were analyzed simultaneously. Calibration curves for each element were constructed based on soil samples with known element concentrations determined by AAS measurements. Some of studied heavy metals is accumulated to some extent compared with background values and there are many high mutual correlations between them. On the other hand, multivariate analysis is found to be an important tool to identify the main factors determining the variability of heavy metal data. Variation of Cr, Cu, and Ni concentrations is controlled by high traffic motion and gas stations, while the concentrations of Pb, Zn, Cd, and Mn in examined soil are mainly affected by aerial deposits from cement factories.

Seed Layer Thickness Effect on the Structural and Optical Characterization of TiO₂ Nanostructure Thin Film

Adel H. Omran Alkhayatt¹, Hussein Ahmed Hussein²

¹Faculty of sciences, University of kufa, Iraq, ²Faculty of sciences, University of kufa, Iraq

ABSTRACT

In this research Titanium dioxide (TiO₂) nanostructure thin films have been prepared by chemical bath deposition method on a deferent thickness of seed layer (1,2 and 3)layers which deposited by sol-gel spin coating technique. Structural and optical characteristics were investigated as a function of the seed layer thickness using x-ray diffraction and UV-Vis spectrophotometer. The results showed that the TiO₂ thin films have a polycrystalline structure in nature with anatase phase and tetragonal crystal structure. The dislocation density, the number of crystallite and the strain of the prepared films were also investigated. The optical properties results showed that the thin film transmittance decrease with increasing the thickness of the seed layers, where the transmittance highest value was in the visible region about 53% at wave length 531 nm. The increasing of number of seed layers that lead to increase the thickness of the seed layer and the thin film which leads to increase the films absorbance. The energy band gap of allowed direct transition was decreased with the increase of the number of seed layers (thickness) from 3.378 eV to 3.067 eV with increase the thickness from 105.7nm to 156.6 nm for one layer and three layers respectively.

Keywords: Nanostructure TiO₂; Thin films; CBD, Sol-Gel spin coating,; band gap.

INTRODUCTION

During the last decades Titanium dioxide (TiO₂) attractive enormous attention in the experimental investigation and in wide range of applications due to their optical and electronic properties and chemical stability¹⁻². Titanium dioxide TiO₂ have three phases of crystal structure Brookite, Anatase and Rutile¹⁴⁻⁷, with wide band gab about (3.02, 3.2) eV for Rutile and Anatase^{1.3}. In public too many researchers have studied on photodiodes and concentration heterojunctions because it effect shows the ultimate performance of the junctions. TiO₂ nanostructure show more surface properties (larger and rougher) areas than thin films^{8,9}. Titanium dioxide is very important semiconductor due to its properties [high refractive index, high yong modulus, high hardness, high dielectric constant, excellent mechanical strength, high UV absorption, high chemical stability, high visible reign transmittance⁴⁻⁷. There are

too many applications for titanium dioxide as a research material such as dye sensitized solar cells (DSSC)¹⁰, photo catalysis¹¹, UV detectors¹² and gas sensor¹³. So there is a very wide of application fields for Titanium dioxide as a commercial production has been used as sunscreen, paint, pigment, ointment, toothpaste ...etc². For deposition of Nanostructure TiO₂ thin films there are several methods such as chemical vapor deposition¹⁴, hydrothermal¹⁵, sol - gel¹⁶, thermal evaporation¹⁷, chemical bath deposition¹⁸, Dc magnetron sputtering¹⁹, spray pyrolysis,²⁰. Within these methods, the chemical deposition methods are comparatively inexpensive as compared to physical deposition methods, where the deposition area is large with low temperature and low cost process. Chemical bath deposition method (CBD) is a simple and low-cost process for deposited TiO₂ nanostructure thin film with controllable morphology²¹⁻²³. The sol-gel spin coating method has a number of advantages over conventional methods, such as low cost process, low temperature process; the film surface topography is control, composition control, and large coating area. Where it is an important technique for the deposition of TiO₂ thin films²⁴.

MATERIALS AND METHOD

Substrate cleaning

Glass substrate was cleaned by (RCA) method (radio corporation of America) by immerge the substrates for 15 min in (1:30) in ultrasonic bath for each of:

(HCL: DI water), b. (acetone: DI water) and c. (ethanol: DI water).

Preparation of titanium tetrabutoxide (TTB)

One portion of titanium (IV) chloride (BDH company) (TiCl₄) was react with four portion of butanol. Titanium (IV) chloride was put into round three neck flask. Butanol have added drop by drop with application of the magnetic stirrer without heating, the separating funnel adjusted to the addition of butanol drop by drop simultaneously till the end of the period (disappearing of the fog), an oiled yellow solution were obtained.

Preparation of sol - gel

0.35ml of (TTB) add to 10ml of ethanol then 2ml of acetic acid have added to the solution then stirrer for 1h and left for 24h at room temperature. A homogenous transparent solution was obtained as shown in the following equation:

Deposition of TiO₂ seed layer

The spin coater (MTI , VTC-100, vacuum spin coater) has been used to coating substrates by aged sol by cast it on substrate drop by drop then the substrate were coated with fixed spin speed of 3000 rpm for 30s and initial speed 500 rpm for 10s then dried in air at room temperature. The samples was annealing At 500 °C for 30 min.

Growth of TiO₂ nanostructure thin films

TiO₂ nanostructure thin films were prepared using CBD method by adding 50 ml of de ionized water (DI water) to 4ml of titanium (III) chloride (15% solution in hydrochloric acid) TiCl₃ (Riedel-de Haen). pH have adjusted by using urea 0.1M (NH₂)₂CO to 0.7. The solution were stirrer for 1h at room temperature, homogeneous ultraviolet solution were obtained. The glass seeded layer were immersed in the solution vertically at 55 °C for 2h and the samples dried in air

at room temperature and then annealed at 550 °C for 1h

RESULTS AND DISCUSSION

Structure properties

The crystal structure of the prepared TiO₂ nanostructure thin films synthesized on seeded glass at different thickness were investigated. The X-ray diffraction (XRD) pattern of the deposited TiO₂ thin films on 1, 2 and 3 seed layers are shown in figure (1). From the figure the crystal structure of TiO₂ thin films was polycrystalline structure in nature and has anatase phase with tetragonal structure, the TiO₂ films with 1,2 and 3 seeded layers reveals good agreement with TiO₂ anatase phase, and well matches with JCPDS card no.04-0477. It was observed that there were four peaks absorbed at 2θ = (25.46, 36.620, 48.224 and 62,241) which belong to (101), (103), (200) and (213) plans as shown in Table (1). The preferred orientation was along (101) plane for anatase TiO₂ nanostructure. All samples show low crystallinity with relatively constant peaks intensity at different number of seed layers number and thickness.

Lattice constants a and c of the tetragonal structure were calculated using the following formula:

$$\frac{1}{d^2} = \frac{h^2 + k^2}{a^2} + \frac{l^2}{c^2} \dots \dots \dots (1)$$

The lattice constants calculated for TiO₂ nanostructure thin films are close to the standard value of anatase phase according to JCPDS card no. 04-0477card.

The average crystalline size D of TiO₂ nanostructure has been calculated with the well-known Scherrer's equation:

$$D = \frac{k\lambda}{\beta \cos \theta} \dots \dots \dots (2)$$

Where k is the shape factor (0.94), λ is the X-ray wavelength and β is the fill width at half maximum FWHM of the diffraction peak in radians, and θ is the Bragg angle. The crystallite size of TiO₂ nanostructure thin films deposited one seeded layer was 15.56 nm, it

was decreases to 12.69 for the deposited film on two seeded layers (thickness increases) as shown in figure (1). The decrement of the crystallite size with the increase of seeded layer number attributed to the nucleation process and by the variation in the nucleation centers density of TiO₂ films with the increase of its thickness. The increment of nucleation centers density lead to the growth of crystallites with a smaller size. The increment of grain size (12.69-15.75)nm for TiO₂ film deposited on three seeded layers can be attributed to the decreases in the grain boundaries by considering the merging process induced from thermal annealing and the enhanced of the crystal quality of the film [29,30]. The micro-strain was calculated using the following relation :

$$\varepsilon = \frac{\beta \cos \theta}{4} \dots \dots \dots (3)$$

The micro strain decreases with the increase of the number of the seeded layer and the film thickness, which leads to decrease in the lattice defects (dislocations) concentration due to the increase in the crystallite size. The dislocation density has been calculated using the following relation:

$$\delta = \frac{1}{D^2} \dots \dots \dots (4)$$

The dislocation density, δ of TiO₂ films deposited on different number of seed layers which is defined as the number of dislocation lines per unit volume, it represents the density of the lattice defects, and it increase with the increase of the grain boundaries (decrease of crystallite size) as a dislocations defect centers and decreased with the increase of the crystallite size.

The number of crystallites per unit surface area (N) could be determined according to:

$$N = \frac{t}{D^3} \dots \dots \dots (5)$$

Where (t) is the film thickness, the number crystallites (N) depends on the variation of crystallite size and film thickness. The values of crystallite size, micro strain, dislocation density and the number of crystallite are tabulated in Table (1).

Optical properties

The absorbance spectra of TiO₂ nanostructure thin films deposited on different thickness of TiO₂ seed layer are shown in figure (2). The absorbance was increases with the increase of TiO₂ seed layer thickness and the nanostructure films have higher absorbance at the short wavelength below 400 nm in the UV region, which is the property of anatase phase. It can be attributed to the increase of the number of atom layers with thickness leads to increase of the density of states within the band gap. Therefore the electrons requires low energy to transfer from valance band V.B to conduction band C.B and the interaction between the incident photons and the material atoms will occur and the absorbance will increase where the absorbance is thickness dependence. Transmittance is inversely proportional with thickness. This behavior can be attributed to the increasing of TiO₂ seed layer thicknesses which lead increase the atoms layer number and thus the optical transmittance is decreased because most of the photons have been absorbed by atoms as shown in figure (3).

The absorption coefficient α can be calculating using the equation:

The optical energy gap E_g can be calculated using

$$\alpha = \frac{2.303 A}{t} \dots \dots \dots (7)$$

Tauc equation:

$$\alpha h\nu = B(h\nu - E_g^{op})^r \dots \dots \dots (8)$$

Where E_g the energy gap for the direct transitions, B is the constant depended on type of material, r is the exponential constant; its value depended on type of transition and r =1/2 for the allowed direct transition. It can be obtained by plotting $(\alpha h\nu)^2$ versus $(h\nu)$ extrapolating the straight line portion of this plot to the energy as shown in the figure (5) for the allowed direct electronic transition.

CONCLUSION

TiO₂ seed layer thin films were prepared by the sol-gel spin coating method on glass substrates and grown by chemical bath deposition. The structural and optical properties of the films were studied as a function of the number of layers. The XRD patterns of the TiO₂ films reveal the existence of a TiO₂ single-phase with the anatase crystal structure. The XRD patterns consist of a (101) main peak, which is due to TiO₂ crystals that grown along the c-axis. The film thickness was increase with the number of layers. The crystallite size and optical band gap decrease with the number of layers. The decrease in the crystallite size is attributed to the difference in nucleation center densities in films with different thicknesses. The decrease in the optical band gap is attributed to the formation of a non-stoichiometric material with increased oxygen vacancies by increasing the film thickness. The film is suitable to be windows of solar cell. But absorbance (A) is high at short wavelength, therefore; the film is good to be photo detector at Ultra-Violet range.

ABSTRACT

Medicinal plants are documented as supplies of usual antioxidants that can defend biological tissues from oxidative damage. In current study, the antioxidant status and antibacterial activities of gold nanoparticles (AuNPs) that synthesised by utilizing *Mentha pulegium* were estimated. Gold nanoparticles (AuNPs) have many potential applications in biomedical and biochemical subjects due to their high biocompatibility and properties and permanency. Chemical reduction activity of plant extract of *Mentha pulegium* in the synthesis of gold nanoparticles was examined employing UV/visible spectrophotometry, X-ray diffraction (XRD), and Scanning electron microscopy (SEM). Antioxidant activities were determined by using 1,1-diphenyl-2-picrylhydrazyl and cuprac methods. The antioxidant activities of gold nanoparticles (AuNPs) prepared by utilizing *Mentha pulegium* were elevated. This may be because the high concentrations of the chemical active compounds of *Mentha pulegium* species that dissolved in the methanol. *Mentha pulegium* was established to exhibit strong potential for rapid chemical reduction of gold ions. The synthesized gold nanoparticles (AuNPs) exhibited promising antibacterial activity on *Escherichia coli* and *Staphylococcus aureus*. The antibacterial activity was obtained for all the strains using methanolic extract synthesized gold nanoparticles (AuNPs). Overall results showed high potential of *Mentha pulegium* extract to synthesize high quality gold nanoparticles (AuNPs) for biomedical and biochemical applications.

INTRODUCTION

Nanotechnology is one of the most important area of investigation in modern biomaterials science, because of its contemporary applications and have developed promptly as one of the most promising multidisciplinary topic of biosciences which involves various fields of bioscience and biotechnology ranging from advanced materials, agricultural, biomedical, electronics, chemical science, environmental, pharmaceutical, information technology and textile as well as to create new applications in nano-medicine and biotechnology. The smaller size that associated with high surface of

nanoparticles are the key elements which make them dependable to biomedical and biological fields, due to its drug carrier properties¹. Nanoparticles are have been exhibiting high drug loading and releasing capacity, low toxicity and ability to target malignant cells, consequently it is suitable for therapeutic applications². AuNPs have many potential applications in biomedical and biological fields due to their distinct surface plasmon properties, high biocompatibility, and stability³. Colloidal GNPs have been suggested for diverse biomedical and biochemical applications because of its electronic and optical properties and exceptional surface⁴. Synthesis of gold nanoparticles using plant extracts are valuable than other biological and biochemical processes because their appropriately for large-scale production. Presently, green nanotechnology is reasonably new, the full scope of scientific development in the field of human health care products⁵. Plant-derived compounds have been recognized as promising agents and it was effectively converted to marketable drugs. Medicinal plants such

as *Mentha pulegium* is utilized because of its biological and pharmacological properties⁷. *Mentha pulegium* L. that has been identified and used since ancient times is a species of *Mentha*. This species is used in folk medicine as antitussive, digestive, abortifacient and antiseptic⁸⁻¹⁰. This herb is also consumed for diabetes¹¹.

MATERIALS AND METHOD

Materials

Neocuproine hydrochloride monohydrate was obtained from BDH, Chloroauric acid, DPPH (1, 1 Di-phenyl picrylhydrazyl) were obtained from Sigma-Aldrich Chemicals. Mueller Hinton Agar (MHA) was obtained from Hi-Media. Leaves of *Mentha pulegium* L. were collected from Alraranjia farms, south of Hilla City, Iraq. All glass wares were sterilized by autoclave before using.

Preparation of plant extract and synthesis of gold nanoparticles

Leaves of Iraqi *Mentha pulegium* were cut into small pieces, diced in a blade blender and 5g of leaves were heating stirrer 50-70 °C with 100 mL of double distilled water (DDW) and twice 70% methanol for 10-15 min and it was filtered using Whatman No. 1 filter paper and kept in freeze. Synthesis of gold nanoparticles were done by reducing 1mM or 1.0g/L of chloroauric acid (10 mL) with (750µL) of *Mentha pulegium* extract at 70 °C slight heating for several minutes was necessary until GNP formation was observed by the appropriate color change to a deep red or purple color indicator of gold Nano particle product .

Purification of gold nanoparticles: The final product of phyto-reduced sample was treated with acetone (1:4 proportion). The resulted product was undergoe aggregation that can then be removed by redispersion after cold centrifugation. The achieved pellet was washed and re-dispersed in sterile (DDW) to produce nanoparticles free from biochemical constituents¹³

Characterization of Nanoparticles

UV-vis spectral analysis: The formation of golden nano-particles was monitored by measuring the UV-vis spectrum after diluting a small aliquot of the sample with (DDW) and a spectrum was read at a wide range of 200 to 800 nm (spectrophotometer (Shimadzu 1800)).

The free radical scavenging activity (DPPH assay): The ability of the AuGNPs to scavenge the stable free radical was evaluated by the method of Leong & Shui^{13,14}. Briefly, a 0.1mM solution of DPPH in methanol was prepared. An aliquot (20-100 µL) of AuGNPs was added to 3 mL of methanolic DPPH solution. Methanol alone used as blank and DPPH in methanol without AuGNPs served as positive control. After 30 minutes of incubation, the discoloration of the purple color was measured at 517 nm and radical scavenging activity was calculated as follows:

$$\text{FRSA} = [(A_c - A_s) / A_c] \times 100$$

Where A_c is the absorbance of the control and A_s is the absorbance of the tested sample after 60 min.

Neocuproine Copper Antioxidant (BCA) Assay¹⁶

The sample or standard acts to reduce Cu^{++} to Cu^+ is combined action of the antioxidants. Reduced copper will selectively appearance a 2:1 complex with the neocuproine chromogenic reagent. The complex product has an absorption maximum at~450nm. A known concentration of Trolox is used to produce are reference standard curve to compare those absorbance obtained by the samples.

Assessment of antibacterial activity

Two bacterial isolates (*Escherichia coli* and *Staphylococcus aureus*) have been used to assess the antibacterial activities of green synthesized AuNPs by using Agar well diffusion method¹⁷. Mueller Hinton Agar plates were incubated with 100 µL of standardized culture (1.5×10^8 CFU/ml) of each bacterium (in triplicates) and spread with sterile swabs. 6 mm wells were made using sterile corn borer and different aliquots were added into the wells. Three concentrations of the gold nanoparticles were loaded on marked wells by using a micropipette under aseptic conditions. After incubation for 24 h at 37°C, the plates were observed. Zone of inhibition was measured and expressed in millimeters as well as the average diameter of inhibition zone was taken for estimating the antibacterial activity of the gold nanoparticles.

RESULTS AND DISCUSSION

UV spectrophotometry study

The bio-reduction of the Au^{2+} to Au^0 continues progressively after the addition of *Mentha pulegium* leaf extract to chloroauric acid (HAuCl_4) solution. The bioreduced Au was produced a purple colored solution (Fig.1c) which is characteristics of gold nanoparticles. This specifies the green route to the reduction of gold ions and stabilization of gold nanoparticles formed. The SPR band of smaller nanoparticles shifts to smaller wavelengths, which is called blue shift, and the SPR band of the larger nanoparticles shifts to higher wavelengths which is called the red shift. XRD of Phillips PW 1830 instrument working data voltage of 40 KV and current of 20 mA with Cu-K radiation was used for creation of bioreduced gold nanoparticles in the current study (as shown in figure 1). The obtained results from XRD patterns of the synthesized AuNPs exhibited four peaks at 2θ values around 39.01° , 46.48° , 64.69° and 77.62° . Appearance of these peaks confirms the crystalline structure of the synthesized AuNPs. This structure is agreed with the basis of the face centered cubic (fcc) structure of the synthesized AuNPs as shown in figure (2). The average particle size of the synthesized AuNPs was calculated by using Scherer's equation. This was performed by applying main Bragg angle at $2\theta = 39.01$ and it was around 24 nm. The weak diffraction peaks at $2\theta = 46.48^\circ$, 64.69° and 77.62° are agreed with (200), (220) and (311) reflections respectively. Thus, the XRD data suggests that the newly formed product is purely gold nanoparticles with high crystallinity. AuNPs formed were monodispersed, uniformly distributed without agglomeration and particle size ranged between 11 and 77 nm.

SEM Measurements

Surface morphology of the synthesized AuNPs was investigated using SEM measurement which was carried out by using Hitachi S - 4500 SEM machine. Prior to sample run, thin films of the sample were prepared on a carbon coated copper grid by just dropping a very small amount of the sample on the grid. Then extra solution was removed using a blotting paper and then the film on the SEM grid was allowed to dry by putting it under a mercury lamp for 5 min. The obtained results are presented in figure (2). The SEM image showed that the crystalline structure of gold nanoparticles were uniform

and showed relatively agglomeration structure as shown in (Fig.2).

DLS Measurements

Dynamic light scattering (DLS) is one of the most popular techniques which is used to determine size of particles for nanoparticle materials. Shining a monochromatic light beam such as a laser onto a solution with spherical particles and in this case occurrence of Brownian motion can cause a Doppler Shift. In this context, when light hits a moving particle it can change the wavelength of the incoming light. This change in wavelength is related to the size of the particle. In this case DLS can be used in computing of the sphere size distribution and giving a description of the particle's motion in the medium. According to this process measuring of diffusion coefficient of the spherical particles and using the auto correlation function can be used in the estimation of the average particle size. An experiment was carried out using an advanced DLS system (Zetasizer Nano S, Malvern Instruments, UK). The biosynthesized gold nanostructure was further demonstrated and confirmed by the characteristic peaks observed in zetasizer image, which indicate that the average of the diameter was in the range of 7.8 to 9.2 nm with highly smooth edges (as shown in figure 3). For further characterization of gold nanoparticles, a zeta potential and particles size measurement were performed using zetasizer machine. The average gold nanoparticlesize was approximately 7 nm as shown in (Figure 3) and zeta potential value is -26.8mV. The zeta potential revealed the stability of colloidal gold in solution. According to the guideline [22], optimum line between stable and unstable colloidal solution is generally taken either more than +30mV or lesser than -30mV. Particles with zeta potentials more positive than +30mV or more negative than -30mV are normally considered stable.

AFM analysis

In figure 4(A, B and C) show the atomic micrograph of the synthesized AuNPs with aerial and 3D topographical view of the topological structures. The AFM images were also used for the analysis of the fractal behavior of the deposited and annealed films. Porosity, roughness. Also fractal dimension was evaluated by analyzing the obtained AFM images. From these images, the uneven surface morphology can be attributed to the presence of

both individual and agglomerated AuNPs.

Antibacterial activity

The results of the antibacterial activities of green synthesized AuNPs against two types of bacterial isolates (*Escherichia coli* and *Staphylococcus aureus*) are presented in table (1). According to the above results, both the *Escherichia coli* and *Staphylococcus aureus* were susceptible to the influence of the AuNPs. The small size of the gold nanoparticles synthesized in this work enabled the easier penetration into the cell wall of bacteria by affecting the cell membrane and finally death of the cell. There is formation of 'pits' on the cell surface, followed by accumulation of the nanoparticles on the cell surface. In addition, the bactericidal activity could be mediated via Au ions released either from colloidal gold nanoparticles in the solution or immobilized nanoparticles. The gold ions then combined with thiol, hydroxyl, and carboxyl group in the cell, deactivate several functions in the cell and damage the cells. Gold nanoparticles combined with respiratory enzyme, protease enzyme and interact with the sulfur and phosphorus of the DNAs of bacteria. This effect can lead to suffocation, indigestion, inhibition of cell replication respectively and thus terminate of the microbes.

Neocuproine Copper Antioxidant

The novel reagent for the CUPRAC total antioxidant capacity assay, namely neocuproine copper (II) chloride, was easily accessible, stable, selective and responsive to all antioxidants. The CUPRAC absorbance of the AgNPs is showed in (Table 2). Five concentrations of the AuNPs were screened for their antioxidant capacity by using CUPRAC. Reducing capacity of (Cu^{2+}) by synthesized AgNPs were compared with Trolox as standard antioxidants. These results of comparison are shown in table 2. The obtained results showed that, the CUPRAC levels were increased in the presence of high concentration of AgNPs because of the reduced Cu (II)-neocuproine reagent by the AgNPs, with a proportional difference in the scavenging ability of the AgNPs (Table 2). Three concentrations of AgNPs were examined for their antioxidant capacity by using CUPRAC. Results obtained for the antioxidant assays proved the in vitro efficiency of the AgNPs on different systems.

Table 1. The zone of inhibition of green synthesized AuNPs against two types of bacterial isolates (*Escherichia coli* and *Staphylococcus aureus*).

Concentration of AuNPs Organisms	Diameter of inhibition zone in mm ±SD (mean of three replicates)		
	50 µmol/ml	100 µmol/ml	150 µ µmol/ml
<i>Escherichia coli</i>	10 ± 2.8	12 ± 2.5	20 ± 3.0
<i>Staphylococcus aureus</i>	9 ± 3.0	12 ± 2.0	18 ± 3.5

Table 2. In- vitro antioxidant assay of AgNPs by DPPH and CUPRAC methods (all values were measured as Trolox equivalent).

Method AgNPs concentration	DPPH Free Radical Scavenging method (Trolox equivalent µmol/L)	CUPRAC Assay (Trolox equivalent µmol/L)
50 µmol/ml	117	221
100 µmol/ml	277	422
150 µmol/ml	350	650

Figure 1. The XRD pattern for gold nanoparticles synthesized by using *Mentha pulegium L.* extract.

Figure 2. SEM image for AuNPS synthesized by using *Mentha pulegium L.* extract.

Figure 3. Dynamic light scattering (DLS) of the gold nanoparticles produced by using *Mentha pulegium L.* extract.

CONCLUSION

The synthesized gold nanoparticles (AuNPs) exhibited promising antibacterial activity on *Escherichia coli* and *Staphylococcus aureus*. The antibacterial activity was obtained for all the strains using methanolic extract synthesized gold nanoparticles (AuNPs). Overall results showed high potential of *Mentha pulegium* extract to synthesize high quality gold nanoparticles (AuNPs) for biomedical and biochemical applications.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Chemistry Dept., Faculty of Science, Kufa University, Najaf city, Najaf Governorate,

Iraq and all experiments were carried out in accordance with approved guidelines.

The Effectiveness of an Interactive Manual according to the Expansionary Theory in Developing the Teaching Skills of the Classroom Teaching for the Practical Education Course in Faculties of Education

Dihya Uweed Harbi Al Arnoosy¹, A'amal Sabah Rdam¹, Zinah Jabbar Gheni¹

¹College of Basic Education, University of Babylon, Hillah City, Iraq

ABSTRACT

The aim of the present study tries to identify “ The Effectiveness of an Interactive Manual according to the Expansionary Theory in Developing the Teaching Skills of the Classroom Teaching for the Practical Education Course in Faculties of Education”. To achieve the aim of the present study, the researcher formulated the following null hypotheses: First Hypothesis: There is no statistically significant difference at the level of (0.05) between the scores of the experimental and control groups in the performance of teaching skills as a whole and measured in the observation form. The second hypothesis: There is no statistically significant difference at the level of (0.05) between the scores of the students in the control group in the pre-test and post-

Keywords: *Expansionary Theory, Classroom Teaching, Practical Education, Faculty of Education.*

INTRODUCTION

The issue of teacher preparation is one of the issues that have been and still occupy a large area of educational thought and although it is a traditional issue, it is soon to put forward a new proposal with any development or change in the dimensions of the educational system. On the one hand it is the cornerstone, on the other hand, the success of the development depends on the issue of teacher preparation. The teacher is the most important element in the educational process and its basic pillar. He is the effective human element which has contracted the burden of preparing and bringing up generations and give them basic right qualities. He is responsible for the educational goals and prepare good creative thinker citizen. Efficient educational system depends primarily on the efficiency of teacher and the way of preparing him well ¹. So, the educational establishments interested in preparing teachers of faculties of education, research

centers and scientific consulting in the issue of preparing teachers and their training and improve their academic, professional. Despite this attention paid by these educational institutions in different countries of the Arab world for teacher preparation programs regulation and supervision, however, these programs had fallen below the required standard and ambition to reach an integrated program that meets the needs of society and its development ². Education has an important position in the construction and development of societies because it aims to bring about changes in human behavior and development of personality and directing it towards the service of human society since it is the process that leads to a comprehensive change in the intellectual behavior of the individual, emotional and performance. It is a continuous process beginning from the first years in the life of the human being to the last days of his life ⁴. The worth saying which belongs to prophet Mohammed ((peace and blessings of Allah be upon him and his pure household)) about the teacher “ I am sent as a teacher” also, the philosophers of a nation, the nobles make a consensus on the importance of the teacher and the great role he plays in the process of upbringing and education for the rising generations ⁵. The preparation of

College of Basic Education, University of Babylon,
Hillah City, Iraq

teachers and imparting them effective teaching skills is a prominent place of interest of educators, researchers and research institutions. The teacher is one of the most important elements in mastering his student to the desired objectives that are designed and planned by educators to meet the challenges of comprehensive development in view of the scientific, technological, social and economical changes for contemporary societies, the systems and methods of the programs of the faculties of education have been developed in Arabic and international levels to improve the outputs of the faculties of education and to cope with the contemporary scientific and technological developments⁵. The theory of expansionary is one of modern theories in education by which the researchers are trying to use education in order to understand the educational aspects and its multiple interrelated dimensions, the systemic approach relies on so-called concept of the system or the format which means in essence a set of things that gathered together in the field or specific major in different educational fields grasp the need to adopt the systemic approach, so, they can follow the complex nature of the educational problems that are affected by an interactive set of different variables⁶. The current research aims to identify: (What is the effectiveness of an interactive manual based on the theory of expansion in the development of teaching skills of students / teachers in the Faculty of Education?), to achieve the aim of the present study, the researchers formulated the following hypotheses. The first hypothesis: There are no statistically significant differences at the level of (0.05) between the scores of the experimental and control groups in the performance of teaching skills as a whole and measured in the observation questionnaire. The second hypothesis: There are no statistically significant differences at the level of (0.05) between the scores of the control group students in the pre- test and post-test teaching skills.

METHODOLOGY

To achieve the aim of the present study, the researchers adopted the experimental approach: Experimental approach: Experimental researches go beyond the limits of the quantitative description of the phenomenon and increases the processing of certain variables under precise conditions to ascertain how they occur. Experimental research is not merely a presentation of past events or the diagnosis of the present and its observation and description but rather the

control of the variables in experimental situations. The experimental approach has the ability to control various factors affecting the phenomenon to be studied.

Population and Sample of the Study

Population of the Study

It refers to individuals or objects that all have certain observable characteristics and the only line of population is the existence of a common property among its members and the characteristics of the society that can be observed "features of population" (Abu Huij, 2002: 44). The population of this research consisted of students of the fourth stage in the Faculty of Education for Human Sciences / Babylon province for the academic year (2017-2018) of (506) students.

Sample of the Study

The choice of the sample of the study is one of the most important steps of the research. When the researcher wants to collect the data about a whole population, he cannot include all the members of it. Rather, he uses a sample of this population to help him collect his data. The purpose of which is to disseminate the results that are derived from them to a larger society. For the purpose of applying the current study experience, the researchers chooses the stylistic method.

Equivalence of the Study Sample

The researchers must create equal groups in relation to variables related to research. On this basis, the researchers were statistically equalized between the two groups of the study (experimental and control) before the start of the program in some variables that they believe they may affect the safety of the experiment and the accuracy of its results. These variables are:

Pre-test scores (for teaching skills).

Mental capacity

The age (calculated in months).

Grades of the teaching methods of the third stage.

The general rate of the third stage.

The researchers obtained the data of the first variable after applying a pre-test to measure the previous knowledge of teaching skills and obtained the data of second variable after applying the Otis test, which was

designed to measure mental ability. The data of third variable were obtained from the students themselves after they were distributed a special questionnaire prepared for this purpose, while the data of the variables (fourth and fifth) of the departmental records based on the book facilitation task.

Measuring instruments

To avoid the effect of this variable, the researchers used the same tools with the two r groups (pre-post test of teaching skills) and (observation questionnaire), thus limiting the effect of this variable.

Instruments of the Study

Preparation of Teaching Skills Test

In order to achieve the aim of the present study and its hypotheses, this requires the construction of a pre-post teaching test to verify the equivalence of the two groups of study (experimental and control) before this program by comparing the two groups after the implementation of the program. The researchers has built an objective test (multiple choice) since this type of test has many positives, the most important of which is its comprehensiveness and objectivity (truthfulness and consistency), as well as the ease of correction and lack of guessing effect. It is also more exciting and interesting for the student. The test paragraphs were derived by examining a number of literature in the curricula, teaching methods and writings related to teaching skills, and extrapolating previous research and studies in the field of teaching skills development. The observation of a long history in social sciences is of great importance in educational research in particular. Many educational situations need to be observed by the researchers in their normal state and recording what they see and hear, what is happening in their natural daily life. In this way the researchers do not interfere in the affairs of the category to be considered In some ways of research, but note what is really happening in the normal situation ¹⁰. Note is considered as the more reliable research tools in measuring performance skills ¹¹. It serves as a manual to the observer to record his/her assessments of performance according to assessment levels identified on questionnaire. Since the current study requires a measure of student/teacher performance, so the researchers build a note questionnaire in accordance with the following steps:

The Aim of the Applying Note Questionnaire

Note questionnaire aims at measuring the performance of student/teacher (sample) teaching skills, (writing daily plan and preparation, explanation (offer) and classroom questions and capture the attention of students throughout the lesson (diversification of stimulations) ,reinforcement and adjust the system within classroom and closing style).

Sources of questionnaire's paragraphs Derivation

- seeing previous research studies conducted in the development of teaching skills.
- Viewing the number of literature in the curriculum, teaching methods and teaching skills-related literature.
- Analysis of main teaching skills that are specified in the study to their components.

Selection of Experimental Design

Experimental design means (base structure for an experience which describes the group's members experience and identify ways of testing this sample selection), a chart or a work program for how to implement the experiment, It includes a summary of what the researchers will do from the writing of hypotheses and their empirical uses to the final analysis of numbers and facts, it helps the researchers to obtain answers to the research, control experimental aspects and their extraneous variables and the discrepancy between the error and the research problem. This research requests determined experiment which consists of two groups, one experimental material to experimental variable (the independent variable) that is the control group This research requests determined empirically consists of two groups, one experimental subject to experimental variable (the independent variable) that is the control group should not expose to a training program.

Statistical Tools

The researchers use (SPSS) program to achieve the procedures and results of the study.

RESULTS AND DISCUSSION

This chapter contains an overview of the results reached at the present study hypotheses, according to a scientific explanation for these results and conclusions which enables the researchers to deduce in light of their

findings. A number of recommendations and suggestions for future studies, as follows:

First: the findings on first main hypothesis

It states that “There are no statistically significant differences at the level of (0.05) between the experimental groups students scores and control group in the performance of the whole teaching skills as actually measured in note questionnaire”. To verify the hypothesis the researchers used (mann – whitney) test and that there is a statistically difference for members of the experimental group that the calculated value of Mann Whitney is less than tabulated one at significance level (0.05). Table (2) shows that the null hypothesis will be rejected Table (2).

RESULTS AND DISCUSSION

The main fifth hypothesis shows that “there are

no statistically significant differences at the level of significance (0.05) between control group students scores in pre and post tests “ to verify this hypothesis, the researchers used Wilcoxon test, the computed Wilcoxon value was higher than tabulated at the level of significance (0.05), so null hypothesis has been accepted, there are no statistically significant differences between the pre-test and post-test for control group members who have teaching skills, table (3) shows that.

Effectiveness Ratio

To determine the ratio of the effectiveness of the independent variable (the training program) on the dependent variable (the skills scale of teaching “theoretical side”), the researcher applied the equation of MacGujian. The efficiency ratio was 0.83. This indicates that the program is effective. The field should be more than (0.60) to verify effectiveness and, if this is less, the program is ineffective.

Table 1. Shows the numbers of fourth stage students in departments of Faculty of Education for Human Sciences / University of Babylon

Department	Number of males	Number of females	Total
Arabic	22	99	121
English	14	76	81
History	21	69	90
Geography	26	71	97
Psychological and Education Sciences	16	31	47
Psychological and Educational Guidance	24	46	70
Total	123	383	506

Table 2. The results of the Mann Whitney test for the differences between the experimental and control groups in overall skill performance as measured by the note questionnaire.

Group	Number of samples	Average grade	Total grade	Value of mann-whitney		Statistical significant 0,05
Experimental	12	16,67	200,00	calculated	tabulated	Statistically significant differences
control	12	8,33	100,00	22	37	

Table 3. Results of the Wilkinson test to find out the differences between the pre and post application of the teaching skills scale to the control group

Control Group	Test	Number of sample's subjects	Mid-ranking	Wilcoxon value		Significant Level(0.05)
	Post- test	12	3,00	computed	tabulated	
Pre- test	12	4,75	19	14	Statistically significant difference	

Table 4. Effectiveness Ratio the skills scale of teaching “theoretical side”

x	y	z	X*y	X*z	Ratio of effectiveness
23,08	23,33	28	538,45	646,24	0,083

CONCLUSION

The effectiveness of the interactive manual on developing the teaching skills of students / teachers. The effectiveness of the expansionary theory in the development of teaching skills in students / teachers.

The Impact of the Roving Reporter Strategy on the Development of Students' Cognitive Motivation

Qassem Raed Jabbar¹, Haidar Hatem AlAjrash¹, Jassim Shaalan Al Ghazali¹

¹*Department of Graduate Studies - Methods of Teaching Socialities,
Faculty of Basic Education, Babylon University, Hillah City, Iraq*

ABSTRACT

The research aims at identifying the effect of the strategy of the Roving reporter on the development of the cognitive motivation of the students. The researcher adopted the method of empirical research as a method of research, which includes an independent variable and a dependent variable, The researcher was rewarded between the two research groups for the purpose of obtaining accurate and objective results in the following variables (age of the time, months of the previous school year, Danilez test of memory) To verify that his experience was applied in the first half of the academic year (2017-2018) They were randomized to two groups of 30 students per group. After the equivalence between the two groups, the researcher prepared the application requirements of the behavioral plans and objectives, of the (40) of the type of choice of the multimeter The researcher has achieved the characteristics of the test for the test, and continued application of the experiment (8) weeks. The results were then analyzed using statistical methods by t-test and showed the superiority of the experimental group that studied the Roving reporter strategy on the control group studied in the cognitive development test.

Keywords: *The Roving reporter strategy, Development, Cognitive motivation*

INTRODUCTION

Education is an organized process to bring about desirable changes in the learner's behavior in order to achieve an integrated development in his personality in the physical, mental, emotional and social aspects. Modern education provides all possible opportunities to the learner to enable him to reveal his own abilities and to help these abilities to grow and develop. In this endeavor, education works to satisfy the learner's vital needs in the movement and activity. Therefore, the visitors responsible for school administration in the developed societies note that they are constantly working to provide opportunities for playing and various activities that correspond to the stages of growth. Min that the standard by which we can rule him on the importance of any school activity, Is the extent of the

contribution of this activity in helping the learner to develop mental, social and physical and otherwise works people to remove any effectiveness does not fit with this reason⁴. As a result of the great development witnessed by the world in recent decades and witnessed in all areas of economic, social, political and technological life, the tremendous scientific and technological explosion and the information and communications revolution, the knowledge varied and the teaching methods and the use of technology in the field of education were developed. And strategies of teaching and work to develop them in line with the successive developments with a focus on the psychological and educational aspects of the learner and provide him with science and knowledge and the development of teaching methods and improve them in line with the theories² that modern education has worked on the development of the curriculum in a comprehensive way because of its great role in the development of the personality of the student moral, scientific and social so as to become more integrated and there are no difficulties in The Adapt to daily life, and that the curriculum consists of a set of educational and scientific

Corresponding author:

Qassem Raed Jabbar. Department of Graduate Studies - Methods of Teaching Socialities, Faculty of Basic Education, Babylon University, Hillah City, Iraq; E-mail: qassim2027yahoo.com

principles, and plans that help us to develop the student's talents and refined The curriculum is responsible for instilling noble values and noble morals in the mind of the student and in the psyche which is the student should return to.¹⁴ The modern curriculum is concerned with the teacher's diversity in modern strategies and methods suited to the nature of learners and what is my Are individual differences in the light of this new role of the teacher is no longer a brief currency on the delivery of information,, But expanded and became a teacher guide and guidance and help the student to develop his abilities and preparations and skills in all respects⁸. The methods and strategies of modern teaching have evolved and varied with the development of societies, scientific and social progress, changing the perception of science and learning, progress in educational and psychological sciences, and the developments in various sciences, The teacher has a duty to know thoroughly the party and modern teaching strategies in order to use the appropriate method that corresponds with the level of pupils mental and age and the nature of the subject and the objectives of the teachin¹². Active learning: The process of dynamic containment of the learner in learning situations that requires active movement and participation in all activities under the guidance and supervision of the teacher¹⁵. Active learning :is an educational philosophy based on positive learner in the educational situation and includes all pedagogical practices and teaching procedures It aims at activating the role of the learner and maximizing it, where learning through work, research and experimentation, and the learner's reliance on himself to get information and ideas and acquire skills, and the formation of values and trends, which is based on learning activities and different learning skills And it did not allow them targeted behaviors that depend On the active positive participation by the learner educational attitude, the behavior of the learner is considered the focus of active learning and not the behavior of the teacher, and it is seen as learning that a group of processes occur within the learner and based on self-desire these processes are activated by stimuli and incentives that are available in the environment surrounding the learner¹³.

The Roving reporter Strategy: It is an active learning strategy, based on the principle of positive interdependence and is the first starter in active and collaborative learning. Positive correlation is achieved when the members of the group realize that they are

interconnected with one another in a way that succeeds when one succeeds. The goals of the group and the tasks assigned to them are determined on the basis of success with the efforts of each member of the group, the Roving reporter must make efforts to achieve success for the group and each member of the group has a unique contribution¹⁵

The steps of the Roving reporter The teacher sets up small groups, the teacher asks a specific question about the subject, the group members choose an educator to act as the mobile reporter, the mobile reporter from each group visits the other groups, the Roving reporter presents ideas and views to other groups and listens to Their thoughts, the Roving reporter returns to his group to provide them with the ideas he has obtained¹⁶

Learner roles the Roving reporter strategy: one learner from each group plays the role of the Roving reporter, the Roving reporter communicator discusses with other groups and tries to integrate group ideas with other group ideas, the Roving reporter communicator moves ideas and opinions from his group to other groups and vice versa. To the teacher for writing on the blackboard and to make sure it is correct².

Teacher's Role in the Strategy of the Roving reporter: Motivator: The teacher acts as the catalyst for learners to increase their motivation. Instructor: Provides learners with the experiences, concepts and activities learned in learning situations. The facilitator: manages and coordinates the classroom's educational situation; does not complete learning tasks, and monitors the interaction of learners within the group; the path: facilitates the use of knowledge and tasks in new and previously acquired attitudes; The performance of activities and the exercise of appropriate thinking processes in their progress do not complete educational positions.¹⁵ , Cognitive motivation: the importance of cognitive motivation in the educational process and raise the spirit of participation and positive interaction within the classroom in general and at the student in particular, and on this reference to recent studies and research that the person loves curiosity and seeking knowledge of nature and this research provides us with a new platform to guide learning They want to learn more about the need to learn more about it. They also seek new experiences, enjoy new learning, and feel satisfied when solving a problem or developing a skill by organizing their curiosity and behavior .It forms

the basis for learning, creativity, mental health, and its exploitation of learning inquiry. Mental cognitive motivation is one of the topics of importance in cognitive psychology because of its impact on human life and the advancement of the nation and its progress. It also helps in solving and overcoming many of the problems faced by the individual and avoiding errors through which the individual can control and control the environment and face rapid and successive changes in different Aspects of life, and can perceive the ocean and interact with it more clearly and securely ⁷. Is defined as the inclination of the individual to indulge in conscious attempts that require cognitive effort that requires mental effort and enjoyment, which helps the individual to adopt precision in making decisions regarding a particular situation or problem ⁹.

METHODOLOGY

It includes a presentation of the methodological procedures used in the current research, starting with the experimental approach, the research society and its sample, and the parity between the two groups, as well as controlling the extraneous variables, defining the learning material and formulating the behavioral goals.

Experimental design of the research: includes the independent variable (the Roving Reporter strategy) and (the normal method) and the dependent variable (mental cognitive motivation) so the researcher used the experimental design of partial control of the two groups are equal, And the other control.

The research community and sample: The research community represents the fifth grade pupils in primary school day for boys in Babil province for the academic year 2017-2018. A sample of the schools of the General Directorate for the education of Babylon was chosen for research purposes. The research sample consisted of two divisions of the students of the fifth grade of the primary school, consisting of 60 students divided between the two divisions (A - B) In a random way, a (A) was selected to represent the experimental group consisting of 30 students whose students will study according to the strategy of the Roving reporter and the (B) division to represent the 30-student control group that will study according to the usual method.

The two research groups are rewarded: If the researcher is statistically equivalent between the experimental and control groups in some variables

that affect the results of the experiment. Although the researcher chose the two groups in the random drawing method, although the students of the research sample from a social and economic center are very similar to one school, he was keen to make the following variables equa (Danilez test for the intelligence and age of students and grades of students for the previous school year). If the researcher made the equivalence between the two groups of variables with the above variables and showed the results as shown in Table (1).

The research material: The research material is one of the basic elements upon which the research is based, according to which the research procedures are carried out. These are the requirements: The scientific material (the content): The scientific material that the researcher is teaching was determined for the students of the research groups during the period of the experiment The researcher prepared ¹⁶ study plan for the experimental group which is taught according to the strategy of (the Roving reporter) and the same for the control method taught according to the normal method.

Statistical means

The researcher used statistical methods to test t-test for two independent samples, not for parity between the two groups, and Pearson correlation equation. The researcher used the equation to correct the correlation coefficient between the two correlations (individual and marital vertebrates) and after using Pearson correlation coefficient and coefficient of ease and difficulty Excellence and effectiveness of the wrong alternatives and the box Kay) $Ka 2 - x2 - quire - his$).

RESULTS AND DISCUSSION

The results indicated that there was no statistically significant difference at the level of (0, 0) between the experimental and the control groups between the average test scores of cognitive cognitive development and for the experimental group which studied the scientific material through the Roving reporter strategy and the mean of the control group studied by the method ^{11,14}, while the mean scores of the control group (45, 23) and the standard deviation (50, 2) In order to determine the significance of the statistical difference between the average scores of the two groups, the researcher used the t-test for two independent samples as a statistical method to show the results. As mentioned earlier, the students of the experimental group studied according to the strategy

of the Roving reporter emphasized the students of the control group, We believe that teaching according to the strategy of the Roving reporter has had a positive impact on understanding the scientific information and facts through the collaborating groups and what the students

discuss. This leads to raising their scientific level and raising the level of discovery, surveying, understanding and knowledge. They have in the light of the experiment carried out by the researcher and the results obtained and the reasons resulting from the search As shown in Table (2)

Table 1. The two groups of research are rewarded with the Danleys Intelligence Test, Grades of the previous academic year in the scientific subject, the chronological age calculated by months

Variable	the group	Sample size	standard deviation	Average Arithmetic	Degree of freedom	t-test value		Level of significance
						Calculated	Table

	Control	30	1.41	8.67				
The chronological age is calculated by months	Experimental	30	5.67	129.69	57	0.891		
	Control	30	4.63	128.55				

Table 2. Experimental and control group in the development test of cognitive motivation in the scientific article

Statistics	Sample size	SMA	standard deviation	Degree of freedom	The following values		Level of significance
the group					Calculated	Table	
Experimental	30	30.5	4.49	58	4.187	2.000	Statistical function
Control	30	24.18	7.3				

CONCLUSION

The Roving reporter strategy has a positive impact on student education. The use of the Roving reporter strategy contributes to the development of cognitive motivation for fifth graders in the scientific subject. The Roving reporter correspondent strategy is to create a spirit of cooperation among students. The Roving reporter

Correspondent strategy helps provide performance feedback for each question given to them the Roving reporter Correspondent. The use of the Roving reporter strategy led to the processing of individual differences among student.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Graduate Studies - Methods of Teaching Socialities, Faculty of Basic Education, Babylon University, Hillah city, Iraq and all experiments were carried out in accordance with approved guidelines.

Using the Constructs of the Transtheoretical Model of Change in Enhancing Regular Physical Exercise for Female High School Students

Zainab Moayad Hamzah¹, Mohammed Baqer Habeeb Abd Ali²

¹Community Health Nursing Department, College of Nursing, University of Baghdad. Academic nurse, Kirkuk Health Directorate, Ministry of Health, Iraq, ²Community Health Nursing Department, College of Nursing, University of Baghdad, Iraq

ABSTRACT

A randomized controlled trial (RCT) was conducted by applying the Transtheoretical Model of Change (TTM) to (1) identify students' current exercise stage of change, (2) determine the effect of the TTM-based physical exercise intervention on students' readiness to engage in regular physical exercise, (3) determine the association between students' age, body mass index (BMI), and their readiness to engage in regular physical exercise, and (4) investigate the differences in students' readiness to engage in regular physical exercise between the groups of social norms, school physical exercise class, grade, socioeconomic class of students' families, and BMI. The study included a random sample of (144) female students; (72 students for the study group and 72 students for the control group), aged 15 to 20-years who were selected from the high school of "Asma'a Bint Abi-Bakr" in Kirkuk City; northern to Iraq. The study results revealed that the mean age for participants in the study group was 16.9 ± 1.4 ; one-third age 16-years-old ($n = 24$; 33.3%). The researchers recommend to encourage graduate students to adopt theory-based studies in their future proposed research, and the necessity of community health nurses in Iraq to conduct similar studies on various settings.

Keywords: Physical Exercise, Transtheoretical Model, Community.

INTRODUCTION

Gender and grade level are reported to be key determinants of achieving the recommended levels of physical activity, among high school students in all grades, a smaller proportion of females reported 60 minutes of physical activity on each of the previous 7 days than males (17.7 versus 36.6 percent, respectively). The risk factors and health-risk behaviors that contribute to adulthood chronic disease are established in childhood and adolescence¹. Recent global data show that the prevalence of recommended levels of physical activity are less than 20% among adolescent girls, slowing the decline in participation in physical activity among

adolescent girls is a public health priority². Mirkin indicated that Iraq has about 50% of the population under the age of 19. However, poor security conditions and the instability have made maintenance of health and active life a difficult task to achieve. As a result, parents do not usually encourage their daughters to engage in sports teams and social clubs due to the security situation which could endanger the lives of their children³. According to the World Health Organization (WHO), physical inactivity causes 2 million deaths a year worldwide⁴. The fourth leading risk factor for global mortality registered for physical inactivity (6% of deaths globally), moreover physical inactivity is determined to be the major cause for approximately 21-25% of breast and colon cancers, 27% of diabetes and approximately 30% of ischemic heart disease burden⁵. Adolescents require at least 60 minutes of moderate to vigorous physical activity on most days for maintenance of best health and fitness for healthy weight during growth⁶. Epidemiological evidence showing level of

activity (aerobic activity 150 minutes/week) decreases the incidence of many chronic diseases and mortality rates⁷. In children and adolescents, exercise supports joint, bone, and muscle health, weight control, and anxiety reduction, psychological functioning, attention span and concentration, enhancing learning and memory, especially in challenging learning situations⁸. There is a study explained independent associations of self-reported screen time and physical inactivity on measurements of psychological distress in adolescents. Through adolescence screen time and physical inactivity are common, and may be carry on this double burden to adulthood⁹. The TTM proposes qualitatively distinct stages of behavior change: Pre-contemplation (where an individual has not considered performing the behavior), Contemplation (where the individual considers the Pros and Cons of the behavior but has not made formal plans to do so), Preparation (where an individual plans and makes preparations for the behavior), Action (where an individual has started to perform the behavior, not performing the behavior regularly) and maintenance (this reflects individuals who have sustained behavior change)^{10,11}. Self-efficacy is the confidence that the person able to successfully engage in a physical activity¹².

MATERIALS AND METHOD

The research design for this study was an experimental, randomized controlled trial design. Control occurs to decrease the possibility of error and thus increase the probability that the study's findings are an accurate reflection of reality and the researcher can reduce the influence or confounding effect of extraneous variables on the study variables. Also, controlling extraneous variables enable the researcher to identify relationships among the study variables accurately and examine the effects of one variable on another¹³. In this study, several variables were examined to determine each subject's readiness to engage in physical activity including age, body mass index (BMI), subjective norms about females' exercising, and the socioeconomic status of students' families.

Population

The study population included high school female students who aged 15 to 20 years, who live in Kirkuk City; northern to Iraq, who met the inclusion criteria mentioned below.

Sampling

The study applied the randomized sampling method. The researcher distributed (160) copies of the study questionnaire to the accessible students. The returned questionnaires were 160; 16 of them were incomplete. So, they were excluded from the data analyses. The final sample size was 144. Thus, the response rate was 90%.

The Exercise Processes of Change Scale (EPOCS)

The Exercise Processes of Change Scale¹⁴ was used to measure the experiences can affect the exercise habits of some people. This scale is a 5-point Likert type scale that is composed of 27 items self-report measure previously validated for use with adolescents. The EPOCS is conceptualized as consisting of two correlated second-order factors which each include five first-order factors. Items from the processes of change questionnaire were rated by participants using a 5-point Likert-type response format. These items were measured on a 5-point Likert scale. Responses on this scale range from 1 (Never) to 5 (Repeatedly). Total scores range from 28 to 140, with a higher score indicating greater Processes of Change¹⁵.

The Exercise Self-Efficacy Scale (ESSES)

The Exercise Self-Efficacy Scale (Nigg, Norman, Rossi, & Benisovich, 1999)¹⁴ was used to measure the Participants responded to 18 items to assess self-efficacy for physical activity, Self-efficacy was scored on a five-point Likert scale with response options ranging from extremely confident to not confident at all.

Demographics

Demographic data were collected using a form that requests the subject's age, class, BMI, exercise class, socioeconomic status of the family.

Setting

The accessible population included adolescents in the high school female students of "Asma'a Bint Abi-Bakr" in Kirkuk city in the Iraq. Data collection took place at this location.

Data Collection Plan

The descriptive statistical measures of frequency, percent, mean, and standard deviation were used to describe participants' demographics. The repeated

measures analysis of variance (RM-ANOVA) was used to measure the difference in the constructs of the TTM over time.

RESULTS AND DISCUSSION

The age mean for participants in the study group is 16.9 ± 1.4 ; one third age 16-years-old ($n = 24$; 33.3%), followed by those who age 17-years-old ($n = 21$; 29.2%), those who age 15 and 19-years-old ($n = 8$; 11.1%), and those who age 18-years-old ($n = 7$; 9.7%) and those who age 20-years-old ($n = 4$; 5.6%). For the control group, the age mean is 16.9 ± 1.3 ; one third age 17-years-old ($n = 24$; 33.3%), followed by those who age 16-years-old ($n = 22$; 30.6%), those who age 18-years-old ($n = 10$; 13.9%), those who age 15-years-old ($n = 8$; 11.1%), those who age 19-years-old ($n = 5$; 6.9%), and those who age 20-years-old ($n = 3$; 4.2%). Concerning the SES, around two-fifth in the study group are of the upper middle class ($n = 29$; 40.3%), followed by those who are of the lower middle class ($n = 26$; 36.1%), those who are of the upper lower class ($n = 15$; 20.8%), and those who are of the upper class ($n = 2$; 2.8%). For the control group, more than two-fifth are of the upper middle class ($n = 31$; 43.1%), followed by those who are of the lower middle class ($n = 29$; 40.3%), and those who are of both the upper lower class and upper class ($n = 6$; 8.3%). Regarding the BMI, the BMI mean for participants in the study group is 22.4 ± 4.2 ; more than a half are of normal range ($n = 43$; 59.7%), followed by those who are both underweight and overweight ($n = 12$; 16.7%), those who have class I obesity ($n = 3$; 4.1%), and those who have class II obesity ($n = 2$; 2.8%). For the control group, the BMI mean is 22.2 ± 4.3 ; more than a half are of normal range ($n = 40$; 55.6%), followed by those who are underweight ($n = 15$; 20.8%), those who are overweight ($n = 12$; 16.7%), and those who have class I obesity ($n = 5$; 6.9%). With respect to the existence of sport class in the school curriculum, all participants both in the study and the groups reported that there is such a class ($n = 72$; 100.0%). Concerning the subjective norms of the local community regarding females' practice of physical exercise, less than a half of participants in the study group reported that their community agree to such a practice ($n = 34$; 47.2%), followed by those who reported that the

community strongly agree ($n = 15$; 20.8%), those who reported that the community somewhat agree ($n = 12$; 16.7%), those who reported that the community undecided ($n = 6$; 8.3%), those who reported that the community disagree ($n = 3$; 4.2%), and those who reported that the community strongly disagree ($n = 2$; 2.8%). For the control group, less than a half of participants in the study group reported that their community agree to such a practice ($n = 32$; 44.4%), followed by those who reported that the community strongly agree ($n = 22$; 30.6%), those who reported that the community somewhat agree ($n = 10$; 13.9%), those who reported that the community undecided ($n = 5$; 6.9%), those who reported that the community strongly disagree ($n = 2$; 2.8%), and one who reported that the community disagree ($n = 1$; 1.4%). The values of the Stages of Change for regular physical exercise for the study group noticeably decrease by time compared to the control group (Pretest = 73.40 vs. 70.80, Posttest I = 65.11 vs. 74.99, Posttest II = 48.84 vs. 80.64) respectively. Lower score means higher SOC. Whether these represent significant differences is the job of the repeated measures (RM) ANOVA. The values of the POC for regular physical exercise for the study group noticeably increase by time (Pretest = 80.93, Posttest I = 96.54, Posttest II = 116.99). For the control group, such values slightly decrease by time (Pretest = 80.45, Posttest I = 80.33, Posttest II = 76.65). Whether these represent significant differences is the job of the RMANOVA. The values of the SE for regular physical exercise for the study group noticeably increase by time (Pretest = 43.57, Posttest I = 51.47, Posttest II = 59.04). For the control group, such values slightly decrease by time (Pretest = 44.88, Posttest I = 42.29, Posttest II = 40.04). Whether these represent significant differences is the job of the RMANOVA. This RCT was designed to predict factors both enable and discourage students from committing to regular physical exercise and assist students to change the physical inactivity behavior to abiding to regular physical exercise. The age mean for participants in the study group was 16.9 ± 1.4 ; one third age 16-years-old ($n = 24$; 33.3%). For the control group, the age mean is 16.9 ± 1.3 ; one third age 17-years-old ($n = 24$; 33.3%).

Table 1. Participants' Sociodemographic Characteristics

	Study (N = 72)		Control (N = 72)	
	Frequency	Percent	Frequency	Percent
Age: Mean (SD) (Study G.): 16.9 ± 1.4 Mean (SD) (Control G.): 16.9 ± 1.3

Study Posttest I	51.47	12.527	70
Study Posttest II	59.04	14.514	70
Control Pretest	44.88	6.530	69
Control Posttest I	42.29	8.105	69
Control Posttest II	40.04	7.337	69

CONCLUSION

The TTM-based intervention was influential in moving students to higher stages of change (Action and Maintenance), enabled them to use students in the pretest time in the Pre-contemplation Stage of Change have greater Pros of regular physical exercise. On the other hand, students in the Preparation Stage of Change have less Pros of regular physical exercise. The TTM-based intervention was influential in enhancing students' moving to higher SOC, using more POC and their SE. It is empirically important to conduct similar studies on larger sample size across Iraq and it is necessary to incorporate the theory-based interventions into the curricula of graduate programs in Iraq and encourage graduate students to adopt theory-based studies in their future proposed research, also it is necessary for community health nurses in Iraq to conduct similar studies on various settings.

Assessment of Knowledge and Attitudes of Primary School Health Coordinators Regarding School Injuries in AL-Hilla District

Hussein H Hasan¹, Muna A Khaleel¹, Naji Y. Saadoon¹

¹Community Health Nursing Department, College of Nursing, University of Babylon, Hilla City, Iraq

ABSTRACT

Every year, a large number of primary school students die from accidents, such as meningitis or leukemia, therefore primary school health coordinators in schools are the first responders for emergencies and accidents during school hours. A descriptive cross-sectional study design was conducted on (80) primary school health coordinators in AL- Hilla District of Babylon Province, including AL-Hilla Center Area, Abi Gharaq Area and Al-Kafel Area, to assess knowledge and attitudes of primary school health coordinators regarding school injuries from 1 September (2017) to 1 September (2018). Findings of the study revealed that majority of the participants were correctly responded, the correct response rate ranged (71.2% – 100%). Overall knowledge of the study participants about school injuries was good. And the overall attitude of the study participants was positive. None of the participants had negative attitude. No statistically significant differences had been found in mean knowledge scores for all domains or the overall knowledge score across the age groups, gender, residence, marital status, number of children and monthly income. The study concluded that the overall knowledge of primary school health coordinators about school injuries was good.

Keyword: *Injuries, Assessment of Knowledge, AL-Hilla District*

INTRODUCTION

The school is an important part of the lives of school students and has a direct impact on their physical and mental health. School health services are often neglected in many countries and this neglect is reflected in a lack of health awareness about primary health care and common infectious diseases among school students¹. School students are exposed to a number of risks and injuries because of their mental and physical abilities that are still immature. Primary school students are at higher risk of accidents and injuries.² Primary school is where a strong foundation a student's education is set, a student's mind and body must be nurtured and prepared for the future. Primary school students are also highly active physically and hence, more prone to injuries, their physical health also needs to be cared for meticulously³.

Schools are the best place to educate and spread health awareness, which is one of the main elements in the school health system. This period is characterized by access to health information and acceptance of assistance to students, especially students who are able to acquire healthy behaviors and habits that affect the current and future family⁴. School health coordination is an organized system that effectively links health (physical, emotional and social) with education, this improves the health status of students and increases their ability to learn by supporting the family, community, school and working together. School health priorities are addressed through coordination between the work of the school's health coordinator and the participants. School health coordination is an effective model for linking education and health. This effective model is the way to change health systems in schools by improving the health status of students in schools and increasing their ability to learn, and support the family, community and school for students⁵.

MATERIALS AND METHODS

A study aims: To assess knowledge and attitudes of primary school health coordinators regarding school injuries in AL-Hilla District and to find out the relationship between knowledge, attitudes of primary school health coordinators with their socio-demographic and personal characteristics such as (age, gender, marital status, years of experiences, the number of training course, etc.)

Design of the study: A descriptive cross-sectional study design was conducted on 80 (primary school health coordinators in AL- Hilla District of Babylon Province, including AL-Hilla Center Area, Abi Gharaq Area and AL-Kafel Area, to assess knowledge and attitudes of primary school health coordinators regarding school injuries from September 2017 to September 2018.

Study Sample: A non-purposive sample of (80) primary school health coordinators in AL- Hilla District of Babylon Province. The study sample divided into three areas including:

- 1 . **Forty five** primary school health coordinators from AL- Hilla Center area.
- 2 . **Twenty** primary school health coordinators from Abi Gharaq area.
3. **Fifteen** primary school health coordinators from Al- Kafel area.

Study instrument: A constructed questionnaire was prepared and modified after a thorough review of the relevant literature. This questionnaire covers three parts:

Personal Characteristics which included:

(gender, age, residence, marital status, number of children, monthly income, level of education and number of years of service, receiving previous information about school injuries, with specifying the source of information: reading, TV, training course, workshop, net, others) which included (10) items.

Knowledge of schools health coordinators about school injuries: which consisted of (general information on knowledge about school injuries, head and neck injuries, bone and joint injuries, wounds and bleeding, food poisoning, bites, stings and foreign bodies and other school injuries).

Attitudes of schools health coordinators about school injuries.

Validity and Reliability: The content validity of the instrument was established through a panel of (16) experts, the reliability of the items was based on the internal consistency of the checklist was assessed by calculating Cronbach Alpha which was = 0.80.

Data Collection and Data Analysis:

A structured questionnaire used to collect data by direct interview. The approximate interview time (20-25) minutes to complete the questionnaire. Data collection is performed from 28 March 2017, to 22 April 2018. To determine whether the objectives of the study were met, the current study data were analyzed by using SPSS, version 25.

RESULTS AND DISCUSSION

Eighty school health coordinators were participated in this study with a mean age of 43.5 ± 8.7 (range: 28 – 62) years, they were 24 males (30%) and 56 females (70%). Regarding the residence, 65 (81.3%) of the study participants of urban and 15 (18.7%) of rural residence, majority of the participants (83.7%) were married (60.6%) had 3- 4 children (41.3%) had a monthly income of more than 800 thousands IQD, 48 (60%) school health coordinators were graduated from college or higher, only (17.5%) of the participants had 10 years or less and (12.5%) had more than 30 years in service while (70%) of them had (11 – 30) years in service with a mean years in service of (19.4 ± 9.6) Range; (1 – 40) years, (Table 1). (Table-2) summarizes the mean scores for each of the knowledge domains in addition to the overall knowledge score for all domains with ranges and evaluation of each domain.

Attitudes of the schools health coordinators towards school injuries

The overall attitude of the study participants was positive, nonetheless, it was neutral for three items where the mean attitude score was (2.25) for the learning first aid is very difficult (2.19) for the sewing a wound resulted from dog bite and 1.98 for prefer to get help from other teachers if a student had a seizure in the classroom. Positive attitude reported for the other (14) items with a mean score ranged between (2.39) to (3.0) (Table 3).

Socio-demographic characteristics of the schools health coordinators (N = 80)

A total of eighty school health coordinators were participated in this study with a mean age of (43.5 ± 8.7) (range: 28 – 62) years, this finding is supported by ⁶ who found that the ages of their study participants (range: 25- 58) years with a mean age of(41.5±7.4 years). Relative to gender (30%) of the study participants were males and (70%) females, this finding was supported by ⁷ who found that the males were only (30%) of the studied group. ⁸ who found that most of their the primary school health coordinators who participated in the study were females (80%) . In regard to residence the present study found that majority of the primary school health coordinators (81.3%) were resident in urban regions. These findings agreed with what was reported by ⁹ in that he stated (97.4%) of his study participants were living in urban areas. Concerning marital status the researcher found that the majority of the participants (83.7%) were married. This finding agreed with what was reported by¹⁰ in the monitored, (83.3%) of their study participants were married. Fortunately, the researcher found that (60.6%) of the study participants were having (3- 4) children. This finding agreed with what was reported by ¹¹ in that they reported (73.3%) of their participants had more than one child. In the present study (41.3%) of the sample under study their monthly income was more than (800) thousands IQD, which consistent with what was found by ¹² nearly half of his participants had a monthly income of (700-1000) thousands IQD. However, there was a disparity in the monthly income as it different across different countries and also affected by some personal factors even within the same country as it is depend on the needs of the participants and their expenditures. Relative to the educational level, the researcher found that(60%) of the primary school health coordinators were graduated from college or higher , these findings supported by that showed the majority of his study participants (84.5%) had Bachelor degree or higher. Concerning the number of years that the participants have in service ranged between (1-40) years, moreover, almost (70%)of participants had (11-30) years in service, while lower proportions (17.5% and (12.5%) for those who had (10)years or less and those who had more than (30) years in service, respectively, these findings supported by ¹⁰ that showed their study practices ranged from (1- 39 years) with a means age of (19.5 years) and SD of (7.2 years). The lower proportion

of those participants with more than 30 years in service could be attributed to the retirement legislations in Iraq, while the lower proportion f those with (10) years or less in service could be attributed to the employment legislation and delayed employment particularly after (2003) where the central employment by ministry of education had been cancelled.

Overall Knowledge assessment of the primary school heath coordinators about school injuries for different studied

These findings agreed with what was reported by (Al-Tameemi, H. M. A. and Khudair, 2016) that showed the result of general knowledge of the primary school health coordinators was good (71%) and was in the same line with study of (Kumar, et. al. ,2015) Knowledge of primary school teachers on first aid management of minor accidents among children at Ambala.

Attitudes of the schools health coordinators towards school injuries with mean scores and assessment (N=80).

The overall attitude of the study participants was positive , nonetheless, it was neutral for three items where the mean attitude score was (2.25) for the learning first aid is very difficult (2.19) for the sewing a wound resulted from dog bite and (1.98) for prefer to get help from other teachers if a student had a seizure in the classroom. Positive attitude reported for the other (14) items with a mean score ranged between (2.39 to 3.0) as shown in table (3).

I see it is necessary to undergo periodic examination for school canteen worker and for taking vaccine necessary.	77	96.3	1	1.3	2	2.5	2.95

CONCLUSIONS

Knowledge of the primary schools health coordinators about school injuries was good, the higher knowledge score of the primary schools health coordinators was reported for general information about school injuries domain, the primary schools health coordinators in Al-Hilla District had generally positive attitude toward information about school injuries and majority of school participants had positive attitude (95%) and only (5%) of them had neutral attitude while none of them had negative attitude.

ABSTRACT

Violence against women is a serious psychological, physical, or sexual acts against women, which pose a danger to women's mental health, such as depression and suicide attempt, as well as maternal and neonatal health problems. Objectives: To assess the level of depressive among women experienced domestic violence, as well as identifying the association between depression and domestic violence. This descriptive correlational study included a convenient sample of (300) women who were exposed to different types of domestic violence. Sample was selected from six primary healthcare centers in AL-Hilla City. Findings revealed that (62.0%) of women experienced different types of domestic violence; most of them reported that they exposed to domestic violence by their husbands. The study indicates that most of participants (68.7%) had moderate level of depression and about (12%) had sever level. There was a statistical significant association between all types of domestic violence and signs of depression ($p < 0.05$). Statistical significant correlations were also found between womens' age, amrital status, and domestic violence. Most of women exposed to domestic violence by their husbands, commonly the sychological type of violence. Any type of domestic violence the women experience increases their vulnerability to depression, specially especilly unmarried women.

Keywords: Domestic violence, depression, women, healthcare centers.

INTRODUCTION

The phenomenon of violence is associated with the existence of human being; violence has been practiced on all layers of society, especially women. Domestic violence is an issue affecting people of all ages, races, genders, and sexual orientations. Violence considered more threatening to women than other form of society¹. Violence against Women is a fundamental violation of women's civil rights. A report by the (WHO) reviled that in 2003 about 30% of women worldwide experienced either physical and/or sexual violence and the violence is increasing among different cultures. Women's mood disorder, post-traumatic stress disorder, and eating disorder are the most common psychological effects

that violence imposes on women. About 57% of Iraqi women are exposure to domestic violence at least once in their lives². In a local study conducted in Baghdad City, the author reported that the women exposed to emotional or psychological violence more than physical and sexual violence³. In another local study done in Diyala Governorate, which explained that Iraqi women exposed to different types of domestic violence such as economic violence (76%), psychological violence (65.2%), and physical violence 46.3%⁴. Violence is a major contributor to women's mental health problems, particularly depression and suicidal behavior, as well as maternal and neonatal health problems⁵. Domestic violence against women is affected by several factors, including demographic characteristics⁶. Studies on the relationship between domestic violence against women and signs of depression are very scarce in Iraq. Violence negatively impacts the physical and mental well-being of women; impacts can range from broken bones to pregnancy-related complications, mental problems, and

Corresponding author:

Hayder Hamzah Al-Hadrawi

College of Nursing, University of Babylon, Hillah City, Iraq; E-mail: haidermsn@gmail.com

impaired social functioning. Partner violence is one of the major causes of women's mental health problems. Women who have experienced partner violence are almost twice as likely to experience depression compared to women who have never experienced any type of domestic violence. Women suffered variety forms of domestic violence including physical, sexual, economic, emotional abuse, and neglect. Violence affects all female segments, no matter whether victims are poor, rich, educated, or illiterate. Single, married, divorced, or widowed are also at risk for domestic violence. Studies also shown that violence is practiced by powerful persons in the family, such as the father, husband, brother, and mother.

MATERIALS AND METHODS

Study Design

Descriptive correlational study was used to assess the relationship between domestic violence and signs of depression among women attending primary health care center in AL-Hilla City.

Population and Sampling Plan

A convenient sample of consenting (300) women who were exposed to different types of domestic violence and attended six primary healthcare centers in AL-Hilla City, Babylon province.

Study Instruments

A three parts questionnaire was used to answer the study questions regarding the association between domestic violence and signs of depression among women attending primary health care centers. The first part is the women's demographical variables. The second part is the Domestic Violence Scale, which contains a total of (21) items divided to four domains: physical violence (4 items); psychological violence (10 items); sexual violence (4 items); economical violence (3 items). The total (21 items) are scored and rated on three levels Likert scale (1= always; 2= sometimes; and 3= never). The third part is the Major Depression Inventory (MDI). The scale includes (11) items. The total items are scored and rated on three levels Likert scale (1 for always; 2 for sometimes; and 3 for never). Women with a mean score of (>1.7) are considered having sever symptoms of depression; (> 2.4) are having moderate symptoms of depression; and women with a mean score of (< 2.3) are

having mild depressive symptoms.

Ethical Considerations

Women were asked for voluntary participation in this study. Before they agree to be a part of the study, they were informed about the study objectives, the required sample size, and the expected benefits. The questionnaire was made anonymous to maintain subjects' confidentiality.

RESULTS AND DISCUSSION

The recent study shows that all the study participants have exposed to different types of domestic violence at least once in their lives. About (57 %) of women exposed to domestic violence by their husbands, This result agreed with the result of (7) who depict that the majority of women experience violence committed by their husbands (61.1%). Women who exposed to violence by the husband was negatively related with (age of husband, education, culture, drug abuse ,...ect) . Also show the psychological violence is the commonest type of domestic violence was experienceby the study sample. This result supported by Zeidan, (2015) ³ who found that women were exposed to emotional or psychological violence more than physical and sexual violence. The researcher explains the risk for domestic violence against women by the psychological status of family, which is considered the most common reasons for domestic violence. Followed by husband's drug addiction, husband's consumption of alcohol, and not doing the household chores properly. Lower educational level, being unemployment, type of family, lower income, and having more children that factors are also associated with domestic violence. According to AL-Hadrawi (2018) ⁸, addiction negatively impact several aspect of individuals' lives and diminish their family and social relationships, which can be a reason for family conflict that leads to domestic violence. The study also shows that (68.7%) of study participants had moderate level of depressive symptoms. This findings agree with the study done by (Pico-Alfonso et al.,2006) ⁹, who indicate that exposure to different types of violence are place victims at greater risk for moderate or severe depression, especially women who exposed to physical and/or psychological violence. The incidence and severity of depressive, anxiety symptoms, PTSD, and thoughts of suicide are more likely to be found among

women who exposed to domestic violence than those who do not experience violence. Significant statistical relationship between marital status and depressive symptoms was found as shown in (table 6). The results indicate that single women are more vulnerable to depressive symptom than other groups. The study reveals a positive correlation between depression and all types of domestic violence women may experience. Regression analysis was also run to predict depression from different types of domestic violence. Regression analysis shows that all types of domestic violence added significant values to the prediction of depression among women with ($p \leq .05$). This findings goes along with the finding of other studies done by (Maldonado et al., 2015; Martin et al., 2006)^{10,11}. Researchers reported that unmarried women were at higher risk for depression. This results can be determined that single female exposed to violence from different family members. “In other words, women who experience different levels of abuse are more likely to experience feeling of unhappiness, hopelessness, and a lack of meaning in existence, which are considered symptoms of depression or psychological distress¹¹.

2	The Mother	9	3.0
3	The brother	53	17.7
4	Husband	170	56.7
5	Others	13	4.3
	Total	300	100.0%

CONCLUSION

Most of women exposed to domestic violence by their husbands, commonly the psychological type of violence. Any type of domestic violence the women experience increases their vulnerability to depression, especially unmarried women. Domestic violence is significantly associated with depression level of victim women. Women who exposed to domestic violence from more than a family member are at higher risk for depression.

Association of Obesity, Diabetes, and Hypertension with Cognitive Impairment in Older age

Rafid Hadi Hameed ¹

¹Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

The main objective of this study is to test the Association of obesity, diabetes, and hypertension with cognitive impairment in older age. Age-related cognitive impairment prevalence is increasing globally. Though regarding its epidemiology, its prevalence has not been characterized. The study aims to calculate the function of hypertension, obesity and diabetes in older people and their association with cognitive impairment.

Keyword: Diabetes, Hypertension, Obesity, Older age

INTRODUCTION

Complications and metabolic syndrome threatens the worldwide health. A huge economic cost has been generated due to high prevalence in various nations which rises over time. Cognitive impairment prevalence is high among older people ¹⁻³. Cognitive impairment and age-related are rising in prevalence because of the worldwide aging societies. In the USA, about 22% of older people currently have cognitive impaired. This has been associated with metabolic syndrome ². Obesity, hypertension, and diabetes have been assessed for their relationship contributing. According to the previous studies, the risk of late impairment is due to the midlife obesity and hypertension. There is a well-established association of diabetes to cognitive impairment future and present risk. On the other hand, perspective and cross-sectional investigations with short periods of follow-ups have come up with mixed results¹¹. Late-life hypertension and obesity have been associated with increased impairment in these studies. Measurement issues such as the BMI further complicate the analysis for obesity. Besides, the roles and obesity warrant clarification in particular ^{4,20}. In light of that, the majority of previous epidemiological investigations often fails

to consider that hypertension, obesity, and diabetes are rare in correlated and tend to cluster in individuals. This study used data from three clinical trials. The data used in this study had metabolic characterization and detailed baseline to investigate the cognitive impairment relationship with diabetes, obesity, and hypertension in the cross-sectional analysis ⁸. Also, the study considered the potential mutual confounding. The study finally pooled the results for combined estimates across the three studies.

MATERIALS AND METHOD

This study was a quantitative research study which used questionnaires to collect data, which was then analyzed to come up with findings and a conclusion. In addition, the study used original baseline data. The three studies included SuDoCo, DECS, and OCTOPUS which were obtained for the cross-sectional association secondary analysis of obesity, blood pressure, hypertension and diabetes and body mass index with cognitive impairment present in the analyses of long binomial regression. In this study, cognitive impairment got defined. It scored more than two standard deviations below the cognitive test on at least one of 5-11 tests. Participants who were underweight got excluded. Finally, the study results were pooled across studies.

Design and sample

Several studies have been conducted previously to test the Association of cognitive impairment in older age

Corresponding author:

Rafid Hadi Hameed

Ministry of Public Health, Maysan Health Department,
Maysan governorate, Iraq;

E-mail: rafidhadii@gmail.com

with obesity, diabetes, and hypertension with. This study analyzed baseline data from three different studies. This was in an effective design of observational and cross-sectional study because the studies were randomized for control trials with secondary/primary outcome POCD. At pre-surgery assessment, all the cognitive and clinical data in the study got measured. In the study sample, data from SuDoCo, DECS, and OCTOPUS were used²³. Cross-institutional collaboration led to access to the original data. Recruitment procedures, inclusion criteria, and study design provided that any participant was excluded if they had a neurological deficit. The study excluded patients with mini-mental state examination in SuDoCo. In DECS, the study excluded those with mental illness. Each of the three studies trials assessed the intervention effect on POCD. The neurocognitive assessment was administered in each of the three studies after and before for the presence of cross-sectional analysis purpose. The study used data from those who finished the pre-surgery cognitive test and the data collected at pre-surgery baseline assessment. The study also included data Patient with missing data on obesity, hypertension and diabetes and underweight patient all totaling 19 were excluded from the analyses.

The development of a questionnaire

In order to identify participants history of hypertension and diabetes, the study used self-administered reported medical history questionnaires. BMI was calculated from the participant's weight and height. The study defined obesity as a BMI of less than 18.5 kg/m². On the other hand, in SuDoCo and OCTOPUS, blood pressure was measured before surgery during the days at pre-anesthetic assessment^{3, 22}. Participants self-reported their level of education in DECS and OCTOPUS. In OCTOPUS study, 11 neuropsychological tests were administered by the trained staff. On the other hand, in SuDoCo and DECS, 6 and five neuropsychological test was administered respectively. Nonsurgical control groups were used to complete all the three studies test to provide normative data. The study showed that all the Neurocognitive tests were sensitive to age. They also included Neurocognitive domains which included mental flexibility, manual dexterity, and attention, processing speed and working memory²¹. Respective normative groups were matched for cognitive function. Paper-pencil versions of Subjective Ordering Task, Trail-Making Test B, Sternberg Letter Cancellation Task, and Grooved Pegboard Test were all applied for OCTOPUS.

Besides, paper-pencil versions were used for DECS. The SuDoCo trial covered Choice Reaction Time tests, Spatial Recognition Memory, Pattern Recognition Memory, and the Motor Screening Test.

Data collection

The study collected data at pre-surgery baseline assessment. The self-administered reported medical history questioners were distributed using multiple log-binomial regression. This was used to determine the associations of each parameter. The questioners were also distributed using revised Dillman method to increase the response rate of the questioners.

Variables and data analysis

The study determined the associations of each metabolic function parameters by the use of multiple log-binomial regression analyses. Unadjusted prevalence, ratios model 0 were estimated by the first model. Sex and age got entered in model 1 as covariables. The study used model 2 for the respective remaining metabolic risk factors control. For instance, analyses of diabetes, hypertension, and obesity got controlled¹⁵. This helped in evaluating the independence of any associations from mutual confounding. For DECS and OCTOPUS studies, there were available data on the educational level of participants. Thus, the educational level got adjusted in model 13 which was the final steps. The study indicated that estimated level of risk corresponded to blood pressure increments by 10-point. Data analysis was performed separately for the three studies. The analyzed data got pooled in fixed-effects inverse variance. On the other hand, were entered the corresponding p-values to the first decimal point. The models were used to estimate risk ratios. The study used random effects models to repeat fully adjusted models (model 2). Table one: shows the proportion of variance in the three studies. Additionally, the pooled analyses helped to estimate of risk across all the three studies participants who were 1545.

RESULTS AND DISCUSSION

The participant analysis was based on N= 272 participants from OCTOPUS, N=272 participants from DECS and N=1001 from SuDoCo as shown in Table 1. The study analyzed a totaled 1545 participants. The participants had a mean age of 61 years to 70 years. 29% of the participants showed cognitive

impairment in DECS. 45.6 % of the participants showed cognitive impairment in OCTOPUS while 8.2% of the participants showed cognitive impairment in SuDoCo. After analyses for hypertension and diabetes age, sex, the study showed that obesity was associated with a 1.29 increased risk. However, none of the risk factors which remained were associated with impairment. Although the majority of these studies only identified each of these candidate prediction with consideration or in isolation of few other metabolic factors, the contribution of individuals of each participant to cognitive outcome in that analysis may have been obscured because all correlate with each other strongly^{10,18}. Besides, investigations which were previously done identified obesity and diabetes and hypertension measured later in life as a cognitive impairment risk factors. One of the first studies investigating cognitive impairment established the cross-sectional relationship of cognitive impairment presence with higher BMI and Obesity was independent of comorbid hypertension and diabetes. Obesity association cognition mediation association by the presence of hypertension and diabetes is unlikely. [9, 10] This is because mediating factors control could affect size reduction. Though, an influence possibility of subclinical elevated insulin resistance remained. Cognitive impairment is not only associated with hypertension and diabetes themselves associated according to the cross-sectional data of this study. Disparity reasons from previous epidemiological studies that impacted diabetes and hypertension in cognitive risk are not clear¹⁷. Furthermore, the cognitive impairment definition according to this study is less sensitive to pathological changes¹⁸. However, none of the studies has clearly determined cognitive impairment and association of cognitive impairment with metabolic risk factors. Every year, about four million deaths attributed

to a high BMI worldwide¹⁶. On the other hand, though obesity is modifiable and preventable, it is a global health problem which is threatening because it increases the risk of poor health outcomes. The study found out that those who were at a higher risk of cognitive impairment were obese individuals. The study also found that increasing BMI among normal-weight people, obesity and overweight increases cognitive risk. Though there was no data on the BMI changes across lifespan²⁵. The pathology which links cognitive impairment with obesity understood poorly but may be casual. Obesity induces the vasculature systemic damage. This can lead to cerebral white matter. Obesity also leads to a pro-inflammatory. However, the relationship of cognitive impairment with BMI in the analysis of this study indicated their effects. Following reduced physical activity or increased food intake, obesity might result at the beginning of cognitive impairment. The study, on the other hand, had several limitations. This means that in comparison with dwelling samples in the community, patient will be less healthy. The result pooled across the three studies was heterogeneous regarding sample characteristics and design which complicates the findings interpretation. Third the single time assessments were used to determine metabolic parameters²⁵. The definition of obesity through the BMI does not capture body fat distribution and this is the main cause of negative health outcome link to obesity. Large Cis also limits the results of this study. Further investigations and studies are needed to evaluate the external validity of the findings through replication in the community-dwelling sample. After understanding obesity role in cognitive impairment, the health program or preventive pharmacological strategies could reduce the risk of cognitive risk in older people and other people who are at high risk of being overweight.

Table 1. Showing the sample characteristics of the three studies

Sample characteristics	DECS	SuDoCo	OCTOPUS
n	272	1001	272
mean \pm sD , age, years,	\pm 11.9, 64.1	\pm 6.5, 69.9	\pm 9.1, 61.4

Model 3: +education	–	53.4%	1.38 (0.82, 2.25)	46.6%	1.29 (0.79, 2.02)	–	1.33 (0.94, 1.87)

CONCLUSION

The study results indicated that obese older people have a higher prevalence of cognitive impairment. The complications of the metabolic syndrome threatens world health. Prevalence is high in most countries and rises over time generating huge economic costs. Obesity and diabetes and hypertension measured later in life as a cognitive impairment risk factors. Cognitive impairment is not only associated with hypertension and diabetes

themselves associated according to the cross-sectional data of this study Measurement issues such as the BMI further complicate the analysis for obesity. Besides, the roles and obesity warrant clarification in particular. Cognitive impairment and age-related are rising in prevalence because of the worldwide aging societies. In the USA, about 22% of older people currently have cognitive impaired. This has been associated with metabolic syndrome. Further, prospective studies should

be done to investigate this association.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq and all experiments were carried out in accordance with approved guidelines.

ABSTRACT

Learning situation witnesses a shift from focusing on supplying information about subject matters to developing as much relevant thinking skills as possible. Actually, subject matters and thinking skills are interrelated as the former is the context which stimulates the learners' thinking. This paper aims at investigating basic thinking skills thought to be integrated to the content of the activity book "English for Iraq 3rd Primary", by Etherton and MacBurine 2016. To this end, the researchers designed a taxonomy of basic thinking skills in light of which the content of that book was analyzed and they employed a mixed-method of analysis (qualitative- quantitative method). The results confirm the integration of both low and high thinking skills in various percentages and it is concluded that this variety is justifiable as the immense integration of certain skills and the gradual introduction of others are expected to establish for an advanced level of thinking.

Keywords: *Content Analysis, Subject Matter, Thinking Skills, Learning, Educational Exercises.*

INTRODUCTION

Language is a cognitive system which involves encoding the outside world into a mental projected world and externalizing the inner world to those around us. Learning a foreign language, however, involves mapping a new mental world onto the already existing one. The English activity books are thought to be very supportive in this aspect. They provide the context where the learners are lent the chance to practice the re-encoding of the outside environment and structure another projected world that conforms to the new domain of knowledge represented by the English language. Accordingly, the content of activity books are more than just subject matters, they have some abstract domain which is intended to address the learners' thinking. "English for Iraq 3rd Primary", by Etherton, Sally and MacBurine 2016, is a new English syllabus designed for the 3rd Iraqi grade primary pupils. One component of this Syllabus is the activity book

which is intended to provide pupils with an opportunity to practice the English language through a number of exercises and activities presented in eight units. The current study aims at analyzing the content of this book to identify to what extent its' content addresses the pupils' basic thinking, and recording inferences relevant to the results of this analysis. Content analysis is a very useful device that enables the researchers to investigate a wide range of information about various educational topics ¹ and it allows an objective, a systematic and a quantitative description of the core of the content ². According to Parveen and Showkate (2017) ³, content analysis is "the analysis of what is being said, written, or recorded". It is a technique which helps researcher derive valid and reliable inferences from the texts ⁴. In their definitions of content analysis, the educators focus on a specific aspects like objectivity, system, reliability, validity, qualitative and quantitative description of the messages that the researcher gets from analyzing the text by using this technique in his analysis. The researcher can analyze and study different types of contents such as diaries, newspaper content, short stories, messages of TV, videos, documents or any symbols because this technique gives replicable and objective inferences for the messages received from the text data ⁵. ⁶ defines subject matter as a fundamental element of the curriculum which involves many resources of knowledge that must be contained in a curriculum to be a meaningful. At the same time, subject matter is the main device that teachers and makers of curriculum use to fulfill the larger goals which integrate thought, purpose and action. As the fruits of education are the processes of thought which the learners acquired from the study of a subject, not from the information itself, thinking skills should then be included in the school curriculum and merged with subjects and through various levels. Thinking skills should not be considered as being separated from learning process. Moreover, developing thinking skills demands a permanent training by giving the learners many opportunities to practice through a group of complex thinking processes (Humanities Unit Curriculum Development Institute Education Department, 1995). Many educationalists suppose that there are general thinking skills which are not assignable to a specific subject but are transferable. In fact, these skills are emphasized at the present time as they are noticed to be very simple, objective and easy to be identified and sub- divided into further components of thinking sub-skills. General skills are expected to be integrated within all stages of education to provide the learners with a better ability of thinking. Hence, there is a demanding tendency to shift the concept of teaching from knowledge transmission to thinking tutoring⁷. There are various definitions of the basic thinking skills and there is much historical literature about the types of thinking which influence teaching. The educators have not agreed-upon a certain taxonomy of the basic thinking skills. Therefore; we can find many taxonomies for this type of thinking depending on their creators' points of view which are based on a specific theory of thinking and its nature. The researchers prepare a list of the basic thinking skills depending on their readings of both the relative studies and the taxonomies presented by researchers in this field. The researchers divide basic thinking skills into two levels. The lower level includes (observation, comprehension, encoding, remembering and organization). The higher level also comprises (classification, comparison, application, query and problem's identification).

METHODOLOGY

Due to content analysis method, data classification and themes or patterns identification bring about subjective interpretation of the content (Hsieh & Shannon,

2005:1278) through recognizing "core consistencies and meanings" (Patton, 2002:453) implied in the content under analysis. Accordingly, the researchers adopt the following procedures to get into interpretations of the outcomes of their analysis:

Sample of Study: The sample intended to be analyzed in this study involves the 182 exercises which constitute the content of the English activity book "English for Iraq 3rd Primary", by Etherton, Sally and MacBurrine 2016 .

Tool of Analysis: To achieve the aim of the study, the researchers design a taxonomy of the basic thinking skills depending on their readings of the relevant studies and the many taxonomies that have been presented in this field. The designed taxonomy is reviewed by some experts in the field of education and methods of teaching English as a foreign language. They suggest some modifications which are taken into consideration in deciding the final pattern of the taxonomy.

Steps of the Analysis: The researchers review the content of each exercise in the activity book under investigation to find out the subject matters that these exercises handle in general. Then, they determine the relevance of content of these exercises to each of the basic thinking skill in the designed taxonomy. After that, the frequency of each skill is calculated.

Reliability of Analysis: It is achieved by the intra-rater statistical method. The researchers analyzed a random sample (about 10%) of the total number of the exercises in the activity book with three weeks interval. The reliability was 0.94 which is, statistically speaking, considered high.

Statistical Tools: These tools involve frequencies, percentages and Holsti equation to calculate the reliability level of the analysis.

RESULTS AND DISCUSSION

Table (1) shows that all basic thinking skills within the designed taxonomy are incorporated in the activity book under analysis, but the distribution of these skills is not the same in all the exercises. Application skill occupies the highest percentage and frequency (i.e.30.8%,150) among all the other skills, followed by observation (28.54%,139), remembering (18.69%,91), organization (12.94%,63), encoding (4.93%,24), classification and query (1.23%,6 for each),

comprehension and comparison (0.62%, 3 for each), and finally problem identification (0.40%, 2). The outcome of analysis confirm the availability of both the lower and the higher thinking skills included in the designed taxonomy. The highest levels of availability are occupied by application and observation skills. Taking into consideration that the learners are dealing with a new language, they need to have as much input as possible because they are expected to build a new language repertoire. Hence, observation is expected to be addressed more frequently by the exercises. However, the analysis shows that application skill overweigh observation. In fact, the activity book for the 3rd primary stage is built on the syllabus of the previous two stages (1st primary and 2nd primary) and is intended to develop the learners' skills and knowledge for the next levels, application is then required to root what the learners have already taught and hence it is stimulated more than other skills. The third more frequently addressed skill is remembering through which the learners recall the already stored information to put it into application domain. This skill is linked with both observation and application throughout the exercises in the activity book. Some tasks required remembering some information as a preparatory step to practice application, while observing certain context elements is employed to activate remembering. Obviously, the occurrence of the three skills (application, observation and remembering) in the first three ranks mirrors their interrelationship on the conceptual level. Organization, the fourth highest occurred skill, involves following particular sequence in arranging items. This skill is expected to exploit observation and remembering of observable variables. It is logical to be the third in sequence in comparison to observation and remembering as the latter serve as the ground for this skill within the domain of the activity book under analysis. The syllabus for 3rd primary aims at enhancing and deepening the skills and knowledge gotten in the previous stages (i.e. 1st and 2nd primary) and founding for the next level which is a more advanced one. Accordingly, activating mental storage (encoding skill) received a moderate emphasis. It was not totally absent but providing a further material to be encoded is simply limited to a particular percentage (4.93%) to allow the learners to practice other skills which are thought to be more essential for the aim of this particular stage. Each of the Classification and the Query skills take up

(1.23%) which is a low percentage. Classification is the skill through which one is able to put items into groups depending on interrelationships and relevant properties of these items while query involves generating questions related to specific subject. The concept of relevance is essential in the two skills and it requires enough knowledge about features of and relations between entities that are intended to be classified or questioned about. A learner must be aware of the links between the components of a particular subject to be able to generate questions about it, and this implicates the ability to keep what is relevant and odd out what is not through directing attention to what is shared by all the items in question and this is the core of classification. Hence, comparable occurrence of these two skills at is thought to be justifiable as query may comprise classification as one of its mental operations. Comprehension and comparison show the same weigh in the statistical calculations; each occupies (0.62 %) among all other skills. This parallel presence of the two skills can be attributed to the fact that differentiating similarities and differences between entities is one of the externalized domain of the passive understanding (comprehension) of the overall associations between entities available in the learners' context of learning (items, vocabularies, images, etc.), and the variables in their concrete environment. In the activity book under analysis, Problem's identification skill has the lowest percentage is limited to training the learners to clarify the identity of a particular image after following certain scheme to complete it. The scheme is represented by the alphabet letters and the identity of the image produced after tracing the scheme of letters is expressed by a word that has been taught to the learners. Problem's identification in this context is expected to be effective in teaching the learners to take the privilege of the background knowledge and past experience in determining the details of a problem. The low percentage dedicated for this skill is due to the limited knowledge of the English language on the learners' part. Putting too much emphasis on this skill at this stage may make the learners panic and consequently affect their thinking in general due to lack of both self- confidence and motivation. However, simple activation of this skill in a manner that conform to the learners' age and experience is more fruitful in training their thinking.

Table 1. Frequencies and Percentages of Basic Thinking Skills in the Activity Book “English for Iraq 3rd Primary”

Basic Thinking Skills	Frequencies	Percentages
The Lower Level		
Observation	139	28.54 %
Comprehension	3	0.62 %
Encoding	24	4.93 %
Remembering	91	18.69 %
Organization	63	12.94 %
Basic Thinking Skills	Frequencies	Percentages
The Higher Level		
Classification	6	1.23 %
Comparison	3	0.62 %
Application	150	30.80 %
Query	6	1.23 %
Problem 's Identification	2	0.40 %

CONCLUSION

After examining the results of analysis, the researchers get into the following conclusions: The unequal distribution of these skills is expectable as the learners’ brain is just like a muscle in that it needs gradual practice to make it flexible enough to receive and bear more training. Accordingly, the step by step insertion of some skills with low percentages serves an integrative frame through which one skill is built on the already trained skill and at the same time prepare the learners’ brain to some higher skills. This combination of varied percentages of various skills is thought to be submissive to the goals of the syllabus set specifically to 3rd primary stage. It is found that in the analyzed sample some skills are prompted to be boosters in that they are intended to root other skills that have been already trained (i.e. application boosts both encoding and remembering). While some other skills are addressed to act as founders in that they have a grounding role and serve as a basis on which other skills are built (i.e. remembering grounds for organization), (observation grounds for all skills). It is possible to say that boosters received more weight than founders as the former goes

along with the aim of the syllabus. The analysis also confirms the notion that prompting a particular thinking skill rather than another is highly dependent on the contextual elements attached to the instruction. There is no one to one correspondence between the particular linguistic form of an instruction and the thinking skill it stimulates. The content of activities in the sample of analysis is proved to be a multi-layers, the surface layer is the linguistic form of the instructions and the deep layer is the skills activated by these instructions. While analyzing the various activities, the researchers infer that the foregrounding of one skill, even in case of one word instruction where no further context elements are provided, does not entail the absence of other skills. It is, hence, concluded that while the instruction brings one skill on stage, other relative skills are present in the background taking their role in the revival of that invited skill. Although comprehension is a basic primary skill it has received the second lowest percentage. In the light of what is mentioned in ⁵, comprehension comprises a combination of sub skills, when all controlled, allow the learners to have good competency to deal with different situations. Direct activation of comprehension received (0.62%); yet activating and reinforcing other skills such as observation, encoding, remembering, organization... etc. nurture comprehension because these skills cast the fruit of their training in nourishing comprehension.

Detection of Parasites from two Species of Biological Vectors in the City of Samawah

Yassir Dakheel Kremsh Alasadiy

College of Education for Pure Sciences, AL-Muthanna University, Iraq

ABSTRACT

The current research is the first study on the role of cockroaches as a biological vector for a group of parasites. 150 samples of cockroaches belonging to American species (92 samples) and German species (58 samples) were collected during the period from August 2017 to April 2018, from two areas in Samawah city. The highest parasite prevalence was recorded in cockroaches collected from toilets (56.03, 34.04), and a total prevalence of (56.67, 33.33), for both species of cockroaches respectively, were followed (66.67) by kitchens and Bedrooms and sitting rooms for *Periplaneta americana* and in kitchens (33.33) for *Blattella germanica*, while the lowest percentage in Bedrooms and sitting rooms was (16.67) for *Blattella germanica*. Statistical analysis showed statistically significant differences in the samples collected from toilets compared to samples collected from kitchens and rooms. The current study recorded four species of protozoa, *Entamoeba histolytica* was first 20(21.74), 22(37.93) and second was *Entamoeba coli* 17(18.47), 10(17.24) and third was *Eimeria spp* parasite 15(16.30), 8(13.79) and *Giardia lamblia* parasite was ranked fourth 9(9.89), 5(8.62) and two species of worms, *Enterobius vermicularis* was the first 75(81.52), 45(79.31) and *Hymenolepis nana* was the second 10(10.87) 5(8.62).

Keywords: Cockroaches, Insect, Pathogens, Food, Cyst, Worms, Houses.

INTRODUCTION

Reproduction and feeding of the animal's parasites (vertebrate and in a vertebrate) depend on several mechanisms for their movement between different hosts, transport is most easily by parasites called "ectoparasites" living near or on the host surface while the internal parasites called "endoparasites" that it must penetrate external defenses and get inside the host. The most important sources of exposure to parasites a: contaminated soil or water: containing the ova or the cysts phases of some parasites such as *Entamoeba histolytica* and *Ancylostoma duodenale*, b: food and vegetables contaminated: foods and vegetables contaminated with ova worm or larvae of some parasites such as *Giardia lamblia*, *Taenia saginata*, c: a petition

with animals: These are animals that are in contact with humans such as dogs, cats, rats and others, d: The use of tools of others: parasites are transmitted from one person to another using the tools of the infected person¹. Cockroaches belong to Blattodea, called termites, and the dominant belief is that they are independent of cockroaches. Currently, 3,500 species and more than 400 species were described worldwide² The name cockroach "comes from the Spanish word for palaces, cucaracha, which turned from the popular English 1620s into cock and cockroach"³ The scientific name is derived from the Latin word blatta, which means "insect avoids light", which in Latin has not only released on cockroaches, but also on another insect such as mantis⁴. Some studies have shown that internal and external parasites can be transmitted by cockroaches. Other studies have found that cockroaches produce an antigen that causes many human health problems. Cockroaches are dangerous when they invade the place where humans live. It carries several types of bacteria, viruses and parasites (protozoa and parasitic worms) in the stool and on certain parts of the body, such as legs and wings, which can cause diseases such as "dysentery, diarrhea and salmonella. Email: dr.yassiralasadiy@mu.edu.iq

addition, the flowing stool and skin often cause asthma that affects people, which happens to a large extent in young people and children (5,6,7). Because of the lack of a previous study showing the role of cockroaches in the transmission of pathogens, so the current study is the first study of its kind in the city of Samawah to detect this role in the transmission of parasitic pathogens (cysts, oocysts and ova).

MATERIALS AND METHODS

Collection of samples

During the current research, 150 samples of cockroaches were collected from residential houses randomly selected, located in two areas of Samawah at latitude 30019' North and longitude 45017' East, the first area of Al-Sayigh district and the second area Al-Nasr district, cockroach samples were collected from bathrooms, kitchens and toilets using sterile tools, forceps and hand gloves and were manually caught from 8 am to 12 pm, during the period from August 2017 to April 2018, at the morning cockroaches were transferred to the Environment Pollution Laboratory at the College of Education for Pure Sciences, AL-Muthanna University.

Techniques for identification, isolation and diagnosis of study samples

According to 11-13 cockroaches were identified in this study, which turned out to belong to the American (*Periplaneta americana*) and German (*Blattella germanica*) species. For the purpose of isolating and diagnosing external and internal parasites was followed by the method 14,15.

Statistical analysis

Statistical program analysis SPSS 20, T-test were used to determine that the significant differences or not significant at ($p \leq 0.05$) for the following relationships:-

1. The percentage of distribution between two species of cockroaches
2. The Percentage of parasites prevalence depending on where cockroaches are collected
3. The prevalence of protozoa and helminths parasites according to the diagnosis of cysts, oocysts

and ova of ectoparasites and endoparasites

RESULTS AND DISCUSSION

During the current research, 150 samples of cockroaches were collected from residential houses randomly selected, located in two areas of Samawah city, during the period from August 2017 to April 2018. This period was selected for the presence of cockroaches in these places, which can be collected and conducted the current research, Table (1) shows that all cockroaches collected are of two species: americana species, *Periplaneta americana* and germane species, *Blattella germanica*. *Periplaneta americana* was more widespread 92 (61.33) followed by *Blattella germanica* 58 (38.67), for adults 79 (85.87), 51 (87.93) and nymphs 13 (14.13), 7 (12.07) in both species, respectively. Statistical analysis showed statistically significant differences in the distribution ratio between *Periplaneta americana* and *Blattella germanica* and the difference in favor of the *Periplaneta americana*. These results confirm strongly the results of previous studies, which indicated that *Periplaneta americana* is widespread in different environments more than *Blattella germanica*. The species *Periplaneta americana* is the most distribution in wetlands, but can survive in dry areas if it has access to water, its prefer for live in the temperatures are warm at about 29 °C (84 °F) and cannot withstand cold temperatures, in residential areas, these cockroaches live in subways and drainage sinks and may move outdoors in courtyards when the weather is warm^{14,16,17}. While¹⁸ mentioned that *Blattella germanica* were common 54%, then *Blatta orientalis* by 34% and finally *Periplaneta americana* by 14.8%, while¹⁹ was founded the nymphs and adults of *Blattella germanica* mostly found specially in summer seasons when compared the distributional pattern of other cockroaches (*Periplaneta americana*, *Blattella orientalis*, *Blattella lateralis*) in Lahore, Pakistan. These cockroaches are usually in the cellars, spaces that allow crawling, cracks and openings in the balconies, building institutions and corridors adjacent to the buildings, *Periplaneta americana* are omnivorous insects that feed on decaying organic matter and a variety of other foods, it particularly prefers fermented foods²⁰. Table (2) shows The Percentage of parasites prevalence depending on where cockroaches are collected from three places in each residential houses, of the 150 samples of cockroaches examined showed that the highest parasite prevalence was recorded in cockroaches collected from toilets (56.03,

34.04), and a total prevalence of (56.67, 33.33), for both species of cockroaches respectively, were followed (66.67) by kitchens and Bedrooms and sitting rooms for *Periplaneta americana* and in kitchens(33.33) for *Blattella germanica*, while the lowest percentage in Bedrooms and sitting rooms were (16.67) for *Blattella germanica*. Statistical analysis showed statistically significant differences in the samples collected from toilets compared to samples collected from kitchens and rooms, it may be because both species omnivorous and Scavenger, but prefer fermented organic matter. Adults can live for almost 2-3 months without food (assuming water is available), or less than one month without food or water, this result agreement with ^{7,19} was conducted cockroaches, especially *Periplaneta americana*, are common health problems that threaten the public health of human beings as they relate to human excreta and transportation from sewage systems into homes and government companies. ²¹ was reported 65% of the emigrants *Blattella germanica* came from adjoining kitchen areas. Furthermore it, *Periplaneta americana* “with 0.6% frequency in the surveyed dormitories” prefers moist and wet places such as toilet and sewers, all toilets and some kitchens are considered the best choice and the main entry-source of this species. The current study recorded four species of protozoa according to the diagnosis of cysts or oocysts and two species of worms, the first species of nematode and the second species of Cestoda according to the diagnosis of ova (Table 3 and 4), *Entamoeba histolytica* was first 20(21.74), 22(37.93) and second was *Entamoeba coli* 17(18.47), 10(17.24) and third was *Eimeria spp* parasite 15(16.30), 8(13.79) and *Giardia lamblia* parasite was ranked fourth 9(9.89), 5(8.62), *Enterobius vermicularis* was the first 75(81.52), 45(79.31) and *Hymenolepis nana* was the second 10(10.87) 5(8.62). And that all these species belonging to protozoa and worms are pathogenic and affecting on human health in the first degree, Except *Entamoeba coli*, which is found naturally in the digestive tract of the human being and its existence is evidence of eating drink or food contaminated with cysts of this parasite. The total of the prevalence of protozoa and worms parasites 66.30, 77.59, 92.39, 86.21 which transited by *Periplaneta americana* and *Blattella germanica*. In addition to the first recording of dwarf worms eggs detected from the cockroaches of the current study compared to the previous study, which addressed a range of pathogens transmitted by cockroaches, statistical analysis showed no statistically significant differences,

Many researchers have studied these parasites and will summarize the importance of each parasite

A: *Entamoeba histolytica*, the parasites are widespread, affecting humans, monkeys, dogs, birds, cats and rats, it lives in the large intestinal wall, especially in cecum region, causing amebiasis or amoebic dysentery, which occurs mainly in the tropics areas. The rate of infection in the world is between 0.2 - 50%, especially in poor families and may be due to malnutrition or to unhealthy conditions ¹

B: *Giardia lamblia* is one of the oldest parasites known to humans. This parasite affects both humans and animals and causes significant damage ²³, The differences in virulence between *Giardia lamblia* as well as the immune state of the body determine the progression of the disease clinically. The symptoms associated with diarrhea of *Giardia lamblia* parasites were described by Zeibigs ²⁴, which can be generally seen on the patient Symptoms of Diarrhea: Diarrhea is often a bad smell with Steatorrhea, bloating with abdominal colic, Anorexia, weight loss, vomiting and sometimes accompanied by Fever ²⁵.

C: *Eimeria spp*: *Eimeria* genus comprises a group of species that belong to protozoa parasites that cause coccidiosis. Which is a common disease in different animals and the liver is the most affected organ of this parasite and causes a serious deterioration in growth leads to high mortality rates and economic losses in institutions suffering from poor sanitation ²⁶⁻²⁸.

D; *Enterobius vermicularis*: Causing a disease called enterobiasis, which spreads in most parts of the world and is frequent in Europe, America and Chile. The number of infections in the world is estimated at 209 million, the incidence among low-income people, orphanages and mental health clinics and high infection in children are infected. The infection is transmitted during the Knit and scratch of the area surrounding the anus or inhalation of the air contaminated with the worm eggs and the eggs remain ability to infection between 2-6 days in the wet areas. This worm causes itching, vaginitis, otitis, abdominal pain ¹.

E: *Hymenolepis nana* is the smallest of the tapeworms that nest in the small intestine of humans. Mostly infections in children in hot regions such as India, parts of Russia, the Mediterranean countries, and Latin America, which causes Dwarf Tapeworm infection

disease. The human infection of this worm causes diarrhea, loss of appetite, vomiting, irritation, itching, rashes, and pain abdomen with some neurological effects²³. Cockroaches found to feed directly on some animals and human tissue specially with cases of children who are neglected²⁰. Human excretions contain a lot of allergens that raise the respiratory system and the presence of these insects in the places of sanitation leads to the transfer of these sensitizers to the other person²⁹.

Table 1. The percentage of distribution for two species of cockroaches according to the stage of life during the study period.

Stage of life	The percentage of distribution %	
	<i>Periplaneta americana</i>	<i>Blattella germanica</i>
Adults	79(85.87)	51(87.93)
Nymphs	13(14.13)	7(12.07)
Total percentage of distribution	92(61.33)	58(38.67)

Table 2. The Percentage of parasites prevalence depending on where cockroaches are collected in the current study

Place collection of samples	No. of cockroaches examination	Number positive of the prevalence of cysts , oocytes and ova parasites	
		<i>Periplaneta americana</i>	<i>Blattella germanica</i>
Kitchens	3	2(66.67)	1(33.33)
Toilets	141	79(56.03)	48(34.04)
Bedrooms and sitting rooms	6	4(66.67)	1(16.67)
Total	150	85(56.67)	50(33.33)

Table 3. The prevalence of protozoa parasites by isolating its cysts from two species of cockroaches

Types of protozoa parasite	Number positive of the prevalence of protozoa parasites %	
	By <i>Periplaneta americana</i>	By <i>Blattella germanica</i>
<i>Entamoeba histolytica</i>	20(21.74)	22(37.93)
<i>Entamoeba coli</i>	17(18.47)	10(17.24)
<i>Eimeria spp</i>	15(16.30)	8(13.79)
<i>Giardia lamblia</i>	9(9.89)	5(8.62)
Total	66.30	77.59
No. of cockroaches examination	92	58

Table 4. The prevalence of helminthes parasites by isolating its ova from two species of cockroaches

Species of cockroaches	No. of cockroaches examination	Number positive of the prevalence of helminthes parasites		Total
		<i>Enterobius vermicularis</i>	<i>Hymenolepis nana</i>	
<i>Periplaneta americana</i>	92	75(81.52)	10(10.87)	92.39
<i>Blattella germanica</i>	58	45(79.31)	5(8.62)	86.21

CONCLUSION

We conclude from the results of the present study that there are only two species of cockroaches, namely American species and German species, and that American species are more abundant than German species, and both species have the ability to transport many Pathogens species. This indicates that cockroaches are not specialized in transporting a particular species of parasite. On the other hand, cockroaches play an important role as a biological vector of many microorganisms and worms.

¹College of biotechnology, Al-Qasim Green University, Babylon, Iraq

ABSTRACT

The study was aimed to genetically detection of genes encode outer membrane proteins related with human serum resistance: lipoprotein A (*lppA*) and outer membrane protein (*ompK36*) in 26 isolates of Enterobacteriaceae family isolated from intestinal and extra-intestinal infections. *lppA* and *ompK36* genes were amplified from genomic DNA using conventional PCR of all isolates of Enterobacteriaceae, it was found that 20(76.9%) of Enterobacteriaceae isolates gave positive result for *lppA* gene at 456 bp while only 15(57.6%) of isolates gave positive result for *ompK36* gene at 305 bp. The highest prevalence of *lppA* gene was 100 % and 80% observed among blood and UTI isolates, respectively, while the percent of *lppA* gene among intestinal isolates was (70%) and the lowest incidence of a *lppA* gene was detected in respiratory tract isolates which was 50 %. The *ompK36* was distributed among 70% of intestinal strains and among 50% while only 25% of blood isolates were having *ompK36*. The highest frequency of the *lppA* was observed in 100% of *E.coli* and *Salmonella typhi* strains which gave positive result at 456 bp, The prevalence of the *lppA* gene in *Shigella dysentery*, *P. vulgaris* and *Serratia marcescens* isolates were 80,75 and 50%, respectively.

Keywords: Enterobacteriaceae, PCR, serum resistance, *lppA*, and *ompK36* genes.

INTRODUCTION

Outer membrane proteins (OMPs) are exist in the outer membrane of Gram-negative bacteria. They help in the translocation of solutes across the impermeable outer membrane of Gram negative bacteria. These proteins are also involved in adhesion and invasion of the bacteria ¹. The lipoprotein (*Lpp*) is related with the outer membranes of bacteria within the Enterobacteriaceae family, the *LppA* has formerly been confirmed to play a role in the host's immune response against some gram-negative enteric pathogens, such as *E. coli*, *Salmonella enterica* serovar *t yphimurium*, *K.pneumonia* and *Y. enterocolitica* ²⁻⁵. Bacterial resistance to the mortal effects of human serum appears to contribute to increased virulence in

extraintestinal infections of Enterobacteriaceae and this resistance conferred by (*LppA*) and *ompK36* ⁶. one of an important virulence factor in *Klebsiella pneumoniae* is resistance to phagocytosis process conferred by some proteins encoded genes ⁷. Deletion of the *LppA* gene from *Klebsiella pneumoniae* strains showed reduced protection against killing by phagocytosis, Therefore, the *K. pneumoniae LppA* protein is associated with the conservation of cell envelope integrity and removal of *LppA* reduced the ability of *K.mpneumoniae* to persist in serum ⁵. Loss of *Lpp* genes in *Salmonella* strains result in deficiency in invasion, motility, cytotoxicity stimulation, and synthesis of inflammatory cytokines ³. The uropathogenic *E. coli* strain displayed reduced persistence in a mouse bacteremia form ^{8,9}. Additionally, loss of the outer membrane protein *ompK36* of *K. pneumoniae* leads to developed antibiotic resistance and complement resistance ^{10,11}. Removal of *OmpK36* gene improves serum resistance beside enhances the ingestion by neutrophils ⁶. The aim of this study was to molecular

Al-Qasim Green University, Babylon, Iraq;
E-mail: haydershkhair@yahoo.com.

detection of the *lppA* and *ompK36* genes among Enterobacteriaceae species isolated from intestinal and extraintestinal infections.

MATERIALS AND METHODS

Isolation and Identification

Twenty six of clinical isolates of Enterobacteriaceae were obtained from different sources (urine, blood, stool and sputum) from patients were admitted to the teaching al-Hilla hospital /Babylon province in the period from November 2017 to March 2018. Each specimens were inoculated on selective media and identified by biochemical tests according to the diagnostic techniques mentioned in ¹². Diagnosis was established by the automated method Vitek® 2 (BioMérieux).

Genetic detection of *lppA* and *ompK36*

We used a PCR conventional method for recognition of selected virulence genes included in this study (*lppA* and *ompK36*).

Extraction of Bacterial DNA

The bacterial DNA was extracted from bacterial isolates by using Genomic DNA Mini Bacteria Kit that supplied by the manufacturing company (Geneaid, UK). The DNA suspension was kept at -20 C until used for PCR amplifying.

PCR Amplifications

Recognition of interest genes of *E. coli*, *Klebsiella pneumonia*, *Shigella dysenteriae*, *Serratia marcescens*, *Salmonella typhi*, *Proteus vulgaris* were accomplished by amplifying the genes via PCR. The primers used in this study were provided by (Macrogen Company, Korea) /Descriptions and sequences of the PCR are displayed in (Table 2-1).

RESULTS AND DISCUSSION

The distribution of bacterial genes according to the site of infection

A total of 26 Enterobacterial isolates has been isolated from different clinical infections. The highest prevalence of the *lppA* gene was observed among blood and UTI isolates (100 % and 80%), respectively, while the percentage of a *lppA* gene among intestinal isolates was (70%) and the lowest prevalence of a *lppA*

gene was observed in respiratory tract isolates which was 50 % (Table 1). The *ompK36* gene was distributed among 70% of intestinal infections and in 50% of both urinary and respiratory tracts infections while only 25% of blood isolates were having *ompK36* gene. Other studies showed that two lipoproteins were involved in pathogenesis of *E.coli* and *Salmonella typhimarium* ^{3,4}. Diao *et al.*, 2017 ⁸ found that *lpp* protein is essential for virulence of uropathogenic *E. coli* CFT073 strain in a mouse bacteremia infection form through stopping complement-mediated bacterial killing.

Molecular detection of virulence factors genes among Enterobacteriaceae isolates

lppA and *ompK36* genes encoded important virulence factors in enterobacterial isolates were genetically scanned by PCR for detection of the presence of these genes that related to human serum resistance in 26 isolates of Enterobacteriaceae family, it was found that 20(76.92%) of Enterobacteriaceae species gave positive result for *lppA* at 456bp, and only 15 (57.6%) of Enterobacteriaceae isolates gave positive result for *ompK36* gene at 305bp as shown in table 2. Zhang *et al.*, 1998 ² showed that both *LP* and *LPS* acted synergistically to prompt cytokine production through different mechanisms and. *Lppa* plays vital role in pathogenesis of species of Enterobacteriaceae such as *E.coli*, *Salmonella typhimarium* and *Yersinia pestis* ³. The *ompK36* is a major porin involved in serum resistance by inhibiting phagocytosis lead to increasing virulence of bacteria ⁶. The highest prevalence of the *lppA* gene was observed in 100% of *E.coli* and *Salmonella typhi* strains which gave positive result at 456 bp, this result comparable with Diao *et al.*, 2017 ⁸ study who found that lipoprotein (*Lpp*) is a major outer membrane lipoprotein in *Escherichia coli* and deletion of *lpp* in uropathogenic *E. coli* strain CFT073 showed decreased persistence in a mouse bacteremia form, and this strain was sensitive to serum killing *in vitro*. Phan *et al.* 2013 ⁹ confirmed an association between *lpp* and serum resistance of *E. coli* ST131 strain, *lppA* and *lppB* were observed as two forms of the lipoprotein genes *lpp* in *S. enterica* serovar *typhimurium* and deletion of *lpp* gene resulted in weakening of bacteria in their motility, invasiveness, and chemokine production and such mutated strains were less virulence in mice when given by systemic and oral ways compared to the wild-type (WT) strain ¹⁶. The prevalence of the *lppA* gene in *Shigella dysenteriae*, *P. vulgaris* and *Serratia marcescens* isolates were 80, 75

and 50% respectively, as shown in figure 1. Kaca *et al.*, 2009¹⁷ confirmed that the smooth *P. mirabilis* S1959 (O3) strain was protected from the bactericidal action of serum by outer-membrane proteins. The lowest percent of distribution (40%) of the *lppA* gene was showed in *Klebsiella pneumoniae* strains, the murein lipoprotein (LppA), is a main outer membrane protein (OMPs) that are liberated by gram-negative bacteria through sepsis. The *K. pneumoniae lppA* protein is essential in supporting of cell integrity, participated to virulence through bacteremia caused by *Klebsiella pneumoniae*, these proteins provide resistance against neutrophil ingestion and killing by phagocytes and serum elements⁵. The *ompK36* gene was identified in 100% of *E. coli* isolates and among 60% of *Shigella dysentery* isolates whereas it was observed among 50 % of both *Proteus vulgaris* and *Serratia marcescens* isolates and only 40% of *K. pneumonia* and *Salmonella typhi* isolates were positive for *ompK36* (Figure 2). This mean that 60% of these isolates were lacking of *ompk36*. Wasfi *et al.*, 2016¹³ showed that the distribution of the *ompK36* gene among *K. pneumonia* strains was changeable in different samples from sputum, blood and urine samples. The *ompK36* show a role in *K. pneumoniae* virulence and infection. Nour El Din *et al.* 2016¹⁸ who observed reduced expression of *ompK36* was detected in (52.38%) of *K. pneumoniae* isolates. Three different porins from *Serratia marcescens* were described one of them omp1

which was replicated and sequenced and it shows a large homology to the family of outer membrane porins that composes the major porins of enterobacteria(19). Previous a study by Mitsuyama *et al.*, 1987²⁰ suggested that *Proteus vulgaris* have only one kind of porins proteins. Biswas (2000)²¹ found association between porin and inflammatory response in *Shigella dysenteriae* infections. Removal of *OmpK36* can lead to the decreasing in virulence of extremely virulent strains and can increase their ingestion by polymorphonuclears phagocytes²². Additional studies revealed that mutant's strains with an *ompK36* removal can inhabit the liver, but cannot remain, after intraperitoneal inoculation. One approach by which *OmpK36* may participate to virulence *in vivo* is by stopping phagocytosis, and this was confirmed by increasing the ingestion of mutants strains by human neutrophils after deletion of an *ompK36* gene²². This is probably due to a modification in the binding of bacteria to phagocytes caused by the absence of the *ompK36*²³. The deficiency of a direct contact between an *ompK36* and a C1q complement protein may describe greater resistance against serum killing in the *ompK36* mutant⁶. A wide range of antibiotics move across the cell wall of *K. pneumoniae* via a channel provided by the *ompK35* and *ompK36* cell wall, therefore elimination of these porins result in more antibiotics resistance^{42,11}.

Where M: Marker (2000-100bp), lane (1-5) *E. coli*, lane (6-10) *K. pneumonia*, lane (11-15) *Salmonella typhi*, lane (16-20) *Shigella dysentery*, lane (21-22) *Serratia marcescens* and lane (23-26) *Proteus vulgaris*.

Figure 1. Agarose gel electrophoresis image that shown the PCR product of a virulence factor gene (*ompK36*) at (305bp) in different bacterial isolates. Where M: Marker (2000-100bp), lane (1-5) *E. coli*, lane (6-10) *K. pneumonia*, lane (11-15) *Salmonella typhi*, lane (16-20) *Shigella dysentery*, lane (21-22) *Serratia marcescens* and lane (23-26) *Proteus vulgaris*.

CONCLUSION

The present study concluded that high prevalence of the *lppA* and *ompK36* genes which encoded for membrane proteins that are responsible for human serum resistance among local Enterobacteriaceae species isolated from different clinical infections and high rate of distribution of these genes was identified in isolates obtained from extraintestinal infections.

Effectiveness of Nursing Intervention for Early Detection of Breast Cancer among Working Women at Baghdad City

Iqbal Majeed Abbas¹, Rabe'a Mohsen Ali¹, Widad K. Mohammed², Iman Abdel Razzak Jaber³

¹Maternal and Neonate Nursing Department, College of Nursing, University of Baghdad, Iraq, ²Adult nursing department, college of nursing, University of Baghdad- Iraq, ³Dean Assistant for Scientific Affairs, Higher Health Vocations Institute -Ministry of Health - Baghdad- Iraq

ABSTRACT

Objectives: To identify the knowledge before and after implementation of nursing interventions and to determine the impact of nursing interventions upon women's practices of BSE in post test and to find out the relationship between women's practices after two months toward performing and management of breast self-examination among study group with studied variables. A quasi-experimental design (one group, a pretest- post test approach) was carried out on (120) working women at Ministry of Industry & Minerals / State Battery Manufacturing Company and Sewing Factory Baghdad (Tents) and Higher Judicial Council- Iraq at Baghdad city. The study demonstrated that the highest percentage (39.2 %) within age group of (41-50) years, (30%) were **primary** school graduate, (59.2 %) were married and (73.9 %) of them their age at marriage is (20-39) years old with mean and SD (**25.18±7.72**), (**45.8%**) of them were live in nuclear families. The highest percentage (53.3 %) of study sample their age at menarche is between 13-14 years, (85.8 %) has a regular menstrual cycle. (54.5%) of them had (1-4) pregnancies, (72.7%) had (1-4) deliveries, (72.7%) did not have any type of abortion, (12.5%) had infertility, (27.3%) using hormonal contraceptive.

Keywords: Breast cancer, Breast Clinical Examination, Breast Self-Examination, Knowledge and Practice.

INTRODUCTION

Breast cancer is the most common cancer among women both in developed and developing countries and is the leading causes of morbidity and mortality worldwide, with approximately 14 million new cases and 8.2 million cancer related deaths¹. It was estimated that the majority (53%) of cases of female breast cancer were occurring in less developed countries. While incidence rates still remain much higher in more developed countries, this shift in the global distribution of cases highlights that breast cancer is continuing to emerge as a major public health problem worldwide². Globally, breast cancer is the most common malignant neoplasm among women in all over the world and responsible for about (12%) for deaths³. It was reported that cancer is the

fourth ranked cause of death in Eastern Mediterranean Region (EMR), after cardiovascular diseases, infections / parasitic diseases and injuries according to WHO report. Incidence and mortality rates are decreasing in developed countries because of early detection and improved treatment in addition to screening program. In contrast in the developing world, lack of information and awareness, absence of nationwide mammographic screening program and women neglecting their health and delay in search for treatment⁴. Female breast cancer incidence rates decreased by about 2% per year from 1999 to 2005. This decrease was reported only in women aged 50 or older, may be due to decline in use of hormone replacement therapy after menopause. Early education on breast self-examination and early screening is extremely important in reducing incidence of breast cancer and achieving optimal outcomes. So empirical evidence suggests that triple assessment technique i.e. breast self-examination (BSE), mammography and \ or ultrasonography and clinical breast examination (CBE) help to ensure early detection, reduce cancer mortality

E-mail: iqbalmajeed1900@gmail.com

rate among women and improve survival rates⁵. It was reported that breast self and clinical examination will detect cancer at a rate between 70% - 80%. Screening mammography (mammograms) will increase detection to 96% - 98%. Clinical examination and mammography can reduce breast carcinoma mortality by 20% to 30%. Screening should start with a baseline mammogram at age 35, or younger if there is strong family history. Annual examination should be performed once a woman reached 40 years of age, and self-examination should be encouraged monthly starting at the age of twenty and continue to carry out through woman lifetime⁶. The high incidence and mortality rates of breast cancer, as well as the high cost of treatment and limited resources available, require intensive health education and continual training toward BSE. The costs and benefits of fighting breast cancer have a positive impact upon early detection and screening which need to be carefully weighed against other competing health needs⁷⁻⁹.

MATERIALS AND METHODS

A quasi-experimental design (one group, a pretest-post test approach) was carried out on (120) working women at Ministry of Industry & Minerals / State Battery Manufacturing Company and Sewing Factory Baghdad (Tents) and Higher Judicial Council-Iraq at Baghdad city. The study sample was exposed to nursing intervention regarding breast self-examination for early detection of breast cancer. Participants were identified by convenient sampling of eligible women met at their job sites. Study sample is divided into seven groups each group is consisted of 15-20 participants. Content validity of the questionnaire has been determined through a panel of eight experts in the specialist medical and nursing fields, while the reliability of the questionnaire has been determined by test and retest approach. The data have been collected during the period from 3rd August 2014 to 30th June 2015 by a questionnaire through self-administered and allow time to fill their response at their will with convenience, private and confidential setting, and comprised of three parts (demographic and reproductive variables, knowledge which consisted of (23) items and practices (16 items) regarding breast self-examination. Implementation of breast self-examination (BSE) as a nursing intervention for early detection of breast cancer: it was implemented through classroom session which was introduced with respect to the essential information relative to the women's needs to perform BSE. It was designed and scheduled

for one day. Intervention session were managed by the following teaching methods: lectures, posters, training for the subjects on breast self-examination simulator and model, in addition to video film and distributing three types of pamphlets (breast self-examination, clinical breast examination and mammography).

RESULTS AND DISCUSSION

Table (1) shows the age group of the study sample which was ranged between (21 – 59) years with mean and SD is (42.88±10.53). the highest percentage (39.5 %) within age group of (41-50) years, (30%) **primary** school graduate, (59.2 %) were married and (73.9 %) of them their age at marriage is (20-39) years old with mean and SD (25.18±7.72), (45.8%) of the study sample live in nuclear families only 5% of them smokers, while (95%) did not have positive smoking, finally (32.5 %) of them were exposed to negative smoking. Table 2 revealed that the highest percentage (53.3 %) of study sample their age at menarche is between 13-14 years, (85.8 %) had a regular menstrual cycle. Age at menopause=48.05±3.75 Min. 40 Max. 54, SE = 0.616, n= 37, (54.5%) of them have (1-4) pregnancies, (72.7%) have (1-4) deliveries, (73.8%) did not have any type of abortion, while 27.3% have abortion, (12.5%) have infertility, while (87.5%) did not have any type of infertility previously,(27.3%) using hormonal contraceptive, (72.7%) did not use hormonal contraceptives, (70.9%) of them are previously lactating mothers and the majority of them using both breasts for lactation. This table revealed that the highest percentage (63.3 %) of study sample did not have previous history of cancer within their families while the rest of study sample had previous history of cancer, more than half of the sample had breast cancer, 52.3% of them are within third degree of consanguinity. Table 3 depicted that there were low and moderate mean scores in most items related to knowledge regarding breast self-examination in pre-test with low relative sufficiency. While there were high and moderate mean scores and relative sufficiency in most items of knowledge in post test after the implementation of nursing intervention with high statistical significant differences between knowledge in pre and posttest regarding breast self-examination. Table 4 depicted that there were high and moderate mean scores in majority of items related to practices of breast self-examination after implementation of nursing intervention. The study demonstrated that the highest percentage (39.2 %) within age group of (41-50) years, (30%) were **primary** school graduate, (59.2 %) were

married and (73.9 %) of them their age at marriage is (20-39) years old with mean and SD (25.18±7.72), (45.8%) of them were live in nuclear families as shown in table (1). This result is in constant with Elwan et al. who reported that the peak frequency of breast cancer increased with age until menopause and then start to decline¹⁰. It was stated that women's age, level of education and those who heard or read about breast cancers considered as a significant predictors of BSE Practice¹¹, while other studies were found that socio-demographic variable were not effective on BSE practice¹². The highest percentage (53.3 %) of study sample their age at menarche is between 13-14 years, (85.8 %) has a regular menstrual cycle. Age at menopause= 48.05±3.75 Min. 40, Max. 54, SE = 0.616, n= 37, (54.5%) of them had (1-4) pregnancies, (72.7%) had (1-4) deliveries, (72.7%) did not have any type of abortion, while 27.3% had abortion, (12.5%) had infertility, while (87.5%) did not have any type of infertility previously, (27.3%) using hormonal contraceptive (72.7 %) did not use hormonal contraceptives, (70.9%) of them were previously lactating mothers, and majority of them used both breasts for lactation as shown in table (2). This study depicted that the highest percentage (63.3 %) of study sample did not have previous history of cancer within their families, while 36.7% of them had previous history of cancer, more than half of the sample had breast cancer, and 52.3% of them are within third degree of consanguinity as shown in table (3). According to ACS (2005) women with family history of breast cancer have a greater risk of developing cancer in their generation especially at first- degree relative (mother, father or daughter and son). A family history of ovarian cancer also increase a risk of breast cancer of women. It was indicated that a positive family history of breast cancer is a strong risk factor for breast cancer at young age¹⁴. The study depicted that there were high and moderate mean scores in majority of items related to practice of breast self-examination after implementation of nursing intervention in table (5).

CONCLUSION

This study indicated that there were more than half of study sample have a barriers toward breast self-examination. There are a statistical significant differences between knowledge in pre and posttest regarding breast self-examination. This study indicated that nursing intervention on BSE could be improve early detection of breast cancer by monthly regular breast self-examination. Overall our findings indicate that the practice of monthly BSE after nursing interventions to implement and re-enforce their awareness about cancer screening programs in Iraq. Practice of breast self-examination is high among working women after nursing intervention therefore a training program on this issue will have impact to avert and reduce the severe morbidity and mortality rate of breast cancer in Iraq.

Effectiveness of Planned Teaching Program regarding Autistic Child in Mothers' Knowledge in Thi- Qar Autistic Center in AL- Nasiriya City

Suror H. Aneed¹, Eqbal G. Ali Ma'ala²

¹ Academic nurse, University of Thi-Qar/ college of nursing, Ministry of Higher Education & scientific research, Iraq, ² Pediatric Nursing Department, College of Nursing, University of Baghdad, Baghdad city, Iraq

ABSTRACT

The study aims to assess mother's knowledge toward autism children and construct an program for mother's according to their assessment needs the planned-teaching regarding autistic child in autism center in AL- Nasiriya city. A quasi experimental study was used for the present study which was carried out from 20th November 2017 to the 1st August 2018 in order to determine Effectiveness of Planned Teaching Program regarding Autistic Child in Mothers Knowledge in Thi-Qar Autistic Center in AL- Nasiriya City, a purposive (non- probability) sample was used in this study the sample composed of (60) mothers accompanied their autistic children include (30) sample for study group and (30) sample for control group. The validity of the questionnaire was obtained through a panel of experts and the internal consistency reliability was achieved through the application of Alpha Correlation Coefficient ($r=0.76$) which was statistically acceptable. The results indicated that mothers had moderate level of knowledge about the child of autism for all items of the scale before apply program. After apply program there are no significant correlation between age, gender, level of education, social status, number of autistic children, mother's profession and between mother's knowledge about autism.

Keywords: effectiveness/ program, autistic child, knowledge, mother.

INTRODUCTION

Autism is a neurological disorder that affects the brain and cause of weakness in the formation of social relations, communication skills and language, and emotional and sensory development¹. One in every 68 children is diagnosed Autism Spectrum Disorder (ASD) in the United States. It occurs four to five times more in boys than girls. Autism symptoms appear in early infancy and is characterized by low social interaction, communication, and present of stereotypes/ repeated behaviors attention deficit, seizure disorder, sensory integration disorder, & sleep disturbance². There is no cure for children with the autism spectrum, however; there are many treatments used to

treat dysfunctional behaviors promote development and increase independence. Treatments can be divided into three main categories: including behavioral therapy, medicines, and occupational therapy³. Mothers of children with autism may suffer from tension in marital relations, extended family relationships, resentment, social isolation, depression, increases in stress, financial difficulties or relationship difficulties, anxiety, problems, lack of information when individuals access unhelpful information & this may frustrate them even further⁴. Behavioral issues on more frequent and intensive basis. Moreover, mothers are more likely to be held responsible for the behavior of their children⁵. Terms of caregiver requirements and spend more time with the child (e.g. doctor's appointments; social activities) mother. It is important for parents of children with autism to get all the information needed in order to get a better understanding condition and the situation of their child choose the appropriate one treatment as well as support for

community, professional programs assistance and availability of services and programs for families with children with disabilities⁶. Special education programs and intensive behavioral therapy early in the life of children can help with autism to get self-care and social, and function, skills often can improve performance behaviors which are not good; these educational programs apply to children around the age of three⁷. The study aims to: (1) assess mother's knowledge toward autistic children (2) construct an program for mothers according to their assessment needs for the planned-teaching regarding autistic child in autism center in AL-Nasiriya city. (3) apply The program "planned teaching regarding autistic child on the mothers knowledge in Thi- Qar autism center". (4) find -Out the relationship between the mother' knowledge about planned teaching regarding autistic child and their demographic characteristics such as their age, gender, level of give birth at child, number of children education, marital status occupation of parents, mother age when in the family, & number of autistic child in the family. (5) find -out the effectiveness of planned teaching program regarding autistic child on the mother's knowledge after the application of the planned program.

MATERIALS AND METHOD

A quasi experimental study was used for the present study which was carried out for the period of 20th November 2017 to the 1st August 2018. The study was carried out to evaluate the Effectiveness of Planned Teaching Program regarding Autistic Child in Mothers' Knowledge in Thi- Qar Autistic Center in AL- Nasiriya City, as a main objective of this study. A purposive (non-probability) sample was used in this study that composed of (60) mothers their autistic children include (30) sample for study group and (30) sample for control group in AL- Nasiriya City was involved in the present study. The data have been collected by using self-administration method to answer the questionnaire format of the mothers their autistic children to assess mothers' knowledge about autistic child before beginning the program. The data collected from the mothers (pretest-post-test1-post -test 2), the data collection process has been performed from (3 March, 2018) to (5 May, 2018). The questionnaire composed of two part the first part is related to the demographic variables of children and their mother and the second part is related to the

mother' knowledge of autistic child. It composed of (48) aspects, scored and rated according to the three levels scale for practice which are indicated by score (3) for always, scored (2) for sometimes, and score (1) for never this measured mean of score. Questionnaire is actually consist of (48) sub items. The test covers relevant points from major content area of instructional program. For the purpose of this study, the number of correct response or the knowledge questionnaire is used as the measure level of knowledge. The mothers in the study have been given knowledge test prior to the implementation of instructional program and were retested after implementing the instructional program. The validity of the questionnaire was determined through a panel of (17) experts chosen from medical and nursing in addition individuals in related to center the autistic. The internal consistency of the instrument was determined through the pilot study and the computation of Alpha Correlation Coefficient (Cronbach's Alpha) which was ($r = 0.76$). The data were collected for the present study through the utilization of the self-administrative questionnaire, by using the Arabic version of the questionnaire for all subjects who were included in the study sample. The researcher distributed the questionnaire for mothers after taking their willing to participate in this study, the interview was conducted with volunteer mothers. It took about 20 to 30 minutes for interviewing and after that the questionnaire was collected. Statistical analyses were conducted by using statistical package for social science (SPSS) version (24) Data analysis was employed through the application of descriptive and inferential statistical approaches which were performed through the computation of the following: frequencies, percentage, standard deviation, alpha correlation, coefficient, t-test and ANOVA

RESULTS AND DISCUSSION

Table -1- revealed that (30%) of child in as age the study group are within the age group (4years) while (26.7%) of child in the control group are within the age (3years), gender in the study present were male. Onset of autistic symptom were in third year of age, while diagnosis autism in the study were in third year of age. Concerning registered of child in a specialized center, both groups (60%) were stated of less of one year. Moreover, most of the children have sleep problem (60%), (63.3%) of child in the study and control groups respectively. **Table -2-** revealed that

the age of mothers were (30-34years).Occupational were employee. the socio-economic status were moderate level, while the residency of parents in the urban area. Type of family living single family. Number of children in family have two children. In relation to the education level of mother (30%) were college graduate,. Most of mothers were married .Finally the maternal age when birth child with disorder were (29-32 years). Table 3 shows high percentage (76.7 %) were moderate level score for pre-test of study group .This table Also, shows high percentile (66.7 %) were high level score for post-1 test of study group. In relation to post-2 test the study group presented (53.3%) for the high level. Table 4 shows that there is no statistical significant association between mothers' age and their knowledge concerning autism child ,of this (p value > 0.05),there are no differences between age group and mean of knowledge when analyzed by ANOVA. Table5- shows that there is statistical high significant association between mothers' level of education and their knowledge concerning the concerning autism child , of this (p value > 0.05),while there is no statistical significant association between mothers' level of education and their knowledge. Table- 6- shows that there is no statistical significant association between mothers' marital status and their knowledge concerning the autism child, and no differences between marital status and mean of knowledge. The study revealed that child in the study group are within the age group (4years) while in the control group are within the age (3years),the researcher emphasizes most the children in this age group are more active and increase motor skills

and the beginning of the disorder. The present study reveal that (70%,76%) of children in the study group and also the control group respectively were male. The findings of the present study supportive evidence is available in the study that showed (78.2% of children were male)⁸. Present study show that of the children their onset of autistics symptom at second year of age. This study supported evidence is available in the study that showed (diagnosed at the age were2&3years)⁹.The results reveals that registered of child in a specialized center, both groups were stated of less of one year. The results reveals that majority of the children have sleep problem in both group. The findings of the present study supportive evidence is available in the study that showed (two-thirds of individuals with autism are affected by sleep problems)¹⁰.conceruning Age of the mothers were (30-34years).The researcher emphasizes is more participant in this age. Occupational were employee. The findings of the present study supportive evidence is available in the study that showed (the majority of the respondents held professional jobs)¹¹. The results reveal that there are no statistical significant association between mothers' age and their knowledge concerning autism child. The findings of the present study supportive evidence is available in the study that showed (there are significant association between child and their mothers and their knowledge about autism)¹⁵. The results reveal that there is statistical high significant association between mothers' level of education and their knowledge there are denote level of education affected on mothers' knowledge.

Total	30	1.77 ± 0.430	2.67 ± 0.479	2.53 ± 0.507
		F =0.144 d.f.= 27 P = 0.866	F = 0.325 d.f.= 27 P = 0.725	F = 0.921 d.f.= 27 P = 0.410

CONCLUSION

The results indicated that mothers had moderate level of knowledge about the child of autism for all items of the scale before apply program. After apply program there are no significant correlation between age, gender, level of education, social status, number of autistic children, mother’s profession and between mother’s knowledge about autism.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Pediatric Nursing Department,

College of Nursing, University of Baghdad, Baghdad city, Iraq and all experiments were carried out in accordance with approved guidelines.

Evaluation Study of Risk Factors (Alcohol, Smoking, Age, Family History, and Obesity) Associated with both Rheumatoid Arthritis and Cancer

Rafid Hadi Hameed

¹Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

This research has been done to evaluate if there is a reduction of the results of risk factors associated with both Rheumatoid Arthritis and Cancer. It has been found that among the most common risk factors among the two diseases are; Alcohol, Smoking, age, family history, and obesity. Smoking has been found to have higher results in both diseases as compared to the other factors. Also, obesity has been found to have significantly reduced as a risk factor for cancer. However, although most of the risk factors have reduced significantly, the prevalence of both diseases is still high and hence there is a need for further research to evaluate the other risk factors which are associated with both RA and Cancer.

Keywords: Cancer, Rheumatoid Arthritis, Smoking, Obesity.

INTRODUCTION

Rheumatoid Arthritis and cancer are among the lethal diseases in the human history. Many people have died of the complications which come as a result of these diseases. Rheumatoid Arthritis is a chronic disease which is marked with the inflammation of the joints. This disease mostly affects the hand joints ¹. At an advanced stage, rheumatoid Arthritis affects all the body organs which lead to complications in the heart, the respiratory system, nerves, and the eyes¹. Rheumatoid Arthritis is most common to ladies as compared to men. In a study done by the Australian Bureau of Statistics, it was found that 2% of the Australian citizen had the disease whereby 1.5% of those affected were men and 2.4% were women¹. The prevalence was higher in those people aged 65 years and above. Cancer is a genetic disease which arises due to the change of the genes which control how the body cells work. It affects the division and growth of cells. These genetic changes can be inherited from parents to offspring's or they can occur due to the errors which

occur during the division of cells or due to the damage of the DNA which is caused by certain environmental exposures ². Every individual's cancer has a unique combination of genetic changes and as cancer grows, more changes may occur. The genetic changes which occur affect three main types of genes that are Proto-oncogenes, tumor suppressor genes, and the DNA repair genes². Since this disease happens due to genetic changes, it is hard to treat it but it can be maintained and controlled. In the recent past, the prevalence of the disease has decreased due to the increased research in the field and advancement in technology which has helped in controlling the hazards which cause cancer. On average, in the developed countries 0.3% of every 100000 people are undergoing cancer treatment as compared to 0.6% in every 100000 people in the past ten years ³. Though there is a significant decrease in the prevalence of cancer and Rheumatoid Arthritis, the numbers of those affected are still high. This paper will discuss the results of these two diseases based on data collected from different regions and evaluate if there is a significant decrease in the prevalence of the two diseases.

METHODOLOGY

Many studies have been done to assess if there is a reduction in the risk factors for both cancer and rheumatoid arthritis. Many of those studies have proved

that there is a significant decrease with other contracting such information. This study will focus on accessing if there is a reduction of those risk factors. This current research study was a quantitative research study which used questionnaires to collect data, which was then analyzed to come up with results, findings and a conclusion.

Study design, sample and sampling procedure

A research design is the conceptual framework within which a study is conducted. It gives a blueprint for data collection, analysis, and measurement¹⁷. This study will be a descriptive research which will be conducted by issuing of questionnaires through a survey. The sample size of this study will be 150 participants globally who will be invited to participate in the survey after meeting the selection criteria. This large sample size has been chosen so that during analysis, the assumption of normality can be made. This is in line with the central limit theorem which states that as the sample size approaches infinity, the data approaches the normal distribution¹⁸. The study will use purposive sampling. This is a non-probability sampling method which allows a researcher to choose a given sample based on set rules. It is the most convenient method of sampling for an online survey since the researcher does not meet physically with the participants so that he or she can apply probability sampling methods²⁰. Only participants who have been suffering from cancer or rheumatoid arthritis will be allowed to participate.

Questionnaire design

The researcher will design the questionnaire and upload it online as a survey and then people who have had cancer and RA complications will be allowed to participate. The first few questions in the questionnaire will be designed such that they will determine if that specific participant is eligible for the study so that the researcher will be able to eliminate all the non-eligible participants and get the required sample.

Data collection

After the survey has been conducted, the data will be downloaded into an excel file and for cleaning and selection of the sample based on the set rules. Only a sample of 150 participants will be selected for the analysis.

Variables and data analysis

Both parametric and non-parametric analysis will be used in the process of data analysis. This is because the questionnaire will contain questions which will lead to the collection of both nominal and scale data hence need to use both analysis methods. Parametric analysis is convenient for scale data and non-parametric analysis is convenient for scale data²¹.

RESULTS AND DISCUSSION

Out of the 150 participants, 54.7% (82 out of 150) were males and 45.3% (68 out of 150) were females suggesting that men had a higher risk of developing either cancer or RA. Also, 70% of the participants were responding to the cancer questions with only 30% that is 45 out of 150 responding to the RA questions. This shows there is a higher prevalence of cancer as compared to RA **Table 1**. Out of the 105 participants who were answering the cancer questions, the researcher found that the minimum age was 18 years with the maximum being 87 years. The mean age was 51 years suggesting that those people within the age brackets of 50 years and above had a higher risk of developing cancer.

Obesity

The 105 participants who were victims of cancer were asked if they have ever had obesity at one time in their lives. Only 5.9 percent of the participants acknowledge to have suffered from obesity with 62% saying that they had never suffered from obesity. This suggests that there is a higher reduction of obesity as a risk factor for cancer.

Smoking

The cancer patients were asked if they have ever smoked in their lifetime. 76% of the participants claimed to have smoked with only 24% who claimed to have never smoked in their lifetime. This shows that smoking is still a higher risk factor for cancer. Out of the 105 cancer participants, only 25% said that they had taken beer with 74% saying that had not taken. This suggests that the results for alcohol as a risk factor for cancer had significantly decreased contradicting a research which was done on 2016 and suggested that there was no significant decrease of alcohol and its risk to cancer-related complications.

Rheumatoid Arthritis**Obesity**

Out of the 45 victims, 66% claimed that they were obese before they developed the RA complications with only 33% who stated that they were not obese. This shows that the results for obesity as a risk factor for RA has not reduced hence rhyming with De la Rosa research of 2018.

Alcohol

Many studies have listed alcohol as one among the highest risk factors of RA. Dogan found that those people who had taken alcohol in any time of their life had 4 times higher risk of developing RA as compared to those who had not taken it. In this study it was found that 90% of the participants who had RA were once drunkard as compared to only 10% who had never taken alcohol in their life. This shows that alcohol is still a higher risk factor for RA.

Cancer risk factors**Alcohol, Tobacco, and their risks of cancer development**

Alcohol has been linked as a risk factor for cancer development. Excessive use of the alcohol damages the body tissues. Those cells which are damaged by the alcohol may try to repair themselves which in turn can lead to DNA changes hence increasing the chances of Cancer Development⁵. Also, the bacteria which live in the Colon and the Rectum can convert alcohol into acetaldehyde which has been shown to cause cancer⁵.

Obesity, Diet and their risk of cancer development

Obesity is a condition in which a person has unhealthy or distribution of fats in the body. Obesity is directly related to diet⁵. Those people who rely on poor diet have a higher risk of developing obesity. On the other hand, those people who develop obesity have a higher risk of developing cancer. According to research done in 2004, obese women had four times risk of developing endometrial cancer as compared to those who were not obese⁷. The study also stated that obese men or women had twice the risk of developing Gastric cardiac cancer, Liver cancer and Kidney cancer as compared to those who were not obese⁷ In another study, the prevalence of

Meningioma type of cancer increased by about 50% in obese people as compared to 20% of those people who were not overweight⁸. Gallbladder and breast cancer affected more than 60% of obese people as compared to 12% of those who were not obese⁹. Ovarian cancer in women was found to affect 45% of obese women as compared to only 16% of those who were not obese¹⁰. From this analysis it is evident that obesity is among the risk factors for cancer.

Rheumatoid Arthritis risk factors

Rheumatoid Arthritis occurs when the immune system attacks the Synovia. The resulting inflammation thickens the synovia which can destroy the cartilage and the bone within the joint. There are many risk factors associated with rheumatoid arthritis. Among the most common risk factors are; smoking and obesity¹¹. Also, there are some risk factors which cannot be controlled like age, family history, and gender.

Smoking as a risk factor for Rheumatoid Arthritis

Smoking has been listed as one among the extrinsic risk factors of rheumatoid Arthritis. This is because smoking increases the oxidative stress in the body which is believed to increase the risk of rheumatoid arthritis¹². In a Swedish population, it was found that the main predictor of severe RA was smoking which had a risk ratio of 2.45. [12] In a Korean population it was found that smoking was closely associated with RA with a risk ratio of 5.006 in comparison to alcohol drinking¹². This shows that smoking is among the highest risk factors which are associated with Rheumatoid arthritis.

Age and gender as a risk factor for rheumatoid arthritis

RA has been found to affect women more than men. In a research conducted to evaluate the prevalence of women to men with RA, it was found that the ratio of women to men was 3:1 with women making up to 75% cases of the RA¹⁵. The ratio decreased to 2:1 after 15 years suggesting that as age increases the prevalence reduces for women¹⁵. Among the behavioral tendencies which make women to have higher risk than men are; hormones, genetic, and lifestyles.

Table 1. Risk factors for cancer according to gender.

		Frequency	Percent	Valid Percent	Cumulative Percent

CONCLUSION

This research has found that most of the risk factors for cancer are still the risk factors for RA. Majority of those risk factors tend to affect people at the age of fifty years and above and hence lead to the development of both cancer and RA. However, the results for many of the risk factors of the two diseases has reduced significantly with only smoking for both RA and cancer remaining as a higher risk factor. The participants of the study were drawn from all walks of life hence representing the picture of the trend of both diseases. Also, the research was conducted using a survey hence everybody was able to participate since identity was hidden.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq and all experiments were carried out in accordance with approved guidelines.

Identification of Active Pharmaceutical Ingredients in *Thevetia neriifolia* Juss Leaf Callus using Analysis of GC-MS

Siham A. Salim

Al-Musaib Technical College, Al-Furat Al-Awsat Technical University, Iraq

ABSTRACT

Plants of *Thevetia neriifolia* are recorded from the most important medicinal plants that used in folklore medicine in different countries. Most of its parts were used to treat different diseases and having antioxidant, antimicrobial and anti-inflammations activities. Callus induction was occurred by culturing of leaf explants that were taken from eight years old trees on Murashige and Skoog (MS) medium supplemented with the auxin 2,4-D at 3.0 mg. l⁻¹. After the gaining of suitable amount of callus and extracted with hexane, the screening of active phytochemicals was achieved by using the analysis of GC-MS. The results showed the presence of forty different compounds that diagnosed in the callus extract with different retention times and peak areas, the main compounds that having various pharmaceutical features including: Hexatriacontane (23.095%), Nonacosane (8.849%), .beta.-Amyrin (8.060%), 2-Methylhexacosane (6.870%), .alpha.-Amyrin (4.446%), Octacosane (4.309%), Phenol, 2,2'-methylenebis-(1,1-dimethylethyl)-4-methyl- (4.030%), Vitamin E (3.134%), .beta.-Sitosterol (3.254%), Isopropyl myristate (2.777%), 1,2-Benzisothiazol-3-amine tbdms (2.886%), Pentatriacontane (1.716%) Squalene (1.170%).

Keywords: *Phytochemicals, medicinal plants, GC-MS technique, Thevetia neriifolia, callus.*

INTRODUCTION

Plant tissue culture is an important and potent source for production of effective secondary metabolites (or phytochemicals). This technique carries many important benefits in the production and extraction of active compounds from small explants in small areas with short periods of time over the year without resorting to the significant depletion of large-scale cultivated plants that caused by traditional methods^{1,2}. The medicinal plants play an important vital-role in everyday human life as they are natural factories for the production of many effective compounds that contribute to the treatment of various infections and diseases. Several studies have been carried out on most medicinal plants for the purpose of increasing the production of active phytochemicals (like phenolic compounds, alkaloids, terpenoids, tannins, steroids, flavonoids and glycosides) on the commercial and pharmaceutical scale. These studies included: the selection of plants with high productivity for effective compounds and manipulation of the conditions of culture or using of precursors, biotic and abiotic elicitors, metabolic engineering and culturing of plant tissue and

organs through the use of different techniques of plant tissue culture^{3,4}. *Thevetia neriifolia* Juss (belongs to the family Apocynaceae) is one of the medicinal plants, and most of its parts were used in folk medicine as anti-septic, disinfectant, anti-bacterial and anti-fungal infections. It is ; therefore, used in the treatment of acute heart disorders, arthritis, gout, ulcers, tooth-ache, acne, nausea, abdominal-pain, diarrhea, dysrhythmias and as strong anti-oxidants. The medicinal importance of this plant is due to its containment of medically effective compounds, such as alkaloids, phenols, glycosides and terpens^{5,6}. Several organic solvents have been used to extract the active secondary metabolites from medicinal plants, including chloroform, methanol, ethanol, hexane and petroleum ether. These active compounds have been quantified using various chromatographic techniques based on standard compounds of the active compounds⁷. Gas chromatography-mass spectrometry (GC-MS) technique is one of the most advanced and effective techniques for screening and identifying the active secondary metabolites that exist in any plant sample without resorting to the use of standard compounds. It provides a library that contain a wide range of mass-

spectrometers for compounds that can be compared with crude materials separated from plant samples^{8,9}. The main objective of this study is focused on the extraction and investigate the active secondary metabolites (phytochemicals) in the callus induced from leaves of *Thevetia neriiifolia* plant using GC-MS technique.

MATERIALS AND METHOD

In vitro-induction of callus from leaf explants

This research was carried out in the plant tissue culture laboratory of Department of Plant Production Techniques at Al Musaib Technical College. Intact and healthy leaves were taken from the *T. neriiifolia* plant (eight-years old) and washed well with running-water and liquid soap to remove dirt from them. Then, they were immersed in a 2% solution of sodium-hypochlorites in the laminar-air-flow cabinet for 15 min., after that, they were rinsed thoroughly with sterile distilled water twice for 2 min. each. The sterile leaves were cut into pieces of 5-10 mm long used as explants and cultured in glass-jars (3*15 cm) containing 20 ml of full-strength MS medium¹⁰ supplemented with 30 g. l⁻¹ sucrose, 3.0 mg. l⁻¹ 2,4-Dichlorophenoxy acetic acid (2,4-D) and 7.0 g. l⁻¹ agar for solidifying before autoclaving at 121 °C and 1.04 Kg. cm⁻¹ for 20 min. Cultures were incubated in the growth-room at 25 ± 2 °C and light-intensity of 1000 lux for photo-period of 14 h. After five weeks, the callus that formed on the explants was sub-cultured on the same formula of medium to increase the biomass of callus for drying and extraction.

Callus extraction and GC-MS analysis conditions

The callus from previous experiment was dried at a temperature of 70 °C in the oven and grinded to fine powder. Extraction process was performed by adding 5 ml of n-hexane to 5 mg of callus powder and left for 6 hrs, the mixture was then centrifuged at 4000 rpm for 10 min. The phytochemicals were identified in the crude-extract of callus using GC-MS(Agilent 19091S-33UI) apparatus equipped with National Institute of Standard and Technology (NIST)Library; column HP-5MS capillary column (cross-bond 5% diphenyl-95% dimethylpolysiloxane): 30m(L)× 250µm(i. d.) with a 0.25 µm film thickness; injection temperature: 290 °C; column temperature: 40 °C held to 2 min., rising 4 °C. min⁻¹, then rising to 290 °C and held for 5 min.; injection mode: split: split at ratio 1 : 20; injected volume: 5 µl. The carrier-gas was Helium (99.99 %); acquisition mass

range: 40-600 m. z⁻¹. The compounds of the extract were identified by comparing their retention indices with NIST library.

RESULTS AND DISCUSSION

The results indicated the efficacy of the auxin 2,4-D in the induction of the callus from leaves of *T. neriiifolia* and increase its biomass, and this is in agreement with many previous studies in the induction of callus using 2,4-D alone and from different explants and different plant species they studied, such as the induction of callus from leaves and stems of *Gymnema sylvestre*¹¹; seeds of *Boerhaavia paniculata* (Souza *et al.*, 2014) and leaves, petioles and internodes of *Terminalia arjuna*. Results presented in Table –1 and Figure – 2, revealed the presence of 40 compounds of active phytochemicals that found in the hexane-fraction of the leaf callus of *T. neriiifolia* and detected with GC-MS, from which the major dominant compound was Hexatriacontane(23.095 %), followed by the compounds: Table 1 Other compounds that were appeared in less than one-percentage were: Hentriacontane (0.377 %); 1-Decanol, 2-hexyl- (0.657 %); Indazol-4-one,3,6,6-trimethyl-1-phthalazin-1-yl-1,5,6,7-tetrahydro- (0.262 %); 2-Dodecen-1-yl(-)succinic anhydride(0.274 %); Nonadecyl trifluoroacetate (0.224 %); 1H-Indene,5-butyl-6-hexyloctahydro- (0.173 %); 1-Nonadecene (0.327 %); Oleic acid (0.202 %); Ethyl iso-allocholate (0.130 %); Benzene,2-fluoro-1-methyl-4-nitro (0.578 %); 1,2-Cyclohexanedicarboxylic acid, hexyl isohexyl ester (0.801 %); 1,2-Cyclohexanedicarboxylic acid, hexyl nonyl ester (0.924 %); N-(3-Chlorophenyl)-bis(2,2,3,3-pentafluoropropane)amide (0.385 %); Octasiloxane, 1,1,3,3,5,5,7,7,9,9,11,11,13,13,15,15-hexadecamethyl- (0.236 %); 1H-Indole-2-carboxylic acid,6-(4-ethoxyphenyl)-3-methyl-4-oxo-4,5,6,7-tetrahydro-, isopropyl ester (0.105 %); Batilol (0.447 %); Cyclobarbitol (0.319 %) and Propiophenone, 2'-(trimethylsiloxy)-(0.257 %). Chandar and Ramasamy (2016)¹² referred in their study that the compound Indazol-4-one,3,6,6-trimethyl-1-phthalazin-1-yl-1,5,6,7-tetrahydro-, was isolated for the first time from the ethanolic-extract of *Combretum albidum* leaves. In the current study, this compound was isolated from the hexane extract of *Thevetia neriiifolia* leaf callus, this displays the efficacy of this method for extraction of different active phytochemicals from various plant parts and callus. It was known that the plants belonging to the family Apocynaceae, including the genus *Thevetia*

possess characteristics and recipes make them from the important medicinal plants in treating diseases or as antimicrobial for many pathogenic bacteria such as: *Staphylococcus aureus*, *Bacillus subtilis*, *Salmonella typhi*, *Klebsiella phenonemia* and some fungal strains such as: *Aspergillus niger*, *Candida albicans*, *Fusarium oxysporum* and *Penicillium spp.*(13). This may be due to the presence of various active phytochemicals in such plants with medicinal and pharmaceutical uses. The current study showed that there are various medicinal and pharmaceutical ly active compounds that have been diagnosed in the crude extract of leaf cal lus of *T. nerifolia* plant using GC-MS analysis. Sixteen different compounds of the identified phytochemicals that have been reported to possess different pharmaceutical and therapeutic activities such as anti-inflammatory, anti-oxidant, anti-microbial and anti-cancer activities, making them of special pharmaceutical importance compared to synthetic drugs and anti-oxidants¹³⁻¹⁶. Also, the compound 2-Methylhexacosane has been reported as a reducer of blood-cholesterol and as an anti-microbial¹⁷. In addition, Isopropyl myristate (is an ester of isopropyl-alcohol with myristic acid; a common-fatty acid) which enters into different pharmaceutical industries as a thickening-agent, emollient and skin-enhancer or as anti-oxidant and anti-microbial¹⁷. On the other hand, the compound 2-Dodecen-1-yl(-) succinic anhydride has a structure similar to phenytoin that used as anticonvulsant-agent, thus making it as a natural medicine for treating convulsion, as well as for its activity as anti-oxidant and anti-microbial¹⁸. Oleic acid is a mono-unsaturated fatty acid which has many important therapeutic benefits including anti-cancer, anti-androgenic, anti-oxidant, anti-fungal, anti-bacterial, anemia-genic, anti-inflammtory, inhibition of 5-.alpha.-reductase and dermatili-genic¹⁹. Moreover, Nikalje *et al.*(2017) revealed that the oleic acid can delay or

hinder the progression of the disease adreno-leuko dystrophy(ALD), the deadly disease that causes damages to the brain and the adrenal glands. Additionally, oleic acid has capability of the regulation of many functions in human body such as blood-clotting, blood-pressure and immune response to the infections resulting from wound-injuries, also, it is possibly responsible for the increasing of high-density lipoprotein-cholesterol (HDL) and decreasing low-density lipoprotein-cholesterol (LDL)²⁰. In the study of Ju *et al.*(2014), they revealed to the isolation of the Batilol compound for the first time from *Styela clava* plant. In the current study , this compound was also diagnosed in the leaf cal lus extract of *T. nerifolia*. Batilol has a medical importance by giving it to prevent radiation disease with X-ray and radio-therapy, as well as anti-oxidant activity. Results also showed the presence of the Cyclobarbitol, which is used medical ly in the treatment of insomnia and as anesthetic , anti-convulsant, neuro-transmitter antagonist, skeletal-muscle relaxant²¹. Another important compound is Nonacosane, which has multiple activities including anti-hypertensive activity, also shows angiotensin, vasodilator, AT2-receptor antagonist, Sal-uretic effects, anti-oxidant and anti-bacterial. Vitamin E is one of the most effective compounds that has been diagnosed in the current study and is necessary for a large number of important activities. It reduces the risk of Alzheimer’s and Parkinson’s disease symptoms and as anti-tumor agent. Also, it has anti-inflammatory and analgesic activity, protects cell-membranes from damages and preventing the formation of plaque in the arteries by preventing of low-density lipoprotein-cholesterol oxidation, thus leads to the lowering of cardio-vascular disease risk. Additionally, its effectiveness as anti-oxidant is represented by delaying or preventing the agerelated growth of cataracts of eye. Moreover, it is commonly used in skin-care creams and lotions.

CONCLUSION

The results of the current study show the medical important of the *Thevetia nerifolia* plant to contain many medically and pharmaceutically active phytochemicals that are diagnosed with GC-MS technique. These compounds can be used for curative purposes such as vitamin E, oleic acid, .beta.-sitosterol, alpha and beta-amyrin, squalene, hentriacontane, hexatriacontane, octacosane, nonacosane, isopropyl myristate, 1-nonadecene, and ethyl iso-allocholate which are useful in the treatment of many bacterial, fungal and

viral infections and many diseases. The medical and pharmaceutical effectiveness of many compounds in this plant requires in-depth studies in various fields.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Al-Musaib Technical College, Al-Furat Al-Awsat Technical University, Iraq and all experiments were carried out in accordance with

approved guidelines.

Impact of Multimedia Teaching in the Development of Positive Thinking among Students

Sadiq Hasan Al-Tufaily¹, Hussein Waheed Al-Kaaby¹, Mohammed Kadhim Al-Hamadani¹

¹College of Basic Education, University of Babylon, Babylon Government, Hillah City, Iraq

ABSTRACT

The goal of this research is to find out the impact of Multimedia Teaching in the development of positive thinking among students, and the researcher used the empirical research method as a method for conducting his research and that which included an independent variable (Multimedia) and dependent variable (Development of Positive Thinking). The researcher also used the empirical design of partial regulation to control the research variables, and before starting to apply the experiment, the researcher matched by the following variables (Time age calculated per years, academic attainment for parents, Danliz test of intelligence, first course degrees). After conducting the equivalence between the two research groups, the researcher set the necessary application requirements for the experiment including the study plans, multimedia programs and the positive thinking test for the two research groups. After completion the experiment application, he applied his instruments to the two research groups. After correcting the students' answers, the researcher obtained data of the empirical and control groups where he treated those data statistically using (te-test) for the independent samples. The result showed superiority of the empirical group, which was studied through multimedia, on the control group studied by the variable of positive thinking development.

Keywords: *Multimedia, Positive Thinking, Development*

INTRODUCTION

Interest is focused on education being a tool for change, especially in developing countries, and has become a means of making a new human being. It aims at helping the individual to grow in physical, mental, emotional and social aspects so that he can adapt to himself and to others¹. Education is an important factor in the building of individuals and societies. Nowadays, it has become a cornerstone of all the developments in this world and is an important factor in bringing individuals to the social ladder within their societies. It increases their qualifications as much as the level of education and teaching they achieve². The curriculum is the means of education in achieving its objectives, it is a link between the teacher and the learner, without which the teacher cannot achieve his educational targets, so our curriculums must be sophisticated and renewable to

convoy the changes that occur in the community, and must be based on sound bases and principles to be able to develop the society and modernize it in a way which enables it from launching towards future horizons³. The process of teaching aims, in some senses, to create desired changes and developments in the behavior and morals of the learner and to acquire him skills, information, knowledge, attitudes and values, in order to develop the educational goals which try to achieve behavioral changes at the learner. The teacher must transfer the information and knowledge required in common ways that attract the interest of the student and his desire to learn taking into account his features and his mental and social characteristics⁴. Since we live in a time of science and technology, so we need scientific education, which makes an aware, critical and thought-loving individual. Multimedia is a new technology that allows students to control and come close to multimedia using the computer. It combines audio, image, text and video. The basic multimedia capability is implied in allowing teachers and learners to dig deeper into topics from a larger angle and larger windows⁵. Multimedia is a new technology in teaching and education. It provides students with a

Sadiq Hasan Al-Tufaily.

College of Basic Education, University of Babylon,
Babylon Government, Hillah City, Iraq

gradual integration into the inputs of the educational process through computers. It also provides the student with an educational environment in which all the various educational means are available in an integral unit to receive disconnected data and information selected from various sources to be in one system controlling its sound recordings, drawings, animations, video clips, etc. in an integral system that ensures the student to achieve the desired goals efficiently and effectively through active interaction⁶. It represents a mixture of audio and visual means to present certain data in one or more form. Then such means varied from static and moving images to animations, texts and music. The development of positive thinking: All what distinguishes man in his innovations and achievements lies in the system and performance of thinking he has. The high achievements of man lies in ideas, without the positive ideas, the humanity to be collapsed since a long time, and all what attracts your thinking and move in the positive direction, you'll see it in your performance and work.

METHODOLOGY

The research methodology deals with the research procedures and methodology in terms of experimental design, selecting the research community and its sample, equivalence of groups, control of foreign variables, setting multimedia programs, research tools and experimentation procedures and selection of appropriate statistical methods.

Research Methodology: The researcher used the experimental method of partial regulation, which consists of the two groups. The first experimental group and the second control group, because it is suitable for the objectives of the current study. The experimental group is studied through the multimedia according to the development of positive thinking, and control group studied according to the usual method.

Experimental Design: Experimental design includes the description of the community that composes the members of the experiment and identifying the methods by which the members of the experiment are chosen. It is considered one of the most dangerous tasks that the researcher has to undertake when conducting a scientific experiment, where the safety and truth of the design are the basic guarantee to reach reliable results.

The research community and its sample: It means all the characteristics of the phenomenon studied by the

researcher. The current research community represents second intermediate class students, all of them in the secondary and intermediate day schools of the Directorate of Education of Karbala (Hindiya district), where the number of classes is not less than two. The researcher randomly selected (Al-Ameer intermediate school) and found that it has three classes for the second intermediate class (A-B-C) and in the random drawing method, (C) class selected and which represented the experimental group with (31) students that studied by multimedia. (B) Class represented the control group and its number (33) students which's studied according to the usual way.

The equivalence of the two groups of the research: the researcher was cautious before to start the experiment on the equivalence of the two groups of research statistically in the variables that are believed to affect the results of the research. He obtained information about students through their school card, as well as he distributed a form with Information written on.

Control of foreign variables: One of the most important characteristics of experimental work in its broad concept is to be a valid work, and the control of the foreign variables is one of the important procedures in experimental research. In order to obtain an acceptable rate of internal validity of experimental design, the researcher controlled the foreign variables including experiment circumstances and combined actions. During the experiment period, nothing affected the conditions of the experiment, and the maturity factor. The researcher was able to control this variable by random selection of students as well as conducting tests in a given time period and under the same condition and measurement tool. He controlled this variable through using the same tool with the two groups. This variable was controlled in the experiment where no student was withdrawn or transferred during the experiment period.

Preparation of the research requirements: One of the important and basic research affairs, which according to the research steps are carried out. These requirements selected are represented in (Determination of the scientific material for the experiment). The researcher selected the scientific material to be taught to the two groups of research during the duration of the experiment conduction for the academic years (2017 - 2018). The material included the last two chapters of the geography book of the Arab world to be taught for the

second intermediate grade. The behavioral goals were formulated and the researcher formulated (60) behavioral goals based on three levels of (bloom) classification within the knowledge field which are Definition-Distinction -Application, based on concepts determined previously. The study plans were prepared for the two groups of research represented in the multimedia for the experimental group and the usual method of the control group. And they're (16) plans for each group according to the content of the subject.

Number of responses alternatives: The method of measurement requires that the measured shall identify his responses to each of his phrases and to indicate one of the alternatives before him. And the response alternatives determined as (apply to me always, apply to me sometimes, do not apply to me).

Selection of the grade estimation balance: The study was based on (Likert balance) in the estimation of the test scores, because it is suitable for the sample of the research. The balance is summarized in putting paragraphs and in front of each paragraph a triple scaling of the response, versus the three weights (3-2-1) for the positive items, while the negative paragraphs is the reverse of the positive paragraphs and takes (1-2-3).

Instructions to answer the test items: The test instructions include a set of instructions suitable for students of the second intermediate class in order to facilitate the answer to the paragraphs, including, (choosing the appropriate alternative to your personality, choosing one alternative for each item, leaving empty paragraphs that contain more than one answer.

The test validity: In order to approve the test validity, the researcher relied on two kinds of validity which are apparent validity and logical validity.

Apparent validity: It is one of the easiest types of validity, as it requires the presentation of the test in its preliminary form on a group of experts and specialists who are related to the test subject (8). Therefore, the researcher depended the rate 80% and more to be considered valid. And the apparent test validity was achieved in all its items and so considered valid.

Logical Validity: The researcher achieved this kind of validity through the definition of positive thinking and clarification of its components and the formulation of its paragraphs, The researcher was keen that they

cover and suit positive thinking, so he showed them on the arbitrators in order to know their views, and got the approval of everyone.

Survey application to test positive thinking:

The first survey application, the test was applied to a sample of students of the second intermediate class who were (30) students in order to identify the clarity of the test instructions and find out the appropriate time to answer its items by recording time on each student's paper after completion of the test.

The second survey application, was applied to a sample of 100 students in order to calculate the psychometric properties of the paragraphs. After correcting the answers, the empty forms were excluded. After that, responses were analyzed by the following:

Construction validity: The validity of construction can be identified by matching the theoretical and practical results. This means that a theoretical hypothesis has been developed for a given subject and a sample has been taken to examine the extent to which the reality is identical, and the results appeared identical.

The differentiated power: One of the basic tasks, extraction of the differentiated power. The researcher extracted the differentiated power of the test paragraphs and appeared that all of them were indicative. The calculated T value was greater than the statistical value of (2.000) and with a degree of freedom (62) at the indication level of (0.05). By that, the (30) test paragraphs are distinct paragraphs.

Reliability: The reliability of the test was obtained by the alpha- Cronbach equation, which is one of the most suitable methods to calculate stability. The stability of the test reached (0.88), which is a good stability factor.

Application of the test tool: The two groups were informed about the test date, one week before it, and it was implemented after completion of the teaching of the subject (content) and in one day under the supervision of the researcher himself.

Statistical means: The researcher used the equation (Alpha Cronbach) to do the equivalence between the two groups of research in the test. The equation is as follows: $(N / N-1) (MG A2 F / A2 K) (9)$.

RESULTS AND DISCUSSION

The results showed supremacy of the students of the experimental group, who studied the material using the multimedia according to the positive thinking test, on the students of the control group who studied the same subject by the usual way according to the positive thinking test, thus the null hypothesis is rejected and the

alternative is accepted. (there is a difference of statistical indication at a level of 0.05 between the mean scores of the experimental group students who studied using the multimedia and the mean score of the control group students who studied using the usual method in the positive thinking test. This is in line with Al-Shimari's study, which assured the supremacy of experimental group on the control group.

Table 1. The equivalence of the two groups

Variable	Group	Sample size	Mean	Difference	Freedom degree	T value		Indication level
Time age	Experimental	31	172.19	88.43	62	Calculated	Statistical	Not statistically indicative
Calculated per months	Control	33	171.13	87.92		0.461	2.000	
First course grades	Experimental	31	68.71	279.75		0.306	2.000	
	Control	33	69.97	277.63				
Danliz test for intelligence	Experimental	31	24.68	48.96		0.715	2.000	
	Control	33	23.52	39.05				

CONCLUSION

After conducting the equivalence between the two research groups, the researcher set the necessary application requirements for the experiment including the study plans, multimedia programs and the positive thinking test for the two research groups. After completion the experiment application, he applied his instruments to the two research groups. After correcting the students' answers, the researcher obtained data of the empirical and control groups where he treated those data statistically using (te-test) for the independent samples. The result showed superiority of the empirical group, which was studied through multimedia, on the control group studied by the variable of positive thinking development.

Post-Tonsillectomy Risks in a Long term: Meta-Analysis Study

Rafid Hadi Hameed

¹ Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

Tonsillectomy is the most common surgery in treatment of children with snoring and sleep apnea. Many of these children have not had any severe throat infections. We aim to evaluate the long term risk of diseases after adeno-tonsillectomy in childhood. We utilized health data on ~3000 individuals born between January 1980 and January 2010. This included healthy cases and controls who were not diagnosed with focal diseases during the surgery observation period (i.e. from birth to 9 years of age) and who had no surgery performed during the follow-up period from 9 to maximally 30 years of age. We found significantly high risks for many diseases, with effects on respiratory, allergic and infectious disorders after removal of adenoids and tonsils being most pronounced. Surgical removal of tonsils and adenoids early in life are associated with longer-term health risks.

Keywords: tonsillectomy, adeno-tonsillectomy, long term risks, surgical removal of tonsils.

INTRODUCTION

Tonsillectomy with or without adenoidectomy is one of the most commonly performed surgical procedures in children in western countries ¹. The most common indications are recurrent upper respiratory infections (URIs) and obstructive sleep apnoea. For children with obstructive sleep apnoea due to adenotonsillar hypertrophy, adenotonsillectomy has proven effective ²⁻⁴. Historically, the functions of tonsils and adenoids have intrigued scientists and medical professionals alike ^{5,6}. Current research suggests that these tissues play specialized roles in immune development and function. For example, the tonsils help protect directly against pathogens ^{7,8} and indirectly by stimulating further immune responses via communication with the rest of the lymphatic system ⁷⁻⁹. Surgeons often remove adenoids and tonsils to treat common childhood illnesses (e.g. recurrent tonsillitis, middle ear infections). Research on the consequences of these surgeries primarily relates to perioperative risks ⁷⁻¹⁰ and the ensuing short-term consequences of surgical procedures for the symptoms

to be treated. Those tonsils (particularly the adenoids) tend to atrophy with age, being largest in childhood and absent in adulthood ¹¹, has suggested that their absence would not affect adult health⁷. However, this does not exclude the possibility that these lymphoid tissues are most immunologically active in early life because they have a critical role in normal immune system development ^{7,8}. AT is a relatively safe procedure but complications do occur. These include postoperative hemorrhage, anesthetic and airway risks, aspiration, pulmonary edema, atlantoaxial subluxation, mandible dislocation, eustachian tube injury, nasopharyngeal stenosis, velopharyngeal insufficiency, and psychological trauma ¹². Mortality rates for tonsillectomy have been estimated to be between 1 in 16,000 to 1 in 35,000 and these deaths are attributed to bleeding, aspiration, cardiopulmonary failure, electrolyte imbalance, or anesthetic complications¹³. Complications are more common in patients with craniofacial disorders, Down syndrome, cerebral palsy, major heart disease, or bleeding disorders and in children younger than 3 years old with proven OSA ¹⁴.

MATERIALS AND METHOD

Study sample obtained from the Danish health registries.

We utilized health data on ~3000 individuals born

between January 1980 and January 2010. This included healthy cases and controls who were not diagnosed with focal diseases during the surgery observation period (i.e. from birth to 9 years of age) and who had no surgery performed during the follow-up period from 9 to maximally 30 years of age.

Surgery groups:

There are three main types of tonsils: pharyngeal tonsils (hereafter referred to as the adenoids), palatine tonsils (hereafter referred to as the tonsils) and lingual tonsils. Adenoids are located towards the posterior wall of the nasopharynx, tonsils are located along the anterolateral walls of the oropharynx, and lingual tonsils are located at the base of the tongue.

We focused on surgery removing the first two (adenoidectomy, tonsillectomy), for the lingual tonsils are not commonly removed. We included adenotonsillectomy where adenoids and tonsils are removed in the same surgery. Surgery codes are based on early ICD operation classification codes from Danmarks Statistics (up to 1996) and the later Nordic Medico-Statistical Committee (NOMESCO) Classification of Surgical Procedures (NCSP) from 1996 onwards including: adenoidectomy, 2618, EMB30; tonsillectomy, 2614, EMB10; adenotonsillectomy, EMB20. There was no surgical procedure code for adenotonsillectomy prior to 1996, so this type of surgery was recorded when both surgical codes (2618, 2614) were entered on the same date.

Selecting disease groups:

We selected diseases based on whether they were likely to be affected by changes in the immune system (i.e. infections, allergies), and we added other disorders because they have been implicated in previous studies examining shorter-term health impacts for some of the focal surgeries of our study (i.e. respiratory infections).

Statistical design and analysis:

We used Cox regressions to model the relative risk for each of the 28 diseases up to age 30 (with age as timescale), depending on whether surgery occurred within the first 9 years of life. We validated the assumptions of the Cox regression model and ensured proportional hazards by stratifying for sex, birth cohort, birth season and demographic parity before estimating proportional hazards.

Estimating risks for non-immune diseases and conditions that surgeries aim to treat:

To quantify whether disease risks due to the focal surgeries are likely to be justified given their proposed health benefits, we calculated relative risks, absolute risks and number needed to treat for conditions that these surgeries treat using the same samples and statistical setup as described above. Conditions that adenoidectomy, tonsillectomy and adenotonsillectomy treat sinusitis, labyrinthitis, otitis media, and (chronic) tonsillitis

To test whether these surgeries may affect risk for diseases known to be unrelated to the immune system, we estimated risk for osteoarthritis, cardiac arrhythmias, heart failure, acid-peptic disease and alcoholic hepatitis

Testing for biases in general health before undergoing surgery:

With access to complete medical records from birth, we were able to test whether or not any such biases could influence the assessment of surgery effects on incident risk of disease.

The null hypotheses tested were that there was no difference in general health between cases and controls for: (1) age at first disease diagnosis, or (2) age at any disease diagnosis for diseases recorded before surgery. Neither null hypothesis could be rejected, indicating that cases were no more sickly than controls prior to surgery for diseases that occurred in the first 9 years of life (see Supplementary Methods - testing for biases in early general health between cases and controls, for further details and findings).

RESULTS AND DISCUSSION

We use relative risk, absolute risk, and number needed to treat to gain a balanced view of the actual general health effects that adenoidectomy, tonsillectomy or adenotonsillectomy were likely to have in the first 30 years of life in Denmark. We found that disease risks typically increased after any of the three surgeries were performed. For some, relative risks translated into substantial changes in absolute risk with the number needed to treat showing that only a few surgeries had to be performed to cause significant individual harm.

The risk of respiratory disease

Tonsillectomy nearly tripled the relative risk of

diseases of the upper respiratory tract (RR=2.72, 95% CI=1.54-4.80 Table 1, 2) and resulted in a substantial increase in absolute risk (ARD=18.61%, Table 1) and a small number needed to treat (NNT-harm=5, Table 1). Thus only about five tonsillectomies would need to be performed to cause diseases of the upper respiratory tract to appear in one of them. This suggests that the negative health consequences for this procedure in the overall population can be considerable. Adenoidectomy more than doubled the relative risk of chronic obstructive pulmonary disorder (COPD, RR=2.11, 95% CI=1.53-2.92, Table 1, 3) and diseases of the upper respiratory tract (RR=1.99, 95% CI=1.51-2.63) and nearly doubled the relative risk of conjunctivitis (RR=1.75, 95% CI=1.35-2.26). This resulted in a substantial increase in absolute risk for upper respiratory tract disorders (ARD=10.7%, Table 1), but gave only very small increases for COPD (ARD=0.29%) and conjunctivitis (ARD=0.16%), consistent with the corresponding NNT values (NNT-harm: diseases of upper respiratory tract=9; COPD=349; conjunctivitis=624, Table 1). Although relative risk increases were reasonably similar for these diseases, the large differences in absolute risk were due to the overall prevalence of these disorders in the population. For example, diseases of the upper respiratory tract occur 40-50 times more frequently (i.e. in 10.7% of control individuals up to 30 years of age) than do COPD (0.25%) and conjunctivitis (0.21%).

Other long-term disease risks

For some diseases, even modest increases in relative risk (RR 1.17-1.65) resulted in relatively large increases in absolute risk (i.e. 2 to 9%) and relatively low number needed to treat values (i.e. NNT-harm < 50), which was largely due to the high prevalence of these diseases in the population (risk in controls ranged from 5 to 20%, Table S4). They mainly included respiratory diseases (groups including: all, lower, lower-chronic, asthma, pneumonia), infectious diseases (all), skin diseases (all), musculoskeletal (all) and eye/adnexa (all). For example, adenotonsillectomy significantly increased relative risk of infectious diseases by 17% (RR=1.17, 95% CI=1.10-1.25, Table 1, 4), but because infectious diseases are relatively common (i.e. 12%, Table 1), the absolute risk increase was 2.14%, so that about 47 adenotonsillectomy surgeries would need to be performed for an extra infectious disease to occur as a result of one of these surgeries (Table 1). When all 28 disease groups were considered, there were small but significant and

consistent increases in relative risk for most of them: 94% of disease risks were significantly increased before Bonferroni correction, 78% after. Thus, the negative health consequences of these surgeries within the first 30 years of life are likely to be widespread, affecting a range of tissues and organ systems, underlining the importance of the uninterrupted presence of adenoids and tonsils for normal development. The removal of these organs early in life appears to slightly but significantly perturb many processes important for later-life health. The many interesting patterns of disease risk based on covariates included in the analysis highlight the complexity of the factors influencing the focal disease risks of our study. For example, consider covariates that significantly modified risks of diseases of the upper respiratory tract and their largest increases in relative (RR=1.99-2.72) and absolute risk (ARD=10.77% 18.61%) after adenoidectomy and tonsillectomy. The risks for these diseases slightly decreased for offspring born to older mothers (RR=0.96, 95% CI=0.95-0.98 for both surgeries), slightly increased (tonsillectomy analysis) when maternal bleeding occurred during pregnancy (RR=1.07, 95% CI=1.03-1.12), increased (both analyses) with APGAR5 score (RR=1.09, 95% CI=1.04 1.13, both surgeries), increased (both analyses) when mothers had a previous induced abortion (RR=1.09, 95% CI=1.06-1.12, both surgeries), increased in immigrants relative to Danish nationals (RR=1.40, 95% CI=1.33-1.47, both surgeries), decreased in those living anywhere in Denmark other than Copenhagen (RR=0.69 to 0.93), and increased when fathers or mothers had a history of the same disease (RR=1.29 to 1.38). All such effects were accounted for in our risk estimates and their significance. In 1998 two reviews were published on trials of the efficacy of (adeno) tonsillectomy for recurrent throat infections in children^{15,16}. Both concluded that the available studies were of poor quality. In daily practice most children suffering from recurrent throat infections undergo tonsillectomy combined with adenoidectomy and not tonsillectomy alone; in the Netherlands 90% of tonsillectomies in children are combined with adenoidectomy, in the USA this percentage is 84%, in Canada 75%, and in England 32%. (Adeno) tonsillectomy is one of the most commonly performed surgical procedures in children in western countries; in 1998, for example, 65/10 000 underwent T_iAds in England and 50/10 000 in the United States¹⁷.

CONCLUSION

We found significantly high risks for many diseases, with effects on respiratory, allergic and infectious disorders after removal of adenoids and tonsils being most pronounced. Surgical removal of tonsils and adenoids early in life are associated with longer-term health risks.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq and all experiments were carried out in accordance with approved guidelines.

Potential Adverse Effects of Radio Frequency-Electromagnetic Fields RF-EMF

Rafid Hadi Hameed

Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

The last decade has witnessed a significant mobile phone usage thus raising public concern as to whether this daily use exposes people to the electromagnetic fields EMF. Many researchers are interested in the human neurophysical functioning. The study will also attempt to investigate the effects of EMF-RF exposure from the mobile phones signals on children as well as adults. There are small changes that are observed on the EEG regarding the alpha frequency spectral power. Additionally, acute RF-EMF exposure has no effects on human cognitive functioning. Children are considered vulnerable, and therefore the risk of their central nervous system and brain being affected is high because the skull is considerably thinner and still developing.

Keyword: *Radio Frequency, Electromagnetic Fields, Children, Adults*

INTRODUCTION

There has been an increased use of mobile phones due to the paid evolution of the Information and communication technologies for more than a decade now. The telecommunication provides people with services such as phone connection, information, entertainment or even learning opportunities over different media platform. The present wireless technology depends heavily on the network base stations fixed antennae, the relay of information through radio frequency signals that are transmitted at the speed of light ¹. The increased use of mobile phone, as well as the growth in the number of base stations, has led to concerns from the public due to the constant exposure to radio frequency (RF) electromagnetic fields (EMF) emitted by the wireless communication devices and mobile phones. Other sources of radio frequency emissions are television, microwave ovens, remote controls, and radio. The emitted RF-EMF is absorbed by the skull to the brain thus altering physiology, human functioning and behavior, as well as neurological functions since the brain is largely exposed

during the calls, received via a mobile or cordless phone ². The public is greatly anxious because they are misled to believe that the electromagnetic emissions from the mobile phones are equivalent to the radiations from radioactivity or nuclear. Mobiles gadgets are used by adults, children plus adolescents, and they were using at an early age. Thus children have developed brain and central nervous system while their skull is moderately thin thus they are potentially susceptible to the exposure to RF-EMF ³. Due to the increase in the number of mobile phones users it is crucial to investigate whether there is any potential impact on the cognitive functions of the brain as a result of mobile phones usage. This study will center on the brain activity and neurobehavioral performance of humans. *RF fields*; the RF is found in the EMF spectrum and occupies the frequency range between 3Hz and 300GHz. The Microwave radiation falls under this band as a subset of RF in the range between 300MHz and 300GHz. Although there are various sources of RF, one of its sources is the mobile phone base stations, radio and television transmitters in the frequency ranges from 200 kHz-900MHz. Others are the welding machines, military radar systems, and plasma etchers. The mobile phones fall in the frequency range of 450-2600MHz. The first generation mobile phones were in the ranges of 450-900 MHz while the third generation lies between 1800-2600 MHz and uses Universal Mobile Telecommunication System (UMTS).

However, the G4 phones operate below 50MHz range ⁵.

The brain is near the mobile phone antenna; thus, the source of RF-EMF is more likely to reach it to some extent and therefore, the radiations are of significant scientific concerns. The second concern is the risk of the brain cancer. Some of self-reported symptoms and complaints are headaches and sleep problems. One hypothesis related to RF-EMF exposure is thermal warming effect causing rise to the tissues surrounding the brain when receiving a mobile call. The estimated value in terms of °C is very low. The highest brain temperature from the different mobile phones was 0.25 °C ⁶. Although the warming effect may be too insignificant to cause damages to the brain, pulsed oscillatory signals may have a direct interference with the brain electric oscillatory activity ⁶, induction of the DNA-damage and extracellular-signal-regulated kinase (ERK) activation. Therefore, it can be concluded that there is no evidence that there is RF-EMF interrelation with the biological systems^{7,8} *Neurophysiological effects*; human brain is a composite system whose functions are affected by any external inference leading to the motor-function and brain oscillation. Electroencephalogram (EEG) is used to investigate various facets of brain functions. One aspect that is investigated is sleep which is an important part of human functioning. Sleep deprivation affects performance, and this problem is one of the self-reported complaints after exposure to RF-EMF ⁹.

MATERIALS AND METHODS

The study design used for this research was qualitative research design. It was an exploratory research whereby different articles and other forms of literature were used to collect relevant data to the topic, and finally, a conclusion was made. A literature review was conducted on relevant experimental studies on RF-EMF from mobile phones. The survey focused on the effects of the exposure of EMF, RF, from mobile phones on cognitive function, neurophysiology, brain activity, memory and performance measures. The measurement methods in these studies under analysis are Evoked Potential (EP), Electro-Encephalogram (EEG) and Event-Related Potential (ERP). The review incorporated the studies on RF-EMF effects on adolescents and children. The analysis included the evaluation of the abstract, outlined outcomes, methodology and experiment design to ensure they are consistent with the topic. *Cognitive processes*; a study by Krause et al. on brain activity after

exposure to EMF using 902MHz and PM 217Hz when visual working memory task is being done. The outcome was alpha 8-10Hz showing that the exposure can have considerable brain responses modification during the task ¹³. *Neurobehavioral performance and RF*; certain studies indicated the considerable effect on slow brain potential when a person is exposed to EMF. Others reported no effect on the performance when exposed to RF exposure ^{14,15}. Evaluation of RT-MF exposure on children confirmed a potentially higher susceptibility because their immunity and regulatory system is still developing. Additionally, their cellular activities are higher than grown up and therefore, the vulnerability probability during exposure is higher. More so, the children skull is at the formative stage, and thus their brain is highly vulnerable because of the small depth of skull as well as less firm ear thus brings the phone closer to the head. A child's head is also small in relation to the penetration depth of the RT-EMF, showing that its brain is deeply exposed. The tissues of the child's brain have a high ability to absorb due to its high water content that serves as an unfavorable influence. Thus despite the structural differences between a child and an adult head, the earlier have different mobile phone use patterns. Some children were to use cell phones at a younger age, they lack headsets, and they spend a long time on calls, unlike adults. The study by Kramarenko and Tan on children of 12-years-old and adults indicated that young ones are more vulnerable and are exposed to adverse health effects when they use mobile phones than grownups¹⁶.

Meta-analysis

Various RT-EMF exposure and neurobehavioral performance meta-analysis have been conducted. For example 10 single and double-blinded controlled trials were conducted by Barth et al. in young adults using GSM 900 MHz exposure. The meta-analysis showed that the cognitive performance was moderately supported by the EMF exposure. There were temporary memory measures when RT was raised, and the error surged as well. Thus the meta-analysis indicates that there are minimal but noteworthy accumulated effects of RF-EMF exposure on working memory, and attention although with uneven direction ¹⁷. Additionally, pooled meta-analysis shows that the effects are insignificant and without uniform direction thus their implications on the daily human performance are uncertain ¹⁷⁻¹⁹. Thus comparing the RT-EMF induced changes to the effects

of hormonal shifts or caffeine, it shows that even severe exposure cannot have any effect on human functioning. However, the data on the signal effects on the children are too limited to make assumptions. More so there is no convincing scientific data that clearly indicate that children are more vulnerable to RT-EMF thus no recommendation is offered in regard to limiting the mobile usage by children.

RESULTS AND DISCUSSION

The telecommunication is undergoing rapid changes thus affecting peoples' daily lives and interactions. The mobile phones are received near the head, and thus the RF-EMF radiations from the phone are absorbed by skull to the brain to a certain degree. The study focused on the possible effects of RF-EMF released by the wireless devices on the human brain activity as well as the neurobehavioral performance. The analyses of RF-EMF signals on the EEG indicated a substantial increase in alpha band. The study by Roschke et al. found that the RF-EMF had no impact even when the exposure duration dropped from 15 -3.5 minutes¹¹. Studies indicated that although the effects of the exposure were found during sleep, the contact takes place before the rest or sleep. The analysis of EEG during cognitive processing shows varying outcomes. One of the studies is Krause et al. that was duplicated but still reported null findings¹³. Generally, the publications under review indicated that any brief or acute exposure of the mobile phone's signal of 900MHz magnitude could cause considerable alterations in human brain activity. Some of the dependable outcome during sleep, rest and cognitive processing includes the upturn of alpha frequency power for the duration of the person is exposed to RF-EMF and after the exposure. Other frequency bands and variable have inconsistent results. The study on the effects of RF on the neurobehavioral performance such as neurophysiological tasks had erratic results. The studies focused on the different task and decreased the RT or increase performance¹⁵. A meta-analysis on a polled data conducted by Barth et al. on ten studies discovered that a minute but measurable, the pooled impact of RF-EMF exposure existed on cognitive activities such as working memory and attention¹⁷. Thus it can be concluded that there is the certain potential that exists between neurobehavioral outcomes and RF-EMF exposure. The study on the long-term effects did not observe some effect on repeated RF-EMF exposure on the administered tasks. In the Besset et al.²⁰ the treatment group was exposed to RF-EMF for

120 min each day for a certain number of days at the same time being administered to neurobehavioral tasks the following day after the contact with 900MHz RF-EMF signals. However, there were no effects that were found. The researchers concluded probably the duration between exposure and testing allowed the recovery of function. The literature review did not identify any other studies on cumulative exposure effects of RF-EMF exposure on neurobehavioral performance and brain activity. It is unclear whether RF-EMF might have long-term effects on children due to high cumulative lifetime contacts. Leitgeb et al.²⁰ provide a summary of why children are more susceptible to RF-EMF exposure over adults. Kramarenko et al.¹⁶ indicate that effects induced slow waves are visible in children than in adults how because the study did not use any form of blinded study design, it was criticized. However, there were no effects of RF-EMF on children's neurobehavioral performance that were observed. It is also worth noting that there are limited studies focusing on the impact of acute RF-EMF exposure on children's cognitive functions and brain activities. Although there is no effect on neurobehavioral performance that is observed in adults, there may be minute alterations in children's brain activity. More so, there is a possibility of higher risk due to long-term cumulative effects of RF-EMF exposure on children than adults^{22,23}. The variation that was recorded in the RF-EMF exposure studies may have been caused by the lack of standardized outcome measures on brain waves as well as the sensitivity of the cognitive tasks. Additionally, the issue of the existence of different experimental protocols in addition to EMF parameters that are highly variable. The methodologies applied in the research had limited validation. The EEG is prone to artifacts, and therefore minimal changes in the movement of the eye can cause the objects to be affected in their connections with recoding electrodes²⁴. Additionally, some studies had a relatively small number of participants, while some of them were affected by factors such as distraction, motivation, and boredom thus influencing their cognitive performance. Other factors are that both males and females may have had different RF-EMF exposure responses and thus equally sized groups of the two genders would have recommended for evaluating RF-EMF exposure. More so, the differences in blinding design could have affected the study results; thus some studies recorded positive findings on the single blinded design however on duplicating the positive study with a double-blinded design and with

many participants the results were different from the previous studies. The timing of the study also may have influenced the outcome. For instance, the delayed effect

of RF-EMF exposure could have affected the desired outcomes. The presence of these effects could be because of the problem with the cross-over designs whereby the wash-out effects are not considered²⁵.

Table 1. The Electromagnetic Fields (EMF) spectrum

Frequency (Hz)	Wavelength (m)			Static Fields
3×10^2	10^6	Non-ionising radiation	Low frequency	Power lines
3×10^5	10^3		Radiofrequency & Microwaves	Radio & TV
3×10^8	1			Mobile phones
3×10^{11}	10^{-3}			Infrared
3×10^{14}	10^{-6}	Optical radiation	UV	Visible light
3×10^{17}	10^{-9}	Ionising radiation		
3×10^{20}	10^{-12}			

CONCLUSION

There has been increased use of mobile phones by both adults and children thus raising concerns as to whether the exposure to the RF-EMF from these wireless communication devices could affect the brain activities. The literature review of various studies that have been conducted regarding the effects of the exposure to such signals shows that there are consistently small changes in the alpha frequency on EEG during cognitive activities rest and sleep during the RF-EMF exposure as well as after similar to GSM phone signals. Medically, the implications of these minute changes in the brain are still unknown. The human is also affected by the hormonal shifts and caffeine in the same way it can be altered by the RF-EMF signals. On the hand, the neurobehavioral performance is not affected by the exposure. Thus acute exposure of the head to the RF-EMF does not affect the human cognitive functioning either negatively or positively. There are limited studies on the effects of the RF-EMF exposure on children. Although children are more susceptible to mobile phone users, it is unknown what cumulative effect will have the neurobehavioral performance and brain activity after long-term exposure.

Prognostic Role of STAT-3 Upregulation in Oral Squamous Cell Carcinoma

Osama M Ghazi ¹, Lehadh M. Al-Azzawi¹

¹ Department of Oral Diagnosis, College of Dentistry, University of Baghdad, Baghdad city, Iraq

ABSTRACT

Oral squamous cell carcinoma is a challenging tumor for clinicians because of its ability to recur and spread despite progressive advancement in treatment options. Researchers studied wide range of histopathological parameters in order to achieve powerful prognosticator enabling them to reduce the consecutive destructive effects on patients with this type of horrible malignancy. Of these parameters, depth of invasion, perineural invasion and lymphovascular invasion have been studied widely. This study was intended to investigate the prognostic effect of STAT-3 overexpression on oral squamous cell carcinoma cells behavior in relation to the depth of invasion, perineural invasion, and lymphovascular invasion. In this retrospective study STAT-3 expression was examined in fifty specimens of primary oral squamous cell carcinomas by immunohistochemistry. The expression labelling indices then correlated with three histopathological parameters closely related to tumor cell invasion and metastases. Strong expression of STAT-3 was detected in 25 cases, which represent 50% of all cases. The expression of STAT-3 was correlated statistically significant with tumor depth of invasion, perineural invasion and lymphovascular invasion. This study suggested that STAT-3 is a powerful signaling contributors for invasive and metastatic ability of OSCC cells.

Keywords: *Oral squamous cell carcinoma, STAT-3, depth of invasion, lymphovascular invasion, perineural invasion.*

INTRODUCTION

Squamous cell carcinoma (SCC) is the chief malignant tumor in the oral cavity constituting approximately 94% of the whole these malignancies ¹. The expectation of biological behavior of oral squamous cell carcinoma (OSCC) still constitutes an obstacle for researchers. Conventional histopathological and clinical parameters failed to predict the prognosis in patients with this type of devastating malignancy and the overall survival rate not exceed 50% despite advancement in treatment modalities ². Even at early diagnosis around 30% of patients exhibit tumor spreading to regional/cervical lymph nodes ¹. Strenuous efforts have been done by countless number of researchers in order to determine reliable parameters that can be employed as powerful

prognosticators of metastatic spread to the lymph nodes, tumor recurrence, and diminished survival in patients with OSCC. Among these parameters; depth of tumor cell invasion, perineural invasion and lymphovascular invasion have been given distinct consideration ^{3,4}. The depth of invasion (DOI) represents the extension of tumor cells beneath the epithelial surface. However, when the epithelium was shattered the investigators renovate a surface line and measure from it ⁵. The differences between the researchers are clear about the optimal depth point that determines the hazard and linked to the poor prognosis. They considered cutoff points of 2 mm ^{6,7}, 4mm ^{8,9}, 5mm ¹⁰ and other different values. Meta-analysis however, suggested 4 mm as the optimal cutoff point in OSCC ¹¹. Diverse definitions have been applied for PNI but the most widely accepted one was that proposed by Batsakis in 1985 who defined PNI as “the ability of cancer cells to invade in, around, and through nerves” ¹³. PNI is a well-recognized pathologic sign that can be detected without lymphovascular invasion. Through nerve, the tumor cells can spread to

Corresponding author:

Osama M. Ghazi.

Department of Oral Diagnosis, College of Dentistry,
University of Baghdad.

a distant site without evidence of any local invasion. However, PNI in some malignancies may be regarded as the only mechanism for metastatic spread¹². The exact pathogenesis behind PNI is quiet uncertain. Nerve growth factor (NGF) and tyrosine kinase A (TrkA) receptor have been shown to contribute in the mechanism of PNI¹⁴. More recent researches showed that PNI may resulted from shared molecular communications between cancer cells and the microenvironment of the nerve. Tumor cells may act probably in different way in this new microenvironment and may exhibit more aggressive behavior. These outcomes ended the previously assumed concept that PNI is a merely process driven by cancer¹⁵. Among head and neck cancers, PNI was reported more frequently in squamous cell carcinoma. The incidence rate may reach as high as 80%¹². STATs family can be separated into two main categories based on functional specificity into one consists chiefly of three members “STAT2, STAT4, and STAT6”. This group triggered by a limited number of cytokines and perform a crucial role in T-cells development and in the signaling of IFN- γ . The other group contains “STAT1, STAT3, and STAT5” which is involved in “development of mammary gland, response to growth hormones, and embryogenesis”. In addition, this group critically involved in oncogenesis by adjusting essential cellular functions such as cell cycle and apoptosis²². Translocation of STATs into the nucleus enable them to bind to specific regions on the DNA and initiating the transcription of the target genes²³. Activation of STAT proteins is a temporary process. Thus, within short period of time the triggering signals deteriorate and the STATs transfer back to the cytoplasm²⁴.

MATERIALS AND METHODES

Patients: This retrospective study utilized fifty formalin fixed paraffin embedded blocks from fifty patients with primary oral squamous cell carcinomas who were treated with total surgical removal retrieved from the archives of oral pathology laboratory of the oral diagnosis department at the college of dentistry/ Baghdad University and Ghazi Al-Hariri hospital laboratory. For every specimen, the histopathological data were tabulated and documented. Depth of tumor invasion measured from the epithelial basement membrane to the deepest invading cell. Ocular micrometer was applied to estimate the actual depth of invasion. It is positioned in one of microscope eyepieces; however, the distance between the etched lines depends upon the objective lens

used. In order to calculate the exact distance between the lines of an ocular micrometer, it is essential to be calibrated by a stage micrometer. The inscribed lines on a stage micrometer are precisely 0.01 mm. In order to calibrate the ocular micrometer for a particular objective lens, the ocular and stage micrometers are superimposed, and the number of ocular graduations per stage micrometer graduation is determined.

Immunohistochemical staining: The immunohistochemical procedure was performed according to the abcam IHC protocol using (Anti-STAT3 antibody (ab76315)IgG, Rabbit monoclonal in a dilution of (1/50) according to Abcam (Cambridge, UK) and human kidney tissue was used as a positive control to STAT3. The sections were deparaffinized, rehydrated in graded alcohols, exposed to endogenous peroxidase block in 3% hydrogen peroxide and boiled in citrate buffer at 90°C for 7 minutes. The slides were incubated with primary antibody overnight at 4°C, and then washed and incubated with secondary antibody at 37°C for 25 minutes. Finally, the sections were developed with DAB chromogen and counterstained with hematoxylin. The immunoreactivity of STAT3 was classified as: Negative (-) (<10% of tumor cells were stained or no staining), Weak positive (+) (11–50%), Positive (++) (51–75%), strongly positive (+++) (>75%)²⁵.

Statistical analyses: All statistical analyses of the present study were performed by statistical package for social sciences (SPSS version 22). Data were summarized using mean \pm SD for quantitative variables and number and percentage for qualitative variables. Mann-Whitney test was used to compare the differences in immunohistochemical expression scores among different clinicopathological parameters.

RESULTS AND DISCUSSION

Both brown cytoplasmic and nuclear localization of STAT-3 was noticed in OSCC tissue samples. The minimum, maximum, and mean scores of STAT-3 were (14, 96, and 63.50). Strong expression was detected in 25 cases, which represent 50% of all cases. In this study, minimum and maximum tumor depth measured were 1.25mm and 8.75mm respectively. The mean depth was 4.04mm. Accordingly tumors with depth less than 4 mm were 28 and those with depth equal or more than 4 mm were 22. Out of 50 cases of OSCC; LVI and PNI were present in 30 (60%) and 24 (48%) cases respectively.

significant statistical relations were detected with LVI, PNI, DOI as shown in table 1. LVI and PNI considered to be risk factors for loco-regional recurrence in oral squamous cell carcinoma in numerous series^{17,26,27}. The incidence of these parameters in OSCC is a controversial issue. Current study showed that the incidence of LVI and PNI was 60% and 48% respectively. One study reported that the incidence of LVI in nodal negative patients was 19% and 51% in nodal positive patients¹⁷. Numeral studies stated that the rate of PNI in head and neck squamous cell carcinomas range from 14% to 63%^{28,29}. It should be mentioned that the differences in determining the exact incidence of both parameters in oral squamous cell carcinoma may be attributed to the difficulties in estimation of both parameters by hematoxylin and eosin staining and the size of the studied sample. Multiple researches have indicated that the depth of the tumor is a strong factor of prognosis and can predict lymph node metastasis in OSCC³⁰. However, the accurate clinically optimum cutoff value not agreed yet. A value of 4mm considered to be a cutoff point by meta-analysis conducted by Huang et al¹¹. Substantial progress has been done regarding STATs structural and functional association since their detection as a main controllers of cytokine signaling. Growing evidences extracted from several studies showed the significant role of STATs particularly STAT3 in a number of cellular processes contribute to the malignant phenotype. Such overexpression (cytoplasmic/or nuclear) or unsuitable activation which occurs in a diversity of cancers is not simply adventitious but it was correlated with increased aptitude of tumors (including oral SCCs) to invade and metastasize. In this study, strong expression of STAT3

was observed in 50% of the cases. Such expression was linked to the increased tumor depth, LVI, and PNI. The capability of cancer cells to invade the ECM is a critical step for cancer progression and metastatic spread. STAT3 implication in such process was supported by strong evidences particularly through matrix metalloproteinases regulation³¹. In addition, tumor invasion and metastasis could be blocked by targeting STAT3³². It was reported that STAT3 activation may disrupt the function of recruited immune cells for tumor benefit through increased immunosuppressive factors production or through inhibition of proinflammatory cytokines production³³. Come in accordance to the results of this study Zhao et al, in 2012 suggested that STAT3 in tongue SCC may participate in the motility, metastasis, and progression. They explained the capability of STAT3 to enhance invasion due to its suppressive function on phosphatase and tensin homolog (PTEN) and E-cadherin. Another study directed by Suiqing et al, in 2005 stated that overexpression of STAT3 was associated with increased invasion, and metastasis in cutaneous SCC. Furthermore, constitutive activation of STAT3 was documented by several studies in most HNSCC cells. Despite the tumorigenic effect of STAT3 is mentioned widely in various cancer types, suppressive role of STAT3 in cancer have been cited in some studies. A cohort study, performed by Pectasides et al, in 102 patients with HNSCC, found that high level of STAT3 nuclear expression related with a favorable prognosis. These contraries in outcomes may be ascribed to the specificity of used antibody directed against STAT3 or to the factors related to methodology used.

Table 1. STAT-3 expression scores in relation to the histopathological parameters.

Histopathological parameter		STAT3 expression		No of cases	Mean ± SD	P value	
		++	+++				
Lymphovascular invasion	Present	6	4	20	30	2.46±0.81	0.005 MW
	Absent	10	5	5	20	1.75±0.85	
Perineural invasion	Present	3	2	19	24	2.66±0.70	0.00 MW
	Absent	13	7	6	26	1.73±0.82	
Depth of invasion	≥ 4 mm	2	5	15	22	2.59±0.66	0.005 MW
	< 4 mm	14	4	10	28	1.85±0.93	

CONCLUSION

Overexpression of STAT-3 was observed in all studied samples of OSCC. This expression was correlated significantly with LVI, PNI, and DOI suggesting that STAT-3 is a powerful signaling contributors for invasive and metastatic ability of OSCC cells.

Security and Interoperability Issues in IoT based Healthcare Architectures

Noor Mueen Mohammed Ali Hayder

College of Nursing, University of Babylon, Hillah City, Iraq

ABSTRACT

Internet of Things (IoT) creates smart devices final construction blocks in evaluation of cyber-physical smart comprehensive structures. The IoT has a relief of application areas, containing healthcare. IoT period is re-planning modern healthcare with appointing technological, social, and economic perspectives. IoT makes chances in several areas. Though, this rise in contiguity makes many outstanding issues. This paper presents a field of some of basic issues challenging spread abroad acceptance of IoT. Especially, it concentrates on security and interoperability issues in the IoT. It is deduced that there is a necessity to expand a various technology attitude to IoT security.

Keywords: *Internet of Things (IoT); Security; Healthcare; Interoperability.*

INTRODUCTION

IoT connects the net with sensors and a numerous of systems, basically utilizing IP-based communications. Human beings provide most of the substances and data found on net yet, thus in IoT, humble systems are often the dynamic principle that presents the data. There are a lot of applications for IoT; containing healthcare systems, that are the basic concentration of this paper. Healthcare systems utilize a collection of gathered systems to make an IoT web allocated to healthcare evaluation, containing controlling patients and automatically finding conditions where treat interventions are needed¹. Medical systems such as other computer devices can be delicate to security attacks and these attacks can impact the security and execution of the system. The susceptibility additions by rising the relation of medical systems and hospitals to the internet. In another view, two essential agents of vicinity and affect measure can be calculated forcible in the security of a system. In the other hand, a system that has more vicinity to man life and so has a greater effect on its environment, is more essential in units of security. It can be mentioned that

a set of medical systems among the internet of thing systems is one of the most essential sets from this view. In the next couple of years, the medical section is hoped to give an evidence the spread broad acceptance of IoT and growth along the new applications and eHealth IoT systems. The IEEE explains interoperability as “capability of two or more devices or elements to truck data and to utilize data that has been trucked”. Other explanations of interoperability are former suitable regarding to especial application’s necessities or requirements³. So, various groups of interoperability have been appeared. Semantic interoperability, Cross-domain interoperability, Syntactic interoperability, and Technical interoperability are illustrations of these groups. All these sorts of interoperability are required to protection integrated and incongruous relations in the IoT. Obtaining interoperability is essential for gathering hybrid objects with each other along various relation webs. It subdues the goal to have millions of sensors, receivers, little and smart systems linked to Internet if these systems can’t in fact join together in a path or another. As a matter of fact, for IoT to growth, objects joining to relation networks, that can be incongruous, require to can touch with other objects or applications. The remaining paper is organized as follow: In Section 2 we describe security requirements in IoT based health care and we describe security challenges in IoT Environment. In Section 3 we present security issues

in IoT based healthcare architectures. In Section 4 we present interoperability issues in IoT based healthcare architectures.

2- Security challenges and requirements in IoT based healthcare

2-1- Security requirements in IoT based healthcare

A critical necessity of IoT is that the systems must be gathered, that let it to perform special jobs, like feeling, relating, data progressing, and so on. The IoT can achieve, transfer, and progress the data from the IoT end-nodes through web to perform upper complex jobs. The IoT ought to can present applications with powerful security support. The device architecture has to present effective securities for the IoT that connects the interruption among the physical systems and the moral worlds ⁴. Information security is discovered as Data Locality, Data Integrity, Data Access, Data Confidentiality, Data Authentication, and Data Availability.

A. Data Locality

Data locality is able to be presented reliability to the SaaS user by Service level agreement (SLA) to assure where the information is safety saved. So, multi-owner, hybrid consumers' information is saved at the same place ⁵. Here, doctor save all of the data according to patient health in cloud therefore, doctor does not realize where the data is saved away. In several term, this able to be an issue. Regarding to durability and data security rules in different countries, data locality is of most great importantly in several architectures of administrations ⁶.

B. Data Integrity

Integrity of data is one of most critical components in each device. Integrity of data is easily obtained in a self-assured device with an odd information degree ⁷. The space device has to assure the integrity of medical evidences. Especially, it has to assure the integrity of medical evidences even about the miscreant locals. Integrity considered that your data is remains as it is accepted user which is able to modify our data. The security mechanisms have to distinguish any meddling of data ⁸. Integrity intends protecting the reality and durability of information. In the health care device, it returns to the reality which information has not been meddled with illegal usage ⁹.

C. Data Access

Access of data issue is basically regarded to security policies presented to clients while reaching information ⁷. A healthcare device is able to utilize a cloud presented through some other provider to save the medical information. This healthcare device will have its own security policies on the basis of which every doctor or sick can have reach to a special group of medical information. Policies of security may justify some attentions where in some of client are not given reach to specific measure of data. These policies of security have to be annexed here with cloud to put off unbeknown of information by unbeknown clients ⁸.

D. Data Confidentiality

Confidentiality can be obtained by reach auditing and encryption methods in healthcare devices ⁹. There has long been care along a patient's health manage privacy and confidentiality ¹⁰. Data confidentiality define the security of a confidential information from present that is regarded as the essential issue in a healthcare device. Encryption can present better confidentiality for this sentimental information by presenting an allotted guide on a safe connection channel among the safe device shapes and their modulator ¹¹.

F. Data Authentication

Authentication is the authenticity verify way, i.e. it verifies the client's individuality, with assimilating the information obtained from the structure with those saved in the basis. It ought to be noted that the structure integrity is not essential. Medical and non-medical applications may need data authentication ⁹. The individuality of sections has to be quietly founded before executing any other activities. Protecting the confidentiality of the data saved in it, assuring that only authorized activities are performed ¹². Just as health-care manages includes sentimental data, the space devices have to assure their confidentiality. In addition, only authorized employees ought to have reach to confidential medical manages ⁸.

G. Data Availability

Availability that's intend information are available whenever and anywhere required ⁴. The health-care manages have to be available in all period of time. Medical manages are often developed, and thus patients perhaps require for improvement of manages

⁸. In healthcare device medical information must be accessible to authorized sections at all period of times. Availability is fatal for doctor since these systems are allocated to healthcare situations of their patient. Regretfully, a doctor could be delivered unavailable along the obstruction of the radio channel.

2-2- Security challenges in IoT based healthcare

In IoT based healthcare devices, most of the smart objects are commonly small, cheap, with restricted security abilities. The existing jutting cryptographic algorithms are weak to progress since the low CPU eras and low forcible encryption. The usage of IoT cloud healthcare needs sensors and systems to connectsafely and divide sensors information and Electronic Patient Health Information (EPHI) to presentcurrentsystem to patients and medical doctors. In this way, security investigators still ask how honesty and safe is the communicationamong these systems. Applying and saving EPHI in cloud systems (general and special) is a basic security danger of spam since cloud servers can be geographically shared all over the world occasioning a problem of IP based blockage.

There are apparentlycompeting, complex security necessities to be developed on a stage with secretlyrestrictedreferences ⁴:

_ Authenticate to hybridwebssafety

_ Assure that information are accessible to hybridproviders

_ Scheduleletter of credits and managingreach to applications and patient's secretlydata

_ Schedule privacy caresamong thehybridclients

_ Presentpowerful authentication and datasecurity (integrity and confidentiality) that are not simplyaccepted.

_ Remainaccessibility of the information or the system

_ Permission for development in the encounter of namelessdangers

_ Quitervicesusceptibilities and expandingfirmwareparties

_ Equipment and develop secretly agreement in IoT health cloud properly

_Protect IoT health webs and reduce the danger of informationinjury

3- Security issues in IoT based healthcare architectures

In improbable healthcare reduction in IoT environments, regarding to security susceptibility not just for medical information dividing confidentiality, , and patient privacy but as well as for IoT place is necessity ^{13,14}. Ida et al. modify IoT place susceptibility in three basic groups containing hardware susceptibility, web susceptibility and application susceptibility. They providelatestanswers for Cloud and IoT security suggested particularly to secure health data. They complete by delivering a suggestion of utilizing a divided security architecture in both two cloud application and systemssurfaces ¹⁵. So, in this paper, health security dangers in IoT places are explained briefly according to the perusedresearch. According to the systematic assay of research, to defeat the security susceptibilityissues, some necessitiesought to be convinced for IoT based Healthcare Architectures. Hereof, some illustrations have been presented as modified in continues. Kraijak et al. ¹⁶ summarized a general comment of IoT, agreement sand generic architecture, applications, privacy and security cares, performance and its comingdrifts. It is placed as aprefatory paper useful to a great listener changing likewebinvestigators, chief information officers (CIO), data technology professional, advisor, and resolutionproviders in marketing company and etc. They stressed that specialissuesought to be demonstratedalong the allinformationconnectionprogress. In addition, in their research, Maksimović et al. ¹⁷ proposed to provide some of privacy and security issues in healthcare places. They explained some authentication techniquesrequired to reviewed client's individuality. Their answer can be utilized to control human essential parameters and some of the environmental parameters impressing health. So, arrangingmethods to end-users and being possible to formcropsregarding to their requirements is useful for both two clients and establishedpromoter. Gupta et al. ¹⁸ showed a cloud of objects model for assay of client's processes in healthcare. Their architecture is according tomounted sensors of implement rather than utilizingSmartphone sensors or wearable sensors to saveworth of the primary healthrelated parameters. Architecture ofcloud middle is createdfrom a Cloud informationhead, Public cloud, Private cloud, and utilizes the XML Web devices for protect and rapidconnection

of data. For a cloud based security mechanism, they asserted reliance, integrity, privacy, and authentication regulations in reach to health information. To assay security natures of this architecture, writers suggest AES and RSA algorithms, sequential for public and private cloud environment. This agreement warrants secretly of data in cloud. In this paper, to assimilate these two structures, decryption and encryption period were computed. The conclusions mentioned that RSA algorithm was stronger and more safe than AES technique. Moosavi et al.¹⁹ described a security plan for medical sensors. They assayed important attributes of provided model, i.e., energy-execution and security along software and hardware first process and histrionic. The suggested model, such as SEA, works on the ground of an entrance in fog surface to perform authorization mechanisms. Their plan formed of i) a safe and authorization architecture and effective end-user authentication according to testimonial based DTLS handshake, ii) safe end-to-end connection according to the sitting continuation, and iii) strong dynamic according to the gathered smart entrances. In addition, Santos et al.²⁰ showed a new m-health system architecture, utilizing RFID labels and created around IoT, to begin an in consistent medication manage device for Ambient Assisted Living (AAL), particularly achieved aged people treat in outpatient clinic. Basic thing of this m-health system architecture is to let aged patients to self-control their health in dynamic, external part of any particular health treat giving amount, either with controlling their illness or by aiming them to manage the opportune and proper usage of their medication. They described digital autographs and concurrent and in concurrent algorithms testimonials, like the most proper answers to defeat m-health security cares. According to Lee et al.¹⁴, provided a service-oriented security framework for inconsistent medical systems and necessities for safe inconsistent medical systems in the IoT. Dangers in device-directional IoT stages are shared into system dangers, genesis dangers, and system dangers. In this essay, a device-directional architecture for inconsistent scheduling of health devices in IoT has been offered. In addition, like in an IoT device, systems and new tele-health objects will always be connected, and this framework can defend most of security necessities in such environment. Furthermore, this framework empowers information secretly, security, and accessibility for enabled clients like patients and under-treatment ones.

4- Interoperability issues in IoT based healthcare architectures

Ordinarily, interoperability of software, hardware, space, servers, and other infrastructures is regarded to standards²¹. Though along the latest years, several applied answers have been offered to utilize with IoT technology, there is no single standard for interoperability of IoT devices²². Shortage of interoperability makes issues containing the improvement of incongruous IoT stages, low device reuse, and end-user discontent. In addition, as IoT technology is yet in its primary, with no technical concord between elements, it is obvious that in the close coming, notable distinct between devices will happen in order to the extension of different standards. Environment of IoT is encountered with a high surface of variety. System, applications, marketing and information are between basic elements in IoT that ought to be regarded for interoperability.

CONCLUSION

We have studied basic security and interoperability issues in IoT based healthcare architectures. Ordinary IoT architectures contain in basic security susceptibility issues the space in system (sensor and/or smartphone), information transfer (sensor to smartphone and smartphone to cloud) and cloud space. Just as wearable's are being communicated to social webs, the dangers to detect special and sentimental data are upper. It is essential to distinguish susceptibilities of these systems due to block epilepsies. The basic impediments to spread broad improvement of IoT in healthcare trade are security and interoperability issues. Supplying client necessity is basic agent impacting great acceptance of IoT. In as much as, on the ground of all, IoT is a new technology, there is a necessity to make known clients about its activities and abilities. So, the device ought to be easy and client-amicably, to render easy having effect on each other learning for patients. One of possible answers to defeat issues distinguished is energetically containing secretly clients in all of the steps of device extension.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Nursing, University

of Babylon, Hillah city, Iraq and all experiments were carried out in accordance with approved guidelines.

Social Stigma Circumstances toward Tuberculosis in Hilla City / Iraq: Community Insight

Hadeel M. Fadel¹, Salma K. J. Jihad¹

¹Community Health Nursing, Faculty of Nursing, University of Babylon, Hillah City, Iraq

ABSTRACT

Tuberculosis is still a main public health problem in many developing countries. Objectives: are to identify the socio-demographic characteristics of the sample, to assess the social stigma circumstances of the disease throughout the insight of the community, and to find out the relationship between the sample socio-demographic data and the social stigma circumstances. A descriptive study was conducted on convenient random sample of 200 of both genders of the clients who visit the primary health care centers in Hilla city from the period (first of October 2017 to first of September 2018). The results of the present study have indicated that the overall assessment reveals that the majority of (61.5%) were positive social stigma towards patients with TB. The study concluded that there is a significant association between the social stigma and the sample demographic characteristic regarding age, educational level and occupation.

Keywords: Tuberculosis, Social Stigma, community insight.

INTRODUCTION

Tuberculosis (TB) is a contagious, infectious disease and remain a main global health issue, it is a social and biological disease caused by mycobacterium tuberculosis. TB causes illness to health for around 10 million persons each year and is one of the highest ten causes of death worldwide ¹. There are two types of TB:- latent tuberculosis (LTB) refers to the infection with M. tuberculosis and the body have capable to fight the bacteria. LTBI cannot spread the infection to others ². Active tuberculosis is another type of TB which can causes sickness and develops the symptoms of disease which are: (cough that lasts more than 3 weeks, fever, night sweats, chills, and weight loss), and can spread the disease to others. About 10-15% of latent infections progresses to active disease ^{3,4,5}. Tuberculosis can spread through the air, TB germs don't grow on surfaces ⁶. Effective TB treatment is difficult due to the unusual structure and chemical composition of the mycobacterial cell wall which inhabits the entry of drugs and makes many antibiotics ineffective ^{7,8}. TB is still a main source

of morbidity and mortality worldwide. In 2016, an estimated 10.4 million persons have been infected with TB and 1.3 million death from TB disease. Between 2000 and 2016, an estimated 53 million TB deaths, 44 million death among people with HIV-negative and 9 million deaths among people with HIV-positive ¹. The recent turmoil and conflicts in the Iraq and increasing the number of displaced people, and refugees led to increase the number of TB cases and has one of the maximum TB prevalence rates in Iraq country, with more than 15,000 persons infected yearly after year 2014 according to Iraq Ministry of Health and the report of the International Organization for Migration (IOM) ^{9,10}. In 2014, the total number of TB cases were 8,341, these cases reported by non- National Tuberculosis Control Program (NTP) in Iraq ¹¹. TB stigma effect on TB patient and make him/her face: Isolation within the family: TB patients experience isolation at home such as forbade the food sharing, utensils or bed sharing ¹³. Isolation within society: The community members expressed a desire to stay away from TB patients. Marriage prospects ^{15,17}. Physical and Psychological Health: TB patients abstain from seeking health care and treatment adherence to avoiding seeing them by people ^{18,19}. TB patients may be exposure to depressive symptoms and emotional distress because of attitude of community against them ²⁰. Financial burden:

Because of stigma the patient with TB experience rejection and losing job²¹.

variables related stigma against TB patient by the community (21 items).

MATERIALS AND METHOD

Design of the study

A descriptive analytical study throughout the period from the first of October 2017 to the first of September 2018.

Setting of the Study

The current study was conducted in Hilla city / Primary health care centers in Hilla, which represent the community population in Hilla city.

Sample of the Study

A convenient random sample of 200 of both genders of the clients who visit primary health care centers in Hilla city are selected.

Instrument of the Study

Demographic Information:

General Information: Socio demographic data sheet consist of (9 items) categorized as general information about person such as (age, gender, marital status, level of education, occupation, residency, personal history of TB, family history of TB and any known person with TB.)

Community Perspective toward TB Patient's Families.

This part presented the variables related stigma against TB patient's family (9 items) which was comprised of the following information: TB would cause an embarrassment, less and shame to the family, if family member can transmitted the disease, if family member asked to stay away from a social group, prevent children to play with other children who have a parents with TB, there is a difficulties in marriage for other family members because of TB, visit a home of TB patient and avoid to eat or drink with family members who have TB.

Community Perspective toward TB Patients.

This part was measured by two following: Theme (1): Isolation within family: (8 items). Theme (2): Isolation within community: This theme presented

Rating and Scoring

The instrument was related through the use of (3) level type Likert scale for the assessment of social stigma toward tuberculosis patient from community insight. The rating and scoring of the instrument was (3) agree, (2) uncertain, and (1) disagree. Table (1) shows the distribution of the demographical characteristics of the sample. The highest percentage of sample represented (19%) were aged between (22-27) years old; (52%) females; (57.5%) married; (43%) secondary education; (33%) employed; (83.5%) are urban residence. In regarding personally, family history of TB and other known person of previous TB, it constituted with negative responses (96.5%, 93.5%, and 89%) respectively. Table (2) indicates that the majority of the sample (49%) were positive in relation to patient's family stigma. (57.5%) positive view as patient isolated within family. (53%) positive responses towards isolated within community in concerning their perspective. Table (3) reveals a majority of (61.5%) were positive social stigma towards patients with TB in Hilla City. Table (4) shows there is a non-significant association between the community insight towards patients with TB and their demographic characteristics at $p\text{-value} > 0.05$. Except community insight with their age, educational level, occupation, personal family and known previous history with TB, there is a significant association at $p\text{-value} \leq 0.05$. In (table.1) Findings of the present study reveal that the percentage of the age group distributed somehow equally, the (22-27) years old represent the highest one. This results came along with some studies when represents that (75%) are within (21-30) years old²³. Regarding gender, results indicate about fifty percent of the subjects are females, this result supported by a study was mentioned that the majority of their sample were female (58%)²⁴. The marital status of present study participants, showed that the sample are married constitute about fifty eight percent out of the total number of the study participants. This result was supported by finding of a study found out that (43%) of their sample were married²¹. findings indicate that most of the participants, forty three percent of our study sample, are secondary school graduated. This results supported by a study found out that majority of study sample (40%) were completed secondary school²⁶. The present study found out that only thirty three present were employed.

A study supported the present results mentioned that (39%) of study sample were employed¹⁸. Concerning residency the present study indicated that majority of the sample resident at urban areas. This result was supported by a study reported that (60%) of their sample were from urban area²⁷. The current study revealed that there was a negative responses regard history with TB as personally, family, and other known person of previous TB. This is consistent with a study illustrated that majority of the sample (70.3%) were did not know person with TB²⁸. In (table. 2). The present study documented from the results that there were unexplained stigma against TB patients and their families. A study found that there was an evidence proven that the community stigmatized and discriminated the whole family members if one of them has TB²⁹. As many studies proved that patient will be isolated within his small community (the family) the

current study came with the same results, this consistent with a study found out that TB patient faced several forms of negative attitude from close people and household member¹³. In (table.3) the final assessment showed a positive perspective towards patients with tuberculosis and considered a social stigma in Hilla City. Some studies findings that there was immense stigma observed¹⁸. In addition, the results of a study survey clearly showed that TB stigma is greater than HIV stigma.^[17,32] In (table. 4) A non-significant association between the community insight towards patients with TB and their demographic characteristics at p-value >0.05 was reported except community insight with sample age, educational level, occupation, a study disagree with our results and findings that age and education level were insignificantly associated with stigma scores²³.

CONCLUSION

The majority of study sample were young adult, female and marriage as socially state, educated secondary and employ. The results of this study reported a high social stigma toward tuberculosis disease. Age, education, occupation, and history of personally, family, and their known previous tuberculosis have been affected their insight towards patients with TB.

The Administrative Reformation and its Impact on Reducing the Psychological Pressure of Workers: Case Study in the Forensic Medicine Department in Babylon Governorate

Rehab Hussein Jawad¹, Laith Ali Yosif Al-Hakim², Raa'd Handhal Taresh²

¹ Business Administration, University of Babylon, Iraq, ² Business Administration, University of Kufa, Iraq

ABSTRACT

The present study aims at knowing the level of the psychological pressure of the workers at the department of the forensic medicine in Babylon governorate. The sample of the study includes doctors, chemists, testers, criminal evidences, nurses and the other subordinate figures. Secondly, it aims at knowing the role of administrative reformation in reducing the psychological pressure of the workers. The questionnaire device is used in collecting data whose measurements have been developed according to Arabic and foreign previous studies that tackled the variables of the present study and its accommodation on the local environment. It has been made sure of the sincerity of the questionnaire by using the accredited statistical means within the application of (SmartPLS) program and by using the intentional sample (78) as the number of suitable questionnaires for percentage (96%). The study has shown the existence of the workers' psychological pressure in the forensic medicine department since the procedures of the administrative reformation have not been enough for reducing it.

Keywords: *Workers' psychological pressure, demonstrative reformation, and forensic medicine department.*

INTRODUCTION

The quick and continuous change nowadays causes stress to workers since the psychological effects differ from one place to another and from career to career. This stress has its own negative impact on the outcome of the work and the aims of the institution ¹. The studies of ² state that the workers in health and education institutions are suffering from stress in their jobs. The nature of health career make its workers exist in places where they must in a direct contact with the sick for a long period of time, using certain instruments which may have a negative effect on their health now and in the future. This is what makes researchers make sure of the relation between the absence and the attendance of the job because of their psychological pressure as there is a relation between their psychological health and the job pressure ³. In the scope of the present study, forensic medicine receives different cases of death, like those caused by murdering,

drowning, hanging and others which workers used to deal with. In addition to that, there are unknown decadent bodies whose reasons of death need to be investigated. Furthermore, the nature of the place regarding the smell and pollution all these are motives for psychological pressure of workers ⁴. For these reasons, the Iraqi House of Representations issues a specific law for lessening the burdens and keeping the future rights of the specialists of this career. The economic side has an important role in workers' lives because financial matters are considered to be the main motive for working properly otherwise decreasing it will be one of the sources of psychological pressures and this will have its negative effect on the conduct ⁵. A person does not work separately but within social environment which needs a serious support from the hands of the organizations by enhancing positive association among workers to reach the aims of organizations. Whitehead & Holmes (2011) ⁶ refer to the importance of knowing the events of the stressed life to measure the psychological pressures of workers through having a set of events whose percentages are distributed to (100%) and consists of (43) points. The role of family relationships is important in specifying the events that

Corresponding author:

occur to the member. Akintayo (2010) states that persons who have good relationships with relatives or friends are the happiest persons who could make good efforts in their career and vice versa.

MATERIALS AND METHODS

Depending on the research efforts of each of the following (7), in which there is the independent variable the administrative reformation (one dimensional) that consists of (11) items. In addition, there is the subordinate variable the psychological pressure of workers along its dimensions: (health dimension, economical dimension, work dimension, life circumstances, social relationships, and personal and family dimension) that wholly consists (39) item.

Research Measurement

In accordance to the researchers acquaintance on most of studies like the study of (7), it is found that these studies as different in the number of items that measure the variable of the psychological pressure of workers since there has been constructed a developed measure consisting (36 item). The researchers have relied on the similar items since they admit the research objectives in five dimensions.

Population and Research Sample

The Research population consists of the sum of clinical, pharmacist, laboratorial, nursing, sanitary, administrative, technological, mechanic, and service staff in forensic medical department in Babylon governorate

Preliminary Data Analysis

Mahalanobis Test: In order to test the outliers along all of the item, it has been resorted to Mahalanobis test through SPSS program. Throughout this test, Mahal. Distance module could be found for each item. The case (questionnaire) becomes outlier when Mahal. Distance is higher than Chi-Square value (Kline, 2016). Since the questionnaire is consisting of (48) items on 0.001 statistically significant degree and the value of chi-Square for df that is between the values (40-50) is ranging from (73,403-86,662), the test has been applied on a number of residual questionnaires which are (75) ones as in table (1). It appears from table (1) that there are no outliers since the values of Mahal. Distance module are less than those of Chi-square in order to give accurate results in

the statistical analysis.

Response Rate: The questionnaires are distributed into (78) into all of the workers in the department of forensic medicine limited to the period from (15-11-2017) to (1-12-2017). The number of the residual questionnaires have been (75) with 96% response rate. All of the questionnaires are suitable to be statistically analysed as in table (2).

Descriptive Statistics of the Workers' Psychological Pressure

Statistical Descriptive Analysis of Health Dimension

It appears from the results of descriptive statistics that the general mean for health dimension is higher than working mean (3) which has attained (3.571). This implies that the employees' answers show a spread of some source of psychological pressure sources emerging from (health dimension) for employees in department of forensic medicine in Babylon governorate. This occurs with a general slandered error (0.0637) which indicates the accuracy of the answers. The general slandered deviation was (0.786) and the general variance was (0,640) and this confirms that there is a reduction in the answers' dispersion from the mean.

Statistical Descriptive Analysis of Economic Dimension

It looks from the results of descriptive statistics that the general mean for economic dimension is higher than working mean (3) which has attained (4.118). This implies that the employees' answers trend to a spread of some source of psychological pressure evolving from (economic dimension) for employees in department of forensic medicine in Babylon governorate. This occurs with a general slandered error (0.0480) which indicates the accuracy of the answers. The general slandered deviation was (0.591) and the general variance was (0,416) and this confirms that there is a reduction in the answers' dispersion from the mean.

Statistical Descriptive Analysis of Work Dimension

It looks from the results of descriptive statistics that the general mean for work dimension is higher than working mean (3) which has reached (3.898). This entails that the employees' answers trend to a spread

of some source of psychological pressure evolving from (work dimension) for employees in department of forensic medicine in Babylon governorate. This occurs with a general standard error (0.0846) which indicates the accuracy of the answers. The general standard deviation was (0.554) and the general variance was (0.621) and this confirms that there is a reduction in the answers' dispersion from the mean.

Statistical Descriptive Analysis of Life Circumstances Dimension

It appears from the results of descriptive statistics that the general mean for life circumstances dimension is higher than working mean (3) which has reached (3.031). This entails that the employees' answers tend to a spread of some source of psychological pressure evolving from (life circumstances dimension) for employees in department of forensic medicine in Babylon governorate. This occurs with a general standard error (0.067) which indicates the accuracy of the answers. The general standard deviation was (0.835) and the general variance was (0.525) and this confirms that there is a reduction in the answers' dispersion from the mean.

Statistical Descriptive Analysis of Social Relationships Dimension

It appears from the results of descriptive statistics that the general mean for social relationships dimension is higher than working mean (3) which has reached (3.005). This entails that the employees' answers lean to a spread of some source of psychological pressure evolving from (social relationships dimension) for employees in department of forensic medicine in Babylon governorate. This occurs with a general standard error (0.055) which indicates the accuracy of the answers. The general standard deviation was (0.686) and the general variance was (0.493) and this approves that there is a reduction in the answers' dispersion from the mean.

Statistical Descriptive Analysis of Personal and Family Dimension

It seems from the results of descriptive statistics that the general mean for personal and family dimension is higher than working mean (3) which has reached (3.170). This entails that the employees' answers tend to a spread of some source of psychological pressure evolving from (personal and family dimension) for employees in department of forensic medicine in Babylon governorate. This occurs with a general standard error (0.083) which indicates the accuracy of the answers. The general standard deviation was (0.475) and the general variance was (0.365) and this confirms that there is a reduction in the answers' dispersion from the mean.

Statistical Descriptive Analysis of Administrative Reformation Dimension

It seems from the results of descriptive statistics that the general mean for administrative reformation variable is higher than working mean (3) which has reached (2.265). This entails that the employees' answers tend to a spread of some source of psychological pressure evolving from (administrative reformation) variable for employees in department of forensic medicine in Babylon governorate. This occurs with a general standard error (0.039) which indicates the accuracy of the answers. The general standard deviation was (0.786) and the general variance was (0.438) and this confirms that there is a reduction in the answers' dispersion from the mean.

Evaluation of the Measurement Model

The items with 0.4 saturation and less have been deleted to check the increase of reliability coefficient throughout the increase of the external saturation values of the other items. It is found that all the external saturation values of the items, reliability coefficient values (1- 0.6), and Cronbach Alfa (more or equals 0.7.) are accepted according to the principle of (Hair et al., 2017: 94). Thus, the measurement sample is followed of the variable workers' psychological pressure along with its (23) items and the values are as in table (3).

CONCLUSION

It appears from testing the hypotheses that the relation between demonstrative reformation and the psychological pressure of workers is a negative one. Consequently, demonstrative reformation can contribute in reducing the workers' psychological pressure. Similarly, it is clear from in the descriptive analysis of data that there is psychological pressure in the workers in the department of forensic medicine in Babylon governorate. In addition, (economic dimension) head the first grade in being a source of workers' psychological pressure in accordance to their opinions. By testing the hypotheses, it is found that the highest value that the psychological pressure of workers can be affected by is via their economic dimension and the ability to elevate this side. Also, it discerns from the workers' answers that (work dimension) has attained the second grade, (health dimension) has achieves the third grade by being a source of psychological pressure for

workers. The latter two are higher than the remainder sources of psychological pressure (social relationships, life circumstances, personal and family dimension). The researchers consider the dimensions that are set as universal to measure the psychological pressure of workers; however, the answers reached to affirm that the economic side, work circumstance, and health dimension are the most areas that form the nature of the psychological pressure of workers in the department of forensic medicine in Babylon governorate. Furthermore, testing the hypotheses has admitted the first main hypothesis that administrative reformation contribute in limiting the psychological pressure of workers in an amount of (R^2) of the explanation amount. The testing of the sub-hypotheses has shown, on the one hand, the acceptance of three hypotheses about the idea of the administrative reformation impact throughout (economic, work, and health) dimensions since the relationship is of a statistically significant indication. On the other hand, it has shown the rejection of the other

sub-hypotheses which is the impact of administrative reformation on the psychological pressure of workers which are (social relationships, life circumstances, personal and family) dimensions since the relationship is not of statistically significant indication. Also, it could be so because the administrative reformation adopted by the general administration has no such items that treat the pressures which emanate from (social relationships, life circumstances, personal and family) dimensions. It is denoted from the descriptive analysis of the demonstrative reformation that general administration do not adopt the actuality of administrative reformation and needs enough time to handle the psychological pressure of workers in the department of forensic medicine in Babylon governorate. From what precedes, it appears the necessity to apply the law of forensic medicine which includes articles related to economic sides in the first place so as to increase the living grade of workers specifically after retiring. In order to promote the health dimension for workers and taking care of their health, it is needed to make health card. It is required to do the dusting of hominization halls to avoid infection transformation. Furthermore, workers in such career should be given obligatory vacations for the nature of the work they exert. In addition, they should take fees which accord with their exerted effort. Finally, they should go through training courses.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Business Administration, University of Babylon, Iraq and all experiments were carried out in accordance with approved guidelines.

The Effect of IL-6 Expression on the Behavior of Oral Squamous Cell Carcinoma Cells (An immunohistochemical Study)

Osama M. Ghazi¹, Lehadh M. Al-Azzawi¹

¹ Department of Oral Diagnosis, College of Dentistry, University of Baghdad, Iraq

ABSTRACT

oral squamous cell carcinoma (OSCC) was and still constitutes a major challenge for medical researchers. Many researchers link between TNM stage, tumor grade, tumor depth of invasion, mode of invasion, perineural invasion, and lymphovascular invasion with locoregional recurrence and poor survival in-patients with OSCC and they concluded that these parameters could be used as prognosticators in this tumor. IL-6 is a multifunctional member of interleukin 6 superfamily of cytokines which has broad biological events like participation of immune response regulation, hematopoiesis, acute phase reactions, and oncogenesis. The purpose of this study was to evaluate the behavioral significance of IL-6 expression on oral squamous cell carcinoma cells. Fifty formalin fixed- paraffin embedded tissues of primary OSCCs were examined by immunohistochemistry for IL-6 expression. The expression scores of IL-6 then statistically correlated with different clinical and histopathological parameters to evaluate the possibility of IL-6 to change the behavior of OSCC cells. Positive expression of IL-6 was detected in 45 cases (90%) among them (31 cases; 62%) showed high level of expression, (14 cases; 28%) were low. only five cases (10%) showed negative expression. Statistical analysis of this expression displayed non-significant relations with clinicopathological parameters studied.

Keywords: oral squamous cell carcinoma, IL-6, prognosticators

INTRODUCTION

Squamous cell carcinoma (SCC) is the most predominant oral epithelial tumor constituting more than 90% of entire oral malignancies¹. Multiple genetic mutations that modify the functions of proto-oncogenes, tumor suppressor genes, genes of apoptosis or DNA repair genes are required for the development of this horrible tumor². These genetic alterations give the tumor cells growth and survival benefits by increasing the construction of growth factors, number of cell surface receptors, increasing levels of transcription or intracellular messenger factor, and increase ability to evade the apoptosis. Loss of tumor suppressor gene actions lead to cellular proliferation, weakening of cell

to cell adhesion, increased capability for invasion and distant metastasis³. In spite of considerable progress in diagnosis and treatment modalities of oral squamous cell carcinoma (OSCC) that improved the prognosis, failure of treatment may occur mainly due to wide local invasion and/or local lymph node metastases which are often found even at initial diagnosis (4). Efforts have been made by many researchers in order to discover dependable parameters that can be utilized as prognosticators of metastatic spread to the lymph nodes, recurrence of tumor, and reduced disease survival in patients with OSCC since the behavior of the tumor is greatly unpredictable. Many parameters (clinical, and histopathological) were studied broadly including TNM stage, tumor grade, depth of invasion, pattern of tumor invasion, tumor budding, perineural invasion, lymphovascular invasion, and lymphoplasmacytic response^{5,6}. It is well known that inflammation especially chronic one is involved in the pathogenesis of cancer. Etiologically, 15 to 20% of all cancers are associated

Corresponding author:

Osama M. Ghazi.

Department of Oral Diagnosis, College of Dentistry,
University of Baghdad, Iraq

with inflammation⁷. Tumor cells produce inflammatory agents including cytokines in order to facilitate stromal invasion⁸. IL-6 is a multifunctional member of interleukin superfamily of cytokines which has broad biological events like participation of immune response regulation, hematopoiesis, acute phase reactions, and oncogenesis⁹. IL-6 was initially recognized as a B cell stimulator factor-2 due to its capability to drive B cells differentiation into antibody generating plasma cells¹⁰. Structurally the glycoprotein IL-6 consists of 184 amino acids with a molecular weight of 26 kDa¹¹. IL-6 synthesized by different cells including “macrophages, fibroblasts, dendritic cells, T-lymphocytes, B-lymphocytes, endothelial cells, keratinocytes, and certain tumor cells”. These cells release IL-6 in response to variable stimuli such as “infection, burns, trauma, and neoplasia”. In turn, IL-6 stimulating many CD130 and CD126 expressing cells^{12,13}. Upon binding of IL-6 to the IL-6 receptor, the resulting complex recruits gp130 subunits to form hexamer composed of two IL-6 molecules, two IL-6 receptor, and two gp130 subunits. The downstream action of the IL-6 thus achieved through stimulation of JAK/STAT, PI3K/AKT and MAPK signaling pathways¹⁴.

MATERIALS AND METHOD

Fifty paraffin-embedded blocks of oral squamous cell carcinoma, were retrieved from the archive of the oral pathology department/ College of Dentistry / Baghdad University. Two 5 µm slides were prepared for each tissue block. The first was stained with hematoxylin and eosin for histopathological evaluation and the other for immunohistochemical staining with IL-6. For each case clinical data including age, gender, anatomical site, and clinical stage according to TNM staging system were tabulated. In addition, histopathological parameters like tumor grade which was evaluated according to WHO grading system, Depth of tumor invasion which was measured from epithelial basement membrane to the deepest invading cell, pattern of invasion (examined at the host/tumor interface Type 1: represents tumor invasion in a broad pushing well delineated borders, POI Type 2 represents tumor invasion with solid cords, bands and/or strands, POI Type 3: represents small groups or cords of infiltrating cells, POI Type 4: represents wide-spread cellular dissociation in small groups and/or in single cells) were obtained. The immunohistochemical procedure was performed according to the abcam IHC protocol using anti-IL-6 antibody (ab9324, USA) in a

dilution of 0.125µg per ml.

Immunohistochemical Scoring

The percentage of cancer cells that expressed IL-6 was calculated as labeling index (LI). The LI was computed by dividing the number of the positively stained cells by that of all the cancer cells. The patients were divided into three groups as follow: negative group = LI <5%; Low IL6 group = 5% ≤ LI <30%; High IL6 group = LI ≥30%¹⁵.

Statistical Analysis

All statistical analyses of the present study were performed by statistical package for social sciences (SPSS version 22). Data were summarized using mean±SD for quantitative variables and number and percentage for qualitative variables. Mann-Whitney test and Kruskal-Wallis test were used as appropriate to compare the differences in immunohistochemical expression scores among different clinicopathological parameters.

RESULTS AND DISCUSSION

Expression of IL-6 in oral squamous cell carcinoma and adjacent non-tumoral mucosa

IL-6 immunostaining pattern was brown cytoplasmic diffuse or patchy involved tumor cells and the infiltrating lymphocytes. Similar pattern of expression was observed in the dysplastic epithelium with a tendency for stronger expression toward the basal layer. In contrast; faint or negative cytoplasmic expression was observed in the adjacent normal epithelium. High expression score was detected in 31 cases with an index mean of (40.61). Negative and low scores were detected in 5 and 14 cases respectively. Regarding tumor site, the highest percentage of high positive scores were observed in the alveolar ridge and the tongue, which were represent (75% and 73%) respectively. With respect to the mode or pattern of invasion, the greatest difference in mean indices of IL-6 expression was observed between mode 1 and mode 4; nevertheless, non-significant relation was noticed (p value= 0.16). As observed from table 1 non-significant relations were detected with all clinical and histopathological parameters. Amongst numerous cytokines studied, IL-6 has been given special attention because it has a pleotropic effect and its pathophysiologic role in tumor progression has been

proposed and reinforced by in vivo and in vitro studies¹¹. This study revealed that 90% of the studied samples showed positive cytoplasmic expression of IL-6 in tumor cells among them high level of expression was detected in approximately 68%. Only 5 cases (10%) were negatively expressed IL-6. Similar observations were reported by many researchers^{7,15,16}. Cytoplasmic expression of IL-6 indicate that oral squamous cell carcinoma (OSCC) cells are capable to produce such proinflammatory cytokine in their living course. Researchers described this proficiency to the effect of the catecholamines released due to the chronic stresses associated with oral cancer or to the effect of treatment (17). The discrepancies in mean IL-6 expression labelling indices in this study were not enough to reach significant statistical relations particularly in tumor grade, tumor stage, lymphovascular invasion, perineural invasion, pattern of invasion, and tumor depth of invasion. In contrast, some researchers found that high IL-6 expression correlated significantly with advanced tumor grade, advanced stage, perineural invasion, vascular invasion, lymph node metastasis, distant metastasis, and tumor recurrence in OSCC and other tumors¹⁵⁻²³. The researchers proposed different mechanisms by which IL-6 may induce invasion and metastatic potential of tumor cells. Yadav and his coworkers suggested that IL-6 may activates STAT3/SNAIL signaling pathway enabling epithelial mesenchymal transition (EMT) of head and neck cancer cells and knockdown of STAT3 significantly reversed IL-6 induced EMT changes¹³. Another study documented that IL-6 Trans-signaling (IL-6TS) has a specific action on metastatic potential of cancer cells by lowering adhesive ability, increasing motility and migration of these cells. In addition, IL-6TS

has an inhibitory effect on maspin (tumor suppressor gene) since maspin inhibits metastatic potential of cancer cells^{24,25}. Further study showed that IL-6 stimulates a network of cytokines which give rise to the invasive tumor in human carcinoma model²⁶. Similarly, IL-6 enhances the expression of both MMP-1 and MMP-9 enzymes which are participate in tumor cell invasion and metastasis¹⁹. Enhancement of cancer stem cell phenotype is another way by which IL-6 contributes to tumor progression and metastasis²⁷. IL-6 may induce tumor immune tolerance by retarding the differentiation of dendritic cells thus facilitating metastatic spread²⁸. It is worth to mention that the majority of previous studies that studied IL-6 in patients with OSCC or other tumors were based on its serum concentration. However, the tissue expression of IL-6 found to be clinically more important than its serum level as a factor related to the prognosis²⁹. In addition, the antagonistic effect of some other cytokines in tumor microenvironment may play a role in inhibiting the probable role of IL-6 in tumor progression and invasion or the IL-6 signaling may trigger the expression of some proteins that neutralize its effect through a negative feedback loop³⁰. Beside that IL-6 expression alone in tumor cells appear not enough. In order to be functional, IL-6 signaling requires the presence of both membrane IL-6R and gp130 a (transmembrane cytokine receptor)³¹. Moreover, monoclonal antibody (used in this study) binding to IL-6R may be disrupted or interrupted confirming the need for multiple clones directed against different epitopes on IL-6R. Finally, the biological behavior of IL-6 in cancer cells is complex and depend on the balance between growth promoting effect and growth inhibitory effect of some other signaling pathways³².

Table 1. IL-6 expression scores in relation to the clinical parameters.

CONCLUSION

Despite high positive expression of IL-6 which was detected in 62% of the studied samples, non-significant statistical relations were recorded with all clinicopathological parameters indicating absence of autocrine or paracrine effect of IL-6 produced by OSCC cells on their biological behavior or may highlight the

presence of antagonistic effect of other proteins that may inhibit the probable effect of IL-6 on tumor cells through negative feedback mechanism or lack of soluble IL-6R expression which is required for IL-6 signaling.

The Effect of MST approach in The Clever Mental Thinking of Pupils

Mahdi Mohammed J¹, Arif Hatim J¹

¹College of Basic Education, University of Babylon, Babylon, Iraq

ABSTRACT

This research aims to identify the approach effect of mathematics , science and technology (MST) in the clever mental thinking of pupils in the fifth class of primary school, the researcher put the null hypothesis which states that : There is no statistical differences at level (0.05) between average marks of experimental group who are learning according to MST approach and pupils' average marks of the control group who are learning according to the usual method in the clever mental thinking test , the researcher applied his experience in the second course of the academic year (2017-2018) for verification , the research sample made up of (600) pupils in the fifth class of primary school in Al-Nisour primary school , randomly they were distributed into two groups , (30) pupils in each group , the two groups are equaled by variables (age , IQ test marks , science degree in the first course of the academic year (2017-2018) based on the importance of the content of the scientific approach and its behavioral aims , the researcher made a test for the clever mental thinking that consists of (40) items of multiple choice questions (MCQs).

Keywords: *MST approach, The clever mental thinking*

INTRODUCTION

The mind is a term almost used to describe and express the higher functions of the human brain, especially those functions in which human be conscious, like argument, thinking , intelligence , memory , analysis and all the emotional emotion that is exposed to. While the brain is main part of the neurological (nervous system) in all vertebrates and a lot of invertebrates, and it's responsible for all information and analysis it, as well as the management and control of most the body organs, also it's a source of information production ¹. Consequently, the mind is a morale word that means the ability of thinking that distinguish between human and other organisms, while the brain is a physical term that is content within the human skull, that contains brain, the stem of brain and cerebellum, the brain usually made up of 80 % of water, and the rest is fat, it's average weight is about 1400 grams. The brain consists a lot of neurons cells between 100 – 150 billion neurons cells, although

the brain weight doesn't exceed 2% of the weight of the body but it consumes 30% of the body energy. In additional to consumption about 20% of oxygen allocated to the whole body, the human brain has the ability to memorize more than two millions information per second ². Thinking is a cognitive process and a basic element in knowledge to human, it's characterized by its social nature and its systemic work that makes it interact with the elements of its construction, which affects and influenced by the other cognitive processes such as perception, imagination, learning and memory ³. The smart thinking doesn't grow automatically and it's not accidental product nor needs an automatic product, the clever thinking to regular and meaningful learning and continuous training. The efficiency of thinking isn't only a natural ability that accompanies the natural growth of the individual , knowledge itself isn't an alternative to knowledge of thought processes , surely knowledge is important but it often becomes ancient , while thinking skills are always new , that is able to acquire and infer knowledge regardless of place , time and the types of knowledge that use the thinking skills in dealing with , undoubted that knowledge in any field makes a basic base of thinking in this field , the most successful

Babylon, Iraq; E-mail: alkhfajymhdy348@gmail.com

people in thinking about any object they are the most knowledgeable about it but knowledge isn't enough, it must be accompanied by an awareness of the thinking process in order to the person be smart and productive in this object⁴. As a result of the development of science, mathematics and technology in recent decades, one of the most important aims of the MST approach is to prepare learners to play a constructive role as adults and as citizens of a technologically advanced society, because of these developments which have an important effect on the human community, in order to be able to use science, mathematics and technology to improve the life in the community, in addition to that many jobs in the present time and future require more knowledge of science, mathematics and technology, the matter that requires that the learners have more knowledge of these fields of study, so Science, mathematics and technology in everyday life are not separate or distinct, but they are used as a whole in analyzing and solving problems in various fields.

METHODOLOGY

It includes a brief description of the procedures that were carried out in order to achieve the aim of the research, starting with the research methodology and experimental design, defining its society and its characteristics that made between the two groups of the research, (experimental and control), as additional to preparing the necessary requirements and the instruments of the research, also the procedures of the experimental Applying and presentation for the most important statistical methods that are used, As the following:

Experimental Design of the Research

The researcher chose an experimental design of partial control type, containing of two groups; the first one is experimental groups exposed to the independent variable, the approach of the MST, and the second one is control that is taught in the usual method.

Research Community and Sample

Research Community

The research community represents the fifth grade pupils in primary school "day" for boys of the academic year (2017-2018) which falls under the borders of the city center of Hilla.

A - Sample of Schools: The researcher chose Al-

Nosur primary school for boys to be a field for the research in order to provide the conditions of research and to show the cooperation of the school administration on the other hand.

B-Sample of pupils: The primary school for boys for the fifth grade consists of two sections, in the simple random sampling method, to determine the two groups of research, (A) section was chosen to represent the experimental group and (B) to represent the control group, so the number of each group was (30) pupils.

Preparing The Research Requirements

The Clever Mental Thinking Test

The researcher has prepared the clever thinking test after considering on the literatures that concerning with this subject according to the following steps:

Identify The Purpose of The Test: The purpose of the research represented in measuring the clever thinking of pupils in all the experimental and control groups, in order to verify the aims of the research.

Reformulated The Test Items : To measure the clever thinking of the two research groups, the researcher prepared an objective test as multiple choice questions, made up of (40) test items as MCQs through (MST approach) in proportion to the age and educational stage of the pupil (fifth class of primary).

Preparing The Test Information: The researcher has prepared the information on how to answer the test items taking into account these things: easy, clear, understandable, short and it able to explain what do the pupils have to do, as well as the researcher put instructions to explain how can answer these questions.

The Exploratory Experiment: In order to investigate of the safety, clarity, difficulty of the items test according to stability, the researcher has applied the test on a sample that consists of (40) pupils in the fifth class of primary in Al-Jamhouriah primary school (day) in the city center Al-Hillah, after the researcher makes sure of these subjects are covered by the experience, it became clear that the items were clear and not mysterious to the pupils and the average time to answer these questions is (58) minutes.

The Statistical Analysis of The Test Items: The purpose of the analysis of the test items is to improve the

test through find out about the weak items and work on reformulation and exclusion of the invalid one , on this basis the researcher analyzed the test items to recognize the difficulty of the item , and its strength as well as the effectiveness of the alternatives aren't correct , and as follows :

Item Difficulty: After the researcher had counted difficulty coefficient of all the test items, he has found out that it's between (0,73-0,28) , that means all the test items are acceptable, so Blom believes that the test items are acceptable if the difficulty coefficient between (0.80 – 0.20).

The Strength of Items Discrimination: When calculating the strength of the distinction of each test items, he found out that it between (0.66-0.32), hence Ebel refers to all the items are new if its discriminating strength is (0.30) or more than this.

The Effectiveness of The Incorrect Alternatives: The researcher calculated the effectiveness of wrong alternatives for all the test items , he has found it between (0,31-0,9) when the gravity be minus and great was attractive and effective and recommended to keep it in the item , the researcher decided to keep the wrong alternatives without changing.

The Test Reliability: The test reliability means that the test will give the same results if it is returned to the same group and in the same conditions. The stability of the test does not mean to be valid , If the test is valid, it should be stable. The stability of the test has calculated into two halves , so the researcher divided the test items into two parties , the first one includes the marks of odd items and the second includes the marks of vertebrates even items, then according to correlation coefficient between the parts of test by using the correlation coefficient (Pearson), the coefficient of stability has reached (0.81) and corrected by the equation of (Spearman - Brown) (0.90) so this is a good mark, since only the test is described by stable if the value is stability of (0,80) or more.

The Statistical Methods

The researcher used the t-test for two independent samples to make the equal between the experimental and control groups, the Pearson correlation coefficient equation, the coefficient of difficulty coefficient, the equation of the item distinction, the equation of the

effectiveness of the wrong alternatives and The statistical pouch SPSS.

RESULTS AND DISCUSSION

Through comparing the marks of the clever thinking test for the pupils of the two research groups, that was applied after the experience to know the effect of the independent variable (MST) in the clever thinking of the experimental group pupils, the average of the pupils' marks in the experimental group reached (32.04) with variation (12.26) while the average of the pupils' marks in the control groups reached (24.69) with difference of (18.38). Using the T-test of the two independent samples to recognize the significance of the differences between these two averages, that shows there is a statistically significant difference between the two groups Table 1. The previous table shows that the calculated T value (7,231) is larger than the T-table value (2) with freedom degree (58) at the level of significance (0.05) that indicating there is a statistically significant difference between the average marks of the pupils of the two research groups. Therefore, the null hypothesis is refuses and the alternative hypothesis accepts that there is a statistically significant difference is reached at a level of (0.05) between the average of the pupils' marks of the experimental group who learnt science according to the MST and the average of the pupils' marks of the control group who learnt science in the traditional method of clever thinking. The results of the research are consistent with many previous research results that showed the positive effect of the MST Approach as an experimental variable on a number of dependent variables. The researcher also used Kolmogorov-Smirnov test of the normal distribution ,which is the non-scientific test of normal distribution, that is controlled through (P) value , so if probability (P) is bigger than level of the significance adopted , that means there is no difference between the aggregate distribution function of the sample and the theoretical distribution function of the equinoctial distribution, which means acceptance of the null hypothesis, i.e. the distribution is equinoctial. After using the test showed that probability of (P) value bigger than the significance level, which was adopted by the researcher, that is (0.05) which is lead to all the members of the two groups follow the normal distribution. The results showed that the pupils of the experimental group who have studied according to the MST approach in the clever thinking of the pupils go better than the control group who studied in the usual method, the researcher

believes that this result can be attributed to the following reasons:

The MST approach helped the pupils of the experimental group to absorb the approach more effectively than the pupils of the control group who have studied the same approach in the traditional method, which is almost entirely dependent on the teacher and on keeping what is within the specific book without absorbing or performing any necessary mental processes.

Education through the MST approach encouraged pupils to develop the questioning ability of science in many classes, so the process of questioning is the basis of scientific discoveries and innovations.

The MST approach gave the pupils an opportunity to develop their scientific curiosity, The use of this approach led the pupils to get the explanation of scientific phenomena and learn what satisfied their curiosity.

This excellence can also be attributed to the effectiveness of the MST approach, which involves the use of various educational methods used to enhance clever thinking skills. These include participatory learning, side conversations, learning by raising questions, making comparisons, identifying characteristics or identifying existing evidence to support the outcome and reflect on the importance of results and critical judgment on the results, which helped pupils to express their ideas and hopes and adjust it, Thus, the MST has enhanced aspects of thinking skills and the tools required to understand phenomena, rationalize objects, and be able to make decisions rationally away from the blind intolerance of other views. Prediction, observation and interpretation interfere and shared with the pupil's clever thinking skills, which leads to raising the developmental balance of these skills.

Table 1. The results of the T-test of the marks of the two research groups of pupils in the intelligent thinking test

Group	Sample size	SMA	variance	Standard Deviation	Freedom	The t-values		Indication level On(0,05)
						Calculated	tabular	
experimental	30	32,04	12,26	3,5	58	7,231	2	statistically
Control	30	24,69	18,38	4,28				

CONCLUSION

the psychometric characteristics has been verified, at the end of the experience which had continued 9 weeks, the researcher has applied the clever mental thinking test on the pupils of the two groups , after results has gotten and analyzed which showed that the pupils of the experimental group who have learnt according to MST approach got the better of the pupils of the control group who have learnt according to the usual method in the variable of the clever mental thinking.

The Effect of Vitamin D and Leucine - Enriched whey Protein Nutritional Supplement on Measures of Sarcopenia in Older Adults

Rafid Hadi Hameed

Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

The study seeks to test the hypothesis that Vitamin D and Leucine – enriched with Proteins affects Measures of Sarcopenia among the Older Adults. Loss of muscles is highly linked to old age; other aspects affected include strength, and mass of muscles, a condition commonly known as Sarcopenia. Sarcopenia poses a threat to independence, performance as well as the quality of life of the affected person. Aspects of Sarcopenia could be influenced positively by nutritional supplements hence, preventing mobility disability.

Keyword: *Protein Nutritional Supplement, Sarcopenia, Vitamin D*

INTRODUCTION

Preserving independence living, function and physical mobility is essential as a person ages and enters the old age generation^{1,4,11}. Sarcopenia is a big risk for diseases such as fractures, falls and reduced mobility, and also leads to long-term and hospital care admission directly. The loss of muscle function as a result of old age, strength and mass known as Sarcopenia make the largest component of physical frailty. Besides, Sarcopenia is related to reduced independence, increased disability and low quality of life leading to death³. However, the progression and onset of Sarcopenia are multidimensional because it involves absorption, marginal nutrient intake, neuromuscular deterioration, altered metabolism, and physical inactivity¹⁰. One of the main interests here is the component of marginal nutrient intake¹³. This is because the component of marginal nutrients intake is a modifiable risk^{5,17}. Vitamin D status and inadequate protein intake are correlated with muscle strength¹⁶. Older adult muscle is less resistance to anabolic stimuli which include mixed meals and exercise despite the adequate intake of protein compared to young adults

^{13, 18}. This condition is known as anabolic resistance. In light of that, recent recommendations mainly focus on the daily intake of proteins. Geriatric patient with the chronic and acute disease should take at least at least 1.2 for healthy adults. On the other hand, older people should take at least 1.0 g/kg BW/day. Furthermore, since older adults have high sensitivity of older muscle to lower dose of amino acid, it means that dietary protein must GET distributed per meal to at least 25g of high-quality protein¹⁹. This will help older adults in the stimulation of muscle protein synthesis. The study hypothesized that improvement of muscle function, strength, protein, and independence among Sarcopenia older adults could GET achieved through the provision of targeted nutritional²⁰. The study explored the safety and efficacy of this concept¹⁴. Besides, this study is not without limitation. The studies handgrip strength and primary outcome is a proxy measurement which is well validated for lower body strength. Though the study showed that leg press strength and handgrip are well indicating the effect of the intervention, the handgrip strength did not¹⁶.

MATERIALS AND METHOD

This study was a quantitative research study which used self- reported questionnaires to collect data, which was then analyzed to come up with findings and a conclusion. This study has been conducted to show the Effect of Vitamin D and Leucine - enriched when Protein Nutritional Supplement on Measures of Sarcopenia

Corresponding author:

in Older Adults. This study followed the randomized, double-blind, controlled and multicenter with active and control group study among Sarcopenic older adults ².

Design and sample

This was a controlled and multicenter with active and control group study among Sarcopenic which took a 13 week the randomized, double-blind. The institutional review board approved the study. Additionally, the procedure of the current study was performed on the ethical laws of the Declaration of Helsinki for human medical research. The participants in the study were recruited in 6 countries of Europe from 18 study centers: United Kingdom, Sweden, Italy, Ireland, Germany, and Belgium. Participants were only allowed to take part in the data collection if they were not affected by any major impairment, between 20-30 kg/m² body mass index. Potential participants were people with liver or kidney failure, acute inflammation, anemia, malignancies or present with contraindication for vitamin D or using any medication were excluded. Participants were then randomized to receive an iso-caloric control or active products. The control product was not supposed to have any micronutrients or protein, and only fats, carbohydrates, as well as any other trace elements. On the other hand, the active products contained, per serving, fibers, minerals, a mixture of vitamins, 800 IU vitamin D, 9g carbohydrates, 3g fat, 3 g total Leucine and 20 grams' whey proteins. Both were delivered to be reconstituted with at most 150mL of water as 40 g powder and taken twice daily by the participants before lunch and breakfast to provide adequate protein bolus ¹². In stratification and randomization, the study used permuted block randomization to the control or active group. The study used a computer to generate the randomization sequence by blinded statistical. The blinded statistical was however not involved in the analysis or collection of data. Also, the randomization code was not to be broken till the modeling statistical of secondary and primary results was ready. To determine the measures of the results, during the designated weeks, those tasked with the responsibility of overseeing the research were able to assess the outcomes. Hydraulic hand dynamometer was used to measure handgrip strength. The two measures of grip strength were recorded in kg. The participants were allowed to stand upright with the arms held in a parallel position to the rest of the body. The study calculated the maximum strength of grip by taking measurements of both hands then too the average high measurements.

SPPB which was the other main aspect of measure includes three components: balance, chair stand test, and gait speed. Each component was scored from 0-4 where 0 meant not possible, and 4 meant the best performance. Summation of the components was done and gave a total score which ranges from 0-12. On the other hand, the individual outcome on the functions of the physical muscles: balance score, speed of gait, and chair stand were defined as a separate subordinate outcome in the study ²¹. Questioners of self-reported physical activities, activities of daily living and Appendicular muscle mass were other secondary outcome used to measure Appendicular muscle mass. The European version of the physical activity scale was used to measure the self-reported amount of activity. The level of independence was measured by the Barthel index with a possible score between 0-100. Also, the researcher used the EQ-5D to measure the health-related quality of life both as visual analog scale and index between 0-100. Self-completed intake diaries were used to measure the product compliance. Fasting insulin and glucose, on the other hand, were measured at screening. The study safety assessment included recording medication use by the participants, medical history, adverse events via telephone calls and nutritional supplementation. Other safety measures included monitoring gastrointestinal tolerance, vital signs, inflammatory status and evaluation of laboratory parameters to the renal functions and the liver.

The development of a questionnaire

The self-reported questionnaire of physical activities related to quality of life with Appendicular muscle mass were other secondary outcome used to measure Appendicular muscle mass ²⁰. The questions were drafted based on the previously conducted studies' literature search although the study did not indicate any authenticated questionnaire

Data collection

The self-reported questionnaires of physical activities were used to collect data and detect an effect size 0.05point differences in SPPB. The use of data monitoring committee randomized additional of eight participants. This followed the blinded interim analysis.

Variables and data analysis

The European version of the physical activity scale

was used to measure the self-reported amount of physical activity. Also, the level of independence was measured by the Barthel index with a possible score between 0-100. Also, the researcher used the EQ-5D to measure the health-related quality of life both as visual analog scale and index between 0-100. Additionally, each component was scored from the 0-4 scale where 0 meant not possible, and 4 meant the best performance. The components were summed in a total score which ranges from 0-12. Data analysis was performed to treat all the randomized participants. This was done regardless of whether all the participants finished full study protocol. The treatment by time in this model was used in the interaction of coefficient to estimate the potential different change in the outcome between control and active group. The MMRM of the outcomes included predefined covariates baseline age, sex, and protein intake¹³. Additionally, the study did not make any adjustment for secondary outcome multiple testing due to the nature of the study which is explanatory. The continuous variables were long-term transformed before the MMRM analysis. Imputation was undertaken for a total of 16 participants for missing¹⁷ majorly the protein intake by the use of the group mean intake. The study used the Mann-white U test to categorize variables that MMRM could not use in the analyses. The demographic details consisted of age mean, sex, living situation, handgrip strength, mental health condition, protein intake and fasting glucose concentration²⁰. Also, the demographic details also consisted of gait speed and nutritional assessment. The one-way ANOVA that analyses test and variance was used in the study to carry out Bivariate analysis as appropriate. Conversely, the multiple linear regressions were used to conduct multivariate analysis on the effect of Vitamin D and Leucine - enriched whey Protein Nutritional Supplement on Measures of Sarcopenia in Older Adults. The independent variables in the bivariate analysis were statistically significant. SAAS software

was used to perform all the statistical analyses according to the already set statistical analyses plan. Independence statistics can be used to repeat the statistical analyses to confirm the findings.

RESULTS AND DISCUSSION

The study indicated that SPPB and the Handgrip strength improved in both groups. As per the chair stand test, the active group improved in comparison to the control group. Additionally, the active group was found to have acquired more Appendicular when compared to the control group. Screened adults for participation were to determine the effect of Vitamin D and Leucine - enriched whey Protein Nutritional Supplement on Measures of Sarcopenia^{3,14}. 380 of the participants were randomized to control groups and to intervention or active groups. After the intervention, all the visits were completed by 302 participants. In both the groups, there were similar baseline background characteristics (table 1). 77.7 years was the mean age. Nutritional intervention among Sarcopenic older adults led to improvement in chair standability and significant gains in muscle mass in the active group^{21,23}. The exercise was considered as the ideal intervention for improving physical activity performance and increasing muscle strength among Sarcopenic older adults. The study also aimed at investigating isolated effects of targeted interventions on nutrition. This suggested that Protein Nutritional Supplement could improve muscles of Sarcopenic older adults because it can stimulate muscle protein synthesis²². The study focused mainly on the effects of protein synthesis. Conversely, to assess the changes in muscle function, strength and mass among Sarcopenic older adults, only a few long-term nutritional interventions have been done²⁴. However, in frail and prefrail older adults (n=65) it was demonstrated that nutritional supplements affected the improvement in SPPB, though it never resulted in muscle strength or mass difference¹⁵.

Table 1. Clinical characteristics and Baseline Demographic

	Control n=196	Active n=184
Sex, female n (%)	129 (65.8)	120 (65.2)

Active	7.5 (1.9)	0.86 (1.38)	0.11	.51
Balance test Control	3.0	0.00		
Active	3.0	0.00	N.A	.89

CONCLUSION

Overall, the study resulted in improvement in lower extremity function and muscle mass. The study also indicated proof of the principle that geriatric patient might benefit from specific nutritional supplementation alone especially for those who are not able to do exercise on their own. The study results encourage further investigations.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq and all experiments were carried out in accordance with approved guidelines.

The Impact of the Numbered Heads and the Active Hand Strategy in the Achievement for the Fifth Grade in Primary in Science Approach

Nada Samir Obaid Al-Jubouri¹, Saeed Hussein Ali Al-Thalab¹, Osama Abid Kadhim Mahdi¹

¹College of Basic Education, University of Babylon, Babylon, Iraq

ABSTRACT

The purpose of this research is identify The Impact of The Numbered Heads and The Active Hand Strategy in the Achievement for the Fifth Grade in Primary in Science approach. Experimental design with partial adjustment (experimental group , control group) , which has post-test in achievement of pupils, that made up of (81) pupils of the academic year (2017-2018) , with (25) pupils studied according to the active hand strategy , and (26) pupils studied according to numbered heads strategy , and (30) pupils studied according to the usual method , the three research groups has equaled statistically by depending on single-variance analysis in the variables (age of pupils , the marks of science approach in the mid-year). After identify the scientific approach for the (eighth , ninth , tenth , eleventh and twelfth) behavioral aims reformed and prepared (32) teaching plans for each group , and prepared achievement test that consists (40) items that were multiple choice question according to (understandable , comprehension and applying) , while the validity depended on the midterm retail , the item difficulty of items , the strength of discrimination and the effectiveness of the wrong alternatives are used.

Keyword: Science Approach, Fifth Grade, Numbered Head.

INTRODUCTION

The educational technology belongs to antiquity, hence the Greeks developed education , education has developed rapidly in that era, recently the educational importance has increased significantly by who interested in teaching and education in universities , schools and educational institutions, Technology aims to the best methods to develop the education, increase the educational levels and solve problems in order to reach more effective learning, The technology is the result of interaction among Human, approaches and instruments. The education is a process of change and continuous growth in human that aims to prepare human to reach to complete physical, mental and emotional growth¹. The Textbook becomes the support of curriculum because it includes the information that the learners need to in

all knowledge fields that is the only source which the learner gets, the teacher's role is to teach the learners to absorb all the information in the textbook then makes a test ² , the teachers can depend on the schedule results of their pupils and work to take into account the individual variance between the levels of their preparedness , knowledge and previous experiences through relying on homework , dialogue sessions , discussions and teaching the mini-groups , all the students can learn and get experiences gradually ^{3,4} , teaching in mini-groups as a typical method to communicate information to the students and encourage them to participation and contribution in the educational process which may be leads to increase the achievement level to the category of learners particularly and the success of the educational process generally ⁵. The cooperative education strategy is distinctive for training and work to overcome difficulties, the pupils are divided into small and heterogeneous groups (include different levels of knowledge) each group made up of (2-5) members , the pupils of one group cooperate in achieving a common aims , the teacher's role is to make the process more

Corresponding author:

College of Basic Education, University of Babylon,
Babylon, Iraq.

easy, and makes all the members cooperate in the work⁶. When the scholar (Spencer Kagan) developed this strategy which the teacher divided the pupils into teams, each team consists of (3-5) member of each group, the teacher gives a number to each pupil in the group and explain the task to be studied by using blackboard and worksheet recently prepared, the teacher asks a question and asks the pupils to discuss it together in all groups in order to make sure that every pupil in each group has taught and knows the answer, after that the teacher choose a number randomly and the pupil who carries this number have to give the answer that agreed by all the members of group, in this way social interaction and positive interdependence are achieved in order to achieve teaching and achieve the aim. The active hand strategy is one of the active teaching and one of the modern teaching strategies that used to prove the aims and teaching skills and also it can be used to review and prepare the lesson, the idea of the active hand is using the hand form, thus the questions write down on the palm of the hand and the answers are on the fingers⁷.

METHODOLOGY

Experimental design

The researcher adopted the partial experimental design because it's more suitable of the study conditions so the researcher adopted two experimental groups and one control group, as in the table (1).

Identify the research community and choose the sample

The research community includes the pupils of the fifth class in public primary school (day study) that belongs to the general education of Babylon / city center of the academic year (2017-2018) that consists of three sections (A, B, C) that have chosen randomly as in the table (2)

Adjusting the extraneous variables

The researcher tried as much as possible to avoid the effect of a lot of variables in continuing the experience and its results, these are some variables: Selected the persons of the sample: the sample was selected randomly of the three research groups as well as the statistical equivalence in the variables (age, the marks of science in the mid-year) that found out the sample members are equal. Maturity element: there was no difference between the students of the three research

groups that concerning of maturity as well as the experience that they do in the same period. The accidents: the experiment has not been incurred to accidents or emergency situations that obstruct traffic (accidents, floods and etc...). Exhaustion of the experience: didn't get a case of interruption, transfer or absence except some personal cases through the period of the experience, the researcher used the same measure instrument for the three research groups (the study achievement).

Preparing the study plans

See some of the literature and previous studies that deal with the numbered heads and the active hand strategy that included the study of (Daniel Paul Baker, 2013) and (Al-Fatlawi, 2015), preparing (96) educational plans by (32) educational plans for each one of the three research groups.

The statistical analysis of the test items

The analysis of the test items is one of the main processes that can be used by the researcher to check the vocabulary, and identify the quality and the effectiveness, each item of the test items has special characteristics, the aim of analyzing the test items is to know the difficult degree of each item (item difficulty), the possibility of differentiation between the difference levels of the pupils and the effectiveness of the wrong alternatives of the test, therefore the researcher corrected the answers of the pupils of the second survey sample that involves (100) pupils.

The effectiveness of the wrong alternatives

That means the ability of the wrong variant in the test items to attract the pupils of the low performance class to choose it. The greater the negative, the more attractive and effective to retain it in item. The researcher applied the equation of the effectiveness of alternatives on each of the items of the test and found that the wrong alternatives have attracted to it a number of pupils in the lower group more than the pupils of the upper group and this indicates to its effectiveness, so the alternatives are all suitable.

The test stability: adopted the method of fragmentation

Seventh: applying the experience:

The researcher herself has studied the two

experimental groups and the control group.

The researcher prepared the study plans for the two experimental groups and the control group, so prepared (64) plans for the two experimental groups according to the numbered heads strategy and the active hand and (32) plans for the control group according to the usual method.

The experience has finished on Monday (30/4/2018).

The researcher applied the achievement test in its final form on Wednesday (25/4/2018) on the three research groups in the same time, and the marks of the three research groups have been got.

Statistical instruments

Analysis Of Variance one-way (ANOVA)

This method was used to identify the significance of the statistical differences between the three research groups at the statistical equivalence of a number of variables and to analysis of the final results.

$$F = (A S G) / F = \text{The F value}$$

A S B = Average squares between groups

A S W = Average squares within groups

(Al-Bayati, 2008 : 259)

Chi – Square

This method was used to identify the significance of variables

$$\text{Chi}^2 = M_g$$

Whereas:

N = notable repeating

E = Expected repeating

(Al-Tarayhi and Hassan, 2013 : 141)

Item difficulty

$$D = (N - N - U) + (N - N - L) / N_2$$

whereas :

(N - N - U) = Number of the pupils who answered correctly in the upper group. (N - N - L) = Number of the pupils who answered correctly in the lower group.

N₂ = number of the pupils in the upper and lower groups.

Item Discrimination

$$\text{Item Discrimination} = (N C U) - (N C L) / N$$

whereas :

N C U = number of the correct answers in the upper group.

N C L = number of the correct answers in the lower group.

N = number of the students of one of the two groups.

Equation of the effectiveness of the wrong alternatives

$$\text{The effectiveness of alternatives} = (N R U - N R L) / N$$

Whereas :

N R U = number of the pupils who chose the wrong answer of the upper group.

N R L = number of the pupils who chose the wrong answer of the lower group.

N = number of the students of one of the two groups.

(Abo Fouda and Najati, 2012 : 123)

RESULTS AND DISCUSSION

This chapter includes a presentation of the researcher's findings and its interpretation according to the research aims and hypotheses, then show the conclusions, recommendations and suggestions. There is no statistically significant difference at the level (0.05) between the mean marks of the pupils of the experimental group who are going to study the science according to the numbered heads strategy and between the average marks of the control group pupils who are going to study the same approach according to the usual method in the achievement test. There is no statistically significant difference at the level (0.05) between the mean marks of the pupils of the experimental group who are going to study the science according to the active hand strategy and between the mean marks of the control group pupils who are going to study the same approach according to the usual method in the achievement test. There is no statistically significant difference at the level (0.05)

between the mean marks of the pupils of the experimental group who are going to study the science according to the active hand strategy and between the mean marks of the experimental group pupils who are going to study the same approach according to the numbered heads strategy in the achievement test. To investigate the validity of the three null hypotheses, the researcher adopted a balance between the three groups by adopting a single-variance analysis, table No. (3). Scheffe Method was adopted to balance among the three research groups, table No. (4). The results show that there are statistically significant differences between the mean marks of the two experimental groups and the control group in the

achievement test, whereas the results show that the two experimental groups that depended on the active hand and the numbered heads strategies got the better of the control group that depended on the usual method in teaching, which go back to the following reasons: The active hand and the numbered heads strategies are one of the modern methods of teaching accepted by pupils as new methods of learning that differ from the traditional method by allowing them to move from recipients to active participants in the classroom. The learning by using an active hand strategy has allowed pupils to have a scientific tendency to fill the void with scientific activity by summarizing the scientific approach into basic points that include the most important study subjects.

Table 1. Experimental design (two experimental groups and one control group).

Group	Equivalence	Independent variable	Dependent variable
Control (A)	1- age by months 2- educational achievement of parents 3- pre-achievement in science approach	The usual method	The achievement
Experimental (B)		The active hand strategy	
Experimental (C)		The numbered heads strategy	

Table 2. Identify the research community.

Group	Section	Total pupils	Total excluded pupils	Total of students after exclusion
Control	A	33	3	30
Experimental	B	26	1	25
Experimental	C	28	2	26
Total	3	87	6	81

Table 3. Investigate the validity of the three null hypotheses,

Contrast source	Freedom degree	Total of squares	Mean of squares	F-valuable		Significance level (0.05)
				calculated	tabular	
Between groups	2	496.15	248.07	6.127	3.15	statistically function
Within groups	78	3157.85	40.49			
Total	80	3654	288.56			

Table 4. Schaeffer Method was adopted to balance among the three groups.

Comparisons		First		second		Third	
groups		first experimental	control	Second experimental	control	Second experimental	first experimental
Arithmetic mean		31.20	25.60	30.12	25.60	31.20	31.12

The Impact of Using Tablets on Developing Listening Skill & perception as a Brain Process of EFL Primary School Pupils

Amjad Abdulhussien Hammad¹, Sabeeha Hamza Dehham¹, Nadia Ali Akbar¹

¹ College of Basic Education, University of Babylon, Babylon Government, Hillah City, Iraq

ABSTRACT

Listening is a very complicated process in which several different knowledge and skills work together simultaneously. The aim of the present study is to investigate empirically the impact of using Tablets on listening skill & Perception on Iraqi EFL pupils'. Tablets contains features such as recording and playback of audio and video clips, download applications and other specifications with a portable carrying device due to its light weight and size. The present study is limited to the fourth-grade male and female pupils in the primary schools in Baghdad City for the academic year 2017-2018. The sample of the study includes 40 pupils as the experimental group and 40 as the control group. Then, it is ensured that the two groups are equal through a statistical analysis of a number of variables such as age, parents education, achievement scores in English in the mid-year examination. After administrating the posttest, the results of the study indicated clearly that the achievements of the experimental group who has been exposed to Tablets higher than that of the control group who has been exposed to the traditional method recommended in the prescribed textbook.

Keywords: Tablets, Listening Skill, Perception, Brain Processes.

INTRODUCTION

The human brain is a complex and innovative system for processing information. Information processing begins by entering sensory organs, which turn physical stimuli such as touch, heat, sound waves, or light photons into electrochemical signals. Sensory information is frequently converted by brain algorithms in both bottom-up and top-down processing. For the brain to process information, it must first be stored. There are multiple types of memory, including sensory, working, and long-term. First, the information is coded. There are specific types of coding for each type of sensory stimuli. For example, verbal input can be encoded structurally, indicating what the printed word looks like, or phonetically, indicating what the word looks like, or a word, indicating what the word means. Once the information is stored, it must be preserved¹. There are many models of how to organize knowledge

in the brain, some depend on how people retrieve their memories, others rely on computer science, others rely on neurophysiology. Hence, the researcher adopted Tablets to Develop Listening Skill and perception of young learners. Developing perception will enhance brain processes. Developmental cognitive neuroscience is a field of science that combines neurology and psychology to better understand how the physical brain affects the mind and vice versa. Perception is the organization, identification, and interpretation of sensory information in order to represent and understand the presented information, or the environment⁴. The perceptual systems of the brain enable individuals to see the world around them as stable, even though the sensory information is typically incomplete and rapidly varying. Human and animal brains are structured in a modular way, with different areas processing different kinds of sensory information. Some of these modules take the form of sensory maps, mapping some aspect of the world across part of the brain's surface. These different modules are interconnected and influence each other. For instance, taste is strongly influenced by smell⁵.

METHODOLOGY

The following statistical procedures which followed by the researcher in order to reach the aim of the study and prove its hypothesis. The following procedures are:

The experimental design can be defined as “ a set of procedures which are used by the researcher for the purpose of testing the hypothesis by achieving valid results which show the relationship between the independent and dependent variables, and the choice of research design depends on the aim of conducting the study ^[8].

The population of this study is the fourth grade/pupils of the Bilad Al-Arab primary school for the academic year 2017- 2018. The total number of pupils in the fourth grade in this directorate (The Directorate General of Education- Baghdad –Karkh /2 (33632)

Equivalence of Subjects: In order to ensure that both the EG and the CG are equivalent, the two groups are equalized in the following variables:

The subjects' age.

The level of parents' education.

The students' scores in the mid-year examination.

The learners' scores in the pre –test.

Controlling Extraneous Factors In any experiment study, the dependent variable may be affected by many extraneous variables in addition to the independent variable. Cohen et al. (2000, 126) state that in any experiment there are some variables other than the independent variable that may influence the dependent variable. The researcher tries to control these extraneous variables in order not to contaminate the obtained results.

Instruction Period Time variable is the so significant factor in any experiment. In the present study, the experiment started on the 22nd of February and ended on 19th April, 2018, so it lasted two months. The researcher himself taught the experimental and the control groups two lessons per a week. The lessons were arranged for both groups on Sunday and Monday in an alternate way.

Instructional Materials

The researcher started his procedures for both groups

(Control and Experimental) based on the definition of instructional material whereas integrated recent technology represented by Tablets inside the classroom for EG. On the other hand, the researcher depended completely on the traditional method to teach CG that taught the pupils on pupil's book and activity book assist by flash cards.

The Control Group

At the beginning, the researcher, as a teacher and at the same directory, applied the traditional methods of teaching listening comprehension assist in this planning teachers of the material. Then the researcher used the traditional methods in order to teach the control group. The material was used for teaching the control group was used according to Teacher's Guide of English for Iraq (Garnet).

Validity of the Tests

Validity is defined as the answer to the question: Does the test measure what it is supposed to measure? To address this question, we use systematic studies to determine whether the conclusions of test results are justified by evidence. Hence, ¹⁰ and ¹¹ state that validity is the match between curriculum goals and test coverage. In the present study, the researcher is concerned with applying two main types of validity; i.e., face validity and content validity.

Face Validity

According to ¹² Face validity is the degree to which a test appears to measure the knowledge or ability it claims to measure, based on the subjective judgment of an observer. While Mousavi (2012) pointed that test will have face validity when the item of the test measure what is supposed to measure.

Content Validity

Content validity refers to the items of the test which should cover particular behavior or skill that should be measured (ibid: 157). While ¹³, mentions that in order to determine content validity, the content specification or table of specification should be designed in which it will show all the areas that should be measured in appropriate parts. The following tables show the specification of both versions (pre-posttest see appendix (B) & (C)) that the researcher adopted in his study.

RESULTS AND DISCUSSION

According to the aim of the study, which is to examine empirically the impact of using Tablets on Developing Language Listening Skill. It is hypothesized that there is no statistically significant difference between the mean scores of the of listening skill performance of pupils of both the CG and the EG. The researcher used t –test formula for two independent samples (Control and Experimental groups) in order to prove the above hypothesis, The results indicated for each strategy and total score of both groups as follows;

Listening for gist: In order to find out the differences between the mean scores of the two groups, t-test formula for two independent groups has been used where the mean scores of EG was 6.225 with an SD 1.527 and the mean scores of CG was 5.275 with an SD 1.664. The calculated t. test value is found out to be (2.660) which is higher than the tabulated t. test value which is (2.000), at the level of significance of (0.05) and a degree of freedom of (78), as shown in (Table 1). This means that there are statistically significant differences between the experimental group and the control group in Listening for gist, and in favour of the experimental group. This indicates that the Tablets which suggested by the researcher helps the pupils to develop their listening for gist more than the traditional method presented in the textbook.

Listening for specific words:

In order to find out the differences between the mean scores of the two groups, t. test formula for two independent groups has been used that the mean scores of EG was 5.975 with an SD 1.441 and the mean scores of CG was 5.625 with an SD 2.306. The calculated t. test value is found out to be (0.814) which is lower than the tabulated t. test value which is (2.000) , at the level of significance of (0.05) and a degree of freedom of (78). As shown in (table 2). This means that there are no statistically significant differences between the experimental group and the control group in Listening for specific words, and there is no impact for Tablets on developing this strategy.

Listening for specific Details

In order to find out the differences between the mean scores of the two groups, t. test formula for two independent groups has been used that the mean scores

of EG was 6.125 with an SD 1.539 and the mean scores of CG was 5.450 with an SD 1.431. The calculated t. test value is found out to be (2.031) which is higher than the tabulated t. test value which is (2.000), at the level of significance of (0.05) and a degree of freedom of (78). As shown in (table 3). This means that there are statistically significant differences between the experimental group and the control group in Listening for details, and in favour of the experimental group. This indicates that the Tablets which suggested by the researcher helps the pupils to develop their listening for specific details more than the traditional method presented in the textbook.

Listening for stress: In order to find out the differences between the mean scores of the two group, t. test formula for two independent groups has been used where the mean scores of EG was 6.100 with an SD 1.464 and the mean scores of CG was 5.200 with an SD 1.244. The calculated t. test value is found out to be (2.962) which is higher than the tabulated t. test value which is (2.000), at the level of significance of (0.05) and a degree of freedom of (78). As shown in (table 4). This means that there are statistically significant differences between the experimental group and the control group in Listening for stress, and in favour of the experimental group. This indicates that the Tablets which suggested by the researcher helps the pupils to develop their listening for stress more than the traditional method presented in the textbook.

Total Score: In order to find out the differences between the mean scores of the two groups, T. test formula for two independent groups has been used that the mean scores of EG was 24.425 with an SD 3.186 and the mean scores of CG was 21.550 with an SD 4.157. The calculated t. test value is found out to be (3.472) which is higher than the tabulated t. test value which is (2.000), at the level of significance of (0.05) and a degree of freedom of (78). As shown in (table 5). This means that there are statistically significant differences between the experimental group and the control group in Total score, and in favour of the experimental group. This indicates that the Tablets which suggested by the researcher helps the pupils to develop their listening skill more than the traditional method presented in the textbook. This proves that there are statistically significant differences between both groups in Listening subskills test except listening for specific word. This indicates that the Tablets suggested by the researcher helps the pupils to develop their listening subskills more than the traditional

activities presented in the textbook. Therefore, the aim of the study is achieved which investigates whether Tablets technique can effect pupils listening skill and them perception or not. While the null hypothesis is refused, therefore, the alternative hypothesis should be used which indicates that there is statistically significant difference between EG who are taught listening skill by using Tablets suggested by the researcher, and control group who are taught listening skill by using traditional method recommended by the traditional textbook. The results of the present study also indicate the importance of activating background knowledge of the pupils in

which it enables the pupils to prepare themselves for listening through Tablets, That Tablets make opportunity to listen to the tracks repeatedly with concerning speech rate, clarify of the sound, accuracy of pronunciations, tone of the speech, pause, level of the sound speaker, a companion sound with the speaker such as sound of broken something, encouragement of population during the race. These merits available in Tablets assist fundamentally in develop listening skill. Also roles of the teacher by permission to the learner recording the lesson to give opportunity to them to review any missing information during listening process.

CONCLUSION

After analyzing the data of the study, the aim of the present study which examined empirically Impact of Using Tablets on Developing Language Listening Skill EFL pupils has been achieved since the results of the posttest indicated that the performance of the EG is higher than the CG. In other words, the results show that EG develop their listening skill. According to the hypothesis of the present study, it has been refused since the results indicate that there are significant differences between the mean scores of the EG which taught listening Skill by using Tablets and the CG which taught listening Skill by following the traditional method recommended by the textbook. Therefore, the alternative hypothesis is used. The aim of teaching listening skill is to enable the learners to be conscious of the importance of listening and how to listen, therefore, teacher should help the learners how to listen correctly through Tablets in order to get more benefit from listening. The researcher concludes that the ultimate aim of teaching listening skill is not to enable the learners to produce but rather to be able to understand the spoken text. Tablets enables the learners to be more active and increase their motivation through encouraging them to listen to the native speaker.

The Risk of Rheumatoid Arthritis in Patient with Type 2 Diabetes Mellitus Receiving DPP4 Inhibitors

Rafid Hadi Hameed

¹Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq

ABSTRACT

Dipeptidyl peptidase-4 (DPP4) could be a transmembrane compound protein that encompasses a perform within the immunologic response. It additionally referred to as CD26, DPP4 inhibitors (DPP4i) are oral glucose-lowering drug for type two diabetes mellitus (T2DM). **Objectives:** This study aim to measure the risk of incident rheumatoid arthritis (RA) associated with DPP4i in patients with T2DM. **Case presentation:** A 42-years-old male with history of RA presented to the outpatient due to hand tingling that was worse in the mornings. He also complained of excessive thirst, finding himself drinking more water than usual and waking up in the night to urinate. There was no vomiting or nausea and no other symptoms. He did report feeling hungry. He had no family history of diabetes, and reported taking his medication for RA every day. The differential diagnosis for her thirst included dehydration, psychogenic polydipsia, diabetes mellitus, diabetes insipidus, and anxiety. The patient had normal vital signs and was well appearing; labs were ordered for him: labs revealed a FBG level of 215 mg/dL, PPG level of 265 mg/dl. Normal renal function tests and normal other investigations. He started combination therapy between DPP4 inhibitors and metformin.

Keywords: Diabetes, rheumatoid arthritis, RA, DPP4i, T2DM, CD26.

INTRODUCTION

Since 2005, new pharmacologic categories of medication potentiating the activity of the incretin hormones are discovered in second or third-line treatment of sort a pair of polygenic disease mellitus: analogs of glucagon-like amide one (GLP-1) and dipeptidyl peptidase-4 (DPP-4) inhibitors. Dipeptidyl peptidase-4 (DPP4) inhibitors, like sitagliptin, saxagliptin and linagliptin, square measure oral glucose-lowering medicine that may be used as monotherapy or combination medical aid with different oral hypoglycemic agents for sort a pair of DM (T2DM) ^{1,2}. Sitagliptin was the primary DPP4 matter (DPP4i) approved by the United States Food and Drug Administration (FDA) for adults with sort a pair of polygenic disease in Gregorian calendar month 2006, followed by saxagliptin, FDA-approved in July 2009, and linagliptin in May 2011 ³. On the one

hand, variety of studies according shriveled levels of DPP4 activity in patients with arthritis (RA), ⁴ seven whereas studies instructed a possible role of DPP4i as a completely unique medical aid for many inflammatory diseases by inhibiting T cell proliferation and protein production, ⁶ nine ⁸ some cases of inflammatory disease doubtless relating to use of DPP4i are according ⁹. The objective of this study was to estimate the reduced risk of incident general AD as well as RA in patients with polygenic disease beginning a DPP4i drug compared with those beginning non-DPP4i oral hypoglycemic agents. We tend to hypothesised that patients beginning a DPP4i would have a reduced risk of incident RA and different AD compared with those beginning non-DPP4i medicine solely. Numerous studies have proven that the Th17 cell-driven reaction response and its connected inflammatory cytokines (including IL-17, IL-22, GM-CSF and TNF) play an awfully necessary role within the pathological process of RA ^{10,11}. Membrane-bound kind of DPP-4 is found on leucocytes as well as T cells, wherever it's referred to as CD26. Immune activation will increase DPP-4/CD26 specificion; CD45RO+ memory T cells express a lot of CD26 ^{12,13}. Inhibition of CD26 activity ends up in reduced T cell activity ¹⁴. Curiously,

Corresponding author:

Ministry of Public Health, Maysan Health Department, Maysan governorate, Iraq;
E-mail: rafidhadii@gmail.com

CD26 will increase T cell activation by increasing the co-stimulator CD86 on antigen-presenting cells in an exceedingly method that needs accelerator activity¹⁵. CD26 associates with different membrane proteins on T cells, as well as the aminoalkanoic acid enzyme CD45 and also the ectoenzyme ADA (ADA), which could be necessary for the co-stimulatory activity of CD26^{13,16}. However, inhibition of DPP-4 accelerator activity might not block of these immune activities; the flexibility of soluble CD26 to bind enzyme and sweetening of T cell proliferation will typically occur even once the situation of DPP-4 has been mutated^{17,18}. DPP-4 cleavage will have an effect on chemokine activity or receptor specificity; thus, inhibition of DPP-4 might alter WBC taxis¹⁹. Interestingly, in human reaction diseases like arthritis, multiplied CD26 levels on leucocytes square measure discovered, nevertheless there's shriveled DPP-4-associated proteolytic enzyme activity²⁰.

Case Presentation

This 42-years-old male farmer presented with a chief complaint of excessive thirst, recent onset of finger tingling, and also complained of generalized joint pain. Although he went to bathroom a lot of time at night, he reported having to wake up six to eight times per night to urinate. He also reported being hungry after dinner, which was abnormal for him. There is no nausea or vomiting. The patient had no known family history of diabetes, but he has personal history of rheumatoid arthritis since 5 years.

His medications included:

Methotrexate: 7.5 mg as single dose per week

Celecoxib: 200 mg PO /12 hr

Omeprazole: 20 mg once daily at morning

Steroid: 2.5 mg PO per day

Vital signs: his heart rate was 96 beats / minute, blood pressure was 125/80, and temperature was 37.30

On general examination: free chest, cardiac and abdominal examination. On examination of upper arm there was Z-thumb and some rheumatoid nodules on the skin.

A basic metabolic panel was done, which ruled out an anion gap metabolic acidosis, and a urinalysis was performed, which confirmed glucosuria and ketonuria.

The patient undergo some laboratory investigations like: CBC which appear normal ,renal function tests which were normal, FBG level which was 215 mg/dl ,PPG level which was 265 mg/dl and HBA1C which was 8.5% . He also did routine investigations like: Chest X-ray, ECG and Abdominal U/S which were all normal.

The patient was diagnosed with: DM with RA

Management and outcome:

Our patient was started with combination therapy between DPP4 inhibitors and metformin.

He started with saxagliptin : 5 mg PO per day as DPP4 inhibitor and metformin :1500 mg /day PO divided per 12 hr with meal.

After period of this regimen we found that DM was controlled but we also observed that the risk of RA was reduced. So we started to study another cases to prove the relation between DPP4 inhibitors and reducing the risk of RA.

We also started to search in other previous studies to prove this result. And we found a lot of result that support that DPP4 inhibitors reduce the risk of autoimmune diseases like RA.

DISCUSSION

Until now, the medical specialty result of DPP4i on AD has not been examined despite biological mechanisms and case reports that recommend an attainable relationship. In a very giant population-based cohort of T2DM patients, we tend to found a shrivelled risk for RA and composite AD among initiators of DPP4i combination medical aid compared with initiators of non-DPP4i combination medical aid. Subgroup analysis examination DPP4i to sulfonylureas conjointly showed a shrivelled risk for alternative AD and composite AD, though the danger for RA wasn't considerably reduced. When examination DPP4i to TZD combination medical aid initiators, no distinction within the risk of RA was seen²¹. It is acknowledged that DPP4 (CD26) is gift in numerous tissues and cells as well as lymphocytes and monocytes as a transmembrane compound protein and is related to immune-regulatory functions^{3,5}. Thirty five DPP4i inhibits lymph cell proliferation and protein production,⁶ nine⁸ thirty six each acknowledged to be concerned in AD pathological process. As polygenic disorder is fairly common in patients with pre-existing

AD,²⁴ it would be price considering a study that examines a job of DPP4i as a unique treatment of AD in patients with T2DM. In a cohort study that revealed in 2014, it proved that the incidence rates for RA are slightly on top of the incidence rate of RA from the Rochester medical specialty Project within the USA²⁵. In conclusion, initiating DPP4i combination medical aid seems to be related to a shriveled risk of AD as well as RA compared with initiating non-DPP4i combination medical aid. In a giant cohort of diabetic patients, that initiating combination medical aid with dipeptidyl proteolytic enzyme four (DPP4) inhibitors showed a shrivelled risk of incident RA²⁶. It's conjointly been reported that CCL20 (a substance of CCR6) recruited CCR6+ arthritogenic Th17 cells to the rheumy joints, and administration of anti-CCR6 mAbs considerably inhibits inflammatory disease²⁷. Though the considerably associated SNP rs12617656 has not been examined for its effects on DDP4 expression, a SNP (rs3093024) in CCR6 has been reported to have an effect on the CCR6 expression level. Additionally, a tri-allelic dinucleotide polymorphism of CCR6 (CCR6DNP) in robust linkage situation with rs3093024 showed effects on factor transcription. The CCR6DNP genotype was related to with the presence of IL-17 within the sera of RA patients²⁸. Currently, multiple gene_gene interactions are reported in RA, however solely the shared epitope_protein aminoalkanoic acid enzyme non-receptor kind twenty two (PTPN22) interaction has been replicated convincingly²⁹. A previous study determined that CCR6+ Th17 cells, however not IFN-g+ Th1 cells, will join forces with secretion fibroblasts from patients with early RA and more drive chronic harmful unwellness by causing IL-6 and IL-8 and therefore the tissue harmful enzymes MMP-1 and MMP-3³². This interaction is fascinating, because it highlights a job for Th17 cells in RA unwellness processes. High CD26 and CCR6 expression could be a hallmark of Th17 cells³³. Hirota et al.²⁹ showed that IFN-g will inhibit each CCR6 and CCL20 (the acknowledged substance for CCR6) production. Curiously, Bengsch et al. Found that CD26 expressed on Th17 cells will negatively regulate the chemotactic CD4+ lymph cell response to the inflammatory chemokines CXCL9_12. Presumably, the cell sorts regulated by CD26 inflammatory cells expressing the receptor CXCR3 (including IFN-g-producing Th1 cells) since all acknowledged ligands of CXCR3 (CXCL9_11) cleaved by CD26. Similarly, cells expressing the CXCL12 receptor CXCR4 can also be

regulated. Therefore, CD26 might facilitate Th17 cells to provide CCR6 by inhibiting the supply of IFN-g and will eventually cause associate redoubled susceptibleness to RA. Indeed, within the Han Chinese GWAS, the analysis of ACPA-positive patient's vs. ACPA-negative patients disclosed that each rs12617656 and rs1854853 had a robust association result with ACPA-positive RA³³. While a pooled analysis of information from ten, 246 patients treated with DPP-4Is within the North American nation had been revealed. Among the reported adverse events that may be concerning sitagliptin, hurting occurred at a frequency of zero.2 incident events per one hundred patient-years, that wasn't considerably completely different to non-exposed patients. The joint symptoms in patients treated with DPP-4I were so thought-about to be comparatively rare. However, analysis of patients whiney of polyarthralgia indicated that polyarthropathy could also be the reason behind the multiple joint inflammation discovered in T2DM patients treated with DPP-4I, a condition which could be unmarked at routine follow-up in diabetic clinics. There are two reported cases of RA related to sitagliptin treatment and a lot of recently, three cases of DPP-4I associated polyarthritis are reported [36], two of whom had chronic inflammatory conditions, Sjögren's syndrome (SS) and hepatitis B infection (HBV). Plasma SDF-1a in RA patients has been reported to be considerably elevated compared with healthy adults or OA patients. In another study, plasma SDF-1a level at the onset of polyarthropathy was under in controls. Moreover, whereas body fluid sCD26 level was shrivelled in active RA patients, no statistically important distinction in sCD26 level among the polyarthropathy cases and management cohorts was discovered during this study, indicating potential variations in biomarkers between RA patients and therefore the polyarthropathy patients with T2DM treated with DPP-4I. In conclusions, these results per associate association between DPP-4I medical aid and therefore the risk of polyarthropathy, with a concomitant decrease in plasma SDF-1a level in affected patients. More pharmacoepidemiological and pathological studies ought to be conducted to substantiate or refute these findings.

CONCLUSION

According above presentation this is a case of type 2 diabetes mellitus and rheumatoid arthritis.

Assessment of Caregivers' Awareness about Home Care of Neutropenia among Children with Leukemia at Oncology Wards in Baghdad City

Asmahan Qasim Mohammed¹, Shahznan Hassan Badr², Marwah Salah Muslem³

¹Master in Nursing Science, College of Nursing, University of Baghdad, Iraq, ²Master in Nursing Science, College of Nursing, Alameed University, Iraq, ³College of Nursing, University of Baghdad, Iraq

ABSTRACT

Objective(s): to assess the awareness of caregiver about homecare neutropenia among children with leukemia at oncology wards, and to find out relationship between level of awareness of caregivers and demographic variable. A descriptive study carried out at Baghdad City from 1st of February 2018 to 30th of September 2018. Non-probability sample of (50) males and females caregivers was selected from the oncology wards in Child Welfare, Child's Central, Al-Kadhmiya and Baghdad Teaching Hospital. To achieve the purposes of the study, a questionnaire format was designed and constructed by the researcher depending on the extensive review of available, related literatures and studies. The first part is related to caregivers' demographic characteristics and the second part (three domains) is related to daily activities of caregivers about home care neutropenia among children with leukemia at oncology wards. Data were analyzed through the application of descriptive statistical analysis (Frequency, Percentage, Mean and Standard deviation) and inferential statistic (significance and correlation coefficient). The study revealed that the majority percentage of caregiver's responses toward personal hygiene domain were 82% don't know about use a moisturizers to prevent dry skin, also 60% don't know that use of mouth wash contain alcohol was contraindicated for child.

Keywords: Assess; Awareness; Caregivers'; Neutropenia; Home care

INTRODUCTION

Neutropenia is a blood condition (granulocyte disorder), that characterized by a deficiency of neutrophils which is a type of white blood cell that defends the body against bacterial and fungal infections. They are made in bone marrow and contain microscopic granules with proteins (enzymes) that digest invading bacteria viruses, fungi, and parasites ¹. If the child has neutropenia, close attention should be given to personal hygiene, like hand washing in order to decrease the risk of infection. Many factors can share the onset of low level of neutrophils such as some types of chemotherapy, cancers that affect the bone marrow directly such as leukemia lymphoma, and myeloma². Infections are the

major cause of mortality and morbidity in children. The risk of infections is principally related to the intensity and duration of the immune suppressive chemotherapy ³. Caregivers of children with neutropenia require knowledge, skills, and judgment to carry out the tasks of care for their sick children. Caregivers may help the patient with daily tasks such as bathing, eating, cleaning the home and preparing meals. Also, caregivers must have jobs to handle the requirements and support the needs of their children who require such assistance and this care helps them stay at home versus living in a facility⁴. The capacity of caregivers to take on the care of the child with neutropenia may have a significant influence on both health outcomes and cost. Children suffer from many health problems and complications as a result of the disease process or the course of treatment. The caregivers may have more knowledge and skills for managing their children illness ⁵. The care of children with neutropenia is a complex procedure that requires the

University of Baghdad, Iraq

use of specialized knowledge of the mothers. To enhance knowledge of mothers concerning the disease, causes, cure and prevention. The knowledge will eventually become an indispensable tool that can be shared to others and will never go out of style. Appropriate care and assessment of children with neutropenia is an important part for improvement the health status of the children and decreased the complication ⁶.

MATERIALS AND METHOD

A descriptive study was carried throughout the period from 1st of February 2018 to 30th of September 2018. Non-probability sample of (50) caregivers about home care neutropenia among children with leukemia at oncology ward in Child Welfare, Child's Central, Al-Kadhmiya and Baghdad Teaching Hospital. To achieve the purposes of the study, a questionnaire format was designed and constructed by the researcher depending on the extensive review of available, related literatures and studies. The study instruments (questionnaire) consisted of two major parts. The first part was related to caregivers' demographic characteristics such as age, gender, educational level, employment, degree of kinship, source of knowledge, income, and the second part was related to daily activities of caregivers about home care neutropenia among children with leukemia at oncology wards. It consisted of three domains (personal hygiene, health and safety of family, and life style). Each domain had 12 items about different aspect of the related domains. The questionnaire was rated on a three likert scale (know, uncertain, and don't know) and was scored as 3 for (know), 2 for (uncertain), and 1 for (don't know). The validity of the questionnaire was established through a panel of (10) experts of different specialties related to the field of the present study. They were asked respectively to review the questionnaire for clarity and adequacy in order to achieve the present study objective. Study sample was excluded. Data were analyzed through the application of descriptive statistical analysis (Frequency, Percentage, Mean and Standard deviation) and inferential statistic (significance and correlation coefficient) and by using SPSS version 20.

RESULTS AND DISCUSSION

The present study revealed that 92% of the sample were females and 64.0% of the caregivers were mothers. These results agreed with a study done by Scarpelli, et al. (2008) who indicated that the higher percentage of their

sample 76% was mothers. The caregivers were mostly the patient's spouse, partner or closest relatives, and females were more tuned to the caring function at home ⁷. The current study revealed that 40% of the sample were at age ranging 20-30 years old. These results disagreed with a study done by Al-Jauissy (2010) who indicated that the higher percentage of caregivers age were between 19 to 50 years old⁽⁸⁾. With regards to caregivers level of education the present study showed that 20% each level were literate and Intermediate school graduates. These results agreed with a study done by Alexander (2009) who reported that the majority of parents were not having much education, and he found that 25% were illiterate and 45% have their education till grade ten ⁹. The present study showed that 86% of the study sample was unemployed. These results agreed with a study done by Al-Jauissy (2010) who indicated that the most of caregivers' occupation 76.3% were housewives. This result indicated that the main occupation of females in our society was being housewives ⁸. The present study found that 44.0% of the caregivers got knowledge related to awareness from nurses. The results of this study disagreed with results obtained by Al- Ibady (2011) who demonstrated that nurses themselves didn't get information from any resource also include a high percentage 52.5%⁽¹⁰⁾. This could be due to the nature of the nurses are considered closer to patients, in addition to spend more time with patients. The current study showed that 40% of the families were having a barely sufficient income to cover their expenses. The results of this study disagree with results obtained by Atlanta, et al. (2008) which mentioned that the majority of cancer caregivers were belong to the lower socio economic status class. The concerns relating to the family's wellbeing change in role and responsibilities, relocation, travelling, difficulty arranging blood and its products, and financial difficulties facing after the diagnosis of leukemia ¹¹. Also, agreed with a study done by by Scarpelli, et al. (2008) which mentioned that the cancer caregivers were living with intermediate socio economic status class ⁷. The current study showed that the majority of the caregiver's response toward personal hygiene domain were 82% don't know about use a moisturizers to prevent dry skin, also 60% don't know that the use of mouth wash contain alcohol was contraindicated for child. These results agree with study done by Hasan, et al. (2011), who conducted a study on assessment of home care management for caregiver's having leukemic adolescent patient in Erbil city which

shows the majority of caregivers had poor practices regarding preparing meals, with poor practice regarding oral hygiene¹². The present study revealed that the high percentages of caregiver's response about health safety domain were 78% don't know about use mouth wash which contain alcohol item. And 62% of caregiver's response were don't know about avoid putting natural plants inside the house. Also 46.0% don't know about do not use suppositories items. And showed that the caregiver's response toward life style domain were 64% "don't know that the exercise daily important for child" item. And 54% were, Don't know that avoiding the sun, rain and cold. Also 42% were don't know about ensure the use of pasteurized milk. This result agree with

study done by Hasan, et al.(2011), who found that the caregivers of adolescent leukemia patients had deficit in knowledge and low practices regarding home care management¹². The present study stated that there were significant relationships between personal hygiene and lifestyle of family caregiver with their income. There were significant relationship between level of education and source of knowledge, and also there were significant relationship between income and employments of the caregivers at $p \leq 0.05$. This study agrees with the study done by Scalone, et al. (2008) which stated that there is no significant relationship between age of mothers with their practice regarded desferal therapy¹³.

Table 1. Socio-demographic Characteristics of caregivers among children with Leukemia

Variables	Classification	Frequency	%
Gender	Male	4	8.0
	Female	46	92.0
	Total	50	100
2- Age group	20-30 years	20	40.0
	31-40 years	19	38.0
	41-50 years	6	12.0
	51-60 years	5	10.0
	Total	50	100
Mean \pm SD = 33.2 \pm 12.5			
3- Level of Education	Illiterate	9	18.0
	Literate	10	20.0
	Primary school	9	18.0
	Intermediate school	10	20.0
	Secondary school	6	12.0
	Institute graduate	3	6.0
	College and above graduate	3	6.0
	Total	50	100
4- Employment	Unemployed	43	86.0
	Freelancers	5	10.0
	Government employee	1	2.0
	Retired	1	2.0
	Total	50	100
5- Degree of kinship	Mother	32	64.0
	Father	4	8.0
	Sister	2	4.0
	Aunt	7	14.0
	Grandmother	5	10.0
	Total	50	100

Table 2. Caregiver’s Responses toward Personal Hygiene Domains

No	Items	Know		Don't Know	
		f	%	f	%
1	Hand washing with soap and antibacterial, especially before and after eating, using the bathroom, playing, touching animals and others	44	88.0	6	12.0
2	Daily bathing, especially during summer	41	82.0	9	18.0
3	Use a moisturizer to prevent dry skin	9	18.0	41	82.0
4	Genital areas of the male and female hygiene after urination and defecation	49	98.0	1	2.0
5	Use an electrical razor instead of using ordinary razor	24	48.0	26	52.0
6	Pruning the hair and nails once every two weeks to ensure cleanliness	32	64.0	18	36.0
7	Wearing clean clothes, and change underwear every day	48	98.0	2	4.0
8	Dental floss prohibited	20	40.0	30	60.0
9	Not sharing eating’s’ utensils with others	30	60.0	20	40.0
10	Avoid any injuries or scratching to the skin	36	72.0	14	28.0
11	Use a toothbrush after meals and before going to sleep	35	70.0	15	30.0

Table 3. Caregiver’s Responses toward Health Safety Domain

No	Items	Know		Don't Know	
		f	%	f	%
1	Avoid approaching people suffering from colds and flu - Measles - smallpox - or any other type of infection.	41	82.0	9	18.0
2	Avoid crowded places as markets and places of public entertainment.	30	60.0	20	40.0
3	See the doctor immediately when: increase in temperature than 38° Celsius-difficulty in breathing, pain-blood in urine or stool.	39	78.0	11	22.0
4	Keep the house clean.	42	84.0	8	16.0
5	Do not use suppositories.	27	54.0	23	46.0
6	No vaccinations only after doctor consultation.	47	94.0	3	6.0
7	Wash hands before and after eating.	47	94.0	3	6.0
8	Shoes should be left at door mats	42	84.0	8	16.0
9	Avoid contact with the stool or urine	47	94.0	3	6.0
10	Avoid putting natural plants inside the house.	19	38.0	31	62.0
11	Do not use mouthwash which contains alcohol.	11	22.0	39	78.0
12	No pets inside the house	28	56.0	22	44.0

CONCLUSION

the majority of caregivers response toward personal hygiene domain were 82% don't know that the use a moisturize to prevent dry skin item, also the high percentage of caregivers response about health safety domain were 78% don't know a bout use mouth wash which contain alcohol item. And the caregiver's responses toward life style domain were 42% were don't know about ensure the use of pasteurized milk.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the College of Nursing, University of Baghdad, Iraq and all experiments were carried out in accordance with approved guidelines.

Antioxidant Enzyme Responses of *Juncus Aschers. (Et Buch.) Adams* to Some of Environmental Stresses and use it as Indicators

Muthik A. Guda¹, Afyaa S. Nasir¹, Azhar Sh. Younus¹, Attyaf J. T. Altamimi¹

¹ Department of Environmental Sciences, Faculty of Sciences, Kufa University, Iraq.

ABSTRACT

Reported in this paper responses of *Juncus Aschers. (Et Buch.) Adams (Juncus A.)* plants antioxidant, The catalase (CAT), ascorbate peroxidase (APX), superoxide dismutase (SOD) and peroxidase activity (POD) as a scavenger of ROS for mitigating the environmental stress. The study was deal with monthly study of eighteen physico-chemical parameters during the period from January 2017 to June 2017, and 4 sites were selected from Baher Al-Najef Depression (BAND) at the Al-Najef Al-Ashraf city /Iraq , The results showed positive correlation between air and water temperature, and positive correlation between annual precipitation with DO, EC, TDS, TSS, SAL, HCO₃⁼, CO₃⁼, Cl⁻, SO₄⁼ and pH, While BOD, PO₄⁼ and NO₃⁼ showed negative correlation. During the sampling path, physical chemical factors were found to be much higher in second site compared to the other site. In the spring, the high concentration of pollutants from it in the winter. This led to high activity of antioxidant enzymes. Current experience has indicated that in a stressful conditions, (*Juncus A.*) Plants overcome stress by altering the activities of the stress enzyme, suggesting evidence of an adaptive mechanism to thrive in a stressful environment and the appropriateness of (*Juncus A.*) Of environmental condition (as indicators), especially under modified climatic conditions.

Keywords: *Juncus Aschers.*, *Environmental stress*, *Antioxidant enzyme*, *catalase (CAT)*, *ascorbate peroxidase (APX)*, *superoxide dismutase (SOD)* and *peroxidase activity (POD)*.

INTRODUCTION

Studies show that (*Juncus A.*) grows in the soil of different pH, salinity, fertility and textures, and achieve high productivity under different climatic conditions¹. *Juncus* has demonstrated its ability to reduce the pollution of the surrounding environment and has been a unique system, where environmental stress is the most restrictive factor². To survive stress, many physiological and biochemical changes occur in different plant species³. Plant interactions with water stress are significantly different at different organizational levels depending on the severity and duration of stress as well as plant species and their growth stage⁴. Under environmental stress,

the plant uses many adaptive strategies in response to various abiotic stresses such as high nutrients⁵, low oxidation potential of sediments and toxic substances; high salt, cold, heat and excessive osmotic pressure, ultimately affecting plant growth and productivity⁶. Plant cells and tissues show many metabolic responses to environmental stress, some of which may have adaptive importance⁷. The level of reactive oxygen species (ROS) in plants is controlled by synchronous action of enzymatic and nonenzymatic antioxidants. Among enzymatic antioxidants catalase (CAT), ascorbate peroxidase (APX), superoxide dismutase (SOD) and peroxidase activity (POD) are important scavengers of ROS⁸. The physiological effects of Environmental stress on this plant have not been well studied⁹. (BAND) also have not been well studied too. In the present study, A sub-acute experiment was conducted to examine the combined effects of Environmental stresses on (*Juncus A.*) by testing antioxidants defense system of the plant to identify their potential role as biomarkers (indicators).

E-mail: muthikabd1@gmail.com

To this aim we tested the following hypotheses:

Some physical and chemical characters of (BAND) water.

The climate factors in (BAND) .

The combined effects of Environmental stresses on (*Juncus A.*) by testing antioxidants defense system of the plant in (BAND) .

MATERIALS AND METHODS

-Determination of the (BAND)

(BAND), located in the province of Najaf in Iraq. It is separated from the Euphrates River only fifteen kilometers. (BAND)width is about 16 kilometers southeast. However, in the middle , shrinks to about (10 km). Which extends to a distance of (40 km) northwest of Najaf to the southwest of the city of Al-Hira. While it is bordered to the east by the Mashkhab-Najaf road and on the western line linking Iraq's strategic oil from the south to the north-west. Four different sites were selected in BAND.

1. Site 1 contains various chemicals from the southern nutrient tributaries (household detergents and pesticides from agriculture).

2. Site 2 contains various chemicals from industry and municipal wastewater.

3 - Site (3) contains the amount of salts from the ground wells.

4 - Site (4) is located near the strategic oil line, which is often suffering from oil pollution.

-Environmental characteristics of the (BAND)

-Water samples were collected monthly from January / 2017 to June / 2017. Where samples were collected from a depth of 30 cm below walls surface for each of studies stations and using polyethylene containers for physical and chemical analysis of water and used glass bottles 250 ml (Winkler bottles) transparent and the other opaque to measure dissolved oxygen(DO) and oxygen biochemical demand (BOD5) .

- water temperature(C°), pH, Electrical Conductivity (EC) , Salinity and Dissolved Oxygen(DO), were measured by using Multi Lab pilot V 4.4 (5.03), turbidity by using a nephelometer Lamotte (WTW)U.S.A 1979 .

- TDS(Total dissolved solids),TSS(Total suspended solids), Bio-oxygen demand (BOD5),Calcium(Ca⁺²) , Magnesium (Mg⁺²), Chlorides(Cl⁻¹), Sulphate(SO₄⁻²), Carbonates(CO₃⁻³), bicarbonates(HCO₃⁻²), nitrate(NO₃⁻²), phosphate (SO₄⁻²) using adopted methods of American Public Health Association (APHA,2003) .

.The climatological features of the sites included mean annual precipitation (mm/m2), mean annual temperature (C°).

Plant materials

Plant materials were harvested in four different locations in each region. Plants were harvested twice during the study. Season at the end of winter, spring. The sample collected in the ice bucket and in the shortest possible time brought to the laboratory. The plant samples were cleaned with tap water and distilled water, the fresh plant material (expanded leaves and not completely damaged) was separated from the whole plants and kept in cool place -20C for studies. The leave samples were homogenized (0.5 g) in the 0.1 m cold phosphate ice solution (pH 7.5) containing 0.5 mL molar of EDTA with pre-formed grout and mortar. The homogeneity was transferred to centrifuge tubes and centrifuged at 4C في in the Beckman refrigerated centrifuge at 15000 r.p.m. For 15 minutes. The floating material was transferred to 30 mL of tubes and reference was made to the enzyme extract.

Enzyme assays:

Superoxide Dismutase (SOD) activity determination: According to Marklund and Marklund (11), reaction mix is consisting of 50 µl crude enzyme extract with 2 ml of tris buffer and 0.5 ml of pyragallol (0.2 mM) which absorbs light at 420 nm. Control solution contains the same materials except for the enzyme extract that was replaced by dH₂O. As a blank, dH₂O was used. Single unit of enzyme is defined as the amount of enzyme that is capable of inhibiting 50% of pyragallol oxidation.

Catalase (CAT) (EC 1.11.1.6) activity was measured according to Beer and Sizer (12), with minor modifications. The reaction mixture (1.5 mL) consisted of 100 mmol L⁻¹ phosphate buffer (pH 7.0), 0.1 mmol. L⁻¹ EDTA, 20 mmol. L⁻¹H₂O₂ and 20 µL enzyme extract. The reaction was started by addition of the extract. The decrease of H₂O₂ was monitored at 240 nm and quantified

by its molar extinction coefficient (36 M⁻¹cm⁻¹) and the results expressed as CAT units mg⁻¹ of protein (U = 1 mM of H₂O₂ reduction min⁻¹. mg⁻¹protein).

Ascorbate peroxidase (APX)(EC 1.11.1.11) activity was determined according to Nakano and Asada (13). The reaction mixture contained 50 mM potassium phosphate (pH 7.0), 0.2 mM EDTA, 0.5 mM ascorbic acid, 2% H₂O₂, and 0.1 mL enzyme extract in a final volume of 3 mL. The decrease in absorbance at 290 nm for 1 min was recorded and the amount of ascorbate oxidized was calculated using extinction coefficient (ε = 2.8 mM⁻¹ APX was defined as 1 mmol. mL⁻¹ per min at 25°C. cm⁻¹). One unit of Ascorbate oxidized as 1 mmol. mL⁻¹ ascorbate oxidized per min at 25°C.

Peroxidase (POD) (EC 1.11.1.7) activity was estimated according to Hemeda and Klein (14). The reaction mixture contained 25 mmol. L⁻¹ phosphate buffer (pH 7.0), 0.05% guaiacol, 10 mmol. L⁻¹ H₂O₂ and enzyme. Activity was determined by the increase in absorbance at 470 nm due to guaiacol oxidation (E = 26.6 mM⁻¹ cm⁻¹).

Statistical analysis

Analysis of variance was performed using SAS version 9.1(SAS Institute Inc., Cary, NC, USA) (15). The data were presented as the means for each treatment. Means were compared using the LSD test at the 0.05 probability level.

RESULTS AND DISCUSSION

In order to determine the nature and extent of physical-chemical stress on macrophytes, eighteen parameters of water and climate were compared between four different locations for six months. Table (1) shows the spatial and temporal changes of the physical chemical parameters of water (BAND). The detergent of household and pesticide from the runoff from the southern tributaries of the nutrient to site-1 contains different chemicals. The municipal wastewater collected at Site 2 also contains various chemicals from the industry. S-3 water has been reduced by mountain salts from the earth walls. Site-4 is located near the strategic oil line, so the higher values were respectively the location 2> location 3> 4> 1, for all physical chemical parameters. Due to high temperature and evaporation the DO, EC, TDS,TSS and SAL were high in spring in all the four sites and due to heavy rainfall in winter the water got

diluted so all those components were lowered down. The same pattern was also seen in HCO₃⁻, CO₃⁻, Cl⁻,SO₄⁼ and pH concentrations (Table 1).While BOD,PO₄⁼, NO₃⁼ was arise in winter and decreases in spring due to thrive plants in spring. The one way ANOVA was executed based on the physico-chemical parameters to reveal the differences between four sites. The COND, TDS, TSS, SAL, HCO₃⁼, CO₃⁻, Cl⁻,SO₄⁼ and pH were higher in Site 2 than the other sites(Table 1). The results showed positive correlation between air and water temperature, and positive correlation between annual precipitation with DO, EC, TDS,TSS, SAL, HCO₃⁼, CO₃⁻, Cl⁻,SO₄⁼ and pH, While BOD,PO₄⁼ and NO₃⁼ showed negative correlation.

Antioxidant enzyme activities:

In contrast to four sites, the activity of SOD, CAT,APX and POD in (*Juncus A.*) were significantly (at P < 0.05) high in Site 2 and Site 3 than other sites (Figs. 1,2,3,4) The SOD activity did not change significantly (at P < 0.05) in winter and spring season but increased significantly in different sites, we observed in SOD activity high in Site 2 and Site 3 than 4 and at last site 1(Fig.1). The activity of CAT increased significantly (at P < 0.05) in spring than in winter season and increased significantly in different sites, we observed in CAT activity high in Site 2 > Site 3 > 4 and at last site 1.. However, the CAT activity was higher in cold stress than in the pollutant stress (Fig.2). (Fig. 3) showed the highest activity of stress enzyme APX in the contaminated sites at spring seasons than in winter. The APX activity was increased significantly (at P < 0.05) in site(2) followed by (3) and (4) at last (1). The POD activity was highest in site(2) followed by (3) and (4) at last (1).but not change significantly (at P < 0.05). (Fig. 4) showed the highest activity of stress enzyme POD in the contaminated sites at spring seasons than in winter. The results showed that the site 2 contains the highest concentration of studied parameters and each duration of the study. This means that the waste water that was dumped in this site was the highest percentage of pollution and therefore the plants developing in this site suffer from stress more than the rest of the plants of other sites. Followed by site 3, whose water contains a high proportion of salts and salts is another type of stress factor on plants developing in that region. The Site 4 and Site 1 were the lowest concentrations of the studied parameters. Therefore, the plants of these sites are the least affected by the stress compared to the other studied

sites. When observing the results of the enzymes, their effectiveness increases with the increase of pollutants in the environment in which the plant grows. Physical and chemical factors of water body if increased Its threshold level caused some stress to its biomass. The imbalance between active oxygen production and elimination is often caused by many chemicals. The antioxidant

enzyme, such as SOD, CAT, APX, and POD, protects tissues against reactive oxygen species. Water quality deteriorates (BAND). Therefore, factors such as EC, TDS, TSS, and SAL are significantly high in site 2> site 3> 4> 1. In addition the higher concentration of pollutants in the contaminated sites stimulates the oxidative stress in the wetland macrophytes (Figs.1,2,3,4).

Figure 1. SOD response in different stations

Figure 2. CAT response in different stations

Figure 3. APX response in different stations

Figure 4. POD response in different stations

CONCLUSION

SOD, CAT, APX and POD provide the first defense line against oxygen toxicity in individuals. Generally in oxidative stress condition the SOD catalyzes dismutation of superoxide radical which in turn forms water and hydrogen peroxide. After that hydrogen peroxide being the substrate, it gets detoxified by CAT, APX and POD. The present study indicates that higher activity of CAT in (*Juncus A.*) Collected from contaminated sites was higher in winter due to cold stress of (*Juncus A.*). The higher activity of APX and POD in spring due to higher concentration of pollutants than in winter. This clearly indicates that the enhanced production of superoxide radicals create an oxidative stress to the (*Juncus A.*) as pollutants indicator.

Anti-Quorum Sensing Nanonetwork

Athraa Juhi Jani

Department of Computer Science, Mustansiriyah University, Baghdad, Iraq

ABSTRACT

Molecular communication is a bio-inspired communication mechanism, where information is exchanged through transmitting, propagating and receiving molecules between two nanometer-scale devices. The characteristics and rules that govern molecular communication are motivated by the communication in biological systems. In this paper a model of nanomachines is considered, one of these nanomachines has some special responsibilities to direct and control processes of the network. These nanomachines, communicate through a shared unguided medium by stipulating and controlling diffusion processes to form a nanonetwork. A protocol is proposed in which these nanomachines attempt to jam the communication among bacteria, through exploring the biological process of quorum sensing in bacteria. This process is a form of consensus among bacteria population. In order to activate bacteria to perform its task (whether it is a useful or harmful), bacteria need to reach consensus first. Thus, these nanomachines attempt to jam the communication among bacteria, through diffusing a molecule which has been tested in biological experiments to lock the bacteria receptors. The nanomachines follow Poisson distribution to diffuse their jamming molecule. Eventually, the proposed protocol is employing the network's nanomachines to prevent bacteria from reaching consensus and eventually from performing harmful activities.

Keywords: *Nanonetworks, Molecular Communication, Consensus, Poisson distribution, Quorum Sensing*

INTRODUCTION

A nanomachine is the basic functional unit of any nano-system. The component in these nanomachines is able to perform a specific task such as communication, computation, data storing, sensing and/or actuation at a nano level. The interaction between these nanomachines forms a nanonetwork. Thus, a nanonetwork expands the capabilities and applications of single nanomachine; where communication and sharing information are enabling nanomachines to execute more complex tasks in a distributed manner¹. Molecular Communication can be considered as interdisciplinary which combines the research fields of nanotechnology, biotechnology, and communication technology. A wide range of research focus on studying the use of chemical communication by living cells. Quorum sensing process^{2,3} is an example of signalling between bacteria, where bacteria can use it to estimate the density of their population in the environment

through estimating the concentration of a certain type of molecules. The observation that communication in the biological systems is usually done through molecules, has gave inspiration to molecular communication. In literature there are several works which explore molecular communication, most of these research are focusing on characterising the information transmission by nanomachines and analysing the performance of these devices. The authors in⁴ define the idea of molecular communication, and demonstrate the research challenges. Some research⁵⁻⁷ focused on studying the consensus problem in molecular communication. Mainly⁵ trying to map the quorum sensing to consensus problem under diffusion based molecular communication. Their goal is to study consensus problem by spreading information about an event or any variation through a diffusion based network. Through communication all nanomachines attempt to obtain the best estimate of this random variable. In this consensus problem the most significant element is diffusion. Diffusion can be defined as the spread of molecules through random motion from regions with high concentration to regions with lower concentration. All nanomachines in the nanonetwork have the ability to sense the concentration of molecules

in the environment and produce new molecules with desired rate. This paper presents an attempt to explore security issues in molecular communication, through exploring the biological process of quorum sensing in bacteria. Where this process is a form of consensus among bacteria population. In order to activate bacteria to perform its task (whether it is a useful or harmful), bacteria need to reach consensus first. Thus, the nanomachines in the defined model are employed to prevent a harmful bacteria from launching their attack. Through proposing a protocol that nanomachines follow. Thus, these nanomachines are attempting to jam the communication among bacteria, through diffusing a molecule which has been tested in biological experiments to lock the bacteria receptors. This paper is organized as follows. In Section 2 the proposed model is described. Then, Section 3 explores the biological perspective of bacteria communication, and then presents the proposed protocol to prevent bacteria from launching an attack, through employing the network's nanomachines. Finally, Section 4 combines conclusions and prospective

future work.

METHODOLOGY

Network Environment and Communication

In this paper a system of nanomachines is considered, these nanomachines are communicating according to diffusion based molecular communication 1. Each nanomachine (where, i has the ability to sense the concentration of molecules from the environment and to emit molecules at a particular rate into the environment. One of these nanomachines is distinguished as that has some responsibilities for directing and controlling processes in the network. While the other nanomachines are distributed in different positions from within its transmission range distance . Communication between nanomachines is based on diffusing and sensing molecules. Each nanomachine from can decide to diffuse, for example, a unit of molecules at time , and any other nanomachine at distance from the nanomachine can sense the impulse of the released unit of molecules within the interval , through the following ¹¹

$$c(u, d, T) = \int_0^T u \cdot \frac{1}{(4\pi Dt)^{\frac{3}{2}}} \cdot \exp\left(\frac{-d^2}{4Dt}\right) \quad (1)$$

where D is the diffusion coefficient of the communication medium. If more than one nanomachine diffuses a unit u molecules, a receiver nanomachine j accumulates the sensed molecules through the summation of the values of $c(u, d, T)$ over diffusing nanomachines i , i.e., nanomachine j senses molecules in total during the interval $[t, t + T]$

$$\sum_i c(u_i, d_{(i,j)}, T_i) - c(u_i, d_{(i,j)}, [T_i - T]_+) \quad (2)$$

where, $d_{(i,j)}$ is the distance between nanomachines i and j , T_i is the time that passed from the diffusion of nanomachine i up to time $t + T$, i.e., nanomachine i diffused at time $(t + T - T_i)$, u_i is the unit of molecules by nanomachine i at that time, and $[T_i - T]_+$ equals to $\max\{T_i - T, 0\}$. In other words, the receiver nanomachine senses the total amount of molecules that have been in its nearest proximity in the time interval $[t, t + T]$ without being able to distinguish which molecules come from which transmitter. If the amount of sensed molecules is greater than or equal to threshold τ , it will be considered as 1, otherwise it is 0. The curve of the function. In Figure 1, $c(u, d, T)$ (the detected molecules) is computed, which represents the peak of molecular concentration sensed by receiver nanomachines at $d= 0.01, 0.5, \text{ and } 1$ from a transmitter

nanomachine. The transmitter nanomachine is assumed to diffuse $u=1$ molecule, in a medium with diffusion coefficient $D=10 \text{ cm}^2/\text{sec}$, initial value of time $t=0$ (the parameters values are based on an experiment in ¹², the value of threshold is assumed to equal $\tau=0.5$, through the experiment t is incremented by 0.01. The peak of the sensed molecular concentration is inversely proportional to the distance between transmitter and receiver nanomachines.

Time Slots Length

All the nanomachines n in the network are assumed to be synchronized, and can communicate in a predefined time slot T_0 . Where T_0 is a system parameter and its length depends on the network's geometric properties, such that $T_0 = v \frac{d_{max}^2}{D}$, where v is a constant that can be equal 1; d_{max} is the transmission range distance of $node_c$, and D is the diffusion coefficient.

Preventing Consensus among Bacteria

Quorum sensing process [2, 3] is an example of signalling between bacteria, where bacteria can use it to estimate the density of their population in the environment through estimating the concentration of a certain type of molecules. In [13, 14] quorum sensing was proposed as a valid tool for signal amplification and synchronization between nodes in a nanonetwork, respectively.

Communication among Bacteria: Biological Background

Bacteria are one cell organisms, their life is based on nutrition consumption, then growing and dividing into two cells, and that process continues. However, bacteria in its different types interact with human body. Bacteria have very important roles in human health, but there are types of bacteria that can cause terrible harm to the human body 3. However, one bacterium cannot do any harmful or useful role inside the human body, it needs to communicate with other cells of its type first by releasing a certain type of molecules (known as autoinducer) 2. As the number of bacteria increases the concentration of that molecule increases in the environment, when the concentration of this molecule reaches a certain threshold, that can allow the bacteria to recognize how many neighbours it has. This process is known as quorum sensing 16. The process of quorum sensing

can be considered as a consensus between bacteria, i.e., each bacteria vote by emitting this molecule, then the vote is counted, and after this all bacteria respond to the vote 17. Thus, the harmful bacteria when they get inside the human body, wait until their number increases, and through this specific molecule they count its population, which is when bacteria recognize that they have the right population size, make all the bacteria release their toxin in a synchronized way 17. From the chemistry point of view, the autoinducer molecule in different types of bacteria consists of two parts, the left part of this molecule in every single type of bacteria is identical, but the right part is slightly different in every single type of bacteria 2. This shows, that each species of bacteria has its own language of communication and that it uses a specific molecule which can fit into a specific receptor of bacteria from the same type 3. However, bacteria can communicate with all other types of bacteria, by having a generic molecule which can be sensed by specific receptors on all types of bacteria 17.

Anti-Quorum Sensing Nanomachines

Suppose that the model discussed in Section 2, in which $n(i)$ nanomachines will attempt to jam the communication between bacteria through diffusing the modified autoinducer molecules (i.e. the anti-quorum sensing molecules). Further more, $node_c$ is responsible for detecting the release of the autoinducer molecule

from the bacteria, and then triggering the other nanomachines $n(i)$ to start diffusing the modified autoinducer to jam quorum sensing and eventually prevent bacteria from launching their attack. Consider that Q molecules are diffused by bacteria at time t into the environment with D diffusion coefficient. The molecular concentration sensed by a bacterium (or a nanomachine) at distance d at certain time t is [22]:

$$c(Q, d, t) = \frac{2Q}{(4\pi Dt)^{\frac{3}{2}}} \exp \frac{-d^2}{4Dt} \tag{3}$$

When (for example) a nanomachine releases molecules, generally the molecular concentration at any given distance gradually decreases over time. However, in the case that a nanomachine continues to emit molecules (which is what happens in quorum sensing), then the molecular concentration will keep increasing. If a nanomachine continues on diffusing molecules for a long time, the molecular concentration could approach ¹³:

$$c(Q, d) = \frac{Q}{4D\pi d} \tag{4}$$

Thus, bacteria constantly release autoinducer, until reaching a certain threshold τ_{qs} . This threshold is an important parameter for activating bacteria (i.e., launching their attack, in case of considering a harmful bacteria type) in quorum sensing phase; thus, threshold τ_{qs} value could approach the maximum achievable molecular concentration $c(Q, d)$.

$$\tau_{qs} \approx c(Q, d) = \frac{Q}{4D\pi d} \tag{5}$$

Molecular concentration of autoinducer at a certain point d in the medium is the accumulated molecular concentration from the diffusion of all the bacteria N in the environment:

$$c(Q, d, N) = \sum_{i \in N} c(Q, d_i) \tag{6}$$

Where d_i is the distance between the point d and the other bacteria in the medium:

$$\sum_{i \in N} (d_i - d)^2 \tag{7}$$

Thus, bacteria will be activated when molecular concentration approaches threshold τ_{qs} , and the time needed for molecular concentration at distance d approaches τ_{qs} is:

$$t_{\tau_{qs}}(d) \approx c(Q, d, N) = \sum_{i \in N} c(Q, d_i) \tag{8}$$

Steps to Prevent Quorum Sensing

Molecular biologist Bonnie Bassler and her team [18-21] injected the harmful bacteria into a mouse and at the same time injected the modified autoinducer molecule. At this stage, the nanomachines $n(i)$ of the defined model are deployed to diffuse the modified autoinducer.

1. $node_c$ will attempt to monitor the environment within its transmission range. If it senses molecular concentration of autoinducer greater than or equal to threshold τ , it attempts to activate the other nanomachine $n(i)$ to diffuse the modified autoinducer. The receptors of $node_c$ are assumed to be able to distinguish between the real autoinducer molecule and the modified one.

2. Thus, $node_c$ diffuses unit u of the modified autoinducer to nanomachines $n(i)$, through time slot T_0 , (T_0 is less than $t_{\tau_{qs}}(d)$). $node_c$ follows the steps in Algorithm 1 to diffuse unit u .

3. The other nanomachines $n(i)$ are activated when they sense the modified autoinducer. Then, nanomachines $n(i)$ attempt to diffuse their modified autoinducer into the environment following Poisson random distribution for k time slots (i.e. kT_0).

4. Meanwhile, $node_c$ attempts to estimate $t_{\tau_{qs}}(d)$. If kT_0 is less than the estimated $t_{\tau_{qs}}(d)$, then $node_c$ diffuses the modified autoinducer molecule again after kT_0 , in order to activate nanomachines $n(i)$ to activate them again.

5. Nanomachines $n(i)$ follow Poisson distribution to diffuse their modified autoinducer again for kT_0 .

6. After the next kT_0 finish, $node_c$ waits for $2T_0$ and attempt to sense the molecular concentration of the real autoinducer. If it is greater than or equal to the threshold τ , then it repeats the above steps; if it is not, $node_c$ keeps monitoring the environment for each T_0 . Figure (2) represents a simple experiment to implement the protocol steps to prevent bacteria from reaching consensus. The x-axis represents the time slot, while the y-axis indicates to the molecular concentration of both the autoinducer molecule diffused by the bacteria and the modified autoinducer diffused by $n(i)$. In this experiment the concentration of the autoinducer is increasing during the first time slots. When the autoinducer concentration reaches a certain threshold τ (in this experiment $\tau=0.4$), $node_c$ activates the other nanomachine $n(i)$ through diffusing unit u of the modified autoinducer. When the other nanomachines $n(i)$ diffuse the modified autoinducer, it is possible to notice that the concentration of actual autoinducer diffused by bacteria is dropping. Which indicates that quorum sensing is prevented.

CONCLUSION

In this paper, a biological process that can be considered as consensus between bacteria is discussed. This process is the key to activate bacteria to launch an attack, or to do something useful (depending on the bacteria type). Then, a network of n nanomachines are employed to perform a protocol to prevent bacteria from

reaching consensus and eventually from performing harmful activities. Experiment result shows that the concentration of the molecule which contributes in activating bacteria is decreased when the concentration of the modified version of this molecules (diffused by the $(n(i))$ nanomachines) increased in the environment. The experiment has been performed as a Matlab program and based on the protocol assumptions. The protocol steps are assumed to be in a specific transmission range of $node_c$, it is possible to assume that different networks are deployed in different positions. However, to present a more general way of preventing bacteria from launching their attacks in human body. Then the important topic of nanomachines motility needs to be explored; in order to assume that these nanomachines are moving in different positions and are attempting to monitor the environment.

Grading of Metabolic Syndrome Components as Premonitory Denotations for Cardiovascular Diseases

Saja Ali Abbas¹, Majed M. Mahmood¹

¹ Department of Biology, College of Science, Mustansiriyah University, Baghdad, Iraq

ABSTRACT

To investigate the magnitude of inflammatory events related to metabolic syndrome (MetS) components in Iraqi men, 68 patients with this medical condition (who were diagnosed as being with MetS depending on IDF criteria 2005)¹¹ versus 20 apparently healthy males were enrolled in this study. Patients were divided for three subgroups depending on the number of MetS components they have. All participants were tested for their circulatory levels of certain inflammatory markers. Levels of high sensitive C-reactive protein (hs-CRP), interleukin-1 β (IL-1 β), tumor necrosis factor alpha (TNF α) and interleukin 6 (IL-6) were measured by using ELIZA technique. Triglyceride (TG), high density lipoprotein (HDL-c) and fasting blood sugar (FBS) were measured by using spectrophotometer. Levels of these inflammatory markers in the three subgroups of patients were as follow: hs-CRP (7667.817 \pm 486.412 ng/ml) in group I, (6167.548 \pm 575.558 ng/ml) in group II and (5660.655 \pm 806.428 ng/ml) in group III, IL-1 β (8.624 \pm 0.295, 8.240 \pm 0.422 and 7.837 \pm 0.182pg/ml), TNF α (9.307 \pm 0.219 pg/ml, 8.883 \pm 0.478 pg/ml and 8.196 \pm 0.122 pg/ml) and IL6 (11.428 \pm 2.421 pg/ml, 10.373 \pm 2.856 pg/ml and 8.452 \pm 0.507 pg/ml) respectively, which indicates that the highest clustering of MetS components induce the sturdiest inflammatory events .

Keywords: Cardiovascular Diseases, Metabolic Syndrome, Premonitory Denotations

INTRODUCTION

Metabolic syndrome (MetS) is generally define as a group of metabolically inter-related risk factors, including abdominal obesity, hypertension, high triglyceride (TG) levels, low high-density lipoprotein cholesterol (HDL-c) levels and high fasting blood glucose (FBG)^{1,2}. It represent a common worldwide public health problem and ranging in it's prevalence from 10% to 40%³. Metabolic syndrome increases the risk of developing T2DM and CVD^{4,5} the leading causes of morbidity and mortality in old adults⁶. The inflammatory process that may occur in those with metabolic syndrome differs from the classical inflammatory responses in certain aspects. This inflammatory events manifest itself systemically and chronically as low-intensity reaction⁷. Metabolic

complications originate when intra-abdominal adipose tissue evolves into a fat storage¹². Intra-abdominal fat is an effective endocrine organ producing adipocytokines namely Leptin, adiponectin, resistin, interleukins such as IL-1 β , IL-6, TNF α and CRP^{8,9}.

MATERIALS AND METHOD

Sixty eight patients with metabolic syndrome (MetS) among Iraqi men were selected randomly from different clinical laboratories, the diagnosis in each case was established by clinical examination¹¹. All of them were recently diagnosed as MetS patients, and not receiving any treatments when included in this study. Their age ranged from 30 to 65 years with a mean of (48.576 \pm 1.277 years). Twenty normotensive apparently healthy men were included in this study as control group with age ranging from 30 to 65 years with a mean of (45.250 \pm 2.427years). The criteria of inclusion were cases with not less than three of the five criteria of metabolic syndrome: hypertension (HTN): a systolic blood pressure (SBP) of \geq 130 mm Hg and a diastolic of blood pressure (DBP) \geq 85mm Hg were considered

as cut-off level of high blood pressures, Fasting blood sugar (FBS) ≥ 100.8 mg/dl, Fasting Triglyceride (TG) ≥ 160 mg/dl, high density lipoprotein (HDL) ≤ 39 mg/dl and waist circumference (WC) ≥ 94 cm. The criteria of exclusion included: Any condition influencing the level of cytokines and the other inflammatory biomarkers rather than the above mentioned illnesses related to MetS.

Patients were divided into three subgroups depending on the number of MetS components they have, namely group I including those with five components, group II patients with four components and group III with three MetS components. In all patients levels of high sensitive C-reactive protein (hs-CRP), interleukin-1 β (IL-1 β), tumor necrosis factor alpha (TNF α) and interleukin 6 (IL-6) were measured by using ELIZA technique. Triglyceride (TG), high density lipoprotein (HDL-c) and fasting blood sugar (FBS) were measured by using spectrophotometer.

RESULTS AND DISCUSSION

As central obesity is provisory according to IDF¹¹, and while all patients in this study were exceeding the normal limits in this regard with a mean of (119.476 \pm 1.529 cm), 86.7% of them were having low HDL-C with a mean of (26.205 \pm 0.997mg/dl, elevated TG encompassed 85.2% with a mean of (230.955 \pm 10.604mg/dl, high blood pressure 83.8% with a mean of (140.379 \pm 1.868 mm Hg) for SBP and (91.212 \pm 1.928 mm Hg) for DBP and elevated levels of FBS 79.4% with a mean of (171.606 \pm 7.657 mg/dl). Among the patients (36) 52.9% were with all the five components of MetS, (21)30.8% with four, and (11)16.1% of them were with three of these components. Significant differences have been deduced in the group of MetS patients represented by the salient changes in the levels of inflammatory mediators. Which is attributed to what is going on of physiopathological abnormalities related to low HDL-c, elevated TG, high BP and elevated FBS beside the well-known role of excessive accumulation of brown fatty tissues in viscera in elaborating a wide range of such mediators¹⁰, provoking us to believe that someday abnormal central obesity may be seen as

a kind of disability. Sequentially hs-CRP recorded a mean of (7428.419 \pm 476.874 ng/ml) in MetS patients compared to (2204.210 \pm 439.700 ng/ml) in control group, IL1 β a mean of (8.057 \pm 0.200 pg/ml) in patients vs (6.856 \pm 0.347 pg/ml) in controls, TNF- α a mean of (8.967 \pm 0.202 pg/ml) in patients vs (7.762 \pm 0.693 pg/ml) in control, IL6 a mean of (8.425 \pm 0.927 pg/ml) compared to (4.002 \pm 1.210 pg/ml) in control group. Statistically all these differences were with significant differences (P<0.05), as detailed in (table 1). What is worthy to be mentioned here patients who were with quantitate components expressed the most extensive inflammatory events reflected by the greatest elevation in levels of the aforesaid biomarkers, i.e. the highest clustering of MetS criteria, the sturdiest elevation of inflammatory markers. In minutiae the mean of hs-CRP in MetS patients who were with the five components (group I) was (7667.817 \pm 486.412 ng/ml), in those with 4 components (group II) was (6167.548 \pm 575.558 ng/ml) and in those with three components (group III) was (5660.655 \pm 806.428 ng/ml). Statistically these differences were significant between group I and group III (P<0.041). Group I of patients also recorded the highest values of TNF α (9.307 \pm 0.219 pg/ml) followed by group II (8.883 \pm 0.478 pg/ml) and group III (8.196 \pm 0.122 pg/ml). Again these differences were significant between group I and group III (P<0.043). Repeatedly and in the same manner, even though with no significant differences, group I revealed the highest level of IL6 (11.428 \pm 2.421 pg/ml), follow by group II with a mean of (10.373 \pm 2.856 pg/ml) and group III (8.452 \pm 0.507 pg/ml), and to less extent IL-1 β (8.624 \pm 0.295, 8.240 \pm 0.422 and 7.837 \pm 0.182pg/ml) sequentially, and as detailed in (table 2). At the time Sedentary and stressful life style with unhealthy manner of eating play roles in the development of MetS in population, the plurality of its components scaling up the magnitude of noxious mediators referred to as risk factors for CVD. Dependently, it's of convenience to diagnose MetS accompanied with the number of its components which give a clue about how violent MetS is in each patient particularly which may reflect the risk in a patient for being threatened with CVD from one side, and it enlighten the fittest way how to deal with each case particularly from the other side.

Table1. Mean of the criteria of metabolic syndrome

Measurement	Group I (n=68) patient	Group II (n=30) control	Total (n=98) P value
Waist circumference (cm) (Central obesity)	119.476±1.529	91.694±1.640	0.000(H.S.)
Systolic blood pressure mmHg	140.379±1.868	120.400±1.219	0.000 (H.S.)
Diastolic blood pressure mmHg	91.212±1.928	75.500±3.571	0.000 (H.S.)
Triglycerides mg/dl	230.955±10.604	132.050±7.863	0.000 (H.S.)
High density lipoprotein mg/dl	26.205±0.997	42.700±1.265	0.000 (H.S.)
Glucose mg/dl	171.606±7.657	84.050±1.639	0.000 (H.S.)

Table 2. Subgroups with metabolic syndrome

Groups	hs-CRP ng/ml	TNFα pg/ml	IL6 pg/ml	IL-1β pg/ml
Group I	7667.817±486.412	9.307±0.219	11.428±2.421	8.624±0.295
Group II	6167.548±575.558	8.883±0.478	10.373±2.856	8.24±0.422
Group III	5660.655±806.428	8.196±0.122	8.452±0.507	7.837±0.182

CONCLUSION

Sequentially hs-CRP recorded a mean of 7428.419±476.874 ng/ml in MetS patients compared to 2204.210±439.700 ng/ml in control group, IL-1β (8.057±0.200 vs 6.856±0.347 pg/ml), TNF-α (8.967±0.202 vs 7.762±0.693 pg/ml) and IL-6 (8.425±0.927 vs 4.002±1.210 pg/ml). Levels of these inflammatory markers in the three subgroups of patients were as follow: hs-CRP (7667.817± 486.412 ng/ml) in group I, (6167.548± 575.558 ng/ml) in group II and (5660.655 ± 806.428 ng/ml) in group III, IL-1β (8.624±0.295, 8.240±0.422 and 7.837±0.182pg/ml), TNFα (9.307±0.219 pg/ml, 8.883±0.478 pg/ml and 8.196±0.122 pg/ml) and IL6 (11.428±2.421 pg/ml, 10.373±2.856 pg/ml and 8.452±0.507 pg/ml) respectively, which indicates that the highest clustering of MetS components induce the sturdiest inflammatory events .

ABSTRACT

New compound was synthesized with good yields using simple methodology. 1,3 oxazole have been synthesized and evaluated anti-bacterial activity for some them. all derivatives were synthesized from hippuric acid (A₁) was obtained by the reaction of glucine with benzoyl chloride. oxazole derivatives (A₂-A₉) was obtained by the reaction of acetic anhydride with acetic acid then to get (A₁₀-A₁₇) react with ethylene di amine that compound was closs,or get(A₁₈-A₂₆) react with ethylene di amine less hours number, then prouduct react with chloro acetyl chloride (A26-A33) . The product compounds were characterized by FTIR and 1HNMR spectra. The results enhanced the activity of new compounds as promising antimicrobial agents and the compound had highly effect against *Staphylococcus aureus* in treatment skin infection (*in vivo*) when the healing was occur after five days compare with control.

Keyword: Oxazole, imidazole derivatives

INTRODUCTION

In recent years, heterocyclic compounds had been received considerable attention due to their pharmacological and pesticidal importance¹⁻⁹. The simplest of five -membered heterocyclic compounds are pyrrole, furan and thiophene, each of which contains a single hetero atom¹⁰. Oxazole is the parent compound for a vast class of heterocyclic aromatic organic compounds. These are azoles with oxygen and nitrogen separated by one carbon oxazoles are a kind of attractive heterocyclic compounds because of their unique structures and varied applications¹¹. The wide range of biological activities of oxazoles includes anti-inflammatory¹², analgesic¹³, antibacterial and antifungal¹⁴, hypoglycemic¹⁵, antiproliferative¹⁶, anti-tuberculosis¹⁷, muscle relaxant.^[18]

MATERIALS AND METHOD

EXPERIMENTAL

Synthesis of(4-X-benzoylamino)acetic acids (A₁)

Glycine (10mmol) in 10ml of 1N sodium hydroxide was cooled at 0-5C and the cold solution was added drop wise to a solution of 10 mmol of appropriate benzoyl chlorides. The reaction mixture was continued under stirring for an additional one hour. The aqueous layer was separated and acidified with 2N hydrochloric acid. The products were collected by filtration and recrystallized from 80% ethanol as colorless needles

Synthesis of(Z)-4-benzylidene-2-phenyloxazol-5(4H)-ones (A₂-A₉)

To a stirring mixture of compound 8 (0.01 mol) acetic acid (5 ml) acetic anhydride (20 ml), aromatic aldehyde (0.01 mol) was added. Refluxed with temperature of reaction was reached to 80C° for 4hr., The mixture became almost solid, and then as the temperature rises, it gradually liquefied and turned appropriated in color. the reaction is allowed to cool. , then the mixture was poured into crushed ice and stirred for 30 min. the product was collected and recrystallized from ethanol.

Synthesis of (Z)-3-(2-aminoethyl)-5-benzylidene-2-phenyl-3,5-dihydro-4H-imidazol-4-one(A₁₀-A₁₆)

To a mixture of compound (4) (0.01 mol) in (20ml) dry benzene, (0.01 mole) ethylene diamine was added. The reaction mixture was refluxed for 2 h. Then, the mixture was allowed to cool to room temperature. The product was recrystallized from ethanol to yield the desired compound

Synthesis of (E)-N-(2-(4-benzylidene-5-oxo-2-phenyl-4,5-dihydro-1H imidazol-1-yl)ethyl)-2-chloroacetamide(A₂₅-A₃₁)

To solution of compound (A₂) (0.006mole) in benzene (40ml) chloroacetyl chloride (0.72ml, 0.006 mole) was added drop wise the mixture was refluxed for 4h, then a reaction mixture was cooled to room temperature.

Synthesis of (Z)-7-benzylidene-5-phenyl-2,7-dihydro-3H-imidazo[1,5-a] imidazole(A₁₇-A₂₄)

To a mixture of compound (4) (0.01 mol) in (20ml) dry benzene, (10ml) ethylene diamine was added. The reaction mixture was refluxed between 4-6h. Then, the mixture was allowed to cool to room temperature. The product was recrystallized from ethanol

Evaluation of antibacterial activity

The agar well-diffusion method was used to detect antibacterial activity for (22) compounds of derivatives (A₁₀-A₃₁) against various bacterial species from gram negative bacteria, *Pseudomonas aeruginosa* and *Acinetobacter baumannii* was chosen while *Staphylococcus aureus* was used as Gram positive bacteria, and *Candida albicans* (yeast). These isolates were obtained from department of Biology/College of Science/Mustansiriyah University. The concentrations for each compound were (1000) µg/ml. Plates were prepared by spreading approximately 10⁵cfu/ml culture broth of each indicator bacterial isolates on Muller Hinton agar surface using sterile cotton swabs. The agar plates were left for about 15 min before aseptically dispensing the 50µl of each compound into the agar wells already bored in the agar plates. The plates were then incubated at 37°C for 18 - 24 h., Zones of inhibition were measured and recorded in millimeter diameter. The Dimethyl sulfoxide used as control.

Measurement LD50 for compound [A₃₀]

Five groups of 6 mice (4weeks old), weighting approximately 20 gm, from National Center For Drug Control and Research (NCDCR), were injected intra peritoneal with 0.5ml of [A₃₀] and from each concentration from the stock (500,1000, 5000,10000) µg/ml, two mice were injected with 0.5ml normal saline and two mice were injected with dilute DMSO with water as a control. After 24 h, all mice (which injected) were examined, and determined the concentration which was killed half of animals and consider LD₅₀

Evaluation of antibacterial activity *in vivo*

Skin infection in Rabbit with *Staphylococcus aureus* was done by contaminated the skin by bacterial suspension and the infection was monitoring and show the infection in skin. compound [A₃₀] was assayed for antibacterial activity against *S. aureus in vivo* for treatment the skin infection in Rabbit with 2.5 µg/ml /3 time daily for one week, Vaseline was used as ointment in the control group

Cell Lines used in this Study

Two types of cell lines have been used. Mammary adenocarcinoma cell line (AMN3) and fibroblastic and epithelial cells with normal chromosomal pictures (REF) as normal murine cell lines were used. Both of them are locally established in ICCMGR and they are maintained for use. The cells are cultured in RPMI1640 media contains 10% fetal bovine serum, glutamine (2 mmol/L), streptomycin (100 U/ml) and penicillin (100 U/ml), then incubated in 5% CO₂ at 37°C for 24 hour. In this time the cells will grow and become monolayer. Single cell then will use to determine the cytotoxicity of compound 30. The confluent monolayer cells treated with 1 ml of trypsin/versine to provide suspension of cells, then add 10 ml of prepared media. About 200 µl of the cells were culture on clean sterile 96- well microtiter plate then let the cells for 24 hr to make single monolayer to be ready to be treated with the compound 30. Next day, random dilutions from immediate filtered stock test were as follows (1000, 500, 100, 75, 50, 25 and 10) µg/ml. Exposure day, decant the media from the cells and add 200 µl from test concentrations. Each concentration was triplicated and returns the microtiter plates to the incubator. Leave wells contains only cells without treatment contains serum free media representing control cells. Three different exposure times of the cells were

included in this research, 24, 48 and 72 hour.

Cell Viability Assay

The cytotoxicity was determined after each exposure time using crystal violet. Decant the tset from the microtiter plate, add 200 μ l of the crystal violet to the wells of the treated cells for 20 min. in the incubator 37°C. The crystal violet will stain the nuclei of the viable cell and the color will be visible to the eye. Then the plates were read by ELISA reader at 495nm. And then the inhibition rate was calculated using the following equation: %Growth Inhibition = (B- A)/A \times 100 %

Were, A represent absorbance of control and B absorbance of sample

RESULTS AND DISCUSSION

Synthesis of all compounds were shown in scheme(1)for Synthesis of targer compounds (A₁) synthesized by the reaction of glycine in the presence of sodium hydroxide(10%) with benzoyl chloride through nucleophilic displacement mechanism (SN₂) The FT-IR spectrum of compound[A₁] (Fig. 1),appearing of stretching vibrationof (OH) group of carboxylic acid at(2602-3400) cm^{-1} and appearance of new absorption band at (3344) cm^{-1} due to stretching vibration of (vNH).frequency of (C=O)acid to(1745) cm^{-1} Other IR characteristics absorption bands were listed in Table (3-1), A₁:yield (93%).m.p (186-188),color (White) , FT-IR cm^{-1} , O-H (3335-2602), N-H(3315), (C=O)acid (1739),(C=O)amid (1600) , (C=C)ar 3075, C=C aromatic (1553,1487),(C-H) alph,(2997-2883), The treatment of compound (A₁) with aryl aldehyde in presence of acetic acid and acetic anhydride lead to the formation of compounds(A₂ and A₈); A₂:yield (84%), FT-IR cm^{-1} C=N(1645) ,C=O(1793),(C=C)ar(1599,1556),(C-H)ar (3080,3101) ,(C-H)alph (3012-2945) , C-O(1297). A₁₆: yield (62%) m.p (206-208), color (Brown), FT-IR cm⁻¹: NH₂(3308,3227), (C=C)_{ar}(1599,1556), C=N(1633), C=O(1715), (C-H)_{ar}(3107, 3064), (C-H)_{alph}(2955-2918), other NO₂(1500),

Compounds(A₁₇ and A₂₄) were obtained by reaction Compounds(A₂ and A₉) with ethylene diamine of long time about 8h. The structure of compound [A₁₇] was confirmed by FT-IR and ¹H-NMR spectrum. FT-IR spectrum of compound [A₁₇] shows the following bands, indicated by the disappearance of the NH₂ stretching vibration band and appearance of new stretching vibration of (C=N). new band at (1641) cm⁻¹ belongs to stretching vibration of amide. The ¹H-NMR of compound [A₁₉], shows the following signals: Singlet at (6.82) ppm due to (C=CH) group proton. Multiplet at (7.74-8.49) ppm due to aromatic protons. - Singlet at (3.56-3.99) ppm due to (CH₂CH₂) aliphatic proton, A₁₇: FT-IR cm⁻¹ (C-H)_{ar} (3032), C=N(1641), (C=C)_{ar}(1593,1570), (C-H)_{alph}(2916-2854), other C-Cl(815)., A₁₈: FT-IR cm⁻¹ (C-H)_{ar} (3037), C=N(1635), (C=C)_{ar}(1608,1570), (C-H)_{alph}(2989-2943), other C-Br(746)., A₁₉: FT-IR cm⁻¹ (C-H)_{ar} (3070), C=N(1699), (C=C)_{ar}(1608,1570), (C-H)_{alph}(2904-2850), other (Ar-NO₂) 1512,1338 s(3.56-3.99) for (CH₂CH₂), m(7.74-8.49) for aromatic proton, s(6.82) for (C=CH) aliphatic proton, A₂₀: FT-IR cm⁻¹ (C-H)_{ar} (3051), C=N(1660), (C=C)_{ar}(1587,1566), (C-H)_{alph}(2928-2910), other C-Br(705). s(4.16-4.23) for (CH₂CH₂), m(7.51-7.97) for aromatic proton, s(7.35) for (C=CH) aliphatic proton. A₂₁: FT-IR cm⁻¹ (C-H)_{ar} (3055), C=N(1694), (C=C)_{ar}(1595,1529), (C-H)_{alph}(2943-2906), other N((CH₃)₂) 812, s(4.18-4.25) for (CH₂CH₂), m(7.31-7.56) for aromatic proton, s(7.19) for (C=CH) aliphatic proton, t(2.78-3.12) for N((CH₃)₂), A₂₂: FT-IR cm⁻¹ (C-H)_{ar} (3064), C=N(1672), (C=C)_{ar}(1606,1579), (C-H)_{alph}(2980-2929), other C-Cl(759), A₂₃: yield (62%), FT-IR cm⁻¹ (C-H)_{ar} (3041), C=N(1635), (C=C)_{ar}(1608,1568), (C-H)_{alph}(2943-2916), other NO₂(1512), A₂₄: FT-IR cm⁻¹ (C-H)_{ar} (3069), C=N(1684), (C=C)_{ar}(1589,1517), (C-H)_{alph}(2948-2835), other C-Br(705) OH(2564-3456), s(3.17-3.57) for (CH₂CH₂), m(7.16-7.83) for aromatic proton, s(6.94) for (C=CH) aliphatic proton, s(9.81) for (OH) group.

Compounds (A₂₅-A₃₁) have been synthesized by treatment of compounds (A₁₇ -A₂₄) with chloro acetyl

chloride in dry benzene. As shown in below equation. The formation of (A₂₅) was disappearance of the by stretching vibration bands for (asymmetric and symmetric) for NH₂ group. and the appearance carbonyl amide stretching vibration bands. The product (A₂₅) was confirmed by FT-IR and ¹H-NMR spectrum. FT-IR spectrum shows band at (3032) cm⁻¹ due to aromatic (C-H), bands at (1697) cm⁻¹ due to (C=O) amide, band at (1597-1518) cm⁻¹ due to aromatic (C=C). The ¹H-NMR of compound [A₂₅] shows the following signals: Singlet at (7.12) ppm due to (C=CH) group aliphatic proton. Multiplet at (7.21-7.54) ppm due to aromatic proton. Singlet at (8.81) ppm due to (NH) group near (C=O). - Singlet at (4.96) ppm due to (CH₂). Multiplet at (4.18-4.26) ppm due to (CH₂CH₂) group aliphatic proton. A₂₅: FT-IR cm⁻¹: NH(3234), C=Oamide (1697), (C-H)_{ar}(3032), (C-H)_{alph}(2982,2834), (C=C)_{ar}(1597,1518), C-Cl(696), m(4.18-4.26) for (CH₂CH₂), s(4.96) for (CH₂), m(7.21-7.54) for aromatic proton, s(7.12) for (C=CH) aliphatic proton, s(8.81) for (NH) near (C=O), A₂₆: FT-IR cm⁻¹: NH(3217), C=Oamide (1689), (C-H)_{ar}(3049), (C-H)_{alph}(2982,2852), (C=C)_{ar}(1600,1577), C-Br 705, A₂₇: FT-IR cm⁻¹: NH(3384), C=Oamide (1696), (C-H)_{ar}(3088), (C-H)_{alph}(2970,2904), (C=C)_{ar}(1600,1543), (Ar-NO₂) 1502,1344, m(4.01-4.13) for (CH₂CH₂), s(5.16) for (CH₂), m(7.74-8.75) for aromatic proton, s(7.31) for (C=CH) aliphatic proton, s(10.12) for (NH) near (C=O), A₂₈: FT-IR cm⁻¹: NH(3281), C=Oamide (1662), (C-H)_{ar}(3186), (C-H)_{alph}(3016,2995), (C=C)_{ar}(1579-1539), C-Br 758, m(3.80-4.06) for (CH₂CH₂), s(4.77) for (CH₂), m(7.54-8.32) for aromatic proton, s(6.93) for (C=CH) aliphatic proton, s(8.70) for (NH) near (C=O), A₂₉: FT-IR cm⁻¹: NH(3200), C=Oamide (1662), (C-H)_{ar}(3086), (C-H)_{alph}(3064,2945), (C=C)_{ar}(1593-1527), N((CH₃)₂) 812, m(4.11-4.21) for (CH₂CH₂), s(5.26) for (CH₂), m(7.37-7.59) for aromatic proton, s(6.92) for (C=CH) aliphatic proton, s(10.11) for (NH) near (C=O), t(3.08-3.48) for N((CH₃)₂), A₃₀: FT-IR cm⁻¹: NH(3267), C=Oamide (1670), (C-H)_{ar}(3063), (C-H)_{alph}(2926,2872), (C=C)_{ar}(1523-1510), C-Cl 754, A₃₁: FT-IR cm⁻¹: NH(3212), C=Oamide (1656), (C-H)_{ar}(3074), (C-H)_{alph}(2978,2938), (C=C)_{ar}(1576-1528), NO₂ 1502. The *in vitro* assay of the compound against different pathogenic bacteria and yeast were achieved using 1000 µg/ml concentration as illustrated by Table (1). The effect of compounds (A₁₆-A₃₁) was evaluated against *Staphylococcus aureus* (gram positive bacteria), *Pseudomonas aeruginosa* and *Acinetobacter baumannii* (gram negative bacteria), and

Candida albicans (yeast). Most of prepared compounds revealed a good activity against *S. aureus*, *P.aeruginosa*, *A.baumannii* and *C. albicans*. some compound shows highest inhibition activity against Gram –ve bacteria (*Pseudomonas aeruginosa* and *Acinetobacter baumannii*), and other had highest effect against Gram + ve bacteria (*Staphylococcus aureus*). The compound A 23 evaluated as potent antifungal agent against yeast (*C.albicans*), (Table 1).

Table 1. The effect of (A₁₆-A₃₁) (1000) µg/ml represented by inhibition zone (mm) against different bacterial species

Comp. No	Inhibition Zone

Assessment of Risk Management Concerning Environmental Pollution Resulting from Musayyib Electricity Generation Plant in Babylon Governorate

Ali Salman Hassan¹, Mohammed M. Radhi²

¹Environmental Studies/ Biology/ Ministry of Education- Iraq, ²Community Health Nursing, Middle Technical University- Iraq

ABSTRACT

Objectives: To assess the risk management concerning environmental pollution resulting from the Musayyib electricity generation plant; and to identify each of extent of coordination between the concerned authorities to monitor environmental pollution and ways to counter environmental pollution. By a non- probability sample account of (150) subjects is selected for the purpose of the present study. A questionnaire as a means for data collection, it consist of two parts; include demographic data and risks management of environmental pollution which composed of (26) items. By self-administration, data are collected from those who working in the electrical generation plant and analyzed through the used descriptive and inferential statistic approach. The study results indicated that the most of the participants are within age groups (25-35) years old, and most of them is male. In regarding education, they most of them formally graduation, and administrative work, as well the subjects have no course of training. It is also, results depicts (70.7%) of the findings are disagreed that there is managed the risks concerning the environmental pollution. There is a significant association between the risks management and participants their level of education and training course at p-value <0.05.

Key words: Assessment, Risks Management, Pollution.

INTRODUCTION

The issue of environmental pollution is of great importance at all national, regional and global levels. So it is a major problem in many societies and to varying degrees. The environmental system in many of the planets on the surface of the earth has become the victim of environmental pollution due to social activities and non-treatment methods ¹. The view of Islam and the preservation of a comprehensive view that included all the contents of the environment that the preservation of water, air and all the contents of the environment and decided to live in a clean environment free of pollutants ². Pollution is a dependent or spontaneous change in the

form of the environment resulting from human waste or change of the natural environment in a way that carries with it dangers to the living organism ³. The most critical fact to electric plant sources that they are considered renewable and own high environmental foot-print, at the levels in which they were practiced ⁴. In facts some electricity generations are the increase of population, change in over-all human culture, industry transport, consumption of buildings and industrial and needs for commercial. In 2009, "fossil fuel accounted for (80) percent of electricity production in the world". Nuclear, coal and natural fuel constituted for about (8%, 23%) also (24%) out total energy consumed in the U.S., respectively "Atlantic Council of United States, 2010". The used primarily of coal, for producing almost (50%) of electricity and natural gas is used to produce almost (18%) of United State electricity ⁵. Impacts of electricity generations related to many issues of environmental, it is own generated consider arguments that have taken many dimensions; some argue that it has resulting in increased degradation of the environment while others argue that it

E-mail: mohammed.amri92@gmail.com.

has contributed to credibility of environmental conditions by used renewable power sources. Very efforts are exciting have been made by many industries to reduce the negative environmental effects as a results of electricity generations e.g. the effort made by electricity generating companies to reduce air pollutions has been facilitated by the development of nuclear energy. There have been various comparisons in the performance of many cycles of fuel by different electricity generating companies with the aim of estimating their environmental impacts conditions and how they may be able to contribute to the circumstances of the environment ⁶. The phenomenon of environmental pollution has become a real phenomenon that threatens the health of the environment and its environment as a living organism, as a result of the increase in human activities, which led to a significant increase in the percentage of environmental pollutants from the maximum limits allowed globally ⁷. Mans is also one of the main sources of environmental pollution in its various activities, industrial, commercial, agricultural and recreational, which lead to pollution of the environment, and it is clear that humans are more dangerous to the environment than natural factors. Man's destroys an environment in his hand, thus awakening his life and the life of others on the surface of this planet ⁸. The most important sources of human environmental pollution are the power plants, especially those stations which operate on fuel, it is known that the most important air pollutants to cities are the facilities of generation and conversion of electricity, followed by the sectors of clean industries and primary industries, all contribute to pollution ⁹. The types of pollution vary according to the methods to which they are classified. If some types of pollution are caused by natural factors such as volcanoes, earthquakes, floods and storms. This pollution is achieved by nature itself. Environmental pollution caused by people's activities can be called human environmental pollution ¹⁰.

METHODOLOGY

A Study Objectives:

To assess the risk management concerning environmental pollution resulting from the Musayyib electricity generation plant.

To identify the extent of coordination between the concerned authorities to monitor environmental pollution resulting from the Musayyib electricity generation plant.

To identify ways to counter environmental pollution resulting from the Musayyib electricity generation plant.

To find out relationship between the demographic characteristics of workers and aspect of environmental pollution, monitor environmental pollution, and ways to counter environmental pollution.

Study Design: A descriptive study, using assessment approach, is carried out to assess the risk management concerning environmental pollution resulting from Musayyib electricity generation station in Babylon Governorate. A non-probability simple random account of (150) workers at generation station. A questionnaire as a means of data collection was constructed for the purpose of study. It consisted from two parts, include:

Part I: This part contains demographical data which include (age, gender, education level, nature of work, and training course).

Part II: This part is composed of (26) item and divided into (3) sections. They include: aspects of environmental pollution which composed of (8) items, coordination between the authorities concerned with monitoring the environmental pollution which composed of (8) items, and ways to counter environmental pollution which composed of (10) items.

Data analysis: Through the used descriptive statistical (SPSS) version XX analysis approach that includes, frequencies, percentages, mean of scores, standard divagation and graphical presentation of data; and inferential statistical data analysis approach that include Chi-squared test.

RESULTS AND DISCUSSION

Results represents the distribution of the workers demographic items in term of frequencies and percentage. Findings reveals that the (48%) are within first age groups (25-35) years old. Regarding gender, the greatest percentages is male, it constituted (74%) out total number of the study sample. Regarding education, most of the study sample are preparatory, it constituted (45.3%). It is obvious that the most of the study sample are administrative work and account (74.7%) out total number. Finally, results indicate that the (40.7%) of workers are no training course. The findings that based on the statistical cut off point. The aspects of environmental pollution resulting from Musayyib electricity generation station was calculated

as frequencies, percentages, arithmetic mean and standard deviation. Results depicts that the (82.7%) they agree that there is environmental pollution. In assessing coordination between the authorities concerned with monitoring the environmental pollution. Results reveals a majority of (68.7%) of the study findings are indicate disagree that there is coordination between the authorities. Regarding assessing ways to counter environmental pollution. The majority of (54.7%) out total of the sample findings are neutral to counter the environmental pollution. Results presents the association between risks management concerning environmental pollution and workers demographic characteristics. It reveals that there is a non-significant association with their characteristics at p-value (> 0.05) except, with their level of education and training course, there is a significant association with the management of risks that concerning environmental pollution at p-value (< 0.05). In regard to the characteristics of the samples relative to the present study. Results represents the distribution of the workers demographic items in term of frequencies and percentage. Findings reveals that the (48%) are within first age groups (25-35) years old. Older people can judge things better. Regarding gender, the greatest percentages is male. Women have many duties, as the duties of the house, the researchers find a few number. Regarding education, most of the study sample are preparatory. There are a lot of scientific levels specialized in the field of electrophoresis but due to the financial crises and inappropriate circumstances that are exposed to the country, revision found a few scientific levels that work in the station in terms of scientific progress (certificate). It is obvious that the most of the study sample are administrative work. Due to the lack of work in the field, many workers want administrative work because the field work is tired and no allocations were made due to the country's conditions. In regard the training course, results shown there were no training course. The worker does not want the training courses because they are expensive and the reason is due to the financial allocations, the supporting bodies and the monitoring bodies. The aspects of environmental pollution resulting from Musayyib electricity generation station. Results depicts that the available of environmental pollution. This is evidenced that there are many oils and gases that undergo in a process of electrical generation power, and versus the abundance of smells and the presence of many gases, including nitrogen and hydrogen peroxide and other for the lack of tools or standards for air spills,

it is also not available the equipment to measure the level of noise within the stations, and is not equipped with modern technical equipment for air. The study has been investigated the environmental effect due to power plans. Their findings confirm that the plants of generations have been affected the environmental purity of the surrounding region very badly. Environmental deterioration is attributed to emission of large cases of respiratory and related ailments to human beings and animal kingdom. It also impacts of process concerning with photosynthesis, balance of minerals and micro-macro nutrients in the plants, soil strata, structures and buildings get affected due to corrosive reactions, especially for workers and residents near the station⁽¹¹⁾. In regard to coordination between the authorities concerned with monitoring the environmental pollution. Disagree to coordination between the authorities. As being the number of environmental monitors in the company is not commensurate with their functional tasks as well as the non-periodic exchange of reports on the state of environmental pollution resulting from the stations and with others stations, or rather the lack of cooperation of companies concerned with the protection of the environment to reduce the effects of environmental pollution caused by stations, as in general the lack of the of surveillance system and lack of adequate and advanced environmental protection systems. Furthermore, a study that has been assessed the environmental impacts of the thermal power plant in Bangladesh. Their results it is confirm the generation of electricity and consumption of energy in general, adverse effects on the environment, and the major environmental impact is thermal power plant⁽¹³⁾. Results presents the association between risks management concerning environmental pollution and workers demographic characteristics. It reveals that there is a non-significant association with their characteristics at p-value (> 0.05) except, with their level of education and training course, there is a significant association with the management of risks that concerning environmental pollution at p-value (< 0.05). that higher education owners are more aware of the management pollution caused by the station. That most of the sample are graduates of institutes so they carry out executive functions. As for the nature of the work, the members of the sample are administrators, they perform the tasks of supervision. With regard to training courses, the increase in the number of training courses increases the knowledge of the workers at work. This results come with the results that investigated the

environmental pollution caused by power plants and its impact on environmental security. Their findings depicts that there is a significant association with the workers level of education at p-value less than (0.01). The result was higher education increasing the degree of education increased the worker's knowledge of protection and management of prevention of pollution ⁽¹⁾.

ABSTRACT

The objective of the research is to identify the impact of a strategy within and outside the circle in the achievement of the fifth grade pupils in social subjects, The researcher followed the method of experimental research to achieve the objectives of the research, which includes an independent variable (strategy within and outside the circle, the usual method), And a dependent variable(educational attainment)The researcher adopted the experimental design with a partial control to adjust the search variables The sample of the study was selected Safad Primary School for Boys for the academic year (2017-2018) The sample consisted of (60) students and chose (a) randomly to represent the experimental group by (30) students and (b) to represent the control group and the number of (30) Before the experiment was applied, the researcher was rewarded between the two research groups for the purpose of obtaining accurate and objective results with the following variables: (Father's education, Mother's education, IQ test, the age of time calculated in months, the previous knowledge). The researcher prepared an achievement test consisting of (40) objective paragraphs of choice type, the researcher obtained data for the experimental group and control.

Keywords: Education, curriculum, methods and strategies, social materials, active learning, strategy within and outside the circle, collection.

INTRODUCTION

Contemporary human societies are witnessing an explosion of knowledge which resulted in a scientific and technological revolution, and resulted in many rapid changes and developments in successive areas of humanitarian activities, hence, human societies are making great efforts to employ this information revolution to allow their members to benefit from the knowledge they possess. The only way to keep abreast of these developments is through education and its curricula ¹ Active learning is the way a student engages in various classroom activities rather than being a passive individual who receives information from others Active learning encourages student involvement in interaction by working in discussion groups, And

participate in the discovery of concepts and exercises based on problem solving, allowing them to participate in activities and lead to the acquisition of concepts and skills of creative thinking and investigation and problem solving, and encourages them to make decisions ² . Modern education has attached great importance to the teaching methods and strategies of active learning and considered it as the cornerstone of the teaching process because of its distinctive role in achieving its objectives And have a clear influence in the attitudes of students, and their attitudes towards the material, and depends on the success of the teacher ³ . The new strategies of active learning were characterized by shifting the focus of attention in the educational process of the teacher and his role in teaching the material to the learner and his active role in learning the material to be the focus of the educational process, And make learning linked to the abilities of the students and their readiness and abilities and their interaction with each other ⁴ . Recent strategies allow learners to work together, play an active positive role and interact with different attitudes to collect facts themselves, It also increases the effectiveness of learning, The studies conducted in this field also emphasized

Babylon, Iraq;

E-mail: hussain.ali20271@yahoo.com

the importance of modern strategies in increasing the achievement of learners and the high rate of achievement in materials, And to increase understanding and social and personal relations between learners ⁵. The social materials have a prominent place in the school curricula because they have a significant impact and effect on the generation generation culturally, scientifically and professionally and to make them useful members of their society and their nation and for all humanity, It helps to understand the learners of the problems surrounding them and their community and their nation to contribute to the development of solutions and proposals for understanding ⁶ History is one of the social items that focus on the past in its events, And his ideas, to show the extent to which this past can affect the present man lives ⁷.

Strategy within and outside the circle:

Strategy within and outside the circle This strategy is based on the ability of students to generate questions and prediction, Brainstorming and cooperative education, This strategy stimulates students' motivation through their ability to answer questions themselves, And not feeling embarrassed because he knows that there are others who read him do not know some information ⁸. A strategic idea inside and outside the circle is to exchange ideas for a specific purpose or purpose, Where the class is divided into two teams Each team is divided into two groups So that the two groups form an internal department and an external department And meet face to face and start the students of the internal group to ask questions to the students of the external group, Then the students of the outside group move clockwise until the team completes the entire cycle, The aim is to help students acquire the skills of asking questions, predicting, Speak quietly, Move for a goal, The strategy can be implemented at the end of the lesson after the teacher has finished explaining and evaluating the lesson. It is the framework of knowledge and skills gained through the subjects taught, School achievement plays a major role in shaping the learning process, And the achievement of the school on its importance is the only variable in the process of learning because the collection process is complex and influenced by many factors such as the teacher and his abilities, And its aptitudes, moods, health, educational experience and methods of education and this is one of the factors.

METHODOLOGY

First: experimental design of the research

It includes one independent variable (Strategy within and outside the circle) and a dependent variable (Collection) so the researcher used the experimental design With partial settings For the experimental group and the control.

Second: the research community and sample:

1- Research community:

This research community consisted of fifth graders in elementary schools for boys in Babil governorate for the academic year 2017-2018.

2. Research Sample:

In order to select the sample of schools the General Directorate for the Education of Babylon was chosen The researcher chose Safad Primary School to conduct the experiment The sample consisted of two students of the fifth grade of the primary school (66) students divided into two divisions (A, B) (A) to represent the experimental group and (b) to represent the control group. After the exclusion of the students in the two groups (A and B) the total number was (60) students by 30 students in both the experimental and control groups. The equivalence of the two research groups: The researcher aimed to statistically equalize the research groups statistically in some variables that affect the results of the experiment and keen to adjust the following variables:(Father's education, Mother's education, IQ test, the age of time calculated in months, the previous knowledge).

1- Father's education

The researcher obtained the data on the collection of the parents through the school card. It was found that the two groups were statistically equivalent in this variable The results of the data showed that the value of the calculated ka (0.802) is smaller than the ka 2 value (7,815) (0,05) and to a degree of freedom (3) Table 1.

RESULTS AND DISCUSSION

Mother's education

The researcher obtained the data on the collection of mothers through the school card. It was found that the

two groups were statistically equivalent in this variable. The results of the data showed that the value of Ka_2 is (2.467) smaller than the value of the ka_2 in the table at (7,815),(0,05) and to a degree of freedom (3), and this is illustrated in the following table 2.

IQ test:

After the researcher applied the test to the two groups of research (experimental and control) The average scores of the experimental group (18.13) and the deviation (5.04) were the mean of the students of the control group (16.83) and the deviation (4.79) When the (t-test) was used for two independent samples To find out the difference between the mean scores of the two groups in the IQ test. The results showed that the differences were not significant at 0.05 and with the degree of freedom (58), the calculated T value (1.024) was smaller than the numerical value of (2,000) in this variable, the following table shows Table (3).

The chronological life calculated by months:

According to the researcher, the average age of the students was (129.6) months, while the mean of the control group was (130.27) The independent T test was (0.501) which is smaller than the T- With a degree of freedom (58) The two research groups are shown to be equal in the age variable and the following table shows Table 4.

Students' grades in social subjects for the previous academic year: The researcher The average score of the experimental group was (64.43) with a standard deviation of (15.99) while the average score of the control group was (63.8) with a standard deviation (19.5) and after the use of the T test (t-test) for two independent samples to determine the significance of the difference in grades It was found that the difference was not statistically significant at (0,05) The calculated T value (0.138) is smaller than the numerical value (2.000) Indicates the equivalence of the two search groups in this variable, and the following table illustrates this Table (5). Excellence Students of the experimental group who studied on According to a strategy inside and outside the circle On pupils Control group Who studied according to the usual method in the achievement test Thus rejecting the first zero hypothesis AND Accept Zero hypothesis Alternative : (There is a difference of statistical significance at the level of significance (0.05) Between the average scores of the experimental group Which are studying In accordance with the strategy inside and outside the circle And the average score of students in the control group Who are studying According to the normal method In the test of collection of social subjects For the fifth grade primary) And this is consistent with the studies that confirmed the superiority of the experimental group, which was studied according to a strategy within and outside the circle on the control group, which was studied according to the usual method as a study.

Table 1. Kay box results for the two sets of research in the educational achievement of parents

				7.25	23.37	30	Control

CONCLUSION

The researcher was rewarded between the two research groups for the purpose of obtaining accurate and objective results with the following variables: (Father’s education, Mother’s education, IQ test, the age of time calculated in months, the previous knowledge). The researcher prepared an achievement test consisting of (40) objective paragraphs of choice type, the researcher obtained data for the experimental group and control.

Occurrence, and Preventive Measures of Injuries by Needles and Sharp Objects in Governmental Hospitals, (AL- Amara City, Iraq)

Amjad Hashim Mohammed¹, Thani Asmar Radhi², Saad Sabri Shamkh³, Aqeel Ghilaim Oglah⁴

¹ MSc. Assistant Lecturer, in the field of Nursing Administration, ² MSc. Assistant Lecturer, Adult Nursing Department, ³ MSc. Assistant Lecturer, Community Health Nursing Department, ⁴ MSc. Community Health Nursing Department, College of Nursing/ University of Misan, Iraq

ABSTRACT

Objectives: 1. to investigate the occurrence and frequency of injuries by needles and sharp objects among health care workers in AL- Amara city, Iraq, 2. to identify the factors that may contribute to these injuries, 3. to explore preventive measures and intervention to deal with these injuries. A descriptive exploratory survey was conducted in Al-Amarah city hospitals during the period from January 2018 to May 2018. It was use of non-probability sample (purposive) of 135 health care workers, the data was collected through the interview technique by using of constructed questionnaires, which consist of 3 parts. The result showed that most of health care workers in the sample are exposed to needle stick or sharp injury in the last 12 month, 108 participants out of 135 reported they have been needle stick and sharp injuries (80%), the majority of incidence occurred by syringe needle (46.3%). Most of injuries occur during use the needle or sharp injuries (n= 37, 34.3%). The majority of (NSI) happened during normal injection procedure (n= 36,33.3%). The main causes of injuries was workload (n=76, 70.4%).

Keyword: Injuries, Needles and Sharp, Preventive

INTRODUCTION

Injuries because needles or sharp objects considered the most important work risks¹. It is a dangerous phenomenon where statistics estimate that there are three million health care workers exposed to blood carrying an infection source every year². Globally, these injuries caused 16,000 hepatitis C, 66,000 hepatitis B, and 200 to 5000 human immunodeficiency virus (HIV) infections per year. More than 90% of these infections are occurring in Third world countries, and most are preventable^{2,3}. There are studies report the risks of occupational blood-borne viruses (BBV) infection for HCWs in developed countries where a range of prevention measures have been applied. In contrast,

the condition for HCWs in Third world countries is not well registered, and their safety is neglected issue³. It is worth mentioning that More than two thirds of health care workers have contact with blood or body fluids throughout their working lives⁴. Based on study the cost of one injury without infection about three thousand dollars⁵. The case of infection caused by injury reach one million dollars or more spend in tests, follow-up, lost time and disability payments. Liver transplantation due to hepatitis C costs hundreds of thousands of dollars. Other costs of injuries include worker reparations, overtime, and expenses related to the recruitment and training of staff to replace the worker who is sick⁵. While there are no financial accounts for citation here, there should be a cost applied to replace nurses and other health care workers who have chosen to leave the care environment because of concerns about needle sticks¹. Programs and studies carried out by the International Council of Nursing and the World Health Organization on the prevention of injuries by needles and exposure to blood borne infection concluded the need to work on the

use of safety tools for medical interventions, as well as the training on general precautions which have proved effective for the prevention of over 80% of injuries will assure that nurses can continue to provide quality patient care ⁶. About 62% - 88% of injuries are preventable ³. The world is suffering from a lack of healthcare workers, especially nurses, in the United States, for example in USA the nursing shortage may reach 800,000 vacant positions by 2020 ². There is a lot of suffering after the injury may be physical, psychological or emotional to the injured person and waiting for the result of lab tests after the injury lead to emotional disorder ⁽²⁾. Moreover there is devastating need for nursing and medical services in Iraq. Nurses shortage especially academic nurse is an important issue in AL-Amara city, Iraq, thus there is an urgent need for the development of policies to prevent injuries to maintain nursing staff, technicians and physicians. In study conducted in Baquba City, Iraq to explore prevalence of needle stick and sharp objects injuries among 240 Health Care Workers (HCW), study suggested 46.6% injuries among physicians and 18.7% injuries among nurses ⁷. This study would provide information to the policy makers in regard to the frequency of injuries, the sources of these incidents, action taken to prevent, and the factors contributing to these incidents. Policy makers can use these data to develop further measures and policies that would help in creating a safe workplace that could be free or with minimal occurrence.

MATERIALS AND METHOD

A descriptive exploratory survey in injuries by needles and sharp objects among health care workers in AL-Amara city, Iraq 2018. Non probability Purposive sample of 135 healthcare workers 32 Physicians, 23 lab technicians and 70 nurses was selected for the study, which consists of three parts. Part (1), demographic data form, It is compressed of eight item which are concerned with the healthcare workers demographic characteristics of healthcare workers age, gender, educational level of healthcare workers, number of experience years, job title, place of the work and number of training courses on the risk of injuries by needles and sharp objects among healthcare worker and part (2), Occurrence and contributing factors. Included 5 items all questions are multiple choice Part (3) Preventive measures included 7 items all questions are yes or no. The content validity of the study instrument was determined by presenting it to a panel of 12 experts both from the academia

and its reliability was A back translation was made by two linguist to back translate the study instrument to its original language; English language. There was no remarkable mismatching between the version translated to Arabic language and the original version in English language. Data were analyzed through the use of simple descriptive statistical data analysis approach (frequency, percentage, mean of score) and inferential analysis procedures (chi-Square) were used for the data analysis.

RESULTS AND DISCUSSION

The results of table (1) show that the majority of age group of the study sample are within (25-29) years (34.8%). The above table also shows that the majority of participants are male (56%). Concerning the years of experience, half of participants who are in the group (1-5) years (50.4%), Regarding educational qualification, more than one third of participants are bachelor's degree (35.6%), About job title more than half of participants are nurses (59%), With respect to current area working more than one fifth that work in the Operation Room (22.2%). A training course (NSI) approximately half of participants are in the none training course (48.9%), About hospitals samples distributed equally among three hospitals; Al-Sadr, Al-Zahrawi, and Missan pediatric hospital (n=45; 33.3%). Table (2) presents a description of the participant's experience of needle and sharp objects injuries such as frequency of injuries and Type of needle and sharp objects, Time of occurrence, Procedures, and main causes. 108 participants out of 135 reported they have been injuries (80%), the majority of incidence occurred by syringe needle (46.3%). Most of injuries occur during use the needle or sharp injuries (n=37, 34.3%). The majority of injuries happened during normal injection procedure (n=36, 33.3%). The main causes of injuries was workload (n=76, 70.4%). Table (3) a description of the preventive measures related to injuries that taken by health care workers to prevent infections. The majority of health care worker that injured with needles and sharp objects had been disinfect the area with an alcohol swab post exposure (N=105, 97.2%), followed by those who had been taken hepatitis B vaccine pre exposure (N=82, 75.9%), those who had been wear gloves during injury (N=82, 75.9%), those who had been allow injury to bleed (n=65, 60.2%), those who received NSI package (lab tests) after injury (n=42, 38.9%), those who had been Notify manager or supervisor of the exposure (n=40, 37%). those who had been Wash injury with soap and water (n=31, 28.7%).

According to the result in table 2 the occurrence rate of NSIs is 80%, this result is agreed by study done by [Amini](#) (90%).⁸. Our research showed the most common sharp tools use was syringe needle 46.3% and it's similar to the study obtain by Mitchell in 2015 who found that syringe needle 53% was the most common used objects⁹. the majority of injuries time occur during the use of the needle or sharp objects (34.3%) similar to the result obtain by Mitchell which was (33.0%)⁹. Our study showed that the most common procedure were normal injections (33.3%) table 2. This result inconsistent with Abu-Rmeileh 2012 who find the wound suturing is the most common (33.5%)¹⁰. Based on this study the main cause of injuries was workload 70.4% table 2. This result disagree with study done by Aderaw in 2013 which showed that lack of sleep and tiredness were the major causes of injuries¹¹. The prevalence of injuries by needles and sharp objects among health care workers, especially under the current circumstances of increased traumatic injuries, psychological disturbance and economic distress, will be higher than that of neighboring countries such as KSA and Jordan, despite of the fact that they are also developing countries as well Furthermore large one setting investigated were teaching hospital where lower experience may play a major role in the incidence of needle stick injuries. In this study most of health care workers had vaccinated against hepatitis B 75.9% table 3. This similar to study done by wicker S. in 2007 who found that 78.2% take the vaccine¹² and also ascertained Ebrahimi in 2007¹³. The health care workers allow the injury to bleed without making pressure 60.2% table 3. This result agree with study done by Jahangiry in 2016 who find that 99% allow the injury to bleed. but didn't wash injury with soap and running water 71.3% table 3. This result disagree with result obtain from study done by Jahangiry in 2016 who find that 75% wash injury with soap and running water; (37.0%) from injured health care workers notify manager or supervisor of the exposure table 3. This result agree with study obtain by Kanlee in 2005 showed 40.8%⁽¹⁵⁾. The largest proportion of health care workers were wearing gloves (75.9%) table 3. This result agree with study done Jahangiry M. 2016 who find that (70.4%) HCWs wear gloves¹⁴. Finally the highest number of health care worker did not made lab test after injury (61.8%) table 1 and this disagree with study done by Kommogldmo in 2016. It is important to mention that the Iraqi health regimen is different from other countries, there is no clear policy to establish basic

rules to prevent needle stick injuries and sharp objects to protect the health care workers

Table 1. Socio-demographic and job characteristics of respondents

Variables	Frequency	Percent
Age		
20-24	23	17.0

Vaccinated for hepatitis B.		
Yes	82	75.9
No	26	24.1
Allow injury to bleed.		
Yes	65	60.2
No	43	39.8
Wash injury with soap and water.		
Yes	31	28.7
No	77	71.3
Disinfect the area with an alcohol Swab.		
Yes	105	97.2
No	3	2.8
Notify your manager or supervisor of the exposure.		
Yes	40	37.0
No	68	63.0
Did you wearing gloves during injury		
Yes	82	75.9
No	25	23.1
Have you done lab tests after injury (Receive NSI Package) .		
Yes	42	38.9
No	66	61.1
Total	108	100

CONCLUSION

The majority of health care workers are exposed to NSI and sharp objects (80%). Some factors play an effective role in NSIs while others have methods to prevent them. Therefore, the recommendations in research, education, practical application and policy regulations are necessary and urgent to be applied to reduce injuries and create a healthy working environment.

Assessment of the Patients' Knowledge about their Disease for Rheumatoid arthritis at Baghdad Teaching Hospital

Hashim Jebur Abed AL-Kaabi¹, Khalida Alwan Mansour²

¹MSc Adult Nursing, Ministry of Health, Iraq, ²Department of Adult Nursing, College of Nursing, University of Baghdad, Iraq

ABSTRACT

The aim of the study was to identify the patients' needs to educational program in the context of their health problems, as expressed in their subjective assessment. A descriptive study design was carried out in the Outpatient Clinics for Rheumatology at AL- Yarmouk Teaching Hospital, from April to May 2018. A non –probability (purposive) sample was selected and composed of (40) adult (male and female) patients with rheumatoid arthritis who attend to Outpatient Clinics for Rheumatology. There were 40 patients included in the study. The mean age of the participants was (41.30 ± 9.90) years. Of the 40 respondents, the largest age category was of those between 40-49 years (35%). There were 27 (67.5%) females and 13 (32.5%) males. The mean of disease duration was 21 (52.5%) years. The results of the assessing show the level of knowledge about disease of patients with RA is very low. Therefore, the results show the need for education programs about exercise, diet, relaxation technique and information about their disease. There was no significant relationship between patients' knowledge domains and clinical characteristics, in addition there were no significant relationship between patients' knowledge domains and social-demographic characteristics at $p \geq 0.01$ value.

Keywords: Rheumatoid arthritis, RA, awareness; education.

INTRODUCTION

Rheumatoid Arthritis (RA) is one of the most important chronic inflammatory diseases affecting the joints and musculoskeletal systems. It is associated with swelling, stiffness and pain and can lead to significant loss of performance and mobility in severe cases². Although, RA defined as one of autoimmune diseases when the body's immune system attacks its own tissues, but the onset of RA is not clear. However, it can be attributed to genetic liability to the disorder, several viruses and bacteria such as Epstein- Barr-Virus and Mycobacterium tuberculosis, disruption of the immunological tolerance as well as weakening the immune system of people as a result of the psychological condition.³ Moreover, because of unknown etiology, cures of RA have not been discovered yet as well. Treatments and therapies

are applied largely to reduce symptoms and delay the progress of the disease¹. RA affects 0.5% to 1% of the general population worldwide, and it is more common in women than men. Although the prevalence is surprisingly constant across the globe, regardless of geographic location and race, there are some exceptions. For instance, in China the occurrence of RA is somewhat lower ($\approx 0.3\%$), whereas it is substantially higher in other groups such as the Pima Indians in North America ($\approx 5\%$). In Iraqi populations was reported at around 1%.⁴ Rheumatoid Arthritis is a disease that requires follow-up and long-term management. "The purpose of teaching a patient is to maintain or improve health, or, in some cases, to slow down the deterioration," said Loreg.⁵ Patient education programs have to be an integral part of treatment because of the pain and disability the people with arthritis face on a daily basis. Patient education is crucial as it allows better compliance and ability to cope with the psychological, physical and the social problems associated with the disease. Therefore, it has to be a complement to traditional medical treatment.⁶ Patient education is very important for the patient to comply

MSc adult nursing, Ministry of Health, Iraq.

with the treatment, to change behaviors and thus to prevent disability⁷.

MATERIALS AND METHODS

Design of the Study: A descriptive study design was conducted in the Outpatient Clinics for Rheumatology at AL- Yarmouk Teaching Hospital, from April to May 2018, A non-probability (purposive) sample of (40) of rheumatoid arthritis adult patient (male & female), above 18 years. and those who were coming for follow-up for more than 1 months were included. The selection of clients was simply randomly clients who have RA, who ethical approval informed consent was obtained from each participant included in this study.

Instrument: For the purpose of data collection, a questionnaire was used, which consists of three parts, **first part** concerning the demographic data form that included the gender, age, level of education, marital status, occupational status and monthly income of the patient, **the second part** concerning clinical characteristics included, the duration of the disease the chronic disease, drugs regulation and the allergy drugs of RA, the **third part** concerning the measure of rheumatoid arthritis patients' knowledge and their its needs. The ACREU rheumatoid arthritis knowledge questionnaire⁽¹⁾, was used to collect data from RA patients, which was translated into local language "Arabic". The questionnaire consists of 31 items covering (8) domains included (prognosis/ outcome (8), joint protection (5), energy conservation (2), pain management (3), coping strategies/feelings (9), exercise (2) and medications (2). The validity of the checklist was determined through presenting it to (21) specialist experts and its reliability was determined through using Cronbach's alpha coefficient. Finally, the test-retest reliability of the ACREU rheumatoid arthritis knowledge questionnaire and 10 patients were assessed twice in four-week intervals.

Data collection: The study was implemented in the outpatient clinics for Rheumatology at AL- Yarmouk Teaching Hospital. The patient who met the study criteria, were approached in the study, the patients were invited to participate in the study and explain the study objectives.

Statistical Analysis: The data analysis through use a descriptive statistical analysis procedures and inferential analysis procedures (SPSS 21).

RESULTS AND DISCUSSION

Table (1) shows that the socioeconomic status of the 40 participants, 27 (67.5%) were females and 13 (32.5%) were males. The overall mean age was 41.30 ± 9.9 years. Moreover, 14 (35.0%) of the participants were aged between 40-49 years. Based on their educational background, the most 18 (45%) of patients graduate from secondary school, 11(27.5%), with primary education and 4 (10%) with Higher education, and 6 (17.5%) had unknown educational backgrounds., (70.0%) of patients were married, 60.0% were Housewife. concerning monthly income. 10% of the patients had monthly income less than (300,000 ID.), (25%) of patients had a monthly income between (300,000 – 600,000 ID.), and majority (40%) of the patients had monthly income between (600,000 – 900,000 ID). whereas the remaining (25%) had a monthly income of more than (900.000 ID.). The results of table (2) show medical history for patients with RA, the table revealed that the most (75.0%) of the patients had chronic disease, (67.5%) of the patients taken drugs regularly. Base on drug allergy only (10.0%) of the patients had drug allergy. Concerning duration of the disease, high percentage (52.5%) of patients the duration range was (4-6) years, and (17.5%) of patients the duration was more than 7 years. Related ESR, the majority of patients were above the normal range. Table (3) presented the RA patient knowledge related the Prognosis, Outcome, Information about disease, joint Protection, energy conservation, and pain management, the table revealed that the mean score of knowledge of patients in all domains was very, except pain management domain was rated low. Table (4) The table revealed that the mean score of knowledge related the coping strategies, exercise, and medications was very, except pain management domain was rated low. The Results of table (5) presented that their No were significant relationship between Patients' knowledge domains and social-demographic characteristics at $p \geq 0.01$ value. The Results of table (6) presented that their No were significant relationship between Patients' knowledge domains and Clinical Characteristics at $p \geq 0.01$ value. About the age group (35%) of RA patients were in the age group 40–49 years with mean age (41.30 ± 9.9) years, this results comes along with a study¹³ that found that the sample age was (41–60) years old and is coming inconsistent with the findings of the study¹⁰ mentioned that the majority of study sample ages were between^{12, 13} years. A High percentage (45%) of the present study the

patient graduate from secondary school, this result agrees with in his study ¹³ who mentioned that the most (60%) of the sample in his study are graduating from secondary school. In additional other study¹² found that the (62.7%), of the sample were graduate from the Secondary School.

CONCLUSION

Rheumatoid arthritis is a chronic inflammatory disease requiring long-term management and counselling, so focus to given to the counselling and education of the patients. On the other hand, patient education in rheumatoid arthritis (RA) is strongly recommended to support patient management.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Department of Adult Nursing, College of Nursing, University of Baghdad, Iraq and all experiments were carried out in accordance with approved guidelines.

Immunohistochemical Expression of CDX2 Protein in Iraqi Patients with Human Gastric Cancer (HGC)

Hanan Jameel Ashour¹, Nahla A. Al-Bakri¹, Kifah Hamdan Abdul-Ghafour²

¹Department of Biology/ College of Education for Pure Science (Ibn- AL-Haitham)/ University of Baghdad, Iraq,

²Department of Pathology /College of Medicine. /University of Baghdad, Iraq

ABSTRACT

This study aimed to evaluate the IHC expression of CDX2 protein in HGC patients and control groups and also to study the correlation between IHC expression of the CDX2 and different clinicopathological variables such as: age, gender, histopathological subtype, grade, and stage of the tumor in HGC cases. the retrospectively sectional study for the period from 2014 to 2018 included a total of 60 formalin fixed paraffin embedded blocks of the HGC tissue (partial or total gastrectomy specimens) that collected from the archived materials of the Department of Pathology of Baghdad Teaching Hospital and the Center of Gastrointestinal and Hepatic Diseases, and also some samples were collected from other private laboratories. The IHC expression of the CDX2 was significantly increased in HGC group compared with control groups ($p < 0.0001$). A clinic-pathological assessment revealed that patient's samples involved 20 males and 10 females; Male to female ratio was 2:1. The age of patients was ranged between 18-76 years with a mean \pm standard error of (48.39 \pm 12.39) year. The majority of the HGC cases, in this study (53.3%) were above 48 years of age. the commonest histopathological subtype was the diffuse subtype (46.6%).

Keywords: CDX2, HGC, IHC expression

INTRODUCTION

Human Gastric Cancer (HGC) is fifth most common malignancy diseases in the world with nearly one million new cases of HGC are reported in 2012 preceded by lung, breast, colorectum and prostate cancers respectively. It is the third leading causes of cancer related death throughout the world in both sexes^{1, 2, 3}. Almost two thirds of them occur in developing countries with peak incidence in the Far East regions including China, Korea and Japan. In Iraq, HGCs have come at the 7th rank among the other body cancers in 2013 and it is the 7th commonest cancer at in men and women⁽⁴⁾. The male: female ratio equals to 1.6:1⁵. The large majority approximately 95% of HGC are adenocarcinoma⁶. Several abnormalities in oncogenes

and tumor suppressor genes have been identified in HGC. This study focused in this study on CDX2 protein, which is a good-established gastric marker protein and is usually used for the clinical evaluation of HGC. There have been many previous articles demonstration the IHC expression of CDX2 protein and prognosis of HGC, but the correlation between the IHC expression of CDX2 protein and HGC is still controversial. CDX2 protein, an intestine-specific home box gene product, plays fundamental role in intestinal development; CDX2 & CDX1 is expressed in the in hindgut related organ such as intestine that assume the responsibility of cell differentiation⁷. Several studies have been indicated that ectopic IHC expression of CDX1 or CDX2 is detected in intestinal metaplasia of the stomach. The aim this study is to assess whether the CDX2 protein could be used as a predictor in patient with HGC and also examine the relationship between the IHC expression of CDX2 protein in normal stomach and in HGC cases and its correlation with different clinicopathological risk categories such as: age, gender, histopathological type, grade, and stage of the tumor in HGC.

MATERIALS AND METHOD

A retrospective audit study on 60 cases for the period from 2014 to 2018, the samples were divided into two groups 30 patients with HGC and 30 healthy samples with Normal stomach (as control group). 60 formalin fixed paraffin embedded blocks of the HGC tissue (partial or total gastrectomy specimens) are selected randomly from archived materials of Pathology laboratory of Baghdad Teaching Hospital and the Center of Gastrointestinal and Hepatic Diseases, and some samples were collected from private laboratories in Baghdad in this study. All clinicopathological information including age, gender, histopathological type, grade and stage of tumor were taken from the patients reports. One section of the paraffin embedded of HGC tissue blocks was stained with H&E and reviewed the histopathological diagnosis, while another one section were stained with IHC was carried out with the CDX2 monoclonal antibody (abcam, UK; optimal dilution, 1:250). Immunohistochemistry Deparaffinization and endogenous peroxidase inactivation of clinical tissues were performed For CDX2 and the samples were hydrated heating in 50 mm EDTA buffer solution (pH 7.0) at 95c was then placed in the water bath (Gallen kump, England) for 30 min for antigen retrieval. The primary anti-CDX2 antibody was applied for one hour at room temperature. After washing in PBS two times, the secondary antibody (Dako, Denmark) was applied for 30 min at room temperature, and incubation with antibody conjugated to HRP (Dako, Denmark) for 10 min at room temperature. After that, the slides were counterstained with Mayer's hematoxylin for 5min and dehydrated in alcohol prior to mounting. IHC reaction is considered positive when brown staining is nuclear for CDX2, the positive control for CDX2 IHC reaction was taken from the Colon carcinoma. Technical negative control for CDX2 was obtained by omission of the primary antibody. The results of IHC expressions of the CDX2 were analyzed in a semiquantitative fashion abased to Halder and his coworker⁸ Score 0: 0-5%, Score 1: 6-35%, Score 2: 36- 65%, Score 3: \geq 66% of tumor cells were positive. The IHC expression of the CDX2 was analyzed statistically in relationship to Clinicopathological parameters of HGC using Fisher's exact probability test, Student t-test. Values were considered statistically significant when $P < 0.05$.

RESULTS AND DISCUSSION

30 cases of control group included 17(56.6%) female and 13(43.3%) male with a mean of age 39.27 ± 4.266 and rang between 33-48 years. 30 of HGC tissue blocks were studied and the results revealed that the samples included 20 (66.6%) males & 10 (33.3%) females and male to female ratio was 2:1. The age of patients was ranged between 18-76 years with a mean \pm SD 48.39 ± 12.39 years. For age distribution of HGC cases, the samples observed that 16(53.3%) of HGC cases were above \geq 48 years, while 14 (46.6%) were <48 years. Large proportion of the histopathological subtype showed the predominance of diffuse subtype 14 (46.6%) compared to intestinal subtype 12(40%). This study revealed that the majority of cases were moderately differentiated 19 (63.3%) followed by poorly differentiated 10 (33.3%) of the cases and 1(3.3%) case of well differentiated. The majority of deeding invasion of HGC cases 23 (76.6%) falls in stage pT3 subserosa. According to TNM staging system, the majority of IHC expression of the CDX2 in HGC cases 16(53.3 %) fall in stage advanced disease (III&IV), while 10(33.3%) was in stage early disease (I&II).

CDX2 immunohistochemical expression

The IHC expression of the CDX2 in HGC cases and control groups were measured by IHC. The mean percentage of CDX2 protein was significantly increased ($p < 0.0001$) in HGC cases than in control group, the differences in frequency of distribution of cases with positive and negative expression of CDX2 of the studied cases are summarized as shown in table (1), fig. (1). CDX2 was not expressed immunohistochemically in all studied normal stomach cases (0%) and expressed in 21 (70%) cases of HGC, with significant increase in its expression with increasing of the lesions severity ($p < 0.001$). Regarding CDX2 staining scoring, the majority of cases of carcinoma 30 out of 10(33.3%) showed in score +3, while only 7 out of 30 cases of HGC (23.3%) were in score +2 and the rest of the cases showed 4(13.3%) in score +1. 9 out of 30 (30%) were negative for CDX2. The age of the patients which included 12 (40%) of HGC cases were \geq 48 years and these showed positive CDX2 expression, and 9(30%) of HGC cases were positive CDX2 expression in the age <48. Out of 20 male cases of HGC, only 12(40%) cases showed positive CDX2 expression, while out of 10 female cases of HGC, only 9(30%) cases showed positive CDX2 expression;

statistically there was no significant relation between CDX2 expression with age and gender as shown in Table (2). In consideration to the histopathological subtype, out of 14 cases of diffuse subtype HGC, 9 (30%) cases of them showed positive CDX2 expression, while out of 30 cases of intestinal subtype of HGC, only 10(33.3%) cases showed positive CDX2 expression; although these results were statistically not significant As shown in table (2). Out of 19 cases of moderately differentiated type of HGC, 16(53.3%) cases of them showed positive CDX2 expression, while out of 10 cases of poorly differentiated type of HGC, 4(13.3%) cases of them showed positive CDX2 expression. Regarding the relationship between HGC cases and stage of tumor, out of 30 cases of HGC falling in stage pT3 (subserosa), 19(63.3%) cases of them showed positive CDX2 expression, while one case falling in stage pT2 (muscularis propria) & pT4 (serosa) showed positive CDX2 expression. these results significantly detected a correlation with tumor invasion and grade tumor p value = 0.014 and 0.03 respectively. As shown in table (2). Worldwide, HGC is one of the commonest cancers after lung cancer and a major cause of mortality and morbidity, especially in developing countries⁹. The etiology of HGC includes both genetic and environmental factors such as *H. pylori*¹⁰. Multiple genetic alterations are detected not only in gastric carcinoma, but also in tumors at other sites. In HGC, CDX2 is present solely in tumor cells while it is not so in adjacent normal stomach mucosa. It is also present in nucleus of pre lesion epithelium surrounding tumor in varying degrees specially, intestinal metaplasia¹¹. In the present study has shown that CDX2 expression was significantly higher in carcinomas than normal stomach cases (70%versus 0%, p<0.0001). All control cases were negative for CDX2 expression. This observations of this study are comparable to the literatures which stated that the CDX2 was not expressed in normal stomach mucosa

with increase in its expression with increasing severity of the lesion from normal to invasive HGC^(12,13,14). Taking the age in consideration, this study revealed non-significant association between patient's age and IHC expression of CDX2. This result nearly compatible with that obtained by other study done by Abdul-Azeem & Radi¹⁵, and also with a study of Zhang *et al.*¹⁶. Also non-significant correlation was found between IHC expression of CDX2 and patient's sex. The slightly increase in the expression rate in males than females could be attributed to the higher incidence rate of HGC in males compared to females, and similar results were seen in different studies^{17,18}. Concerning the histopathological subtypes of HGC, this study shows non-statistically significant difference in IHC expression of the CDX2 in histopathological subtype of HGC, This result is consistent with done by other studies. On the contrary to the above results, some studies found different observations. Some of these studies had found a significant relationship between IHC expression of the CDX2 and histopathological subtype of HGC, the positivity rates were higher in intestinal subtype of HGC than diffuse subtype. Actually it was difficult to interpret the causes behind such conflicting data, it could be attributed to different factors such as geographical, racial, technical, analytical as well as the results have been interpreted using a wide variety of protocol variables and scores, which makes the comparison between studies rather difficult. Regarding the tumor grade of HGC, in the current study was found statistically a significant difference in IHC expression of the CDX2 among different grades of studied HGC cases. The current work showed a significant lower CDX2 in poorly differentiated and higher value was detected in moderately differentiated. This result agrees with results similar other studies. Some studies are in discordance to the present one.

Table 1. IHC expression of CDX2 among studied groups

Studied group	CDX2 expression score				expression
	0	+1	+2	+3	
Control cases	30(100%)	0(0%)	0(0%)	0(0%)	(%0)0
HGC cases	9(30%)	4(13.3%)	7(23.3%)	10(33.3%)	21(70%)
Total	39(65%)	4(16.6%)	7(11.6%)	10(16.6%)	(34%)21
p-value	P= 0.0001				

Table 2. Distribution of CDX2 expression in HGC cases in relation to different studied Clinic pathological characteristic

Clinic pathological characteristic		CDX2 expression		p-value
Age	>48	positive	9(30%)	P= 0.53 ^{N.S}
		negative	5(16.6%)	
	≥48	positive	12(40%)	
		negative	4(13.3%)	
Gender	Male	positive	12 (40%)	P=0.29 ^{N.S}
		negative	8 (26.6%)	
	female	positive	9 (30%)	
		negative	1 (3.3%)	
Subtype of tumor	intestinal	positive	10(33.3%)	P=0.24 ^{N.S}
		negative	2(6.6%)

	III&IV	positive	11(36.6%)	
		negative	5(16.6%)	

Figure 1. IHC expression of CDX2 among studied group

CONCLUSION

This study showed that the IHC expression of the CDX2 was increased in carcinoma tissue, the overall expression of CDX2 in HGC cases in the present study was 70% and there was no significant correlation between IHC expression of the CDX2 and different clinicopathological variables such as: age, sex of patients, histopathological subtype and TNM stage. While there was significant correlation between IHC expression of the CDX2 and tumor grade in which CDX2 expression was more common in moderately differentiated type HGC cases than in poorly differentiated type. From the above results it is obvious that CDX2 plays an important role in the progression of the gastric neoplastic transformation and has utility to differentiate premalignant from malignant lesions of the HGC, and this might improve the accuracy, precision and sensitivity of gastric lesions diagnosis. The relationship between the IHC expression of the CDX2 and the tumor grade may be a useful additional prognostic factor.

Association between Transcription Factors 7-like 2 (rs7903146) Polymorphism and Some Renal Biomarkers with Type 2 Diabetic Nephropathy Complications

Ziyad Tariq Abd AL-Razzaq¹, Alaa Frak Hussain², Emad Abbas Al Mulla¹

¹Al-Furat Al-Awsat Techniques, Kufa, Iraq, ²College dentistry- University of Karbala, Iraq

ABSTRACT

Diabetes mellitus as the most prevalent metabolic disease is a multifactorial disease which is influenced by environmental and genetic factors. In this systematic review, we assessed the association between genetic variants and diabetes/its complications in studies with Iraqi populations. Conducted in this study was to investigate the possible role TCF7L2 rs7903146 (C/G) variant on susceptibility of T2DM among Iraqi type 2 diabetic patients with nephropathy complications and its relations with some type of kidney biomarkers. This case-control study included 100 T2DM patients and 100 patient with kidney failure 100 healthy person (control group). The results confirm the association between the TCF7L2 rs7903146 polymorphism and increase risk for type 2 diabetes in Iraqi an populations.

Keywords: Single nucleotide polymorphism; type 2 diabetes mellitus; transcription factor 7-like 2 (TCF7L2).

INTRODUCTION

Type 2 diabetes is associated with impaired insulin secretion. Both 1st and 2nd phase insulin secretion are reduced, but the effect is particularly pronounced for the 1st phase. Although both genetic and environmental factors are thought to play a role, the processes culminating in impaired insulin secretion are not completely understood, but both genetic and environmental factors are thought to play a role. Over the past 2 years, genome-wide association scans have transformed the genetic landscape of type 2 diabetes susceptibility. TCF7L2, the susceptibility gene with the strongest effect on disease susceptibility discovered to date, was conferred pre genome-wide association¹. In 2006, with rapid replication TCF7L2 of its consequence on diabetes susceptibility in multiple population was positional candidate gene that mapped to region spanning 215.9kb on human chromosome 10q25 with replicated linkage to T2DM¹¹. The incidence and prevalence of diabetes mellitus (DM) have increased sharply throughout the world. According to the latest report, the

prevalence of DM has increased to 11.7% in China² and 9.1% in the world³. The total number of adult diabetes is expected to rise to 642 million by 2040³. Diabetic nephropathy (DN), one of the most serious complications of DM, is a progressive kidney disease caused by damage to the capillaries in the kidneys' glomerular. End-stage renal disease (ESRD) is the most severe form of chronic kidney disease. Also known as Stage 5 chronic kidney disease or kidney failure. DN is the leading cause of ESRD in the Europe, Japan, and the United States⁴. DN was also the major cause for 40.4% of newly developed ESRD in the United States^{5,6}. In the UK, it was estimated that around one third of patients with ESRD were due to diabetes⁷. In Korea, according to the Fifth Korea National Health and Nutrition Examination Survey in 2011, the prevalence of DN was 26.7%⁸. In China, the Shanghai Diabetic Complications Study reported that the prevalence of DN was 26.2%⁹. The expenditure for people with DN are extraordinarily high. In the Medicare population alone, DN-related expenditures among this mostly older group were nearly \$25 billion in 2011¹⁰. Therefore, earlier diagnosis and prevention of DN become imminent. However, the mechanism of DN is complicated, in addition to the risk of poor glycemic control and hypertension, inherited factors are considered to play an important role in its progression.

Al-Furat Al-Awsat Techniques, Kufa, Iraq

A systematic review showed that the prevalence rate of type 2 diabetes in Iraq was 10.2% of the population, ranking ninth in the Arab world, the world's thirty most in terms of injuries. Transcription factor 7-like 2 (TCF7L2) gene is located on chromosome 10q25.3¹¹, which encodes a transcription factor with a high-mobility box and functions in gene activations related to downstream events of the when signaling pathway. TCF7L2 has been revealed as an susceptibility gene for type 2 diabetes¹². There are at least four well-studied single nucleotide polymorphism (SNP) markers in the human TCF7L2 gene, which are associated with T2DM. viz, rs 7903146, rs7901695, rs12255372 and rs11196205. Previous studies have shown an association between T2DM and rs7903146 polymorphism of (TCF7L2) gene. There is no inclusive information for genetic association studies of diabetes in Middle Eastern population including Iraqi an population. The aim of this study was to investigate the possible role TCF7L2 rs7903146 (C/G) variant on susceptibility of T2DM among Iraqi type 2 diabetic patients with nephropathy complications and its relations with some type of kidney biomarkers.

MATERIALS AND METHOD

Study design

A case – control study.

Patient's classes

One hundred (100) patients with type 2 diabetes mellitus and one hundred (100) patients with type type 2 diabetes mellitus with Kidney failure who admitted to some of Iraqi teaching hospital as well as one hundred (100) healthy person (control group).

Sample collection and processing

Blood samples were collected in the morning by venipuncture using (10 mL) disposable syringes. Blood was divided into two parts :

The first will be used for (biochemical analysis) 8ml was put in the gel tube and left to clot for 30 minutes in room temperature and then separated by centrifugation at 4000rpm for 5 minutes .

The second will be used for (molecular analysis) 2 ml blood was put into EDTA tube , mixed gently and put on shaker for DNA extraction .

Parameters to be measured:

Glycated hemoglobin (HBA1c)

serum Urea and creatinine levels

serum lipid profile (total cholesterol, HDL,LDL,VLDL,TG)

serum glucose level.

Genotype analysis

Genomic DNA was be extraction from both healthy and patient groups.

The purity and concentration of extraction DNA was be assessed by specific prime.

AGAGAGCTAAGCACTTTTTAGACAC C allele

AGAGAGCTAAGCACTTTTTAGACAG G allele

AGATGAAATGTAGCAGTGAAGTG Generic primer

Selected PCR protocol to verify the SNP at the axon of intended gene, in addition to another one at intone.

Amplifying the segment of gen contain SNP by PCR and electrophoresis techniques.

correlation studies between the different phenotyping and genotyping data obtained.

The preferred condition which provided the best result was addition of:

12.5 µL mater mix

1.5 µL C allele

1.5 µL G allele

1.5 µL Generic primer

5 µL DNA sample

4.5 µL nuclease free water. A total reaction volume is a 26.5 µL that added to the 500µl PCR tube at 25° C then, centrifuged for 30 seconds at 2000 xg in a micro centrifuge for mixing the sample tubes and then placed in thermocycler.

Statistics

Genotype and allele frequencies were calculated

for the described SNPs. The groups were compared using the χ^2 test to analyze the statistical significance of the difference in allelic distribution of various polymorphisms in patients and controls. Values of $p < 0.001$ were considered statistically significant. Odds ratio was performed using MedCalc for Windows, version 7.4.1.0 (MedCalc Software, Mariakerke, Belgium)

RESULTS AND DISCUSSION

Clinical and biochemical characteristics of study subjects. The current study included 300 subjects (100 DM, 100 DN and 100 healthy individuals). The clinical and biochemical characteristics of the recruited individuals were presented in Table (1). It shows significant differences in (Glucose, Urea, Creatinine, Triglyceride, Cholesterol, LDL, HDL, VLDL, HbA1C) in the group of DM/DN patients when compared with those of the health group. However, no significant difference was seen in Age.

Genotype SNP rs7903146 for DN

Allele-Specific PCR Assay to Genotype SNP rs7903146 in TCF7L2 Gene for Rapid Screening the patient with DN The amplification product of TCF7L2 Gene polymorphism was obtained to have a size of 197 bp. The PCR product was electrophoresed on 1.5% agarose and directly visualized with ethidium bromid under UV light. The amplification and the size of the resulted amplicons were confirmed by agarose gel electrophoresis analysis Figure (1).

Genotype SNP rs7903146 for DM

Allele-Specific PCR Assay to Genotype SNP rs7903146 in TCF7L2 Gene for Rapid Screening the patient with DM The amplification product of TCF7L2 Gene polymorphism was obtained to have a size of 197bp. The PCR product was electrophoresed on 1.5% agarose and directly visualized with ethidium bromid under UV light. The amplification and the size of the resulted amplicons were confirmed by agarose gel electrophoresis analysis Figure (2). Through the results described in the research we can conclude the following: High concentration of glucose, lipids (TG, TC) and lipid proteins (LDL, VLDL) with low concentration of (HDL) in blood type 2 diabetic patients and also in kidney patients compared to control group. This is consistent

with many previous studies[13,14]. Which indicate a higher glucose concentration in patients with type 2 diabetes than in control group. The reason for the high level of glucose in people with type 2 diabetes is due to lack of insulin secretion or a defect in the resistance of insulin receptors in the body or in the pancreas and dysfunction of the pancreas and metabolism. There was no apparent significant relationship between the age of type 2 diabetic patients and renal failure patients. It was found that the relationship between the level of lipids (TG, TC) and glucose is significant in the blood type 2 diabetics and control group and also this relationship is significant morbidity between these lipid and kidney patients with diabetes. The relationship between lipid protein analysis (LDLc, VLDL) was significantly higher in the blood of type 2 diabetic patients and diabetic kidney patients than in control group. It was also found that the proportion of these lipid proteins higher in patients with diabetes kidneys than in patients with type II diabetes. The relationship between high density lipoprotein (HDLc) and glucose is significantly reversed in the blood of type 2 diabetics, as well as in the blood of kidney patients compared to control group, where they are inversely insignificant. (HDLc) was found to be lower in patients with diabetes than in patients with type 2 diabetes who did not have kidney disease. The relationship between the level of sugar cumulative (HbA1C) positive morbidity in the blood of patients with diabetes type II compared to the level in the control group. The relationship between blood glucose of type 2 and kidney and ages patients is not significant with control group. As for urea, it was found that there was a significant relationship between the proportion of urea in patients with type 2 diabetes and control in the control group. While the relation was significant between the proportion of urea in people with kidney disease and control group. The ratio of creatinine in the serum of people with diabetes is significantly lower with its level in the control group, while this relationship is significantly stronger among kidney patients and its level in control group. In the genetic analyzes (CC, CG, GG), the statistical results showed that there is significant difference between the disease and control group and this is evident in the values of (P-Value) in addition to the value of OR (Odds ratio)

Effect of Vitamin D Deficiency in Pregnant Woman

Faeza A Fakhry

University of AL-Nahrain, Health Center, Iraq

ABSTRACT

Vitamin D deficiency (VDD) is a serious health problem for pregnant woman and their children. Because of the poor cultural and economic situation suffered by society and the adoption of the wrong system of nutrition and insufficient exposure to the sun and incorrectly. Vitamin D deficiency results in complications for newborns, which include low birth weight, low growth and respiratory infection. The ratio of the mother also causes vitamin D deficiency to several complications, including pregnancy diabetes due to a change in the proportion of glucose in pregnancy, septicemia and bacterial vaginosis. This complication may be due to lack of vitamin D supplementation by pregnant women. The association of vitamin deficiency during pregnancy with biochemical reactions affects the fetus in the formation of the skeleton, resulting in children with congenital rickets and fractures. Objectives: To assess the vitamin D deficiency in pregnant woman and her fetus health state, to identify the effect of vitamin D deficiency in pregnant woman and her fetus.

Keywords: *Effect, Vitamin D deficiency, pregnant woman*

INTRODUCTION

The world community today is suffering from some unhealthy behavioral changes towards the lack of exposure to the sun and incorrectly, in addition to the lack of intake of cod liver oil or so-called omega-3, which leads to risk of skin cancers and the exposure of children to rickets¹. Vitamin D has fat solubility and also has the ability to form a steroid hormone inside the body, and plays an important role in the balance of calcium and phosphorus in the shortage causes rickets in children, and osteomalacia in adults². Vitamin D deficiency lead to weak body immunity, the body's willingness to develop cancer, cardiovascular disease, diabetes, rheumatic diseases, weakness and chronic pain in the muscles, and neuropsychiatric weakness³. The aim of this study is to assess the status of vitamin D in this case of the mother and its effect in the newborn, in the case of failure program to introduce programmed support for pregnant women and inadequacy of giving pregnant women vitamin D supplements. Will lead to weak fetal growth and thus develop into the birth of

disabled children and the most dangerous of them hit the rickets⁴. World ranging from 18-84% depending on the country and the habits worn by the country⁵. Therefore, mothers and their children should consult the health centers and hospitals for the necessary tests for vitamin D, and receive important instructions to prevent vitamin D deficiency during pregnancy and lactation its impact on the fetus and the newborn in childhood, in order to reduce the future development of chronic diseases in adulthood⁶.

METHODOLOGY

A descriptive study on non-probability sample (purposive sample) of one hundred Twenty (120) women to assess the effect of vitamin D deficiency in pregnant women who attending outpatient clinic for seeking treatment at Baghdad General Teaching Hospital, clinic of Mother and Child Center in Sheikh Omar, Advisory clinic at ALawiya Teaching Hospital. The questionnaire form was consisted of (4) main parts: Demographic characteristics, Reproductive Information Medical conditions, and Life Style Information. The data were collected by using interview method and self-report techniques with study participants. The data were collected by using interview method and self-report techniques with study participants after obtaining permission from each of them according to

Corresponding author:

Faeza A. Fakhry

University of AL-Nahrain, Health Center, Iraq.

the inclusion criteria.

Statistical analysis methods

Statistical data analysis approaches were used in order to analyze and assess results of this study which classified in two parts, descriptive statistics, such that tables observed frequencies, percentages, association tables, and inferential statistics, such that [Chi-Square test for testing the independency, Binomial test for testing two categories nominal scale, statistical hypothesis based on (C.C.) Contingency's Coefficient test.

RESULTS AND DISCUSSION

The study showed that the highest percentage (28%) of study sample at age group (22 – 34) years (table 1), (35.8%) of study sample years of marriage are ranging between (5-9) years (table 1), (87%) of study sample their socio-economic level were low (table 1). The highest percentage (38%) of study sample for the ratio of the number of pregnancies to the group (3-4) times (table 2), the highest percentage (30%) of study sample for the number of abortions (table 2), the highest percentage (50%) of study sample for number of living children (table 2), the highest percentage (14%) of study sample for the number of stillbirths (table 2), the highest percentage (43%) of study sample for delivery type of cesarean (table 2), the highest percentage (57.8%) of study sample for using breastfeeding reported feeding period less than or up to one year (table 2), the highest percentage (35%) of study sample for using artificial feeding (table 2). The highest percentage (79%) of study sample who suffer from hair loss (table 3), the highest percentage (67.5%) of study sample who suffer from difficulty boarding stairs (table 3), the highest percentage (65.8%) of study sample who suffer from difficulty to getting up after sitting position (table 3), the highest percentage (64%) of study sample who suffers from problems in the gums and teeth (table 3), the highest percentage (60%) of study sample who suffer from pain in the bones especially from the bones of the spine and thigh (table 3), the highest percentage (49%) of study sample who have difficulty washing the head (table 3). The highest percentage (90.8) of study sample who prefer light clothing (table 4), the highest percentage (83%) of study sample who eat eggs twice a week especially egg yolk (table 4), the highest percentage (80.8%) of study sample who take supplements during pregnancy (table 4), the highest percentage (55.8%) of

study sample who eat fish at least twice a week (table 4), the highest percentage (54%) of study sample who prefer to wear dark clothing (table 4), the highest percentage (42.5%) of study sample who exposed to the sun for certain hours a day (table 4). Relative to subject "Women's Age", studied sample are focused at the three age groups, bounded (22 - 34) years, and they are accounted 90(75%) with mean and standard deviation 28.14, and 6.14 yrs. respectively, then followed by subject "Marriage years", which shows that studied sample are focused at the first three groups, bounded (<5 - 14) yrs, and they are accounted 105(87.5%) with mean and standard deviation 8.53, and 4.84 yrs. respectively. 8(6.7%) of studied sample are not the lonely wife includes, as well as most of them are selected from urban residents and accounted 109(90.8%). Results shows that "Socio-Economic Status" accounted through applying of WHO instrument, which consists of several components such that, occupation, education levels, crowding index, and a particular properties (House ownership, possession car, available of specific requisite materiel). Three social and economical levels represented by the preceding contents (Low, Moderate, and High). Vast majority of studied sample had low evaluated, and they accounted 105(87.5%), and the leftover had moderate, and accounted 15(12.5%). According to preceding results, vitamin D deficiency regarding pregnant woman can be considered as indigent disease classified. Table (2) shows the observed frequencies, and percents of the studied "Reproductive Health Side" parameters, such that "Number of pregnancies, Number of abortions, Number of living children, Number of stillbirths, Type of delivery, Type of feeding, Breastfeeding period, Fetal birth defects, Size of fetus normal or abnormal, and size of head's fetus normal or abnormal", with their comparisons significant, to explore behavior of studied parameters either they randomly or none randomly distributed comparing with their an expected outcomes, which showed that significant differences in at least at $P < 0.05$ among different classes of that parameters. Relative to subject of "Number of pregnancies", studied sample are focused mostly at the first three classes, and they are accounted 110(91.7%). Results shows that "Number of Abortions", recorded vast majority with who had one time, and they accounted 30(25%). Number of living children are focused mainly at the first class, and they are accounted 61(50.5%), then followed by the number of stillbirths for who had applicable are focused at only, and are accounted 17(14.2%). Delivery type of

cesarean from a total sample are formed 52(43.3%). Among studied sample, 42(35%) using artificial feeding, and among breast feeding women, 26(57.8%) reported feeding period less than or up to one year. 10(8.3%) who has fetal birth defective, and the same percent for whom had abnormal size fetal, as well as 7(5.8%) registered for who had abnormal head's size. Table (3) show descriptive statistics regarding medical information for effectiveness of vitamin D deficiency in pregnant woman, such that "Frequencies, and percents, Mean of

score, Standard deviation, Relative sufficiency", as well as comparisons significant. Results shows that an overall evaluations of medical information, as well as personal style side and reproductive health side are reported no significant relationships at $P > 0.05$, except with number of pregnancies, type of delivery, and breastfeed period concerning medical information which shows significant relationship at $p < 0.05$.

Environmental Assessment of the Quality of Water and the Hydrochemical Formula Used for Some Groundwater Wells in Karbala Governorate

Raad Mahmoad Nasif Al-Khafaji¹, Adnan Jassam Hammady²

¹College of Education for Pure Science (Ibn Al-Haitham), University of Baghdad, Iraq,

²College of Education, Al-Iraqi University, Baghdad, Iraq

ABSTRACT

The ground water in the study area is classified according to the total dissolved solids it is concluded that the water in the type is brackish water. The electrical conductivity in water of the study area is Excessively Mineralized Water. The study found that there is an increase in the concentrations of positive and negative different ions such as calcium, magnesium, sodium, potassium, sulfate, chloride, carbonates, bicarbonates and nitrates due to natural and anthropogenic¹. The Hydro chemical Formula and Water Type is the quality of the prevailing water is NaSO₄- in the wells of the study area. The study found that when comparing the results of the research with the global measurements, the water type is not suitable for human consumption. Regarding the drinking of animals, it is found that it is suitable for consumption. When compared to industrial use, it was found to be unfit for industry. As for the construction found useful for use. Their use to irrigate irrigation is not useful.

Keyword: Hydrochemical Formula, Assessment, Groundwater

INTRODUCTION

Water is considered as the origin of life. It represents the most important agent of natural resources over the earth. Water as a part of our environment has a capacity to fill human needs for aesthetic appreciation. Due to the present conditions in Iraq, which are characterized by a shortage of surface water supply as a result of retaining water of the Tigris and Euphrates Rivers within the neighboring countries¹. In addition to the dry conditions during the present period which started some years ago. There is a need to search and find other sources of water supply from ground water resource on regional scale, The study area is located in the Mesopotamia Plain and 105 km from Baghdad in the south-west and is confined between the eastern latitudes (44 ° 40 54- 43 ° 54 °10)

and north latitude (32 ° 21 42-32 ° 40 °54). It is located on the edge of the desert in the west of the Euphrates and on the left side of the Husseiniya plateau, bordered to the north and west by Anbar province and from the south by the province of Najaf and from the east by Babil Province. Aim of the study: Studying the hydrochemical properties of groundwater in Karbala governorate and the nature of this water. Determination of the validity of groundwater for different uses by comparing them with the Iraqi and global determinants.

METHODOLOGY

GEOLOGY OF THE STUDY AREA

1-Stratigraphy

More than 80% of the map area is covered by Quaternary sediments. Pre- Quaternary exposed rocks are represented by Dammam, Euphrates, Nfayil, Injana, Zahra and Dibdibba formations, with age ranges from Eocene to Pliocene-Pleistocene. While the studied unexposed formations within the map area are indicated by. Umm Er Radhuma Formation and Tayarat Formation

College of Education for Pure Science (Ibn Al-Haitham), University of Baghdad, Iraq;

E-mail: raadalkhafagee@yahoo.com

ground surface ².

2-Exposed Formation

The following formations are exposed in the map area:

Dammam Formation (Eocene)

Dammam Formation is composed of variable carbonate rocks mainly limestone, dolomitic limestone and dolomite, with marl. It is characterized by the presence of cavities, fractures, fissures and joints ³. The depositional environment is marine water of open platform.

Euphrates Formation (Lower Miocene)

The Euphrates Formation is exposed in several localities and consists of basal breccia, limestone and marl. The matrix is composed of carbonate material with some clayey and sandy admixture ³.

Nfayil Formation (Middle Miocene)

The Nfayil Formation is exposed in the southern and western parts of area. Generally, consists of sandy dolomitic and gypseous marl with inter bedded calcareous, sandy claystone, fossiliferous limestone and sandstone, with limestone intercalations.

The Injana Formation is exposed along both ridges of Tar Al-Najaf and Tar Al-Sayid, and in the eastern bank of Al-Razzaza Lake. It consists of silty, sandy calcareous claystone and sandstone.

Zahra Formation (Pliocene – Pleistocene)

The Zahra Formation is exposed as spot scanty, cropping out southwest, and south of Al-Razzaza Lake. It is composed mainly of calcareous sandstone, sandy carbonate and sandy and chalky limestone.

Dibdibba Formation (Pliocene - Pleistocene)

The Dibdibba Formation is well exposed along both ridges of Tar Al- Najaf and Tar Al-Sayid, occupying the top most part of the exposed sequence, forming the top rock of the plateau between Karbala and Najaf.

1-Laboratory work

The Hydrochemical study of the candidate water within the study area included the analysis of well water (20) wells, which ranged between (6 - 272) meters for

the season of water increase. The positive ions (K +, Na +, Mg²⁺, Ca²⁺) and negative ions (, -Cl ,) , As well as (pH), electrical conductivity (E.C.), total dissolved salts (T.D.S.). Tests were conducted in the General Authority for Drilling of Wells and Groundwater of the Ministry of Water Resources

The Hydrochemical study of the candidate water within the study area included the analysis of well water (20) wells, which ranged between (6 - 272) meters for the season of water increase. The positive ions (K +, Na +, Mg²⁺, Ca²⁺) and negative ions,

As well as (pH), electrical conductivity (E.C.), total dissolved salts (T.D.S.).

Tests were conducted in the General Authority for Drilling of Wells and Groundwater of the Ministry of Water Resources.

Hydrochemistry of groundwater The chemical composition of groundwater is the double result of water entering the groundwater reservoir and the interactions with the rocks containing different minerals⁵.

Physical Properties

1- Hydrogen ion concentration (pH)

The maximum pH values we rerecorded in well (3) were (7.8) .and minimum values were (7.1) in well (10) and the mean (2155.6). The pH of water is controlled by the equilibrium achieved by dissolved compounds in the system. In natural waters. Table 2

2- Total Dissolved Solids (TDS)

The maximum TDS values were recorded in well (6) (40000 mg/L) and, the minimum value was recorded in well (1) (1070 mg/L). By comparing the TDS values with those reported by (6), it is concluded that the water in the type is brackish water also by (7),(8) and (9).

3-Electrical conductivity (EC)

In water of the study area, EC ranges from 1400 – 11970µs/cm with 3877 µs/cm in average When comparing what exists in 18 we note that The relationship between electrical conductivity and mineralization Located within Excessively Mineralized Water.

Major Ions

1-Calcium ion (Ca²⁺)

The highest concentration of calcium ion in the water of the study area was 612 mg / l in well (10), while the lowest concentration of calcium was (70) mg / L in well (8). The overall concentration of calcium was 264.05 mg / l. Figure (1) shows that all groundwater models in the study area exceeded the permissible drinking water limit of 75 mg / l according to international standards ¹⁰. The increase in the concentration of calcium in the water of the study area is due to the effect the process of ion exchange between sodium and calcium.

2-Magnesium ion (Mg²⁺)

The results of Table 2. showed that the highest concentration of magnesium ion in the water of the study area was (305) mg / L in well (1) while the lowest concentration of magnesium (66) mg / L in well (8). The overall concentration of magnesium in the studied aquatic models was 142.5 mg / L. The high concentration of magnesium ion in the water of these regions is due to the effect of the ion exchange process and the effect of evaporation processes.

3-Sodium (Na⁺)

The highest concentration of sodium in the water of the study area was (1020) mg / L in well (1), while the lowest concentration was (85) mg / L in well (8). The general rate of sodium concentration in aquatic models (332.74) The high concentration of sodium in water is due to the dissolving of sodium salts concentrated in the soil as a result of watering of plants. Household cleaning agents also increase sodium as a result of containing sodium hypochlorite, which is transferred from the sewage system to the groundwater system by means of dispersion.

4-Potassium (K⁺)

The highest concentration of potassium ions in the water of the study area was (120) mg / L in well (19) while the lowest concentration of potassium (3.5) mg / l in well (4). The overall concentration of potassium in the water of the study area was 53.01 mg/l

Anions

1-Sulfates (SO₄)

The water of the study area is characterized by the abundance of sulphates where the highest concentration of sulphate (2349) mg / l in well (1) (2.35). The lowest concentration of sulphate was (375) mg / l in well (8). The total sulfur concentration in the water of the study area was 954 mg / l. Figure (2) shows that all candidate water models in the study area exceeded the drinking water limit of 12 mg / l according to international standards (11). The high concentration of sulphate in the water of the study area is due to the presence of sulfur salts in the soil, as well as the presence of secondary gypsum.

2-Carbonates (CO₃) and bicarbonates (HCO₃)

The highest concentration of bicarbonate ion in the water of the study area was (979) mg / L in well (1), while the lowest concentration of bicarbonate (50) mg / l in well (6). The overall rate of bicarbonate was 363.65 mg / l. The increased concentration of bicarbonates in these waters resulted in the melting of sodium bicarbonate in the soil due to irrigation processes, as well as the effect of wastewater through the drainage system in these areas.

4-Chloride (Cl)

Table (3) shows that the highest concentration of chloride in the water of the study area was (1328) mg / L in well (1), while the lowest concentration of chloride was 176 mg / l in well (16). The chloride concentration in the water area of the study area was 598.5 mg / l .

5-Nitrate (NO₃)

The lowest concentration was (0) mg / L in well (12). The overall nitrate concentration in the studied aquatic models was 4.29 mg / l. It should be noted that all candidate water models in the study area fall within the permitted drinking water limit of 50 mg / L according to international standards (10).

Hydrochemical Formula and Water Type

The hydrochemical formula of water can be determined by taking the concentrations of main cations and anions in (meq %) (mill equivalent percent) in water with total dissolved solids concentration (TDS) as (mg/l) or (g/l).

The hydrogeological formula of the study area was as follows:

	SO_4^{2-}	Cl^-		
T.D.S.	40.55	39.48		pH
4911.5	38.60	30.09	27.54	6.21
	Na^+	Ca^{2+}	Mg^{2+}	

The water quality can be determined by positive and negative ions in units of epm% whose concentration is greater than 15% by placing the negative and positive ions on their decreasing concentrations

So the quality of the prevailing water is NaSO₄- in the wells of the study area Table (3) shows the hydrochemical formula and the water type in the study area. Four types of water are shown: Sodium sulphate (1, 2, 4, 5, 9, 10, 11, 12,13,14 ,, 18,19) And calcium sulphate represent the well (20). Calcium chloride represents the two wells (3, 15), indicating that sulphates are predominant in the sense of negative ions, while sodium ions (6, 7, 8,) Is predominant for positive ions in most water models studied.

Figure 1. Shows positive ion concentrations in the study area

Figure 2. Shows the concentrations of negative ions in the study area

CONCLUSION

The Hydro chemical Formula and Water Type is the quality of the prevailing water is NaSO₄- in the wells of the study area. The study found that when comparing

the results of the research with the global measurements, the water type is not suitable for human consumption. Regarding the drinking of animals, it is found that it is suitable for consumption. When compared to industrial

use, it was found to be unfit for industry. As for the construction found useful for use. Their use to irrigate irrigation is not useful.

Effectiveness of an Educational Program on Nurses' Knowledge toward Restraint and Seclusion for inpatients at Psychiatric Teaching Hospitals

Nibras.H. Abdel-Hussein¹, Saja. H. Mohamed²

¹Academic Nursing Specialist, Babylon Director, Ministry of Health, Iraq, ²Psychiatric and mental Health Nursing Department, College of Nursing, University of Babylon, Iraq

ABSTRACT

A quasi-experimental design is carried throughout the present study with the application of test-retest approach of pre-test, post-test I, and post-test II; for the study sample, the sample consisted of (25) nurse ((11) male and (14) female) were selected from AL-Rashad Psychiatric Teaching Hospital in Baghdad City, during the period of 1st November 2017 to 16th September 2018. In the pre-test; post-test design in the dependent variable is measured before implementing the program and two after implementing the program for nurses. The data was collected by questionnaire which consisted of two parts, first part consists socio demographic data, Second part is about restraint and seclusion which designed through the use of multiple choice question, a numerical value was given to each rating point; (1) for right answer, and (0) for the wrong answer. In the present study, data were analyzed through the use of statistical package for social sciences (SPSS), version 21. The finding of the study indicated that The nurses had little training about how to deal with agitated patients in psychiatric wards. Most of the nurses who participated in the study have preparative school graduates, and they have an extremely low level of knowledge more than others.

Keyword: *educational Program, Knowledge, Restraint, and Seclusion.*

INTRODUCTION

Violence and aggressive behavior are major concerns in psychiatric wards and patients requiring admission often display agitated behavior which can put at risk the health and safety of the patients and the staff that supporting them. Concerns for patients and staff safety in acute settings have been expressed worldwide¹. Violence and aggressive behavior is common, especially in mental health settings, In clinical practice, restrictive measures (restraint and seclusion) might partially prevent unwanted behaviors, but do not fully eliminate them, at least when used independently¹. Psychotic behaviors are the most frequent reasons for using patient restrictive measures (restraint and seclusion) even without any signs of potential violence¹². The National Institute for Mental Health in England⁽¹⁸⁾ and the National Institute for Health and Clinical Excellence¹⁸ have published guidelines emphasizes the importance of using preventive measures to manage violent behavior in healthcare, highlighting safety priorities in mental health.⁽²⁰⁾, despite the fact that studies have reported quite

similar reasons for restraint and seclusion. These reasons include threats or use of violence against oneself or other people, attempts to escape, aggression towards property, inability to care for oneself and agitation/disorientation¹⁵. Although coercive interventions (restraint and seclusion) can be effective as a last resort in preventing injury to patients and maintaining their security⁵. Thus the use of this interventions (restraint and seclusion) is one of the indicators of the quality of psychiatric treatment in hospitalized patients⁹. The use of seclusion and restraint in psychiatric practice is a controversial issue in the hospitals of Iraq, as a recent study have shown seclusion to be a predominant restrictive measure. In contrast to many surrounding countries, in this study a psycho-educational program is arranged in such a way that the protection of the physical integrity of the patient is more important than professional considerations with respect to the treatment of severe mental illness. Despite its importance, there is no studies in Iraq have been conducted on the use of restraint and seclusion in psychiatric practice. Lack of knowledge or understanding of alternatives to restraint has been identified as a barrier

to reducing these measures⁴. Other barriers include staff and resource limitations, environmental constraints, policy and management issues, beliefs and expectations of staff, inadequate review practices and communication barriers. Psychiatric nurses are one of the most important groups who have a significant role in providing care for psychiatric patients. Because of the nature of the nursing profession, psychiatric nurses are the first people who are in contact with psychiatric patients. The role of them in this condition is to help the patients understand and control on their violence and aggression. We conducted this study because the nursing staff has the primary role in carrying out the practical procedure. The psychiatric nursing needing for novel and effective methods to address violence and aggressive behavior of patients on psychiatric wards. And to increase nurses' knowledge and experiences of restraint and seclusion with psychiatric patients in hospitals, and how these experiences are applied. Objectives of the study: To identify the effectiveness of an educational program on the nurses' knowledge for the study sample. Compare the levels of nurses' knowledge before and after the educational program.

METHODOLOGY

Study Design and Study Sample: A quasi-experimental design is carried throughout the present study with the application of test-retest approach of pre-test, post-test I, and post-test II; for the study sample, the sample consisted of (25) nurse ((11) male and (14) female) were selected from AL-Rashad Psychiatric Teaching Hospital in Baghdad City, during the period of 1st November 2017 to 16th June 2018. In the pre-test; post-test design in the dependent variable is measured before implementing the program and two after implementing the program for nurses. The questionnaire consisted of three parts:

Part 1: covering letters to obtain the agreements of the nurses to participate in the present study.

Part 2: socio-demographic data sheet contains information regarding; Gender, age, level of education, years of experience in nursing, and years of experience in psychiatric field. **Part 3:** This part of the questionnaire includes the knowledge about the restraint and seclusion: it consist of (50) items scale of knowledge about restraint and seclusion.

Part 4: The educational program is the most

important part in this study because it measure the nurses' information. The researcher focuses and depending on books, researches, and WHO reports talk about the subject for constructing the program.

Data Collection: The data collection was carried out from February 15th 2018 to September 13th 2018. Data was collected after obtaining the permission from the Directorate of Hospitals. The researcher met each nurse staff of the study for explain the objectives of the study, then filled by the nurses. All the (participants) nursing staff of the study both groups (25 study group) are exposed to pre-test, to determine their performance in the restraint and seclusion. The participants need approximately (30) minutes to complete all items of the questionnaire. All the nursing staff of the study group is exposed to the educational program at AL-Rashad Psychiatric Teaching Hospital, and exposed to the first post-test after the educational program was finished immediately to measure changes in their knowledge regarding restraint and seclusion. And all the participants of study group are exposed to the second post-test after three months of the first post-test to measure changes in their knowledge regarding restraint and seclusion.

Data analysis: The domain is designed through the use of multiple choice question, a numerical value was given to each rating point; (1) for right answer, and (0) for the wrong answer. In the present study, data were analyzed through the use of statistical package for social sciences (SPSS), version 21.

RESULTS AND DISCUSSION

In the present study, data were analyzed: Regarding gender the table shows that the highest percentage of the participants (56.0%) were females. According the age (48.0%) were at age group between (30-39 years). For the level of education (64.0%) of the sample are from the preparative nursing schools. Also the table reveals that the highest percentage of the sample (56.0%) were experience in nursing at period ranging (1-5 years). And for the years of experience in psychiatric field (76.0%) of the sample were ranging from (1-5 years). The study sample have extremely low and low levels of knowledge; (80.0%) (n= 20) and (20.0%) (n= 5) in phase one; while have low, intermediate and good (20.0%) (n= 5), (44.0%) (n= 11) and (36.0%) (n= 9) at phase two, and at phase three the participants of the study group have low, intermediate and good levels of knowledge;

(12.0%) (n=3), (52.0%) (n= 13) and (36.0%) (n= 9). The table indicates that a non- significant relationship between demographic characteristics and knowledge about restraint and seclusion for the study sample. The results of table 4. show that:

1- The within subjects test indicates that the interaction of time and group is significant (F= 164.349, p= 0.00).

2- The main effect of time is significant (F= 131.493, p= 0.00).

3- The between groups test indicates that there the variable group is significant F= 164.349, p= 0.00). The significant interaction indicates that the male group and female group are changing over time and they are changing in different ways, in other words, in the figure 1 the lines of the two groups are not parallel. In the figure 1 for this particular situation it is clear that the male group is increasing in knowledge over time and the female group is increasing in knowledge over time. Regarding the differences in the knowledge about restraint and seclusion within the three phases (table 5) indicates that there is a high significant differences in levels of knowledge between phase one and phase two (sig.= 0.00) and phase three (sig.= 0.00). This result shows that there is a changing in levels of knowledge between phase one and phase two and phase three. This table shows also that there is no change in levels of total knowledge between phase two and phase three (sig.= 0.33). The result of the study showed that participants of both gender were males 44.0% and females 56.0% who are participated in the study. This results is disagree with Yas (25) who stated that there is a shortage of female nurses who are working in the psychiatric hospitals. Also the (table 1) indicated that the age of the study sample, most of them 48.0% were at age (30-39) years old; these

findings agree with the results of Mohammed (17) who has reported that most common age is around (30-39). This is considered this group of age for the sample is the productive age of the person and it is more preferred than other age to work in psychiatric hospitals to be able give care to psychiatric patients. According to the nurses' education levels, the study has showed that the majority of them 64.0% were preparative school graduates and most of them female. This level of study is in Iraq only because of the urgent need for nurses working in hospitals for the shortage of nursing staff in general, which caused the opening of a number of nursing preparative schools for female to plug the shortage of the nursing staff, including mental hospitals. These results disagree with the findings of Mohammed(17) who reported in his study that 41.0% were medical institution group who participated in his study. The table shows that the highest percentage of the study sample 56.0% were having (1-5) years of experience in nursing. These results coincide with the findings of Mohammed(17) who has reported (1-9) years that most common years of experience in nursing for his study are 55.2%. This can be explained by the fact that new nurses have been appointed because of the need for nurses to work in this field (nursing field) in this hospitals because of increasing the number of admitted psychiatric patients to the hospitals. According to the nurses' years of experience in psychiatric field, the results show that majority of them 76.0% are having (1-5) years of experience in psychiatric field. There was major increase in the level of knowledge for both groups who are participated in the program and they were keen to join in all sessions of the program and reacted well to what they heard in these sessions (Table 4, & 5; Figure 1). This study is the first study in Iraq that includes an assessment of nurses' knowledge regarding restraint and seclusion, and the effect of educational program for these nurses.

Figure 1. Changes in the levels of the nurses’ knowledge about restraint and seclusion in the males group and females group throughout the three phases.

CONCLUSION

The nurses had little training about how to deal with agitated patients in psychiatric wards. Most of the nurses who participated in the study have preparative school graduates, and they have an extremely low level of knowledge more than others. The participants who spent (1- 5) years of experience in psychiatric field have an extremely low level of knowledge more than those who have more 5 years of experience in psychiatric field. The studied nurses confirmed that the study group have improve and increase in their awareness and level of knowledge about restraint and seclusion in phase two, and three. The educational program is effective to increase awareness and knowledge of the studied nurses about restraint and seclusion after its implementation.

The Effect of Rainfall on the Ratio of Atmospheric Carbon Dioxide Drift for the 2015-2016 Season

Khawla N. Zaki¹, Monim H. Al-jboory¹, Ruaa M. Ibrahim¹

¹ Atmospheric Sciences Department, Collage of Sciences, Mustansiriyah University, Iraq

ABSTRACT

Carbon dioxide is one of the most important greenhouse gases that is increased in atmosphere by effect of human. These rates increase in the winter season while less when the plant began to grow, where withdraws this gas by photosynthesis. CO₂ is closely related to several elements of climate. CO₂ meter device was used at Mustansiriya station for the purpose to measure concentration of gas during the winter season for the period (14/12/2015 to 27/ 3/2016), before rain fell by observing the weather situation, 14 rain cases were recorded during this period. Rainfall data is measured use the automatic weather station located in the Department of Atmospheric Sciences, Collage of Science. The result shows that increasing in concentrations of gas that has been measured about the natural gas, where the concentration of CO₂ initial at the beginning of the rainy season is up to 450_{ppm} at the end of the winter, while it was about 350_{ppm}. External gas ratios by washing was high whenever the rainstorm is strong. The intensity of the gas flux is also increased by increasing the rain intensity I, so the rainy winter of Baghdad reduced the percentage of CO₂ in the atmosphere.

Keyword: Washout, Wet deposition, Intensity of rain.

INTRODUCTION

Atmosphere composed of several gases, nitrogen and oxygen occupy 98%, Argon occupy 1% and all other gases place small quantities usually they are not mentioned as percentage, but as units of part of a million (ppm) to describe gases with simple ratios in the atmosphere, including CO₂ and water vapor. Although the percentage of CO₂ does not exceed in some sources 0.035%, but these percentages in case of increasing the result of human activities, involve the use of fossil fuels as a source of energy and cement industry, which caused a large increase in gas rates. That is not less important than the increase caused by energy production and transportation, the danger of this increase in temperature rise as one of the most important greenhouse gases, causing global warming. Any increase in the proportions of this gas has great damage to the environment and human. Thus, there is a relationship between weather

variables and percentage of increase or decrease of this gas and these most important variables rain. This study was to indicate whether there is a rain effect on the rates of presence of gas CO₂ or not affected by the rain using the method of wet deposition of gases based on equations¹. Drifting chemicals from the atmosphere either operations physical or methods of chemical transformations, If these substances are present in the atmosphere in large molecules or large droplets, the Physiological deposition to soils and vegetation and the sea may occur due to the deposition of gravity. Either small particles that have quicken deposition Neglected; it may be deposited into these surfaces with dispersion. Either Gas deposition occurs by adsorption to surfaces directly. These gaseous substances interact with other materials to form substances that are subsequently drifted. There are two kinds of deposition: The first type is dry deposition, which means that any physical drift process does not include precipitation. The second type is wet deposition, which refers to the processes in which atmospheric chemicals accumulate in the rain and snow and fog droplets. Wet deposition is drifting many chemicals from the atmosphere even gases. When these substances are combined with the droplets of water present in the cloud, this process is called deposition

polluted rain (Rainout), but if the merger occurs under any cloud accompanied rain through the air toward the ground called this process deposition Washout ¹. The aim of this study is to find the effect of rain on the percentage of carbon dioxide in the atmosphere in the area of waziriya in Baghdad, depend on the idea of wet deposition of gases and calculate the proportion of gas after the rain and these ratios are strongly affected by the rainstorm.

MATERIALS AND METHODS

Drifting gases in the atmosphere, including carbon dioxide, are dissolution inside the rain drops that do not return to land. When equilibrium occurs, the chemical composition in the rain drops is given by Henry’s law [2]

$$C_{\text{water}} = C_{\text{(air)}} / H \dots 1$$

Where, $C_{\text{(water)}}$: is the concentration of the dissolved chemical in the rain droplets , $C_{\text{(air)}}$: concentration of the gases in the air, H: Henry law constant has no units which equal a ratio ($C_{\text{water}} / C_{\text{air}}$).

The density of flux resulting from the gas dissolved coupled with rain falling given by equation [3]

$$F = C_{\text{(water)}} \times I = C_{\text{(air)}} \times I/H = C_{\text{(air)}} \times w_r \times I \dots 2$$

Where, F: density of flux is the density of any variable on the unit area, but here the intensity of the flood we mean the ratio of the dissolved gas concentration in the amount of rain.

I : rainfall rate in mm / hr, w_r is the external washing ratio and equal 1 for co2 gas, The outside washing coefficient λ for carbon dioxide is calculated by relation⁴.

$$\lambda = (10^{-4}) (I^{0.53}) \dots\dots\dots 3$$

Where λ units S^{-1} It should be noted that the value of the observed range from λ

$0.4 \times 10^{-3} S^{-1}$ to 6×10^{-5} can guess the concentration of air after the end of each rainstorm, the drifting process of the first rank so dissolution equation

$$C_{\text{(air)}} = (C_{\text{air}_0}) e^{-t\lambda} \dots\dots\dots 4$$

Where t is the time per second so the amount of CO₂ externally washed and deposited on water complexes

$$C_{\text{(airo)}} - C_{\text{(air)}} = C_{\text{(CO2)}} \dots\dots\dots 5$$

Dataset

It is known that CO₂ concentration depends on two factor, location and time such as day and night, summer and winter and agricultural and residential area. A device was used to measure carbon dioxide concentration before rain that is named CO₂ meter. It is a digital device has a ppm (part per million) range from (0 - 4000 units) and temperature range from 0 to 50 (C) or (F) at height varies from (0 - 9000 m) . Monitor the weather situation through the website of the General Authority for Aerial and Seismic Monitoring .The measurement of gas concentrations of co2 before the rain for the period 2015-2016. The station in the Department of Atmospheric Sciences Recorded 14 rain storms ranging from heavy to medium and weak. This station is located at a height of 50 meters above sea level, where the wazirya area in Baghdad is located 32 meters above sea level and the height of the building science faculty 18 meters to avoid any natural impact of industrial buildings such as trees or high buildings, which may affect the data of weather variables. This station was installed in 2007 and is considered one of the first stations in Iraq to measure and collection of weather variables, including temperature, humidity, rain, speed and direction of wind, atmospheric pressure, solar radiation and other variables. The use of rainfall data measured at the station for a period of one season from 2015-12 to 2016-3 the wazirya area of Baghdad.

RESULTS AND DISCUSSION

Carbon dioxide is a rare atmospheric gas, accounting for 0.04% of the atmosphere, according to NOAA measurements on the island of Monalo, Hawaii [6]. The concentration of this gas varies according to different factors, including areas close to the surface of the earth and remote areas, the city and the countryside, as well as the industrial cities for non-industrial as it varies by month, In the northern hemisphere the concentration of gas is highest in spring and less in the autumn [7]. Thus, its concentration varies with time and place. Co₂ affected by the high population density and the rate of increase as the population in the region, for example, found that the rate in the New Baghdad area higher than the rate in the Mansour area [5], Percentage of change with time as increasing at night and less during the day Because effect of the plant where the process of photosynthesis at night, the proportion of gas in the atmosphere increases. In addition to the above mentioned, CO₂ gas is also

affected by different weather factors of temperature, rain, etc. In this study we will show the effect of rain on the percentage of the presence of this gas in the atmosphere, through measurements of the percentage of the existence of this gas using the device described above for severe rain cases And medium intensity and weak, and these assignments can be divided by the amount of rain as follows:

- Light (0.3mm-3.9mm)
- Medium (4mm-10.9mm)
- Heavy (11mm-20.9mm)
- Very heavy higher than 21mm.

Using equations (1-5) the following results were obtained that will be explained in the tables below. Rain intensity depends on the amount of rainfall and the number of hours of rain, the highest intensity was on 30/12/2016 as table 1, while the highest amount rain was on 22/2/2016 and 27/3/2016, but different rain falling period In the first case, it was approximately 6 hours and in the last two cases (9-12) hours (which was caused by the sinking of most of the residential areas of Baghdad). These cases are classified as heavy rain, so the wash rate of CO₂ is greater than the other cases as tables 2, Figure 1. Where the proportion of gas remaining in the atmosphere after the rain is very little compared to what exists before the rain and so there is positive relationship between them, where the greater the intensity of the rain increased the rates of washing carbon dioxide in the atmosphere as figure 2, i.e proportion of this gas in the atmosphere is decrease, The Correlation coefficient between them (strong correlation, r²=0.811) and this enhances the above. In the case of light rain recorded in the days 14/12/2015, 6/2 / 2016, 14 / 3/2016 as table 2, show The proportion of gas remaining in the atmosphere

after the rain is greater than the state of heavy rain. when the amount of rain is equal, the carbon dioxide gas ratios vary depending on the concentration of the gas before the rain, and this is what happened 31\12, 1\1 where I equal, but the gas ratios varied according to the initial concentration and the time also affects the proportions of gas On 31 / 12/2016 rain occurs at night and 1/1/2016 rain occurs during the day, as shown in table 2. the density of flux F(the ratio of the dissolved gas concentration in the amount of rain) has been shown that the intensity increases with intensity rain as the flux density varies depending on the intensity I, When are The intensity of light rain is F = 131 , when I is severe, F = 1374 and when I medium F = 735, so there is a positive relation between them as shown in Figure 3.

Measurements were shown for concentrations of carbon dioxide for the city of Baghdad, the high rates of this gas significantly despite the multiplicity of causes that lead to increase in the atmosphere and its impact on the environment on the one hand and human on the other, The concentration of this gas begins to decline at the end of the winter, where the presence of this gas at the beginning of the season is equal to 435ppm at the end of the season is about 350ppm as shown in Figure 1. In figure 4 the amount of gas out washing or so-called (washout), this ratio increases with increased rain intensity, the greater the intensity of heavy rain was a large washout ratio and thus reduce the concentration of carbon dioxide in the atmosphere . at the end of rain period the concentration of gas Washout less than The measured concentration (initial). This shows that the increase of concentrations of carbon dioxide to the city of Baghdad in a large amount, the more rainy winter in Baghdad helps to reduce the concentration of carbon dioxide in the atmosphere.

Figure 1. Concentration of CO₂ through study period

Figure 2. Relation between washout CO₂ and intensity rain.

Figure 3. Relation between F and I.

Figure 4. Concentration of CO2 initial and washout CO2 through study

CONCLUSION

Concentration of CO₂ decreases at the end of the winter season as the measurements show that the concentration of gas at the beginning of the season is about 450ppm and at the end of the season 350ppm. The percentage of gas out washing (washout) increases with increasing rain intensity, the greater the amount of rain, the lower the proportion of the presence of carbon dioxide. The flux density of dissolved gas in the rain

increases with increasing rain intensity, where when I = 0.25mm, F = 69 and when I = 2.7mm, F = 101.

Histopathological Study of Infection with Helminthic Parasites Intestinal of some Tigris River Fish passing Through Tikrit City, Iraq

AlShaima Mohammed Jasim¹, Sinai Najy Muhsin², Ail Mohammed Abed¹

¹College of Science, University of Tikrit, Iraq, ²College of Dentistry- University of Tikrit, Iraq

ABSTRACT

A total of 100 fish samples were collected from Tigris river at Tikrit city, during the period from September 2017 to March 2018. These fishes were belonging to ten species which were *Alburnus sellal*, *Arabibarbus grypus*, *Carasobarbus luteus*, *Coptodon zillii*, *Cyprinus carpio*, *Cyprinus kais*, *Leuciscus vorax*, *Luciobarbus Xanthopteru*, *Mystus pelusius* and *Silurus triostegus*. The results revealed infection with four species of worms including three cestoda *Eubotherium salvelini*, *Schyzocotyle acheiognathi* in *cyprinus carpio* with percentage of infection (5.2, 10)% respectively and *Ligula intestinalis* in *Coptodon zillii* with percentage of infection (9)%. One specie acanthocephala (*Neoechinorhynchus zabensis*) in *Arabibarbus grypus* and *Carasobarbus luteus* with percentage of infection (20, 5.8)% respectively. In this study also recorded two new hosts including *Eubotherium salvelini* and *Ligula intestinalis* were recorded the first in Iraq. The present study included the histopathological changes on the intestine which infected with parasitic worms (acanthocephalan, cestoda). It has been differentiated the intestinal villi appeared with epithelial degeneration and cellular debris in the lumen of intestinal, also the basement membrane of this epithelium was displaced from the core of villus, cavitation in muscular layer, complete sloughing of epithelium in intestinal cavity and white blood cells infiltration especially in lymphocyte cells.

Keywords: Tiger fish, Worms, histopathology, cestoda.

INTRODUCTION

Fish are infected with a wide spectrum of parasites, some of them are pathogenic for other kinds of fish or the vertebrates such carnivorous including the human being¹. It became important to study the causes and life cycles to be diagnosed and finding the way to control it². Some parasites cause a mechanic damages for the fish when they move throughout their tissues, and they cause over growth in the connecting tissues that obstacles the processes of reproduction and growth. Some of fish parasites or their larvic stages transfer in to the human being by eating fish uncooked or bad cooked such as nematode worm *Gnathostoma*, liver worm *Clonorchis sinensis* and cestoda worm *Diphyllobothrium latum*³. Because of few studies in the country that deal with tissue changes resulted from intestinal infections by parasitic worms in Tigris river fish, so this study aims at isolating parasitic worms and studying the tissue pathogenic changes of intestinal tissue infected by

parasites.

MATERIALS AND METHOD

A total of 100 fish specimen were collected during the period from September 2017 to March 2018 from different local shops in Tikrit City. Samples transferred to our parasite laboratory in College of Science according mentioned method to⁴ the method is that splitting linear at media ventral line from head to anus then opened from first splitting to cover gills on length line side of fish. After that this piece was removed to appear internal parts to examine the body cavity by eyes in order to notice worms. The gastrointestinal tract was dissected out from the rectum to the esophagus, opened longitudinally and examined carefully. worms have been preserved in 70% alcohol, they were stained with following method to⁵, dehydrated in an ethanol series (70%, 80%, 90%, 100%), cleared in Xylene mounted with Canada balsam. As tissue sections were fixed in

10% neutral formalin, prepared them were passed by Histokinate then embedding of paraffin, were cut thickness five microns, stained with hematoxylin and eosin (H&E) and examined under microscope^{6,7}.

RESULTS AND DISCUSSION

Through the current study is collected and examined 100 fish, involved ten species of fish. They have taken from Tigris river at Tikrit city. The results revealed that infection with four species of worms involving three cestoda *Eubothrium salvelini*, *Schyzocotyle acheiognathi* in *Cyprinus carpio* with percentage of infection (5.2, 10)% respectively and *Ligula intestinalis* in *Coptodon zillii* with percentage of infection (9)%. One specie acanthocephala (*Neoechinorhynchus zabensis*) in *Arabibarbus grypus* and *Carasobarbus luteus* with percentage of infection (20, 5.8)% respectively as shown in table (1). This study also includes the effects pathogenic tissue are caused by parasite worms as following:

cestoda: *Eubothrium salvelini*

Differentiated tissue sections to intestinal in *Cyprinus carpio* that the intestinal villi were containing great vacuoles in between epithelial cell which were also appeared mostly degenerated with presence sloughed cells in the lumen of intestinal (fig. 1).

Schyzocotyle acheiognathi

Pathogenic tissue changes to intestinal in *Cyprinus carpio* show that the lamina propria and sub mucosa was infiltrated with lymphocytes and other white blood cells, also these cells are aggregated in the form of local patten around the suspected parasites and empty blood vessel (fig. 2). It also displays the intestinal mucosa was formed low great villi, but its epithelium which are lining appeared completely sloughed from the surface which appeared like the core of villi with different regions infiltrated by white blood cells (fig. 3).

Acanthocephala: *Neoechinorhynchus zabensis*

It indicates through examined tissue sections to intestinal in *Arabibarbus grypus* there are certain areas in the epithelium was lost its continuation with others, also other areas were lost its epithelium completely and these areas were invaded by white blood cell and lymphocytic aggregation, the blood vessels in the lamina propria had thick wall with great number of

white blood cell and red blood cell in its lumen (fig. 4). Distinguished tissue sections in *Carasobarbus luteus* that the intestinal villi appeared with epithelial degeneration and cellular debris in the lumen of intestine, also the basement membrane of this epithelium was displaced from the core of villus. Which this core was greatly infiltrated with lymphocytic and other white blood cell aggregation (fig.5). The current study is recorded that pathogenic tissue changes resulted from infection with intestinal worms included:

1. Cestoda : *Eubothrium salvelini*

The current study indicates that damages are caused by this worm in *Cyprinus carpio*, degenerated epithelium of intestinal villi and appeared vacuoles, sloughing cells in sub mucosa layer. perhaps, it has been caused these damages to be secreted by worm that toxin effects on tissue cause defect in organisms function⁸. Generally, damages are mechanical in the area of connecting worm, it has been obtained cause of inflammation peritonitis or causes of internal hemorrhage^{9,10}.

Schyzocotyle acheiognathi

This study shows that mechanical damages of intestinal *Cyprinus carpio* caused by parasitic worms. it also results from parasitic infiltration of intestinal layers especially mucoid and submucoid layer of inflammatory cells of lymphocytes types. this infiltration is represented as reaction of parasitic process¹¹. principally, inflammatory cells focus were got in the never layers of parasitic worms when it tried to stick intestine walls by use bothria. According to the size of worm, it may be led to the pressure is resulted from sticking worm intestine walls to lose far of intestine. In view of bigness worm perhaps leads the resulted pressure to stick worm of intestinal wall to lose from epithelial layer. this agreed with¹².

Acanthocephala : *N. zabensis* in *Arabibarbus grypus*

This study displays that pathogenic intestinal changes to fishes are infected by parasite, there closed in cavity intestinal of parasite section are caused damaging epithelial desquamation strongly with reducing villus because of being fixed probosis parasite in epithelial layer and makes irritation, parasite makes acute response inflammatory locally because the presence of worms parasite, these finding are agreed with^{12,13}.

Most of pathogenic effects of acanthocephalus resulted from sticking adult worm and larves in tissue , however , pathogenic effects of infection are resulted from sticking adult worm deep areas in tissue devastation has been arrived at more deeper than sticking areas proboscis parasite, parasite usually tends to stick of epthela layer and perhaps extend sticking to muscular layer of intestinal ^{13,16}.

N. zabensis in Carasobabus luteus

the current study shows that worm cause damage

variously in intestinal of *Carasobabus luteus* infected , appears that tissue sections degeneration epithal , absement membrane and core of villus greatly infiltrated with lymphocytic and other white blood cell aggregation, is represented as reaction of host towards sticking worm. It has been known that acanthocephalus penetrate some or all wall layers of intestinal fish infected especially if it was long proboscis parasite ¹⁷. These damages causes to close cavity intestinal especially when these worms in the bigger size and lot of numbers, this agreed with ¹⁸.

Table 1. Recorded worms species in fish, Prevalence and Average of violence infection

Worms species	Hosts	Number of fishes		Number of isolated worms	Prevalence (%)	Mean intensity of infection
		Examined	Infected

CONCLUSION

The present study included the histopathological changes on the intestine which infected with parasitic worms (acanthocephalan, cestoda). It has been differentiated the intestinal villi appeared with epithelial

degeneration and cellular debris in the luman of intestinal, also the basement membrane of this epithelium was displaced from the core of villus, cavitation in muscular layer, complete sloughing of epithelium in intestinal cavity and white blood cells infiltration especially in lymphocyte cells.

ABSTRACT

Digital image processing for medical images has advanced so much in a very short period of time, but we still have to figure out very narrow issues which can be very important sometimes. One such problem is to successfully differentiate between a normal bone marrow slides images with an abnormal one. This needs to be done with high accuracy because these classification results will be going for classification of different types of Leukemia. In order to work through the process, a number of features will be extracted from each image. A set of images will be used to get the features and another set will be used to test out the features extracted from the training dataset. This classification technique is done at a high accuracy rate to identify a malicious Leukemia image.

Keywords: Leukemia, image processing

INTRODUCTION

From multiple types of cancers, Leukemia is one type of blood cancer. As per ¹, about 4.5% cases of cancer in Malaysia are for Leukemia. This type of cancer starts in bone marrow. The main cause of Leukemia is extra formation of malignant white blood cells (WBCs) which are also immature in nature ². Unfortunately, children are more likely to have Leukemia as compared to adults. There are four types of this cancer:

- AML - Acute Myelogenous Leukemia
- ALL - Acute Lymphocytic Leukemia
- CML - Chronic Myelogenous Leukemia
- CLL - Chronic Lymphocytic Leukemia

Types of WBCs which can be affected by Leukemia are neutrophils, basophils, along with eosinophils, monocytes and lymphocytes. The progression speed of acute Leukemia (AML and ALL) is more than chronic

Leukemia (CML and CLL). If caught at early stages of the disease, Leukemia is very much curable and treatable. A hematologist recommends a complete blood count (CBC) test to check for the disease. A detailed study of morphological marrow of bone smear analysis needs to be conducted if there are found any form of abnormal counts of the cell from the test. This is finalized to ensure the presence and detection of leukemic cells in the blood ³. There are instances where the counts of platelets and RBCs becomes very low in leukemia. Based on the current scenario in medical industry, the presence of leukemia is observed by taking a look at the nucleus and the cytoplasm via a microscope ⁴. The only problem is that this task of looking under the microscope is a very tedious task to accomplish, and that goes even for an expert too. Because of this process's extensive nature of diagnose, the final results might lead to misdiagnosis.

Classification of leukemia is a long and complicated process with multiple steps. The first step is to separate the images of bone marrow into normal and abnormal category. Again, this classification is also a multistep process. These processes are as follows:

- Image enhancement
- Image segmentation
- Features extraction
- Classification

In medical imagery, the first step which is image enhancement plays a very important and crucial role. Reason being this step improves and enhances the quality of the image and it becomes easy and efficient for human viewing. But medical images comes with their own issues and weaknesses. This issue is missing contrast from the image which is due to the bad lighting at the time of image acquisition. Hence, image enhancement steps are taken so that this problem can be overcome with. The steps which leads into image analysis and image interpretation is none other than image segmentation, in this step the medical image is separated into regions ⁵. The tasks which follows this one, such as feature extraction and image classification relies heavily on the quality and efficiency of image segmentation ⁶. In Leukemia, WBCs holds very important information about the diagnosis of leukemia. Hence, during the segmentation process the RBCs and background will be segmented and we are left with the WBC only which will go further into the analysis. The next step is to extract the features out of the image having only WBCs. These are the features holding vital information about the classification and diagnosis. A hematologist observes the WBCs from the image on various parameters ⁷:

- Size
- Shape
- Nucleus chromatin structure and its characteristics
- Nucleoli's size and color
- Cytoplasm's color
- Characteristics of granules and their presence/absence

These are some of the features which are extracted in order to classify efficiently. Color based features are extracted in this paper, which are as follows:

- Standard deviation
- Mean
- Variance

These features are extracted for red, blue and green channel separately. These features and then used to classify the faulty and non-faulty leukemic cells. We can categorize the whole implementation is broadly divided

into two parts:

This would be our base dataset, which we will use to create a baseline for comparison with other images.

We then need to process the other half of raw data i.e. we process the remaining images to as to make a decision for test images. This decision will be in regards to whether the test images belong to cancerous or non-cancerous category.

The whole project will be divided into 2 parts. Part 1 involves extracting features from a set of sample images, part 2 is about comparing the extracted features with images to mark them as cancerous or not. We have employed 35 distinct sample images to create a baseline data as well as comparison with the test images. This data size can obviously be increased or decreased as per the user's requirements. But as per the author's guidelines, the bigger the training dataset images, the better. More number of input images will yield better baseline and hence better results to compare with. Once the extraction process is complete, we define the optimal range for each feature. This range for every feature will be used in the next step in order to classify the images into cancerous and non-cancerous category. Part 2 takes a test image as input and extracted feature range from part 1 as well is taken as input. Features are extracted for the test image. These new features will be compared with the feature database and baseline. This is how the new image is classifies into cancerous and non-cancerous categories.

METHODOLOGY

In the given paper, the author has used the following methodology for the implementation of a generic system to classify leukemic cells in the blood samples. The process is automated so that manual interventions like looking under a microscope could be dealt with and an efficient result could be obtained. Because a misdiagnosis in this case could be a heavy mistake from the medical perspective.

- Input all the images (cancerous only) into the system
 - Extract the following parameters from these images, one by one
 - o Mean value of red channel pixels
 - o Mean value of blue channel pixels

- o Mean value of green channel pixels
- o Standard deviation of red channel pixels
- o Standard deviation of blue channel pixels
- o Standard deviation of green channel pixels
- o Variance of red channel pixels
- o Variance of blue channel pixels
- o Variance of green channel pixels

- In this code, we are using a total of 35 images (we can increase this number by including more images)

- Hence, we will get a total of 35 sets of parameters for all the cancerous images

- After getting all the values, we will decide a range for maximas and minimas for all the parameters used.

- After this, we will have a range for each parameter.

- To test an image, again calculate all the above parameters for that test image

- Now, if any of the parameter of test image comes under the range of our dataset, the image comes closer to be a cancerous image

- But, if even 1 of the parameter is out of range, then test image is declared not cancerous.

- To test, a set of random images is also given.

RESULTS AND DISCUSSION

Following are the images which passes the test and are termed as healthy cells based on the classification criteria.

Based on the above experiment, it is evident to say that the implementation based on feature extraction specifically on the color features of these images works really well and efficiently.

Figure 1. First case image after calculate Mean value

Figure 2. First case image after calculate Standard deviation value

Figure 3. First case image after calculate Variance value

Figure 4. Second case image after calculate Mean value

Figure 5. Second case image after calculate Standard deviation value

Figure 6. Second case image after calculate Variance value

CONCLUSION

This paper study involves classification of leukemic affected cells from the general lot of healthy cells. This is done using the microscopic blood sample images. The proposed system uses the microscopic images and extract the features in terms of standard deviation, mean and variance of red, green and blue channel of the microscopic blood sample images. The algorithm used in the above discussion is able to identify the infected cells in RBCs when used for an infected individual.

The system showed efficiency, reliability, was able to perform calculations in a considerable less amount of time and with much less error, high accuracy, cheaper computation cost and a robustness in finding the exact solution. This way, it'll become easier to identify the diseased patient.

Relation Level between Physics Nature and Science Teaching Methods for Preparatory Grade Physics Teachers

Ahlam Hameed Al-Janabi¹, Dihya Uweed Al-Arnoosy¹, Hamdan Mahdi Abbas¹

¹College of Basic Education, University of Babylon, Iraq

ABSTRACT

this research aims to identify the relation level between understanding nature of physics and science teaching methods, the descriptive approach has been used to verify the two research tools and testing first tool which is the nature of physics by its aspects (aims, nature, ethics and the interaction between physics and technology) in addition to choosing science teaching methods. The results indicate that there is a poor relation between nature of physics and science teaching methods; many recommendations have been reached in this matter.

Keywords: *testing nature of physics, testing science teaching methods.*

INTRODUCTION

Physics plays an important role in most scientific and practical fields as well as it is regarded as one of the main domains in technical development and other theoretical sciences such as: chemistry, biology, mathematics and applicative sciences such as: medicine, engineering and agriculture ¹. We can say that it covers a large field since it studies the phenomena of the universe and the particles of the material, through this importance comes the importance of paying attention to it and its methods of teaching.

Teaching the nature of a science is considered a massive challenge in the field of science teaching and this matter calls for developing teachers teaching guides which depend on educational science curriculums standards that contribute in the method of learning the nature of science in a manner that positively reflects on the teachers educational practices and their students' performance to deeply understand the nature of that science, scientific knowledge and educational contemplating, therefore, this research is considered one of the supplemental researches as it links between theoretical and applicative aspects in the fields of science

philosophy and teaching methods. A lot of new trends emerged in teaching science and physics depending on modern teaching methods that show the relation between science and technology since it forms a proper introduction to science teaching through transforming the theoretical fact of aspects into practical fact in a manner that facilitates the student's improvement of scientific output since these methods are the result of steps and stages followed by the teacher to achieve certain goals as well as modern and various teaching methods. The following studies tackle the nature of science: ¹ study about the extent of Oman teachers' understanding of science nature in the light of (gender, experience) variables, ² study on (the effectiveness of negotiation approach on science nature development), the study of ³ on the opinions physics, chemistry and astronomy teachers about science nature, ⁵ study on the (aspects of analysis of science nature in science curriculums in Portugal's intermediate schools) and ⁴ study on investigating teaching committees opinions at the colleges of educational sciences - Jordanian universities about the scientific knowledge and its impact on the educational behavior and beliefs of students. Also the following studies discuss teaching methods and their skills: ⁶ study on (the actual situation of teaching methods used at the College of Education – Oman and the reason behind their usage) since this study aims to identify the utilized methods (lecturing & discussion and asking questions along with lecturing), ⁷ study on (*physics teacher beliefs about physics and learning physics*), ⁸

Corresponding author:

Ahlam Hameed Al-Janabi.

College of Basic Education, University of Babylon,
Iraq

study on (assessing the performance of natural sciences in the intermediate stage in the light of general standards of general education) and ⁹ study on (*Jordanian physics teacher* beliefs about teaching strategies and assessment included in science curriculums).

METHODOLOGY

The researcher followed the descriptive method since it is the proper one for the aim of the research which can be summed up in identifying the relation level between the understanding nature of physics and science teaching methods for preparatory grades physics teachers. The research sample includes (140 physics teachers of both genders) of preparatory stages; sample method has been used for the random layer which represents a proportion of (32%) of research population. Preparing this research requires the preparation of the two research tools that must include standards by which the relation level between physics and science teaching methods is identified and therefore, the researcher has followed the following steps to develop these tools: reviewing previous studies and seeking the views of experts and specialists in the fields of psychology and science teaching methods; in the light of these steps, the two research tools have been developed and the first tool which is the nature of physics by the aspects of (aims, characteristics, processes, ethics and the interaction between physics and technology) has been tested. First tool test is a multiple choice question that consists of (20) items and testing teaching methods in the fields of scientific knowledge levels, teaching methods and assessment is also a multiple choice question that consists of (20) items. The statistical means used in the research are percentage, arithmetic average, Pearson correlation coefficient and (T-test) for one sample and two independent samples.

RESULTS AND DISCUSSION

The results show that applying physics nature test on teachers sample indicates that the arithmetic average has reached (18.87) which is equal to (60.04%); percentage method has been adopted in order to explain the results since (80%) represents very high understanding level, (79.70%) represents high understanding level, (69.60%) represents medium understanding level and less than (60%) represents low understanding level. We notice from table (4) that percentage of choices for three aspects is (60.04%) and this percentage indicates a

medium level of understanding of physics nature; this result complies with (Hussam Al-Deen & Schwartz, 2008) research results. The results in table (5) have been reached by using (T-test) method in testing physics nature understanding according to (gender) variable. We notice from table (5) that the calculated significance level reached (0.79%) which is more than significance level amounting to (0.5%) that conforms with null hypothesis which provides that there are no differences in understanding physics nature according to gender variable and this can be attributed to the mutual interest in searching for different references whether within the specialty, modern or classic. Arithmetic averages and standard deviations for teachers according to (years of experience variable) have been calculated as in table (6). We notice from table (6) that teachers with experience years less than (5) have an arithmetic average of (38.73) and a standard deviation of (7.03), teachers with experience 5-10 years have an arithmetic average of (34.8) and a standard deviation of (9.89); teachers with more than 10 years of experience have an arithmetic average of (37.76) and a standard deviation of (7.78). Table (7) shows the results of teaching methods test which has been applied on the same sample of teachers. We notice from table (7) that the total arithmetic average is (9.223) which is equal to (28.197%) and this does not rise to the educational acceptance level of (60%). Table (8) shows the results of teaching methods test which has been applied on physics teachers according to years of experience variable. Arithmetic averages and standard deviations for physics teachers' grades in teaching methods test according to teaching experience have been extracted as teachers with less than 5 years of experience have an arithmetic average of (28.66), teachers with 5-10 years of experience have an arithmetic average of (28.76) and teachers with more than 10 years of experience have an arithmetic average of (28.12). As for the range of relation between physics nature test and methods of teaching test, teachers' answers on both tests show that correlation coefficient between the tests' grades has reached (0.38) which is considered to be poor and indicates a poor correlation. In the light of the results presented by the researcher, she reached the following conclusions: the necessity to assess physics books in order to check on the inclusion of the physics nature fields since they have an impact on teachers' educational practices through using teaching methods, certain questions patterns and students education assessment in manner that achieves scientific progress; the necessity to

activate the role of teachers by training them before and during service through including plans which aim to make them qualified to link between physics and science teaching methods.

Table 1. Shows some of the items for choosing teaching methods

No.	Item	A	B	C
1	A Scientific output that proves its validity in certain times and conditions is considered a:	Scientific fact	Scientific concept	Scientific theory
2	one the reasons that call for using different methods and means in teaching science is:	Increase in number of students	Scientific variety	There are no specific reasons
3	Teacher’s movements, students responses and teaching aims of study subject represent:	Teaching method	Teaching style	Teaching strategy
4	Using certain skills to identify problems such as explanation or prediction is called:	Social skill	Motor skill	Scientific thinking
5	The skills that science teaching is trying provide for students are:	Academic personal skills such as thinking and manual skills	Student appreciating the importance of science in his daily life	Discussing scientific topics and their effects

Table 2. Shows preparatory stage physics teachers’ understanding level of physics nature

Aspect	Grade	Arithmetic average	Standard deviation	%
Aims and characteristics	12	8.14	1.48	68
Nature and ethics of science	13	6.48	1.44	72
Interaction between technology and physics and the society	18	4.25	1.25	75
Aspects together	37	18.78	4.17	60.04

Table 3. Shows the arithmetic averages and standard deviations of teachers understanding of physics nature test according to years of experience variable

Field	Gender	Number	Arithmetic average	Standard deviation	(T-test)	Significance
Total grade	Males	70	37.77	6.36	0.22	0.79
	Females	70	36.65	6.77		

Table 4. Arithmetic averages and standard deviations for teachers according to (years of experience variable)

Field	Years of experience	Number	Arithmetic average	Standard deviation
Total grade	Less than (5) years	30	38.73	7.03
	5-10 years	36	34.8	9.89
	More than 10 years	74	37.76	7.78

Table 5. Arithmetic averages and standard deviations of teaching methods test for physics teachers according to gender variable

Gender	Members of sample	Arithmetic average	Standard deviation	Percentage of mediums %
Males	70	8.871	2.539	27.722
Females	70	9.107	2.227	2,459
Total	140	9.223	2.362	28.197

Table 6. Arithmetic averages and standard deviations according to teaching experience

Experience	Members of sample	Arithmetic average	Standard deviation	Percentage of mediums %
Less than 5 years	30	9.1	2.310	28.66
5-10 years	36	8.94	2.42	28.76
More than 10 years	74	7.55	2.01	28.12

CONCLUSION

It is clear from the presented results that the percentage of physics nature test has reached (60.40%) which indicates a medium level for physics teachers; the researcher attributed this matter to their lack of employing intellectual fields through different scientific processes in their teaching methods, since it would deviate them from their main teaching task, and focusing only on the curriculum in addition to the reason of failure of developing their trends and beliefs to search for everything new in the different education stages. The results showed that teaching methods test has reached (28.197%) and this percentage does not rise to the acceptance level due to the teachers' unfamiliarity with science teaching methods and their only concern is to

complete the curriculum whatever the teaching methods. The results also show that the relation between physics nature test and methods of teaching test is poor according the teachers grades in both tests and this matter refers to the poor correlation between them and the importance of variety in employing teaching methods to understand the nature of physics.

The Effectiveness of a Proposed Teaching Method to Develop the Productive Thinking Skills of Primary School Students in Reading

Reyadh Hatif Obaid

Faculty of Basic Education, University of Babylon, Hillah City, IRAQ

ABSTRACT

The study was conducted with the aim of building a proposed teaching method for developing the productive thinking skills of primary school pupils in Iraq. The sample was selected from the center of Babylon Governorate, and the use of the relevant skills, such as percentages and t-test, and the search results in a list of the skills of thinking and the building of the method. The results of the study showed that the proposed educational method has an impact on the development of productive thinking skills among primary school students.

Keywords: *Effectiveness, Instructional Method, Productive Thinking Skills, Reading*

INTRODUCTION

The educational and educational process in Iraq suffers from multiple problems, especially its components, which are represented by students, teachers and curriculum. The curriculum is prepared according to the old educational philosophy which believes in the frequent receiving of the knowledge and the efficient teacher according to this philosophy is able to transfer the great amount of information to the learners. Which guarantees the teacher the abundance of information transmitted to the learners regardless of whether this information is practical or not and does the literacy skills of learners improve and refine their talents? If the teaching methods used by teachers are limited to Providing the learners with knowledge is not enough to prepare the successful learner because the teaching profession has sufficient knowledge and performance^{1,2}. If there is a defect in the performance competencies, the teacher cannot achieve the educational goals no matter what his cognitive competencies. This is confirmed by the recent trends in the preparation of teachers, Education

is not enough to influence the learner for the purpose of learning, but the teacher to have the necessary skill to perform educational tasks in educational situations to ensure the development of thinking skills of learners, and therefore can be said that what results from the educational effort in the field Education is a natural reaction to the problems experienced by various educational institutions revealed by experience and practice, and that the problems of reading education vary according to the stage of study and that the observed weakness in the achievement of learners for the primary stage may be due to weakness in the performance of teachers at the primary stage. The research problem can be summed up in the following question: Does the proposed educational method have an impact on the development of productive thinking skills among primary school students in reading^{3,4}. The question of thinking occupies a major place in the educational sciences, in other sciences and in life in general, because the task of thinking is to find suitable solutions to the urgent theoretical and practical problems faced by man in nature and society. These problems are constantly renewed, which always prompts him to seek new methods and methods to help him find solutions. And thus enables him to overcome difficulties, so thinking - as a cognitive process - is an essential element in the mental construction of knowledge possessed by man, and Hoing believes that creative thinking is a complex

Corresponding author:

Reyadh Hatif Obaid

Faculty of Basic Education, University of Babylon,
Hillah City, IRAQ.

thinking that involves breaking or reconstructing old or old ideas. The researcher believes that the development of ideas produced by learners depends to a great extent on the teaching methods they receive from teachers, as Philip's study The study aimed to evaluate the content of the teaching programs and teaching methods used in Turin, Italy, and used in this study the personal interviews and the questionnaire restricted in data collection. One of the most important conclusions was that the content of the programs was varied but did not take into account the individual differences, despite its diversity, with the need to involve teachers in the development of programs and propose methods of teaching to create the productive learner, Phillips 1999: 69. Bradley asserts that there is no ideal way to impose on the teacher Affect his idea and innovation but he must be aware of the goals and the nature of learners and the possibilities available as well as his potential as a leader of the educational process is the decision maker ^{6,7}. The method of teaching consists of most components of the educational process as well as the objectives, content and sources of learning and emphasizes the transfer of ideas, skills and activities to bring about the desired change in the behavior of the learner Fawal, 2005: 258), and the researcher believes that the importance of teaching method comes from how the teacher achieve the objectives of his lesson The method that depends on positive change, and the active teacher who pays his students to the thinking of the product is continuous and can be a reading material to achieve this, Berlson stressed the need for careful reading and accurate text that is intended to analyze the content and this distinguishes it from normal reading, reading includes a thorough understanding of the vocabulary and the extraction of meanings as well as understanding the sentences and identify relationships and knowledge of the rules of language and recognize the links between the paragraphs of the text and awareness of patterns of knowledge and organization and order so that the learner can understand the text accurately Durkin and Dolores, 1995: 122), And the reading in terms of education in the present age an important way to fruitful learning, and an essential component of the educational process is based on it to provide students with information and skills and applied positively, to give that process fruit and achieve its objectives. The objective of the study was to identify the effectiveness of teaching in the Karen model in the achievement and thinking produced by the second grade students in physics. To achieve this goal, the researcher

formulated the following hypotheses: "There is no statistically significant difference at the level of (0.05) The experimental group studying physics using the Karen model and the mean scores of control group students who study the same material in the normal way with the post-test "and" there is no statistically significant difference at the level of significance (0.05) between the average grade of the experimental group students who study the The study sample consisted of (54) students who were randomly assigned to the experimental group (27) students and the control group (27) students who were equal In the following variables (age, parental achievement, intelligence, first course grades for physics, previous information, and productive thinking), the researcher prepared two tests, the first of which consists of (40) test paragraphs of the type of multiple choice and the other, Wen (26) position, has been confirmed Alsekoumtrah characteristics of the two tests, and the results of the study showed the superiority of the experimental group students on the control group students in the collection and thinking about the product. Study of the painter: The objective of the study is to identify the impact of a training program based on the dimensions of learning in the development of some of the thinking skills produced by students in Kuwait. The sample of the study (89) students from sixth grade students in Kuwait. Six sub-tests are (interpretation, analysis, evaluation, fluency, flexibility, originality) and the overall score of the test. This confirms the parity of the experimental and control groups before applying the learning program based on learning dimensions. Study of Ramadan: The study aimed to design a training program to develop the motivation of achievement among students of secondary education who are late in school and to discover the effect of training using this proposed program on the development of educational achievement and on the development of creative thinking. (108) students from the first grade of high school in Petra secondary school, and used the measure of achievement motivation and the Tawarenz test of creative thinking verbal (Picture A) and the Tournes test of innovative thinking using images (Picture B) Naya Critical Thinking 2000 and a training program for the development of motivation achievement. The results showed that there were statistically significant differences between the average scores of the experimental group and the control group in the post-measurement of the variable achievement of the first semester marks (creative thinking - critical thinking) and

the motivation of achievement for the experimental group. Statistical significance between the average of the students of the experimental group in the tribal and remote measurements for the variable achievement of the first semester marks (creative thinking - critical thinking) and motivation for achievement in favor of the group Therapies.

METHODOLOGY

Procedural definition: A set of reading texts included in the curriculum prepared by the Iraqi Ministry of Education for the students of the fifth primary for the year 2017. **Research objective and hypothesis:** This research aims to: Building a proposed teaching style according to the skills of productive thinking and Learn the effect of the proposed method in developing the productive thinking skills of primary school students in reading. **The hypothesis of the research:** "There is no difference in statistical significance at the level of significance 0.05 between the average grade of students in the fifth grade of primary in the applications of tribal and post-test skills of thinking product» Table 1. **Determination of the educational material:** The researcher identified the article in agreement with the teacher of the Arabic language and also comes (education and mothers, the caliph and the world, and visit the city, and Hamolabi and Bilbly). **Building the proposed learning method:** Use the researcher after reading and reading the literature and websites steps of the educational method as follows:

Raise the motivation of students towards new learning.

Reading the text of the teacher and pupils.

Inferring: Thinking beyond the information available to fill gaps

Predicting: Using previous knowledge to add meaning to new information and linking it to existing knowledge structures. **Elaborating and Resenting:** Developing basic ideas and information given in important detail and additions that may lead to new products, and adding new meaning to the information by changing its image (represented by symbols, diagrams or diagrams). **Summarizing, Restructuring:** Shortening the subject and abstracting it from the main ideas in an effective and practical way, and modifying existing knowledge structures to incorporate new information. **Scheduling the experiment in time for execution and**

evaluation: Specify the time required to perform the experiment as shown in the table 2. The evaluation included the evaluation of experts and arbitrators: The researcher presented the proposed educational method to a number of experts and arbitrators to validate it, and tried the proposed method on a number of students. The researcher tried the proposed program on (55) students - without the research sample - to verify their ability to interact Positive with the curriculum followed in the proposed teaching style.

Search Tool (Test Product Thinking Skills)

The researcher proceeded to build the research tool according to the following procedures and steps:

1. Review previous studies and research that dealt with language skills in general and thinking skills and thinking in particular.
2. Prepare a list of the thinking skills required by the research sample.
3. Selection of a set of texts to build the test paragraphs.
4. Preparation of the test paragraphs and presented to the arbitrators.
5. Choose the search group randomly.
6. Coordinating with the school administration to implement the necessary procedures and apply the tests.
7. Selection of a group of students sample exploratory, in order to know the appropriate time for the test and measuring the stability and honesty and the strength of discriminatory paragraphs and the level of difficulty and effectiveness of the alternatives wrong.
8. Apply the test on the sample of the study and monitor the results and analysis

Statistical Methods: The researcher used the following statistical methods: (one test for one sample, Pearson correlation coefficient, coefficient of difficulty and ease, effectiveness of the wrong alternatives, paragraph discrimination coefficient, and square.

RESULTS AND DISCUSSION

The researcher reached the following results as

in Tables (3) and (4): Table (3) shows that there are statistically significant differences in productive thinking skills, because the calculated value of (4.77) is smaller than the scale value of (1.96) at the level of significance (0,05) A decrease in sample performance in the test of product thinking skills. Table (4) shows that the average scores of pupils in the tribal application (11.5) and the difference (32.83), while the mean of the same group in the post application (31) degree, the variance (43.9) (T-test) for one sample found that the calculated T value was (5.46), which is greater than the tabular value of (2.02) at the level of significance (0.05), which means rejecting the null hypothesis and accept the alternative hypothesis “There are statistically significant differences between students in the two applications Tribal and remote testing and in favor of post-test application “and thus can be said:

1. the weakness of students thinking skills product.
2. Despite the importance of thinking skills, but it has not been assigned a curriculum or lesson that students can practice.
3. Lack of interest in interactive teaching in the teaching of the Arabic language led to the low level of students in the skill of productive thinking.

4. The proposed educational method has a positive impact on the development of skills among primary school students.
5. the possibility of developing the skills of thinking product using the integrated method and the ability, and the physical potential, and the conditions for its application.

Interpretation of the results: The researcher believes that the proposed educational method provided the students who studied in light of a better opportunity in terms of conservation, memory, understanding, attention, application and analysis of the main skills and sub-thinking produced through the creation of learning as well as the analysis of the proposed educational content and organization cumulatively from simple to complex; In the use of the above learned mainly in the most complex learning, especially when directed to the transition to the effectiveness or new information without prior mastery, as well as the proposed method of education was given sufficient opportunity for feedback (feed_back), which provided the student with The success of this step-by-step process has led to the reinforcement and encouragement to continue learning. The student feels that he has learned something successfully and this increases his motivation to continue studying.

Table 1. Shows the training needs of the sample students

Lesson	Title
The first	is to think beyond the information available to fill the gaps in it
The second	is to use the previous knowledge to add meaning to the new information and to link it to existing knowledge structures
The third	is to develop the basic ideas and the information given and to enrich them with important details and additions that may lead to new products
Fourth	add a new meaning to the information by changing its image (represented by symbols, diagrams or graphs
Fifth	Shortening the subject and stripping it of the main ideas in an effective and practical way. To modify existing knowledge structures to integrate new information

Table 2. Shows the times of implementation of the training program

n	Themes	Time
1	Education and mothers	40 minutes
2	Caliph and the world	40 minutes
3	City visit with two lessons	80 minutes
4	The Hammurabi obelisk is	40 minutes
5	Balbly	35 minutes

Table 3. The mean, the mean, the standard deviation, the degree of freedom, the two values, and the statistical significance of the sample of the research in the test of the tribal product

N	mean	The mean medium	standard deviation	df	t		Statistical significance level (0.05)
					Calculated	Table	
140	5.11	8	2.55	139	4.77	1.96	Statistical function

Table 4. Shows the arithmetical mean, variance, and T calculated and tabular value of students in pre and post-test applications

The experimental group	mean	variance	t	
			Calculated	Table
Tribal	5.11	32.83	5.46	2.02
after	31	43.9		

CONCLUSION

The sample was selected from the center of Babylon Governorate, and the use of the relevant skills, such as percentages and t-test, and the search results in a list of the skills of thinking and the building of the method. The results of the study showed that the proposed educational method has an impact on the development of productive thinking skills among primary school students.

Financial Disclosure: There is no financial disclosure.

Conflict of Interest: None to declare.

Ethical Clearance: All experimental protocols were approved under the Faculty of Basic Education,

University of Babylon, Hillah city, IRAQ and all experiments were carried out in accordance with approved guidelines.

The Effectiveness of the Token Reinforcement in Reducing The Aggressive Behaviour Among Pupils With Learning Difficulties

Wadian Jawad Abul-Kadhim¹, Ryadh Hatif Obaid¹, Hawraa Abbas Krmash¹

¹College of Basic Education, University of Babylon, Iraq

ABSTRACT

The study aims to identify The Effectiveness of The Token Reinforcement in Reducing The Aggressive Behaviour Among Pupils With Learning Difficulties, the researcher adopted the experimental approach with one group with pre- and post- test, the research sample consisted of (8) pupils with learning disabilities and before apply the program, the researcher applied the measure of The aggressive behaviour in order to identify their behavior problems before apply the program, then the program was applied that made up of a group of activities , games and videos that be a suitable for the problem of The Aggressive Behaviour that they suffer from, so the program made up of (15) sessions, whereas the aggressive behaviour is reduced, after the program was completed , the researcher applied the measure of The aggressive behaviour phenomenon on the research sample in order to identify the variables that happened before and after applying the program, then the data have been statistically processed by Wilcoxon Test, the results have presented the effectiveness of the token reinforcement that led to reducing the level of the aggressive behaviour among pupils in the research sample.

Keyword: Reinforcement, Pupils, Effectiveness.

INTRODUCTION

It's undeniable that, care of children and attention to them is considered the bedrock of building a strong family with drops and well-establishment, in order to create a good and successful children , it's necessary to pay attention and upbringing of them in the correct way, but upbringing of normal children in general and special needs children requires attention and care of them, and provide them with psychological and educational programmes of their own, that's for the negative effect of disability on the individual level (Disabled Child), at the family level and society as well, as is known, the disabled child has a special building and psychological creation, as a result of his/her disability and his/her sense of difference from other children, disability leads child to disturb his/her image of him/herself, this results in a lack of harmony with him/herself and others, therefore there are some behavioral problems such as : aggression, hyperactivity, introversion, withdraw and other forms of turbulent behavior. Kaval and Mostert (2004) ¹ refers to that several of researchers believe that a lot of researchers believe that academic difficulties can't be dealt with, in isolation from the effective and social aspects which

in turn overcome these difficulties, then pupils with learning difficulties are the most pupils who cause behavioral problems based on the teachers' viewpoint inside The class room whereas these pupils appear behaviors and obstructing manners for the progress of the classroom creating an chaotic environment within the classroom, this leads to the formation of a serious obstacle to all pupils of what the pupils with learning difficulties and teachers by frustration and discomfort as a result to chaos and didn't achieve the educational task. The majority of pupils with learning difficulties who face problems in keeping pace with others, making friends and keeping them positive emotions about themselves. At the same time, some are aggressive toward others, including partners, while others are shy and withdrawn in social situations and interactions.⁷ Pupils with violent behavior described as they don't have the ability to have friendships with the persons around them, as there are elements that lead to keeping others away from these troubled children, as they hurry towards violent behavior, abuse and irresponsibility, and the tendency to control and impulsive and excessive activity that leads to overheating Movement and distraction. On the
