EXECUTIVE EDITOR

Vidya Surwade

Associate Professor, Dr Baba Saheb Ambedkar, Medical College & Hospital, Rohinee, Delhi

INTERNATIONAL EDITORIAL ADVISORY BOARD

1. **Dr. Abdul Rashid Khan** B. Md Jagar Din, (*Associate Professor*)
Department of Public Health Medicine, Penang Medical College, Penang, Malaysia
2. **Dr. V Kumar** (*Consulting Physician*)
Mount View Hospital, Las Vegas, USA
3. **Basheer A. Al-Sum**,
Botany and Microbiology Deptt, College of Science, King Saud University,
Riyadh, Saudi Arabia
4. **Dr. Ch Vijay Kumar** (*Associate Professor*)
Public Health and Community Medicine, University of Buraimi, Oman
5. **Dr. VMC Ramaswamy** (*Senior Lecturer*)
Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur
6. **Kartavya J. Vyas** (*Clinical Researcher*)
Department of Deployment Health Research,
Naval Health Research Center, San Diego, CA (USA)
7. **Prof. PK Pokharel** (*Community Medicine*)
BP Koirala Institute of Health Sciences, Nepal
8. **Sajjad Salim Issa AL-Musawi**, Supervisor for Student of the Arab
Board in Family Medicine
9. **Prof. Dr. Ayad F. Alkaim**, Professor of Surface Chemistry and
Applications of Nano-materials, Babylon University, Iraq

NATIONAL SCIENTIFIC COMMITTEE

1. **Dr. Anju Ade** (*Associate Professor*)
Navodaya Medical College, Raichur, Karnataka
2. **Dr. E. Venkata Rao** (*Associate Professor*) Community Medicine,
Institute of Medical Sciences & SUM Hospital, Bhubaneswar, Orissa.
3. **Dr. Amit K. Singh** (*Associate Professor*) Community Medicine,
VCSG Govt. Medical College, Srinagar – Garhwal, Uttarakhand
4. **Dr. R G Viveki** (*Professor & Head*) Community Medicine,
Belgaum Institute of Medical Sciences, Belgaum, Karnataka
5. **Dr. Santosh Kumar Mulage** (*Assistant Professor*)
Anatomy, Raichur Institute of Medical Sciences Raichur(RIMS), Karnataka
6. **Dr. Gouri Ku. Padhy** (*Associate Professor*) Community and Family
Medicine, All India Institute of Medical Sciences, Raipur
7. **Dr. Ritu Goyal** (*Associate Professor*)
Anaesthesia, Sarswathi Institute of Medical Sciences, Panchsheel Nagar
8. **Dr. Anand Kalaskar** (*Associate Professor*)
Microbiology, Prathima Institute of Medical Sciences, AP
9. **Dr. Md. Amirul Hassan** (*Associate Professor*)
Community Medicine, Government Medical College, Ambedkar Nagar, UP
10. **Dr. N. Girish** (*Associate Professor*) Microbiology, VIMS&RC, Bangalore
11. **Dr. BR Hungund** (*Associate Professor*) Pathology, JNMC, Belgaum.
12. **Dr. Sartaj Ahmad** (Assistant Professor),
Medical Sociology, Department of Community Medicine, Swami Vivekananda Subharti
University, Meerut, Uttar Pradesh, India
13. **Dr Sumeeta Soni** (Associate Professor)
Microbiology Department, B.J. Medical College, Ahmedabad, Gujarat, India

NATIONAL EDITORIAL ADVISORY BOARD

1. **Prof. Sushanta Kumar Mishra** (Community Medicine)
GSL Medical College – Rajahmundry, Karnataka
2. **Prof. D.K. Srivastava** (*Medical Biochemistry*)
Jamia Hamdard Medical College, New Delhi
3. **Prof. M Sriharibabu** (*General Medicine*) GSL Medical College, Rajahmundry,
Andhra Pradesh
4. **Prof. Pankaj Datta** (*Principal & Prosthodontist*)
Indraprastha Dental College, Ghaziabad

NATIONAL EDITORIAL ADVISORY BOARD

5. **Prof. Samarendra Mahapatro** (*Pediatrician*)
Hi-Tech Medical College, Bhubaneswar, Orissa
6. **Dr. Abhiruchi Galhotra** (*Additional Professor*) Community and Family
Medicine, All India Institute of Medical Sciences, Raipur
7. **Prof. Deepti Pruthvi** (*Pathologist*) SS Institute of Medical Sciences &
Research Center, Davangere, Karnataka
8. **Prof. G S Meena** (*Director Professor*)
Maulana Azad Medical College, New Delhi
9. **Prof. Pradeep Khanna** (*Community Medicine*)
Post Graduate Institute of Medical Sciences, Rohtak, Haryana
10. **Dr. Sunil Mehra** (*Paediatrician & Executive Director*)
MAMTA Health Institute of Mother & Child, New Delhi
11. **Dr Shailendra Handu**, *Associate Professor*, Phrma, DM (Pharma, PGI
Chandigarh)
12. **Dr. A.C. Dhariwal**: *Directorate* of National Vector Borne Disease
Control Programme, Dte. DGHS, Ministry of Health Services, Govt. of
India, Delhi

Print-ISSN: 0976-0245-Electronic-ISSN: 0976-5506, Frequency: Monthly

Indian Journal of Public Health Research & Development is a double blind peer reviewed international journal. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, and Public Health Laws and covers all medical specialties concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and South East Asia.

The journal has been assigned International Standards Serial Number (ISSN) and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases. The journal is covered by EBSCO (USA), Embase, EMCare & Scopus database. The journal is now part of DST, CSIR, and UGC consortia.

CONTENTS

Volume 9, Number 12

December 2018

1. The Etiological Profile of Seizures in Children in a Tertiary Care Hospital, Hapur, Uttar Pradesh 01
Shweta Singh, M Agrawal, Yogesh Kumar Goel, Dayachand Verma
2. Does Pregnant Mother are aware about PMTCT of HIV? What is their Attitude and Do they Practice the Measures on PMTCT of HIV?: A Narrative Review 07
Neethu Sabu, N V Muninarayanappa, Kavitha Mole P J
3. Recent Resting Habit of Adult *Phlebotomus argentipes* the Vector of *Visceral leishmaniasis* in a Kala Azar Endemic Foci of Bihar India 12
Chandrima Das, Shilpa Raj, A K Mukhopadhyay
4. Substance Use Disorder - Vital Hurdle in Sustainable Development of Nigeria 18
Jummai Fatima Muhammad, Malavika Bhattacharya
5. A Study of Urinary Uric Acid/Creatinine Ratio as an Additional Marker of Birth Asphyxia 23
Renu Yadav, Sangeeta Singhal, Gagan Agarwal
6. Incidence, Prevalence and Mortality of HIV/AIDS across Different Levels of Human Development Index: A Global Perspective 28
Ravi Prakash Jha, Kritika Bhattacharyya, Rabindra Nath Mishra, Akash Mishra
7. Study to Assess the Social and Economic Impact of Alcohol in a Peri-Urban Area of Tamil Nadu 34
Shankar S, Raghuram V, Elango S
8. Economics of Sustainability – A Theoretical Perspective 40
S N Sugumar, S Balasekaran, S Chandrachud
9. Factors Affecting Neonatal Mortality and Morbidity - An Epidemiological Study 45
Tapan Pattanaik, Ratan Kumar Das, K Trimal Subudhi, Mahesh Chandra Sahu
10. Students' Perception and Attitude on Education Curriculum and System in an Indian Dental School 50
Madhura Sen, Kundabala M
11. Perception of Anganwadi Services in Urban ICDS Blocks in Kozhikode Corporation –A Cross -Sectional Study 55
Sivakumar D, Asma Rahim, Deepika

12. Prevalence and Factors Associated with Depression among the Students of a Medical College in Kerala 59
Madhusudan M, Aravind M, Arun Gopi, Ajanya V, Vinaya Pradeep, Fabeena Mangaladan U, Sakeer Hussain OC
13. Platelet-Rich Fibrin as Palatal Bandage: A Case Report 65
Yamini Mannava, Sangeeta Umesh Nayak, Deepa G Kamath, Trishna Dash
14. The Exemplar of Employment Epoch in India with HRD Perspective 69
S Thangamayan, S Chandrachud, S N Sugumar
15. Effectiveness of Structured Teaching Programme on Knowledge of Kangaroo Mother Care among Mothers 74
Regina Antony, Harichandhana S, Sinu Paul
16. Indoor Air Pollution an Ignored Public Health Issue: Study to Find the Awareness and Practices Regarding Indoor Air Pollution in a Rural Setting Near Chennai 80
Ruma Dutta, Dinesh Raja, Timsi Jain, Gomathy Parasuraman, Prashanth R, Sivaprakasam P
17. Factors Influencing Semen Analysis in Case of Infertility 85
Dinesh Kumar Singh, Anju Singh, Shivendra V Singh, Paras Kharbanda
18. Awareness of Undergraduate Students Regarding Blood Donation among Non-Medical Colleges in Selected Setting 92
Faizan Khan, Uppu Praveen, Gurpreet Kaur, Deepika, Deeksha Singh
19. Surveillance of Elderly Patients with Hypertension in Eastern India: Our Experience 95
Sura Kishore Mishra, Suresh Kumar Behera, Mahesh Chandra Sahu
20. Medical Devices Access in Asian Countries: Sustainable Growth Trajectory in India 101
Sammita Jadhav, Milind Chunkhare, Jagdish Jadhav
21. HIV Risk among Labor Migrants: An In-Depth Study of the Literature 107
Manas Ranjan Behera, Rattanathorn Intarak
22. Study of Hypertension in Elderly Patients of Both Sexes in Western Rajasthan Population 116
Hazarimal Choudhary, Veerendra Choudhary
23. Practices regarding Biomedical Waste Management among Health Care Workers of Tertiary Care Hospitals of Meerut, U.P. 120
Rijul Ranjan, Pawan Parashar, Varsha Chaudhary, Arvind Shukla
24. Study of Determinants of Renewal of Health Insurance Policies 124
Neha Ahire, Parag Rishipathak
25. Phytochemical Analysis and Antifungal Activity of *Ganoderma lucidum* 130
Naveen kumar C, Srikumar R, Swathi S, Chidambaram R, Muthukrishnan G, E Prabhakar Reddy
26. Pattern of Cutaneous Manifestations among HIV Patients of a Tertiary Care Teaching Hospital .. 136
Ramesh Holla, Bhaskaran Unnikrishnan, Darshan B B, Prasanna Mithra, Nithin Kumar, Vaman Kulkarni, Rohit Shenoy

27. To Study the Knowledge and Association between Self Medication and Education among People Residing in Hilly Area	140
<i>Sharmishtha K. Garud, Prakash M. Durgawale, Dhirajkumar A. Mane, Satish V. Kakade</i>	
28. Low-level Laser Therapy in the Management of Diabetic Sensorimotor Polyneuropathy	147
<i>Prathap Suganthirababu, Sai Sowjanya B.V., Lavanya Prathap, Kumaresan A, Chiranjeevi Jannu, Vahini devi Chandupatla</i>	
29. Expression of miR-21 and its Target Gene Bcl-2 in Oral Squamous Cell Carcinoma	153
<i>N Sangeetha, N Malathi, Ganesh Venkatraman, Rayala Suresh Kumar</i>	
30. Consumer Trust in E-Commerce Transaction in Delhi	159
<i>Nitin Girdharwal, Salabh Mehrotra</i>	
31. Knowledge and Awareness of Handling Methyl Methacrylate Monomer among Undergraduate Dental Students	165
<i>Arul Amalan, Bharath Rao K, Runki Saran, Krishnaraj Somayaji, Amith A Singh, Madhumitha Natarajan</i>	
32. A Study on Effects of Serum Calcium Levels in Relation to Ankle Joint Instability - A Case Control Study	169
<i>Karpagam Krishnamoorthy, V Vijayaraghavan, J Vijayakumar</i>	
33. Impact of Service Quality on Customer Satisfaction Special Reference to Retail Outlets in Tamil Nadu	174
<i>Varadarajan Rangarajan, K Thulasi Krishna</i>	
34. In Vitro Evaluation of the Cytotoxicity of Chlorhexidine Digluconate, Povidone Iodine and Phenolic Compound Mouth Washes on Chinese Hamster V79 Cell Lines	180
<i>Mranali K Shetty, Bijju Thomas, Karthik Shetty, Veena Shetty, Roma M</i>	
35. Secure and Efficient Subnet Routing Protocol for MANET	184
<i>Kaushal Kishor, Parma Nand, Pankaj Agarwal</i>	
36. Awareness about Privacy and Security of Patient Health Information	190
<i>Pushpalatha K, Dola Saha, Nachiket Gudi, Rajesh Kumar Sinha</i>	
37. Correlation between Type of Diet and Periodontal Parameters	195
<i>Harshit Atul Kumar, Neetha J Shetty</i>	
38. Nutritional Assessment in Obese Children with and Without Non-Alcoholic Fatty Liver Disease (NAFLD) in an Urban Area of Punjab, India	201
<i>Pooja Goyal, BR Thapa, Neeta Raj Sharma, Jagadeesh Menon, Anmol Bhatia</i>	
39. Impact of Noise on Hearing of Individuals Working in the Temples	208
<i>Anuradha Shastry, Rajesh Ranjan, Jayashree S Bhat</i>	
40. Effect of Sudarshankriya Yoga on Some Auditory Processing Abilities and Speech Perception in Noise among Middle Aged Adults	213
<i>Meenakshi Gopinath, Jayashree S Bhat, Rajesh Ranjan</i>	

41. Influence of Family Structure and Gender on Oral Health Behavioral Characteristics in Siblings, a Narrative Review 219
Ramprasad Vasthare, Sunaina Puri, Ravindra Munoli
42. Comparison of the Influence of Different Tooth Tapers on Retention of Metal Crowns Luted with Two Resin Cements 224
Pankaj Kulkarni, Veena Hegde, Lokendra Gupta
43. When Sustainable Development Matters in Health Care Supply Chain: An analysis of Influential Factors of Waste Management 229
Sasanka Sekhar Mishra, Kamalakanta Muduli, Manoranjan Dash, Umesh Chandra Parida, John Pumwa
44. Mineral Trioxide Aggregate Apexification a Novel Approach for the Tooth with open Apex – A Case Report 237
Vinod Jathanna, Shreya Hegde, Shivangi Vats
45. Goal Directed Physiotherapy Treatment Program for Improving Lower Extremity Function in a child with Spastic Paraplegic Cerebral Palsy. A Case Report 241
Kovela Rakesh Krishna, Mukesh Kumar Sinha
46. What is the Nature of the Activities Used for Children in Kindergarten? 245
Saniya Sidhesh Nadkarni, Namita Narayanan, Jithin John C K, KR. Banumathe
47. Comparative Study of Carbapenem-Sensitive Acinetobacter Infection with Carbapenem-Resistant Acinetobacter Infection among Inpatients of a Tertiary Care Teaching Hospital in South India 249
Mukherjee Ramita, MR Pavan, Achappa Basavaprabhu, Jeganathan Jayakumar, Bajpai Sukrit
48. Gender Differences in Quality of Life in Type-2 Diabetics with Metabolic Syndrome 255
Sharmila JB, Thahira Banu A, Janet Mary Ann, Asirvatham, AJ
49. Study on Role of Deviance Behaviour & Its Impact on Entrepreneurship 261
Malathi Narayanan, Sainath Malisetty, CH. Bala Nageswara Rao
50. Serodiagnosis of Listeriosis among Pregnant women and Neonates using a Rapid Serological Assay 268
Balamuruganvelu Singaravelu, Sreenivasalu Reddy. V, Geethavani Babu, Harish PV
51. A Study on Quality of Life (QOL), Stress and Coping among Wives of Alcohol Dependence Syndrome (ADS) Clients Admitted in Selected Hospitals of Udupi District 274
Tessy Treesa Jose, Renjunal Yesodharan, Asha K Nayak, Anjali K G
52. Four Vital Capacity Breaths Can Delay the Onset of Haemoglobin Desaturation Following Nasopharyngeal Oxygen Insufflation 279
Sa Ribeiro, Karl N, Misquith, Julie, C R, Upadya, Madhusudan
53. Oral Health Status of 12 Years Old Children in Rural Area of District Indore, MP: A Cross Sectional Study 286
Singh Varsha, Wavare R.R, Kaur Samarjeet, Varshney Amit Mohan

54. Effect of Neuro Muscular Electrical Stimulation in Swallowing Muscle Function on Post Stroke Dysphagia	291
<i>A Kumaresan, M Manoj Abraham, Prathap Suganthirababu</i>	
55. Estimation of Random Blood Glucose from Gingival Crevicular Blood- A Cross Sectional, Diagnostic Study	295
<i>Aarthinisha V, Julius A, Mohan Valiathan, Bhuvaneshwari Birla Bose, Vidya Jayaram, Juala Catherine Jebaraj, Krishna Prasanth</i>	
56. Comparison of Salivary Nitric Oxide Levels among Smokers and Non-Smokers in Chronic Periodontitis- A Biochemical Study	300
<i>Mani Sundar N, Julius A, Mohan Valiathan, Krishnaraj S, Bhuvaneshwari J, Hemalatha V.T, Krishna Prasanth</i>	
57. Detection of Vancomycin MIC by Agar Dilution in Clinical Isolates of MRSA Showing Reduced Zone of Inhibition by Disk Diffusion Method	306
<i>P Vamsi Muni Krishna, V Sreenivasulu Reddy, V Praveen Kumar, P Suresh</i>	
58. Effect of Intravenous Dexmedetomidine on Spinal Anaesthesia with Hyperbaric Bupivacaine in Lower Limb Orthopedic Surgeries - A Randomized Controlled Study	311
<i>Adithya Jayaprakash, Shaik Gulam Osmani, Anupama Suresh Y, Suresh Y.V</i>	
59. Evaluation of the Effect of Menopause on Saliva and Dry Mouth- A Cross Sectional Study	317
<i>Hemalatha V T, Julius A, Kishore Kumar S P, Asokan G S, Aneetha Raman G, Mani Sundar N, Krishna Prasanth B</i>	
60. Review on Type-2 Fuzzy in Biomedicine	322
<i>M Lathamaheswari, D Nagarajan, A Udayakumar, J Kavikumar</i>	
61. Segmentation of Mammography Calcifications Using Fusion of Fuzzy C-Means and K-Means Algorithm	327
<i>S Poonguzhali, Ananthi Sheshasaayee</i>	
62. Twenty years' (1996-2015) Trends in Deaths Caused by Poisoning in the Transkei sub-region of South Africa	334
<i>B L Meel</i>	
63. Bestiality in Mthatha Region of South Africa: A Case Report	339
<i>Banwari Meel</i>	
64. Discrimination in the Payment of Occupational-Specific Dispensation (OSD) Scale and other Allowances in a Rural University of Eastern Cape's Human Resource Department Malicious or Ignorance?	342
<i>B L Meel</i>	
65. Development of Word Awareness Skills in Typically Developing English Language Learners During Early Primary Grades	346
<i>Somashekara Haralakatta Shivananjappa, Shwetha Prabhu, Jayashree Sunil Bhat</i>	
66. Twenty Years' (1996-2015) Trend in Lightning-related Deaths in the Transkei Sub-region of South Africa	352
<i>Banwari Meel</i>	

67. Effects of Ambient PM _{2.5} Exposure on Lung Function Disorder in Community around Construction Industry	358
<i>Rina Marina, Ema Hermawati, Alvia Hamastia, Ridcho Andrian</i>	
68. The Effect of Nutrition Counseling on Intake of Energy, Protein, and Nutritional Status of Chronic Kidney Disease with Haemodialysis	364
<i>Usdeka Muliani, Roza Mulyani, Amrul Hasan, Ismi Rajiani</i>	
69. Association of Physical Workload with Salivary Cortisol in Clinincal Pharmacist	369
<i>Errisa Sulfiana, Abdul Rohim Tualeka, Noeroel Widajati</i>	
70. Knowledge and Attitudes of Nursing Staff in AL-Suwaira General Hospital about Cervical Cancer	374
<i>Ahmed Kadhim Jawad</i>	
71. Physical Environment of Houses as Determinants of Pneumonia among Children in Country Sides	381
<i>Asep Tata Gunawan, Nur Hilal, Wibowo Adysapta, Lagiono, Rusmini, Ismi Rajiani</i>	
72. Efficacy and Safety of Mirabegron in Treatment of Overactive Bladder (Dose Range Study)	385
<i>Ali Abdulbaqi Ali Ismael, Hayder Hakim SalehAli Abdulbaqi Ali Ismael</i>	
73. Analysis of Factors Associated with Blood Sugar Levels in Type 2 Diabetes Mellitus Patients	391
<i>Bertalina, Amrul Hasan, Ismi Rajiani</i>	
74. Physical Environment of Home Affecting the Infection of Helminthiasis among Toddlers in Rural Areas	396
<i>Asep Tata Gunawan, Budi Triyantoro, Agus Subagyo, Siti Mulidah, Marsum, Siti Kusumawati, Ismi Rajiani</i>	
75. Knowledge and Attitudes of Academic Instructor Toward First Aid at the Technical Institute-Suwaira	401
<i>Ammar A Okab</i>	
76. The Effects Lactobacillus Crispatus Probiotics on Proliferation and Metastasis of Cervical Cancer Cell Line using 3D Cell Culture	407
<i>Azher Adnan, Elahe Motevaseli, Esmaeil Sadroddiny</i>	
77. Comparison between Echocardiography and Computerized Tomography Pulmonary Angiography in Detection of Pulmonary Hypertension in Advanced Chronic Lung Diseases	414
<i>Atheer Adnan Fadhil, Mustafa Nema, Hayder Adnan Fawzi</i>	
78. Angiotensinogen II Type I Receptor A1166C is Associated with Serum Sodium Level and Essential Hypertension in Javanese Population	421
<i>Atik S Wulandari, Mohammad A Widodo, Teguh W Sardjono, Diana Lyrawati</i>	
79. Analysis on Quality of Food Sanitation Hygiene and Escherichia Coli (<i>E. Coli</i>) Contamination at Restaurants around Commuter Line Stations in Central Jakarta, 2018	427
<i>Dinda Ayu Ratnasari, I Made Djaja, Budi Hartono</i>	
80. Focal Interictal Epileptiform Discharges in Idiopathic Generalized Epilepsies	434
<i>Gheyath AlGawwam, Akram Al-Mahdawi, Seevan Ali, Hayder A Fawzi</i>	

81. Quantitative Fire and Explosion Risk Assessment of Fuel Tanker Truck: Preliminary Case Study at Fuel Terminal X Jakarta	440
<i>Laksita Ri Hastiti, Fatma Lestari, Indri Hapsari Susilowati</i>	
82. Smile Card as a Breakthrough to Increase Dental and Oral Hygiene Level in Primary School Students in Jakarta	446
<i>Jusuf Kristianto, Ita Yulita, Dwi Priharti, Heru Santoso Wahito Nugroho</i>	
83. Analysis of Determinant Factors of Exclusive Breastfeeding in Indonesia: A Case of Ulakan Tapakis District	450
<i>Marisa Lia Anggraini, Arni Amir, Hardisman Dasman</i>	
84. Effect of Strategic Foresight on the Success of Healthcare Marketing	456
<i>Ahmed Mohammed Fahmi, Araden Hatim Khudair, Bushra Shakir Al-Shukri</i>	
85. Study of the Organic Pollution in Euphrates River, Southern of Iraq	462
<i>Ali Abdulhamza Al-Fanharawi, Ahmed Sabah Al-Jasimee</i>	
86. International Patients Safety Goals (IPSG) based on Knowledge Management of SECI (Socialization, Externalization, Combination and Internalization) on Adverse Events at Jakarta Islamic Hospital	468
<i>Harif Fadhillah, Nursalam, Muhammad Hadi, Ferry Efendi, Rr Dian Tristiana</i>	
87. Factors Affecting the Side Effects of Anti-Tuberculosis Drugs	475
<i>Masriadi, Eha Sumantri, Sanasiah, Heru Santoso Wahito Nugroho</i>	
88. The Effects of Cold Compress and Warm Compress on β -Endorphin Levels, IL-6 and TNF α among Adolescent with Dysmenorrhea	480
<i>Mukhoirotin, Kurniawati, Diah Ayu Fatmawati</i>	
89. Mediating Effects of Wisdom in the relation between Lifestyle Habits (LH) and Health Conservation (HC) of Middle-aged Men	486
<i>Hee Kyung Kim</i>	
90. Association of Helicobacter Pylori and Irritable Bowel Syndrome	492
<i>Ali Talib Al-Damarchi, Ghufan Abdulelah Al-Talakani</i>	
91. Groundwater Contamination of Some Soils Near the Kefal River	498
<i>Kifaya Hasan Qassim</i>	
92. Relationship of Patient Characteristics with Patient Satisfaction	503
<i>Anggun Wulandari, Ester Mariana, Nyoman Anita Damayanti</i>	
93. Evaluation on Preparation of Fire Hazards in Pt. X Muncar Banyuwangi (Study on Fish Canning Company in Muncar Banyuwangi)	507
<i>Hesti Jatmikowati, Yustinus Denny Ardyanto Wahyudono, Tjipto Soewandi</i>	
94. Association between Exclusive Breastfeeding with Health Belief Model in Working Mothers	513
<i>Mardiana, Ave Alyatalaththova Mahabay Aryotochter, Galuh Nita Prameswari, Muhammad Azinar, Lukman Fauzi, Efa Nugroho</i>	

95. Availability, Accessibility, and Acceptability of Health Services in Remote Indigenous Community of the Baduy Dalam Tribe 519
Asri Nur Maulidya, Dumilah Ayuningtyas
96. The Effectiveness of Applying Score System in Growth Chart to Predict Stunting and Improve Nutritional Knowledge of Pre-Schoolers' Mother in Indonesia 525
Haripin Togap Sinaga, Abdul Hadi, Alfridsyah, Ichsan, Nelson Tanjung
97. The Relationship between Hypermobility Syndrome and Systemic Lupus Erythematosus 532
Mohammed H. Al-Osami, Sarah Mohammed, Waleed Ibraheem Ali, Hayder Adnan Fawzi
98. Mapping the Model of Ecological Vegetation as Potential Malaria Habitats in a Malaria-Endemic Region in Oesao Village, Kupang Regency, Indonesia 539
Ragu Harming Kristina, Sri Subekti, Yoes P. Dachlan, Santi Martini, Heru Santoso Wahito Nugroho
99. Barriers in Treating Patients with Acute Coronary Syndrome in Indonesia Primary Health Care: A Phenomenological Study 550
Kumboyono Kumboyono, Dini Prastyo Wijayanti, Titin Andri Wihastuti, Septi Dewi Rachmawati, Yulia Candra Lestari
100. Association between Papilledema and Guillian - Barré Syndrome 555
Mohammad A.S. Kamil, Aqeel K. Hatem, Adel M. Abbass, Sajidli. Alhussaini
101. Effect of Sensory and Tactile Stimulation to Increase Glasgow Coma Scale (GCS) Score on Stroke Clients who Have Consciousness Disorders at Abdul Moeloek Hospital, Lampung 562
Purbianto, Dwi Agustanti
102. Liver Function and Some Biochemical Parameters affected by Anabolic Androgen Steroids and Diet Supplements Consuming 566
Enas Abdul Kareem Jabbar, Jamela Jouda, Haider Sabah Abdulhussein, Bassad A. AL-Aboody
103. Relationship between Self-Concept with Women's Premenopause Anxiety in Facing the Menopause, in Pamekasan, East Java 573
Yulianto, Yufi Aris Lestari, Erik Toga, Muh. Al Amin, Asef Wildan Munfadlila, Ahmadi
104. The Effect of Use of Edutainment on Changes in Hemoglobin Levels in Adolescents (Case Study of SMPN 4 Banjarbaru) 579
Nia Kania, Siti Nurhayani, Lenie Marlinae, Nida Ulfah
105. Relationship between Folate Receptor Alpha (FR α) with Estrogen Receptor, Progesterone Receptor, HER-2 Neu Expression in Breast Carcinoma 582
R A Tandjung, Djumadi Achmad, Ni Ketut Sungowati, Muhammad Husni Cangara, Rina Masadah, Berti Julian Nelwan, Prihantono Prihantono
106. Study of Quality of life at Worker User Train **Commuter line** and TransJakarta Busway Bogor - Jakarta 2018 589
David Kusmawan, Indri Hapsari Susilowati, Mufti Wirawan
107. The Effect of Sleep Hygiene and Brain Gym on Increasing Elderly Comfort and Sleep Quality 595
Nursalam, Fitriana Kurniasari S, Elida Ulfiana, Ferry Efendi

108. Analysis of Factors Relating to Practice of Breast Self-Examination (BSE) among Women in Indonesia 601
Sirajudin Noor, Diana Hardiyanti, Nursalam, Esti Yunitasari, Rr Dian Tristiana
109. Mangosteen Rind on Oral Mucositis Caused by Radio and Chemotherapy in Cancer Treatment (In Vivo Study on Rats) 606
Lanny Sunarjo, Iman Supardan, Ismi Rajiani
110. Factors Related to Personal Absorbed Dose in Health Workers at Hospital's Radiology Unit 612
Yunita Kemala Sari, Tri Martiana, Linda Dewanti
111. Analysis of Factors Related to Communication Skills in Midwifery Students 618
Rekawati Susilaningrum, Sri Utami, Nursalam Nursalam
112. Improving the Immune Response Il-10 and Secretary Immunoglobulin A in the Elderly after Getting Synbiotic 624
Rudy Hartono, Agustian Ipa, Aswita Amir, Bambang Wirjatmadi, Ridho Pratama, Ronny Horax
113. Emotional Support of Family and Depression Incidence among Elderly in Ngumpul Village, Jogoroto Sub-District, Jombang City 629
Wiwiek Widiatie, Siti Muniroh, Kurniawati
114. Role of Procalcitonin in Detection of Bacterial Pneumonia 634
Suha Maher Abed, Mohammed M. Al Boraqy, Sabah Neamah AL Fatlawi Syamsul Arifin, Fendy Suhariadi, Nyoman Anita Damayanti
115. The Influence of Leadership Style and Domicile to Power Distance of Midwife Coordinators and Village Midwives in Hulu Sungai Tengah District 641
Syamsul Arifin, Fendy Suhariadi, Nyoman Anita Damayanti
116. Qualitative Study: A History of Stunting in the Massenrempulu Community of Enrekang District 645
Agustian Ipa, R. Bambang Wirjatmadi, Shrimarti Rukmini Devy, Rudy Hartono
117. The Effect of Rosella Beverage Intervention on Lipid Profiles and Antropometric in Obese Adult Men 650
Fariza Yulia Kartika Sari, Evy Damayanthi, Lilik Kustiyah
118. Exposure of Xylene in Working Environment and Methylhippuric Acid in Informal Footwear Worker in Bogor, Indonesia 656
Ridcho Andrian Am, Ema Hermawati
119. The Analysis of Risk Factors against Malaria in the Tangkiling Public Health Center, Bukit Batu District, Palangka Raya City, Indonesia 662
Untung Halajur
120. Correlation between Micronutrient intake and Hemoglobin Preconception Women 667
Rahayu Yekti, Agussalim Bukhari, Nurhaedar Jafar, Abdul Razak Thaha

121. Antibiotic Susceptibility Profile and Molecular Characterization of Quinolones Resistant *Klebsiella Pneumonia* Isolates: First Report from Iraq 672
Sawsan Mohammed Kareem, Israa M.S. Al-Kadmy, Saba S. Kazaal, Alaa N. Mohammed Ali, Tuqa jawad abduljaleel, Zahrra Mohammed wahaeb, Zainab ali abdulhussain
122. Joint Effect of Obesity and Cigarette Smoking Against Hypertension Stage 1 among Men Adults: Finding from the Indonesian Family Life Survey-5 679
Aprizal Satria Hanafi, Nurhayati A Prihartono
123. Comparison of Various Obesity Indices against the Occurrence of Stage 1 Hypertension in Indonesia 685
Anggun Pratiwi, Nurhayati A Prihartono
124. The Status of Lipid Peroxidation System in Erysipelas Patients on the Background of Diabetes Mellitus 692
Madina Marjokhova, Marina Afashagova, Asiat Marjokhova, Maryana Nagoeva, Marina Ivanova, Marina Nalchikova, Zarema Tagirova
125. Environmental Health Risk due to Exposure to Lead in Batteries Smelter Industry- Cinangka Village, Bogor, Indonesia 697
Ladyka Viola, Haryoto Kusnoputranto, Bambang Wispriyono
126. Evaluation of Bone Mineral Density in Adult Epileptic Patients Treated with Valproate 704
Mohammad A.S. Kamil, Aqeel K. Hatem, Mustafa Easa
127. Policy and Role Analysis Integrated Health Education Centers for Non-Communicable Diseases Toward the Prevention and Controlling of Hypertension 711
Yandrizal, Rizanda Machmud, Melinda Noer, Hardisman, Ekowati Rahajeng, Desri Suryani, P.A Kodrat Pramudho
128. Association of Apolipoprotein E Polymorphism with Cognitive Functions in Elderly 717
N. Saelan Tadjudin, Andi Jayalangkara Tanra, Andi Asadul Islam, Suryani As'ad, Muh. Nasrum Massi, Ilhamjaya Patellongi, Prihantono Prihantono
129. Designing Instrument for Early Stimulation, Detection, and Intervention for Growth and Development of Children based on Android System 723
Heru Santoso Wahito Nugroho, Sunarto, Budi Joko Santosa
130. Effectiveness of the Training Model to Increase the Knowledge, Attitude, and Practice of Traditional Birth Attendants about Early Initiation of Breastfeeding in Bogor District, Indonesia 729
Evi Martha, Hadi Pratomo, Siti N. Qomariyah

Indian Journal of Public Health Research & Development

CONTENTS

Volume 9, Number 12

December 2018

131. Evaluation Cystatin C Levels and Some Factors of Renal Function in Hypertensive Patients 736
Amera Kamal Mohammed, Thanaa Abdul-Mahdi, Mahmoud Hussein Hadwan
132. A Comparison of Satellite Carbon Monoxide Measurements from MOPITT and AIRS over Iraq during the Winter and Spring of 2012 742
Jasim M. Rajab, Ibtihaj S. Abdulfattah, Hussein Abdelwahab Mossa
133. Association between Serum Calcium level and the size of Hematoma in Intracerebral Hemorrhage 749
Rafid Hadi Hameed
134. Asthma and Allergic Rhinitis are Potential Risk Factors for a Migraine in Adolescents 754
Rafid Hadi Hameed
135. Critical Thinking Activites Involve Sufficient English Language Classroom Materials Effects Students Physiological Performance and Biologically 760
Haider Hatem AL-Ijrish, Dhiaa Uweed AL-Arnoosy, Nada Abbas AL-Sltani
136. Depressive Symptoms among Hemodialysis Patients at Teaching Hospitals in Baghdad City 764
Iman A. Issa
137. Determiration of Menopausal Symptoms among Women Attending Babylon Teaching Hospital in Al-Hilla City 769
Wafaa Ahmed Ameen, Muna Abd- Al Wahab Kheleel
138. Effect of Oral Simvastatin Therapy on Patients with Plaque Psoriasis Treated with Potent Topical Steroid 776
Adhwaa Mohsen AL-Shimary, Sarmad Nory AL-Dujaly, Mohammed Kadhim AL-Hattab
139. Effect of ZnO Nanoparticles, Fullerene (C60) and Pyocyanin on Imipenem Resistant Gram Negative Bacteria Isolated from Hospital Environment 779
Dhia H. Hussain, Zahraa A. Khadam, Mohammed F. AL Marjani, Maha M. Khadim, Dunya J. Ridha, Laith B. Ali, Batoool K. Al-Mousawi
140. Effectiveness of Educational Units in the Development of Analytical Thinking 784
Ibtisam Sahib Al- Zwaini, Zeana Gabbar Ghany
141. Evaluation of Shear Bond Strength of Metal Brackets in Total Dryness and Partial Dryness Conditions 790
Issam Merzah Abdullah, Kasem Ahmed Abeas, Lamees Khudir Mohamed, Arkan Muslim Abd Al-kareem

142. Generalized Power-Law Model of Magnetohydrodynamic Blood Flow with Heat Transfer 794
Ahmed Bakheet, Esam A Alnussairy, Zuhaila Ismail, Norsarahaida Amin
143. Hydronephrosis and Ureter Dilatation in a Sample of Iraqi Patients Diagnosed and Characterized using Ultrasound Examination 801
Osamah Ayad Abdulsattar, Mohammed Ridha Jodi, Hasanain Ahmed Jasim
144. Indirect Effect of Smoking on Liver Function: A Comparative Study among Iraqi Students in Baghdad City 805
Falah S. Al-Fartusie, Hassanain K. Al-Bairmani, Emad M. Eltayef, Ahmed H Yousif
145. MRI Findings in Iraqi Patients with Epilepsy: A Cross Sectional Study 810
Hasanain Ahmed Jasim, Osamah Ayad Abdulsattar
146. Study of Occupational Health Hazards for Nursing Staff at Al -Hashimiyah General Hospital in Babylon Governorate 815
Waleed Kareem AL-Khaykane, Muna Abdul Wahab Khaleel
147. The Contributing Factors for Head Traumatic Patients and their Relation to its Outcomes at Al Hilla Teaching Hospital 822
Wafaqq Mahdi Hadi, Shatha Saadi Mohammad, Hassan Alwan Baiee
148. The Effect of Post and Brennan Strategy on the Achievement of Fourth Stage Scientific Branch Students in Biology 827
Hanan Hadi Diwan, Wafa Abdulrazaq, Abbas Hussein Mughher
149. The Effect of Teaching General Methods of Teaching on the Dimensions of Structural Theory in the Holistic Thinking of College Students 832
Saja Abd Msarhad, Mohammed Hameed Al- Masoudi
150. Ultrasound Finding in a Cohort of Iraqi Patients with Hematospermia: a Cross Sectional Study 837
Osamah Ayad Abdulsattar
151. Antipsychotics-related Knowledge of Nurses working at Baghdad Psychiatric Teaching Hospitals. 842
Ali Mlaghy Shakhat Al-Salhee, Maan Hameed Ibrahim Al-Ameri
152. Attitudes of Biological Waste Management among a Sample of Academic Personnel Working in Baghdad 848
Lamia Yaqoub Mohammed, Raghad Hassan Hussein Sanyi, Izzat Abdulsatar Mezher Al-Rayahi
153. Biological Activity of New Hydantoin Derivatives on *Acinetobacter Baumannii* Biofilm Formation Isolated from Clinical Sources 852
Ihsan Ali Raheem, Suzan Saadi Hussain, Rajwa Hasan Essa, Abdul-Jabar Kh. Atia, Fatima Rammadan Abdul
154. Building a Proposed Educational Program Based on the Skills of Close and Backward Thinking in the Creative Writing of the Fifth Literary Students 858
Mohammed Thamer Khalil Al-Rubaie, Dhiaa Awaid Harbi Al-Arnousi, Mohammed Shaker Nasser Al – Rubaie
155. Cognitive Flexibility and Its Relationship to the Divergent Thinking of Fourth Grade Students 861
Mohammed Hamid Al-Masoudi, Mohammed Shakir Naser, Haidar Maan Ibrahim

156. Decadal Analysis of Carbon Dioxide Emissions from Different State of Fossil Fuels in Iraq 865
Ahmed S. Hassan, Khawla Nihad Zaki
157. Detection of Some Virulence Factors of *Aeromonas hydrophila* Bacteria That Contaminated Tigris 869
Rasha Mohammed Sajet AL-Oqaili, Istabreq Muhammed Ali Salman, Rana Fadhil Abbas
158. Determination of Boron Concentration in Water Samples of the Rivers in Al- Diwaniya-Iraq Using CR-39 Track Detector 874
Abbas A Sweaf, Thaer M Salman
159. DNA- In Situ Localization of Human Herpes Virus-8 and Mutated P57 Genes Sequences in Tissues from a Group of Female Iraqi Patients with Breast Tumors 879
Israa Habeeb Nasser, Shakir H. Mohammed Al-Alwany
160. Effect of Snow Ball Strategy in the Comprehension Reading of Intermediate School Female Students in Reading and Texts 885
Saif Tarik Al Esawi, Monir Ubaid Al Juburi, Enas Waleed Jasim Al Zubaidi
161. Effect of the Strategy of (P.E.C.S) in the Achievement of Students in the Second Grade Intermediate in Science 890
Ahmed emad hadi Al-Janahi, Saeed Hussein Al-Thalab, Abdul Ameer Khalaf Arat
162. Efficacy of A Theory-Based Health Education in Enhancing High School Female Student's Preconception Health Behaviors in Baghdad City 895
Ruaa Seerwan Hameed, Raad K. Faraj
163. Electrical Properties of Polyaniline - PEDOT Nano Composite 901
Maan A Saleh, Abdulazeez O.Mousa, Mohammed Hadi Shinen
164. Evaluation of Mothers Practices toward Care Children with Squints in Abin-Alhithim Teaching Hospital for eyes in Bagdad City 905
Suad Hassoon Khudhair
165. Extracellular Biosynthesis of Silver Nanoparticles Using *Sphingomonas paucimobilis*, *Serratia* Sp. and *Pseudomonas aeruginosa* and Their Antimicrobial Activity 911
Hamzia Ali Ajah, Khawlah Jebur Khalaf, Ali Murtatha Hasan
166. Influence of Copper Nanoparticles on Dielectric Properties of Polystyrene 916
Mohammed Jawad Kadhim, Nahida B Hasan
167. Isolation and Identification of Bacteria Isolated From Soil That Can Degrade 3 – Chloropropionic Acid 921
Wafaa Hassan Muslem, Roswanira Abdul Wahab, Fahrul Huyop Isotopes Inhalation Rate Israa Kamil Ahmed
168. Isotopes Inhalation Rate 927
Israa Kamil Ahmed
169. Multivariate Analysis of Toxic Heavy Metals Contents in Soil Detected by Laser Induced Breakdown Spectroscopy 933
Tagreed K. Hamad, Aseel S. Jasim, Hussein T. Salloom, Alaa J. Ghazai

170. Seed Layer Thickness Effect on the Structural and Optical Characterization of TiO₂ Nanostructure Thin Film 937
Adel H. Omran Alkhayatt, Hussein Ahmed Hussein
171. The Antibacterial and Antioxidant Effect of Gold Nanoparticles that repared from Iraqi *Mentha Pulegium L* 943
Rafah M Thyab, Abass J. Attia, Mahmoud Hussein Hadwan
172. The Effectiveness of an Interactive Manual according to the Expansionary Theory in Developing the Teaching Skills of the Classroom Teaching for the Practical Education Course in Faculties of Education 949
Dihya Uweed Harbi Al Arnoosy, A'amal Sabah Rdam, Zinah Jabbar Gheni
173. The Impact of the Roving Reporter Strategy on the Development of Students' Cognitive Motivation 955
Qassem Raed Jabbar, Haidar Hatem Al Ajrash, Jassim Shaalan Al Ghazal
174. Using the Constructs of the Transtheoretical Model of Change in Enhancing Regular Physical Exercise for Female High School Students 960
Zainab Moayad Hamzah, Mohammed Baqer Habeeb Abd Ali
175. Assessment of Knowledge and Attitudes of Primary School Health Coordinators Regarding School Injuries in AL-Hilla District 966
Hussein H Hasan, Muna A Khaleel, Naji Y. Saadoon
176. Association between Domestic Violence and Depression among Women Attending Primary Health Care Center in AL-Hilla City 971
Hind Tasjeel Abass, Hasan Alwan Baiee, Hayder Hamzah Al-Hadrawi
177. Association of Obesity, Diabetes, and Hypertension with Cognitive Impairment in Older age 976
Rafid Hadi Hameed
178. Content Analysis of Subject Matter According to Basic Thinking Skills, Environment and Psycho-affective 982
Shahla Abdul Kadhim Hadi, Maysaa Yousif Naser, Abd Ali Nayif Hasan
179. Detection of Parasites from two Species of Biological Vectors in the City of Samawah 987
Yassir Dakheel Kremsh Alasadiy
180. Detection of Serum Resistance Genes (*lppA* and *omK36*) in Enterobacteriaceae Species Isolated From Extraintestinal Infections 993
Hayder Shkhair Al-Janabi, Mohanad Jawad Kadhim, Mohammed Talib Altameemi, Thualfiqar Galib Turke, Rusul Adel Jabar, Zainab Mohamed Sahab
181. Effectiveness of Nursing Intervention for Early Detection of Breast Cancer among Working Women at Baghdad City 999
Iqbal Majeed Abbas, Rabe'a Mohsen Ali, Widad K. Mohammed, Iman Abdel Razzak Jaber
182. Effectiveness of Planned Teaching Program regarding Autistic Child in Mothers' Knowledge in Thi-Qar Autistic Center in AL- Nasiriya City 1006
Suror H. Aneed, Eqbal G. Ali Ma'ala

183. Evaluation Study of Risk Factors (Alcohol, Smoking, Age, Family History, and Obesity) Associated with both Rheumatoid Arthritis and Cancer 1013
Rafid Hadi Hameed
184. Identification of Active Pharmaceutical Ingredients in *Thevetia nerifolia* Juss Leaf Callus using Analysis of GC-MS 1019
Siham A. Salim
185. Impact of Multimedia Teaching in the Development of Positive Thinking among Students 1024
Sadiq Hasan Al-Tufaily, Hussein Waheed Al-Kaaby, Mohammed Kadhim Al-Hamadani
186. Post-Tonsillectomy Risks in a Long term: Meta-Analysis Study 1029
Rafid Hadi Hameed
187. Potential Adverse Effects of Radio Frequency-Electromagnetic Fields RF-EMF 1035
Rafid Hadi Hameed
188. Prognostic Role of STAT-3 Upregulation in Oral Squamous Cell Carcinoma 1040
Osama M Ghazi , Lehadh M. Al-Azzawi
189. Security and Interoperability Issues in IoT based Healthcare Architectures 1045
Noor Mueen Mohammed Ali Hayder
190. Social Stigma Circumstances toward Tuberculosis in Hilla City / Iraq: Community Insight 1050
Hadeel M. Fadel, Salma K. J. Jehad
191. The Administrative Reformation and its Impact on Reducing the Psychological Pressure of Workers: Case Study in the Forensic Medicine Department in Babylon Governorate 1057
Rehab Hussein Jawad, Laith Ali Yosif Al-Hakim, Raa'd Handhal Taresh
192. The Effect of IL-6 Expression on the Behavior of Oral Squamous Cell Carcinoma Cells (An immunohistochemical Study) 1063
Osama M. Ghazi, Lehadh M. Al-Azzawi
193. The Effect of MST approach in The Clever Mental Thinking of Pupils 1069
Mahdi Mohammed J, Arif Hatim J
194. The Effect of Vitamin D and Leucine - Enriched whey Protein Nutritional Supplement on Measures of Sarcopenia in Older Adults 1074
Rafid Hadi Hameed
195. The Impact of the Numbered Heads and the Active Hand Strategy in the Achievement for the Fifth Grade in Primary in Science Approach 1080
Nada Samir Obaid Al-Jubouri, Saeed Hussein Ali Al-Thalab, Osama Abid Kadhim Mahdi
196. The Impact of Using Tablets on Developing Listening Skill & perception as a Brain Process of EFL Primary School Pupils 1086
Amjad Abdulhussien Hammad, Sabeeha Hamza Dehham, Nadia Ali Akbar
197. The Risk of Rheumatoid Arthritis in Patient with Type 2 Diabetes Mellitus Receiving DPP4 Inhibitors 1091
Rafid Hadi Hameed

212. The Effect of Rainfall on the Ratio of Atmospheric Carbon Dioxide Drift for the 2015-2016 Season 1181
Khawla N. Zaki, Monim H. Al-jboory, Ruaa M. Ibrahim
213. Histopathological Study of Infection with Helminthic Parasites Intestinal of some Tigris River Fish passing Through Tikrit City, Iraq 1188
AlShaima Mohammed Jasim, Sinai Najy Muhsin, Ail Mohammed Abed
214. Leukemia Detection Using Image Processing 1194
Raid Abd Alreda Shekan, Ahmed Mahdi Abdulkadium, Ali Mohammed Abdul majid
215. Relation Level between Physics Nature and Science Teaching Methods for Preparatory Grade Physics Teachers 1199
Ahlam Hameed Al-Janabi, Dihya Uweed Al-Arnoosy, Hamdan Mahdi Abbas
216. The Effectiveness of a Proposed Teaching Method to Develop the Productive Thinking Skills of Primary School Students in Reading 1204
Reyadh Hatif Obaid
217. The Effectiveness of the Token Reinforcement in Reducing The Aggressive Behaviour Among Pupils With Learning Difficulties 1210
Wadian Jawad Abul-Kadhim, Ryadh Hatif Obaid, Hawraa Abbas Krmash
218. Effects of Silver Nanoparticles on Biofilms of *Streptococcus* Spps 1216
Mais Emad.Ahmed, Zainab Zamel Khalaf, Jenan A.Ghafil, Ahmed Qassim Al-Awadi
219. Activity Measurement of Airborne Alpha and Beta Particles in Destroyed Radiochemical Laboratories, at Al-Tuwaita-Iraq 1222
Iman Tarik Al-Alawy, Osamah Abdulameer Mzher
220. Antibacterial and Anti virulence Factors activity of ZnO nanoparticles Biosynthesized by *Lactococcus lactis* ssp. *Lactis* 1228
Afraa Ali Kadhim, Jehan Abdul Sattar Salman, AdawiyaJumaa Haider
221. Calculation of Optimum time Exposure of Ultraviolet Radiation for Different Seasons at Baghdad City 1234
Ahmed Ali Hameed, Firas Sabeeh Basheer
222. Cell–Cell Communication (Quorum Sensing) in Gram-Negative and Gram-Positive Bacteria: A Review 1238
Ghaidaa J. Mohammed, Firas S. Abd Al-Mayahi, Habeeb W. Kadhum, Ali B. Muhsen
223. Closed Loop System Synchronization of Quantum Dot Semiconductor Lasers with Optical Feedback 1243
Basim Abdullattif Ghalib, Noor D Mohammed Taqi, Riyad N Ali
224. The Effectiveness of Tablets in Developing Teaching Skills at the University 1247
Ahmed Iyad Anwar, Haidar Hatem Al-ijrish
225. Using the Constructs of the Health Belief Model in Changing the Health Beliefs of Male Nurses about Testicular Self-Examinations 1252
Nabeel Abdulrazzaq Jasim, Arkan Bahlol Naji

226. Effectiveness of Polytechnic (Applied) Theory in the Development of Information Processing Methods among Secondary School Students 1258
Aarif Hatem Al-Jubouri, Alaa Ibrahim Razouk
227. Cloud Platform Specification based on Bioinformatics Application 1263
Yasmin Makki Mohialden, Huda Abdulaali Abdulbaqi, Rafaa Ismael Yahya, Basim K. Abbas, Saba Abdulbaqi Salman
228. Effect of Strategy of “Plan” in Correcting Wrong Geographical Concepts and Commuting the Exam Concern of Literary 5th Level’s Student 1268
Ali Salman Dhahi, Mahdi Jader Al-Kilaby, Saad Abdulrazzaq
229. Effect of Teaching the Reading and Texts by the Two Strategies of (SLap & CSR) On Expressional Performance of 2nd Intermediate Grade Students 1271
Aseel Tahseen Ulaiwy, Dihya Uweed Harbi alarnoosy
230. Fabrication of a Solar Cells by Organic – Inorganic Hybrid Perovskites 1276
Aref S. Baron, Sattar J. Kasim, Adel H Omran
231. Improving an Illumination System in the Microscopic Imaging of Nuclear Tracks Using Light Emitting Diode 1282
Saja Faez Hassan, Iman Tarik Al-Alawy, Hazim Gati Daway
232. Social Psychology, Political and Scientific Situation of the Eighth Century AH the era of the Pride Investigators (Fakhr Al-Muhakikin) 1288
Ali Obayes Hussein, Yousif Kadhum Gogahle, Abdulsattar Nsaif Jasim
233. The Effectiveness of the Theory of Expansion in the Development of Mental Skills among Students 1292
Dihya Uweed Alarnoosy, Amaal Sabah Radah Al-Taei
234. The Impact of the Clustering Strategy in the Acquisition of Students in Junior High in Grammar Arabic 1297
Marwa Tawfiq Makki Al-Khafaji, Saad Hassan Alaw, Khalid Rahi Hadi
235. The Training Effect on Listening Skills in the Pupils’ Achievement with Learning Difficulties in Reading 1302
Nawras Fattlawi Kmil, Abdul Salam Jawdat Al-Zubaidi
236. Theoretical Study of Extensive Air Shower Effects in Atmosphere by Simulating the Lateral structure of Several Cosmic Radiations 1307
Hassanen Abdulhussaeen Jassim, A. A. Al-Rubaiee, Iman Tarik Al-Alawy
237. Type II Toxin Antitoxin System in Imipenem Resistant *Klebsiella pneumonia* in Baghdad, Iraq 1312
Fatima S. Ali, Mohammed F. AL Marjani, Sawsan H. Authman
238. Fiber Content and Acceptability of Rice Bran Cookies for Young Women in Mamuju Regency 1319
Zaki Irwan
239. The Role of Religion and Spiritually in the Care of Patients in Family Medicine 1324
Rafid Hadi Hameed
240. Analysis of the Association between Sebum Levels and Staphylococcus Epidermidis Infection Identified by PCR in Comedonal, Papular, and Nodular Acne Vulgaris 1329
Farida Tabri

241. The Influence of Diabetic Foot Gymnastic to Body Balance in Elderly Diabetes Mellitus Patients in Gatoel Mojokerto Hospital Diabetic Club 1334
Tatik Sutarti, Muhith Abdul, Mallongi Anwar, Sandu Siyoto, M Himawan Saputra
242. The Model of Supervision for Impermanent Food Sellers by Women Volunteer in Kendari City Indonesia 1339
Tasnim Tasnim, Maria Inge Lusida
243. Resistance Status in *Aedes Aegypti* Strain from North Toraja, Indonesia to Malathion and Temephos Insecticides 1345
Hasanuddin Ishak, Sepri Ponno
244. Can The Length of Nurse Employment Lead to Work-related Stress at Inpatient Ward in Hasanuddin University Hospital, A Teaching Hospital, Makassar, Indonesia 1349
Andi Indahwati Sidin, Adellia U.A.Mangilep, Sri Dewiyanti
245. Potential Honey Propolis Trigona to Prevent Arthritis Rheumatoid by Increase Foxp3 Level; A Preliminary Study 1353
Andi Zulkifli Abdullah, Agussalim Bukhari, Aliyah, Andi Nilawati Usman
246. Human Dimension Plays a Role in Realizing The Health of the Urban Dwelling, Jakarta, Indonesia 1359
Dyah Nurwidyaningrum, Haryoto Kusnoputranto, Setyo S. Moersidik, Emirhadi Suganda
247. Maternal Education Level and Parental Income Toward Stunting to Students of Salulayang Elementary School in Mamuju Regency 1367
Adriyani Adam, Andi Salim
248. Analysis of Educational Factors, Interest and Motivation Towards the Behavior of Early Detection of Cancer Cerviks in Women of Fertile Age in the Upt Health Center Kembangbahu Lamongan 1371
Tatik Sutarti, Muhith Abdul, Anwar Mallongi, M. Himawan Saputra, lilik Darmawati
249. Ineffective Regulation of Narcotics Crime Prevention (Criminology Perspective) 1376
Amir Ilyas, Rini Anggraeni, Yuyun Widaningsih
250. Multivariate Analysis of the Occurrence of Needlestick Injuries on the Nurses at X Hospital in Makassar 1382
Atjo Wahyu, Rostati, Sudirman Nasir
251. Factors That Affect the Quality of Life of Pregnant Women 1389
Muhammad Anwar, Saifuddin, Ridwan Amiruddin, Ridwan Thaha
252. Developing and Validating Low Cost Male Catheterization Mannequin as Learning Media in Clinical Skills Learning 1395
Indah Puspasari Kiy Demak, Puspita Sari, Andi Alfia Muthmainah Tanra, Sumarni, Reyhan Kiy Demak, Anwar Mallongi
253. New Approach for Referral Preparation to the Health Care Center in Denpasar City and Bogor Regency 1399
Ni Komang Yuni Rahyani, Gusti Agung Ayu Budi, Wayan Dian Ekayanti
254. The Difference Existence of *Aedes* sp Larvae based on Ovitrap Locating in Samarinda City Indonesia 1405
Mardiana, Arief Wibowo, Mahmudah

198. Assessment of Caregivers' Awareness about Home Care of Neutropenia among Children with Leukemia at Oncology Wards in Baghdad City 1096
Asmahan Qasim Mohammed, Shahznhan Hassan Badr, Marwah Salah Muslem
199. Antioxidant Enzyme Responses of *Juncus Aschers. (Et Buch.)Adams* to Some of Environmental Stresses and use it as Indicators 1102
Muthik A. Guda, Afyaa S. Nasir, Azhar Sh. Younus, Attyaf J. T. Altamimi
200. Anti-Quorum Sensing Nanonetwork 1108
Athraa Juhi Jani
201. Grading of Metabolic Syndrome Components as Premonitory Denotations for Cardiovascular Diseases 1115
Saja Ali Abbas, Majed M. Mahmood
202. Synthesis and Study anti-Bacterial Activity of New Dimidazole Derivatives 1119
Alaa J. Hamad, Abdul Jabar K. Atia, Mohammed F. Al-Marjani, Sahar Abdullah K., Redha I. AL-Bayti, Enaam H. Batah
203. Assessment of Risk Management Concerning Environmental Pollution Resulting from Musayyib Electricity Generation Plant in Babylon Governorate 1125
Ali Salman Hassan, Mohammed M. Radhi
204. Effect of Strategy within and Outside the Circle in the Achievement of Students in the Fifth Grade in Social Studies 1131
Hussein Ali Mohammed, Jinan Marza Hamza, Mohammed Resen Damman
205. Occurrence, and Preventive Measures of Injuries by Needles and Sharp Objects in Governmental Hospitals, (AL- Amara City, Iraq) 1136
Amjad Hashim Mohammed, Thani Asmar Radhi, Saad Sabri Shamkh, Aqeel Ghilaim Oglah
206. Assessment of the Patients' Knowledge about their Disease for Rheumatoid arthritis at Baghdad Teaching Hospital 1141
Hashim Jebur Abed AL-Kaabi, Khalida Alwan Mansour
207. Immunohistochemical Expression of CDX2 Protein in Iraqi Patients with Human Gastric Cancer (HGC) 1148
Hanan Jameel Ashour, Nahla A. Al-Bakri, Kifah Hamdan Abdul-Ghafour
208. Association between Transcription Factors 7-like 2 (rs7903146) Polymorphism and Some Renal Biomarkers with Type 2 Diabetic Nephropathy Complications 1154
Ziyad Tariq Abd AL-Razzaq, Alaa Frak Hussain, Emad Abbas Al Mulla
209. Effect of Vitamin D Deficiency in Pregnant Woman 1161
Faeza A Fakhry
210. Environmental Assessment of the Quality of Water and the Hydrochemical Formula Used for Some Groundwater Wells in Karbala Governorate 1168
Raad Mahmoad Nasif Al-Khafaji, Adnan Jassam Hammady
211. Effectiveness of an Educational Program on Nurses' Knowledge toward Restraint and Seclusion for inpatients at Psychiatric Teaching Hospitals 1175
Nibras.H. Abdel-Hussein, Saja. H. Mohamed

255. Relationship of Sleep Quality with Student Learning Motivation in Nursing Academy 17 of Karanganyar 1410
Tatik Sutarti, Dyah Rohma Wati, Muhith Abdul, Mallongi Anwar
256. The Risk of Disease Transmission from Bat's Bacteria to Humans and other Animals 1414
Siti Rabiatal Fajri, Sri Nopita Primawati, Islamul Hadi, Galuh Tresnani
257. The Effectiveness of Health Education on Improving Santris' Knowledge about the Dangers of Scabies at Al Mubtadi'ien Bahrul Ulum Tambak Beras Jombang 1421
Tatik Sutarti, Muhith Abdul, Mallongi Anwar, Ronasari Mahaji Putri, Novita Dewi
258. New Approach for Referral Preparation to the Health Care Center in Denpasar City and Bogor Regency 1426
Ni Komang Yuni Rahyani, Gusti Agung Ayu Budi, Wayan Dian Ekayanti
259. Product Quality of the Local Fried Onion in Palu City, Indonesia 1431
Yusma Indah Jayadi, Nikmah Utami Dewi, Muhammad Nasir, Ayu Astari Puspitasari, Hermiyanti, Herman Kurniawan
260. Economic Burden of Cancer Patients at Hasanuddin University Teaching Hospital, Makassar : A Qualitative Study. 1438
Amran Razak, M Alimin Maidin, Muhammad Tamar, Zuardin
261. The Effectiveness of 0.03% Bimatoprost Solution Vs Minoxidil 5% in Androgenic Alopecia 1444
Farida Tabri, Anis Irawan Anwar, Anni Adriani¹, Dwi Aryaningrum
262. Expression of TLR-4 in *Salmonella typhi*-Induced Balb/c Mice Treated by Miana Leaves (*Coleus scutellaroides* (L) Benth) 1449
Fadhilah Syamsuri, Mochammad Hatta, Rosdiana Natzir, Gemini Alam, Muhammad Nasrum Massi, Burhanuddin Bahar, Sutji Pratiwi Rahardjo
263. Correlation of Stimulation with Development of 2-Year-Old Babies (Baduta) in Mamuju District, West Sulawesi 1455
Supratti
264. Analysis of Malaria Incidence based on Behavioral Factors in the Islands 1461
Irma Muslimin, Andi Salim
265. Community Empowerment in Management Community-based Total Sanitation through Health Education in Majene 1466
Abdul Ganing, Asrie Abu, Harpenas, Irma Muslimin, Adriyani Adam
266. Changes in Attitudes in Stunting Prevention through ASAKI Animation Media for Pregnant Women 1472
Andi Salim
267. The Effect of Pornography Accessity to Influence Sexual Behavior 1477
Sandu Siyoto, Mayta Sari Dwianggimawati, Atik Setiawan Wahyu N, Dhita Kurnia Sari, Riza Tsalastatul Mufida, Muhammad Ali Sodik
268. Developmental and Growth Delays (Stunting) on Students of Salulayang Elementary School in Mamuju Regency 1482
Yudianti

Indian Journal of Public Health Research & Development

CONTENTS

Volume 9, Number 12

December 2018

269. Implementation of Low Power LFSR's Design through the use of GDI Method 1486
P Soundarya Mala, Ch Srigiri, R Jayaram Kumar, Srivani Vaddi
270. Analysis of Image Segmentation of Magnetic Resonance Image in the Presence of in
homogeneities 1492
B Sujatha, K Jyotsna, M Madhavi, V Kusuma Kumari
271. Monitoring and Controlling of Pest in Agriculture Plantations using Pre Processing
algorithm 1499
Srija Madhu, D Om Prakash, S Mohan Krishna, I Srinivasa Rao, P Sreekanth
272. Analysis of Conical Dielectric Probe is Used to Identify the Defective Skin Phantom 1504
Biswaranjan Barik, K Seetharama Raju, Ch.S.Giri, Rupalin Nanda
273. Integration of Unobservant Web Information for Enhanced Information Retrieval System 1509
M S Chakravarthy, S Kumar Reddy, V AjayKumar, P Sreeramachandra
274. Security Approaches of Fault Tolerance using Cloud Computing Platform 1514
P.S.R.Chandra, T.V.Prasad, A Pavani Kumari, Madhu.S, I. Lova Prasad
275. Recognition of Object using Improved Features Extracted from Deep Convolution
Network 1517
D Satti Babu, Leelavathy N, Ramakrushna Rath, M.V. Satish Varma
276. Development of Integrated and Efficient Non Conventional Power Distribution 1525
D.Ravi Kishore, I.Solomon Raju, G.Chandrasekhar Reddy, T.J.Prasannamba
277. Smart Home Power Management using Load Serving Substances by IOT 1529
M John Sreenivasa Rao, N.Vijaya Kumar, P Suguna Ratna Mala, K.Narendra Babu
278. School Children's Vehicles Tracking and Identifying System by using GPS and
IoT Technology 1534
A.Abdul Rahman, Sujata.B, A.Vandana Peter, Radha Mohan Patnaik, M.V.N. Lakshmi Durga
279. Smart Grid System Architecture over Embedded System using Internet of Things 1539
M Saritha Devi, D.Vijendra Kumar, A Madhu, B Naveen Kumar
280. Analysis of Space Period Blocks Codes for Independent Channel Coefficient Using MIMI-CDMA
Techniques 1544
M.S.K.Reddy, P.Nagamani, Sunila Sailaja, B Manoj
281. Automated Fault Recognition in Power Line Patrolling Using GSM and IoT Technology 1548
Kishore R.D, M. Ramjee Sakpal, P Amar Kiran, M.V. Raghavendra Reddy

282.	Advance Development of Warning Alarm System for Earthquake Using MEMS Sensor	1553
	<i>Prasad TV, Barik B, Ratnavalli BL, Babu D Satti</i>	
283.	Designing a Parabolic Double Bi Quad Micro Strip Patch Antenna for High Gain Bandwidth	1557
	<i>G.Venkata Vinod, G Srujana, Ch Rajesh Babu, B Santosh Kumar</i>	
284.	Advance TMR and Clock Gating Technique to Design Fault Tolerant ALU	1561
	<i>Ch R Babu, Ravi Kumar K, Shaik Abdul, Appala Ratna Kishore</i>	
285.	Pressure Monitoring by Capturing IR Image	1566
	<i>Patnaik R.P, MVNL Durga, E Radhika, A Pavana Kumari</i>	
286.	Automatic Monitoring of Human Body Physiological Parameters Using Lab VIEW	1570
	<i>G.V.Vinod, V Lavanya, Venkata Ramana, Durga Bhavani</i>	
287.	IoT based Water Quality Monitoring System Using WSN	1575
	<i>G V Vinod, A.V.Peter, I.S.Rao, Sailaja.S, Y.S.Naga Babu</i>	
288.	IoT Based Health Care Monitoring System using Wireless sensor Networks	1579
	<i>Ch. Uma Devi, Prasad T.V, Jyotsna.K, M.Madhavi</i>	
289.	Toxic Gases Identifying in Industries with Alert System using IoT	1584
	<i>M.S.Varma, N Leelavathi, Sirisha Sangamitra, Venkateswara Kiran</i>	
290.	Design and Development of Advance Data Mining Technique for Extraction of Data	1589
	<i>P.Nagamani, Satya Lakshmi, K.V.K.Sasikanth, M.V.Sangameshwar</i>	
291.	Balanced Health Monitoring System using Stop Words for Social Big Data Applications	1595
	<i>M V Sangam, Ramakrushna Rath, G Appala Raju, R Bala Dinakar, G Venkata Rao</i>	
292.	Identification and Detection of Unwanted Data in Online Promotion Social Networks	1602
	<i>B B Ranjan, Srujana G, Rupalin N, P.Kiranmai</i>	
293.	An Efficient Approach to Identify the Cybercrime through Big Data Analytics	1609
	<i>K.V.K Sasikanth, M.V. Sangameshwar, SK Hussain, Sirisha S, Manoj B</i>	
294.	Intelligent Home Automation System Using GPRS A Smart Switch to Connect and Disconnect Electrical Devices at Home by Using Internet	1615
	<i>Palle Rakesh, B.N. Srinivas</i>	
295.	IoT based Advanced Health Care System Using Wireless Sensor Networks	1618
	<i>G Sudhakar Reddy, P Sandhya</i>	
296.	An Efficient Robotic Process Automation Platform Designed for the Modern Enterprise Home Using GSM and CDMA	1623
	<i>N. Ramakrishnaiah, Chukka Santhaiah, B.Venkateswara Rao</i>	
297.	Multilingual Sentiment Analysis of Hinglish Tweets	1627
	<i>Sukanya Ledalla, Tummala Sita Mahalakshmi</i>	
298.	An Efficient Technique for Energy Proficient Clustering based Routing for Packet Split and Merge in Wireless Sensor Networks	1632
	<i>Chukka Santhaiah, N. Ramakrishnaiah, B Tejaswi</i>	
299.	A Study on the Development of Machine Learning in Health Analysis	1637
	<i>Suresh Kumar Mandala, Neelima Gurrapu, Mahipal Reddy Pulyala</i>	

Indian Journal of Public Health Research & Development

CONTENTS

Volume 9, Number 12

December 2018

300. Error of Judgment and Vicarious Liability of the Hospitals in case of Medical Negligence in India 1642
Navin Kumar Koodamara, Santhosh Kumar A
301. Vitamin D Deficiency and First Trimester Miscarriage A Case Control Study 1645
Shaymaa Abd. Hassan
302. A Study on Attitude towards using New Technologies among B.Ed. Student Teachers in relation to few Biographical Variables 1649
Smt.Nandini N
303. Effect of Flipped Classroom Instructional Strategy on Self Directed Learning 1652
Arjinder Kaur, Amit Kauts
304. Modeling a Variant of Periodic Heterogeneous Vehicle Routing Problem with Driver Scheduling 1657
Sutarman, Herman Mawengkang
305. Impact of Webquest on Student Engagement 1665
Sukhmandeep Kaur, Amit Kauts
306. Teacher Effectiveness and Adjustment in Relation to Organizational Politics in Bhutan1670
Kamalpreet Kaur, Thinley Wangchuk
307. Research and Integration of IoT based Solar Photovoltaic Panel Health Monitoring System 1678
S. S. S. Ranjit, M Abbod, Reader
308. Challenging Issues for Educating the Disabled Children in Inclusive Education System 1685
Arsi Prasad Jha
309. Techno-Pedagogical Competence among Senior Secondary School Teachers 1693
Preeti Bala, Imli Kokla
310. Stylised Facts on Drivers and Constraints in Zimbabwe's Manufacturing Sector Performance 1699
David Damiyano, Nirmala Dorasamy, Lawrence M Lekhanya
311. Cyber Bullying as an Outcome of Social Media Usage: A Literature Review 1706
Pavitar Parkash Singh, Vijay Kumar, Majid Sadeeq
312. Perception on the Commitment of Organization Board: Modeling with Importance Performance Analysis 1711
Pasukat Sembiring, Ujian Sinulingga, Marihat Situmorang

313.	Impact of Leadership Styles of Secondary School Principals on Work Motivation of Teachers in Bhutan	1719
	<i>Harish Mittu, Sonam Tenzin</i>	
314.	Art of Visual Communication, Evolution and its Impact	1725
	<i>Nida Ijaz</i>	
315.	Professional Ethics of Teacher Educators in Relation to Value Pattern	1729
	<i>Sasmita Kar</i>	
316.	Eve-Teasing: Effect on Emotional Intelligence of Adolescent Girls In Relation to Stress	1734
	<i>Amardeep Kaur</i>	
317.	The Efficacy of Prophylactic Imepemen in Preventing Post-Ureterorenoscopy Fever	1741
	<i>Ahmed. NazarDhannoon</i>	
318.	A Study of Impact of Ict on Critical Thinking of Elementary Level Mathematics Students	1745
	<i>Pooja Pant, Prof. Alka Muddgal</i>	
319.	Depression among Senior Secondary School Students: Influence of Internet Addiction	1749
	<i>Navdeep Singh Raji</i>	
320.	Assessing Leadership Styles of Higher Education Students through Blake and Mouton's Managerial Grid	1754
	<i>KanikaGarg, Mridula Mishra, ChanchalWadhawan</i>	
321.	Career Indecision among Senior Secondary School Students: Impact of Internet Savviness	1759
	<i>Navdeep Singh Raji, SasmitaKar</i>	
322.	Linguistic Intelligence and Social Intelligence in Secondary School Students: A Regression Analysis	1767
	<i>Rajib Chakraborty, SyedaSadiyaSadath, Dr.Vijay Kumar Chechi</i>	
323.	Impact of Adversity Quotient on Learning Behaviour among Secondary School Students	1773
	<i>Kundan Singh, Sabina Parveen</i>	
324.	Perceived Social Support and Perceived Stress, Relations to Adjustment among Migrant Students: A Test of Buffering Hypothesis	1780
	<i>Neha Vats, Navdeep Kaur</i>	
325.	Reinforced Concrete Bridge Structural Health Classification using Hybrid Principal Component Analysis and Artificial Neural Network Approach with Wireless Sensor Network	1788
	<i>R.S. Concepcion II</i>	
326.	Optimization Modeling for Sustainable Production and Scheduling of Crude Palm Oil Milling Industries	1795
	<i>Herman Mawengkang, Sutarman</i>	
327.	An Integer Programming Model For Sustainable Multi-Product Fish Production Planning Problem	1802
	<i>Firmansyah, Herman Mawengkang, Sutarman</i>	
328.	Phenanthrene Biodegradation Efficiency of Bacillus sp. P4a Isolated from Hydrocarbon Contaminated Soil	1810
	<i>A. Fazila, N. Ismail, I.Darah</i>	

329. Work Place Happiness: A Tool for Teacher Effectiveness 1816
Cheki Gyeltshen, Nimisha Beri
330. The Participation of Women in the Village Adat Justice: the Regulations and Its Implementations in North Aceh Regency 1821
Manfarisyah, dan Yulia
331. The Influence of Economic Growth Per Capita and the Average Length of Schooling on the Human Development Index in West Java 1826
Andria Zulfa, Rita Meutia
332. The Optimal Level of Production Factors to be Applied of Maize Farming at Kuta Makmur District North Aceh Regency 1832
M Benbuleuen
333. Procedure for Integrated Administration Services, Infrastructure Facilities for Public fulfillment with Service Quality in Purwosari District 1838
Dyah Sawitri, Aprieni Eko Sulistyawati, Riezky Amalia, Enlik Kresnaini
334. The Role of Women in Food Security (Case Study of Rice Farmers in Blang Pala Village, Banda Baro District, Aceh Utara Regency) 1844
N Shamadiyah, P.P.P.A, Nasution
335. Erosion Prediction and Soil Conservation Planning in Krueng Seulimum Watershed Aceh Province, Indonesia 1849
H Akbar, K Murtalaksono, N Sinukaban, S Arsyad
336. Creative Economic Strategy Base on Local Wisdom- An Effort in Increasing Global Competitiveness in Malang Raya 1856
Ana Sopanah, Syamsul Bahri, Mohammad Ghozali
337. The Effect of Firm Decision Making of Risk Preference Concerning to Debt to the Firm Performance in Indonesian Stock Exchange 1863
Yohanes Indrayono
338. Analysis of Relationship Cost with Household Food Security of Farmers in Padang City 1868
R Praza, Nofialdi, Jafrinur, N Shamadiyah
339. The Transformation of Free Aceh Movement (GAM) from Armed Movement into Political Movement: Strategy and Challenges of Aceh Party (PA) 1875
M. Akmal, Misri A. Muchsin, T.M. Jamil, Rusli Yusuf
340. Analysis the Competitive Advantage of Arabica Gayo Coffee Organic in Indonesia 1880
Mariyudi, Suryadi, M Sayuti, Hendra Raza
341. An Analysis of Culture Value in Adat Bak Poe Teumeureuhom, Hukom Bak Syiah Kuala, qanun Bak Putro Phang, Reusam Bak Binatara 1985
Khalsiah, R Candrasari, N Fadhillah, R Praza, N Desiariawati
342. Storytelling to Narrate the Heart Through Historical Tourism to Internalize the Values of Local Wisdom 1890
Bachtiar Akob
343. Analysis of Productivity Measurement Using Marvien.e Mundel Method in Zakat Board of Lhokseumawe City 1896
Anwar ST. MT.M.Ag. IPU, Ardiansyah Nasution

344. The Effect of Islamic Work Ethic and Motivation through the Organizational Citizenship Behaviour and Employee Performance at Bank Aceh Syariah 1903
Y Dharma, A Ikhsan
345. Development of a Creative Economy Model as an Alternative in Poverty Alleviation 1910
Anwar Puteh, Em. Yusuf Iis, Azhar Hasan, Aiyub Yahya, Nurul Mawaddah
346. Effect of Highway Network Connectivity on Regional Development in the North Zone of Aceh 1915
H Fithra, Sirojuzilam, S M Saleh, Erlina
347. The Existence of Keujruen Blang in the Management of Water Resources as Local Wisdom in Rice Farming in Sawang Sub-District 1923
Yulia, Manfarisyah, Sulaiman
348. The Influence of Transformational Leadership and Organization Commitment on the Job Satisfaction and the Employees Performance of City Council Secretaries in Bireuen District 1928
Marbawi, Apridar, Yulius Dharma
349. The Impact of Sulfur Dioxide and Dust Pollutant Emission from Industrial Area Toward the Ambient Air Changes in Cilegon City 1934
Yayat Ruhiat, Abdul Fatah, Rian Fahrizal
350. Uterine Inversion After Normal Delivery; A Case Report 1941
Rajuddin, Afifi
351. Prospect of Minapolitan Area Development in Aceh Timur Regency 1945
Mawardati, Jamilah
352. Credibility-Profit Chain in Indonesian Islamic Banking Industry 1951
Naufal Bachri
353. An Analysis of the Potentiality (Loan Repayment Capacity) of Unorganised Sector Employees on the basis of Ratio Analysis Related to their Disposable and Discretionary Income 1957
Sharad Mittal
354. Customers' Attitude Towards Shopping Malls: Does Gender Matter? 1963
Bhavik U. Swadia, Jaimin Patel
355. Computer Vision Syndrome in Visual Display Terminal users (VDT) 1967
Mohammad Nooruz Zaman, Varsha Singh
356. Enhanced Improvement in Dynamic Behavior of Hybrid Active Power Filter using PI Controllers and Fuzzy Logic 1972
N. Madhuri, P.Chandra Sekhar, M.Suryakalavathi
357. Forensic Accounting as a White-Collar Crime Detection Tool: A Study 1978
Riya Jimmy, Gokul S, Jayashankar J
358. Analysis of the Impact of Perda Implementation Number 2 of 2014 on the Development of Prostitution in Jambi City 1985
Anismar, Burlian Senjaya, Teuku Muzaffarsyah, Dida Helena

359. The Reflection on the Implementation of Pre-Marriage Course in Aceh 1989
Jamaluddin, Faisal, Nanda Amalia
360. An Efficiency Analysis in the Zimbabwean Metal Manufacturing Sector 1995
David Damiyano, Nirmala Dorasamy, Lawrence M Lekhanya
361. Low Cost Child Abduction Prevention with RFID Technology 2001
A.Kamaraj, C.KalyanaSunadaram, G.Shobana

Indian Journal of Public Health Research & Development

Contents

Volume 9, Number 12

December 2018

362. The Nursing Image of College Students 2006
Jeong In Lee, Mi Lim Im
363. Data Analysis on the Application of Advanced Information System to Relieve Knee Osteoarthritis in Korean Adults 2011
Seong-Ran Lee
364. Effects of Isometric Pull-Down Exercises on Acromio-Humeral Distance According to Various Angle 2017
Mi-Ra Lim, Na-Hyun An, Dong-Yeop Lee, Ji-Heon Hong, Jin-Seop Kim, Jae-Ho Yu
365. Development of Running-bra Pattern for Mid-aged Women 2024
Do Yoon Park, Mi Hyang Na
366. Evaluation of Visual Image with Change in Collar Design and Width 2029
Jeong Ha Kim, MiHyang Na
367. Investigating Major Related Determinants of Short or Long Sleep Time among Older Koreans in the Community 2034
Hye-Sook Choi, Moon-Hee Kwon
368. Usefulness assessment of Stereotactic Body Radiation Therapy with Breathing Observation (RPM system) in Lung Cancer Patients 2039
Geum-Mun Back, Soo-Kyung Na
369. The Effects of Support Surface Change and Upper Arm Resistance Exercise on Abdominal Muscle Thickness 2045
Jun-Seok Seo, Bo-Kyung Heo, Keon-Cheol Lee, Dong-Yeop Lee
370. Study on Efficiency of Joint Research on National R&D Projects by Research Entity and Technology Life Cycle 2050
Byeongjeong Kim, HanjoJeong
371. Evaluation of Benefit of Prophylactic Scaling Service According to National Health Insurance Policies 2056
Eunsuk Ahn, Soyoun An, Younsoo Shim, Jongbin Kim, Jisun Shin, Sungwoo Shin, Jongsoo Kim
372. Meta-analysis of Effects of Cosmetological Manual (Su-gi) Therapy on Psychological Factors -Focused on Journal Articles Published in Korea- 2061
Su-JeongRyu, Meoung-Sun Lee
372. Changes in Serum Lipids according to the Amount of Exercise Activity in Middle-Aged Women 2068
Myung-Chul Kim, Hang-Sik Park, Jean-Kyung Paik, Duk-Young Jung, Su-Min Lee
373. Effects of Job Characteristics and Organizational Communication on Job Satisfaction among Dental Hygienists 2073
Da-Young Ryu, Yong-Keum Choi, Young-Soo Lee

374. A study on the s Diffusion of Infectious Disease Issues and Paradox of Public Health	2077
<i>Kyung-Do Seo, In-Kyu Choi</i>	
375. The Effects of Fall Prevention Static and Dynamic Trunk Stabilization Exercises on the Balance of Elderly Females	2082
<i>Sang-HO Lee, Dong-Yeop Lee</i>	
376. The Causal Effects of Job Characteristics and Organizational Culture on Knowledge Sharing among Health Care Professions	2089
<i>Da Ye Lee, Ji Eun Cha</i>	
377. The Effect of Team-based Learning (TBL) on Leadership, Empowerment, and Followership of Nursing Students	2098
<i>Ok Hee Koo</i>	
378. Relationship between Sleep and Oral Health among Korean Adults	2104
<i>Hye-Sook Choi, Moon-Hee Kwon</i>	
379. Relationship between Facial Satisfaction and Dental Aesthetic Treatment Awareness among High School Students	2108
<i>Young-Hee Jung, Jung-Eun Ha, Min-Ji Kim</i>	
380. The Association between Leadership Styles of Adolescent Football Coaches and Players' Social Skills	2115
<i>Kyung-Seok Han, Chun-Ho Yang</i>	
381. Association between Selection Attribution of Marine Tourism in Jeju, Overall Satisfaction and Motivation	2123
<i>Young-Hee Han, Kyung-Seok Han, Chun-Ho Yang</i>	
382. The Desire to Win Determines Match Performance Abilities of Taekwondo Athletes in Elementary School	2130
<i>Kyung-Seok Han, Chun-Ho Yang</i>	
383. The Implementation of a Digital Healthcare Service for People with Disabilities: A Pilot Study	2137
<i>Soo-Kyung Bok, Youngshin Song</i>	
384. Effects of Water Depth on Lower-limb EMG and RPP in Aquatic Squat	2144
<i>Ki-Hong Kim, Geun-Hwe Koo, Hwan-Jong jeong, Chun-Ho Yang</i>	
385. Factors Affecting on Nursing Performance of Delirium for General Hospital Clinical Nurses	2151
<i>Eun Min An, Ju Young Park, You Jeong Jo, Hyun Ji Kang</i>	
386. Effects of Integrative Dementia Prevention Program on Cognition, Depression, and Quality of Life in the Elderly	2158
<i>Jong-Eun Yang, Bo-Kyoung Song, Jong-Bae Choi</i>	
387. Effects of Communal Exercise with 'Parkinson Home Exercise' Application on Gait Ability for Parkinson's Disease Patients	2163
<i>Yunjin Park, Jaeho Yu, Younghwa Song, Ryng Hwang, Sungwon Kim, Hyunghun Moon, Sungki Lee, Sukyool Jung, Hyeyoung Cho</i>	
388. On the Effect of College Students' Attitude towards computer on their Academic Procrastination	2169
<i>Wonshik-Na</i>	

389. On the Relationship between College Students' Personality Types and their Ego-Resilience & Self-Efficacy- Based on the MBTI Personality Assessment 2175
Mi-Hee Han
390. A Study of a Model of Christian Alternative Schools 2180
Manoh Han
391. A Novel Ensemble Learning Method for Classification and Regression Based on Weighted Stacking of Estimators 2186
Prakash Chandra Jena, Debahuti Mishra, Subhendu Kumar Pani
392. Regulatory Effects of Gami-Shinkiwihan on Osteoporosis Induction 2196
Sun Young Park, Ho Hyun Kim, Ki Bong Kim, Sang Hyun Ahn
393. Antibacterial and Antioxidant Activity of *Pleurotus eryngii* Extracts 2206
Eun-Ji, So-Ra Han, Ki-Hwa Kim, Bo-Ram Park, Kun-Ok Lim, Tae-Jin Oh
394. Work Commitment and Servant Leadership among Teacher Education faculty of State Colleges and Universities (SUCs) in Region III 2214
Julieta M. Lagasca, Teody San Andres
395. Dose Assessment for Modeling Medical Phantom of X-Ray Phase Contrast in Web Measurement Convergence-based 2228
Chang-Gyu Kim, Myung-Joon Kwack, Boo-Woo Lee, Sooyeul Lee, Yoonseon Song, Byung Gyu Chae
396. Physical and Psychological Factors Affecting Smartphone Addiction in Adolescents According to Depression 2234
Weon-Hee Moon, Myoungjin Kwon
397. A Study on Learning Satisfaction's Relations to Career Adaptation and Psychological Independence in College Students 2241
Mihee Han
398. The Effects of Career Barriers and Career Efficacy on Job Seeking Stress: A Comparative Perspective of Nursing and Social Welfare University Students 2248
So-Yun Choi, Kyung-Sook Kim
399. Promoting of Healthy Cities through Social Ecological Paradigm 2255
Nam Sook Kim
400. Review on Privacy Preserving of Medical Data in Cloud Computing System 2261
Sridhar Reddy Vulapula, Malladi Srinivas
401. Grandchildren Parenting Experiences of Grandparents 2270
Yun-JeongKim
402. Smoking Prevention School Projects Perceived by Health Teachers 2275
Jung Im Kim
403. Proposal Study on Public Data-Centered Crime Prevention Through Environmental Design (CPTED) in Seoul City Utilizing Classical Music 2280
Ji-Heon Song, Sung-Jun Kim

404. Effect of Action Observation of Meaningful Tasks on Upper Extremity Motor Function in Patients with Stroke 2286
Jong-Bae Choi, Bo-Kyoung Song
405. The Case Study and Analysis of Technology through Sports and ICT Convergence in Korea 2292
Se-Yun Kim, Yong-Bae Jeon
406. Antibacterial and Antioxidant Activity of *Pleurotuseryngii* Extracts 2298
Eun-Ji Yu, So-Ra Han, Ki-Hwa Kim, Bo-Ram Park, Kun-Ok Lim, Tae-Jin Oh
407. Effect of Horse Riding and Horse Riding Simulator Exercises on the Balance of the Elderly 2306
Eun-Ja Kim, Dae-hun Kim
408. A Collaborative Outlier Detection Method for High Dimensional Data sets 2311
Sarita Tripathy, Prasant Kumar Pattnaik, Laxman Sahoo
409. Knowledge Management for Youth: Skill India for Global Knowledge Economy 2317
Sasmita Mohanty
410. Surveillance of Microorganisms and Their Drug Sensitivity Patterns in Diabetic UTI Patient at a Tertiary Care Teaching Hospital 2324
Moumita Das, Swayamprabha Sahoo, Ishwar Chandra Behera, Srikant Kumar Dhar, Mahesh Chandra Sahu
411. Assessment of Degree of Collaboration to “Airway Foreign Body” Indian Literature through Bibliometric Snapshot 2331
Manoj Mishra, Santosh K Swain, Swayamprabha Sahoo, Mahesh C Sahu
412. Input of Stress Indices towards Intensity of Perceived Stress Among Beginner Nurses at Critical Care Unit 2338
Sasmita Das, Prassana Baby, Mahesh Chandra Sahu
413. Surveillance of *Candida Albicans* and their Antifungal Susceptibility in Oral Candidiasis 2346
Pradeep Mallick, Manoj Kumar Sahoo, Priyanka Debta, Mahesh Chandra Sahu
414. Biomarker for Evaluating Peripheral Vertigo-A Study at a Tertiary Care Teaching Hospital of Eastern India 2352
Santosh Kumar Swain, Smrutipragnya Samal, Mahesh Chandra Sahu, Priyanka Debta
415. An Unusual Cause of Peripheral Facial Nerve Palsy-A Case Report 2357
Santosh Kumar Swain, Smrutipragnya Samal, Mahesh Chandra Sahu, Priyanka Debta
416. Anti-Candidal Activity of 5 Rare Plants against Drug Resistance *Candida* Species 2361
Mahesh Chandra Sahu, Swayamprabha Sahoo
417. Surveillance of Ciprofloxacin Resistance Bacteria in Chronic Suppurative Otitis Media 2367
Pritam Priyadarshi Rath, Swaymprabha Sahoo, Mahesh Chandra sahu
418. Oral Benign Fibrous Histiocytoma: Immunohistochemical Study of Two Cases 2372
Juber Rahman, Sreepreeti Champatray, Swagatika Panda, Neeta Mohanty
419. Hyperplasia of the Mandibular Condyle: A Rarity 2376
Basanta Kumar Choudhury, Rashmita Sahoo, Satya Ranjan Misra, Santosh Kumar Subudhi
420. Adenoid Cystic Carcinoma of the Hard Palate: A Case Report 2381
Satya Ranjan Misra, Ujjaval R Tripathy, Narottam Praharaj, Rashmita Sahoo, Shayari Niyogi

421. “Oral Health Related Quality of Life (OHQOL)–Perspectives of College Students of an Educational University in Bhubaneswar: Descriptive Cross–Sectional Study” 2386
Dharmashree S, Sthitaprajna Lenka, Radha Prasanna Dalai, Karishma Rathor
422. Management of the Most Common Type of Anterior Temporomandibular Joint Dislocation: A Systematic Review 2393
Rashmita Sahoo, Nihar Ranjan Sahoo
423. Caries Prevalence among Preschool Children of 3-5 Yrs Old in Bhubaneswar, Odisha 2402
Antarmayee Panigrahi, Uma Sankar Mishra
424. Surgical and Aesthetic Management of Severe Dental Fluorosis Associated with Chronic Generalised Periodontitis: A Case Report 2406
Gatha Mohanty, Anurag Satpathy, Rinkee Mohanty
425. Implant Positioning in Esthetic Zone 2412
Sreeprada Dash, Gunjan Srivastava, Gopal Krishna Choudhury, Monika Samal
426. Prevalence of Oral Habits among 6-12 Yrs Old Children of Bhubaneswar, Odisha 2418
Antarmayee Panigrahi, Uma Sankar Mishra
427. Oral Self Injurious Habits–A Review 2423
Sourav Bhattarajee, Sudeep Sreepad Iyer, Antarmayee Panigrahi, Susant Mohanty, Biswabandita Mohanty
428. Dental Malpractice, The Odds in Dental Treatment 2430
Satya Ranjan Misra, Lora Mishra, Manoj Kumar, Shayari Niyogi, Saswati Priyadarshini
429. Apitherapy in Pediatric Dentistry: A Review 2435
Biswabandita Mohanty, Susant Mohanty, Antarmayee Panigrahi, Sudeep Sreepad Iyer, Sourav Bhattarajee
430. Hand Hygiene an Important Need in Daily Practice 2441
Pradyumna Ku Sahoo, Smita R Priyadarshini, Gopal Choudhury, Abhishek Ranjan Pati, Abhijita Mohapatra
431. Mother’s Knowledge & Attitude Regarding Oral Health of Pre-Adolescent Children’s and Associated Risk Factors on Dental Caries Experience and Oral Hygiene Status 2445
Naveen N, Abhinav Patel, Yunus G. Y., Ram Tiwari, Swati Patnaik, V. Balasubramanyam
432. Ultrasonography in Maxillofacial Lesions 2451
Basanta Kumar Choudhury, Santosh Kumar Subudhi, Radha Prasanna Dalai, Shibasis Biswas, Saswati Priyadarshini, Rupsa Das, Suvranita Jena
433. Global Tobacco Control 2458
Karishma Rathor; Sthitaprajna Lenka, Dharmashree S, Debasruti Naik, Rucha Varu, Narendran Achuthan
434. Current Trends in Implant Dentistry 2465
Sthitaprajna Lenka, Karishma Rathor; Narendran Achuthan, Dharmashree S., Rucha Varu, Radha Prasanna Dalai
435. Prosthetic Rehabilitation of Patient with Multifocal Central Giant Cell Granuloma 2469
Gunjan Srivastava, Sitansu Sekhar Das, Subrat Kumar Padhiary, Kajal Kiran Sahoo
436. Rehabilitation of a Patient with Severe Attrition A Case Report 2473
Abhilash Mohapatra, Gopal Krishna Choudhury; Mirna Gharnayak, Abhijita Mohapatra, Pradyumna Kumar Sahoo

437. Lip Curve Changes in Patients with Premolar Extraction and Non-Extraction Treatment	2477
<i>Smruti Bhusan Nanda, Tusar Kanti Nayak</i>	
438. Vertical Discrepancies in Orthodontics	2486
<i>Smruti Bhusan Nanda, S Lakshana, Tusar Kanti Nayak, Snigdha Pattanaik, Subhrajeet Narayan Sahoo, Noorjahan Mohammad, Pragya Panigrahi</i>	
439. Skeletal Anchorage System in Orthodontics	2491
<i>Tusar Kanti Nayak, Snigdha Pattanaik, Smruti Bhusan Nanda, Noorjahan Mohammad, Subhrajeet Narayan Sahoo, Abhik Sinha</i>	
440. Dentistry with Ergonomics	2496
<i>Antarmayee Panigrahi</i>	
441. Vistas of Smile Designing	2501
<i>Kajal Kiran Sahoo, Sudipta Sahu, Nikita Sahu, Sashikant Sethy</i>	
442. The Basic Genetics of Malocclusion	2507
<i>Tusar Kanti Nayak, Subhrajeet Narayan Sahoo, Smruti Bhusan Nanda, Snigdha Pattanaik, Noorjahan Mohammad, Pragya Panigrahi</i>	
443. Describing Role of Bacteria in Carcinogenesis with Special Emphasis on <i>Fusobacterium</i> species in Oral Cancer: An Overview	2512
<i>Devi Prasad Mandal, Shakti Rath, Swagatika Panda, Neeta Mohanty</i>	
444. Mini-Implants in Orthodontics	2516
<i>Smruti Bhusan Nanda, Noorjahan Mohammad, Tusar Kanti Nayak, Snigdha Pattanaik, Subhrajeet Narayan Sahoo, Pragya Panigrahi</i>	
445. Changes of Temporomandibular Joint from Child to Adulthood	2521
<i>Tusar Kanti Nayak, S Lakshana, Snigdha Pattanaik, Noorjahan Mohammad, Subhrajeet Narayan Sahoo, Smruti Bhusan Nanda, Pragya Panigrahi</i>	
446. Denture-Adhesives: A Brief Overview of the Indian Scenario	2526
<i>Debarchita Sarangi</i>	
447. Dentist Role in Child Abuse and Neglect	2530
<i>Sudeep Sreepad Iyer, Antarmayee Panigrahi</i>	
448. Application of Virtual Reality in the Public Health	2535
<i>Amit Khatua, Snigdha Pattanaik</i>	
449. Internet of Things Applications in Agriculture: A Survey	2539

The Etiological Profile of Seizures in Children in a Tertiary Care Hospital, Hapur, Uttar Pradesh

Shweta Singh¹, M Agrawal², Yogesh Kumar Goel³, Dayachand Verma³

¹Assistant Professor, ²Associate Professor, ³Professor, Department of Paediatrics, Saraswathi Institute of Medical Sciences, Hapur

ABSTRACT

Objectives: 1) To study the incidence of seizures in children (1month – 18 years of age).

2) To elucidate the clinical and etiological profile of seizures

Setting: Children with seizures admitted in paediatric ward and paediatric intensive care unit of SIMS, Hapur.

Duration: Four years (January 2013- December 2017)

Design: Longitudinal observational study

Participants: All children admitted in paediatrics with convulsions were studied according to the performa designed with especial emphasis on detailed history, clinical examination and relevant investigations in stepwise manner.

Results: out of the 808 were cases of seizure (6.9% of the total admissions) there were 468 (58%) boys and 340 (42 %) girls. Maximum number (n= 523; 64.6%) were below 5 years. The most common presentation was GTCS (68%). The associated symptoms were fever (76%) followed by altered sensorium (58%). The most common cause was febrile seizure (48%), CNS infections (19.7%) and idiopathic cases (16.9%).

Conclusion: Childhood seizures are common neurological problem with maximum number of cases occurring at a younger age group. Improvement of basic health facilities, hygiene and immunization can bring down the various infective causes of seizures. Enabling the parents through the awareness programmes can facilitate the overall success in the good results of outcome of the seizure episodes.

Keywords: convulsions, seizure, febrile seizure, immunization

INTRODUCTION

Seizures are one of the most common form of neurological illness among children admitted to the hospital¹. A seizure or convulsion is a time limited change in motor activity and/or behavior that results from abnormal electrical activity in the brain³. An acute

symptomatic seizure occur secondary to an acute problem like electrolyte disturbances, meningitis, encephalitis, acute stroke or brain tumor. An unprovoked seizure is one that is not an acute symptomatic seizure. Remote seizure is one that is considered secondary to a distant brain injury such as an old stroke, neonatal hypoxic brain injury. Reflex seizures are usually precipitated by a sensory stimulus such as flashing lights. Epilepsy is a disorder of the brain characterized by an enduring predisposition to generate seizures. For clinical purposes epilepsy is considered to be present when two or more unprovoked seizures occur in a time frame of more than 24 hours. The manifestations of the seizure depend upon

Saraswathi Institute of Medical Sciences, Hapur.

Email: mameerut@yahoo.com

the threshold of the brain to manifest a clinical seizure. The age and neurodevelopmental maturity status determine the clinical manifestations and the type of seizure encountered. The protean clinical manifestations and the complexity associated with the cause and management has led to the revised classification of seizures by the International League Against Epilepsy (ILAE)²⁰.

When the data from the developed nations are compared with developing nations, surprisingly similar results of incidence and prevalence is found in childhood seizures, with the cause being different even in different regions of the same nation^{15,16,18}.

In most studies, the febrile seizures are the most common cause of seizure in children below 5 years of age. Electrolyte disturbances like hypocalcaemia was common between 1 month to 1 year of age⁵.

Causes like viral encephalitis, pyogenic meningitis, tubercular meningitis, epilepsy, head injury, late HDN, cerebral palsy, developmental anomaly of brain were other causes. Not to mention, neurocysticercosis shows predominance in certain regions of India^{5,6,12}.

The outlook for most children with symptomatic seizures or those associated with epilepsy is generally good but seizures may signal a potentially serious underlying systemic or central nervous system disorder that requires an aggressive resuscitation, stabilization and concurrent implementation of diagnostic testing, monitoring and pharmacological interventions.

Seizures perplex both the parents regarding the occurrence and prognosis and paediatricians regarding cause and management. Due to paucity of the epidemiological study on seizures, the present study was conducted to emphasize the evidence based knowledge, attitude and practice towards the seizure in children.

METHOD

This longitudinal observational study was conducted in the Department of Paediatrics, Saraswathi Institute of Medical Sciences, Hapur (U.P.) between 1st January, 2014 to 31st December, 2017. All children of age 1 month to 18 years with acute seizures (history of seizures at home witnessed by relatives or seizures during hospitalization witnessed by staff) were included in the study. The study was approved by the Ethical Committee

of the Institution. Patients were enrolled after written informed consent from parents and guardians.

Inclusion Criteria:

All children between 1 month to 18 years of age with seizures were included in the study.

Exclusion Criteria:

1. Neonates
2. Toxicological causes of convulsions
3. Children with seizure mimicking disorders like breath holding spells, migraine, apnea, syncope, panic attacks

Data Collection:

The history and clinical findings of subjects who were included in the study were recorded in the preformed Performa designed for the study. Relevant investigations were done to diagnose the cause of the seizure in step wise manner.

Complete blood count

C-reactive protein

Metabolic screening like serum electrolytes, serum calcium, serum glucose

Cerebrospinal fluid analysis

Imaging studies (CECT, MRI) of brain

Electroencephalograph

Chest x-ray, Montoux test

Statistical method:

As the present study was a descriptive study, the data was expressed as percentages and frequencies.

OBSERVATIONS AND RESULTS

Out of the 11680 children admitted during the study period, 808(6.9%) children fulfilled the criteria of cases with convulsions.

In our study the incidence as calculated by the percentage of seizure cases in total indoor pediatric patients was found to be 6.9%. In the age wise cohort, maximum number of cases were below 5 years(523) as shown in Table 1.

Table 1: Incidence of convulsions in different age groups

Age group	No. of cases	Percentages
1month-1 year	177	21.9
1year – 3years	193	23.8
3 years – 5years	153	18.9
5years -7 years	75	9.2
7 years- 9 years	58	7.1
9 years- 11years	40	4.9
11years – 13 years	56	6.9
13years-15 years	24	2.9
15years-18 years	32	3.95

There were 468 boys and 340 girls in the study group accounting for 58% and 42% of the study population respectively.

GTCS was the most common type of clinical seizure seen in 550 cases followed by complex partial seizure in 245 cases as shown in table 2.

Table 2: Type of seizure at presentation

Type of seizure	No. of Cases	Percentages
Generalized tonic clonic	550	68%%
Complex partial seizure	245	30%
Absence	1	0.01%
Simple Partial	3	0.3%
Infantile spasms	3	0.3%
Myoclonic	6	1%

There was a wide spectrum of presentation at the time of admission, with most common symptom being fever (76%), followed by altered sensorium (58% cases) and headache (40% cases). There were 614 children who were febrile at the time of admission, reflecting infections as a major cause precipitating the abnormal movements either as URI, ASOM, diarrhea, meningoencephalitis, localized brain infections etc as shown in table 3.

Table 3: Symptoms Associated with Convulsions

Clinical Features	Cases	Percentage
Fever	614	76%
Rash	64	8%
Altered sensorium	468	58%
Headache	323	40%
Cough	307	38%
Vomiting	185	23%
Loose motions	121	15%
Pain abdomen	24	3%
Lethargy	387	48%
Ear discharge	24	3%
Trauma	7	0.8%
Focal deficits	131	16%
Todds palsy	16	2%

Serum Calcium

Of all patients, 24 (2.4%) had low serum Baseline serum calcium (<8.4%).

Serum Glucose

All the cases had their serum glucose level done, of which 16 had hypoglycemia (<70mg/dl).

Lumbar puncture was done in 387 cases (47%) which showed low CSF glucose in 94 cases; with CSF picture suggestive of viral meningoencephalitis in 8%, pyogenic in 6% and tubercular in 5.8% of the total cases.

For the uniformity of the protocol CT scan of the brain was done in all cases .There were abnormal findings in about 260 cases with tuberculoma in 40, TBM in 46, NCC in 89, trauma in 7 and miscellaneous malformations in 14.

EEG was done in those cases where high electrical activity were expected. We had 194 abnormal EEGs showing generalized epileptiform activity (100), focal lesions in 77 cases and benign rolandic epilepsy 17 cases.

Amalgamating, the history at presentation, clinical findings and laboratory analysis febrile convulsions were the most common cause of seizure in about 38 % of cases followed by CNS infections 35% cases and

idiopathic 16.9% of cases as shown in detail in table 4. There were 19 cases of congenital CNS infections, malformations and syndromic presentations.

Table 4: Etiology of Convulsion

Aetiology	Cases	Percentage
Simple Febrile seizure	226	28.2
Atypical Febrile seizure	80	10
Pyogenic meningitis	48	5.9
Tuberculous meningitis	46	5.6
Tuberculoma	40	4.9
Neurocysticercosis	89	11
Viral encephalitis	67	8.2
Idiopathic Epilepsy	137	16.9
Acute infarcts	8	0.9
TORCH infections	3	0.3%
Benign Rolandic Epilepsy	17	2.9
Hypocalcaemic	24	2.4
Hypoglycemia	12	1.5%
Trauma	7	0.8
Miscellaneous	16	1.9

DISCUSSIONS

Seizures are the most common paediatric neurologic problem which presents as a medical emergency, perplexing both the parents and the paediatricians. Due to the protean manifestations and scarcity of literature regarding the seizures, still there is a lacunae in the whole some approach for the management of the same. To emphasize on the evidence based management of seizure, the present study was done in our hospital over a period of four years among the children of age group of 1 month to 18 years.

The incidence of seizure in our study was nearly 6.9%, which is similar to the findings of other authors^{1,2}. There was slight male preponderance in our study with 468 boys and 340 girls. One of the reasons for this finding could be that conditions like febrile seizure are more common in males (male to female sex ratio of 1.4 to 1.2 :1)^{4,5,6,7}.

There was an age wise variation of incidence of the seizure with maximum number of cases below five years and minimum between 13-15 years. The maximum number were between 1 year to 3 years closely followed by 1 month to 1 year and then 3 to 5 years group. Seizures have been found to have a higher incidence in younger children in many studies with a decreasing frequency in the older age group^{1,8,9}. A survey done to know the prevalence of epilepsy, found that the peak age of onset was around 1 year and 90% of the attacks occurred during the first three years⁷.

In our study the most common clinical type of seizure was GTCS followed by CPS. The literature tells generalized tonic clonic, (GTC) seizures are the most common type of childhood seizures, occurring in almost 61% of cases^{7,9,10}. Generalized epilepsies were twice as common as partial epilepsies in one community survey, possibly due to the over estimation as generalized tonic clonic seizures are more dramatic and more likely to be noticed⁶. Partial seizures are generally less common with an exception to developing countries with high incidence of neurocysticercosis, where partial seizures are reported commonly¹².

The most common presenting symptom was fever (76%) followed by altered sensorium(58%),lethargy (48%), headache(40%), cough(38%), vomiting(23%), loose motions(15%), rash (8%), pain abdomen(3%) , ear discharge, focal deficit. Infectious causes of fever such as tonsillitis, upper respiratory tract infections and otitis media as precipitants to seizure are also noted by others. There are studies which reported diarrhea as a highly associated symptom in patients with seizures, and rotavirus infection was an identified etiology¹¹ & also rotavirus related seizures could occur in both febrile (41%) and afebrile (59%) children¹². Only 16% seizures were associated with neurological deficit which was slightly higher than reported earlier⁷.

Of the 387 CSF examinations done, 94 were abnormal. 54% of them had an elevated protein level, while 27 % had low CSF glucose. An elevated PMN count suggests bacterial meningitis while lymphocytosis indicates aseptic, tuberculous or fungal meningitis; elevated CSF protein indicates infectious, immunologic, vascular or degenerative etiology or tumors of brain and spinal cord while hypoglycorrhachia is classically suggestive of pyogenic etiology⁶.

CT scan was performed in all patients which revealed abnormalities in 32% cases (n=260) including diffuse cerebral edema (9%), basal exudates, hydrocephalus, cerebral atrophy, ring enhancing lesions, malformations and trauma. Maytal et al concluded that routine practice of obtaining brain CT scans for all patients with new onset of nonfebrile seizures is unjustified. Emergent CT is not indicated for patients with no known seizure risk factors, normal neurological examinations, no acute symptomatic cause other than fever, and neurological follow up. For these patients, referral to a pediatric neurologist for further workup, including EEG and the more diagnostically valuable MRI would be appropriate¹³.

EEG is recommended as part of the neurodiagnostic evaluation of the child with an apparent first unprovoked seizure¹². It is not helpful in children with simple febrile seizures but are probably most helpful if there is doubt about whether FS has really occurred, because EEGs carried out on the day of the seizure are abnormal in as many as 88% of patients¹³. We found EEG abnormalities in 194 cases, with maximum number showing generalized epileptiform activity (100) followed by focal trigger in 77 cases. The electrical activity resembled benign rolandic epilepsy 17 cases.

There were a total of 306 cases of febrile seizures with typical cases being 226 in number (28.2%). The Yelandur survey¹⁶ estimated the prevalence to be 3.28-5.71 per 1000 whilst the more recent Uttarakhand survey found a prevalence of 2.27 per 1000 population¹⁴.

Infective pathology like bacterial and viral meningoencephalitis accounted for 5.9% and 8.2% cases respectively. Bacterial meningitis has been ascribed differently as a cause of seizure varying from as low as 0.4-1.2% to 13%^{5,16}.

We found neurocysticercosis in 11% cases (n=89), which is slightly lower than that of other reported series 24.4% of active lesions and 9.9% calcified granuloma of NCC as a cause of seizures¹².

We had 5.6% (n=46) TBM cases and tuberculoma 4.9% (N=40). Murthy et al have reported that approximately 50% of children and 5% of adults with tuberculous meningitis manifest seizure at some point of time¹⁸.

Metabolic causes like hypocalcemia and

hypoglycemia were present in 2.4% (n=24) and 1.5% (n=12) children respectively. Hypocalcemic seizures have been found as high as 13% to 25.6% of cases in the age group of 1 month to 1 year⁵. Of course in developing countries rickets with hypocalcemia is a leading cause of afebrile seizures in toddlers.

We had 137 (16.9%) idiopathic cases of seizure. A German study reveals as high as 47% cases of epilepsies to be idiopathic in origin, and also generalized epilepsies are twice more common than focal in being idiopathic¹⁹.

CONCLUSION

Childhood seizures are common neurological problem with maximum number of cases occurring at a younger age group. Pediatricians have to be vigilant on subtle clinical manifestations and a stepwise approach to the diagnosis and management of it while keeping the age specific etiological variation in mind. Improvement of basic health facilities, hygiene and immunization can bring down the various infective causes of seizures. Enabling the parents through the awareness programmes can facilitate the overall success in the good results of outcome of the seizure episodes.

ABSTRACT

Introduction:-Human Immunodeficiency Virus (HIV) or Acquired Immunodeficiency Syndrome (AIDS) is a dreadful disease and it is more prevalent in the world ^[1]. In these circumstances people must have adequate knowledge on HIV/AIDS and its prevention .On account of that, this paper aims to assess the awareness, attitude and practices of pregnant women on HIV/AIDS, its transmission and prevention. **Method:** - A computerized search for published literature and journal articles was undertaken through Pub Med and EBSCO databases. Typical search strategies have used for each data bases .During initial search 12445 articles were retrieved and after screening 20 articles were selected for full text assessment and finally 8 articles were included in the study. **Results:-** Out of 8 literatures ,7 research studies concluding that there is a low level of awareness of HIV/AIDS, Mother to Child Transmission(MTCT) and its prevention and 1 study suggests that there is adequate knowledge among the pregnant women regarding HIV/AIDS ,mother to child transmission and its prevention. **Discussion:-**Various review of research studies published from 2017 to 2017 concluded that the level of awareness regarding Prevention of Mother to Child Transmission(PMTCT) of HIV among the pregnant women as well as the adolescents has been revealed in all the studies, whereas the attitude and practice on HIV/AIDS and its prevention has been concluded in two studies respectively.

Overall analysed data from the eight studies suggests the gap between awareness and practice. This gap can be eliminated when women lead a safe sexual life.

Conclusion--:- Effective use of Prevention of Mother to Child Transmission (PMTCT) of HIV services can be enhanced by changing the attitude towards HIV/AIDS and improving the awareness on HIV/AIDS and its prevention.

Keywords: Awareness, attitude, practice, prevention of mother to child transmission, pregnant women.

INTRODUCTION

Human Immunodeficiency Virus (HIV) or Acquired Immunodeficiency Syndrome (AIDS) is one of the dreadful challenges to human life and their dignity. It has adverse effects on all levels of society and has enormous impact on global economic and social development ^[1]. HIV and AIDS disease has been around the world, although no one has been able to pinpoint its origin.

Moreover there are many theories and beliefs which are floating around the medical world regarding the origin of HIV/AIDS, there are certain causes which

is primarily responsible for the transmission of virus from one human to another, such as unprotected sexual intercourse, transfusion of infected blood products and from mother to child. Despite of having these many causes, still there are various myths and stigma existing in the world regarding the transmission of HIV ^[1]. Many people speak about the late stages of AIDS without knowing the facts that HIV does not produce AIDS always. The Prevention of Parent to Child Transmission of HIV (PPTCT) programme was launched in the year of 2002, in all major hospitals in five HIV prevalent states. At the end of 2016, there were 20756 integrated

counselling and HIV testing centre, all over India and mostly these services are offering by Government hospitals ^[2].

When we focus on the transmission of HIV, pregnancy is a period, where the transmission of virus from mother to child occurs and develops a condition that endangers both mother and baby. The epidemic of HIV has a devastating effect on children who are less than 15 years of age due to vertical transmission of HIV. So it's a crucial period, where the incidence of HIV should be prevented by mother and family members. For that what are all the requisites to be taken by them? Do they have adequate knowledge on prevention of mother to child transmission of HIV? What is their attitude towards HIV/AIDS? Do they practice it well before? ^[3]

Taking this into account; various studies have been conducted to assess the awareness, attitude and practice towards prevention of mother to child transmission of HIV among pregnant women.

NEED FOR THE STUDY

There is vast literature which suggests that the significant portion of population have low level of awareness and also have unfavourable attitude towards AIDS and its prevention. These are the threat to our country, as people are becoming the victim of HIV/AIDS. The latest estimate shows that India is the country where third largest number of people living with HIV in the world ^[4].

Evidence suggests that there is low awareness on timing of mother to child transmission of HIV as well as its prevention. Hence strengthening of PMTCT services are recommended in the antenatal care settings ^[5].

Researchers also concluded that the level of knowledge among pregnant regarding prevention of mother to child transmission of HIV is low. So appropriate strategies to be carried out to help them make informed decisions ^[6].

Keeping this in view it is very essential to focus on awareness attitude and practice of pregnant women towards HIV/AIDS and its prevention, to prevent the transmission of HIV from mother to baby and thereby to save the life of mother and baby and to lead a healthy life ahead.

AIM

The aim of this review is to assess the level of awareness and attitude of pregnant women towards PMTCT services as well as the various practices which has been followed by mother to prevent the transmission of mother to child transmission of HIV.

OBJECTIVES

- To assess the level of awareness, attitude and various preventive practices following by the mother who lives in the different part of the world to prevent the transmission of HIV from mother to child.
- To determine the demographic factors which is associated with the awareness attitude and practice on Prevention of Mother to Child transmission of HIV

MATERIAL AND METHOD

Search strategy method:

A computerised search have done to collect the articles which are available in different databases from the year of 2007 to 2017. The search strategy was limited to only English language and considered only the studies which are conducted on human species.

Initial search strategy made by using the terminologies and its synonyms which are processed in databases such as Pub Med and EBSCO. The terminologies which have been used to collect the article are as follows:

Keywords: awareness, knowledge, attitude, practice, utilization, prevention, mother to child transmission, perinatal transmission, HIV, ANC

Type of studies

Comparative studies, Descriptive studies, Cross-sectional studies.

Type of participants

Women in reproductive age, pregnant women, male and female adolescent

Settings

Antenatal clinics in hospitals, schools and obstetrics

and gynaecological clinics.

Outcomes

Findings from these studies will lead to a clearer understanding regarding the awareness, attitude and practice of pregnant women on Prevention of Mother to Child Transmission of HIV and will be act as baseline information in order to strengthen the prenatal educational programmes for the creation of awareness among the public. Thereby it enhances the utilization of PMTCT services.

RESULTS

Description of extracted data

Rastogi, Saumya, Charles Bimal, Sam E Asirvatham (2009) ^[6] conducted a cross sectional study to assess Knowledge of antiretroviral in preventing parent to-child-transmission of HIV among women living with HIV in Tamil Nadu, India and the findings suggested that One fifth of the participants were not having adequate knowledge about Prevention of Parent To Child Transmission of HIV and about 40% participants didn't know that ARV can prevent the transmission of HIV from parent to child and the findings concludes that while looking at the risk of transmission of HIV from an HIV infected mother to her child, the knowledge level regarding PMTCT and ARV among them is low and formulation of appropriate guidelines and strategies to generate awareness among them is to be taken into consideration.

Asfer Anteneh, Beyene Habtamu (2013) ^[5] carried out a cross sectional study to assess the awareness and knowledge on timing of mother-to-child transmission of HIV among antenatal care attending women in Southern Ethiopia. The analysed data found that all Antenatal women who attended the ANC were aware about HIV/AIDS and its transmission and only few of the pregnant women were aware that HIV is transmittable from mother to child during pregnancy, labour and delivery. So the available findings concludes that awareness and knowledge were low among pregnant women regarding the time of MTCT.

Emah Irene, Yakanana, Monebenimp, Fransecisca et al., (2009) ^[7] conducted a descriptive cross sectional study to assess the knowledge of pregnant women on Mother-to-Child Transmission of HIV in Yaoundé. The

findings from the study revealed that almost 99% of the pregnant women had heard about HIV/AIDS and its transmission, hence it reveals that the pregnant women have good knowledge on HIV and PMTCT.

Haider, Gifareen., Zohra, Nishat., Nisar, Nusrat et al., (2007)^[8] conducted a descriptive study to determine the knowledge about AIDS/HIV infection among women attending obstetrics and gynaecology clinic at a university hospital, Pakistan. The results from the study stated that out of total pregnant women 86% were heard about HIV/AIDS and the majority of women knew about its transmission. It concludes that the level of awareness on HIV/AIDS infection among pregnant women is satisfactory. But there are few misconceptions regarding transmission of HIV and that to be considered.

Bhavna T, Puwal., Dr. Vaibhavi, Patel., Dr. Sheetal, Vyaset al., (2010)^[9] carried out a Quantitative, Cross sectional study to assess the knowledge about transmission and prevention of HIV/AIDS among the high risk groups (HRG) population of Ahmadabad city. Findings from the study suggested that about 85% high risk groups aware about HIV and knew that the transmission rate was highest through sexual route. About half of high risk groups knew about all major modes of prevention. This study concludes that it is important to have adequate knowledge about transmission and prevention of AIDS among high risk group to change its high risk behaviour and improve the health.

Byamugisha Robert, Tumwine K James, Ndeezi et al. (2009)^[10] conducted a cross sectional study to determine the attitudes to routine HIV counselling and testing, and knowledge about prevention of mother to child transmission of HIV among antenatal attendees in eastern Uganda. The result shown that almost all the ANC attendees had a positive attitude towards testing of HIV and the HIV status helped the women to lead a healthy life and about 65% of the participants have the knowledge that the HIV can transmit from her mother to baby. This study reveals that a routine check up HIV testing and counselling during the Antenatal period is largely accepted by the pregnant woman who are residing in Uganda.

Gupta Onam, Lal Dhruvendra & Sindhu Kaur (2016) ^[11] carried out a comparative study to assess knowledge, attitude and practice of HIV/AIDS among adolescents in Two Districts of Punjab. Results from this study stated

that total adolescents from different places heard about HIV/AIDS and many of them aware that HIV/AIDS could be prevented by condom. The result concludes that various interventions at different level is enquired to enhance the awareness among the adolescents as they are tomorrow's citizens.

Kuete Martin, Yuan Hongfens, Ite Qiuan et al (2014)^[12] carried out a find out a cross sectional study to find out the Sexual Practices, Fertility Intentions, and awareness to Prevent Mother-to-Child Transmission of HIV Among Infected Pregnant Women at the Yaoundé Central Hospital, Cameroon. The results suggested that sexual desire has been significantly changed since their HIV diagnosis and about 19% of participants had multiple sexual partner. 94 pregnant women with HIV infection provided appropriate information on socio-demographic character, sexual and fertility patterns and they have adequate awareness on preventing Mother to Child Transmission of HIV. Over all findings concludes that Cameroon women who infected with HIV and living with HIV infected partner, expressed high sexual and fertility intentions with severe unmet needs including safer sexual practice and conception

SUMMARY OF FINDINGS

Available 8 literature are quantitative and cross sectional studies. Out of 8 literatures, 7 research studies concluding that there is low level of awareness of HIV/AIDS and MTCT and its prevention and 1 study suggests that there is adequate knowledge among the pregnant women regarding HIV/AIDS, mother to child transmission and its prevention.

DISCUSSION

A comprehensive review of research studies published from 2017 to 2017 found that the level of awareness regarding Prevention of Mother to Child Transmission of HIV among the pregnant women as well as the adolescents has been revealed in all the studies, whereas the attitude and practice on HIV/AIDS and its prevention has been concluded in two studies respectively.

Overall analysed data from the eight studies suggests the gap between awareness and practice. This gap can be eliminated when women lead a safe sexual life.

A favourable attitude towards HIV/AIDS and its prevention have the significant impact on the practices of

adolescents and pregnant women towards the prevention of HIV transmission, from one person to another as well as from mother to baby.

Practices among the adolescents on prevention of HIV/AIDS are satisfactory. But their preventive practices only limited to the use of contraceptives during sexual intercourse. More precautions to be taken out by the adolescents throughout their life, in order to prevent the transmission of HIV from parent to child, also to have a healthy sexual life.

Implementation of certain awareness programmes to be encouraged among the adolescents and reproductive aged women helps them to have a satisfactory marital life.

IMPORTANCE IN EDUCATION

Today's children are tomorrow's citizens. Creating awareness on HIV/AIDS, its transmission and its preventive measures among the children in educational settings make the individual to follow the aspects of PMTCT services in the future. There by it helps the people to lead a healthy and safe life ahead. More over public educational programmes through mass media and prenatal educational programmes which focuses on the needed information regarding HIV/AIDS, its transmission and prevention will improve mother's awareness as well as the public.

So it is a great concern to give adequate information regarding PMTCT programmes in educational settings. By this we can strengthen the campaign and ensure the maternal and child survival.

FUTURE SIGNIFICANCE

The National AIDS Control Organisation states that annually there are estimated 29 million of pregnancies occur in India and around 35255 occur in HIV positive pregnant women. In the absence of preventive measures or intervention an estimated cohort of 10361 babies will be infected and born annually. Hence strengthening of PPTCT services is essential to prevent the perinatal transmission of HIV. So enhancing the awareness among pregnant women regarding PMTCT services, will make them to have favourable attitude and it improve the practice on PMTCT services and thereby it helps to achieve the goal of reducing the number of children born with HIV.

LIMITATIONS

- Computerized data bases were limited
- Was limited to only in pregnant women
- Was limited to only English language

CONCLUSION

The number of HIV positive babies is higher in recent years. Lack of knowledge regarding poor diagnostic facilities, problems in Antiretroviral therapy (ART), these are the great concern which adversely affects PMTCT services.

Lack of awareness about HIV/AIDS, its transmission and prevention are the determined factors which facilitate the spread of HIV/AIDS in developing countries. So women living with or without HIV/AIDS, need to know the risk behaviour of pregnancy which affects their own health as well as the risk of transmission to their foetus or infants.

Strengthening of prenatal educational programme on HIV/AIDS with the emphasis on its preventive measures and various services available to prevent the Mother to Child Transmission of HIV, among the pregnant women seems to be necessary.

Conflict of Interest: The author of this study was entirely supported by the University and there was no any financial concern between the researchers during the study period. Hence there was no any kind of conflicts were existing among the researchers while writing, peer review, and editorial decision making.

Source of Funding: It was not a funded research study.

Ethical Clearance: Ethical clearance is not applicable for this study as it is a narrative review.

ABSTRACT

From 1976 to 2014, DDT, and from 2015 till date, alpha cypermethrin insecticide is being sprayed as indoor residual spray up to 1.8 meter i.e 6 feet height in human dwellings as well as in cattle sheds in, India, as a part of Kala -azar elimination programme. This is being a practice out of the belief that *Phlebotomus argentipes* the vector of kala azar is endophilic in nature and cannot hop beyond 1.8 meters height. Sixteen months study was therefore conducted in three villages in a kala azar endemic block Warisnagar, district Samastipur, Bihar from September 2016 to November 2017 to note the vertical distribution of *P. argentipes* in indoors and their distribution in outdoors aswell. In all the three study villages, density of adult *P. argentipes* was found more in Cattle sheds than in human dwellings. Irrespective of IRS and non IRS villages, significant numbers (*p* value 0.47) of *P. argentipes* were found above 1.8 meter in CS and HD of which 33.37 percent were blood fed and gravid females. Sizable number of *P. argentipes* was also found in outdoor peridomestic situations throughout the study period. Therefore it may be the time to evaluate vector control strategies in kala azar endemic areas of Bihar for successful elimination of the disease from India.

Keywords: Distribution of *Phlebotomus argentipes* in indoor and outdoor. Kala azar endemic villages. Bihar

INTRODUCTION

Phlebotomus argentipes, the vector of visceral leishmaniasis or Kala azar in the endemic states like Bihar, West Bengal are predominantly endophilic in nature. They rest in cracks and crevices on walls, in dark corners of rooms, especially in mud huts and cattle sheds. They are found more in cattle sheds than human dwellings. It has also been noted that *P. argentipes* do not fly / rest above 1.8meter (6 feet) from ground level^{1, 2, 3}. Since 1976, as a part of kala azar vector control programme, indoor residual spray with DDT was done in human dwellings and cattle sheds up to 1.8meter for control of *Phlebomus argentipes* in India. Noting the wide spread DDT resistance problem^{4, 5, 6, 7}, since 2015 Government of India have started vector control

programme with two rounds of IRS with Alpha-cypermethrine at the dose of 25mgm per sq.meter twice a year up to 1.8meter (6 feet)^{7, 8}. The state of Bihar is yet to achieve successful Elimination of Kala azar, may be one of the reason that, the flies have changed their resting behaviours. A sixteen months study was conducted in a highly kala azar endemic Block Warisnagar, District Samastipur, Bihar starting from August 2016 till November 2017 to note the population of *P. argentipes* in different heights at cattle sheds and human dwellings as well as to note availability of the files in outdoor peridomestic conditions.

MATERIALS AND METHOD

In comparison to India, Bihar state alone contributed more than 72 percent of total kala azar cases per year between 2012 to 2017 (Dpt. of NVBDCP. Government of India). Since 2014 district Samastipur, alone has contributed more than 8.5 percent Kala Azar cases of Bihar (Personal communication Dpt. NVBDCP.

Government of Bihar). Two villages i.e. Mannipur and Satmalpur which are reporting perennial transmission of kala azar and are under insecticidal pressure and village Kishanpur which is without any kala azar case in Block Warisnagar, were selected random method for the study.

All human dwellings and cattle sheds were searched thoroughly by standard entomological methods⁹. Cattle sheds and human dwellings had good density of *P. argentipes* were noted and marked. Out of marked houses, three human dwellings and three cattle sheds in each village were selected by random method. For outdoor collection, ten dark and damp outdoors with five to eight meters diameter surrounding each of the noted house and cattle shed were selected. In each village three human dwellings, three cattle sheds and ten peridomestic outdoor situations were selected for longitudinal study between August 2016 to November 2017. In each human dwelling and cattle shed, three CDC miniature light traps model 512, specially designed for sand fly collection (made by John W. Hock) were installed overnight at the heights of 0.6 meter (2feet), 1.2 meter (4feet) and above 1.8 meters (above 6 feet) by standard WHO method⁹. In outdoor situations ten CDC light traps per village were installed for overnight at a height of 0.6 meter (2feet).

In each village a total of twenty eight light traps (nine in human dwellings, in nine cattle sheds and ten at peridomestic outdoor situations) were installed per night per months. The sand flies, collected in individual trap were brought to the laboratory separately and height wise species identification has been done by the method of Lewis¹⁰.

RESULTS AND DISCUSSION

Results on distribution of indoor and outdoor population of *P. argentipes* in three study villages of block Warisnagar, district Samastipur are shown in Tables 1,2 and 3.

Month wise adult *P. argentipes* were collected from different heights from indoors of selected human dwellings and cattle sheds are shown in Table 1 and 2.

Village Kishanpur, is non endemic kala azar, sixteen months observation on density of *P. argentipes* from September 2016 to November 2017 is shown in Table 1. As per Table 1, 46.7% flies were found above 1.8 meter height in human dwellings. 26.5 and 27.8

percent flies were found up to 0.6 meter height in HD and CS respectively. 24.8 and 31.8 percent *P. argentipes* were also found up to 1.4 meter height in HD and CS respectively. Therefore statistically significant (p value 0.051) number of *P. argentipes* were found above 1.8 meters in unsprayed non endemic village Kishanpur. Very low density of *P. argentipes* in both human dwellings and cattle sheds were noted in the winter months between December 16 to February 2017. Density started increasing from the month of March on the onset of warm weather with a peak in the months of June-July and September – October.

Villages Mannipur and Satmalpur are endemic for Kala azar transmission and under Indoor Residual Spray (IRS) with Alpha-cypermethrin.

During study period, village Mannipur were sprayed in every third week of months September 2016, April 2017 and September 2017. Density of *P. argentipes* in different altitudes are shown in Table 2. lowest density was noted here in the winter months of December 2016 to February 2017. Throughout the study period 32.0 and 29.2 percent *P. argentipes* were found above 1.8 meter height in HD and CS respectively. It was noted that population of *P. argentipes* in CS (411) is more than that of in HD (366). Peak density was noted in September- October, 2016 and in the month of May 2017. Throughout the study period maximum number of flies in this village was found as 33.8 percent in HD and 43.2 percent in CS up to 1.4 meter height. (p value 0.390).

Village Satmalpur, as shown in Table 2, had a very high density of *P. argentipes* in CS as 962 in comparison to HD as 281.26.0 and 37.9 percent *P. argentipes* found above 1.8 meters in HD and CS respectively which is statistically significant with p value 0.565. 50.9 and 36.3 percent of *P. argentipes* were found within 1.4 meters in HD and CS respectively. Like other two study villages, minimum density was also noted in the winter months of December 2016 to February 2017 and maximum in the months of September, October 2016 and May 2017 in Satmalpur.

As per present observations, significant numbers (p value 0.051, 0.390, & 0.565) of *P. argentipes* adults prefers to rest more in Cattle sheds than Human dwellings In villages Kishanpur, Mannipur and Satmalpur respectively, which corroborates with the early findings

of Smith ¹, Hati et al ^{2,3}. In earlier literatures it was mentioned that *P.argentipes* in India cannot hop or rest beyond 1.8 meters height ^{1,2,3,10}. In our present study is clearly showing presence of significant number (*p* value 0.47) of *P.argentipes* beyond the height of 1.8 meter in three study villages of which 33.37 percent females were full blood fed and gravid females.

The present observations corroborate with our previous four months observations from July to November 2016 in the same area ¹¹. Thus our present findings clearly show that *P.argentipes* adults have changed their behaviour over the period of time and significant numbers are available above 1.8 meter. This invites for a change in policy of IRS (*on the basis of findings*) by national programme.

Month wise and village wise number of *P.argentipes* collected by CDC light traps in outdoor and indoor are shown in Table 4. During the study period ten Light traps were installed per village per month in outdoor peridomestic situations. In indoor 18 traps were installed per month per village in different height in HD and CS.

In outdoor no *P.argentipes* were trapped in the month of January 17 and Maximum numbers were recorded 122 (average 4.06/ trap/night) and 138 (average 4.6/trap/night) in the months of May and June 2017 respectively. In indoor collection only 2 *P.argentipes* were trapped (average 0.03/ trap/night) in the month of January 2017. Maximum numbers were trapped 591(Average 10.94/ trap/night) in September'17, 494 (Average 9.14/trap/night) in October 2016 and 341 (average 6.31/night/ trap) in the month of May 2017. Significant numbers of *P.argentipes* were found in outdoor (*p* value 0.001) in comparison to indoor (Table 3).

In the present study reveals irrespective of IRS and non IRS villages *P.argentipes* found in greater numbers in cattle sheds than human dwellings. In general significant numbers (*p* value 0.47) were found above 1.8 meter height. They are also found in significant numbers (*p* value 0.001) in outdoor peridomestic situations. Therefore it is the time to evaluate vector control strategies in kala azar endemic areas of Bihar for successful elimination of the disease from India.

Substance Use Disorder - Vital Hurdle in Sustainable Development of Nigeria

Jummai Fatima Muhammad¹, Malavika Bhattacharya²

Techno India University, West Bengal

ABSTRACT

On the global front, Millenium Developmental Goals (MDGs) were recently replaced with Sustainable Developmental Goals (SDGs) keeping in view the importance of inclusive growth. Thus, the SDGs have been designed so that people belonging to all economic strata can get benefitted by them. Differences in economic status can have severe consequences, including increased levels of drug addiction and related crimes. It creates a huge burden on the healthcare system on local level and on the society at large. This problem is very prominent in many sub-African countries, including Nigeria. This study made an attempt towards identifying and analyzing various factors that may be contributing towards economic disparities, its burdens on the society (with reference to substance use disorder, in particular) and the various inclusive growth measures that can contribute towards addressing this problem. All concerned stakeholders including government, semi-private, private organizations, NGOs and global organizations need to work together to handle the deteriorating conditions so that the situation can be brought under control before it gets too late.

Keywords: SDGs, Financial inequality, Healthcare facility affordability, Addiction, Substance use disorder

INTRODUCTION

The Millenium Development Goals (MDGs) were generated as part of the UN Millenium Declaration in September 2000¹. However, the targets could not be achieved within the deadline of September 2015. The UN General Assembly, in September 2015, replaced the MDGs with Sustainable Development Goals (SDGs) with deadline of 2030². An Inter-Agency and Expert Group on Sustainable Development Goal Indicators (IAEG-SDGs) has also been formed for monitoring the progress towards achieving these goals³.

Like many other nations, Nigeria also failed to achieve the MDGs. The major reasons for this failure include improper resource management, pitfalls at the levels of bureaucracy, extreme poverty, strong presence

of insurgent groups such as Boko Haram, unavailability of properly trained healthcare workers etc⁴. An UN report has indicated that in 2011, around sixty percent of the poorest human population lived in only five countries (China, India, Nigeria, South Africa and Uganda)⁵.

MATERIALS AND METHOD

Getting addicted to alcohol and other substances is growing into a major concern for the society. Mainly the target group is either women, adolescents or young adults. Once addicted, they become highly vulnerable and often move towards anti-social activities. They also become cause of huge healthcare expenditures (both aimed towards treatment and rehabilitation). This study aimed towards understanding the current situation in this context with reference to Nigeria, in particular. For this purpose, various publications, articles and reports available and related to it were searched for, reviewed and analyzed. Rising levels of poverty, inequality in availability and distribution of basic facilities (such as food, housing, sanitation, primary healthcare facilities and education), unemployment and presence of insurgent

groups are pushing a significant proportion of the Nigerian population towards substance abuse disorder.

FINDINGS

Overview of Substance use disorder

Drugs abuse could be seen as making bad use of drugs, wrong usage of drugs alone, but it includes buying and using of drugs for treating self without doctor's prescription⁶. Law enforcement official said drugs abuse is the use of illicit drugs⁷. And medical authorities see drug abuse as the failure of the people or patient to comply with directions for using prescribed medicines, engaging in dangerous self medication. Substance use disorder has been a topic of interest to many professionals in the area of health, particularly mental health. An area with enormous implication for public health, it has generated a substantial amount of interest in the field of research⁸.

Epidemiological survey all over the world has indicated that substance use disorder is common and is one of the most disturbing health related problems among the youth⁹⁻¹⁴. The situation is not different in Nigeria, and several studies have reported their widespread presence¹⁵⁻¹⁸. Substance use disorder is primary reason why many youths are incarcerated as well as a source of crime and health problems in our society today. It has become unprecedented in Nigeria that the number of youth incarcerated in various prisons across the country has increased dramatically over the last few decades: Majority of these youths have been arrested for substance offences, either drugs, alcohol or tobacco addiction.

Substance use disorder remains a public health problem in many countries, Nigeria included, and are associated with many social and economic factors^{19,20}. The disorder mostly starts among school children during adolescence stage, as a result of the several factors including peer group influence, curiosity, bad friends, environment, social pressure, the school and "I don't care attitude from teachers", self medication²¹⁻²³.

Using these substances for prolonged periods can have severe consequences, both at the level of the individual as well as the society. Some of the most prominent damages include increased rates of diseases such as cancer and sexually transmitted diseases, higher numbers of homicides and suicides, personality

disorders, higher incidences of depression, increased frequency of unplanned sexual activities, increase in the number of school dropouts, higher rates of crime, higher rates if unemployment, leading to poverty²⁴⁻²⁶.

World scenario on Substance use disorder

Survey in the United Kingdom indicated that 5-20% of secondary school students use substance with 2-5% , using them weekly and with a peak prevalence at 14-16 years of age^{27,28}. A baseline survey on drug use and abuse commissioned by the National Agency for Campaign against drug abuse in the year 2001 and 2006 revealed that more than a fifth of secondary school, students in Kenya have taken alcohol and the figure rise to more than three-fourth for university students (Republic of Kenya, 2004). It has been observed that in Kenya, more than 22.7% of secondary school students have taken alcohol 68% among university¹¹. A large number of students across all age groups have been exposed to alcohol, tobacco, Mirae (khaf), bhang and marijuana, and even substance such as heroine and cocaine^{29,30}.

Most of these young people begin with alcohol, cigarette, Indian hemp, abasic gum solutions and cough syrups, and later progress to more dangerous ones such as heroine, cocaine^{29,30}. The menace of drug abuse in socio-economic, political, health education section brings a setback in our day to day life. The probable adverse effects of these psychoactive substances have caused international concern over many years and international legislations have been enacted at various times to control their circulation and use. These include formation of United Nations International Drug Control Programme (UNDCP) and surveys conducted by this organization³¹.

Situation of Substance use disorder in Nigeria

International drug trafficking is becoming a growing concern for Nigeria. Reports have shown that at least five states of Nigeria (Kano, Borno, Kaduna, Rivers and Plateau) are heavily involved in this process and show a corelative increase in levels of violence and unrest³². It has also been found that dependence on drugs is also being exploited to gain political mileage³³. In addition to well known narcotic drugs (mainly marijuana and cannabis), prescription drugs (such as codiene syrup, tramadol and Rohypnol) are also being for drug abuse. Studies have shown that even these prescription drugs, when consumed in excess quantities can lead

to impairment of judgemental abilities and withdrawal symptoms similar to hard drugs³⁴.

Just like many other countries, the healthcare, rehabilitation and accessory support systems that are available for catering to the needs of these growing numbers of patients suffering from substance use disorder in Nigeria are inadequate³⁵.

Moreover, although Nigeria has bodies such as National Directorate of Employment (NDE), National Economic and Empowerment Development Scheme (NEEDS) and National Poverty Eradication Programme (NAPEP) which have been established with the aim of reducing/alleviating poverty and unemployment among youths, both of them remain serious threats till date³⁶. This has led to increase in frustration and hopelessness among the youth thereby pushing them towards temporary solitude in drug addiction.

Measures that can be implemented to improve the existing scenario

Since the problem of substance use disorder has multiple contributing factors ranging from non-availability of basic requirements for survival with dignity to corruption and high crime rates, preventive measures are required to take care of each of these lacunae.

The existing healthcare system needs a complete overhaul. It has been found that there is shortage of drug rehabilitation treatment centres worldwide, and Nigeria is no exception³⁵. Formation of special “community-care centres” with participation of members from the community can serve to fill this gap as these patients can be holistically treated by joint efforts of these community members and healthcare workers. The government should encourage such “treatment-focussed policies” as they have shown promising results in other countries³⁷.

Since Nigeria is the most populated country in the African sub-continent³⁸, special priority must be given towards an effective policy of inclusive growth. This will ensure that the basic amenities reach the most economically deprived citizens. This, in turn, will help in overall upliftment of their lives, in terms of food security, education, access to healthcare facilities and employment³⁹. Moreover, they will become more aware of the pitfalls of getting into drug addiction. Awareness, thus generated, will also empower them to stand up to

drug traffickers and corrupt administrators.

National policies must also be developed so that corruption can be handled across all levels. In fact, the National Drugs Law Enforcement Agency (NDLEA) was established in 1985 with the aim of curbing drug trafficking and making provisions for punitive measures against all those who would get involved in this process⁴⁰. The National Agency for Food and Drug Administration and Control (NAFDAC) should also be provided with adequate power and logistic support so that it can monitor production of banned habituating products. Anybody found guilty of promoting or helping in the process of drug addiction or drug trafficking should be subjected to very harsh punishments.

CONCLUSION AND FUTURE DIRECTIONS

This study aims to give an overview of the factors that are leading to the increasingly disturbing trend of getting addicted to unwanted substances and prohibited drugs. The most severely affected group is very young in age. The factors which are primarily responsible for this inclination range from poor economic status of the family to distorted environment in which the child is forced to stay. Differential distribution of healthcare and educational facilities across various sub-sections of the population and its subsequent effects on the society are equally responsible for their increased incidences among children, adolescents and young adults. This study also aimed towards analysing how alterations in the economic status might affect this distribution pattern, especially among Nigerian populations. Inclusive growth models that pay due attention towards addressing this issue are urgently required for being able to remove these economic differences and the downstream effects.

A Study of Urinary Uric Acid/Creatinine Ratio as an Additional Marker of Birth Asphyxia

Renu Yadav¹, Sangeeta Singhal², Gagan Agarwal³

¹Junior Resident, ²Professor and Head, ³Professor, Muzaffarnagar Medical College, Muzaffarnagar

ABSTRACT

Perinatal asphyxia refers to an impairment of the normal oxygenation during parturition and the ensuing adverse effects on the fetus/neonate. It is one of the major causes of early neonatal mortality in India. Among the institutional births, incidence is 5% and accounts for 24.3% of neonatal deaths. It is an insult to fetus or newborn due to lack of oxygen (hypoxia) or lack of perfusion (ischemia) to various organs of sufficient magnitude and duration. The aim of the study was to observe the urinary uric acid to creatinine ratio in patients with perinatal birth asphyxia in a hospital setting. It was concluded that UUA/Cr concentration increase considerably after birth asphyxia, and the increase is associated with severity of HIE with a poorer outcome. Hence, UUA/Cr might have an important role in diagnosing and predicting the outcome of perinatal asphyxia.

Keywords: Birth asphyxia, perinatal asphyxia, uua/cr ratio.

INTRODUCTION

Perinatal asphyxia refers to an impairment of the normal oxygenation during parturition and the ensuing adverse effects on the fetus/neonate. It is one of the major causes of early neonatal mortality in India. Among the institutional births, incidence is 5% and accounts for 24.3% of neonatal deaths.¹ It is an insult to fetus or newborn due to lack of oxygen (hypoxia) or lack of perfusion (ischemia) to various organs of sufficient magnitude and duration.

Over 9 million children die each year during the perinatal and neonatal periods, and nearly all of these deaths occur in developing countries.² Birth asphyxia remains a major cause of global mortality, contributing to almost one quarter of the world's 3 million neonatal deaths and almost half of 2.6 million third-trimester stillbirths.³ Every year approximately 4 million babies are born asphyxiated; this results in 1 million deaths and an equal number of serious neurological consequences

ranging from cerebral palsy and mental retardation to epilepsy.⁴

In term infants, 90% of insults occur in the antepartum or intrapartum periods as a result of placental insufficiency. The remainder is postpartum usually secondary to pulmonary, CVS or neurologic abnormalities. The proportion of postpartum events is higher in premature neonates, especially in ELBW infants.⁵ According to a study conducted at Thailand, inappropriate antenatal care, vacuum extraction, male sex, prolapsed cord and 1 and 5-minute low Apgar scores, were significant risk factors for hypoxic ischaemic encephalopathy (HIE).⁶

Outcome of birth asphyxia depends on apgar score at 5 minutes, heart rate at 90 seconds, time to first breath, duration of resuscitation arterial blood gases and acid – base status at 10, and 30 minutes of age.⁷ Although apgar score does not exactly predict the neurodevelopmental outcome it is still the most feasible and practical to perform. The early outcome is either death/or presence of hypoxic ischaemic encephalopathy (HIE) stage I, II or III, according to Sarnat and Sarnat staging. Most of the HIE cases presented with depressed neonatal reflexes, seizures, lethargy, and papillary abnormalities. The common acid base disturbance was metabolic acidosis,

Corresponding author:

Renu Yadav,

Junior Resident, Muzaffarnagar Medical College, Muzaffarnagar, email. Drrenuyadav2007@gmail.com.

observed mainly in babies with HIE stage III.⁸

This study is to evaluate the utility of urinary uric acid to creatinine ratio (UA/Cr ratio) as marker for early, easy and cost effective detection of perinatal asphyxia and also find out co-relate with birth asphyxia and its severity with ratio of uric acid & Creatinine.

AIMS AND OBJECTIVES

To observe the urinary uric acid to creatinine ratio in patients with perinatal birth asphyxia in a hospital setting.

MATERIAL & METHOD

This prospective case-control study was carried out in the Department of Pediatrics at Muzaffarnagar Medical College, Muzaffarnagar College name . All the term babies (39-41 weeks) born in the hospital or delivered outside, were admitted in NICU of the hospital with Birth Asphyxia were included. Babies with other major illness or any congenital abnormality were excluded.

RESULTS

The cases comprised of 33 (66.0%) male & 17 (34.0%) females, controls consisted of 29 (58.0%) male & 21 (42.0%) female. While 16 (32.0%) cases & 12 (24.0%) controls were ≤ 2.5kg at birth, 34 (68.0%) cases & 38 (76.0%) controls were >2.5kg at birth as observed and recorded in the table. Further, whereas mean of birth weight of cases was 2.73±0.62 kg the same was 2.83±0.55kg for control group. While 14 (28.0%) Inborn among cases & 35 (70.0%) Inborn among controls were afflicted with perinatal asphyxia, 36 (72.0%) Out born from among cases and 15 (30.0%) from controls were found afflicted with the disease.

Table no 1: Distribution of perinatal asphyxia among inborn and out born neonates

Neonates	Case (n=50)		Control (n=50)	
	Frequency	Percentage	Freq- uency	Percen- tage
Inborn	14	28.0	35	70.0
Out Born	36	72.0	15	30.0

A great variety of perinatal risk factors for birth asphyxia were enumerated in the table 2. Out of eight

number of risk factors for birth asphyxia mentioned in the table, major being Meconium Stained Amniotic Fluid (MSAF) 19 (38.0%), Assisted breech 14 (28.0%) and LOC(loop of cord around the neck)6 (12.0%). All other causes or **Risk factors** are commonly not encountered.

Table no 2: Distribution of perinatal risk factors for birth asphyxia

Risk factors	Case (n=50)	
	Frequency	Percentage
MSAF	19	38.0
Prolonged second stage	3	8.0
LOC(loop of cord around the neck)	6	12.0
Assisted breech	14	28.0
APH	3	6.0
Cord prolapsed	1	2.0
Difficult extraction by ISCS	2	4.0
Obstructed Labour	2	4.0

In medicine Sarnat staging, or the Sarnat Grading Scale is a classification scale for hypoxic-ischaemic encephalopathy (HIE), of the newborn, a syndrome caused by a lack of adequate oxygenation around the time of birth which manifests as altered consciousness, altered muscle tone, and seizures(table 3). Based on above while 10 (20.0%) cases were categorized under Stage-1, 31 (62.0%) under Stage-2 and 9 (18.0%) were placed under Stage-3. Of Sarnat Grading Scale

Table no 3: HIE staging distribution

HIE Staging	Frequency (n=50) (%)
Stage-1	10 (20.0)
Stage-2	31 (62.0)
Stage-3	9 (18.0)

Comparison between various parameters of cases and control group was made and results were tabulated. On perusal of the results we find that there was great difference in the mean values of Urinary uric acid (mg/dl), as well as the values of Urinary uric acid and creatinine ratio between the cases and controls (table 4). Variations in respect of both these values was statistically highly significant P<0.001. As for difference in the mean Urinary creatinine (mg/dl) values between the two groups the same was not significant P=0.536.

Table no 4: Comparison between various parameters of case and control group

Parameters	Case (n=50)	Control (n=50)	p-value
Urinary uric acid (mg/dl)	35.97±2.23	19.17±2.74	<0.001
Urinary creatinine (mg/dl)	12.13±3.14	11.74±3.14	0.536
Urinary uric acid and creatinine ratio	3.18±0.85	1.76±0.54	<0.001

Table 5, shows Co-relation with birth asphyxia and its severity with the ratio of uric acid & Creatinine was established and recorded in the table. On scrutiny we find that maximum no. of 31 neonates were under stage2 where Urinary uric acid and creatinine ratio was also maximum being 3.24±0.82. Under stage 1 & stage 2, where Urinary uric acid and creatinine ratio was 3.04±1.02 & 3.12±0.83 respectively, the no. of asphyxiated neonates were also 10 & 9 only. As such we may conclude that higher values of Urinary uric acid and creatinine ratio were attributable to the severity of perinatal asphyxia.

Table 5: Co-relate with birth asphyxia and its severity with ratio of uric acid & Creatinine

Parameters	Frequency (n=50)	Urinary uric acid (mg/dl)	Urinary creatinine (mg/dl)	Urinary uric acid and creatinine ratio
Stage 1	10	35.66±1.64	12.76±3.45	3.04±1.02
Stage 2	31	35.96± 2.36	11.85±3.11	3.24±0.82
Stage 3	9	36.28±2.47	12.34±3.12	3.12±0.83
p-value	-	0.833	0.721	0.806

DISCUSSION

Perinatal hypoxia is one of the leading causes of perinatal mortality in developing countries. Birth asphyxia is an important cause of static developmental and neurological handicap both in term and preterm infants (in 3 to 13% of infants with cerebral palsy (CP) have evidence of intrapartum asphyxia).⁹ In addition to pulmonary, renal, and cardiac dysfunction, HIE develops in one third of asphyxiated newborns.¹⁰ Mild encephalopathy carries a good prognosis, although in moderate and severe encephalopathy the risk of death or neurologic sequelae increases greatly.¹¹ Though there are more and more studies and understanding of the mechanisms leading to birth asphyxia, early determination of tissue damages due to birth asphyxia are still lacking. Brief hypoxia impairs cerebral oxidative metabolism leading to an anaerobic glycolysis to generate ATP. During anerobic conditions one molecule of glucose yields only 2 molecules of ATP as opposed to producing 38 molecules of ATP during aerobic conditions. During prolonged hypoxia, cardiac output falls, cerebral blood flow (CBF) is compromised and a combined hypoxic-ischemic insult produces further failure of oxidative phosphorylation and ATP

production, sufficient to cause cellular damage. Lack of ATP and increase excitotoxic cellular damage leads to an accumulation of adenosine diphosphate (ADP) and adenosine monophosphate (AMP), which is then catabolized to adenosine, inosine and hypoxanthine. If there is uninterrupted tissue hypoxia and there is also reperfusion injury, hypoxanthine is oxidized to xanthine and uric acid in presence of xanthine oxidase leading to an increase in uric acid production, which come out in blood from tissues and excreted in urine.

Present study found that perinatal asphyxia is one of the commonest causes of admission and morbidity. In our study, males (58%) were affected more than females (42%) which is similar to a study done by Siva Saranappa SB et al¹² where males were 70% and 67% respectively. It is also comparable with most other studies where male dominance was recorded, 55.88% in study by Dongol et al¹³ 55.5% in study by Kumar et al¹⁴, 61% by Shrestha et al¹⁵.

In this study, majority (100%) was appropriate for gestation age. Post maturity has been noted to be an important risk factor of birth asphyxia by earlier workers like Azam Multan which was not seen in this

study.¹⁶ Among the maternal risk factors associated with perinatal asphyxia, MSAF was the major contributing factor, accounting for 38% of the cases. This study is comparable with the study done by Lalsclottir et al¹⁷ in Iceland where 50% of the women of asphyxiated babies had meconium stain amniotic fluid. Bahubali Gane et al reported meconium stained amniotic fluid independently associated with perinatal asphyxia.¹⁸

The present study revealed significant increase in UA/Cr ratio in early spot urine samples from asphyxiated full term newborns and also proved positive correlation between the urinary UA/Cr ratio. In a study by Pallab Basu et al¹⁹ it was found that urinary UA/Cr ratio was significantly higher in cases than controls (3.1 ± 1.3 vs 0.96 ± 0.54 ; $p < 0.001$) which is similar to our study. Another study by Bader et al²⁰ also showed UA/Cr was higher in the asphyxiated group when compared to controls ($2.06 + 1.12$, vs $0.64 + 0.48$; $P < 0.001$) which is similar to our study. The results of the present study were in concordance with those of Reem Mahmoud and Dina El Abd²¹ who reported Urinary UA/Cr ratios were higher in asphyxiated infants (2.9 ± 0.73) when compared with the controls (0.72 ± 0.35 , $P < 0.001$).

Purine degradation products such as hypoxanthine, xanthine and uric acid are useful clinical indicator of tissue hypoxia.²² Detection of hypoxanthine and xanthine requires sophisticated techniques (like, High Performance Liquid Chromatography or HPLC)²³ and instruments which are impractical in maximum neonatal setup. But for urinary uric acid and creatinine estimations, only very simple instruments like photoelectric colorimeter or semi-auto-analyzer, simple reagents and simple techniques are required and can be acquired at low costs.

In the present study, majority 62% had Stage 2 followed by 20% stage 1 and 18% stage 3. It was seen that HIE stage I was the most common followed by HIE stage II and finally HIE stage III which is similar to present study. All Babies with HIE stage I had recovered and had a good prognosis while those with Stage III had all expired. Choudhary L et al in their study mostly babies were of stage 2 category and his study proved positive correlation between the urinary UA/Cr ratio and the severity (grading) of HIE ($P < 0.001$). UUA/Cr ratios were significantly higher in infants with severe HIE (3.61 ± 0.61) when compared with infants with moderate HIE (2.95 ± 0.98 ; $P < 0.01$) and those with mild HIE ($2.64 \pm$

0.25 ; $P < 0.001$). The values of the UA/Cr ratios in the mild and moderate HIE groups were also statistically significant ($P < 0.01$). These patterns were also followed in present study but statistically non-significant. This may be possible due to small sample size.

Kumar et al. conducted a study on 110 neonates comprising 55 cases and 55 controls born in Rajendra Institute of Medical Sciences. Spot urine sample collected within first day of life. A cut-off urinary uric acid to creatinine (UA/UCR) ratio value of >1.14 was taken as the cut-off level. The urinary UA/UCR ratios were found to be higher in asphyxiated infants (2.58 ± 1.09) when compared with those in the controls (0.86 ± 0.17 which also is in favour of our study).

Thus the UUA/Cr allows rapid recognition of asphyxia and assessment of its severity and the potential for short term morbidity of death.

CONCLUSION

Currently diagnosis of perinatal insults relies on adequate documentation of general medicine and obstetrics factors and on radiological and laboratory assessments. But early identification of infants at highest risk for developing seizures to hypoxic ischemia is critical, so that therapeutic strategies can be facilitated. Many specific biomarkers are being investigated now a day to assess damage after perinatal asphyxia in neonates of which UUA/Cr is non-invasive, sensitive, early and cost effective. The most common perinatal danger component was MSAF (38%).

So we conclude that UUA/Cr concentration increase considerably after birth asphyxia, and the increase is associated with severity of HIE with a poorer outcome. Hence, UUA/Cr might have an important role in diagnosing and predicting the outcome of perinatal asphyxia. There exists still a need to study these parameters in the context of therapeutic hypothermia and how the parameters change over the period of treatment.

ABSTRACT

Background: HIV/AIDS has asserted its pandemic status by claiming more than 35 million lives so far. The disproportionate burden of HIV/AIDS across the globe in terms of mortality, incidence and prevalence rates intrigued researchers to examine and evaluate the degree and direction of a two-way association between the global HIV/AIDS epidemic and national development across different levels of HDI to formulate the policies. The present analysis is to concentrate directional influence of HDI on these rates.

Data and Method: Age-standardized HIV/AIDS mortality, prevalence, and incidence rates of 179 countries were extracted from Global Burden of Disease Study 2015. The human development index along with its 4 components were obtained from Human Development Report 2016. The association between each of the rates and HDI was judged by Spearman correlation, Linear and Quantile regression analysis, and the Kruskal-Wallis test.

Results: HIV/AIDS mortality, prevalence, and incidence rates were found to be inversely correlated with national HDI ($r = -0.707, -0.677, -0.557$ respectively; $P < .001$), as well as the 4 indicators of HDI. Countries in Low HDI group were found to experience higher burden of HIV/AIDS in terms of these rates than that of Medium, High, and Very high HDI countries.

Conclusions: Lower development status characterized by low HDI values was found to increase the burden of HIV/AIDS around the world. Higher levels of deprivation in terms of Health, Education, and Economy were not only found to affect the overall well-being but might just raise the severity of HIV/AIDS across the regions. Hence for HIV/AIDS control or eradication, development could be the key aspect; hence recommended that special attention should be paid to develop an enabling environment in the countries of lower HDI groups.

INTRODUCTION

Since the first reported case in the second half of twentieth century, Human Immunodeficiency Virus (HIV) leading to Acquired Immunodeficiency Syndrome (AIDS) had diversified prevalence, incidence and mortality rates across different regions had intensified

attention of WHO and a huge number of medical and social scientists. In few decades since first outbreak, it shaped to pandemic status by claiming more than 35 million lives so far. As per WHO recent published factsheets, nearly 1 million people died from HIV related causes during past 1 year and currently the number of people living with HIV has hit approximately to an alarming level (36.7 million) whereas another 1.8 million people reported to be newly infected in 2016 globally.¹ Out of an estimated 6000 new infections that occur globally each day, two out of three are in sub-Saharan Africa with young women continuing to bear a disproportionate burden.² Though between 2000 and 2016, the new cases of HIV infection fell by 39%, the incidence rate is still high among key populations and their partners.

In order to capture the variability in the spread of HIV/AIDS and to reassess the extent of the lethal threat it poses to the entire civilization and its development; prominent gaps were found to exist between developed, developing and least developed countries for incidence, prevalence and mortality in different age groups since the beginning of twenty-first century. Only, Sub-Saharan Africa countries accounted for almost two thirds of the global burden of new HIV infections. Through globalization of Antiretroviral Therapy (ART) and improved coverage of health facilities supported by National HIV programmes with better partners, it is expected that the wide gap in the incidence, prevalence and mortality related to HIV/AIDS between developed, developing and least developed countries should be narrowed. The reality, however, suggest that with the coexisting inequality and instability in different dimensions of lives across different regions as reflected by social, economic and health indicators, there would always be a considerable amount of differences in the levels and patterns of HIV/AIDS epidemic across nations.

Human Development Index which has been constructed to measure the average achievements in three major dimensions namely Health, Education and Standard of living is designed to capture the variability in people's lives and overall well-being. Countries and regions with relatively poor performance with respect to HDI can be characterized by the poorer access to education and health facilities, lack of infrastructure, prevalent security risks, poverty and persistent endemic diseases as compared to those countries and regions

which have made sustainable advancements to ensure human well-being. Persistent diseases and its high prevalence, incidence and mortality on the other hand impede development and hence reverse the social and economic gains that these countries are striving to attain.³ As we could see in the case of Sub-Saharan Africa, the high prevalence of HIV/AIDS in adult working age population was considered to be one of the leading arguments for that region being deprived of earning demographic dividend.⁴ In other words, it is a disease that particularly hits those who should be economically productive, and thus threatens not only health, but also the economic stability and potential of a country.⁵ So far, the studies associating HIV/AIDS and human development had been carried out to assess macro implications of the disease either in African continent or in some of the African countries with devastating history of HIV/AIDS on purely regional basis.⁶⁻⁸ One such study affirmed the need to look into the impact of HIV/AIDS on human development in Africa extending beyond health issues and it asserted that HIV/AIDS should and must be seen as a global development concern, affecting education and knowledge acquisition, income and social status, productivity and economic growth, and other direct and indirect components of human development such as gender equality and human rights.³

Through this paper we would like to shed some light on three different dimensional components of the current trajectory of HIV/AIDS in terms of incidence, prevalence and mortality rates across 179 countries and review the degree and direction to which HIV/AIDS epidemic is associated with human well-being that is measured by HDI and how the incidence, prevalence and mortality rates vary across these 179 countries as we classify them into 4 HDI groups.

OBJECTIVE

To present the overall variation of HIV/AIDS epidemic in terms of Incidence, Prevalence and Mortality rates for 179 countries and to provide quantitative evidence in support of the existing association between each of these rates with each component dimensions of HDI. Further, to propose dynamic models to predict the conditional mean and quantiles for Incidence, Prevalence and Mortality rates separately by taking HDI as predictor variable. And, finally, to depict the variability of the above rates across these 179 countries as well as across the 4 HDI groups (Very High, High, Medium and Low HDI groups).

DATA AND METHODOLOGY

Global HIV/AIDS epidemic

Mortality, prevalence and incidence rates of HIV/AIDS for 179 countries were extracted from Global Burden of Disease Study 2015.⁹

HDI

HDI is a composite index that measures the average achievements in three basic dimensions e.g. Life Expectancy Index (LEI), Education Index (EI) and Income Index (II) derived from Life Expectancy at Birth (LEB), Mean Years of Schooling (MYS), Expected Years of Schooling (EYS) and Gross National Income per capita (GNI_{pc}) and was obtained from Human Development Report 2016¹⁰ categorized as Very High (HDI \geq 0.800), High (0.800 > HDI \geq 0.700), Medium (0.700 > HDI \geq 0.550), and Low (HDI < 0.550) HDI groups.

STATISTICAL ANALYSIS

The median values and inter quartile ranges were calculated and Kolmogorov-Smirnov test for each variable under study were performed to check the normality¹¹ and at the rejection of null hypotheses, Spearman correlation coefficients were calculated separately between each of these rates and HDI and its 4 indicators in order to establish the association. Further,

Table 1: Medians, Interquartile ranges and Kolmogorov-Smirnov test results of global HIV/AIDS epidemiological parameters per 100,000 individuals

Global HIV/AIDS epidemic	n	Median	Interquartile Range	Kolmogorov- Smirnov test (P value)
Mortality	179	4.119	0.596-20.307	.000
Incidence	179	12.431	3.114-49.835	.000
Prevalence	179	133.99	35.056-696.023	.000

The median, interquartile range corresponding to the HIV/AIDS mortality, incidence and prevalence rates across these 4 HDI groups presented in table 2 indicated that all the three rates were increasing significantly as one move from high HDI to low HDI. The median mortality, incidence and prevalence rates were 0.375, 2.514 and 44.87 among countries of very high HDI while these were 52.126, 91.551 and 1232.03 among low HDI countries.

Table 2: HIV/AIDS mortality, incidence and prevalence rate across the categories of Human Development Index

HDI category	No. of countries	Mortality	Incidence	Prevalence
Very High	48	0.375 (0.208-1.301)	2.514 (1.21-3.93)	44.87 (19.24-101.91)
High	49	4.119 (1.23-8.95)	12.138 (3.994-23.75)	123.87 (31.426-335.24)
Medium	41	6.889 (2.342-33.701)	20.485 (7.20-81.23)	171.98 (66.70-1016.18)
Low	41	52.126 (20.924-115.198)	91.551 (36.297-252.601)	1232.03 (511.005-2914.98)

linear regression and proposed separate linear regression models performed to predict the conditional mean of each of the 3 dependent variables (HIV/AIDS mortality, prevalence, and incidence rates) considering HDI as the independent variable (HDI). In order to understand the average effect of HDI at different quantiles of each of the dependent variable's conditional distribution, quantile regression analyses were performed.¹²

Kruskal-Wallis test followed by pairwise comparisons were carried to examine whether the differences in HIV/AIDS mortality, prevalence and incidence rates across the 4 HDI groups were statistically varying.¹³ Statistical analyses were performed using SPSS 20 (IBM-SPSS Inc, Armonk, NY) and STATA (Stata Corp, College Station, Texas). P values < .05 were considered significant.

RESULTS

HIV/AIDS epidemic and national HDI

Each of the three rates e.g. mortality, prevalence, and incidence rates indicated (Kolmogorov-Smirnov test) non-normality of their distributions across the countries (P < .05). As indicated in table 1 of the listed countries 95% observed prevalence of HIV/AIDS were between 35.056 to 696.023 while annual incidence and mortality rates were between 3.114 to 49.835 and 0.596 to 20.307 respectively.

The pairwise comparisons between HDI categories revealed that HIV/AIDS related mortality and incidence rates differed significantly between each except between High and Medium HDI groups whereas prevalence do differ significantly between each of the categories of HDI except between Very High and High HDI as well as High and Medium groups.

Table 3: Spearman correlation coefficients between Human Development Index (HDI), its 4 indicators, and HIV/AIDS epidemiologic parameters

Variable	Mortality	Incidence	Prevalence
HDI	-0.707***	-0.677***	-0.557***
Life expectancy at Birth, y	-0.753***	-0.727***	-0.613***
Mean years of schooling	-0.617***	-0.594***	-0.485***
Expected years of schooling	-0.660***	-0.627***	-0.520***
Gross national income per capita, \$	-0.622***	-0.593***	-0.480***

The negative and highly significant value of correlation coefficients revealed that each of the 3 rates were inversely correlated with HDI as well as with each of its indicators.

Among the 4 indicators of HDI the association of each of the rates was highest with LE (r = -0.753 with mortality, -0.727 with incidence, and -0.613 with prevalence) and lowest with GNI (r = -0.622 with mortality, -0.593 with incidence, and -0.480 with prevalence). table 3, fig 1

Fig 1. Scatter plots showing Spearman correlation coefficients between Human Development Index (HDI) and HIV/AIDS mortality, HIV/AIDS incidence and HIV/AIDS prevalence rates (per 100,000 individuals).

Table 4: Comparison of linear and quantile regression results using HIV/AIDS mortality, incidence and prevalence rate as dependent variables

Dependent Variable	Ordinary least squares coefficient estimate	Quantiles				
		0.10	0.25	0.50	0.75	0.90
Mortality	-222.547***	-2.091	-19.649***	-58.804***	-167.786***	-379.914*
Standard error	38.688	1.55	4.693	12.245	48.071	147.058
Incidence	-604.022***	-15.250***	-40.797***	-134.410***	-257.179**	-914.380
Standard error	175.527	3.866	9.204	23.971	92.377	699.14
Prevalence	-6613.414***	-37.813	-424.805**	-1736.044***	-3618.695**	-13231.43
Standard error	1571.27	31.960	135.366	324.393	1355.662	7665.4

From table 4, The results of Linear and Quantile regression analyses indicated that all the OLS coefficients were significant whereas the coefficients at .10 quantile corresponding to the conditional distribution of mortality and prevalence and at .90 quantile corresponding to the conditional distribution of incidence and prevalence were found to be insignificant. It was also seen that at .25, .5 and .75 quantiles, HDI had significant inverse effect on HIV/AIDS mortality (b=-19.649, -58.804, -167.786; P<.001), incidence (b=-40.797, -134.410, -257.179; P<.001 and P<.01)) and prevalence (b=-424.805, -1736.044, -3618.695; P<.001 and P<.01) whereas at .10 and .90 quantile, HDI had no significant effect on the conditional distribution of prevalence (b=-37.813, -13231.43; P<.05).

DISCUSSION

Current epidemiology of global HIV/AIDS in terms of mortality, prevalence, and incidence rates, it was transparent that significant disparity existed in the burden of HIV/AIDS across different levels of Human Development table-2. HIV/AIDS related mortality, prevalence, and incidence rates were found to be inversely correlated with national HDI and its 4 indicators (i.e. life expectancy at birth, mean years of schooling, expected years of schooling, and GNI per capita). The situation worsened in case of those countries which belong to the lower HDI group according to the existing classification; that comprises countries mostly of Sub-Saharan Africa and thus the disproportionate burden of HIV/AIDS in terms of mortality, incidence and prevalence became more severe with the lower level of overall well-being as characterized by lower levels of HDI values.

HIV/AIDS related burden and different dimensions of HDI are expecting to exert a 2-way force; on one hand, the burden of HIV/AIDS directly affects important health and demographic indicators such as mortality rates and life expectancy resulting to bring down the National HDI, whereas poverty, illiteracy and poor health facilities and infrastructure further aggravate the HIV/AIDS related mortality, incidence and prevalence rates. It was estimated that in the 7 most affected countries in Africa, life expectancy declined by 12.1 years by 1995-2000 and expected to decline further by 29.4 years by 2010-2015.³ Analysis of global inequality of life expectancy showed that 6 years of the difference in life expectancy between Africa and North America, the two extreme continents in terms of health and wealth, is due

to HIV/AIDS.¹⁴

The OLS regression asserted that the National HDI had significant inverse effect on each of the rates i.e. with increase in the National HDI values, the corresponding national rates on HIV/AIDS mortality, incidence and prevalence would decrease. The Quantile regression analyses revealed that HDI was significantly negatively associated with HIV/AIDS mortality, incidence and prevalence rates at different quantiles, though as we move from .10 quantile to .90 quantile, the average inverse effect of HDI at these quantile points corresponding to the conditional distribution of these 3 rates were found to grow stronger.

The 2-way interaction between education and HIV/AIDS has been extensively discussed.^{3,8,15} In the present study, it was found that years of schooling were reversely related to HIV/AIDS epidemic, hence needs to be enhanced especially in low- and medium-income countries being an essential component for human development. HIV/AIDS is one of the culprit reversing the trend toward the achievement of universal primary education in most African countries caused by death of AIDS parents resulting to economic status deterioration leading to increased number of children out of school (especially girls) that further impact on de-education of the future generation.^{3,15} Undoubtedly, education can make a significant contribution to the prevention of HIV transmission and is the most important vehicle to combat HIV/AIDS.¹⁶⁻¹⁷

Many of the researchers have described AIDS as a disease of poverty and continue to make the vicious circle with the loss of young wealth-producing adults and the high cost of caring for those with AIDS. More than 60% of people living with HIV inhabit the world's poorest region: sub-Saharan Africa.¹⁸ Even with the help of global organizations such as UNAIDS, a nation with low economic growth can hardly pay the cost of highly active antiretroviral therapy and prevention programs.¹⁹ Hence, the cyclical relationship is clear: poverty makes people more vulnerable to AIDS and AIDS generates poverty. This was verified in this study by the negative correlation between GNI per capita and HIV/AIDS mortality, prevalence, and incidences rates.

AIDS has been long considered as a disease at the core of a vicious circle, whereby the downstream effects of AIDS on socio-economic status and the upstream

effects of socioeconomic status upon the risk of acquiring HIV.¹⁸ The upstream effects were verified in our study with negative regression coefficients of HDI on HIV/AIDS mortality, prevalence, and incidence rates, which may be due to the effects of poor education and poverty on HIV/AIDS.

CONCLUSION

Higher levels of deprivation in terms of Health, Education, Economy responsible for HDI are to affect the overall well-being by accelerating the spread of HIV/AIDS. Hence in order to control the rates of transmission in less development regions, HIV/AIDS sustained effective method of prevention and control programs need to be intensified.

Study to Assess the Social and Economic Impact of Alcohol in a Peri-Urban Area of Tamil Nadu

Shankar S¹, Raghuram V², Elango S³

¹Assistant Professor, ²Professor, ³Professor & Head, Department of Community Medicine, Chennai Medical College Hospital and Research Centre (CMCH&RC), Trichy, Tamil Nadu

ABSTRACT

Introduction: Alcoholic beverages have been used in human societies since the beginning of recorded history. There is an exponential relationship between the amount of alcohol consumed and criminal behavior, including drunken driving and legal arrests. The cost associated with alcohol amounts to more than 1% of gross national product in high income and middle-income countries, with the costs of social harm constituting a major proportion in addition to health cost. **Methodology:** A community based cross sectional study was carried out using pretested questionnaire method to find out social and economic impact of alcohol in study population. Study population included all alcoholics aged between 18 and above who visited UHTC for other ailments & were willing to participate during the period and data analyses done with SPSS ver. 15.0. **Result:** Among 212 individuals, 37% alcoholics were involved in public commotion, rash driving, nearly 90% of them utilize their family income for alcohol consumption, 65% of them were in financial crisis and lost their job. On family income basis, the economic impact of excessive alcohol consumption is approximately 20-30 %.

Keywords: Alcohol, Impact, Social, Economic, Urban, Tamil Nadu.

INTRODUCTION

Alcoholic beverages have been used in human societies since the beginning of recorded history¹. The patterns of alcohol intake around the world are constantly evolving and alcohol is ubiquitous today. Increase in the average volume of drinking are predicted for the most populous regions of the world in South-east Asia including India¹. Cultural differences apparently influence the pattern of alcohol consumption⁴. In addition, alcohol is linked to categories of disease whose relative impact on the global burden is predicted to increase. The crucial need from a public health perspective, is for regular means of coordination whereby prevention of alcohol related problems is taken fully into account in policy decisions about alcohol control and regulation in market for alcoholic beverages.

Alcohol and tobacco are important products of global addictive demand and have experienced a rapid increase in per-capita consumption. The fastest growth has been in developing countries in the Asian subcontinent where the per capita pure alcohol consumption has been

increased by over 50 % between 1980 and 2000¹. Alcohol is casually related to more than 60 medical conditions. Overall, 3.5 % of global burden of disease is attributable to alcohol which accounts for as much death. Although the recorded alcohol per capita consumption has fallen since 1980 in most developed countries, it has risen steadily in developing countries so in India¹. The per capita consumption of alcohol by adults more than 15 years in India is increased by 106.7% between 1970-72 and 1994-96¹.

The pattern of drinking alcohol in India has changed from occasional and ritualistic use to social use. Today, the common purpose of drinking alcohol is to get drunk. Financial constraints among patients suffering from excessive alcohol use may hamper the ability to obtain the routine healthcare and further delay the diagnosis of alcoholic liver disease². Because of this, alcohol related problems are usually not detected until hepatic decompensation occurs. There is an exponential relationship between the amount of alcohol consumed and criminal behavior, including drunken driving and legal arrests¹.

Alcoholic beverages normally serve both the interest of public health and welfare, and simultaneously gain extra revenue for the government. Household expenditure studies in 1960s found families spending 3% - 45% of their income on alcohol³. Excessive alcohol consumption causes premature deaths (average of 79,000 deaths annually); increased disease and injury; property damage from fire and motor vehicle crashes; alcohol-related crime; and lost productivity⁴. The net effect of alcohol on health is detrimental, with estimated of 3.8% of all global deaths and 4.6% of global disability-adjusted life-years attributable to alcohol⁵. Disease burden is closely related to average volume of alcohol consumption, and, for every unit of exposure, is strongest in poor people and in those who are marginalized from the society. The cost associated with alcohol amount to more than 1% of gross national product in high income and middle-income countries, with the costs of social harm constituting a major proportion in addition to health cost⁵.

METHODOLOGY

A community based cross sectional study was carried out from March to August 2016 at Urban Health Centre Samayapuram, which is located in the Urban field practice area of CMCHRC, Trichy district in Tamil Nadu. The study was conducted after obtaining clearance from Institutional review board. Study population included all alcoholics aged between 18 and above who visited UHTC for other ailments & were willing to participate during the period. Interviews were anonymous and data remained confidential throughout the study. Each participant was informed about the purpose of the study and informed consent was obtained from each respondent. Data was collected using pre tested and semi structured questionnaire including, Alcohol Use Disorder Identification Test (AUDIT)⁶. The questionnaire was developed based on the information gathered from literature. The questionnaire was first prepared in English and explained to the study population in Tamil. Data was collected by personal interview method. The data from the questionnaires were entered and analysed in SPSS 15.0 Trial version.

RESULTS

Table 1: Sociodemographic profile of study population

Variables	Categories	No. of Subjects	Percentage (%)
Age in yrs.	< 20	22	10.4
	21- 40	156	73.5
	41- 60	23	10.8
	>60	7	3.3
	Total	212	100
Gender	Male	201	94.8
	Female	11	5.2
	Total	212	100
SES (Modified BG Prasad Classification)	Upper	14	6.6
	Upper Middle Class	17	8.2
	Middle Class	25	11.7
	Lower Middle Class	54	25.4
	Lower Class	102	48.1
	Total	212	100
Education	Illiterate	98	46.2
	Completed School	67	31.6
	Graduate/ Diploma	30	14.1
	Masters	17	8
	Total	212	100

Majority of the study population were in the age group of 21 to 40 (73.5%) years and were males (94.8%). Nearly three quarters of the study population belonged to lower class (48.1%) and lower middle class (25.4%). About half of the study population were illiterates (46.2%) Table 1.

Table 2: Alcohol consumption pattern of study population

Variables	Categories	No. of Subjects	Percentage (%)
Type of Alcohol Beverage	Beer	34	16.0
	Brandy	103	48.5
	Rum	56	26.4
	Whiskey	17	8.0
	Others	2	0.9
	Total	212	100
Frequency of Alcohol Consumption	Occasionally	5	2.3
	Monthly	57	26.8
	Weekends	112	52.8
	Daily	38	17.9
	Total	212	100
Quantity of Alcohol consumed	<2 drinks (< 60 ml)	55	25.9
	3-4 drinks (90 - 120 ml)	108	50.9
	5-9 drinks (150 - 270 ml)	43	20.2
	>10 drinks (>300 ml)	6	2.8
	Total	212	100

It was observed that nearly half of the study population consumed Brandy (48.5%), followed by Rum (26.4%). Majority admitted to consume alcohol only during the weekends (52.8%). About 17.9% of study population admitted to daily consumption of alcohol. Nearly half of the study population consumed on an average of 3 -4 drinks (90 – 120 ml) per sitting Table 2.

Table 3: Social Impact of Alcohol consumption

Variables	Categories	No. of Subjects	Percentage (%)
Daily Routine activities affected due to alcohol consumption	Never	39	18.3
	Rarely	68	32.0
	Monthly	77	36.3
	Weekly	23	10.8
	Daily	5	2.3
	Total	212	100
Got Injured in drunken state	Never	132	62.2
	Within this year	31	14.6
	Previous year	49	23.1
	Total	212	100
Conflicts with family members	Never	56	26.4
	Occasionally	102	48.1
	Frequently	54	25.4
	Total	212	100
Fight in public places	Never	76	34.4
	Occasionally	110	51.8
	Frequently	26	12.2
	Total	212	100
Driving Two wheelers while Drunk	Never	103	48.5
	Occasionally	89	41.9
	Frequently	20	9.4
	Total	212	100
Fined for Drink and Drive	Yes	61	28.7
	No	151	71.3
	Total	212	100
Changed Job due to alcoholism	Yes	70	33.1
	No	142	66.9
	Total	212	100
Consume Alcohol during working hours	Never	145	68.3
	Occasionally	47	22.1
	Frequently	20	9.4
	Total	212	100

Only around 2.3% of the study population admitted that their daily routine activities were affected due to alcohol consumption. Nearly 38% of the population had an injury during drunken state. Nearly three fourth of the study participant’s family were concerned about the drinking problem. Around 25% of the participants had frequent conflicts with the family members due to drinking. About 12% of the study population gave

history of having frequent fights in public places. One third (33%) of the study population were involved in road traffic accident. Nearly 10% of the study subjects admitted to driving while they were drunk. About 28% of the subjects gave a history of being fined for drunken driving. One third of the study subjects had a job change because of alcohol consumption. About 10% of the study subjects admitted to alcohol consumption during working hours. (table 3)

Table 4: Economic Impact of Alcohol consumption

Variables	Categories	No. of Subjects	Percentage (%)
Source of expenditure for Alcohol	Own	26	12.3
	Family member	156	73.5
	Friends	30	14.2
	Total	212	100
% of Family Income spent for Alcohol	< 20	61	28.7
	20 – 30	79	37.2
	30 – 40	48	22.6
	40 – 50	16	7.5
	>50	8	3.7
	Total	212	100
Family financial problems	Yes	139	65.5
	No	73	34.5
	Total	212	100
Medical Expenses due to Alcoholism (% of Total Income)	< 20	4	1.8
	20 – 30	104	49.1
	30 – 40	93	43.8
	40 – 50	9	4.2
	>50	2	0.9
	Total	212	100
Amount spent on Alcohol per month in INR	Less than 1000	78	36.8
	1000 – 2000	115	54.2
	More than 2000	19	9.0
	Total	212	100

The predominant source of expenditure for buying alcohol was from family members (73.5%). Nearly 11% of the study subjects spent more than 40% of their total family income on alcohol consumption. Majority of the study population admitted to have financial problems due to alcoholism. Nearly 5% of the study subjects spent more than 40% of their income on meeting the medical expenses related to alcoholism. About 9% of the study population spent over 2000 INR per month on alcohol consumption.(Table 4)

DISCUSSION

Age and gender distribution of alcohol users in the present study is similar to study conducted by Sujit D Rathod in Madhya Pradesh⁷. With regard to literacy status the findings of the present study are in contrast to the study conducted by Sujit D Rathod, who found nearly 60% of their study population had less than 11 years of schooling, whereas illiterates comprised of 28% compared to 46% in the present study.⁷ with regards to socio-economic status in the present study nearly 74% belonged to low socio-economic class which is similar to findings of study conducted by Sujit D Rathod⁷.

In the present study nearly 18% of study population admitted to daily consumption of alcohol, which is almost similar to the study conducted by A. pillai in Goa⁸ who found that about 29% of the subjects gave history of heavy episodic drinking per month.

In the present study, nearly 66% of alcoholics were in financial crisis which comparatively decreased from 85% in previous study. Each alcoholic spend nearly 20-30% of their income for medical expenses due to alcohol consumption, on the other hand in our reference study nearly 50-65% income were spend by alcoholics for medical expenses⁹. In previous study, only nearly 25% alcoholics were indulged in causing self-harm or harm to others, rash driving and failed to do their routine, in our study nearly 37% were involved in causing self-harm and harm to others, specifically 36% were failed to do routine and indulged in rash driving¹⁰.

In a study conducted by Prackash.C et.al, 32.8% of the study population consumed alcohol 6 days in a week on an average, in contrast in the present study more than half of the study population consumed alcohol during weekends¹¹. A study conducted in eastern India found that average expenditure among ALD patients on alcohol was Rs. 3800/month, in contrast in the present

study it was observed that around 9% of the population were spent > 2000 INR per month on alcohol¹². Eleven % lost their job, and 7 % sold immovable property, in the present study it was observed that 33% of the study population admitted to frequent job change because of alcoholism. Besides, 52 % had disturbed social and family life, 34 % abused their spouse, 20 % suffered accidents, and 37 % indulged in physical violence in contrast the present study showed that 74% of them had conflicts with family members & 64% had fights in public places because of alcoholism. It was observed that 33% of the study population had met with accidents following alcohol consumption¹².

CONCLUSION

Predominance of low socio-economic classes and low literacy levels as found in the present study is a matter of concern. Disruption of social life because of alcohol as found in the present study is another important issue that needs further attention. Evidence – based strategies for reducing excessive drinking should be implemented. Health awareness programs have to be effectively implemented to decrease social burden of alcohol.

¹Professor and Head, Economics Dept. VISTAS, Chennai, ²Research Scholar, R.K.M. Vivekananda College, Chennai, ³Professor, Economics Dept. VISTAS, Chennai

ABSTRACT

Success of the human life relies on the sustainability of people's standard of living. Defining the term sustainability is a difficult task as it is complex in nature. This study is an attempt to project, new hypotheses to the term sustainability, by using natural and warranted growth rates. The unique concept of this research is to introduce a new concept called 'SNS Measurement' for Sustainability. This study also throws light on the link between the present and future generation in terms of sustainability in natural resources. Production is meaningful only when consumption is made and consumption without production leads to scarcity. Therefore the present theory initiates the concept of sustainability which involves in three aspects, firstly, the problems of distribution equity between inter and intra generations, secondly linkage of productions and production efficiency and finally, replacement of natural and artificial resources.

Keywords: Sustainability, Natural resources, SNS Measurement, Environment, Future.

INTRODUCTION

The concept of sustainability of sustainable growth is very complex, subjective and an abstract. Common men do not know what it may mean and what its implications might be. UNESCO document states that every generation should leave water, air and soil and other natural resources as pure and unpolluted to the future generation. It precisely states that each generation should leave un-diminished flora and fauna to the younger generation. Does it mean that present generation should not construct buildings, road and dams? Is it our moral obligation to preserve our flora and fauna to the future? Is it our sacrifice to the future generation. Is it compulsory to share the environment with the future? In fact it is an obligation to conduct ourselves in such a way to leave the undamaged environment to the future. It implies that we should not satisfy ourselves by impoverishing our successor. But we do not know the present optimum consumption that preserves an unpolluted environment to the future. Another point which relevant to this is that, we do not know the type of technology and consumption pattern and requirement of the future generation. No idea about the taste and preference of future generation. One thing, however, we must realize that we should not live at the expense of future well-being. Sustainability is a problem because each of us knows that we profit at the expense of the future⁵. In fact, we have free ride on each

other and we have free ride on the future. Environment is the base for our survival but it should not become the matter of survival for the future. It is like a legacy, one should preserve the future.

ISSUES IN SUSTAINABILITY

Sustainability is a matter of distributional equity between the present and the future. It is about sharing of well-being between present generation and future generation. It is a matter of promoting our welfare without affecting the well-being of the future generation. Sustainable development is a point at which the needs of the present generation are fulfilled without compromising the ability of future generation to meet their own needs⁶. Achievement of sustainability is equity between both within the generation and across the generation, i.e. intergenerational equity and intra generational equity. It is the optimum utilization of natural resources in the present and future. It is a matter of equity rather than efficiency according to Howarth and Norgaard.³

People, by and large, put more emphasis on equity between generation, rather than equity across a given generation, it does not mean that latter is not important. The World Commission on the Environment and Development (The Brundtland report) in 1987 stated that both intergenerational equity and intra generational

equity are important. Those who talk and raise the issue of sharing river and ground water, forget the share, they must leave to the future generation. Now, the intergeneration environmental disputes are in the limelight. However sustainability demands more attention on the equitable shares between the generations.

When we use up some resources which are replaceable whether it is mineral, animal or any other environmental amenity, then we should provide replacement for equal value. The substitute that we provide in exchange could be knowledge, could be green technology etc. If there is no replacement there will be environmental degradation. Therefore the environment needs public policy, because each of us knows the repercussion of environmental degradation and it is burning issue today.

The solutions require for the estimation of natural and manmade capital requirement for both present future generation. It is in postponement of current consumption to the future generation. The issue of sustainability may be more appropriate to the developed countries. Because they have reached the stage of high mass consumption and further exploitation is not necessary. Whereas in the case of developing countries, the basic needs are yet to be fulfilled. Therefore the present generation in the UDC can go further and employ the resource to overcome poverty and vast income inequality without damaging the environment. The paradox arises because if we concern about people who are currently poor, that will translate into an increase in current consumption not into an increase in investment. Therefore thinking about poor people today will be disadvantageous from the point of view sustainability.

It is a serious problem even in UDCs if the technology of the production process is not nature friendly. Here comes the importance of efficiency of production function and nature and pattern of consumption. However, natural capital can be exploited by man, but cannot be created by man. According to thermodynamic school, natural capital and manmade capital are in most of the cases complements rather than substitutes². They stated further that natural capital such as land, animals, aquatics, non-renewable and renewable energy and mineral stock are primary inputs and manmade capital and labourers are the agents of transformation. Sustainability intended are very high within the group and it is very low between the groups. Sustainability as a matter of distributional equity between the present and

the future; it becomes the issue of saving and investment. It is the choice between current consumption and future consumption. Then one has to find out the technology which reduces the wastage in the production process. Hence, the concept of sustainability involves the problems of distribution equity between inter and intra generations and productions and production efficiency and replacement of natural and artificial resources.

MEASURES OF SUSTAINABILITY

According to Hartwick-Solow, so long as the stock of capital did not decline overtime, non-declining consumption was possible. The stock of capital could be held constant by reinvesting from all non-renewable resources. Extraction in man-made capital, is built up for replacement. Man and natural capital are assumed to be perfect substitute under their model.

PEARCE-ATKINSON MEASURE OF SUSTAINABILITY

They have proposed an indicator of weak sustainability criterion viz., PAM. To them,

$$PAM = a - C_m/Y - C_n/Y$$

Where

a is Marginal Propensity to Save, C_m = Manmade capital and C_n = natural capital

The economy is sustainable if $PAM > 0$. The equation states that PAM will be positive if MPS exceeds the sum of depreciation on manmade and natural capital. According to David pearce¹ and Giles D Atkinson(1993), sustaibility estimation to countries like Czechoslovakia, Germany, Hungary, Japan, Netherland, Poland and the USA passed the weak test ($PAM > 0$). Mexico and the Philippines are classed as “Marginal” ($PAM = 0$) while Ethipia, Indonesia, Madagascar, Malawi and Nigeria are unsustainable ($PAM < 0$). Recently, Atkinson and Proops (1998) adopted the PAM measures to include imports and exports.

‘SNS MEASUREMENT’ OF SUSTAINABILITY

God has erected the universe and the environment. Natural capital such as land, water, atmosphere and minerals are gifts of nature. God has created nature along with the man kind. Man has to produce, the basic needs for his comfort. God has created land but man has to employ land to produce food grain cloth and

shelter. In the process of exploration and employment of natural resources, man has to be careful to leave the undamaged environment to the future generation. Optimum utilization of natural resources may leave due share to the future. Full employment equilibrium income of the economy indicates optimum utilization of natural resources. We cannot suffer today without employing the available resources for the sake of future generation. We cannot starve today for the sake of tomorrow's prosperity.

At the same time we cannot use the environmental resources by damaging it or going beyond her capacity. No one can go beyond the nature or conquer the nature. When we reach the peak there comes the down fall. That is life cycle and it is unavoidable law of life. Any economy is subjected to fluctuation. Therefore equality between demand and supply, saving and investment would indicated the economics of sustainability.

The economics of sustainability exist when $G = G_n = G_w$. That is the Actual growth rate = natural growth rate = Warranted growth rate. At this point the present societies fulfil its needs and reach the optimum point. Beyond this point there would not be sustainability. The points of equality between S and I is the optimum but unstable. That is $S=I$, the starting point of un- sustainability. Therefore investment must be less that saving. Sustainability is very high if $S=K$. If it becomes $S=k$ or $S=I$, it is the point of sustainability. This can be explained with the following equation. For sustainability according to

Therefore, for sustainability the growth rate of capital must be equal to the growth rate of income which satisfy the economic equilibrium too. What the researcher concludes is that the economic equilibrium itself indicates the sustainability of the economy. This also can be explained graphically.

Figure 1. SNS Measurement

$$PAM = S/Y - K_m/Y - K_n/Y > 0 - 1.$$

Let $K_m/Y + K_n/Y = K/Y$ and rewrite equation 1

As $S/Y - K/Y > 0$ -2 (or)

$$S/Y > K/Y \quad -3$$

$$S > K \quad -4$$

Equation 4 indicates high level of sustainability. If $S=K$ then it is fairly sustainable. If we give incremental value to equation one, Then it can be rewritten as follows.

$$\Delta S / \Delta Y - \Delta K / \Delta Y > 0 \quad 5 - \text{or}$$

$$\Delta S / \Delta Y > \Delta K / \Delta Y \quad 6 - \text{or}$$

$$\Delta S > \Delta K \quad 7 - \text{or}$$

For high level of sustainability, the growth rate of saving must be be greater than the growth rate of capital. But the equality between the growth rate of income and growth rate of capital can explain both economy's equilibrium and sustainability.

Let $S/Y + C/Y = 1$ that is $APS + APC = 1$

Let $K_n/Y + K_m/Y = 1$ that is share of both natural and manmade capital in the total national income. Let $S/Y + C/Y = K_n/Y + K_m/Y$ [$K_n/Y + K_m/Y = K/Y$]⁸ That is $S+C = K$

By giving incremental value the above equation can be written as follows.

$\Delta S + \Delta C$
 At equilibrium point,
 $\Delta Y = \Delta S + \Delta C$. Since $\Delta K = \Delta S + \Delta C = \Delta Y$, hence $\Delta K = \Delta Y$ or $I = \Delta Y$

In figure 1, the present well-being is presented in the X axis and future well-being in the Y axis. OL straight line explains the equality between present and future generation. OL straight line (or) production function OL satisfies the sustainability norms. On the other hand,

OL_1 production function indicates over exploitation of natural resources and un-sustainability. Similarly, OL_2 production function explains the under-utilisation of natural resources by the present generation.

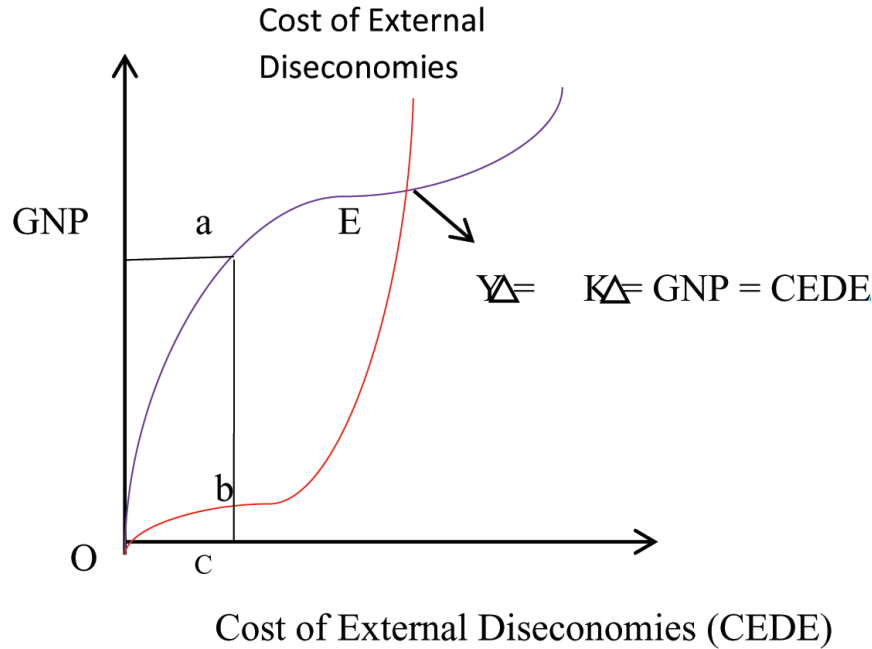

Figure 2. SNS Measurement

In figure 2, at point 'E' the rate of growth of income is equal to rate of growth of capital. After point 'E' there is no possibility for sustainable development. After this point the present generation ride on the future generation. At point 'a' GNP is greater than the cost of external diseconomies. That is $ab > bc$. Therefore the net economic welfare ($ac - bc > 0$) is positive enough to leave due share to the future. At the same time people in the present may live happily without suffering from external diseconomies such as air pollution, noise pollution, water pollution, etc.

CONCLUSION

The term sustainability is more abstract and subjective. Measurement of sustainability is possible if we able to estimate the value of manmade capital and natural capital. We also need the estimation of capital requirement for the present and future generation. But the measurement of capital requirement for the future as well as the present generation depends up on the level of technology of the present and future generation. Further, the capital requirement of the future, level of technology of the future and the total population in the future

cannot be estimated. However, the PAM measurement indicates that the economics of sustainability is possible in a point where MPS is greater that the capital output ratio. The SNS measurement of sustainability indicates that the sustainability is possible where growth rate of income is equal to the growth rate of capital. This is also possible to estimate if we able to estimate the cost of external diseconomies. As long as the cost of external diseconomies is less than the total income of the country, the sustainable development is possible.

In conclusion, it is to state that sustainability is not necessarily viewed as the matter of distribution between the present and future but it must be viewed as a matter of survival of the present⁴. Over exploitation, wastage of non-renewable resources and man's invasion against the nature will create unfavourable environment to the present generation. Man's attempt to conquer the nature is like one who is digging his own pit, because, man cannot conquer the nature. Man cannot understand the nature. One should understand that the deviation from the nature is deviation from happiness. Therefore we can only follow the law of nature. Let us see how the present generation can be protected from the environmental

degradation. How to stop the damage or stein we put on the environment. The act of protecting the present generation from the external dis economics will automatically help the future generation. Let us hope for the eco-friendly production function and consumption pattern. Let we conclude that the real and peaceful life can be lived just by following the nature not by understanding and conquering the nature.

Factors Affecting Neonatal Mortality and Morbidity - An Epidemiological Study

Tapan Pattanaik¹, Ratan Kumar Das², K Trimal Subudhi², Mahesh Chandra Sahu³

¹Professor, Department of Obstetrics and Gynaecology, ²Assistant Professor, Department of Paediatrics, ³Assistant Professor, Directorate of Medical Research, I.M.S & SUM Hospital, Siksha 'O' Anusandhan Deemed to be University, Bhubaneswar, Odisha, India

ABSTRACTS

Background: Neonatal period is very much vulnerable to different problems leading to death. Neonatal morbidities are burden to the health system and claim the neonatal life. Sample registration system (SRS) statistical report 2013 says Odisha have very high NMRs around 35 or more per 1000 live births. This study aims at finding out the epidemiological causes affecting the neonatal morbidities and mortality.

Material and method: This is a retrospective observational study. Tenure of the study is one year from January 2014 to December 2014.

Result: Total number of 304 cases was observed. Percentage of deliveries requiring NICU admission-18.78%. Majority of cases admitted (58.8%) cases were within 24 hours of delivery. Out of which 61.8% cases were male. 51.3% cases were delivered by NVD. Highest number of mothers was within 25-30 years of age and was multipara. Neonatal jaundice and prematurity are the two important cause of morbidity (49.3%, 32.8% respectively). death rate was 2.96% while number of cases improved was 93.7%. 3.2 % cases had left the hospital against medical advice.

Conclusion: The neonatal morbidity and mortality is a reflection of the socio economical background of the mother. A holistic approach from proper antenatal care to delivery and a proper neonatal care can reduce not only the mortality but also the morbidities of the neonate.

Keywords: Low birth weight, Prematurity, NICU, Birth asphyxia, meconium aspiration

INTRODUCTION

Neonatal period is very much vulnerable to different problems leading to death. In developing countries 96% of the world's, approximate 5 million annual neonatal deaths occur. ¹ India contributes to one-fifth of global live births and more than a quarter of neonatal deaths. Nearly, 0.75 million neonates died in India in 2013, the highest for any country in the world. ² Sample

registration system (SRS) statistical report 2013 shows neonatal mortality rate(NMR) to be 28 per 1000 live births.³ In year 2000 the NMR was 44 per 1000 live births while it has declined to 28 per 1000 live births in 2013. But this rate of decline is less compared to rate of decline of infant mortality rate. The Millennium Development Goal-4(MDG 4) by year 2015 could not be achieved due to this slow decline in NMR. Neonatal morbidities are burden to the health system and claim the neonatal life. Bang *et al* (1995–1996) has studied a detail burden of common morbidities in rural community settings.⁴ According to Global, regional, and national causes of child mortality in 2000–13, with projections to inform post-2015 priorities: an updated systematic analysis. Lancet 2015, preterm birth complications and infections are the two major causes of neonatal deaths in

India.⁵ Studies on the timing of neonatal deaths indicate that about three-fourths of total neonatal deaths occur in the first week of life.^{6,7,8}

According to High-Level Expert Group appointed by the Planning Commission of India, in a scenario of the health inequality and social inequality, the poorest and most disadvantaged have a higher risk for disease.⁹ Sample registration system (SRS) statistical report 2013 says Kerala and Tamil Nadu have low NMRs (<20 per 1000 live births) whereas Odisha, Madhya Pradesh and Uttar Pradesh have very high NMRs (35 or more per 1000 live births). The NMR in rural areas is 31 while that is 15 per 1000 live birth in urban areas. The discrepancy is more marked in Andhra Pradesh, Assam, Jharkhand and Kerala.³ There is no definite sex- differentiated NMR statistics available but studies shows females neonates are deprived of proper health care compared to male one.^{10,11} Maternal age and education has got direct influence on the neonatal mortality and morbidity. This is well evidenced by NMR statistics of Kerala. In India, 30% of neonates are borne with low birth weight¹² and more than 80% of total neonatal deaths occur among LBW/preterm neonates.¹³ Both neonatal sepsis and perinatal asphyxia contributes a huge towards NMR.¹⁴ The interventions in antenatal, during delivery and postnatal period influence a lot for prevention of neonatal mortality. UNICEF coverage evaluation survey in 2009 (CES 2009) shows only a quarter of pregnant ladies had full antenatal checkup, 73% of pregnant ladies had institutional deliveries and only one third of neonates were breastfed within 1hr of birth.¹⁵

Our study aims at deriving the factors affecting the neonatal morbidity and mortality in Orissa which is having high NMR.

METHODOLOGY

This retrospective observational study was conducted in the department of paediatrics, IMS and SUM hospital which is a teaching hospital in Orissa, India for a period of one year (Jan 2014 to Dec 2014). This is a teaching hospital having neonatal ICU (NICU) facility. This NICU is having 15 no of beds and only the neonates who are delivered in the same hospital are admitted here. All the NICU admissions strictly follow the admission criteria of the NICU protocol. This NICU has phototherapy unit, radiant warmer, high frequency ventilator, bubble continuous positive airway pressure,

ultrasonography having neonatal echocardiography, neuro sonogram facility, exchange transfusion facility. Radiological investigation facility like CT scan and MRI are also available in the hospital. The unit lack of the facility of inhale nitric oxide.

After Ethical clearance and due consent from the parents, in our study we have taken all the neonates admitted to the NICU during the period January 2014 to December 2014. The neonates who had undergone any surgery and all the referred cases and all the neonates who had left against medical advice were excluded from the study. The neonates admitted for observation and discharged within 24hrs were excluded from the study. The obstetric data and demographic data were retrieved from the labour room birth register.

Gestational age of the baby was calculated from the first day of last menstrual period (LMP) and in case of unknown LMP gestational age was calculated from the earliest ultrasonography. Babies borne before 37 completed weeks were considered as premature baby. Birth asphyxia was diagnosed as per American Academy of Paediatrics and American College of Obstetrics and Gynaecology (ACOG) guideline for hypoxic ischemic encephalopathy (HIE). Only culture positive (blood, CSF, urine, swab etc.) cases were considered under sepsis.

RESULT

In this retrospective observational study, 1618 deliveries were documented and among them 304 (58.88%) babies were admitted in the NICU. The incidence of NICU admission was 18.78%. Among 304 admitted NICU babies, 179 (58.88%) were admitted within 24 hour due to fulfilment of NICU admission criteria. Most of the NICU admitted babies were male babies (61.8%). It was also found that 58.8% mothers were from low socioeconomic backgrounds (Table 1).

Table 1: Demographic data of study population

Age (n=304)	No of cases	Percentage (%)
Less than 24hr	179	58.8
More than 24hr	125	41.1
Gender (n=304)		
Male	188	61.8

Cont... Table 1: Demographic data of study population

Female	116	38.1
Socioeconomic status(n=284)		
Low	167	58.8
Medium	99	34.8
High	18	6.3

Babies admitted to NICU, who were delivered by normal vaginal delivery accounts for 51.3%.(Table 2). Maximum number of (42.6%) of mothers belongs to age group 25-30 years (Table 3). It was revealed that, multiparous mother accounts for 49.2 cases and 38% cases were primipara (Table 4).

Table 2: Mode of delivery of NICU babies (n=304)

Mode	No of cases	Percentage (%)
Normal delivery	156	51.3
Instrumental delivery	13	4.2
Caesarean delivery	135	44.4

Table 3: Maternal age distribution, n=284 (less than 304 NICU babies as 16 cases are twin and 2cases are triplet)

Age	No of cases	Percentage (%)
15-20yrs	18	6.3
20-25yrs	99	34.8
25-30yrs	121	42.6
>30yrs	46	16.1

Table 4: Parity of the Mother, n=284

Parity	No of cases	Percentage%
Primipara	108	38
Multipara	140	49.2
Grand multipara	36	12.6

In our study 49.3% babies were within normal weight (> 2.5 kg) whereas 34.2% cases were extremely low birth weight (<1 kg) (Table 5). Most common morbidities in this study were neonatal jaundice (49.3%) and prematurity (32.8%) (Table 6). Coming to outcome to NICU admission babies an encouraging number of babies 285 cases (93.7%) were improved whereas death account for 2.9% but 10 cases (3.2%) could not

be followed up as they have left against medical advice (Table 7). Sepsis and birth asphyxia each attributes (33.3%) towards the cause of the death (Table 8).

Table 5: Birth weight of NICU babies

Weight in Kg	B	Percentage
<1Kg,ELBW	104	34.2
1-1.5Kg,VLBW	40	13.1
1.5-2.5Kg,LBW	10	3.2
>2.5Kg	150	49.3

Table 6: Diagnosis of NICU babies, n=304, but total more than n due to coexistent morbidities

Diagnosis	No of cases	Peren-tage %
Neonatal jaundice	150	49.3
Prematurity	100	32.8
Respiratory distress syndrome	84	27.6
Sepsis	66	21.7
Low birth weight	43	14.1
Birth asphyxia	31	10.1
Meconium aspiration	29	9.5

Miscellaneous	3	0.9

Table 7: Outcome of neonatal admission, n=304

Outcome	No of cases	Percentage%
Improved	285	93.7
Death	9	2.9
Left against medical advice or referred	10	3.2

Table 8: Cause of death of NICU babies, n=9

Cause	No of cases	Percentages %
Sepsis	3	33.3
Birth asphyxia	3	33.3
Congenital diaphragmatic hernia	1	11.1
Meconium aspiration	1	11.1
Respiratory distress syndrome	1	11.1

DISCUSSION

In our study total number of NICU admission is 304 in number and total number of deliveries is 1618. Percentage of deliveries requiring NICU admission-18.78%. In a study by Wade Harrison Crude admission rate is 77.9 per 1000 livebirths in 2012.¹⁶ In the present study 58.8% neonates were admitted within 24 hours of delivery and 61.85% cases were male.

In a study by Walana W, the dominant sex was males 54.0% and the remaining were females 46.0%. Admissions were significantly common among neonates within the age group ≤ 2 days.¹⁷ 58.8% of parents belong to lower socioeconomic status in the present study which is similar to study by K suchita.¹⁸ In the maternal characteristic study K suchita found 52.76% mother were multiparous which is similar to our result. (49.2%). In the Majority of cases (42.6%) in this study, the maternal age is within 25 to 30 years of age which is accordance to studies by Wade Harrison.¹⁶

Coming to mode of delivery in this study maximum number of neonates was delivered by normal delivery (51.3%) followed by caesarean section 44.4%. 32.7% were delivered by caesarean section in the study by Wade Harrison. In our study 49.3% cases are more than 2.5 kg in weight while percentage of ELBW, VLBW, LBW babies are 34.2, 13.1, 3.2% (total 50.7%) respectively. Study by K Suchita shows 65.52% cases to be more than 2.5kg weight. While Shabbir Hussain et al¹⁹ has found 53.8% neonates were <2.5kg while 46.2% babies were >2.5kg in weight, which in accordance to our study.

Neonatal jaundice and the prematurity are the two important cause of morbidity in our study. Neonatal jaundice accounts for 49.3% of cases and prematurity

accounts for 32.8% of cases. In a study by Sridhar et al, the most common specific morbidity for admission was neonatal sepsis (28.8%) followed by RDS (23.85%) and hypoxic ischemic encephalopathy (17.72%).²⁰ While Gaucham et al. in Nepal reported, neonatal jaundice, sepsis and perinatal asphyxia as being commonest indication for admission to NICU.²¹ The number of deaths in this study is 9 cases and the number of cases who left the hospital against medical advice (LAMA) are 10. The death rate was 2.96% which means the number of death in 1000 live birth was approximately 30.

CONCLUSION

Neonatal jaundice and prematurity are the most common morbidity in our study, while birth asphyxia and sepsis are the two most common cause of mortality. All these causes of mortality and morbidity are clearly associated with maternal age, parity, socioeconomic status, birth weight of the neonate. The male preponderance may be due to the gender bias of the society. All these morbidities and mortalities can be prevented by proper antenatal care and intervention in right time. The number of death may not reflect the actual figure of the society as this is a hospital based study and we have not followed the LAMA cases. Further multi-centric trials are required.

Ethical Clearance: This study is approved from our institutional ethics committee.

Students' Perception and Attitude on Education Curriculum and System in an Indian Dental School

Madhura Sen¹, Kundabala M²

¹Lecturer, Department of Paediatric and Preventive Dentistry, ²Professor, Department of Conservative Dentistry & Endodontics, Manipal College of Dental Sciences, Mangalore, Mangalore, Karnataka, India

ABSTRACT

Background: The continuous evaluation of the fundamental methodologies by feedback in teaching-learning will lead to better understanding of the profession eventually.

Objective: the objective of this study is to evaluate the students' perspective on dental education and attitude towards dental education and determine whether there is a need for a change in curriculum.

Materials and method: A total no. of 216 dental students were invited to participate in the online questionnaire survey, to assess their attitude and perspective towards the study topic. The data was statistically analyzed using SPSS version 20 and descriptive analysis was done.

Results: Students are in agreement with Problem Based Learning pattern and clinically oriented curriculum, with increased no. of clinical hours and wider range of pre-clinical exercises with audiovisual aids, including comprehensive patient care with more case discussions.

Conclusion: Students desire to have student centered active learning with teaching more clinically oriented using audio visual aids with comprehensive patient care training to help them in their future clinical practice.

Keywords: Education Curriculum, Students' Perception and Attitude, Teaching-learning, Problem Based Learning, Patient care

INTRODUCTION

Oral health is an important yet neglected health issue, especially in developing countries, like India. The onus of the same belongs to dental fraternity. The foundation of good oral health care lies in the motivation and training of dental students. Learning is soon shifting from being teacher centric to student centric.¹ Efficiency with which students learn directly affects their quality of work and finally patient satisfaction.² Dentistry is a profession in which both, theoretical knowledge and hand skills are of equal importance. Though a strong theoretical base is

important, it must be supplemented with equal or more practical training. Both together build a firm ground for good dental practice. Fundamental understanding of the subject during learning process leads to better applicability of the knowledge and skill in future. The continuous evaluation of the fundamental methodologies and basics in learning as well as teaching will lead to better outcome of the product and better understanding of the profession eventually. This will lead to better health care delivery to provide better service to the humanity. So, feedback from the students and the teachers at regular intervals depending on the changing scenario of the profession is very important for contemporary approach to upgrade the teaching learning program.

Hence, the purpose of this study was planned

The objectives were to evaluate students' perspective towards:

Corresponding author:

Professor, Department of Conservative Dentistry & Endodontics, Manipal College of Dental Sciences, Mangalore, Affiliated to Manipal Academy of Higher Education, Mangalore, Karnataka, India

Didactic theory classes by questionnaire method.

Pre-clinical, practical exercises by questionnaire method.

Clinical curriculum by questionnaire method.

METHODOLOGY

A total no. of 216, IV BDS dental students and interns were invited to participate in survey after obtaining ethical clearance. E-Questionnaires were distributed by sending a link to the participants containing 15 questions each to assess their attitude and perspective. The received responses were tabulated and statistically analyzed using SPSS version 20 and descriptive analysis was done.

RESULTS

Results of the questionnaire regarding theory classes are represented in figure 1. Approximately 58.3% of all participants agreed 9.3% strongly agreed that theory class content is applicable to cases treated in clinic. Many students (53.5%) agreed that time duration of individual theory classes are appropriate. Power point presentations and audio-visual aids were considered to be helpful by the participating students (56.3%). 66% of all participants strongly agreed that problem based learning will be beneficial. It was found that 64.2% of the dental students strongly agreed that the curriculum should be more practical oriented and less cumbersome.

RESULTS

Figure 1: Students responses regarding lecture classes. Question 1 to 5

Figure 2: Students' responses regarding pre-clinical training.

Figure 3: Students' responses regarding clinical training. Question 12-15 Question 6-11

Results of the questionnaire regarding pre-clinical training are represented in figure 2. 53.5% students agreed that second year is the correct time to start preclinical training. Although approximately 56.7% students agreed number of hours allotted to pre-clinical training is enough, 56.1% strongly agreed more procedures and techniques should be taught during preclinical training. Video demonstrations were considered helpful before the exercise by 59.1% of the students. Most students (46%) felt the need to receive demonstrative hand-outs before the preclinical exercise.

Results of the questionnaire regarding clinical training are represented in figure 3.

Third year seemed like an appropriate time to start treating patients by a large majority of students (91.7%). Majority students (57.7%) strongly agreed case discussion with faculty before treating the case is helpful. 50% strongly agreed student's clinical assessment during postings improves their competence. Approximately 40% agreed Clinical training equips to treat patients in our private practice after course completion. Moreover, a large majority 53% strongly agreed that comprehensive care training should be offered.

DISCUSSION

Students' view of education experience can also be an important source of information for curriculum assessment.⁶In our study, we have divided learning in dentistry into three different categories. The categories are: learning in theory classes, learning of basic skill in pre-clinical training, and learning during clinical hours providing patient care.

Regarding the lecture classes, according to present study, a majority of students agreed that even though the theory class contents are more than sufficient, the contents could have been more clinically oriented and less cumbersome (Figure 1). The current undergraduate

curriculum is more theory based and less skill based. It is heavily packed leaving very less time for students to acquire a deep understanding of the subject and clinical skills. Thus making it difficult to develop lifelong skills such as critical thinking, problem-solving and communication.⁷ There lies a necessity to integrate a need-based curriculum which is outcome based, involving the needs of students, the community, clinical practice and dental research.⁸

A majority of students agreed that time duration of the lecture classes was appropriate which is an average of forty-five minutes (Figure 1). This is in compliance with the recommend class time of forty-five minutes.⁹ Studies have proven that there is a lapse in attention after the initial 10-18 minutes and this is regardless of how compelling the lecture is thus the optimum length of lectures should be thirty minutes instead of sixty minutes.¹⁰ However, to comply with rules regarding hours dedicated to lectures and with limited time, pedagogical techniques and group discussions are recommended to overcome the short attention span of students.¹¹⁻¹⁴ Moreover, teachers have to follow recommendations by the dental council. This study recommends to modify the syllabus time to time to fulfil the needs of the future generation.

Majority of students felt the need for incorporating problem-based learning (PBL) in their dental school education (Figure 1). It helps students to relate themselves to clinical scenario because such a model of learning is an accurate reflection of real-life learning. Hence PBL is very suited to professional education programs like dentistry where it depends not only on knowledge but also on clinical applications.¹⁵ It also inculcates an attitude of constant learning which is a necessity in today's era of evidence-based learning.

Students preferred audio-visual aids in lectures in our study (Figure 1) which is in agreement with other studies since it helps them to learn more efficiently, organize their class notes and thus improve the students' performance.^{2,16-19} In contrary, Susskind found that though helpful, Powerpoint presentations (PPT) did not enhance the performance of students.²⁰ The reason for preferring PPT maybe perhaps due to most of our topics involve pictures of clinical and laboratory cases. Moreover, it not only saves time for the teacher during lecture hours but also able to create a picture of clinical procedures, which will have a long lasting impact in the mind of students.

The ultimate goal of the preclinical dental training is to prepare students to deliver the best possible care in the clinic by simulating the clinical conditions in laboratory. The students are then expected to build on that foundation during their clinical education and graduate, ready to enter practice.²¹ Based on the responses to the questionnaire, it was found that a majority of students consider the number of hours dedicated to preclinical training to be sufficient (Figure 2) and second year of dental school is an appropriate time for preclinical exercises both in operative dentistry and prosthodontics (Figure 2) and it also satisfies the syllabus suggested by Dental Council of India. A vast majority of students felt wider range of preclinical dental procedures and techniques (Figure 2) like preparations for ceramic crowns, veneers, and inlays should be taught which may improve the relevance of preclinical courses in similar dental school settings.^{21, 22}

In the present study, students find, video demonstrations of the preclinical procedures as well as handouts about the procedure, of great value (Figure 2). This is in agreement with previous studies which had received a positive response from students, when their school included audio-visual aids and educational handouts to their course structure.²² Visual aids help students' conceptualize better and gives them a clear understanding and handout will help them for future reference.

The degree of understanding clinical training and patient treatment is most critical and is the basis of students' professional career as a dentist. Majority of students agreed that the third year of their dental education was the appropriate time to start treating patients (Figure 3). Contrary to our study, in another study, dental students feel that they have lost out on time that could be spent on treating patients especially in the first half of dental school curriculum which curbs the experience of clinical learning.²³ Another study has pointed out that students are unable to judge the significance of their education until sometime after they graduate and have practiced dentistry on their own.²⁴ Hence it is better to increase the hours of clinical postings in nodule centres or in private clinics/ corporate clinics during undergraduate training may help to train the students for clinical practice.

Students have strongly agreed that discussing treatment plan and obtaining guidance from faculty

before treating a particular case is helpful to them (Figure 3). The skills and techniques that students learn in the clinical setting heavily depend on their interaction with faculty who also serve the role of a guide and mentor, where teaching, mentoring and patient treatment co-exist, in a pressing environment.^{25,26}

In our study, students found timely clinical assessments and tests are helpful (Figure 3) to get feedback from the faculty to improve themselves. Proper assessment drives and stimulates for deeper learning, but this cannot be generalized.^{27,28} When a well-planned assessment has a clear objective, provides feedback immediately to students, fulfills its rightful role and comprises an integral part of the educational process.²⁹

Dental education puts forth a unique challenge of preparing future health professionals. This involves teaching a multitude of skills that go beyond the content of periodic assessments and tests. A student's self-confidence is a significant concern in all phases of dental curriculum.³⁰ In this study, a significant percentage of students felt that their undergraduate dental education equips them well to work successfully in private practice (Figure 3). It is understood that undergraduates will not attain complete clinical excellence at the time of graduation. Nonetheless, there lies a responsibility with dental educators to equip students with the necessary self-assessment ability, clinical reasoning, initial self-confidence and preparedness for professional life and the ability to practice independent dentistry safely.²⁶

Students that participate in this study felt the need for comprehensive clinical training (Figure 3). This can be due to the fact that treatment provided in a comprehensive clinic setting mimics the setup of a private practice. It gives the students a chance to build strong bonds with the patients and see the effects of treatment delivered. Comprehensive clinical training environment has been known to offer a lot in an educational setting.²⁶ Schools offering comprehensive care approach to clinical education observed that it enhanced the students' clinical experience.³¹

CONCLUSION

Within the limitations, from the present study it can be concluded that:

1. Students prefer an educational environment that is based on active learning rather than passive

information delivery from faculty. Theory classes can be aimed at being more application oriented and presented using audio visual aids.

2. Pre-clinical training can include more clinically oriented procedures to enhance clinical performance in later years.
3. Students also felt that comprehensive care training would help in their future clinical practice.

This study provides an insight for curriculum planners. Teaching environment based on student's preferences will aid effective learning.

ABSTRACT

Introduction: Integrated Child Development Services is the largest national programme for the development of mothers and children in the world. The services are rendered through Anganwadi worker (AWW) at Anganwadi centre (AWC). An evaluation study is carried out to assess the perception of anganwadi services provided by the beneficiary mothers of 3 to 6 year old children in Urban ICDS blocks in Kozhikode Corporation

Method: A cross sectional descriptive study was carried out in 4 urban ICDS blocks in Kozhikode. Data was collected using pretested semi structured questionnaire and interviewing beneficiary mothers of 3 to 6 year old children .

Results: Out of 234 mothers interviewed, 221(94.4%) of mothers perceived that the children were getting supplementary nutrition regularly from anganwadi centres. A large majority 196(83.8%) of mothers were satisfied with the PSE activities conducted in AWC'S. A large proportion 207(88.5%) of mothers perceived that AWW's did not inform about the date, time, place of health checkup. A large proportion of mothers 158(67.5%) felt that AWW's did not offer any referral advice for the children during illness. About 129(55.1%) of mothers perceived that health education session were conducted occasionally in AWC's.

Conclusions: In conclusion according to mother's perception health checkup ,health education services and referral services were poor.

Key-words: *Supplementary nutrition, Preschool education, Health checkups, Referral services, Immunisation, Health education*

INTRODUCTION

Integrated Child Development Services described as India's gift to her children helps to achieve major national nutrition and health goals embodied in National policy for children (1974),National health policy(1983),National plan of action for children(1982),National nutrition

policy(1993)¹. ICDS was launched in 1975 with 33 projects. This programme is formulated to enhance the health, nutrition and learning opportunities of infants, young children and their mothers especially targeting for the poor and deprived. ICDS serves the target groups through network of anganwadis². The centre is run by local community based women called AWW who is supported by another women anganwadi helper in service delivery³. The specific services provided through programme are Supplementary nutrition programme, Preschool education, Immunisation, Health checkup, Referral services, and Nutrition and health education⁴. ICDS has expanded remarkably in its scope and coverage, and today it covers around 33.738 million

children between three to six years of age, 39.871 million children between 6 months to three years, 18.047 million expectant and nursing mothers⁵. In Kerala, it covers around 4, 64249 children between three to six years of age and 4, 21540 children between 6 months to 3 years and 1, and 95927 pregnant and lactating mothers⁵.

To improve on the functioning of the anganwadis in urban areas, it is necessary to evaluate the services. Hence a study on perception of ICDS services of urban anganwadis is planned. This study brings in to focus certain bottlenecks and shortcomings in implementation of the programme in urban areas which can help in improving the services in the urban anganwadi centres. It helps us to improve health service delivery by producing information relevant to decision – making and assist planners and managers in making improved decision about programme and project. In this context this study was undertaken to assess package of services provided by the ICDS programme to 3 to 6 years children by assessing the perception of beneficiary mothers for uplifting the status of children.

METHOD

A community based cross sectional descriptive study was carried out in 4 urban ICDS blocks in Kozhikode Corporation. Keeping in view of prevalence of average and below average anganwadis in a study in Bangalore city by Vijayanthi et al in 2010 noted as 54%, a confidence level of 95%, absolute precision of 9.2%, a sample size of 117 anganwadi centres was calculated⁶. Using Simple random sampling method sample size of 117 anganwadi centres were selected from total 543 anganwadi centres in Urban Kozhikode Corporation. Data was collected over a period of one year from July 2012 to June 2013. Ethical clearance was obtained from institutional ethics committee and relevant permission from Social welfare department in Kerala. From each AWC 2 mothers – were selected by simple random sampling method. So 234 mothers of registered beneficiaries of 3 to 6 year old children were included to assess the perception regarding services provided by the Anganwadi centres. Using various tools for data collection which included pretested semi structured questionnaire and interviewing mothers of registered beneficiaries of 3 to 6 year old children. Data entered in MS excel and analysed using SPSS Software.

RESULTS

To assess the perception of mothers of beneficiary children, 2 mothers from 117 anganwadi centres were selected using simple random technique. Totally, 234 mothers were interviewed.

GENERAL CHARACTERISTICS

Out of 234 women, most number were educated up to high school 66(28.2%) and higher secondary 62(26.5%). 73(31.1%) educated up to lower and upper primary. There were 33(14.1%) educated up to graduate and above. In our study 129(55.1%) of mothers were from three generation families, 67(28.6%) were joint families and only 38(16.2%) were from nuclear families. Among 234 mothers 131(56%) were living in semipucca houses, 101(43.1%) in pucca houses. Only 2(0.9%) were staying in kutcha houses. Income was assessed using the APL//BPL cards, based on this large proportion of family of mothers 156(66.7%) were having APL card, rest of the families 78(33.3%) were having BPL card.

Table1. General characteristics of respondents

General characteristics	No.(n=234)	%
Literacy Level		
Primary	73	31.1%
High school	66	28.2
Higher secondary	62	26.5
Graduate & above	33	14.1
Family Type		
Nuclear	38	16.2
Joint	67	28.6
Three generation	129	55.1
Housing Type		
Kutcha	2	0.9
Semipucca	131	56.0
Pucca	101	43.1
Income Status		
APL	156	66.7
BPL	78	33.3

BASIC INFORMATION ON FUNCTIONING OF AWC

A large proportion 221(94.4%) of mother were of perception that AWC opens and works regularly. About 181(77.4%) of mothers reported that AWC’S were at a walk able distance from their residence. There were 53(22.6%) perceived that their residence was far off from the anganwadi’s. Mothers were enquired about the reasons for sending children to anganwadi’s. In this study it was observed that ,130 (55.6%) mothers reported education was a major priority for mothers for sending their children to AWC’s followed by supplementary nutrition 76(32.5%). About 28(12%) mothers reported that they send children to anganwadi’s for both food and education.

PERCEPTION REGARDING SERVICES PROVIDED IN ICDS CENTRES

In this study among 234 mothers, 221(94.4%) of mothers perceived that the children were getting supplementary nutrition regularly from anganwadi centres. Most of the mothers 169(72.2%) were of opinion that quality of supplementary nutrition was average and only 26(11.1%) perceived as good quality. About 39(16.7%) reported that food is of poor quality and they mentioned that sometimes spoiled food was given in anganwadi centres. Majority 144(61.5%) of mothers reported that AWW’s monitor the growth of child once in a month and 89(38.1 %) of mothers opined that growth monitoring was done once in 3 months or

occasionally

Most number 196(83.8%) of mothers were satisfied with the PSE activities conducted in AWC’S. There were 38(16.2%) of opinion that they were not satisfied with the PSE activities. A large proportion 170 (72.6%) of mothers perceived that PSE activities in the AWC helps in improving the psychological development of the child and 64(27.4%) of mothers informed that PSE activities does not improves the same.

The majority 182(77.8%) of mothers reported that AWW’s informs mothers on date, time and place of immunisation sessions and rest 52(22.2%) of mothers were reported that AWW’s did not inform them on immunisation sessions. There were 129 (55.1%) of mothers were perceived that health education session were conducted only occasionally in AWC’S and 67(28.6%) of mothers were of opinion that health education session were conducted monthly or 3 monthly in AWC’s.

A large proportion 207(88.5%) of mothers opined that AWW’s did not inform them about the date, time, place of health check up .In our study 142(60.7%) of mothers reported that AWW’s counselled them during sickness of children and 92(39.3%) of mothers perceived that there was no counselling. A large proportion 220(94%) of mothers opined that they did not receive medicines from AWW’s. Most number of mothers 158(67.5%) felt that there was no referral from AWW’S.

Table 2: Perception of mothers regarding services of AWC’S

Services of AWC’s	Proportion of respondents who said “YES”- No.(n=234)	%
SUPPLEMENTARY NUTRITION PROGRAMME		
Regularity in Getting SNP	221	94.4
PRE SCHOOL EDUCATION		
PSE activities-Satisfaction	196	83.8
PSE improves psychological development	170	72.6
IMMUNISATION		
AWW informs immunisation	182	77.8
HEALTH CHECKUP		
AWW’S informs on health check up	27	11.5
Counselling during sickness	142	60.7
Received medicines	14	6.0
REFERRAL SERVICES		
Referred children	76	32.5

DISCUSSION

A study by Manoj Kumar tripathy etal(Orissa 2011) observed that 94% of mothers perceived that AWC'S opens and works regularly and 55.5% of mothers are of opinion that AWC's were walkable distance from their residence⁷. Pandey etal (Lucknow 2013) reported that 33.8% of respondents perceived that the purpose of enrolment at AWC's of their children was learning⁸.

NCAER (2001) revealed that 42 % of households reported good supplementary nutrition in anganwadi's⁹. Manoj Kumar tripathy etal in his study mentioned that 73.5% of mothers reported that supplementary food is acceptable to the children⁷. Jose bobhan (Kerala 2006) noted that 75.5% of mothers reported regular supplementary feeding in AWC's¹⁰. According to Pratichi child report (West Bengal -2009),50% of mothers reported low quality of food in anganwadi¹¹.

About 46% of mothers reported no weighing of children in anganwadi's according to (Pratichi report West Bengal -2009)¹¹. NCAER (2001) showed that, 62.1% of mothers reported growth monitoring in anganwadi⁹. Manoj Kumar tripathy etal observed that 88.5% of mothers reported growth monitoring in anganwadis⁷.

According to NCAER (2001) , 93.3% of mother reported that anganwadi's provided preschool education⁹. In the Pratichi child report (West Bengal -2009), 28% of mothers reported no PSE in anganwadi's¹¹. Manoj kumar tripathy etal(Orissa 2011) reported that 55% of mothers reported play mode learning in centres and the same study also mentioned that only 27% of mothers are of opinion that preschool educational activities aid in psychological growth of children⁷. Nibharani etal (Assam 2001) reported that only 26.67% of mothers satisfied with nonformal preschool education provided by anganwadi's¹². According to NCAER (2001) 74.8% of the households reported regular healthcheckup by anganwadi⁹. Ram prabhakar (Kolkata 2012) 77.8% of respondents reported that AWW had never counselled regarding health issues¹³.

CONCLUSION

In conclusion according to mother's perception health checkup, health education and referral services were poor. There is a need for effective coordination between the health functionaries and the anganwadi workers in health checkups and referral services, nutrition and health education and referral services.

Prevalence and Factors Associated with Depression among the Students of a Medical College in Kerala

Madhusudan M¹, Aravind M², Arun Gopi³, Ajanya V⁴, Vinaya Pradeep⁴,
Fabeena Mangaladan U⁴, Sakeer Hussain OC⁵

¹Assistant Professor, Department of Community Medicine, DM Wayanad Institute of Medical Sciences, Wayanad District, Kerala, ²Assistant Professor, Department of Community Medicine, Chettinad Hospital and Research Institute, Kanchipuram District, Tamil Nadu, ³Lecturer in Biostatistics, ⁴Undergraduate Student, ⁵Tutor, Department of Community Medicine, DM Wayanad Institute of Medical Sciences, Wayanad District, Kerala

ABSTRACT

Introduction: Depression has a higher prevalence among medical students compared to general population. This could lead to deteriorating academic performance, errors in patient care and even suicides. There are hardly few studies conducted in this part of the country to assess the prevalence of depression among medical students and also the factors associated with it. Also, there are no studies which have used the new version of the Beck's Depression inventory (BDI-II). Hence in this background the present study was undertaken

Methodology: This was a cross-sectional study done at DM Wayanad Institute of Medical Sciences, Wayanad District, Kerala, between October 2017 and January 2018. All the undergraduate medical students of the college were the study subjects. Data was collected using a predesigned and pretested self-administered questionnaire (Beck's Depression Inventory II). Completed responses were obtained from a total 720 students.

Results: 68.5% were found to have no depression and 31.5% depression. 15.1%, 9.3% and 7.1% were found to have mild, moderate and severe depression respectively. Prevalence of depression was *more* among males compared to females, unmarried subjects compared to married, Part I-Final Phase students compared to other phases, NRI quota students compared to other quotas, Muslims compared to other religions, urban origin students compared to rural and those with a history of major life event, chronic illness, feeling of loneliness, backlog in academics, consumption of alcohol and tobacco compared to those without. However only **place of origin, h/o major life event, feeling of loneliness, backlog in academics and h/o consumption of tobacco and alcohol were found to have statistically significant association with depression.**

Conclusion: The prevalence of depression in our study was lower compared to other studies. Urban origin, h/o major life event, feeling of loneliness, backlog in academics and h/o consumption of tobacco and alcohol were found to be associated with presence of depression

Keywords: Depression, students, medical college, Kerala, Beck's Depression inventory II

INTRODUCTION

Depression is a mental disorder characterized by loss of interest and pleasure (anhedonia), decreased energy (anergy), feelings of guilt or low self-worth, disturbed sleep and/or appetite, and poor concentration.¹ It is a significant contributor to the global burden of disease and affects people in all countries across the

world with a global prevalence of depressive episode of 3.2%. Depressive disorders often start at a young age and often are recurrent throughout life. For these reasons, depression is the leading cause of disability worldwide in terms of total years lost due to disability. The demand for curbing depression and other mental health conditions is thus on the rise globally.²

Worldwide, it has been demonstrated that 25–90% of medical students are stressed, and stress is an important determinant of depression leading to a higher prevalence of depression among medical students than general population.^{3–6} Several factors may account for this fact. These include daily life stressors and stressors specific to the tedious learning environment.⁷ The potential negative effects of emotional distress on medical students include impairment of functioning in classroom and clinical practice, stress-induced disorders and deteriorating performance. In medical doctors, it has been demonstrated that depression affects patient care leading to increased prescription error.⁸ Depression is also associated with higher suicide rates and this may be reason for higher suicide rate in medical professionals than the general population.⁹ This is especially true in female medical professionals.¹⁰ Students in extreme stress or depression need serious attention, otherwise inability to cope successfully with the enormous stress of education may lead to a cascade of consequences at both personal and professional levels.¹¹

To prevent depressive symptoms among medical students, decreased self-esteem, self-perceived medical errors and thus improve on the quality of care given to patients, factors associated with depression in medical training should be identified and appropriately tackled.¹² There are hardly few studies conducted in this part of the country to assess the prevalence of depression among medical students and also the factors associated with it. Also, there are no studies which have used the new version of the Beck's Depression inventory (BDI-II). BDI-II was developed for the assessment of symptoms corresponding to criteria for diagnosing depressive disorders listed in Diagnostic and Statistical Manual of Mental Disorders; Fourth Edition (DSM-IV, 1994).¹³ In this background, the present study was undertaken to find out the prevalence of depression among medical students and also the factors associated with it using the new version of the Beck's Depression inventory (BDI-II).

MATERIALS AND METHOD

This was a cross-sectional study done at DM Wayanad Institute of Medical Sciences, Wayanad District, Kerala, between October 2017 and January 2018. All the undergraduate medical students of the college (i.e., phase I to phase III, part II) willing to participate in the study were the study subjects. After obtaining approval from the college administration, the students were approached individually in their hostel rooms and briefed about the purpose of the study. Participation in the study was voluntary. Oral informed consent was obtained from the subjects and data was collected using a predesigned and pretested self-administered questionnaire, the first part of which had questions pertaining to basic socio demographic details and possible factors contributing to depression and the second part Beck's Depression Inventory II. The Beck Depression Inventory–Second Edition (BDI-II) is a 21-item self-report instrument developed by Aaron Beck (1996) for measuring the severity of depression among adults and adolescents aged 13 years and older. The composition of items has been carefully constructed which are related to depressive symptomatology such as hopelessness, irritability, guilt feelings, fatigue, lack of interest in sex, loss of pleasure, and also feelings of suicide thoughts/wishes etc. Each item in BDI-II is assigned a score 0 to 3. Thus, the total score of each participant ranges from 0 to 43. The interpretation of final scores is as follows; 0-13 → no depression, 14-19 → mild depression, 20-28 → moderate depression and 29-63 → severe depression.¹³ Completed responses were obtained from a total 720 students. The respondents were asked not to mention their names for maintaining anonymity and also to encourage participation and elicit truthful response. Data were kept confidential.

Data were entered in MS Excel and analyzed using Statistical Package for Social Sciences v21.0. Descriptive statistics such as mean and percentage and also inferential statistics like Chi-square test to find out association were used.

RESULTS

The total number of subjects were 720 of which 263(36.5%) were males and 457(63.5%) females. 23(3.2%) were married and 696(96.7%) were unmarried. 173(24%), 270(37.5%), 148(20.6%), 129(17.9%) were from Phase I, Phase II, Phase III part I and Phase III,

Part II respectively. The mean age of the subjects was 21.03 \pm 1.55 years.

Out of the total 720, 493(68.5%) were found to have no depression, 227(31.5%) were found to have depression. 109(15.1%), 67(9.3%) and 51(7.1%) were found to have mild, moderate and severe depression respectively (graph 1). Prevalence of mild depression was more among females, whereas moderate and severe depression was more among males (graph 2). Prevalence of mild and moderate depression was highest among management quota students, whereas severe depression was highest among NRI quota students (graph 3). Prevalence of mild depression was highest among Phase II students, moderate depression among Phase I students and severe depression among Phase III, Part I students (graph 4). Prevalence of mild depression was highest among Muslims, moderate depression among Hindus, and severe depression among Christians (graph 5). Prevalence of mild and severe depression was higher among unmarried students whereas moderate depression was higher among married students (graph 6). Prevalence of mild depression was higher among

rural students whereas moderate and severe depression were higher among urban students (graph 7).

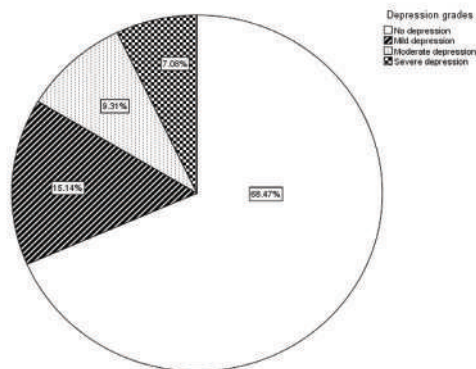

It was observed that the prevalence of depression was more among males compared to females, unmarried subjects compared to married, Part I-Final Phase students compared to other phases, NRI quota students compared to other quotas, Muslims compared to other religions, urban origin students compared to rural and those with a history of major life event (loss of a close family member or friend, road traffic accident, break up, hospitalisation for major illness etc., in the last 3 years), chronic illness (sickle cell disease, asthma, diabetes, hypertension etc.) feeling of loneliness (due to living away from home/ parents/siblings/friends), backlog in academics, consumption of alcohol (> once a week) and tobacco (at least once daily) compared to those without. However only place of origin, h/o major life event, feeling of loneliness, backlog in academics and h/o consumption of tobacco and alcohol were found to have statistically significant association with depression (table I).

Table I: Factors associated with depression among medical students.

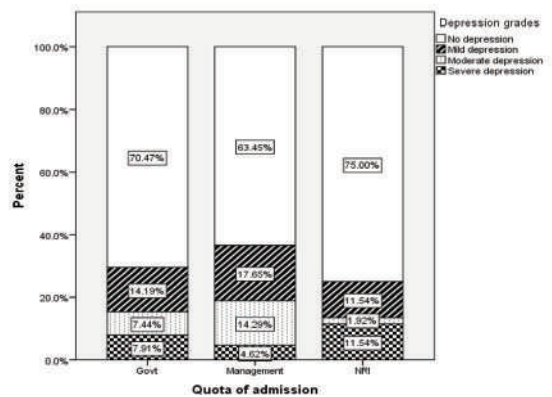

Variables		Depression present	Depression absent	Total	P value

DISCUSSION

The prevalence of depression in our study was 31.5%. However, few other studies have reported a higher prevalence i.e., 58% and 44.4%. The differences could be due to the different questionnaires used (PHQ-9 in the former and older version of BDI in the latter) and the differences in the sociodemographic characteristics of the subjects. 15.1%, 9.3% and 7.1% subjects were

found to have mild, moderate and severe depression respectively. Rawat et al., and Agrawal et al. have reported it as 43%, 12% and 3% and 44.42%, 27.12 and 0.98% respectively. The differences could be due to the reasons mentioned above.^{14,15}

It was observed that the prevalence of depression was more among males compared to females, unmarried subjects compared to married, Part I-Final Phase students compared to other phases. Agrawal et al. have also reported the prevalence to be more among unmarried subjects compared to married. However, Agrawal et al., and Rawat et al., have reported the prevalence to be more among females compared to males and Phase II students and Phase I students respectively which is in contrast to our study.^{14,15}

In the current study place of origin, h/o major life event, feeling of loneliness, backlog in academics and h/o consumption of tobacco and alcohol were found to have statistically significant association with depression whereas sex, marital status, Phase of MBBS and h/o chronic illness were not found to have statistically significant association. Ngasa et al., have noted that the presence of a chronic disease, major life events, gender and being a student at the clinical level were found to have statistically significant association with depression whereas h/o consumption of alcohol was not found to have statistically significant association. These differences could be due to differences in the questionnaires used (Ngasa et al., have used PHQ-9 questionnaire) and also sociocultural differences between the subjects in the two studies.¹⁶ Agrawal et al., have noted that gender, year of study and marital status were found to have statistically significant association with depression.¹⁴

The limitations of the study were that the study subjects were from a single college. Hence the findings cannot be generalized to the medical students' community of the country or world.

CONCLUSION

The prevalence of depression in our study was lower compared to other studies. Urban origin, h/o major life event, feeling of loneliness, backlog in academics and h/o consumption of tobacco (at least once daily) and alcohol (> once a week) were found to be associated with presence of depression.

Platelet-Rich Fibrin as Palatal Bandage: A Case Report

Yamini Mannava, Sangeeta Umesh Nayak, Deepa G Kamath, Trishna Dash⁴

¹Ex PG Student Periodontology, ²Associate Professor, ³Professor and Head, Ex Intern, Dept. of Periodontology, Manipal College of Dental Sciences, Mangalore, Manipal Academy of Higher Education, India

ABSTRACT

Introduction: PRF [Plasma-rich fibrin] consists of numerous growth factors and platelet cytokines that promote faster wound healing. The use of PRF bandage on donor site in FGGs [free gingival graft procedures] can significantly reduce morbidity and accelerate healing. The aim of the presented case report is to document the contribution of PRF in the healing of FGG donor site.

Method and Material: PRF was prepared and compacted as a dressing on the palatal wound. Post-operative follow-up was done every week for 1 month.

Results and Discussion: It was observed that wound healing was superior and accelerated compared to conventional FGG. Complete wound healing was observed in 2 weeks. The patient reported minimal pain during first 2 days post-operatively.

Conclusion: Owing to the promising results delivered, a PRF palatal bandage is an efficacious method to safeguard the raw wound engendered as a result of FGG remarkably alleviating discomfort afflicted patients.

Keywords: FGG, PRF, Donor site

INTRODUCTION

FGG is a widely used procedure for the augmentation of keratinized tissues in the oral mucosa.^[1] The root coverage provided by FGGs is similar to that of regenerative procedures and pedicle grafts however; FGGs offer superior gingival thickness which in turn helps in preventing recurrence of recession.^[1] The graft is usually harvested from the palatal mucosa in the premolar-molar region.^[2,3] Being autogenous, the clinical outcome is far better than that of synthetic or allogenic grafts.^[3] The primary disadvantage of this technique is the inevitable formation of two surgical sites and morbidity of the donor site. The palatal wound heals in 2-4 weeks by secondary intention relatively causing more pain and discomfort to the patient than connective

tissue grafts^[1,3]

To overcome this, the use of a bio-active material consisting of growth factors may be considered for accelerating healing of the donor site.^[4] Platelet-rich fibrin, a second generation platelet concentrate stimulates angiogenesis, guided epithelial cell migration, development of an effective neovascularization resulting in accelerated tissue cicatrization, faster wound coverage and tissue remodeling.^[4, 5] Moreover, fibrin and fibrin degradation products provide immunity by stimulating the migration of neutrophils and permitting their adhesion to endothelium and fibrinogen by increasing the membrane's expression of CD 11c/CD18 receptors^[5]

This case report describes the clinical outcome of PRF used as a palatal bandage and the significant reduction in post-operative pain and inflammation, consequently reducing the donor site morbidity. An attempt has been made to relate and compare the palatal wound healing where FGG was done and wound closure was achieved with a non-eugenol pack.

CASE REPORT

A systemically healthy male patient, aged 28 years was referred to the Department of Periodontology, Manipal college of dental sciences was evaluated for this case. Root coverage was indicated for lower left central incisor 31[Photoplate1]. 1 week ahead of surgery, the patient was advised for the following investigations-bleeding time, clotting time, hemoglobin count and platelet count, all of which were found to be within the normal range.

Surgical technique:

Prior to preparation, vitals of the patient were checked and found to be normal. Intra-oral asepsis was attained with 0.2% chlorhexidine digluconate solution and local anesthesia was administered. The receptor bed was prepared [Photoplate1] and a sterile template was used for measuring the dimensions of the graft, required for coverage.

Donor site:

A split-thickness graft of the required dimensions was harvested by conventional scalpel technique from the palatal keratinized mucosa in the region around the premolars and the first molar. The bleeding was controlled by digital pressure. A sample of 10ml venous blood was collected from the antecubital vein, without any anti-coagulant and was immediately subjected to centrifugation at 3000rpm for 10 minutes as described by Choukronet.al.⁵ A layer of fibrin formed in the tube between a layer of erythrocytes at the bottom and plasma poor plasma [PPP] at the top. Being a good hemostatic agent PPP was separated from the centrifuged blood using syringe and was applied on the palatal wound using gauze to control bleeding. The PRF was then emptied onto sterile gauze [Photoplate2] and squeezed to form a PRF membrane, which was resized to that of the palatal wound [Photoplate2]. The PRF was secured in place and the wound was closed by matrix suturing with 5-0, braided silk suture and placing a non-eugenol pack. Retention of the periodontal pack and protection of the donor site was aided by a sterile acrylic stent.

Recipient site:

The FGG obtained was placed at the prepared recipient bed and sutured using 5-0, braided silk suture. [Photoplate1] A non-eugenol pack was placed over it. The patient was prescribed analgesics for 3days and

chlorhexidine mouthwash for 2 weeks and recalled for suture removal after 1week and follow up was scheduled at intervals of 1week for 1month.

Clinical outcome

The patient was questioned if he faced any pain or discomfort at the donor site. According to the patient, discomfort was minimal, especially for first 2 days post-operatively. Palatal wound was then examined which revealed that the periodontal pack was intact and the palatal sutures were secure. After 10 days, the sutures were removed and the wound was further scrutinized. An uneventful superior healing was observed at the donor site that was visibly appreciable [Photoplate3.]. The wound had diminished in size and the margins showed no signs of inflammation, merging with normal tissues. Complete wound healing was observed in 2 weeks.

Photoplate1 Pre operative and Immediate Post Operative photographs of recipient and donor site

Photoplate 2. Preparation of Platelet-rich Fibrin and Donor Site Covered With PRF Membrane

Photoplate 3. From Clockwise Direction, Donor Site: A) On The Day Of Surgery, B) Second Day Post-operatively C) Fourth Day Post-operatively D) 10th Day Post-operatively E) one month operatively

DISCUSSION

Free gingival grafts have been extensively used since their introduction by Bjorn in 1963.^[6] The fate of the graft is largely dependent on the survival of the connective tissue at the recipient site.^[7] Usually, sloughing of the epithelium is observed and sometimes, the graft, though healthy, is bulbous, and can be demarcated from the normal tissue.^[7] Complete healing in FGGs is delayed and occurs by secondary intention, thus the graft is morphologically distinguishable from adjacent tissues for months.^[3, 7] Moreover, donor site pain and morbidity was much longer and greater, making it less preferable for root coverage procedures.^[3]

The use of PRF as palatal bandage was first advocated by Aravindaksha et al.^[2] as an efficacious approach to protect the raw wound area of palatal donor site to reduce healing time and patient discomfort. PRF is known to improve body's natural defense mechanism and promote healing and regeneration of tissues. Being strictly autologous, it is advantageous over the conventional PRP as it eliminates the need for biochemical handling of blood.^[8] Additionally, preparation of PRF is inexpensive and eliminates the risks related to toxinogenous [bovine] derived thrombin.^[4] However, the preparation of PRF is technique sensitive as it involves immediate collection of blood and centrifugation, prior to initiation of clotting cascade.

The triad of angiogenesis, immunity and formation of epithelial cover are substantiated by PRF.^[5] PRF comprises of fibrin that binds to several growth factors like, fibroblast growth factor, platelet derived growth

factor, vascular endothelial growth factor and angiopoietin which play an important role in initial angiogenesis. The molecular structure of fibrin serves as an optimal matrix that supports proliferation of fibroblasts and endothelial cells, allowing rapid angiogenesis.^[5] PRF is considered to be an immune organizing node, owing to its rich content in cytokines that possess chemotactic properties and facilitate neovascularization.^[9] These cytokines are gradually released from the PRF during fibrin matrix remodeling that favors wound healing.^[9] Rasmuset et al.^[10] postulated that the fibrin matrix promotes synthesis of Type I collagen and protects endogenous fibrogenic factors from proteolytic degradation, forming a physiologic architecture conducive to wound healing.

In the present case, excellent healing was achieved within 14 days. The graft was pink, firm and merged with the surrounding tissues. Signs of inflammation or infection were not seen. The reason for accelerated and superior degree of healing may be attributed to the use of PRF as a palatal bandage.

CONCLUSION

PRF as an adjuvant has succeeded in mitigating post-operative pain and morbidity of the donor site. Using it as a bio-active dressing is time-saving and cost-effective. From a clinical standpoint, PRF promotes all the imperative parameters associated with wound healing and further implications of this novel technique in periodontal surgeries need to be elucidated.

Ethical Clearance- Ethical committee approval was taken prior to the publication from institutional ethical and research committee Manipal College of Dental Sciences, Mangalore, Manipal College of Higher education.(MAHE)

ABSTRACT

The term human resource means the total sum of competencies in the society. The development of an economy depends on all competencies of Human resources. In present day context, the human resource development gains importance as it shapes development strategies of nations in global context. The hotplate of recent economy issue is the employment factor and in turn manpower development of the respective country. The developed countries are free from the problem of unemployment but suffering from, disguised unemployment and underemployment. The current study focuses on market mechanisms, by employing new strategies in the present academic system through matching education and training to augment the need for human resources. The basic objective of present study to induce the Tamilnadu government intensify efforts so as to increase public as well as private investment and spending on key Social Services, such as Education system, Social welfare measures, Proper Nutrition, sufficient irrigation facility, Adequate and clean sanitation Public health and Family Welfare etc., Chapter one provides basic idea about the Human resource development and Employment. Chapter two displays the methodology of the study. Chapter three lists the review of literature. Chapter four describes the share of employment in all three sectors and corresponding industrial break up with projection of the share of employment in developed countries. Chapter six describes the same for developing countries. The last chapter concludes with the findings and suggestions.

Keywords: HRD, Employment, Economic Development, Labour, Sectors

INTRODUCTION

The human resources has crossed its territory of significance from personnel department to Administrative level and policy framework. The performance of production intended to verbal evolution of human resource development. Human beings are an asset who must be hired, satisfied, developed, and retained in current scenario. In long run, like financial assets and materials assets, even human assets also be maintained and replaced based the demand of the commercial world. In the line of organization human resources attains the higher grade as it sustain the feasibility of business policy in the reality. The human resources development are not restricted with the formal approaches such as class room training, hands on courses or preplanned training programme, but also extended to informal way by means conversation, coaching by manager, project proposal and presentation. Healthy organizations are adopting

both formal and informal bases for the development of human resource development. The dictionary meaning of human resources, 'the people, staff or person who operates and maintains the organization which is contrasted from other assets like physical, financial, monetary and material assets'. Human Resource is a process implemented in an organization which deals with the people and issues related to people such as reward, appointment, recompense, routine management, and training. The growth of human resources in the recent past has witness the level of reaps and bounds of development of business practices and it becomes integral part of the organization.

METHODOLOGY

Hypothesis

Human resource development influences the mental and physical conditions of the employee.

Human resource development improves labour working days.

OBJECTIVES OF STUDY

To analyze the role of human resources development in growth of Indian economy.

To prove the HRD meant for the right person is in the right place at the right time.

To construct a framework for employees to improve personal and technical skills, knowledge, and abilities.

REVIEW OF LITERATURE

According to India Labour and Employment report 2014¹, the structure of the labour market, patterns of employment growth, and labour-market institutions play an important role in shaping development patterns and outcomes. However, there is a lack of analytical documentation on these issues.

Amitabh Kundu and P.C. Mohanan² According to them, the trends and pattern of economic growth does not guarantee that the growth of job opportunities will be equal to that of the working age population or higher than that, after wiping out the backlog of unemployment.

T.S Pabola and Partha Pratim Sahu³, According to them, a major proportion of workers in non-agriculture economic activities work in informal sector where they suffer from a large quality deficit in employment, in terms of low productivity, low earnings, poor conditions of work and lack of social protection.

IMA report⁴ has analyzed and prepared a report on the India employment Report, the employment during 2015-16. In this report, they compared the employment with talent scenario in India. During the this period nearly 462.5 million people above the age of 14 years were employed, and it is more than 9 million, a decade ago. It is unfortunate that nearly 18 million were searching for jobs. The number of people has increased by about 91 million between 1999-00 and 2015-16. However, both number of people employed and their share in the total population have decreased steadily in the last four years. Between 1999-00 and 2015-16, about 1.5 times more people were employed in the urban areas than in rural areas. The urban workforce increased at a much faster rate 3.3 percent CAGR compared to 0.8 percent of rural work force. The rate of rural employment declined

from 3.5 times urban employment in 2004-05 to 2.4 times in 2015-16.

Sona Mitra⁵ According to her, proportional employment generation has not been achieved along with incremental output growth rate and secondly employment opportunities have negative growth with the traditional labour intensive industries.

HRD and Management Development

The strength of human resource development depends on the management and leadership development process which is flexible and continuous, linking an individual's development to the goals of the task available in the organization. The correlation between the level of employment and economic activity, witness a positive response from the worldwide statistics. Table 1 depicts the share of employment from the primary, secondary and tertiary sector with respect to economic activity, extracted from world development Indicators for the year 2011 to developed countries.

Table 1: Share of Employment by Economic Activity (%) year 2011

Country	Agriculture	Industry	Service
UK	1.5	23.5	75.0
USA	2.0	22.0	76.0
France	1.5	23.5	75.0
Japan	5.0	29.0	65.0
Germany	2.5	31.0	66.0
Italy	5.5	29.5	65.0
Australia	4.5	20.0	75.5

Source: World Development Indicators (WDI): 2011⁶

The above table indicates, the elasticity of employment in the developed countries significantly differs across the sectors. As a matter of fact, there is no provision for further employment irrespective of output. Except pure agriculture, the scope for the employment is almost zero and the value of elasticity in service sector ranges from 0.3 to 0.5. However, there is a space for the overall employment level, for the agro based industries and core manufacturing industries for service sector in

large base. From our projections, it is seen that even if the service sector grows at more than 10 per cent, its share in employment by 2013 will still be only 29 percent rising from the level of 23 per cent in 1999-2000.

Table 2: Employment Projections (at % growth rate)

	1999-2000	2004-05	Projected Elasticity	Growth Rate	Employment Growth rate	2017
Agriculture	237.56	240.32	0.10	4.00	0.40	252.11
Mining& quarrying	2.27	2.24	0.00	4.70	0.00	2.24
Manufacturing	48.01	51.79	0.22	10.50	2.31	68.11
Electricity, Gas and water supply	1.28	1.29	0.00	8.30	0.00	1.29
Construction	17.62	21.10	0.60	8.50	5.10	38.32
Trade, hotels& restaurant	37.32	45.76	0.50	9.20	4.60	78.49
Transport, Storage and communication	14.69	18.78	0.40	10.50	4.20	30.76
Financing, insurance, real estates and business services	5.05	5.90	0.50	11.00	5.50	11.21
Community, social and personal services	33.20	35.95	0.30	7.60	2.28	47.11
Total Employment	397.00	423.13	0.22	8.00	1.76	529.64
Labour Force (1.5%)	406.05	437.43				522.99
Labour Force (1.8%)	406.05	443.93				549.90
Unemployment rate (1.8%)	2.23					3.68

Source: Planning Commission: 2016

From table 2, it is evident that fast-tracking growth is dominant in all economic activities to expanding employment opportunities. The need of the hour arises to support and enhance both demand and supply sides of the human resources in order to achieve new heights of employment. On the demand side the most compelling force is evident for growth in the employment. The estimates are projecting a sustained growth of 8.5 per cent per annum, by 2015, and unemployment will be totally eliminated. The macroeconomic policy framework may facilitate accelerated growth in the economy. Secondly, demand side strategy envisioned with specific policies

for selective sectors aimed at the growth of labour intensive industries like apparel industry, leather industry and textile industry. This must be managed in such a way that there is no compromise with efficiency. The supply side interventions should be in capacity building and enhancing the skill endowment of the labour force.

The following table portrays the share of employment by economic activity for the South East Asian countries for the year 2011.

Table: 3 Share of Employment by Economic Activity (%) Year 2011

Country	Agriculture	Industry	Service
China	49.8	23.5	26.7
Indonesia	55.5	14.0	31.0
Thailand	49.0	18.5	32.5
Philippines	35.0	15.0	50.0
Malaysia	17.5	31.5	51.0
Korea Rep.	10.5	26.5	55.5
Pakistan	58.5	14.5	27.0
India	57.0	21.0	22.0

Sources: World Development Indicators (WDI): 2011

It is acknowledged from Table 3 that discussion of the employment situation or an employment strategy will not be complete without a reference to the social safety nets for workers. The organized sector of the society represents the social secured sector which are lacking in the developed countries like India.

Table 4: Rate of Growth of Population, Labour Force and Employment: 2011

Time intervals	Population growth (% per annum)	Labour force (% per annum)	Employment Growth (% per annum)	Gross Domestic Product growth (% per annum)
1972-73 - 1977-78	2.27	2.94	2.73	4.70
1977-78 to 1983	2.19	2.04	2.17	4.05
1983 to 1987-88	2.14	1.74	1.54	4.23
1987-88 to 1993-94	2.10	2.29	2.43	5.85
(1983 to 1993-94)	(2.12)	(2.05)	(2.04)	(5.20)
1993-94 to 1999-2000	1.93	1.03	0.98	6.63
1999-2000 to 2010-2011	1.21	1.73	1.27	5.21

Source: Report of Task force Employment Opportunities, Planning Commission:⁷

The essence of the study is to compare the employment with the economic activity for which the growth rate of population, labour force and employment are compared with the Gross Domestic Product with their growth rate. Surprisingly there is a positive linkage between employment and the GDP, and also other Economic indicators.

CONCLUSION

From the current study, it can be reviewed that employment opportunity are to be generated through the effective human resource management. Unless and

otherwise, it is difficult to enhance the production policy and other industrial policy. The main suggestion of the study is the rural industrialization through available human resource the backward, semi-urban and remote areas. The labour intensive industries are encouraged to implement the human resource policy in order to create more employment opportunities. The may pave way for equality in the developmental activities as well as utilization of available human resources in optimum way.

Effectiveness of Structured Teaching Programme on Knowledge of Kangaroo Mother Care among Mothers

Regina Antony¹, Harichandhana S², Sinu Paul²

¹Associate Professor; ²IV BSc Nursing Students, Amrita College of Nursing,
AMRITA VishwaVidyapeetham, Kochi, Kerala, India

ABSTRACT

Objective : The objective of the study was to find out the efficacy of structured teaching programme (STP) of Kangaroo Mother Care (KMC) among mothers in AIMS, Kochi. **Materials and method:** A quantitative approach with quasi experimental pretest – posttest design and convenience sampling technique was used in this study. Study was conducted on 100 antenatal mothers (50 experimental and 50 control group) attending gynecologic OPD, AIMS, Kochi, Kerala. The tools used for the study was Knowledge Questionnaire on KMC with 13 items related to demographic data and 17 items related to KMC. **Result :** The present study reveals that out of 50 subjects of experimental group, the mean pretest knowledge score is 7.4 and the mean posttest knowledge score is 10.5 after the implementation of Structured Teaching Programme (STP). The control group, mean pretest knowledge score is 8.2 and the mean posttest knowledge score is 6.9. There is high level of significance in the knowledge score of the subjects between the experimental and control group at ($t(98) = 2.62, p < 0.000$). The pretest and post test knowledge score was greater in primigravida mothers than multi gravida mothers. A statistically significant association was observed for educational level and knowledge score ($f = 17.56, p < 0.05$), prior information and knowledge score ($f = 8.369, p < 0.05$). **Conclusion:** Based on the study findings the STP was significantly effective to improve the knowledge level of mothers regarding the KMC. Majority of the mothers (35 (68%)) had inadequate knowledge regarding KMC before the implementation of the STP and after the implementation 37 (74%) attained adequate knowledge.

Keywords : Structured Teaching Programme, Kangaroo Mother Care, Knowledge, Mothers

INTRODUCTION

Kangaroo care seeks to provide restored closeness of the newborn with family members by placing the infant in direct skin-to-skin contact with them. This ensures physiological and psychological warmth and bonding. The parent's stable body temperature is more smoothly than an incubator, and allows for readily accessible breast feeding when the mother holds the baby this way. While this model of infant care is substantially different from the typical western neonatal intensive care unit. It is estimated more than 200 neonatal intensive care units

practice kangaroo care today. One recent survey found that 82% of neonatal intensive care units use kangaroo care in the States today¹.

Caring low birth weight baby is a great challenge for the neonatal care unit and the family. Number of low birth weight baby is still far beyond the expected target in our country. The cost of the quality management of these babies is increasing day by day. KMC is low cost approach for the care of low birth weight baby. This method of care was introduced and popularized by Dr. Edger Roy, Dr. Martinez and Dr. Charpak in late 1970's².

Sivapriya S, Subash J, Kamala S. (2008) conducted a quasi experimental study to assess the knowledge of mothers of preterm babies regarding kangaroo mother care and to evaluate the effectiveness of structured teaching programme on kangaroo care among the mothers of preterm babies. A total of 35 mothers were

selected for the study. Findings of the study revealed that, the pre-test knowledge of the Kangaroo Care was Nil. After the structured teaching programme post test knowledge of the mother regarding Kangaroo Care was increased. 6 (17.10%) mothers had inadequate knowledge on Kangaroo Care, 25 (71.4%) mothers had moderately adequate knowledge and 4 (11.5%) mothers had adequate knowledge on Kangaroo Care. Kangaroo Mother Care is a simple low cost and highly effective intervention for low birth weight babies. And also teaching programmes can improve the knowledge of mothers on Kangaroo Care. So, educational programme on Kangaroo Care can be provided to Mothers, which in turn will improve the preterm and low birth care ^[3].

Preterm birth is now the leading cause of under-five child deaths worldwide with one million direct deaths plus approximately another million where preterm is a risk factor for neonatal deaths due to other causes. There is strong evidence that kangaroo mother care (KMC) reduces mortality among babies with birth weight <2000 g (mostly preterm). KMC involves continuous skin-to-skin contact, breastfeeding support, and promotion of early hospital discharge with follow-up. The World Health Organization has endorsed KMC for stabilised newborns in health facilities in both high-income and low-income countries ^[4]. The study will initiate key steps in the development, implementation and expansion of sustainable, facility-based KMC services in the institution and thereby in all developing countries.

AIMS AND OBJECTIVES

The aim of the study was to find out the efficacy of structured teaching programme of KMC among mothers in AIMS, Kochi

- 1) Identify the pretest and post test knowledge score on KMC among mothers' of experimental group
- 2) Evaluate pretest and posttest level of knowledge score among mothers' control group
- 3) Compare the post test level of knowledge score among primi and multipara mothers'
- 4) Find the association between the selected demographic variables and knowledge level on KMC among mothers'

HYPOTHESIS

H1: There will be significant difference in the

posttest knowledge score after the administration of the STP the experimental group.

H2: There is significant association between the post test knowledge score and the selected demographic variables .

VARIABLE

Independent Variable : STP regarding KMC

Dependent Variable : Knowledge of mothers'

MATERIALS AND METHOD

The study was conducted on 100 antenatal mothers and the research approach is quantitative and research design used was quasi experimental pretest–posttest. The researcher explained the purpose of study and obtained an informed consent and the tool was administered and the data was obtained from the mothers. The tools used for the study was Knowledge Questionnaire on KMC with 13 items related to demographic data and 17 items related to KMC. Each mother took nearly 20 minutes to take fill the questionnaire. The data obtained was analyzed using inferential and descriptive statistics i.e independent and paired' t' test. and Chi square .

DATA COLLECTION INSTRUMENTS

Tool 1: Knowledge Questionnaire on KMC.

Part I Demographic Performa

The semi structured questionnaire was with 13 items related to demographic data-age , marital status ,education ,occupation area of residence, ,number of delivery , number of children, birth weight ,mode of delivery ,number of pregnancy, prior information, prior practice of KMC

Part II Knowledge questionnaire

17 items related to KMC with four options out of which one answer is the most appropriate which is graded as one and the wrong answer with zero.

RESULTS AND DISCUSSION

Section 1 : Socio demographic characteristics of subjects

Table 1 : Distribution of subjects based on demographic variables. n = 100

Sl no.	Sample characteristics	Frequency (f)	Percentage (%)
1	Age in years		
	18-25	49	49 %
	26-32	46	46 %
	33-40	5	5 %
	Above 40	-	-
2	Education		
	Primary school	15	15 %
	Secondary school	27	27 %
	Graduate	46	46 %
	Postgraduate/above	12	12 %
3	Occupation		
	Homemaker	62	62 %
	Government employee	6	6 %
	Private employee	32	32 %
	Business	-	-

Table 1 depicts most of the mothers 49(49%) falls in the age group between 18-25 ,46(46%) of the mothers were graduates ,62(62%) of the mothers were homemakers ,59(59%) of the mothers were primi gravida and 66(66%) of the mothers did not have any prior information about KMC .

NY PRIOR INFORMATION

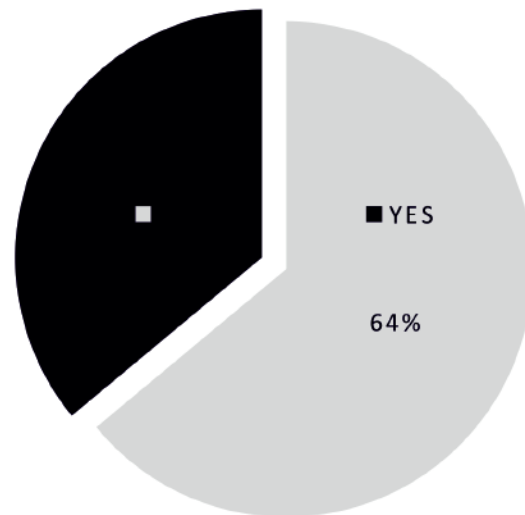

Figure 2: Distribution of subjects according to any prior information

Data presented in figure 2 shows the frequency and percentage of mothers according to any prior information on KMC . Among 100 mothers 64 (64%) of the mothers have no information on KMC and 36(36%) are having informations on KMC .

Section II: Analysis of pre & post test knowledge score of the mothers

Table II – Distribution of samples according to pre –test knowledge score of experimental group

n = 50

Pre test score experimental group		
Level of knowledge	Frequency (f)	Percentage (%)
Adequate knowledge ≥ 13	0	0 %
Moderate knowledge 9-12	16	32 %
Inadequate knowledge ≤ 8	34	68 %

The data presented on table 2 shows that out of 50 mothers 16(32%) of mothers have moderate knowledge, 34(68%) has inadequate knowledge before the implementation of STP on KMC

n = 100

GRAVIDA

Figure 1: Distribution of subjects according to gravida

Data presented in figure 1 shows that out of 100 mothers 59(59%) of the mothers are primi gravida and 41(41%) are multigravida.

Table III – Distribution of samples according to post –test knowledge score of experimental group

n=50

Post test score experimental group		
Level of knowledge	Frequency (f)	Percentage (%)
Adequate knowledge ≥ 13	6	12 %
Moderate knowledge 9-12	37	74 %
Inadequate knowledge ≤ 8	7	14 %

The data presented on table III shows that out of 50 samples 6(12%) samples have gained adequate knowledge ,37(74%) of sample has attained gained moderate knowledge and 7(14%) have inadequate knowledge after the implementation of STP.

Section III: Comparison the pre test and post test level of knowledge score of experimental and control group

Table IV – Distribution of samples according to mean ,standard deviation ,mean difference and ‘t’ value of the experimental group n = 50

	Knowledge		mean difference	t-value	df	level of significance
	Mean	SD				
EXPERIMENTAL GROUP						
Pre test	7.40	1.714	.115	11.964	49	.000
Post test	10.50	1.854	.123			

$(t (49) = 3.269, p(.000))$

The data presented in table IV shows that there is a significant difference in the knowledge score of the subjects within the group after the intervention.

Figure 3: The mean pre test and post test knowledge scores

Figure 3 indicate that the mean knowledge score of the experimental group pre test is 7.4 and the mean post test score is 10.5 after the implementation of the intervention and the mean knowledge score of the control group pre test is 8.2 and the post test is 6.

Table V – Comparison of posttest between the experimental and control group

n= 100

	Knowledge		mean difference	t-value	df	level of significance
	Mean	SD				
EXPERIMENTAL GROUP Post test	10.50	1.854	0.123	8.369	98	.000
CONTROL GROUP Post test	6.94	2.368	0.73			

(t (98) =2.62 ,p<0.000)

The data presented in table V shows that there is high level of significance in the knowledge score of the subjects between the experimental and control group.

Section IV- Association between knowledge level of subjects and selected demographic variables

Table VI – Association between education and pretest knowledge score

n= 100

Variable	Level of Knowledge			df	χ^2	p-value
<i>Education</i>	inadequate	moderate	adequate	6	17.536	0.008
Graduate	28	21	0			
Postgraduate	3	8	1			
Primary school	13	2	0			
Secondary school	18	9	0			

Table VI reveals that there is significant association between education and level of education at (χ^2 -17.536,p<0.05)

DISCUSSION

Out of 50 samples of experimental group 16(32%) of the sample had moderate knowledge,34(68%) had inadequate knowledge , before the administration of STP.

Out of 50 samples of experimental group 37 (74%) of the sample gained moderate knowledge,7(14%) are still having inadequate knowledge and 6 (12%) samples are having adequate knowledge after the administration of STP.

The mean pre test knowledge score is 7.40 and post test knowledge score is 10.50of the experimental group. And the mean pre test knowledge score is 8.28 and post test knowledge score is 6.94 of the control

group. Statistical analysis of data shows mean post test knowledge score was 10.50 which is higher than the mean pre test knowledge score was 7.40. There is 3.1 mean increase in the knowledge .

There is high level of significance in the knowledge score of the subjects between the experimental and control group at (t (98) =2.62 ,p<0.000).

Sivapriya S, Subash J, Kamala S. (2008) conducted a quasi experimental study to assess the knowledge of mothers of preterm babies regarding kangaroo mother care and to evaluate the effectiveness of structured teaching programme on kangaroo care among the mothers of preterm babies. After the structured teaching programme post test knowledge of the mother regarding Kangaroo Care was increased. 6 (17.10%) mothers had

inadequate knowledge on Kangaroo Care, 25 (71.4%) mothers had moderately adequate knowledge and 4 (11.5%) mothers had adequate knowledge on Kangaroo Care.^[3]

The findings of the present study correlates with the findings of the supportive study . Hence STP can be considered as an important teaching method to impart knowledge

CONCLUSION

KMC is a powerful, easy method to use and to promote the health and wellbeing of low birth weight babies. KMC helps in maintaining temperature of infant; facilitates breast feeding; improves growth; reduces infection; and improves mother-infant bonding.^[4] Many Mothers in India does not know how to practice KMC on their low birth weight babies and hence they do not practice also. So, to know the current knowledge and attitude of mothers regarding KMC and to improve their knowledge and practice some research studies are needed to carried on with teaching programmes on mothers of low birth weight babies. In turns it also helps the nursing personnel to improve their communication skills.^[5]

Indoor Air Pollution an Ignored Public Health Issue: Study to Find the Awareness and Practices Regarding Indoor Air Pollution in a Rural Setting Near Chennai

Ruma Dutta¹, Dinesh Raja², Timsi Jain³, Gomathy Parasuraman⁴, Prashanth R⁵, Sivaprakasam P⁶

¹Associate Professor, ²Assistant Professor, ³Professor, ⁴Associate Professor, ⁵PG, ⁶Professor & Head, Department of Community Medicine, Saveetha Medical College Thandalam, Chennai

ABSTRACT

Background: Indoor air pollution (IAP) refers to chemical, biological and physical contamination of indoor air. It is of great concern owing to the range of ill effects it has on health. Rural India still relies on biomass fuels for cooking inspite of availability of cleaner fuels.

Objective: To assess the knowledge, and practices regarding indoor air pollution and its health hazards among rural women in Kuthambakkam village in Tamilnadu.

Methodology: A cross sectional descriptive study was conducted among rural women from 150 households in Kuthambakam village in Tamilnadu. Personal interviews were conducted at their houses using a structured questionnaire. Data obtained was analyzed using SPSS version 21.

Results: The mean age of the study participants was 38.5 years. Majority of the women were married (90.7%) or widowed (2.6%). 13.3% were illiterates. Overcrowding was found to be present in 46% households. Kitchen was not separate in 42.7% houses. Majority households used LPG (70%) as source of cooking fuel followed by wood (18%), kerosene (11.3%) and cow dung (0.7%). 4% of the houses did not have any windows in the kitchen while in remaining houses windows (64.7%) were the common mode of exhaust for smoke. The practice of burning mosquito coils and incense sticks was seen in 37.3% and 46% households respectively. The study found that 16 (38%) men smoked inside their houses. 57% women were not aware that indoor air pollution is hazardous to their health and well being.

Conclusion: Indoor air pollution is a looming threat often ignored by people. It is imperative to make people aware of indoor air pollution and its deleterious effects on human health.

Keywords: Biomass fuel, Health, Ignorance, Indoor air pollution

INTRODUCTION

Indoor air pollution (IAP) refers to chemical, biological and physical contamination of indoor air.¹It is of great concern owing to the range of ill effects it has

on health. Globally, IAP from use of solid fuel accounts for more than 1.6 million deaths and 39 million DALYs every year.² Approximately, three billion people in the world, use biomass such as crop residues, dung, straw, wood, kerosene and coal as their primary source of energy for cooking and heating. In the South East Asia region, 78% households rely on solid fuel for cooking. IAP was estimated to cause 374000 deaths in children below 5 years & 185000 deaths among adults. India is the main victim and IAP is estimated to be responsible for between 4% to 6% of the national burden of disease.² A majority of these households are located in poor rural

Corresponding author:

Assistant Professor, Community medicine, Saveetha Medical College, SIMATS, Chennai- 602105, India
Ph: 9884227438
E-mail – dinsha85@gmail.com

communities and burn such solid fuels in inefficient devices, often in kitchens that are poorly ventilated, resulting in very high exposures to multiple toxic products of incomplete combustion.³

According to WHO, a pollutant released indoors is 1000 times more likely to reach the lung than that released outdoors. Biomass smoke contains harmful pollutants like suspended particulate matter, nitrogen dioxide (NO₂), carbon monoxide, sulphur dioxide (SO₂), formaldehyde and carcinogens. Indoor smoking of tobacco also contributes to IAP. Studies both in India and other countries have confirmed that exposure to biomass fuels has a significant association to chronic respiratory symptoms such as chronic cough, chronic phlegm and chronic respiratory diseases such as chronic bronchitis, asthma, corpulmonale and respiratory failure.²⁻⁵

According to the Census of India (2011), many households still rely on firewood fuel for cooking and approximately 20% rely on other forms of biomass fuels. In rural areas, approximately 80-90% of households are dependent on biomass for cooking. In contrast to cleaner fuels, kerosene and LPG were accounted for 19% and 48%, respectively.⁶ Poverty, inaccessibility to improved cooking fuel, and lack of awareness about harms of biomass emissions are among the major factors that drive their widespread use.⁷ In India, out of 0.2 billion people using fuel for cooking; 49% use firewood; 8.9% cow dung cake; 1.5% coal, lignite, or charcoal; 2.9% kerosene; 28.6% liquefied petroleum gas (LPG); 0.1% electricity; 0.4% biogas; and 0.5% any other means.⁸

A person's exposure to indoor air pollution is determined by the concentration of pollutants in the indoor environment and by the amount of time spent in this environment. Stove features (the presence of chimney or flue that routes smoke to the outside), the location of the stove and kitchen, as well as ventilation practices have a major impact on indoor air pollution. In most societies women are in charge of cooking and they spend between 3 and 7 hours per day near the stove preparing food.² It is estimated that an average woman in India may be subjected to 60,000 hours of exposure to smoke due to combustion of biomass fuels in her life time.⁵ Being the most vulnerable group, the present study was conducted among rural women in Kuthambakkam village in Tamilnadu.

OBJECTIVE

To assess the knowledge, and practices regarding indoor air pollution and its health hazards among rural women in Kuthambakkam village in Tamilnadu.

METHODOLOGY

It was a cross sectional descriptive study conducted between January - February 2016 in Kuthambakkam village, the rural field practice area of Saveetha Medical College and Hospital, Thandalam. Permission was obtained from the Institutional Ethics Committee prior to the conduct of study.

According to NFHS 4, 73% of households use clean fuel for cooking in India. Based on this prevalence and taking relative precision as 10% of prevalence, at 95% confidence level the sample size was calculated as 142. So for the present study it was decided to survey 150 households. Kuthambakkam village is located 30 Km away from Chennai and has a population of 5047 people and 1277 households.⁶ The required number of households was selected using simple random sampling method. In each of these household, women aged 18 years and above were interviewed. Informed consent was obtained after explaining the purpose of the study. Those women who were not willing to participate in the study were excluded. Personalized interviews were conducted at their houses using a structured questionnaire.

Data obtained was analyzed using SPSS version 21. Descriptive statistics were calculated. Results were expressed in the form of simple proportions, mean and standard deviation.

RESULTS

The study was conducted among women from 150 households in Kuthambakkam village. The mean age of the study participants was 38.5±12.1 years (min:18 years & max:73 years). Their age distribution is depicted in Table 1.

Majority of the women were married or widowed (90.7% & 2.6% respectively) while the rest were unmarried. Only 13.3% were illiterates (Table 1).

Majority 70.7% women were residing in nuclear families. The total family income per month of these households ranged from Rs 500 – 80,000 (mean: Rs 8910 ± 7902). Under-five children were present in 64 families

(42.6%) and geriatric people in 33 families (22%).

It was found that more than half (58.6%) of the houses were semipucca followed by pucca houses (28.7%) and only 12.7% of houses were kutcha. Majority houses had cemented floor (63.3%), 14.7% had mud floor and rest were either tiled/ marble. Majority (55%) of the houses had only 2 rooms and 10% had only single room. Overcrowding was assessed using person per room criteria and was found to be present in 46% households.

Kitchen was not separate in 42.7% houses. Majority households used LPG (70%) as source of cooking fuel followed by wood (18%), kerosene (11.3%) and cow dung (0.7%). It was found that 4% of the houses did not have even windows in the kitchen while in remaining houses windows (64.7%) were the common mode of exhaust for smoke followed by exhaust fan (29.3%) and chimney (2%). When questioned if they keep the windows and doors open at the time of cooking, only 68% replied in affirmative. (Table 2)

The practice of burning mosquito coils and incense sticks was seen in 37.3% and 46% households respectively. The study found that men in the family smoked in 42 (28%) of households, of which 16 (38%) smoked inside their houses (Table 3). 13 (31%) were regular smokers, 19 (45.2%) smoked occasionally and 10 (23.8%) smoked rarely.

45% women were aware of potential sources of indoor air pollution. 43% women were aware that indoor air pollution is hazardous to their health and well being. 9% women reported respiratory illness in their family members.

Table 1: Distribution of women according to their age, marital status and education status (N= 150)

Age group	Frequency	Percentage%

DISCUSSION

In the present study almost one third of the houses did not use clean fuel for cooking (18% wood, 11.3% kerosene and 0.7% cow dung). According to National Sample Survey (NSS) 2010, carried out by Government of India, biomass fuel remains a widely used energy source in rural India where nearly 80% of households use them as the primary cooking fuel. In contrast, the majority of urban households use liquefied petroleum gas (LPG) as the primary cooking fuel; however, about 19% of urban households also use biomass fuel for cooking purposes.⁹ The use of LPG, which is known to result in the lowest pollution levels within households, remains a nonfeasible proposition for bulk of India's population as a result of prices, limited supply, and access.³

Poverty, inaccessibility to improved cooking fuel, and lack of awareness about harms of biomass emissions are among the major factors that drive their widespread use.^{9,10} The knowledge regarding association of indoor air pollution with health and disease was very poor in the present study as only 45% women had knowledge that indoor air pollution is a potential health hazard. Burning biomass fuels can have adverse effects on health because of its incomplete products of combustion which includes suspended particulate matter, carbon monoxide, poly aromatic hydrocarbons, poly organic matter, formaldehyde, etc.. The combustion of coal in particular results in production of oxides of sulfur, arsenic, and fluorine which can have deleterious effect on ones' health when inhaled for a prolonged duration of time.¹¹

In India, an estimated 400,000 deaths from acute

lower respiratory infection (ALRI) in children younger than five and 34,000 deaths from chronic obstructive pulmonary disease (COPD) in women are attributed annually to household solid fuel use, making this the third leading risk factor amongst all risk factors contributing to the national burden of disease and exceeding the burden attributable to outdoor air pollution^{12,13}. Some of the earliest human evidence linking indoor air pollution from biomass combustion with respiratory health came from studies carried out in Nepal and India in the mid-1980s.^{14, 15}

Health hazards due to biomass fuels could be reduced to even more than 50% by using smokeless chulas (improved cooking stoves) with proper exhaust chimneys.¹⁶ Studies have demonstrated that improved cook stoves reduce considerably the smoke, either by having a far better combustion or by having an excess of air or with a combination of both, the health impacts of smoke from open fires inside dwellings can be reduced using such improved cook stoves, changes to the environment (e.g. use of a chimney), and changes to user behavior (e.g. drying fuel wood before use, using a lid during cooking).¹⁷ In the present study, windows (64.7%) were the common mode of exhaust for smoke followed by exhaust fan (29.3%) and chimney (2%). 4% of the households didn't even have proper windows for the escape of smoke.

Apart from using biomass fuel, other habits like burning of incense sticks and mosquito coils in the household also leads to indoor air pollution.^{18,19} In the present study more than one third of the houses had a practice of burning mosquito coils inside the house and almost half of the women burnt incense sticks in the house.

According to WHO passive smoking or the second hand smoke is a serious form of Indoor air pollution.²⁰ In the present study 38% of the men who were smokers were smoking inside the house adding up to the risk of diseases to the inmates of the house.

CONCLUSION

Choice of cooking fuel depends on the socio-economic status of the people however; the choice of inhaling indoor air pollutants is not dependent on the socio-economic status alone. Indoor air pollution is a looming threat to the health of people and is an often ignored public health issue. Hence, it becomes imperative that people should be made aware of possible

indoor air pollutants like bio mass fuel, passive smoking, incense sticks, mosquito coils etc and its deleterious effect on ones' health by conducting regular Information Education & Counseling (IEC) activities among the people. Improved cooking stoves or subsidized LPG should be made accessible to all the people irrespective of their socioeconomic status.

Factors Influencing Semen Analysis in Case of Infertility

Dinesh Kumar Singh¹, Anju Singh², Shivendra V Singh³, Paras Kharbanda⁴

¹Associate Professor, Department of Pathology, ²Professor, Department of Forensic Medicine, Mayo Institute of Medical Sciences, Barabanki, Lucknow, U.P. ³M.B.B.S. M.D. (Pathology), ⁴Associate Professor, Pathology, G.C.R.G. Institute of Medical Sciences, Lucknow

ABSTRACT

Background / Objectives: In recent years, infertility in men has increased, which may be associated with their advancing age, habits like tobacco use, alcoholism and occupation. Semen parameters might be sensitive markers for these influencing factors.

Materials and Method: This study was conducted in all patients referred to Pathology department for semen analysis from Obstetrics and Gynaecology department in KVG Medical College and Hospital, Sullia from July 2011 to August 2013. 50 cases were included in this study. Information was collected as per the proforma by questionnaire from the patients about their occupation, smoking habits, tobacco chewing and alcohol intake. Semen examination was done as per WHO standard protocol procedures. Patients were classified into tobacco consumers, alcoholics and combined smokers & alcoholics. All these cases were again grouped according to age and occupation .

Results: Semen parameters like volume, motility, count, density and morphologically normal spermatozoa were comparatively reduced in tobacco users & combined alcoholics & tobacco users. Variation of semen quality with respect to age was not significant.

Conclusion: The influence of advancing age and occupation like drivers (radiant heat), and agriculture (gonadotoxic pesticides and fertilizers) could probably be considered as additive factors for oligozoospermia.

Keywords: age, alcohol, occupation, semen parameters, tobacco use.

INTRODUCTION

Parenthood is considered one of the most important life achievements in the Indian society. The importance of surgery to the psychological wellbeing of the couple can also be gauged from the fact that the overwhelming majority of patients seeking vasectomy reversal in India do so not because they have remarried or want additional children but because they have lost an only child. This compares with 2.6% patients in U.S. who seek a vasectomy reversal for this reason.^[1]

Infertility is defined as the failure to achieve a pregnancy within one year of regular (atleast 3 times per month) unprotected intercourse. It effects approximately 15% of sexually active couples ; a causative male factor is present in approximately 40% of cases. Oxidative stress also contributes to defective spermatogenesis and poor quality of sperm associated with idiopathic male factor infertility. Infertility is regarded as male factor when an alteration in sperm concentration or motility or morphology is present in atleast one sample of two sperm analysis, which comply with WHO 1999 guidelines, collected between one to four weeks apart.^[2]

The causes of male infertility fall into one of three categories : pretesticular, testicular and post-testicular .^[3]

Detection of male fertility problems relies heavily on the assessment of conventional parameters, namely sperm concentration, motility, morphology, viability,

Corresponding author:

Dr. Anju Singh

Professor, Department of Forensic Medicine, Mayo Institute of Medical Sciences, Barabanki, Lucknow, U.P. Email-ID- dranju0105@gmail.com

volume and Ph.^[4]

Rapid developments have occurred in the management of couple infertility due to a male factor. These have stimulated renewed interest in semen analysis, which has become more correct, more reliable and more informative.^[5]

Semen analysis is the initial and most essential step of the infertility evaluation, which also includes a physical exam, hormonal evaluation, sperm function testing, and genetic analysis. ^[6] In practice, however, because of a lack of standardization, a wide variation in results among laboratories, and an apparent need for increased quality control.^[7]

Previous estimates of infertility help-seeking were based on data from women. Men report a percentage seeking help that appears to be somewhat lower than reported by women. About 1 in 5 of those seeking help reported male-related infertility conditions.^[8]

Basic semen analysis is used to evaluate the male partners of couples with infertility. Conventional techniques for the evaluation of semen have been standardized by the World Health Organization (WHO) ^[9].

MATERIALS AND METHOD

Detailed history of age, occupation, tobacco use, smoking and alcohol intake was taken as per the proforma by questionnaire and detailed physical examination including genital examination was done. Semen samples were collected from all patients by masturbation after 2-5 days of sexual abstinence in wide mouthed polypropylene bottle and these semen samples were processed and analyzed by single qualified person.

I. MACROSCOPIC EXAMINATION

1). Liquefaction : Normal semen sample liquefies within 30 minutes at room temperature. Occasionally, samples may not liquefy, in which case additional treatment like, mechanical mixing or enzyme digestion may be necessary.

2). Color : Semen sample is examined immediately after liquefaction or within 1hour of ejaculation. Normally, semen is homogenous grey opalescent and may appear less opaque if sperm concentration is low. Red brown when mixed with blood or yellow in patients

with jaundice or taking vitamins.

3). Volume : of ejaculate is measured using graduated cylinder.

4). Viscosity : is measured by gentle aspiration into wide bore 5ml pipette and then allowing the semen to drop by gravity and observing the length of the thread. A normal sample leaves the pipette as small drops. In cases of abnormal viscosity, the drop will form thread more than 2cm long. Alternatively, the viscosity may be evaluated by introducing a glass rod into sample and observing the length of the thread that forms on withdrawal of the rod.

5).pH : is measured by using pH paper by evenly spreading one drop of semen onto the pH paper and after 30 seconds, the color change is compared with the calibration strip.

II. MICROSCOPIC EXAMINATION

A) Fixed volume 10µl semen is taken on to a clean glass slide with micropipette and covered with a 22mm×22mm coverslip. After stabilizing for 1minute, wet preparation is examined under light microscopy to note :

i) Motility : Select the fields atleast 5mm from the edge of the coverslip.

- Atleast 5 microscopic fields are assessed to classify 200 spermatozoa.
- Motility is graded as:-
 - a) Rapid progressive motility
 - b) Slow progressive motility
 - c) Non motile forms
 - d) Dead forms

ii) Preliminary estimation of sperm concentration : Scanning the wet mount and estimating the number of spermatozoa per high power field will help to estimate sperm count roughly, which is used to decide the dilution factor for determining sperm concentration by hemocytometry.

B) Assessment of sperm concentration :- The concentration of spermatozoa should be determined using hemocytometer method on two separate preparations of

semen sample, one on each side of counting chamber. The dilution is determined from preliminary estimation of sperm concentration.

Constituents of semen diluting fluid:

Sodium bicarbonate 5gm

Formalin (neutral) 1ml

Distilled water 99ml

Procedure

- Automatic pipettes or WBC pipettes are used for making dilutions.
- Charge the improved Neubauer hemocytometer with 10µl of thoroughly mixed diluted sample. Later, allow to stabilize for about 5 minutes in a humid chamber to prevent drying.
- Spermatozoa in the RBC chamber are counted.
- Sperm count per ml = N/conversion factor x10x6 N= number of sperms in RBC chamber.

C). Assessment of sperm morphology:

- Preparation of smears by feathering technique as peripheral blood smear preparation.
- Air dry the smear. Later fix in equal parts of 95% ethanol & ether for 5-15minutes.
- Stain with Leishman stain or stain in aqueous basic fuchsin for 5 minutes.

* Examine the slide under oil immersion, all normal & abnormal spermatozoa are assessed and scored. Atleast 200 spermatozoa are counted and scored.

D). Calculation of Leukocytes : Leukocytes in millions per ml= w×c/100 W- no.of leukocytes per 100 sperms counted

C- sperm count

E). Calculation of immature germ cell: Immature germ cell in millions per ml = N×C/100

N-number of immature germ cells per 100 sperms counted. C- Sperm Count.

RESULTS

AGE:

The mean age of the patients was 25.54. The distribution of semen quality among age groups is shown in Table 1 .

TABLE-1: Distribution of semen quality among age groups:-

Semen Quality	Age Groups (in years)				
	21-25	26-30	31-35	36-40	41-45
nz	2	6	4	-	1
atz	7	3	3	-	2

atz	6	3	2	-	1
tz	-	-	-	-	-
otz	-	-	-	-	-
oz					

nz- Normozoospermia, oz- Oligozoospermia, atz- Asthenoteratozoospermia, tz- Teratozoospermia

13/50 cases were normozoospermic. The remaining 37 cases were classified into oligozoospermic and asthenozoospermic. All these cases were again stratified according to age (21-25, 26-30, 31-35, 36-40, 41-45) and occupation (sedentary, business, drivers & agriculture) for statistical analysis.

Control Group :

These cases constituted 26% of 50 cases (13/50).

The mean values of controls are shown in table 2. Mean age was 31.3yrs

TABLE-2 Mean values of Controls

Parameters	Values
n	13
Age in years	31.3
Volume (ml)	2.57
Liquefaction Time (min)	28.84
Sperm Count	69.24
Total Motility	58.07
a%	36.53
Morphologically normal sperms (%)	78.84
Morphologically abnormal sperms (%)	21.15
WBC ($10^6/ml$)	5.76

Normal controls are stratified according to age group

Table No. 3 : Stratification of normal control according to age group

Parameters	21-25	26-30	31-35	36-40	41-45
n	2	5	4	-	2
Volume	2.25	2.4	1.25	-	3.5
Liquefaction time	37.5	24	30	-	30
Sperm count	81.4	69.34	62.12	-	71.1
Total motility	60	58	61.2	-	50
a%	45	37	40	-	20
Morphologically normal sperms	82.5	83	70	-	82.5
Morphologically abnormal sperms	17.5	17	30	-	17.5
WBC Cells	3	7.2	5.2	-	8

Stratification of normal control according to age group

Maximum no. of cases belong to age group 26-30 (n=5). Semen volume was Highest in age group 41-45 years. Liquefaction time was highest in age group 21-25 years. The sperm count was highest in the youngest age group (21-25 years). But not much difference was there in between other age groups. The progressive motility was least in the oldest age group (41-45 years) and not

much difference in other age groups. Rapid progressive motility was least in 41-45 years. The percentage of normal sperms was least in age group 31-35 years (70%) whereas other age groups did not show much variation. Abnormal sperms was highest in age group 31 – 35 years. WBC cells were highest in age group 26 – 30 years. No significant change in pH was observed between age groups.

Table No. 4 : Distribution of control groups according to their occupation

Parameters	Agriculture	Sedentary	Business	Drivers
n	2	5	4	2
Volume	2	2.7	1.25	3.5
Liquefaction Time	35	33	23.75	22.5
Sperm Count	61	74.68	68.7	65
Total Motility	72.5	54	57.5	55
a%	50	31	37.5	35
Normal sperms	70	83	77.5	80
Abnormal sperms	30	17	22.5	20
WBC	3.5	6	8	3

The maximum were sedentary workers. The drivers had the maximum semen volume.

The liquefaction time was highest among agriculturalists and least in drivers. Sperm

Count was maximum in sedentary group and least in agriculture.

The motility was least in drivers and maximum in agriculture. The rapid progressive motility was least in sedentary.

The percentage of normal sperms was highest in sedentary groups and least in agriculture. The percentage of WBC cells was highest in business group and least in drivers.

DISCUSSION

In this study 50 cases were studied excluding the patients with history of genitourinary tract infection, systemic illness, tuberculosis, cryptorchidism, mumps, testicular injury, obstructive azoospermia and diabetes mellitus.

EFFECT OF AGE ON SEMEN QUALITY

In this study, 13 cases belonged to the control group. The mean age in this group was 31.3 years. The semen quality was satisfactory. The mean sperm count was 69.24 million/ml. The total motility was 58.07% whereas rapid progressive motility was 36.53%. The morphologically normal sperm percentage was 78.84%.

Also, in this study, out of 50 cases, the sperm count was highest in the youngest age group but not much significant difference in other age groups. The rapid progressive motility was least in 41-45 years age group. The percentage of normal sperms was least in age group 31-35 years(70%).

In a study conducted by Kidd SA, Eskenazi B, Wyrobek AJ, it was found that increase in male age is associated with a decline in semen volume, sperm motility, and sperm morphology.^[10]

The findings of this present study was also supported by another study done by Liliane FS, Joao BA, Claudia GP, Ana LM, Fabiana CM et al which demonstrated a morphological evaluation by MSOME with increased age.^[11]

Table No. 5: Comparison of effect of age on quality by various workers

STUDY	YEAR	SPERM COUNT	TOTAL MOTILITY	RAPID PROGRESSIVE MOTILITY	ABNORMAL FORMS
Kidd SA et al ^[10]	2002	Decreased	Decreased	Decreased	Increased
Liliane FS et al ^[11]	2006	Decreased	Decreased	Decreased	Increased
Present Study	2013	Decreased	Decreased	Decreased	Increased

EFFECT OF OCCUPATION ON SEMEN QUALITY:

The patients were divided into agriculture, drivers, sedentary and business group. In the control group, the maximum were sedentary workers. The liquefaction time was highest among agriculturalists. The sperm count was maximum in sedentary group and least in agriculture.

The percentage of normal sperms was highest in sedentary group and least in agriculture.

Outside the control group, the maximum number of

oligozoospermic cases belonged to agriculture followed by drivers and least in sedentary.

Asthenozoospermic cases also were maximum in agriculture category followed by drivers.

Mukhopadhyay D et al in 2006 concluded that occupational stress can have deleterious effect on semen parameters. He noticed a decline in sperm count, total motility and increase in abnormal forms.^[12]

Johrami R et al also found similar findings in 2013 and concluded that radiant heat and exposure to pesticides leads to adverse affect on semen quality.^[13]

OCCUPATION

Table No. 6: Comparison of effect of occupation on semen quality by various workers

STUDY	YEAR	SPERM COUNT	TOTAL MOTILITY	RAPID PROGRESSIVE MOTILITY	ABNORMAL FORMS
Johrami R et al ^[13]	2013	Decreased	Decreased	Decreased	Increased
Mukhopadhyay D et al ^[12]	2006	Decreased	Decreased	Decreased	Increased
Present study	2013	Decreased	Decreased	Decreased	Increased

In control group the mean sperm count, total motility, rapid progressive motility and morphologically normal spermatozoa were 69.24 million/ml, 58.07%, 36.53% and 78.84% respectively. Among the control group, maximum were sedentary workers. The drivers had the maximum semen volume. The motility was least in drivers. The percentage of normal sperms was highest

in sedentary groups and least in agriculture. It is evident from the results of the present study that- Semen quality is declining in the past few decades.

Age alone did not alter the semen quality significantly but act as a minor risk factor.

Fig. 1: Photomicrograph of Normal Spermatozoa

Fig. 2: Photomicrograph of spermatozoa with bent midpiece

Fig. 3: Photomicrograph of spermatozoa with bent tail

The influence of advancing age and occupations like Agriculture (specially use of gonadotoxic pesticides and fertilizers) and Drivers (radiant heat) can be considered as hazards and additive factors for reduced semen quality.

Therefore, it can be concluded that in concordance with other researches that semen quality is declining and there is a role of multi factorial etiology in male infertility.

Awareness of Undergraduate Students Regarding Blood Donation among Non-Medical Colleges in Selected Setting

Faizan Khan¹, Uppu Praveen², Gurpreet Kaur³, Deepika³, Deeksha Singh³

¹Staff Nurse, Max Hospital, New Delhi, ²PG- TUTOR, Teerthanker Mahaveer College of Nursing, TeerthankerMahaveer University, Moradabad UP, ³Staff Nurse, Apollo Hospital, Delhi

ABSTRACT

Background: Blood is life sustaining fluid and is valuable and donating blood can save the life of individuals. The South East Asia's estimated blood requirement is about 16 million units per year, but it collects just about 9.4 million units annually, leaving a gap of 6 million units. (World health organization¹. **Objective:** of the study to determine the awareness level of non- medical undergraduate students regarding blood donation using questionnaire on awareness regarding blood donation **Method:** A descriptive survey was conducted among 104 non-medical undergraduate students who were studying at selected setting. Random sampling technique was adopted for selection of the colleges and Multi stage (Proportionate and random) sampling technique for selection of the sample and Tools used were demographic proforma and tool for assessment of level of awareness regarding blood donation, data was obtained by self-administered questionnaire. **Results:** Majority 79(75.9%) of the sample had moderate level of awareness regarding blood donation and around 24 (23.7%) of the sample had high level awareness regarding blood donation. **Conclusion:** With help of organizing various awareness programmes we can improve the awareness which will make the students to participate actively in voluntarily donating the blood.

Keywords: Awareness, blood donation, non-medical undergraduate students.

BACKGROUND

Blood can save millions of life, and young people are the hope and future of a safe blood supply in the world. The South East Asia's estimated blood requirement is about 16 million units per year, but it collects just about 9.4 million units annually, leaving a gap of 6 million units¹. India with its huge population of over 1 billion is lagging behind in blood collection. India has 2760 blood banks that can collect 9 million units of blood annually, but collects only 7 million. Human blood is an essential element of human life with no substitute. The theme of World Health Day in 2000 was "Blood saves Life². Safe blood starts with me." Nowadays, blood transfusion is still one of the main components of care and treatment

to patients with serious conditions such as trauma, major surgeries, chemotherapy, and patients in need of long-term therapies.

However, problems regarding a permanent shortage of blood are observed in blood services all over the world. The only source of blood is blood donation recruitment of voluntary, non-remunerated blood donors poses major challenges to transfusion services throughout the world. Increase in the level of awareness and development of a positive attitude towards blood donation is the top most priority of all national blood transfusion centers. The first step for attaining this goal is to perform comprehensive studies about awareness and attitude of the population towards blood donation to gauge the present situation, beliefs and both positive and negative attitudes of the population towards blood donation.

OBJECTIVE

To determine the awareness level of non- medical undergraduate students regarding blood donation using

questionnaire on awareness regarding blood donation.

METHOD

A descriptive survey was conducted among 104 non-medical undergraduate students who were studying at selected colleges like College of Journalism and Mass Communication, College of Agriculture Sciences, College of Architecture and College of Law & Legal Studies under Teerthanker Mahaveer University. Random sampling technique was adopted for selection of the colleges and Multi stage (Proportionate and random) sampling technique for selection of the sample and The following criteria were set for the sample selection - of both male and female who enrolled and studying in selected setting, who are willing to participate in the study and who are studying in non-medical colleges of selected setting

Tools used were demographic proforma and tool for assessment of level of awareness regarding blood donation, data was obtained by self-administered questionnaire.

RESULTS

Obtained data was analyzed based on objectives of the study by using SPSS 16.0 version. Out of 104 sample majority (43.5%) of them were in the age majority (60.5%) of the sample were above 20 year age and remaining (39.4%) are below 20 year of age. Most of sample belonged to male gender (56.6%) and majority of the sample were belongs to Hindu religion (73%), most (33.65%) of the sample fathers were graduates and even most (33.6%) of the sample mothers were also graduates, majority of the sample (85.5%) were didn't donate blood ever before, around 34.6% sample and their families underwent for blood transfusion.

Table-1 Frequency and percentage sample on the basis of level of awareness (n = 104)

S.No	Level of awareness regarding blood donation	f	%
1	Low level of awareness	1	0.9
2	Moderate level of awareness	79	75.9
3	High level of awareness	24	23.07

The data presented in table 1 revealed that majority (75.9%) of the sample were at moderate level of awareness regarding blood donation, only 0.9% of them at low level of awareness regarding blood donation.

DISCUSSION

Most 63(60.5%) of the sample were in the age of 20 years and above 20, majority 60 (56.6%) of them were male, most 76 (73%) of the sample belong to the Hindu Religion. Majority of the subjects fathers 33(31.7%) were with post graduate and above educational qualification and majority of subjects mothers 35 (33.6%) were graduated, around 89 (85.5%) of the sample were never donated blood before.

Around 59 (56.7%) had never received donated blood for themselves or for their family member and about 68 (65.3%) sample had never underwent for blood transfusion. Majority 79(75.9%) of the sample had moderate level of awareness regarding blood donation and around 24 (23.7%) of the sample had high level awareness regarding blood donation.

The presented study was supported by a study conducted among 288 (Male- 162, Female-126) subjects of age group 18- 60 at rural Puducherry The results shows that majority (79.5%) subjects were aware blood can be donated. Around 17.5% of subjects had past history of blood donation. Most 55% of the subjects donated blood to their relatives.³

The present study supported by a study conducted among health science students at South India. The result found that the majority (60%) of subjects have high level of awareness and only (20.7%) subjects have low level of awareness.⁴

CONCLUSION

The present study concluded that non-medical undergraduate students were have the some awareness regarding blood donation and. Some of the subjects didn't donate the blood. With help of organizing various awareness programmes we can improve the awareness which will make the students to participate actively in voluntarily donating the blood.

Surveillance of Elderly Patients with Hypertension in Eastern India: Our Experience

Sura Kishore Mishra¹, Suresh Kumar Behera², Mahesh Chandra Sahu³

¹Associate Professor, Department of Cardiology, MKCG Medical College, Berhampur, Ganjam, Odisha, India, ²Associate Professor, Department of Cardiology, IMS and SUM hospital, Siksha "O" Anusandhan University, K8, Kalinganagar, Bhubaneswar, Odisha, India, ³Assistant Professor, Directorate of Medical Research, IMS and SUM hospital, Siksha "O" Anusandhan University, K8, Kalinganagar, Bhubaneswar, Odisha, India

ABSTRACT

Background: It is unknown to what extent General Practitioners (GPs) manage hypertension (HT) differently in older patients, as compared to younger age groups. The purpose of our study was to know the incidence of hypertension in older patients as compare to younger age groups.

Method: In this retrospective observational study the data of hypertension patients attending at MKCG medical college and IMS and SUM Hospital were documented and analyzed. The study population consisted of all patients aged 60 years or older with at least one blood pressure (BP) measurement during the inclusion period, without pre-existent HT, diabetes mellitus (DM) or atherosclerotic cardiovascular disease at time of study start.

Results: We included 19,500 patients from 159 GP's practices of whom 1,181 (6.1 %) were newly diagnosed with HT. Corrected for age-adjusted SBP, older patients were less likely to be diagnosed with HT (odds ratio per year age increase 0.98, $p < 0.001$). Corrected for age-adjusted SBP, no significant effect of age on the probability of treatment in newly diagnosed HT patients was observed ($p = 0.82$).

Conclusions: This study showed that GPs are less inclined to diagnose HT with increasing patient age, but do not withhold treatment when they diagnose HT in older patients.

Keywords: Hypertension, Aged 80 and over, Age factors, Electronic health records, General practice

INTRODUCTION

Evidence on the effectiveness of treatment of hypertension (HT) in patients of 80 years and older is conflicting^[1-4]. Traditionally older patients were ignored in Dutch guidelines as patients up to 65 years old were treated according to their risk estimate of atherosclerotic cardio-vascular disease, for which blood pressure (BP) was one of the criteria^[5]. For older patients however, the general practitioner (GP) had to rely on his/her clinical judgment, which varied widely as to when it was appro-

priate to start treatment^[6]. In 2008 the Hypertension in the Very Elderly Trial (HYVET)^[1] indicated that treatment of HT in patients of 80 years and older was beneficial on mortality from stroke and overall mortality. There is evidence that high BP is not associated with a higher risk of death in the frail^[3], but further analysis of the HYVET study showed that both frail and fitter patients appeared to gain from antihypertensive treatment^[5]. In 2012 the Dutch cardiovascular risk management guidelines^[7] set systolic blood pressure (SBP) target values below 150–160 mmHg in older patients. Similarly, guidelines of the British National Institute for Health and Care Excellence (NICE), the European Society of Hypertension (ESH) and the European Society of Cardiology (ESC) recommended SBP target values below 150 mmHg in patients over 80 years old^[8,9]. However, there is evidence

Corresponding author:

Dr. Suresh Kumar Behera

Associate Professor, Department of Cardiology,
IMS and SUM Hospital, Bhubaneswar.
Email: surebehera@yahoo.co.in

that compliance to these revised guidelines is incomplete^[10], particularly in older patients^[11, 12] and a recent review suggested that indeed, each patient's individual clinical condition may need to be taken into account for optimal HT treatment^[13]. In practice, other than patient-related barriers, e.g. doctor or system related barriers, whether they are appropriate or inappropriate, may play a role in incomplete guideline compliance. In light of the conflicting evidence and lack of information whether GPs manage HT differently in older patients, we wanted to investigate how HT is diagnosed and treated in this age group, as compared to younger patients.

METHOD

In this retrospective observational study the data of hypertension patients attending at MKCG medical college and IMS and SUM Hospital were documented and analyzed. The study population consisted of all patients aged 60 years or older with at least one blood pressure (BP) measurement during the inclusion period, without pre-existent HT, diabetes mellitus (DM) or atherosclerotic cardiovascular disease at time of study start. All the data were analyzed by SPSS 20 software and documented.

RESULTS

Our cohort consisted of 19,500 patients aged 60+ with at least one BP measurement and without a diagnosis of HT, DM or arterial cardiovascular disease or antihypertensive medication prior to the first BP measurement. The source population comprised of 131,545 patients aged 60 years or older. Sixty one percent were 60–69 years old, 28.2 % were 70–79 years old and 10.8 % were 80 years or older. The percentages of women in these age groups were 55.7, 57.9 and 64.0 % respectively. Table 1 shows SBP values, by age group and gender. Outcomes Percentages of patients with diagnosis of hypertension, by age and systolic blood pressure shows the percentages of patients with a new diagnosis of HT for each age- and SBP-group with 95 % confidence intervals. The corresponding numbers are reported in Table 2. Of those patients with a BP between 160 and 179 mmHg and aged 60–69 years, 18.2 % (16.5–20.0) had a new diagnosis of HT within 1 month. For patients of 70–79 years and 80 years and older within the same BP group these percentages were 12.1 % (10.2–14.2) and 7.1 % (5.0–9.9) respectively. The p-value for trends between age groups was significant in all three

BP groups between 140 and 200 mmHg, indicating that, within these SBP groups, older patients are less likely to be diagnosed as hypertensive than younger patients. Effect of systolic blood pressure Z-scores, age and gender on new diagnosis of hypertension The outcomes of the logistic regression analysis with newly diagnosed HT as outcome were as follows. The unadjusted odds ratio (OR) for the SBP Z-score was 4.30 (95 % CI 4.01 – 4.61; $p < 0.001$). Adjusted for age, the OR for the SBP Z-score was 4.35 (4.05–4.67; $p < 0.001$). This adjusted OR of 4.35 for SBP Z-score means that the odds of new diagnosis of HT is multiplied by 4.35 when the SBP increases by one standard deviation. Adjusted for SBP Z-score, age had a significant effect on the probability of diagnosis of HT (OR 0.98 per year age increase, 95 % CI 0.97–0.99, $p > 0.001$). We found no significant interaction between age and SBP Z-score in our model. Gender had no significant contribution to the model.

This model permits calculating the probability of a new diagnosis of HT on basis of a given SBP Z value and age. For example: a 60-year-old male patient with a SBP Z-score +1 (165 mmHg) has a predicted probability of a new diagnosis of 15.9 % (95 % CI: 14.5–17.3 %). The probability for an 80-year-old with the same SBP Z-score (170 mmHg), is only 11.2 % (95 % CI: 10.1–12.5 %). These findings are illustrated in which shows the predicted probabilities of a new HT diagnosis, in relation to SBP and age. Percentages of patients with treatment of hypertension, by age and systolic blood pressure We calculated the percentages of patients that received antihypertensive treatment within 4 months after being diagnosed as having HT. In the group with an SBP of 140–159 mmHg for instance, 45.3 % (37.2–53.6) of the 60–69 years old patients and 50.0 % (18.8–81.8) of the 80 years and older patients were treated; and in the group with an SBP of 160–179 mmHg, 69.9 % (64.7–74.6) of the 60–69 years old patients and 50.0 % (33.2–66.8) of the 80 years and older patients were treated. For details on all age groups please see Table 3. None of the p-values for age-related trends were significant. Effect of systolic blood pressure Z-scores, age and gender on treatment after diagnosis of hypertension For the outcome treatment, the OR for the SBP Z-score was 2.96 (95 % CI: 2.45–3.57). Age and gender had no significant contribution to the model. (OR for age 1.00, 95 % CI: 0.98–1.02, $p = 0.82$).

Table: 1 Systolic Blood Pressure by gender and age mean SBP with standard deviation; percentages above 140 mmHg and 160 mmHg

Age	N	Gender	SBP (mmHg) Mean	SD	SBP>140 mmHg	SBP> 160 mmHg
60-69	5270	Male	142	19.9	55.8%	20.7%
	6619	Female	141	20.7	53.8%	20.8%
70-79	2316	Male	145	20.8	63.1%	26.4%
	3182	Female	146	21.2	65.1%	28.3%
80+	761	Male	146	21.6	64.5%	27.9%
	1352	Female	149	22.2	71.1%	32.0%

Table 2: New diagnosis of hypertension within one month after inclusion

SBP (mmHg)	Age (years)	N	New diagnosis (%)	P for trend

200+	60-69	69	95.7 (88.0-98.5)	
	70-79	37	97.3 (86.2-99.5)	
	80+	27	88.9 (71.9-96.1)	

DISCUSSION

The study included a large and, because we excluded patients with diabetes, existing HT and other cardiovascular conditions, homogenous cohort. Moreover, the data were collected during the normal practice of GPs, and reflect how they manage HT in daily care. We have no reason to assume that GPs participating in IPCI differ in their HT management from their non-participating colleagues; therefore, the conclusions may be generalized to the Dutch population. In the study we only studied recorded BP measurements and diagnoses. Especially diagnoses by medical specialists may not all be recorded by the GP. Therefore, registration bias is possible. All patients in our study have an immortal time of two years, which may introduce age related bias, as older patients have a shorter life expectancy and hence are less likely to be

included in the cohort. Moreover, in general, diagnosis of HT is based on more than one measurement, which is not accounted for in our study. This may further explain why the percentages with a diagnosis of HT are rather low. A further limitation may be that this study does not permit any insight into the reason why older patients are less likely to be diagnosed as having HT. For our study we excluded patients with comorbidities such as DM and pre-existing cardiovascular disease. On the one hand this reduces the generalizability of the results. On the other hand, excluding patients with these co-morbidities eliminates these co-morbidities as potential confounders because, according to international guidelines, these patients should have strict BP control. By excluding these patients, it was easier to study the impact of age and BP on the outcomes. A strength of this study is that, by using reference SBP values we could control for the

natural increase of BP by age. As reference BP data for the older Dutch population were not readily available, we used data from the Eastern India population, which may be a limitation. In our cohort, mean BPs in all age strata were slightly lower than the used reference values [16]. This may be explained by the fact that we excluded patients already diagnosed with HT. Comparison with existing literature Although previous studies compared HT management in older to younger age groups [11, 12], to our knowledge, this is the first study to take age-specific SBP levels into account. The proportions of patients with a new diagnosis of HT were rather low and this seems in accordance with existing literature about guideline adherence [10]. However, our follow up period of one month does not allow conclusions about guideline adherence as some patients may receive the diagnosis of HT later on. Although we demonstrate that older patients are less likely to receive a diagnosis of HT, our data do not provide any insight why these patients are less likely to be diagnosed. A possible explanation may be the clinical condition, especially frailty in older patients as an important reason to refrain from treatment of HT [3, 9]. Other barriers to guideline compliance in older people are outside the scope of this study.

CONCLUSIONS

This study showed that GPs are less inclined to diagnose HT with increasing age, but do not withhold treatment when they diagnose HT in older patients. Increasing life expectancy will lead to larger numbers of older patients, yet the optimal management of HT in this age group has not been elucidated. In this respect there are indications that BP target values will depend on features, such as frailty, in older patients. More research, especially in the form of trials, will be needed to determine to diagnose HT in older patients are correct.

Ethical Clearance: This study is approved from our institutional ethics committee.

Medical Devices Access in Asian Countries: Sustainable Growth Trajectory in India

Sammita Jadhav¹, Milind Chunkhare¹, Jagdish Jadhav²

¹Medical Technology Department, Symbiosis Institute of Health Sciences,
Symbiosis International University, Pune, India, ²Symbiosis Society, Pune, India

ABSTRACT

Technologically advanced solutions for treatment of diseases, scientific rigor & research has seen tremendous growth in therapeutic usage of medical devices ^[1]. The role of 'Make in India' initiative becomes of utmost importance as a driving force for technological advancement of medical devices industry ^[2]. However, challenges exist & need to be addressed in providing affordable healthcare by producing medical devices that are cost competitive and effective to increased access ^[2]. Asian Countries like Japan, China and South Korea are foremost in the Medical devices sector ^[3].

This paper probes the sustainability of 'Make in India' policy with the growth trajectory of Asian countries in medical devices discusses; ways of overcoming challenges through regulations, policies and other stakeholders contribution.

Keywords- Medical device, Make in India, Growth trajectory, Sustainable model.

INTRODUCTION

Advanced technological solution has seen tremendous potential in therapeutic usage of medical devices ^[1]. Medical devices play a significant role in screening, diagnosing and treating patients as well as in restoring patients to normal lives. ^[2]. Globally, the medical device industry witnesses impressive growth and plays a vital role in the healthcare ecosystem reaching USD 520 billion by 2020 ^[2].

Since the last few decades, the Indian healthcare industry has seen improved growth scale with a greater need to better the quality of healthcare and provide affordable healthcare solutions as a result of which the medical device industry has also grown considerably. The compound annual growth rate (CAGR) of Indian medical device industry is around 15% of health **care as compared to CAGR of 4-6% of healthcare in other countries**. Even though there is improved access and affordability of healthcare services, India faces high level of dependency on imports of medical devices ^[1].

Although Asian countries like Japan, China and South Korea are foremost in the Medical devices sector there is a sufficient opportunity in medical devices

manufacturing and development of industries in India ^[2].

The Government of India's 'Make in India' initiative presents a platform for the medical device industries to revisit the operating model, identify key aspects for sustainability and explore possibilities for creating a transformative change in the medical devices sector. The role of 'Make in India' initiative has become the game-changer for technological advancement in the medical devices industry ^[3].

It therefore becomes necessary to probe the sustainability of 'Make in India' policy with the growth trajectory of Asian countries in medical devices and devise methods of overcoming challenges through regulations, policies and other stakeholder contribution.

GROWTH TRAJECTORY OF MEDICAL DEVICE MARKET IN ASIAN COUNTRIES

China - a leader in the Asian Market.

China's medical device market ranks second in the world. The driving force behind the growing market of medical devices in China is the increase in income and expanding population. By 2050, China will have 1.4

billion population above 60 years thereby increasing the demand of medical devices for these Chinese ageing baby boomers. A tremendous gap between urban and rural healthcare system in China exists, as well as between various types of hospital care. There is an inflow of huge number of population towards well-resourced and prominent healthcare centers in urban areas, due to poor health care systems in rural areas [5].

Chinese medical device market value is estimated around USD 11 billion in 2015. Chinese government needs to bridge the gap between quality healthcare and promote domestic manufacturing [5], as a result of which healthcare expenses is estimated to grow at 5.2% of the GDP in the next few years [6].

Market Challenges in China

Chinese government must revise and relook at the basic laws of foreign investment to ease investor influx and prevent the Medical Device sector growth trajectory from getting foiled by a robust regulatory framework. Infrastructure for small scale healthcare industries should be developed at grass root level, equitable access should be provided for basic healthcare services and Public Healthcare reforms must be implemented [5].

Developmental factors of China's Medical Device Market

China consists of state specific incentives, cheaper access to land and training subsidies to develop medical devices manufacturing base [1]. It will also facilitate establishment of electronic medical record system linked directly through medical devices thereby enabling smooth sharing and storage of patient's data especially in the remote areas, relieving overcrowding in the hospitals and shortening wait lists [5].

About 70% of advanced medical devices in China are exported from the European, American and Japanese markets that are in great demand in the hospitals especially in the private and tertiary care hospitals [7]. China possesses highly competitive and fragmented medical devices market [7]. One-third of China's med-tech market consists of medical equipment like x-ray, ultrasound and other imaging equipment [5].

Opportunities in China

With increase in per capita incomes, China's consumers are demanding more sophisticated

and reliable medical devices. Ageing population, affordability to healthcare products and growing health care needs are the key growth drivers in China's medical device industries.

Restructuring and privatization of hospitals is the predominant motive in healthcare delivery in China. Doctors are rated according to the number of patients they treat as well as the research output they produce which is linked with the performance appraisals, salary and career advancement. A well-orchestrated coordination is provided for the physician-patient interaction through the use of digital solutions like mobile, social network, web, wireless devices, and physician portals [5].

Japanese invasion in the Medical Devices industry

Japan ranks third largest medical device market, having more ageing population driving the medical device manufacturing companies. Manufacturers have to follow Japanese Pharmaceutical Affairs Law to develop and market their products [4].

The Japanese medical devices market was approximately USD 32.5 billion in 2012, primarily dependent on import of sophisticated medical equipment with a whopping import size of approximately USD 7.4 billion from U.S.A. According to the American Medical Devices and Diagnostics Manufacturers' Association (AMDD), a trade association with Japanese operations enabled approval of 58% of "new medical devices" in Japan during the last 7-year period [4]. A 2.5% CAGR in Japan's medical device manufacturing is estimated by Espicom Business Intelligence from year 2013 to 2018 year [5].

Market Challenge in Japan

Factors affecting the degree of penetration in Japan's Market are the local competition, regulatory norms to be overcome, language and social factors, type of product, its quality & serviceability and commercial practices. Other factors affecting market entry in Japan includes level of competition between domestic manufactures and international players, import authorization necessities, restricted or banned imports, provisional entrance of goods, certifications, principles & classification requirements [5].

Market Opportunities in Japan

Japan's aging population and continuous demand

for advanced medical devices is the key determinant of vertical growth of Japan's medical device market. Domestic medical device production in Japan includes: diagnostic imaging tools; therapeutic and surgical kits; monitoring systems, home therapeutic equipment, dialyzers, and endoscopes. Some of the world's leading companies like Nipro, Toshiba Medical Systems, Hitachi Medico and Nihon Kodan are some of the highest performing Japanese Medical Devices Companies. Most major U.S. and foreign medical device firms have an office in Japan or at least a Japanese official [5].

South Korean medical devices growth landscape

Korean medical devices market is third largest in Asia continent. In Korea, healthcare market is focused in five major cities of Seoul, Pusan, Daegu, Daejeon and Kwangju. These cities contain about 60% of Korea's hospital beds [8]. About 49.8 million are growing older thereby providing a good opportunity for medical device market headway [9]. The medical device market is estimated to be around USD 3.9 billion dollars and growing at an average rate of 13.5 % [10].

Opportunities in Korea

The Korean government aims to increase the medical device exports to achieve USD 12.5 billion growth by 2020 making a 3.8% contribution in the global markets. Korea presents unique opportunities for medical device companies due to a population of 49.8 million people who are growing older and whose average income is on the rise. Currently costly medical devices like digital X-ray, MRI, CT and ultrasound diagnostic systems are manufactured locally and are marketed in more than 50 countries in and around the world including USA and European nations [11]. Due to sophisticated technology and more features, Korean medical devices are in higher demand in the global market.

Challenges in Korea

Korea promotes electronics and medical engineering courses in its colleges and graduation schools. This has enabled them to possess huge number of technical experts spear heading the electro-medical equipment industry [11].

There has been a steep rise in the number of hospitals and medical equipment in Korea thereby creating huge number of local manufacturers. Highly sophisticated and reliable medical products of the Korean domestic

manufacturers have made them worthy competitors in the overseas market landscape. The Korean domestic equipment industries perform continuous market monitoring in overseas as well as local markets [11].

Regulatory aspects of the growing Korean Medical Devices industry

Introduction of electronic filing system for medical devices and ease in tracing of the Medical Device- Korea Food & Drug Administration (KFDA) Commissioner has the right to track medical devices that possess critical risk for the human health are some regulatory parameters laid by the Korean government. Manufacturers in Korea recall medical devices that cause incurable serious adverse side effects or death [9].

INDIAN MEDICAL DEVICE ECOSYSTEM

Regulatory measures and medical device manufacturing policy decisions create a conducive atmosphere for large- scale manufacturing of products.

Challenges in the Indian Scenario

Indian medical devices industry follows outdated regulatory standards, which needs amendments and improvements. Indian manufactured products are substandard and give poor compliance, causing the Indian markets to have high level of dependency on medical devices exports. The Indian manufactured medical products are highly taxed and expensive with a lack of motivation from government to promote manufacturing. Poor tax incentives policy to encourage home grown manufacturing, inadequate funding policy from the government to sponsor innovation and lack of expertise in manufacturing high end quality medical products are the major challenges for the Indian Medical Devices industry [12].

Support from Indian Healthcare industry

The Indian medical industries must align themselves with the 'Make in India' initiative of the Indian government. Other stakeholders like healthcare providers and health insurers should also contribute and play their part in the Make in India plan and leverage Government policies and regulate the changes. Design and development of medical products with total customer satisfaction will lead to high quality creation, provide attractive solutions and generate cost effective innovations [13].

Backing from other sectors enabling growth of Medical devices

Indian insurance sector must provide wider coverage to both diagnostics and screening products. Local production will be enhanced by increasing the insurance over indigenously manufactured devices. Industry – academia interface must be enhanced to foster research, consultancy, entrepreneurship and innovation in medical devices industry. Associative work between industry and academia will enable exchange of ideas, facilitate partnerships, fragmentize and regulate the manufacturing process^[13].

Table 1: GDP and Population size between the four giants of Medical devices countries^[14].

Sr. No.	Countries	Public healthcare expenditure as a % of GDP	Population size
1	India	1.407	1.31 billion
2	China	3.09	1.37 billion
3	Japan	8.55	126.96 million
4	South Korea	3.98	50.62 million

STRATEGIES AND SUSTAINABLE GROWTH MODEL FOR INDIA FROM ASIAN COUNTRIES

State specific incentives can be started similar to China to develop a medical devices manufacturing base that includes economical production of high gain medical devices. Provision of cheaper access to land and training subsidies will greatly motivate new entrants in the medical devices manufacturing sector. Use of high tech & sophisticated technologies like telemedicine and the use of digital solutions like wireless devices and physician portals will enhance the quality of healthcare delivery system. The medical devices market should be well structured and organized. It should promote research and innovation in the medical devices manufacturing sector.

India must aim for having world-class manufacturing facilities similar to that in Japan. India should promote generation of technical expertise in electro-medical equipment manufacturing similar to Korea to manufacture highly refined and reliable medical products.

SUSTAINABLE GROWTH MODEL FOR INDIAN MEDICAL DEVICES INDUSTRY

Amendments in policy and strategic implementation of regulatory mechanism can bring about tremendous opportunities for the MNCs and local companies in India. The changes in the regulatory design will attract more investment and bring technological upgradation in the medical devices industries. Technological collaborations between MNCs and domestic associates can leverage their product's reach in the market and domestic manufacturers can explore contract-manufacturing setting up international standards of infrastructure, enabling India to become a global center for medical devices manufacturing in the world^[15].

Financial measures must be taken to develop and nurture the emerging medical device-manufacturing ecosystem to attract investors. Provision of Duty credits on import of raw materials for medical device manufacturing and a favorable government policy to introduce concession on VAT for imported equipment will act as an enabling environment for Medical devices growth in India.

Superior segment manufacturing and incentivizing of low to medium technology products will create a conducive environment for large-scale medical device manufacturing. Low and medium technology products that can be incentivized may include disposables, consumables, certain imaging equipment, implants, stents, some categories of laboratory diagnostics equipment and innovative eHealth based solutions^[12].

Indian Government should promote and make policies that are conducive to a macro - economic environment for medical device manufacturing. The Indian government through Make in India initiative must achieve 100% foreign direct investment for Greenfield and brownfield entries. Low and middle level companies should be partnered with giants in medical device manufacturing firms and supported well to manufacture efficient and reliable medical devices and flourish in the market^[16].

Strong bonding between the customer and the seller should be established to have good sales and marketing. Apart from sales and marketing, installation, servicing and maintenance of the medical devices should be

done efficiently and regularized well. Accuracy and efficacy of screening and diagnosis should be improved. Portable diagnostic devices should be manufactured on a larger scale to meet the demands of homecare and remote locations. Advanced sophisticated assistive and rehabilitation devices that would reduce the healing time and restore patients to healthy state should be produced by Indian manufacturers. Homecare screening devices for early detection of diseases should be produced on a larger scale^[12].

CONCLUSION

The traditional US and western European markets are under regulatory scrutiny and pricing pressure providing the Asian markets an opportunity to leverage accessibility in medical devices. The Indian medical devices market is fourth in Asia after Japan, China & South Korea^[2]. Best practices in these countries in terms of access to health care services, fast track approach, tax holidays, can be adopted by India and design a holistic ecosystem for medical devices for sustainable growth.

Leveraging 'Make in India' initiative for medical devices and incorporating best practices of the Asian giants in medical devices will provide local innovation and make India a global center for medical device manufacturing.

HIV Risk among Labor Migrants: An in-Depth Study of the Literature

Manas Ranjan Behera¹, Rattanathorn Intarak²

¹Assistant Professor, School of Public Health, Kalinga Institute of Industrial Technology (KIIT) Deemed to be University, Bhubaneswar, Odisha, India, ²Lecturer, St. Theresa International College, Ongkarak, Nakhon-Nayok, Thailand

ABSTRACT

Background: This study aimed to identify multilevel strategies associated with HIV risk among labor migrants.

Method: An extensive literature review from the global data base such as PubMed, google scholar and EBSCO were searched by using key words in various combination such as AIDS, HIV, migration, mobility, migrants and labor migrants.

Results: The review of the present study revealed that the HIV risk among labor migrants was associated with multilevel determinants. These are of socio-demographic variables, components of knowledge factor, life style and sexual practices. The socio-demographic determinants associated with HIV risk were: age, education, income per month, marital status, pre-and extra marital sex, and cultural norms. The determinants of knowledge factor frequently associated with HIV risk were: awareness towards HIV/AIDS, perspective and perception towards HIV/AIDS and limited condom use. The determinants of lifestyle component most often linked to HIV risk were: history of migration, exposure to pornography and peer influence. Sexual practices frequently related to elevated HIV risk were: sex with commercial sex workers, sex with casual unpaid partners and men having sex with men.

Conclusion: The result findings across labor migration necessitates the need for multilevel intervention strategies. Also, additional research is required to inform the policy maker and administrator towards development, implementation and evaluation of multilevel intervention that overlaid the prior methodological limitation and build new tailored interventions.

Keywords: HIV, AIDS, HIV risk, migration, labor migration, migration factors

BACKGROUND

The 2017 UNAIDS data estimated that in 2016, 36.7 million people were living with HIV and 1.8 million people were newly infected with HIV¹. With the continuous growth of the epidemic, migrants are considered a high risk to HIV infections². The World Migration Report 2018 estimated around 244 million

international migrants in the world and they remitted around USD 429 billion in 2016 in low-and middle-income countries³. There has been a move from individual HIV risk behaviour to multilevel as caused by cultural, social, political and economic determinants. For example, HIV scholars have pointed that understanding of HIV risk through ecological models⁴ and social vulnerability⁵. Such approaches have helped researchers in understanding HIV risk among labour migrants. Labour migrants are particularly stayed away from their families and spouses and engaged in markets, mines and fields. They are forced to do dangerous and demanding jobs for low wages, living with unfavourable environments and have limited access to health care. They face limited social network support, forced to adapt

foreign culture, customs and cultures. These factors may impact to increase HIV risk among labor migrants as well as other vulnerable populations.

It has not been fully understood the HIV transmission pathways in labor migrants, but the burgeoning literature both in social and health science examining various issues of migrant's population^{6,7,8}. Until now, HIV risk among labour migrants has not been thoroughly studied. Therefore, this study tries to look with a multidisciplinary approach⁹ for potential determinants that could be used to formulate multilevel interventions for communities, institutions, families, couples and individual. This comprehensive review identified four categories of evidence based multilevel determinants that represents the association between HIV risk and labor migration. These were: (1) socio-demographic; (2) knowledge; (3) life style; (4) sexual practices. It also represents gaps and limitations in previous studies and offer recommendations for future research.

SEARCH METHOD

The relevant English data base such as PubMed, EBSCO and google scholar were examined for articles by using key words in various combination: AIDS, HIV, migration, mobility, migrants and labor migrants. All reviewed articles reference section was also studied to find additional articles. The author acknowledges that despite of extensive literature search some of the pertinent articles might have been omitted, especially to those labor migrants who occasionally represented by particular occupations (e.g. seafarers, truck drivers). About 116 research papers were included in this study.

Inclusion and exclusion criteria

The labor migrants in this study, defined as: individuals who leave their native place (home location) and move for a short period (temporarily) to a different location (both in-side and out-side of country) to engage in salaried activity with the intention of returning to their native place again. Thus, only articles that directly linking with labor migration and HIV/AIDS were included. The permanent immigrants were excluded from the study as they do not have intention to return back to their native home location. Further, asylum and refugees were excluded in the study though they act as a forced migration and may associated with distinct risk but may not likely to come back their home location. The articles published between 1989 to 2017 and written

in English language were included in the study.

Multilevel determinants

While reviewing the literature from various data base, a comprehensive list of multilevel determinants gathered that are linked to HIV risk were established and categorized into the four groups: (1) socio-demographic; (2) knowledge; (3) life style; (4) sexual practices.

RESULTS

Socio-demographic determinants

Young people are centre of HIV/AIDS epidemic and are disproportionately affected by it¹⁰. Every day, approximately 3000 new HIV infections occur among young people, aged between 15-24 and this population account for more than one-third of all new HIV infections¹¹. A study conducted in China, based on the nationwide 1% population sampling survey in 1995, it was found that 86% of labor migrants were between 15 and 65 years of age and 75% were between 15 and 34 years of age¹².

Limited studies found that age at sexual initiation associated with HIV risk for labor migrants. Previous studies in China, Nepal, Kenya and South Africa demonstrated that an association between early age at sexual initiation and multiple sex partners^{13,14,15,16}. Unprotected sexual intercourse within last three months and frequent cigarette smoking were more prevalent among young labor migrants than with elder migrants¹³. Similarly, another study among Mexican labor migrants in the US showed that migrants from the youngest age group (18-29 years old) particularly have elevated risk behaviours such as sex with a commercial sex worker, sex while under the influence of alcohol or drugs and sex with a male partner¹⁷. A research carried out by Population Council in four high HIV prevalence states of India on migration/mobility patterns among male workers and their links with HIV risk found that almost 70% of male labours are young between 18 to 29 years, more than half of a young labours are married and resides away from their wives because of work. Further reports suggest that nearly 31% have intercourse with either sex workers or non-spousal unpaid female partners in source places in past 2 years¹⁸. Also, labor migrants with only primary education and higher incomes were more likely to engage risky behaviour¹⁹. Further, a study of migrants in Shanghai, 12% of migrants were educated to high

school or college level, 48% to secondary school level, and 28% to primary school level, with remaining 9.1% of migrants being illiterate or semi-illiterate²⁰. Marital status has also been found to be a significant predictor of vulnerability to HIV/AIDS among migrant workers. A study conducted in Myanmar showed that respondents, who were single, divorced or separated, visited sex workers more frequently than married labor migrants¹⁹. Another study in China showed that being married was associated significantly with increased HIV risk behaviors²¹. Also, an ethnographic study on migration and HIV transmission have conducted in Northern Karnataka have found that nearly 35% of married labor migrant men were involved in extramarital sex whereas around 40% of unmarried men were engaged with premarital sex²².

In-depth investigation has also revealed that socio-cultural environment played a crucial role in men's sexual behaviour. Various factors that affect men's sexual behaviour include community norms and practices^{23,24} gender roles and inequalities^{23,25} stigma and discrimination^{23,26} and low education status²⁷. Research in different settings argues that those who ignore social, cultural norms and gender inequality experiences different types of sexual interactions such as types of sexual relationship (non-spousal/premarital/transactional), the frequency and opportunities for sexual contact and condom use^{22,26,28,29}. Further, rigid traditional gender norms allow men greater freedom for sex, more mobility and opportunity for engaging with multiple sexual partnerships³⁰.

Knowledge factor determinants

Most studies have documented lack of knowledge about HIV/AIDS among labor migrants that closely linked with HIV-related risk behaviours. Most migrant workers had inadequate HIV/AIDS knowledge despite health education campaigns. For example, in Russia, male labor migrants from Eastern Europe and Central Asia were asked eight-item assessment of HIV/AIDS knowledge. These migrants, on average, scored only 3.6 items correctly³¹. Further, 45% of migrants felt that oral contraceptive and IUDs could prevent HIV infections. A study among Mexican migrant laborers' on knowledge about HIV transmission showed that the migrants had higher knowledge on major modes of transmission, whereas there was misconception that HIV contracting through AIDS testing, public restrooms and mosquito

bites³². Some migrants believed that AIDS is a diseases of drug addicts and homosexuals and personal appearance could tell whether person is infected with HIV or not. Also, Burmese labor migrants in Thailand were given a knowledge assessment on HIV prevention, transmission and associated risk factors, the total score was 36, 41 and 82% respectively³³. Male participants scored higher than female migrants in all scales and the level of HIV/AIDS knowledge increased with addition of each year education level. Further, some literatures documented that labor migrants had low knowledge on HIV. For example, one study in China showed that only 37% of labor migrants had knowledge that condom usage could prevent HIV transmission and 38% knew that antibiotics use could not prevent HIV infection¹³.

Limited condom use is associated with high HIV risk among labor migrants. It is mainly associated with difficulty in obtaining condom, health beliefs, various cultural norms and practices and impaired judgements. A study in South Africa stated that the migrant mine workers reported of using very limited condom despite of free supplies^{34,35}. In Moscow, the tajik labor migrants reported of engaging unprotected sex due to various reasons: they did not carry condom when they were drunk, using condom during sex decrease sexual pleasure and obstacles in getting condoms due to unidentified status in the city³⁶. The Mexican labor migrants in the USA reported that the lack of knowledge prevails them to know accurate use of condom. About less than fifty percent of these migrant men had always protected sex with occasional partners, whereas about a third had unprotected sex³².

Life style determinants

It is widely believed that environment of an individual brings profound influence to his/her behaviour. For example, when an agricultural worker (farmer) migrated to an urban life style which is greatly different from rural environment, we cannot be guaranteed that his/her sexual behaviour was changed/affected by the current living life style. Therefore, it is important to understand the potential predictors that affect HIV risk due to migration. These factors may include migration history (total duration living in the city after migration, place of initiation and continuation of sex work etc) exposure to pornography, peer influence and other socio-demographic characteristics coupled with knowledge, attitude and perception which has been explored in other

literatures^{37,38,39}.

Migration History

Migrant worker's frequency of a visit to their families in native country has a significant association with HIV-related risk behaviour. Labor migrants, who lived away from their native land for prolonged periods tend to have increased HIV-related risk behaviours. A comparative cross-sectional study carried out in three rural communities of West Africa found an association between higher mobility and increased HIV-related risk behaviours. Furthermore, condom use was found least, where mobility was greatest⁴⁰. The few studies conducted among male labor migrants in China demonstrated that sexually transmitted diseases (STDs) were significantly associated with the high frequency of visiting home⁴¹.

Peer influence and Pornography exposure

Studies documented that peer influence occupies an important role increasing the likelihood of risky sexual behaviour leading to HIV risk among labor migrants. A study in Shanghai, China reported that, the respondents who had peers engaging in sex with a non-regular sex partner were 4.4 times more likely to be involved in risk behaviour than were those who did not engage⁴². Another study in Metema district, northeast Ethiopia documented that seasonal migrant worker's social environment such as peer influence can lead to HIV risk⁴³.

Past research from developed countries suggested that exposure to pornography is associated with increased acceptance of premarital and extramarital sex including paid sex^{44,45,46,47,48}. A recent research in United States among adults has shown that individuals who had visited sexually explicit websites were twice more likely to have multiple sexual partners than their counterparts⁴⁴. Another study which looked into different aspects of pornography exposure historically from 1973-2010 also found a positive association with multiple sexual partners and paid sex⁴⁷.

Sexual practices determinants

Evidence suggests that male labor migrants are more likely to engage HIV risk than non-migrants. For instance, women with a migrant husband are twice more prone to HIV positive than a non-migrant husband⁴⁹. A study of labour migrants in Moscow reported a majority of migrants having unprotected sex with commercial sex workers³⁶. In Durham, North Carolina, a study

conducted among Hispanic migrants, 22% respondents stated that they had visit sex workers in the previous year. These migrants reported, on average, about 6.7 sex worker visits per year⁵⁰. A study in Tajik migrant workers in Moscow reported that all participants did not use condom while sex with commercial sex workers³⁶.

Studies have demonstrated that casual unpaid partner (such as relatives, neighbours and friends) influences the HIV risk among migrants at place of origin. A study conducted in Azamgarh and Prakasam districts in India reported that in Prakasam district, the migrant workers were engaged sex with a casual unpaid partner more than the Azamgarh district⁵¹. Having multiple sexual partner are associated with risky HIV behaviour. Long time away from their regular partner/spouse and lack of social control at home environments, labor migrants often engaged sex with multiple sexual female partners at destination areas. About less than one third percent (30%) of Eastern European and Central Asian migrant workers in Russia were stated engaging sex with multiple sexual female partners in last 3 months³¹. Comparing with Nepali migrant workers who travelled to India with non-migrants, the study showed that around 49% of migrants were reported having multiple female partners in last five years whereas it was only 25% for the non-migrants during the same period⁵². The recent labor migrants of rural Tanzania who had more than two partners in last 12 months was 24% whereas for non-migrants it was only 11%⁵³.

Men having sex with men also cause increased risky sexual behaviour. A study among Mexican labor migrants in New York city, USA stated that four male migrants ever had sex with men out of total 50 male migrants⁵⁴. In another study among Latino labor migrants those who seek day labour jobs in the USA, the study concluded that 38% of male migrants solicited for sex by a male partner, while only 9% of those engaging sex with the solicitor⁵³. Further, another study in California among Mexican labor migrants, about 37% of migrants had reported sex with male in last three months⁵⁵. The study concluded that these male migrants had averaged 11 sexual partners in last 2 months in comparison with non- men sex with men.

DISCUSSION

The review of the present study was revealed that the HIV risk most frequently related to multilevel

determinants at different levels of socio-demographic variables, components of knowledge factor, life style and sexual practices. The socio-demographic determinants related to HIV risk were: age, education, income per month, marital status, pre-and extra marital sex and cultural norms. The determinants of knowledge factor frequently associated with HIV risk were: awareness towards the HIV/AIDS, perspective and perception towards HIV/AIDS, and limited condom use. The determinants of lifestyle component most often associated with HIV risk were: history of migration, exposure to pornography and peer influence. Sexual practices were most often related to HIV risk were sex with commercial sex workers, sex with casual unpaid partners and men having sex with men.

To understand how migrant labor differ in prone to HIV risk from other susceptible communities, additional exploration is required in the development, execution, and evaluation of multilevel interventions. The review findings represent a couple of specific ways in which the present body of knowledge is inadequate because of methodological confinements of various current studies and offer solutions towards its improvement. One, sometimes there is occasion where a lack of consistency in how investigators perceived labor migration from various sorts of migration. This could be improved through by adopting rigorous systematic approach on criteria and definition made for labor migration.

Two, with respect to gender, HIV risks among female migrant labors are more, is also less studied. Hence, the risk of HIV in female migrant labor ought to be investigated. For instance, Lin⁵⁶ stated that HIV risks were higher in female migrants because of intoxication and Deonar stated that HIV risk among women were higher because of less self-efficacy⁵⁵. Other studies have been reported that some female migrant labor engaged in transactional sex or commercial sex work in order to survive^{57,58}.

Three, most of the studies used sample qualitative data, non-probabilistic samples or independent variables with narrow range, and many of these studies do not intend to assess the strength of risk factors through a systematic phenomenon. Research designs could be more rigorous to achieve possible cross study comparisons that could overcome the constraints of mobility and undocumented status of labor migrants. There is a more need and key attention to document the HIV prevalence data through

a wide variety of systematic phenomenon such as probabilistic sampling, subgroups of migrants within the specified samples, independent variables/factors with broader range, and collection of more biological samples. Furthermore, to investigate the whole migration process, longitudinal studies are needed that could encompass the sites of source, transit, destination and return⁵⁹.

Four, mixed method approach with proper quantification and statistical analysis could be helpful in assisting in better and comprehensive understanding of the multilevel determinants of HIV/AIDS and labor migration⁶⁰. Also, qualitative and ethnographic study may add better understanding in sociocultural and policy context. Future studies should be focused on implementation challenges in research like: how best to communicate with migrant labors through digital technology and how to deal with the problems of policymakers, implementers and community leaders. The later emphasize on community participation that could lead the development and implementation of community based research activities⁶¹.

Five, lack of investigation on protective factors have been found among labor migrants for HIV risk infection. Several studies^{62,63,64} have been reported that labor migrants had high HIV risky behaviours, but their condom use is more and they are likely to be tested for HIV infection. But the protective factors are more broadly perceived across four categories of determinants. Kissingers study revealed that in a social organization such as church related group was linked with fewer female sex workers visit and condom use found consistent in Latino labor migrations of New Orleans⁶⁵. Whereas Saggruti study revealed that the migrants who lives with their wives had lesser risky sexual behaviour in Mumbai, India⁶⁶. Wide variety of approaches should need to study and focus on protective factors that consider strengths and resources of an approach^{67,68} focused on individual, group, family, socio-cultural norms, values, beliefs which are corelated with protective behaviours of HIV and preventive intervention strategies.

In conclusion, there are new concerns such as migration and HIV/AIDS to be studied, which includes HIV testing attitudes amongst the migrants⁶⁹, HIV positive status due to migration⁷⁰, and delays in testing of HIV/AIDS in migrants⁷¹. Further, other issues among labor migrants and their families such as barriers and access to ART treatment, adherence and prevention of

HIV from mother to child transmission to be studied.

Study of Hypertension in Elderly Patients of Both Sexes in Western Rajasthan Population

Hazarimal Choudhary¹, Veerendra Choudhary²

¹Principal Specialist (Medicine) Department of Medicine Government Bangar Hospital, Pali (Rajasthan),

²Associate Professor of Medicine Govt. Medical College Pali, Rajasthan

ABSTRACT

45 elderly male and 45 elderly female patient aged between 60-75 years suffering with Hypertension were studied their associated diseases were Diabetes Millitus 7(15.5%) in males 9(20%) in females. Obesity 4(8.8%) in males 5(11.1%) in females CVD 5(11.1%) in males 4(8.8%) in females stroke 7(15.5%) in males 5(11.1%) in female. Renal insufficiency was 5(11.1%) in males and 4(8.8%) in females. CCF was 3(6.6%) in males 4(8.8%) in females physical inactiveness 4(8.8%) males 5(11.1%) in females Alcoholic 5(11.1%) in males 2(4.4%) in females Tobacco chewers. 3(6.6%) in males 4(8.8%) in females Dementia 2(4.4%) in males 3(6.6%) in females patients. The recorded BP in elderly patients of both sexes were classified as Grade I (mild) SBP – 140 – 159 DBP (90-99 Hgmm) were 14(31.1%) males 12(26.6%) in females patients Grade II moderate SBP (mm Hg) (160-179) DBP (Hgmm) (100-109) 10(22.2%) were males, 11(24.4%) were female patients. Grade III (severe) SBP (mmHg) >80 and DBP(MMHG) > 100. 21(46.6%) were males and 22(48.8%) were females. Isolated systolic BP SBP - 140 DBP <90 17 (37.1) in males 18 (40%) female Patients. Causes of secondary HTN in females were Cushing syndrome 9(2%) in males 12(26.6%) in females coarctation of aorta 2(4.4%) in males, 1(2.2%) in females Reno vascular stenosis 5(11.1%) in males 3(6.6%) in females, Endocrine disorders 4(8.8%) in males 9(20%) in females obstructive sleep apnea 10(22.2%) in males, 8(17.5%) in females, Drugs 7(15.5%) in males and females chronic kidney diseases 5(11.1%), in Males, 3(6.6%) in females Pheochromocytoma 3(6.6%) in males, 2(4.4%) in females. This study of HTN in elderly patients with different clinical manifestation will certainly help the physician to treat such patients efficiently as HTN is an important risk factor for CVS morbidity and mortality.

Keywords- HTN – Hypertension ; SBP - Systolic Blood pressure, DBP = Diastolic Blood pressure. ; ISH = Isolated systolic Hypertension CVD = cardiovascular disease.

INTRODUCTION

Based on the average reading 140 mm Hg systolic or greater and/ or 90mm Hg diastolic or greater or receiving anti hypertension medications for those above sixty years In clouding elderly male and females are hypertensive patients⁽¹⁾ Hypertension in geriatric population is typically characterized by high systolic BP

(SBP) in the setting of normal or even decreased diastolic BP Both elevated SBP and elevated pulse pressure are related to an age related increase in the arterial stiffness. No single factor accounts for this age related increase in SBP Although many factors like arterial stiffness, hypertrophy and loss of contractility of vascular smooth muscle cells, fibrosis, collagen deposition, fragmentation of elastic lamina, calcification. Decreased baroreceptor sensitivity increased sympathetic nervous system activity. Increased Alfa- adrenergic receptor was responsiveness. Endothelial dysfunction, decreased nitric oxide production, Sodium sensitivity, decreased ability to excrete sodium load. Low plasma rennin activity. Insulin resistance, central adiposity are the factor to increase the blood pressure in geriatric population⁽²⁾ It is

Corresponding author:

Cell no - +919001921421

observed that, majority of old patients in whom isolated systolic Hypertension develops have not had an elevated diastolic pressure before⁽³⁾ Hypertension in the elderly patient represents a management dilemma to cardio vascular specialist and other practitioners. Furthermore wide adaptations of drug strategies targeting subgroups of Hypertensive patients with specific risk conditions to lower blood pressure (BP) beyond traditional goals, difficult questions arise about how aggressive elderly patients should be treated. Is HTN in the elderly an emergency state or not ?. Does BP control lower the risk associated with cardio vascular and death of geriatric Population ?. Hence attempt was made to rule out the various diseases associated with HTN in elderly patients of both sexes. So that physician can treat the cause of HTN along with regulating the elevated BP which can reduce the morbidity and mortality of elderly patients suffering with HTN.

MATERIAL AND METHOD

45 elderly males and 45 elderly females aged between 60-75 years due to illiteracy approximate age was noted. The elderly patients who were regularly visiting to medicine department of Bangar Govt. Hospital Pali – 306401, (Rajasthan) had a complaint of Hypertension were selected for study. These patients were middle socio - economic status. These patients were examined with their cause of HTN and associated diseases. Biochemical and pathological test were also carried out to confirm their diseases. Moreover, ECG was also done to rollout CVD. The individual patients of both sexes were studied, noted and treated accordingly. The duration of this study was about four years.

OBSERVATION AND RESULTS

Table -1. Study of causes of HTN in both elderly sexes of western Rajasthan – DM 7(15.5) in males 9(20%) in females. Obesity was 4(8.8%) in males 5(11.1%) in females CVD 5(11.1%) in males 4(8.8) in females. Stroke was 7(15.5%) in males 5(11.1%) in females Renal insufficiency 5(11.1%) in males 4(8.8%) in females. CCF 3(6.6%) in males, 4(8.8%) in females. Physically inactive was 4(8.8%) in males 5(11.1%) in females Alcoholic 5(11.1%) in males 2(4.4%) in females. Tobacco – chewers 3(6.6%) in males 4(8.8%) Dementia 2(4.4%) in males 3(6.6%) in females

Table – 2. Classification of record of BP in both sexes of western Rajasthan population – Grade – I (Mild) SBP (mmHg) 140-159 DBP (Hg mm) 90-99.14(31%) in males, 12 26.6% in females. Grade II (Moderate) SBP(mmhg). 160-179, DBP(mmhg) 100-10-, (22.21 in males, 11(24.4%) in females. Grade III SBP (mm Hg) > 80 DBP (mm Hg) > 100 21(46.6%) in males 22(48.8%) in females isolated systolic BP SBP > 140 DBP<90 in females 17(37.7%) in males, 18(40%) in females

Table – 3 Study of patients with secondary HTN in both elderly sexes of western Rajasthan Cushing syndrome 9(20%) in males 12(26.6%) in females. Coarctation of aorta 2(4.4%) in males 1(2.2%) in females Reno vascular stenosis 5(11.1%) 3(6.6%) in females Endocrine disorders, 4(8.8) in males 9(20.%) in females obstructive sleep apnea 10(22.2%) in males 8(17.5%) in females. Drugs (NSAID), Alcohol 7(15.5%) in males and females. Chronic kidney disease was 5(11.1%) in males 3(6.6%) in females. Pheochromocytoma was 3(6.6%) in males 2(4.4%) in females

DISCUSSION

In the present study of HTN in elderly patients of both sexes in western Rajasthan population The patients of HTN associated with several diseases like DM 7(15.5%) in males 9(20%) in females. Obesity was 4(8.8%) in females, CVD 5(11.1%) in males 4(8.8%) in females. Stroke was 7(15.5%) in males, 5(11.1%) in females Renal insufficiency 5(11.1%) in males 4(8.8%) in females CCF 3(6.6%) in males 4(8.8%) in females. Physical inactive was 4(8.8%) in males 5(11.1%) in females Alcoholic 5(11.1%) in males 2(4.4%) in females Tobacco chewers 3(6.6%) in males 4(8.8%) in females Dementia 2(4.4%) in males 3(6.6%) in females (table 1). These findings were more or less in agreement with previous studies. ⁽⁴⁾⁽⁵⁾⁽⁶⁾. The BP was recorded and classified into four groups Grade – I (mild) SBP (mmHg) (140-159) DBP (mmHg) 90-99 7(15.5%) males 8(17.7%) females. Grade II (moderate) (SBP (mmHg))

160-179 DBP (mmHg) 100-109) 9(20%) in males and females. Grade-III (severe) was SBP (mmHg) > 180, DBP (mmHg) > 100. 2 (26.6%) observed in males, 10(22.2%) in females. Grade IV isolated systolic SBP (mmHg) > 140 DBP (mmHg) <90 17(37.7%) in males 18(40%) in females (table No 2). Cause of secondary HTN is the elderly patients were Cushing syndrome 9(20%) in males 12(26.6%) in females. coarctation of aorta 2(4.4%) in males 1(2.2%) in females. Reno vascular stenosis 5(11.1%) in males, 3(6.6%) in females endocrine disorders 4(8.8%) in males, 9(20%) in female. Obstructive sleep apnea were 10(22.2%) in males, 8(17.5%) in females. Drugs (NSAID Alcohol) 7(15.5%) in males and 7(15.5%) in females were observed equally. Chronic kidney disease was 5(11.1%) in males, 3(6.6%) in females. Pheochromocytoma 3(6.6%) in males 2(4.4%) in females these findings were more are less in agreement with previous studies. ⁽⁷⁾⁽⁸⁾

It was also observed that major reduction in DBP (<65 mmHg) might be associated with ischemic Cardiopathy. Lowering DBP might jeopardize appropriate blood flow in the brain, heart and kidney during the diastole. However, low DBP was not responsible for an increase in the mortality⁽⁹⁾ Essential HTN is the most common cause of HTN but Secondary HTN is more prevalent in elderly patients than younger subjects. Renal vascular HTN is common in older people and should be treated with multi drug therapy because renal insufficiency is of unknown cause⁽¹⁰⁾ moreover ISH in the elderly patients was more difficult to control because of large artery stiffness and major changes in the arterial wall aortic calcification Hence the traditional drugs of anti HTN largely produce vasodilatation rather than decrease arterial stiffness⁽¹¹⁾ hence increased risk of CVD in elderly secondary to increased arterial stiffness an epiphenomenon related to an underlying chronic debilitating illness and or cardiac dysfunction and anti HTN therapy induced lowering of DBP which leads to myocardial ischemia and increased risk for on acute coronary events. High grade stenosis of coronary arteries, increased risk of Myocardial infarction with anti HTN therapy – induced decreased in BP may well occur. Furthermore, one cannot make any distinction between those cardio vascular events that are naturally occurring vs those that are treatment induced indeed frail elderly person (admitted) may have DBP < 60 mm Hg and SBP< 120mmHg in association with reduced survival and often without abnormal left ventricular function or anti hypertensive drug therapy

Apart from anti hypertensive therapy life style modifications including weight loss, physical exercise, low salt diet, should be recommended for patients with hypertensive

SUMMARY AND CONCLUSION

the study of hypertension in elderly patients of both sexes is quite useful to the physician and cardiologist because isolated systolic HTN is a peculiar BP in elderly patients, the approach to HTN in geriatric population should be no different than that of other geriatric syndromes HTN in older people represents a heterogeneous process and should be approached on an individual, case – by case basis, but this study needs further patho-physiological, Histo-pathological, genetic study because remedy and prevention of thickness of blood vessels, exact mechanism of systolic and diastolic movements of heart is still unclear

This research work is approved by ethical committee of Govt. Bangar Hospital Pali- 306401. (Rajasthan)

ABSTRACT

Background: The term “biomedical waste” has been defined as “any waste which is generated during diagnosis, treatment or immunization of human beings or animals, or in the research activities pertaining to or in the production or testing of biologicals and includes categories as mentioned in schedule I of the Government of India’s Biomedical Waste (Management and Handling) Rules 1998”.

Objectives: To assess the practices related to Bio-Medical Waste Management

Material & Method: The present cross sectional study was conducted from march 2016 to February 2017 among healthcare workers of tertiary care hospitals of Meerut city. Simple random sampling was used. The written consent was taken. Data was analysed using SPSS version 19 and Pearson’s Chi square test was applied.

Results: The healthcare workers segregate BMW according to different categories and they were doing this at the point of generation (87.6% and 88.5% respectively). 88.5% HCWs did not dispose all kind of waste into garbage waste. Majority (89.2%) were following color coding for disposal of BMW. Correct practice related to disposal of Normal Waste was observed in 89.2% of HCWs. Most of the HCWs were correctly disposing category 1,6,7 and 8 of BMW (97.1%, 89.2%, 88.5% and 97.1% respectively) whereas Category 2,3,4,9 and 10 were disposed correctly by nearly three-fourth of the HCWs (72.3%, 73.9%, 72.3%, 78.0% and 78.0% respectively).

Conclusion: Practices regarding Bio-Medical Waste was also found to be satisfactory in all the Health Care Workers but lower for IV class workers.

Keywords: *Biomedical waste management, hospital, healthcare workers.*

INTRODUCTION

Nature has made everything for a defined purpose. ‘Anything which is not intended for further use is termed as waste’. In the scientific and industrial era, turnover of the products is very high. With increasing need of Health Care in fast changing society, the role of hospitals/nursing homes comes to the forefront. Hospital is a residential establishment which provides short term and long term medical care consisting of observational, diagnostic, therapeutic and rehabilitative services for a person suffering or suspected to be suffering from disease or injury and for parturient.¹

The term “biomedical waste” has been defined as “any waste which is generated during diagnosis, treatment or immunization of human beings or animals, or in the research activities pertaining to or in the production or testing of biologicals and includes categories as mentioned in schedule I of the Government of India’s Biomedical Waste (Management and Handling) Rules 1998”.²

The inadequate and inappropriate practice of handling of healthcare waste may have serious health consequences and a significant impact on the health of health care personnel, to waste workers, patients, to

general public and environment as well.³

MATERIAL & METHOD

The present cross sectional study was done among healthcare workers with the objective to assess their practice regarding biomedical waste management. The study was conducted from March 2016 to February 2017. Ethical approval for the study was taken from institutional ethical committee of Subharti Medical College, SVSU, Meerut. Simple random sampling was used for selection of hospitals. Out of the two tertiary care hospitals in the city one was selected randomly and from the list of 150 bedded hospital in the city one was selected randomly. After that list of all the health care workers (nursing staff, OT technician, lab technician and fourth class) were procured from respective hospitals. Two visits were made in both the hospitals. Health care workers who were present on these two visits and give consent were included in the study. Each category of Health Care Worker were attended separately and two visits for each category was made for collection of data. Prior permission was taken from the concerned authority and arrangement was made to gather the workers at pre-decided date, time and place. Those who were left due to duty etc were attended on second visit. The purpose and objectives of the study was explained to the Health Care Workers prior to data collection and they were assured about the confidentiality of the responder. Data was collected on predesigned pretested semi structured questionnaire which included details of socio-demographic variables like age, sex, education, designation and other details about knowledge of Health Care Workers regarding Biomedical Waste Management. Before filling the questionnaire, each question was explained to the Health Care Workers so that they could understand the questionnaire completely and could answer properly. Single observer demonstrated the questionnaire to all workers. Completion of questionnaire was assured at the time of collection. Data was coded, entered and analysed using SPSS version 19 and suitable test was applied.

FINDINGS

Table No.-1 DISTRIBUTION OF STUDY POPULATION ACCORDING TO THEIR PRACTICE RELATED TO SEGREGATION OF BIOMEDICAL WASTE

	Freq	%
Segregate BMW According To Different Categories		
YES	275	87.6
NO	39	12.4
Segregation Of BMW At The Point Of Generation		
YES	278	88.5
NO	36	11.5
Total	314	100

According to this table majority of the healthcare workers segregate BMW according to different categories and they were doing this at the point of generation (87.6% and 88.5% respectively).

Table No.-2 DISTRIBUTION OF STUDY POPULATION ACCORDING TO THEIR PRACTICE RELATED TO DISPOSAL OF WASTE

	Freq	%
Do You Dispose All Kinds Of Waste Into Garbage Waste		
YES	36	11.5
NO	278	88.5
Do You Follow Color Coding For Disposal Of Normal Waste From The Hospital		
YES	280	89.2
NO	34	10.9
Following Color Coding For BMW Disposal		
YES	280	89.2
NO	34	10.8
Total	314	100

This table shows that 88.5% HCWs did not dispose all kind of waste into garbage waste. Majority (89.2%) were following color coding for disposal of BMW. Correct practice related to disposal of Normal Waste was observed in 89.2% of HCWs.

Table No.-3 DISTRIBUTION OF STUDY POPULATION ACCORDING TO THEIR PRACTICE RELATED TO DISPOSAL OF BMW ACCORDING TO COLOR CODE

	Freq	%
CATEGORY 1		
CORRECT	305	97.1
INCORRECT	9	2.9
CATEGORY 2		
CORRECT	227	72.3
INCORRECT	87	27.7

INCORRECT	69	22
Total	314	100

According to this table most of the HCWs were correctly disposing category 1,6,7 and 8 of BMW (97.1, 89.2, 88.5 and 97.1% respectively) whereas Category 2,3,4,9 and 10 were disposed correctly by nearly three-fourth of the HCWs (72.3%, 73.9%, 72.3%, 78.0% and 78.0% respectively).

SEGREGATE BMW ACCORDING TO DIFFERENT CATEGORIES

FIGURE 1. DISTRIBUTION OF HCWs ACCORDING TO THEIR PRACTICE RELATED TO SEGREGATION OF BMW ACCORDING TO DIFFERENT CATEGORIES

SEGREGATION OF BMW AT THE POINT OF GENERATION

FIGURE 1a. DISTRIBUTION OF HCWs ACCORDING TO THEIR PRACTICE RELATED TO SEGREGATION OF BMW ACCORDING TO DIFFERENT CATEGORIES

FIGURE 2. DISTRIBUTION OF HCWs ACCORDING TO THEIR PRACTICE RELATED TO DISPOSAL OF WASTE

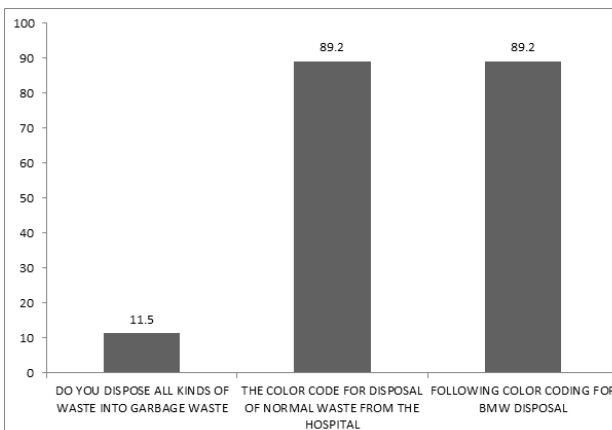

FIGURE 3. DISTRIBUTION OF HCWs ACCORDING TO THEIR PRACTICE RELATED TO DISPOSAL OF BMW ACCORDING TO COLOR CODE

DISCUSSION

In our study the practice of segregation of BMW according to different categories was 97.3% in Nursing Staff and 96.2% in Lab Technician, while it was 100.0% in OT Technician and 28.9% of IV class workers whereas Sehgal et al (2015)⁴ reported in their study that the practice of segregation of BMW according to different categories was 100.0% in Nursing Staff, Lab Technician and IV class workers. Sanjeev R et al (2014)⁵ reported in their study that the practice of segregation of BMW according to different categories was 68.6% in HCWs.

In the present study 88.5% HCWs said No for the practice of disposal of all kinds of waste into general garbage among HCWs whereas Sanjeev R et al (2014)⁵ reported in their study that the practice of disposal of all kinds of waste into general garbage among HCWs said No was 81.8%.

In the present study almost all the Nursing Staff (99.1%) and most of the Non Nursing Staff (92.1%) had correct practice of category 1. The difference was found to be statistically significant. Majority of the Nursing Staff (89.8, 88.9, 85.3 and 84.9% respectively) had correct practice related to category 5,6,9 and 10 whereas nearly two-third of the Non Nursing Staff (66.3, 65.2, 59.6 and 60.7% respectively) correctly dispose BMW according to color code. The difference was found to be statistically significant. Three-fourth of the Nursing Staff (77.3%) and nearly two-third of Non Nursing Staff (59.6, 65.2, 59.6 and 65.2%) had correctly dispose category 2, 3,4 and 8. The difference was found to be statistically significant. Incorrect practice related to category 2,3,4,5,8,9 and 10 was found to be more among class IV HCW (73.4, 62.2, 73.4, 64.4, 62.2 and 73.3% respectively).

CONCLUSION

The present cross-sectional study was conducted among health care workers of tertiary care hospitals

of Meerut city with the objectives to assess practice regarding Biomedical waste Management. Practices regarding Bio-Medical Waste was found to be satisfactory in all the Health Care Workers except for IV class workers.

Conflict of Interest: There is no conflict of Interest in my study.

Study of Determinants of Renewal of Health Insurance Policies

Neha Ahire¹, Parag Rishipathak²

¹Assistant Professor, Symbiosis Institute of Health Sciences, ²Director, Symbiosis Centre for Health Skills, Symbiosis International (Deemed) University, Pune, India

ABSTRACT

Introduction- Health insurance in India is still at a naïve stage. Out of pocket (OOP) expenditure is still the most predominant mechanism for funding healthcare. Studies have shown that there exists a close relationship between the health conditions of the people and the economic growth of the country in which they live. In such scenario, there is a dire need to study determinants of renewal of health insurance policy.

Method – A descriptive study was carried out to understand factors affecting renewal of health Insurance policy in Pune City. Questionnaire was circulated to 200 individuals who were covered under voluntary health insurance. Further, this population was studied for two variables a) those who have renewed their health insurance policy at least once and b) who did not renew the policy and discontinued after one year. Further determinants of renewal were compared within both the groups. In addition, respondents were identified from both the groups who have availed benefit of health insurance policy through cashless hospitalisation or reimbursement. The claim settlement process was studied through 5-point Likert scale.

Results- Age, income, percentage spending on healthcare as well as total expenses affects the renewal decisions. Younger individuals have shown to be more customary in paying the premium and renewing the policy & willing to renew health insurance policy. The group who have renewed health insurance have also rated tax savings component higher

Conclusion -The study suggests need of product innovation to suit everyone's needs. The products offered should focus upon long term benefits and tax savings components to sustain customers for a longer duration. The results also suggest improving the claim settlement process as customer satisfaction is significant factor in influencing the renewal decision of policyholder.

Keywords – Health insurance, Renewal, claim settlement

INTRODUCTION

Even after the liberalisation of insurance sector in 1986 penetration of health insurance in India is still at a naïve stage. Approximately 12 percent of the population is covered under some form of insurance. With the central and state government, aiming towards universal health coverage and through the launch of

schemes like Ayushman Bharat, insurance sector is certainly progressing towards better days.

The public health spending in India is equal to 1% of GDP, the out of pocket (OOP) being the pre dominant mechanism for financing healthcare in the country. The penetration of health insurance is remarkably low as compared to that in other developing economies in the world.¹

The World Bank in a 2012 report says that the healthcare expenditure was one of the major cause of poverty in India.² Nearly 65 % of the India's poor get into debt and 3% fall below poverty line each year because healthcare related expenses. In such scenario, Health insurance is the only viable option to make healthcare

Corresponding author:

Neha Ahire

Assistant Professor, Symbiosis Institute of Health Sciences, Symbiosis International (Deemed) University, Pune, India, Email: nehaahire@sihspune.org

available and accessible.¹

One of the most ambitious goals was to achieve universal healthcare by 2020. This goal was aiming at covering maximum population under health insurance and significantly reducing out of pocket expenditure.^{2,3} It is observed that nearly 40% of hospitalised patients sell assets or borrow money to afford treatment and an average of 24% fall further down the poverty trap in this process. One of the reasons for lack of a proper health-seeking behaviour within the poor community is the expensive medical treatment especially at private hospitals and the poor facilities available at public health centres.^{3,4}

Studies have shown that there exists a close relationship between the health conditions of the people and the economic growth of the country in which they live.⁵ As government continues to take efforts in this step, the insurance companies which are the major players in the market should aim at increasing demands of health insurance.^{5,6}

Health insurance is the need of the hour and the consumers are willing to purchase insurance if the they pursue product is beneficial.⁷⁻⁹ Several studies have listed the most prevalent variables: gender, marital status, Religion/ethnicity, education, income level, age, geographical mobility, and family size. The studies pertaining to demand and supply of health insurance in India are scarce as compared to the developed countries so are the studies pertaining to renewal of health insurance. It is considered that factors which affect the purchase decision will also influence the renewal of health insurance policy.⁸

Health insurance policies like any other product is affected by consumers purchase decision. Repeat buying of the same product in health insurance is considered as renewal. The classical five stage consumer decision process model introduced by Philip Kotler which gave a generalized view of the purchase decision, still remains valid as a basic approach to consumer purchase decision process and may be applied to health insurance purchase.

Fig. 1 The Five Stage Buying Decision Process

(Image source- Principles of Marketing, 14th edition, Philip Kotler)

Consumer choice is one of the essential preconditions for regulated competition in health care. Health insurance in higher income educated group adopts five stage decision process. Thus it is considered that the determinants of purchase and renewal of health insurance are common.¹⁰

Studies carried out in various parts of India as well as globally have shown that the major contributing factors to the health insurance are the age, gender, income marital status and occupation. On the supply side of health insurance, the determinants are important, as it is the basis for improvement in their processes like ease

of reimbursement and other administrative processes.¹¹

Health insurance is voluntary and the consumer may take it if found beneficial. This is the main challenges of the companies to attract to something without which also one can survive. Health insurance policy are annual and typically renewed after one year. It is only recently some private

General insurance companies have started selling two-year health insurance plans. Health insurance providers are generally reluctant to offer long-term health insurance policies.¹²⁻¹⁴

However, some amount of customers get attracted towards the policy considering the tax saving component the penetration is still very low. On the other hand, there

are many challenges for an insurance company to have long-term products. One reason is the impulsiveness of medical costs in future. Healthcare delivery is affected by changing technology, evolving equipment's and procedures. Apart from this healthcare cost is also affected by governmental rules and fiscal policies. On the other hand, least efforts are taken to understand the demography, epidemiology and prevalence of medical conditions in population so that the appropriate pricing of the policy can be derived. In such scenario, there is a need to study determinants of health insurance policy renewal.¹⁵

Aim- The study aims to bring out determinants of renewal of health Insurance policy

Objectives of the Study

To study the factors influencing renewal of health insurance policies in Pune City.

To assess customer satisfaction among those who have availed the benefits of health insurance.

METHODOLOGY

A descriptive study was carried out to understand factors affecting renewal of health Insurance policy. Data was collected through a questionnaire from individuals enrolled in voluntary health insurance policies in Pune City. The questionnaire was circulated to 200 individuals out of which 130 responded and filled

the complete questionnaire. Questionnaire included data on different socio-economic variables like age, income, gender, education & occupation. Other important parameters on which information was gathered included healthcare expenditure and hospitalisation & claims if any during the insured period.

The inclusion criteria were limited to individuals enrolled in voluntary health insurance at least once in three years. Further, this population was studied for two variables a) those who have renewed their health insurance policy at least once and b) who did not renew the policy and discontinued after one year. Further determinants of renewal were compared within both the groups.

In addition, respondents were identified from both the groups who have availed benefit of health insurance policy through cashless hospitalisation or reimbursement. The claim settlement process was studied through 5-point Likert scale. The parameters studied included claim settlement process, transparency, hospital care, documentation and accurate communication and overall experience with payer and provider.

Data Analysis and Results

The total sample size included in the study was 130. Out of 130 respondents 59 had renewed their health insurance policy whereas 71 did not renew it. This clearly indicates that non-renewal of health insurance is more.

Table 1- Descriptive statistics of policyholders renewing and not renewing health insurance

Parameter	N=59 Renewed health insurance policy	Mean	N=71 Did not renew health insurance policy	Mean
Total monthly income	58		71	
More than 1 lakh	N=22	57510	N=17	45226
40,000 to 1,00,000	N=18		N=34	
Up to 40,000	N=38		N=27	
Annual healthcare expenditure	59	49092	71	40982
Age	59	40.23	71	42.31
Percentage spending on health annually	59	18.22	71	15.23

Cont.... Table 1- Descriptive statistics of policyholders renewing and not renewing health insurance

Average Premium paid	59	11,452	71	11,300
	Number of policies renewed	Claim filed	Number of policies did not renewed	Claim filed
Claim filed due to hospitalization	59	N=22	71	N=23

Table1 shows the distinct characteristics of both the groups. It is evident that those respondents who have renewed health insurance policy have higher income as compared to those who haven't renewed. This suggest that higher income enables one to pay the premium on a regular basis and be more sustainable towards health insurance. The similar observations were seen with total monthly expenditure and percentage spending on health, which was higher in the group who have renewed health insurance. The mean age of the respondents was found to be lower in the group who have renewed health

insurance. This suggests that younger respondents have shown more continuity and regularity. Younger individuals in the renewed group also said that the tax saving components is also an important deciding factor in insurance purchase and renewal.

Also, renewal of health insurance was found to be significantly affected by Healthcare expenses. The percentage spending on health was more than the non renewed group.

Experience with claim settlement process

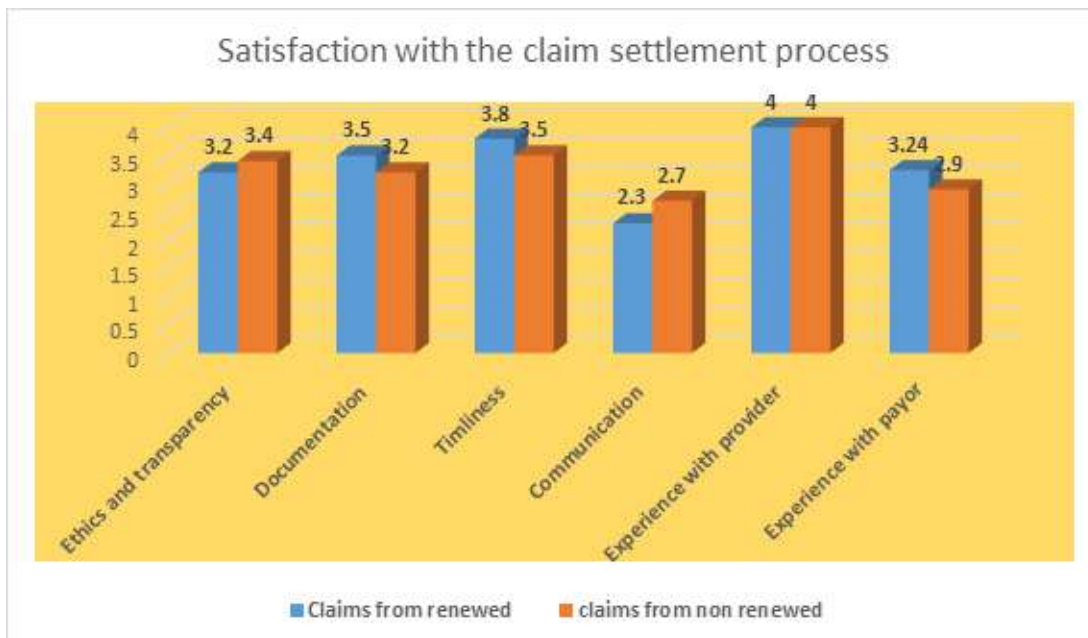

Fig 2 –Satisfaction levels with respect to health insurance policy

Total 71 respondents did not renew their health insurance policy after one year.23 of them faced were hospitalised and could avail the benefit of the policy. Number of claims filed from the group who

have renewed Health insurance were 22.and from the non-renewed were 23.The experience related to claim settlement process was also studied in both the groups.

The results have been summarised in Fig 2.

From the Total 130 respondents 59 respondents renewed their health insurance policy. Out of these 59 respondents 22 were hospitalised and could availed the benefit of the policy. Those hospitalised were further enquired about the claim settlement process and associated factors. The questions included information on ethics and transparency, documentation, timeliness of process, communication, experience with payer and providers.

DISCUSSION

The study aims to identify factors affecting continued enrolment in health insurance policy through renewal of the policy in Pune City. The variables included in the study attempted to examine the determinants of renewal of health insurance policy. In the study younger age, higher income and high healthcare expenditure were found to be significant determinants of continuation of the policy. The experience about the quality of care, experience of payer and provider also affects renewal. The findings can be correlated to the marketing studies, where the researchers have found that if the customer is satisfied there is higher probability of repeat purchase of the product. We also found that if the customer's satisfaction level from insurer is high and his experience from insurer was good then probability of renewing the policy was high.

These experiences positively influence renewal of health insurance policy.

Age, income, percentage spending on healthcare as well as total expenses also affect the renewal decisions. Younger individuals have shown to be more customary in paying the premium and renewing the policy. And are ready to renew health insurance policy. The group who have renewed health insurance have also rated tax savings component higher. This means that this is also one of the attracting factors in continuing the policy. This attracts for product innovations with better tax saving components along with coverage and premiums. Out of the total 71 respondents of non renewed group, 23 had availed the benefit of hospitalisation but this even this benefit could not result into continuation of the policy for the next year. This suggests that mere hospitalisation expenses are not enough to retain the policy holders.

In both the groups, there was no significant difference in the average amount of premium paid. However the income varied in both the groups. This suggests that for better continuity of the policies products needs to be designed to suit every ones economic status.

From both the groups majority of respondents who have files claims have rated claim settlement process as average. The process is considered a cumbersome one with loads of documentation. The suggests that process needs to be more transparent and customer friendly.

CONCLUSION

Health insurance policies are not long-term policies and they are required to be renewed each

year. Understanding the factors that affect the demand and renewal decisions of continuing in health insurance programme is vital for future growth and development of this sector. The important determinants in terms of renewal of health insurance policies observed in the study were younger age, higher income and higher medical expenses.

The study also aims at product innovation with long- term benefits and tax savings components to sustain customers for a longer duration. Insurance companies need to develop and market the product and choose target customers in a policyholder in the manner to ensure long-term continuity. The results also suggest improving the claim settlement process as customer satisfaction is significant factor in influencing the renewal decision of policyholder. This should encourage insurance companies to provide a good experience to the customer during the period of the policy.

Phytochemical Analysis and Antifungal Activity of *Ganoderma lucidum*

Naveen kumar C¹, Srikumar R², Swathi S³, Chidambaram R⁴, Muthukrishnan G⁵, E Prabhakar Reddy⁶

¹Ph.D Scholar cum Assistant Professor, Department of Microbiology, ²Research Associate, Department of Center for Research, ³Tutor, Department of Microbiology, ⁴Professor, Department of Radiology, Sri Lakshmi Narayana Institute of Medical Sciences, Puducherry, ⁵Scientist –C, Model Rural Health Research Unit, National Institute of Epidemiology (ICMR/DHR), Tirunelveli, ⁶Professor cum Central Lab Head, Department of Biochemistry, Sri Lakshmi Narayana Institute of Medical Sciences, Puducherry

ABSTRACT

Ganoderma lucidum has been used for several decades for both treatment strategy and health promotion. The manifestation of new infections, drug resistant, high costs of synthetic drugs and their side effects has led to an increase in the use of traditional medicine globally. Hence an endeavor has been made in this study to examine the antifungal activity of both ethanol and methanol extracts of *G. lucidum*. The phytochemical screening was done to reveal the bioactive constituents of *G. lucidum*. The phytochemical screening of *G. lucidum* revealed that the extracts contain bioactive compounds such as carbohydrates, glycosides, triterpenoids and phenolic compounds. The both extracts of *G. lucidum* were then subjected for the Minimum Inhibitory Concentration (MIC) determination with the help of micro-dilution bioassay. Various pathogenic organisms were selected against which the antifungal activity of the extracts were determined. The result of the antifungal activity showed that the methanolic extract of *G. lucidum* showed the strongest antifungal activity among the two extracts against the fungal strains.

Keywords: *Ganoderma lucidum*, Antifungal activity, Minimum Inhibitory Concentration.

INTRODUCTION

Nature has been a source of medicinal agents for thousands of years and an impressive number of modern drugs have been isolated from natural sources; many of these isolations were based on the uses of the agents in traditional medicine¹. The herbal medicines serve the health needs of about 80% of the world's population, especially for millions of people in the vast rural areas of developing countries; more than 65% of the global population uses medicinal plants as a primary health care modality².

Plants have been a major focus of investigations for novel biologically active compounds³. However, filamentous fungi have been the producers of some of the

most powerful secondary metabolites which have been developed into therapeutic agents⁴. In view of this, the searches for new anti-microbial agents from medicinal plants are even more urgent in the countries like India where infectious diseases of fungal origin are not only widespread, but the causative agents are also developing an increasing resistance against many of the commonly used antibiotics⁵.

There is a constant search for new antibiotics because the existing drugs have unwanted toxicity and their inappropriate and indiscriminate use have led to an increase in antibiotic-resistant strains⁶. Numerous investigations have proved that medicinal plants as well as microorganisms contain diverse classes of bioactive compounds such as Tannins, Alkaloids, Flavonoids, Terpenoids, Phenols, etc⁷. The main aim of this current study was to detect the various bioactive components present in *G. lucidum* and also determine the antifungal

activity to prove its use as a safe and potent antifungal agent.

MATERIALS AND METHOD

Preparation of extracts

The fruiting bodies of *G. lucidum* were obtained from MKV Organics, Puducherry. The extraction method of with certain modifications was used⁸. The dried fruiting bodies were grinded to a fine powder using a domestic blender. For preparing the extracts, methanol and ethanol were used as solvents to obtain the pharmacologically active compounds from the mushroom⁹⁻¹¹.

For every 1 gram of powder, 50 ml of solvent was used and was subjected to extraction using a Soxhlet extraction apparatus. After the completion of extraction, the supernatant was filtered through Whatman #1 filter paper. All solvent extracted fractions were evaporated to dryness to obtain residues. The extracts were stored at 4°C in air tight containers for further investigations¹².

Phytochemical screening

The different qualitative chemical tests can be performed for establishing a profile of given extract for its chemical composition. The extracts were then subjected to qualitative chemical tests for various phytoconstituents like Alkaloids, Flavonoids, Carbohydrates, Reducing sugars, Tannins and Phenolic compounds, Cardiac glycosides, Terpenoids, Anthraquinones, Saponins, Volatile oils and Steroids¹³⁻¹⁵.

Detection of alkaloids

a) Mayer's Test

To a few ml of extract, one drop of Mayer's reagents was added by the side of the test tube. A white creamy precipitate indicated the test as positive.

Preparation of Mayer's Reagent

Mercuric chloride (1.358g) was dissolved in 60 ml of water and KI (5.0 g) was dissolved in 10 ml of water. The two solutions were mixed and made up to 100 ml with water.

b) Wagner's Test

To a few ml of extract, few drops of Wagner's reagent were added by the side of the test tube. A reddish brown precipitate confirmed the test as positive.

Preparation of Wagner's Reagent

Iodine (1.27 g) and KI (2 g) were dissolved in 5 ml of water and made up to 100 ml with distilled water.

Detection of Carbohydrates

a) Molisch's test

To 2 ml of extract, two drops of alcoholic solution of α -naphthol was added, the mixture was shaken well and 1 ml of conc. H_2SO_4 was added slowly along the sides of the test tube and allowed to stand. A violet ring indicated the presence of carbohydrates.

b) Benedict's Test

To 0.5 ml of extract, 1 ml of Benedict's reagent was added. The mixture was heated on a boiling water bath for 2 mins. A characteristic coloured precipitate indicated the presence of sugar.

Benedict's Reagent

Sodium citrate (173g) and Na_2CO_3 (100g) were dissolved in 800 ml of distilled water and boiled to make it clear. $CuSO_4$ (17.3g) dissolved in 100 ml distilled water was added to it.

Test for Glycosides

a) Legal's test

To the extract, few drops of 10% NaOH were added to make it alkaline. Sodium nitroprusside was added to the solution. Presence of blue colouration indicated the presence of glycosides in the extract.

b) Keller-Killiani test (for cardiac glycosides)

To 2 ml of extract, 2 ml glacial acetic acid is added, followed by one drop of 5% $FeCl_3$. Conc. H_2SO_4 is added from the side of the test tube. Reddish brown ring appears at the junction of the two liquid layers indicating the presence of cardiac glycosides.

Detection of Proteins and Amino Acids

a) Millon's Test

To 2 ml extract, few drops of Millon's reagent were added. A white precipitate indicated the presence of proteins.

b) Biuret Test

An aliquot of 2 ml of extract was heated with 1 drop of 2 % CuSO₄ solution. To this 1 ml of ethanol (95%) was added, followed by excess of KOH Pellets. Pink colour in the ethanolic layers indicated the presence of proteins.

Detection of Flavonoids

a) Shinoda test (Magnesium Hydrochloride reduction test)

To the test Solution, few fragments of Magnesium ribbon were added and concentrated HCl was added drop wise, pink scarlet, crimson red or occasionally green to blue color appears after few minutes.

b) Alkaline reagent test

To the test solution few drops of sodium hydroxide solution was added; formation of an intense yellow color, which turned to Colourless on addition of few drops of dil. acid, indicated the presence of flavonoids.

Detection of Phytosterols

a) Libermann Burchard's Test

To the extract, 3 ml of acetic anhydride was added and mixed. To this one drop of concentrated H₂SO₄ were added slowly along the sides of the test tube. An array of colour change showed the presence of phytosterols.

Test for Triterpenoids and Steroids

a) Libermann Burchard's Test

Extract was treated with few drops of acetic anhydride, boiled and cooled. Conc. H₂SO₄ was added from the sides of the test tube, showed a brown ring at the junction of two layers and the upper layer turning green showed the presence of Steroids and formation of deep red colour indicated the presence of triterpenoids.

b) Salkowski test

Extract was treated with few drops of conc. H₂SO₄, shaken well and allowed to stand for some time; red color at the lower layer indicated the presence of Steroids and formation of yellow colored lower layer indicated the presence of Triterpenoids.

Detection of Phenolic Compounds and Tannins

a) Ferric Chloride Test

To the extract, few drops of neutral 5% ferric chloride

solution were added. A dark green colour indicated the presence of phenolic compounds.

b) Lead Acetate Test

To the extract, 3 ml of 10% lead acetate solution was added. A bulky white precipitate indicated the presence of phenolic compounds.

Fungal Test strains used

A total of five fungal species were tested. *Candida albicans* (ATCC-10231), *Aspergillus niger* (ATCC-6275), *Aspergillus flavus* (ATCC-204304), *Aspergillus fumigatus* (ATCC-16907) and *Cryptococcus neoformans* (ATCC-208821).

Culture media and inoculum preparation

The isolates were grown on Sabouraud dextrose agar (Himedia) for 48 h at 35°C. The inoculum preparation followed the directions of document M27-A of the NCCLS¹⁶. Thus, the optical density (OD) of a 0.5 McFarland standard at 530 nm was measured five times on different days. Therefore, a suspension of each of the yeasts in sterile distilled water was adjusted in Bausch & Lomb spectrophotometer to that OD₅₃₀ range.

Minimum Inhibitory Concentration (MIC)

The MIC was determined as the lowest concentration of the extract which inhibited the growth of the tested fungi. A broth micro-dilution bioassay in 96-well micro titer polystyrene plates was used to determine MIC. The method of was followed with modifications¹⁷. The wells of each column (1-12) were filled with 50 µl of sterilized RPMI broth (except the first well of each column). 100 µl of the extracts (methanol and ethanol) having a concentration of 10 µg/ml was added to the first well of columns 4-12. Serial two fold dilutions were made of the 10 µg/ml extract with the broth in the 07 consecutive wells of the columns. The concentration of the extracts ranged from 10 to 0.0625 µg/ml. Next, 50 µl of the fungal inoculum were added to each well so that the final volume of each well was 150 µl. The first & second column of the plate served as the positive and negative control. The plates were covered and then incubated at 37°C for 24h. After 24-48 hrs, 40 µl of 0.2 mg/ml iodinitrotetrazolium chloride was added to each well and the plates were further incubated at 37°C for 30 min. Fungal growth in the wells was indicated by development of red-pink color, while growth inhibition was indicated

by no change in the colour of cell suspensions. The MIC of each extract is defined as the lowest concentration inhibiting the growth of the fungi and was recorded.

RESULTS AND DISCUSSION

Qualitative phytochemical screening

The phytochemical screening of *G. lucidum* revealed

that the extracts contain Carbohydrates, Glycosides, Triterpenoids and Phenolic compounds. Methanol and ethanol extracts were found to extract the maximum active components being solvents that have low polarity. This result was in accordance to the previously reported literature¹⁸ and is represented in Table-1.

Table.1 Qualitative phytochemical analysis of

Ganoderma lucidum from two organic solvents

S. No	Phytochemical	Test	Observation	
			Methanol	Ethanol
1	Alkaloids	Mayer's test	-	-
		Wagner's test	-	-
2	Carbohydrates	Molisch's test	+	+
		Benedict's test	+	-
3	Glycosides	Legal's test	+	+
		Keller-Killiani test	+	+
4	Proteins and Amino acids	Millon's test	-	-
		Biuret test	-	-
5	Flavonoids	Shinoda test (Magnesium Hydrochloride reduction test)	-	-

Determination of Minimum Inhibitory Concentration (MIC)

The MIC values of the extracts against the tested strains are represented in Table-2. The MIC value of the extracts ranged from in descending (10 µg/ml, 05 µg/ml, 2.5 µg/ml, 1.25 µg/ml and 0.625 µg/ml).

The MIC of the methanol extract was found to be 0.625 µg/ml against *Candida albicans*, for ethanol extract was found to be 1.25 µg/ml against *Candida albicans*. *Candida albicans* and *Aspergillus fumigatus* were found to be the most susceptible fungal strains as the two extracts inhibited their growth.

For *Aspergillus flavus* and *Cryptococcus neoformans* the ethanol extract was found to be the most effective, whereas for *Aspergillus fumigatus*, both extracts were equally found to be effective, for *Aspergillus niger* only the methanol extract was found to be effective. The antifungal activity of the methanolic extract against *Candida albicans* and *Aspergillus fumigatus* is of great importance as they are emerging pathogens¹⁹.

Table. 2 Minimum inhibitory concentration (MIC) ($\mu\text{g/ml}$) values of the extracts against the tested organisms

Minimum Inhibitory Concentration ($\mu\text{g/ml}$)		
Organisms (n=360)	Methanol	Ethanol
Candida albicans (162)	0.625	1.25
Aspergillus flavus (32)	ND	2.5
Aspergillus fumigates (86)	2.5	2.5
Aspergillus niger (56)	1.25	ND
Cryptococcus neoformans (24)	ND	1.25

Antifungal activity

This study justifies the claimed uses of *G. lucidum* in the traditional system of medicine and its bioactive components to treat various infectious diseases caused by the microbes²⁰.

The presence of antimicrobial substances in the higher plants and filamentous fungi is well established. Hence the antifungal activity of *G. lucidum* is described in this study²¹.

Candida albicans, *Aspergillus flavus*, *Aspergillus fumigates*, *Aspergillus niger* and *Cryptococcus neoformans* were found to be inhibited by the both extracts of *G. lucidum*. The presence of important phytoconstituents like Carbohydrates, Glycosides, Triterpenoids, Phenolic compounds and tannins could be responsible for the antifungal properties²². However, thorough research needs to be done in order to recognize the phytoconstituents responsible for the antifungal activity before being used for the development of any drugs.

CONCLUSION

The results obtained from this work showed that extracts of *G. lucidum* medicinal mushroom screened exhibit antifungal effects present more in methanolic extract than ethanol extracts against the fungal strains. This study also supports the traditional usage of the studied plants and suggests that *G. lucidum* extracts possess compounds with antifungal properties that can be used as antifungal agents in new drugs for the therapy of infectious diseases caused by pathogens.

Pattern of Cutaneous Manifestations among HIV Patients of a Tertiary Care Teaching Hospital

Ramesh Holla¹, Bhaskaran Unnikrishnan², Darshan B B¹, Prasanna Mithra¹, Nithin Kumar¹, Vaman Kulkarni¹, Rohit Shenoy³

¹Associate Professor, ²Professor, Department of Community Medicine, Kasturba Medical College (Manipal Academy of Higher Education) Mangalore, Karnataka, India, ³Under Graduate Medical Student, Kasturba Medical College (Manipal Academy of Higher Education) Mangalore, Karnataka, India

ABSTRACT

Introduction: The most recent data from UNAIDS, about 35 million people are living with HIV infection worldwide. Cutaneous disorders occur more frequently as HIV infection advances and immune function deteriorates; however, they are common and of various types throughout the course of HIV disease. Taking cutaneous disorders into consideration for case management is essential to improve quality of life for HIV-infected patients. **Materials and method:** The current record based study was conducted at the tertiary care teaching hospital of Kasturba medical College, Mangalore. The records of all the HIV positive patients who visited dermatology clinic, were retrieved from the record section of the hospital. The information pertaining to the demographic characteristics, mode of transmission of HIV and cutaneous manifestations were obtained from the case records.. Data was entered and analyzed using SPSS

Results: About half (n=67, 51.5%) the patients were in the age group of 26-35 years, and one quarter (n=30, 23.1%) were between 36 and 45 years old. About 86.9% (n=113) of patients acquired HIV through the sexual exposure. **Conclusion:** Oropharyngeal candidiasis was the most common dermatological manifestations observed among the participants in the current study

Keywords: HIV, Mangalore, cutaneous manifestations

BACKGROUND

HIV infection/ AIDS is a global pandemic, the hallmark of which is a profound immunodeficiency, which results from a progressive quantitative and qualitative deficiency of helper T cells. ^[1] According to the most recent data from UNAIDS, about 35 million people are living with HIV infection worldwide. ^[2] Estimates from NACO (National AIDS control organization) the national adult HIV prevalence in India is approximately 0.36 percent, amounting to between 2 and 3.1 million people. More men are HIV positive than women. Nationally, the

prevalence rate for adult females is 0.29 percent, while for males it is 0.43 percent. Prevalence is also high in the age group of 15-49 years (88.7 percent of all infections). ^[3] Aberrant immune activation and inflammation in HIV infected individuals contribute considerably to the increased incidence of chronic conditions like cancer, neurocognitive dysfunction, diabetes, kidney, liver and cardiovascular disease ^[1]

Cutaneous disorders occur more frequently as HIV infection advances and immune function deteriorates; however, they are common and of various types throughout the course of HIV disease. Taking cutaneous disorders into consideration for case management is essential to improve quality of life for HIV-infected patients. ^[4] Skin disorders are common manifestations of human immunodeficiency virus (HIV) disease: they affect between 80% and 95% of HIV-infected patients according to the literature, ^[5-9] occurring at any time in

Associate Professor, Department of Community Medicine, Kasturba Medical College (Manipal Academy of Higher Education) Mangalore, Karnataka, India, Email : drdarshanbb@gmail.com

the course of infection. It is commonly seen that skin is the first and only organ affected during the course of the disease. [10,11]

Cutaneous disorders during HIV infection are numerous and [7,8] can vary from the macular rash seen in acute seroconversion syndrome to end-stage Kaposi Sarcoma. [1] The more common non-neoplastic manifestations are seborrheic dermatitis (seen in up to 50% of patients with HIV), folliculitis (~20% of patients with HIV) and shingles (seen in 10-20% of patients). [1] Some have drawn attention because their onset defines some of the Centers for Disease Control and Prevention (CDC) acquired immunodeficiency syndrome (AIDS) clinical categories, eg, oral candidiasis, zoster, herpes simplex, oral hairy leukoplakia, and Kaposi sarcoma, but most have been documented solely in case reports. In the context of HIV infection, cutaneous disorders can present with particular clinical manifestations: unusual anatomical sites, increased severity, treatment failure, and unusual clinical appearance. These lesions are often the first manifestations of symptomatic HIV disease. Clinicians need to be aware of these diagnoses and the order of their appearance since correct interpretation is essential for counseling patients about the progression of their illness and for initiating appropriate therapy. [5] Hence, this study was undertaken to find out the various cutaneous manifestations among HIV patients and also to list out the other opportunistic infections in HIV patients with cutaneous manifestations.

MATERIALS AND METHOD

Ethical clearance was obtained from the Institutional Ethics Committee (IEC) of Kasturba Medical College, Mangalore (MAHE) before starting the study. The current record based study was conducted at the tertiary care teaching hospital of Kasturba medical College, Mangalore. The records of all the HIV positive patients who visited dermatology clinic, were retrieved from the record section of the hospital after obtaining the permission from the Medical Superintendent. The information pertaining to the demographic characteristics, mode of transmission of HIV and cutaneous manifestations were obtained from the case records. Medical case records were scrutinized for the completeness; and incomplete records were excluded from the study. Data was entered and analyzed using SPSS (Statistical Package for Social Sciences) Version 11.5. Results were expressed by using proportions, mean and standard deviation.

RESULTS

Table 1: Baseline characteristics of study population (n=130)

Baseline characteristics	Number	Percentage
Age group (Years)		
≤ 25	25	19.2
26-35	67	51.5
36-45	30	23.1
>45	08	06.2
Gender		
Male	86	66.2
Female	44	33.8
Marital status		
Single	40	30.8
Married	90	69.2

A total of 130 patients with HIV attended the dermatology clinic during the study period. The demographic features of the patients are given in Table 1. About half (n=67, 51.5%) the patients were in the age group of 26-35 years, and one quarter (n=30, 23.1%) were between 36 and 45 years old. Two-thirds (n= 86, 66.2%) of the patients were male. 30 patients (23.1%) were employed in hotels and 33 (25.4%) of them were housewives.

Table 2: Distribution of study population according to mode of transmission of HIV (n=130)

Mode of transmission	Number	Percentage
Heterosexual	110	84.6
Homosexual	003	02.3
Blood transfusion	002	01.5
Mother to child	001	00.8
Unknown	014	10.8

The distribution of study participants by route of transmission is given in Table 2. About 86.9% (n=113) of patients acquired HIV through the sexual exposure, among which 110 were through heterosexual exposure while 3 were through homosexual exposure.

Table 3: Cutaneous manifestations of HIV infected patients (n=108)

Cutaneous manifestation	Number	Percentage
Candidiasis	39	36.3
Viral infections	23	21.3
Bacterial infections	09	08.4
Scabies	08	07.5
Pigmentation	07	06.4
Ichthyosis	07	06.4
Dermatophytoses	05	04.6
Pruritus	04	03.7
Seborrheic Dermatitis	03	02.7
Xerosis	03	02.7

Table 3 gives the cutaneous manifestations of HIV. About one-third (n=39, 36.3%) of the patients had candidiasis, while 23 patients (21.3%) had viral infections like herpes zoster and herpes simplex.

DISCUSSION

This was a retrospective study done by studying the case records of 130 HIV infected patients attending the tertiary care hospital. Out of 130 HIV patients with cutaneous manifestations 86 (66.2%) were males and 44 (33.8%) were females. Majority of the patients (n=97, 74.6%) belonged to the age group of 26-45 years. The age differences in the occurrence of the disease between the sexes could be attributed to early marriages in females and early detection, either due to pregnancy or because their spouse tested positive. Studies done by Spira et al [4] and Singh et al [12] also show high male prevalence. The National Commission on Macroeconomic and Health India report reveals that in high prevalence area like Karnataka, Andhra Pradesh, Maharashtra and Tamil Nadu males had higher prevalence 12.9 compared to females 4.4. [13] as reflected in our study.

Housewives formed 25% of the study group, hotel workers 23%, drivers 8% and manual laborers 7%. Occupations such as fishermen, farmers, masons etc formed 34% of the study group. The statistics points to a low socioeconomic status, similar to a study done in eastern India in which 80% of study participants

belonged to lower socioeconomic strata with income less than Rs.1500 per month. [12] This points to a low level of education and awareness, which is reflected by the increased number of cases seen in this group. Further, it also points to poor nutrition, which in itself can hasten the progression of the disease.

More than four fifth of cases gave history of heterosexual exposure as mode of acquisition of infection while 3 patients gave history of homosexual mode of infection. This is congruent with another study done in India in which majority (94%) of cases were transmitted through heterosexual contacts, however a study done by Powers reported that in only 34% of cases the mode of transmission of infection was by heterosexual route. [14] Study by Spira reported 35% transmission of infection by homosexual route, which is much higher than our study. [4]

Oropharyngeal candidiasis was the commonest mucocutaneous manifestation accounting for 39 (36.3%) cases followed by viral infections such as herpes zoster, herpes simplex and molluscum contagiosum in 23 (21.3%) patients. Other cutaneous manifestations were scabies ,pigmentation , ichthyosis , dermatophytosis and less commonly xerosis and seborrheic dermatitis. The pattern obtained was similar to other studies. [15-17] However, these findings are very different from another study done in India with a similar sample size (n=137), which found seborrheic dermatitis to be the most common manifestation (74%), while oral candidiasis was seen in only 17.5% of patients. Further, pigmentation and xerosis were more prevalent, 47% and 52.5% respectively, as compared to our study. [12] Pruritus is a common complaint in the HIV-infected patient. [18] The overall predominance of skin disorders in homosexual and bisexual men compared with the other HIV transmission groups, even after exclusion of Kaposi sarcoma, may be explained by the fact that these patients usually report more easily their discomfort than the others. Moreover, some skin disorders, such as condyloma or molluscum contagiosum, are known to be caused by sexually transmitted agents.

CONCLUSION

As evident from present study HIV mainly affected the working age group of the society predominantly through sexual route. Oropharyngeal candidiasis was the most common dermatological manifestations observed

among the participants in the current study.

Ethical Clearance- Taken from Institutional Ethics committee

Source of Funding- None

Prof. Department of Community Medicine, Krishna Institute of Medical Sciences, Karad, Maharashtra (India)

ABSTRACT

Background: Self-medication can be both beneficial and harmful for Hilly Area people where universal access to health care is yet to be achieved. This area is having various disease drug resistant region and also very much vulnerable to harms of self-medication. *Objectives:* Therefore, this study was initiated to determine the knowledge of self-medication and also found to be association between education and self medication practices in hilly population. *Material and Methods:* The study was a community-based cross-sectional study carried out at Kalgaon PHC of Patan Taluka. A total of 487 heads of family were selected by randomization. *Result:* In spite of all these conditions commonly practiced self medication in hilly area for fever, headache, etc. In this study fever and headache as reported by 64.7% and 61.0% followed by Abdominal Pain 54.2%, Cough (55.9%), and Diarrhea 43.9%. Although among population 63.7% respondents had correct knowledge regarding dose, 64.9% about duration, 9.7% about contraindication, 0.6% regarding expiry date. *Conclusion:* Higher percentages of self-medication practices were seen among all the population. This study helps the respondents had better knowledge of dose, duration, indication as compared to its contraindication and its adverse effects.

Keywords: Self-medication, Knowledge, Health education, Hilly Area, Cross Sectional Study

INTRODUCTION

Self-care has been characterized as the basic level of health care in all societies from the ancient time. This urge of self-care might have been a driving force motivating for self-medication.

The World Health Organization has been promoting the practice of self-medication due to inadequacy in implementing health care delivery system, particularly in remote and rural areas.

OTC (over the counter) drugs are intended for self-medication and are of established efficacy and safety, their inappropriate use due to lack of knowledge of their side effects and interactions could have serious insinuation, especially in special population groups like children, elderly, pregnant and lactating mothers¹.

Antimicrobial resistance is a current problem worldwide particularly in developing countries where antibiotics are often available without a prescription².

Aim:- To study prevalence of practice of self-medication among people residing in hilly area.

Objectives:-

To study status of knowledge regarding Self Medication among people residing in hilly area.

Author Correspondence:

Dr. Sharmishtha Garud,

Assistant Professor Department of Community Medicine, Krishna Institute of Medical Sciences, Karad, Maharashtra (India)-415539, Mobile: +91-09960690610

To study the association between self - medication and education of the study population.

MATERIAL AND METHOD

Background to the study area:-

The present study was carried in remote and hilly areas of Patan Talukain Satara District. Out of 13 P.H.C.s in Patan Taluka,Kalgaon P.H.C. was selected randomly and out of 5 sub centres, Kachni was also selected randomly covering population of 2754 in 551 households.Kachni is 27 km. from KrishnaInstitute of Medical Sciences “Deemed To Be University” , Karad.

Study design:-

The study was conducted as a community-based cross-sectional survey in an attempt to assess the practices towards self-medication among the residents of hilly area of Patan Taluka using a self-administered questionnaire.

Study Population:-

The study population comprised of heads of families residents at sub centre Kachni selected randomly from the five sub centres in jurisdiction of Kalgaon PHC in the patan taluka. The inclusion criterion for the selection of participants was that they had to be permanent residents of the local and were to be above 18 years of age.

Sample size:-

The desired sample size for the study was determined using the formula

Assuming 50% of families (head of families) were using self medication.

$$\text{i.e. } p = 50\% \text{ (users)}$$

$$q = 50\% \text{ (non users)}$$

$$L = \text{allowable error}$$

Minimum families (head of families) to be studied is

$$n = 4pq/L^2$$

$$n = 4 \times 50 \times 50/5^2$$

$$n = 400$$

Sampling Technique

Out of 13 PHC in Patan Taluka, Kalgaon PHC was selected randomly and out of 5 sub centre,Kachni also selected randomly by lottery method.With the minimum sample size known, a total of 487 heads of family were selected, randomly and were enumerated and the number of participants from each was selected by sampling fraction.

Survey Instrument

This study instrument was an anonymous, self-administered, questionnaire based-survey, carried out from November 2013 to June 2014. A self developed questionnaire which was tested for validity and reliability and modified accordingly consisting of mainly closed-ended questions was used for data collection. The information on the questionnaires included social demographic variables such as age, gender, income,occupation and level of education. In addition to questions on demographic information, the questionnaire also included questions on knowledge of self-medication, involvement in self-medication practices, frequency of self-medication, sources of drugs used, and reasons for self-prescribing.

Data Analysis:

Following completion of data collection, it was reviewed, organized and entered into a micro computer running the Statistical Package of Social Science (SPSS version.) software for windows Vista and Epidemiological Information Software (Epi Info 3.5.3) to validate and analyze the entries. The results are based upon the data obtained from residents. The prevalence of self-medication was reported as percentages. The survey was descriptive and data was summarized as rates and ratios.

Ethical Considerations:

The study was approved by the Department of Community medicine, and Ethical committee of Krishna Institute of Medical Sciences Deemed University Karad. And a letter of consent was obtained from the medical officer of PHC Kalgaon. Participants were properly informed by the interviewer on the nature of study, its confidentiality, importance to the society and procedures for completing the questionnaire, and informed consent was obtained in all cases. **Funding:**

Project is funded by Krishna Institute of Medical

Sciences “Deemed To Be University”, Karad.

Limitations:

This study was largely constrained by time which prevented the use of a larger sample size. Another limitation of this study was the reliance on self-reported data about self-medication from the respondents coupled with inability to ascertain drugs used, and their dosages. The inability to establish the occurrence of side effects

following drug use could also have limited the study.

Observations and Results:

A total of 487 study subjects were included in the study and the data was collected by structured interview among the heads of family from hilly area.(aged above 18 years).

Socio-demographic characteristics:-

Table 1: Socio-demographic characteristics of the respondents

Sr. No.	Demographic variables	Frequency	%	
	Age	Upto 30yrs	22	4.5
		31-40yrs	109	22.4
		41-50yrs	175	35.9
		51-60yrs	147	30.2
		61-70yrs	34	7.0
	Mean age	46.82		
Std. Deviation	9.640			
	Gender	Male	384	78.9
		Female	103	21.1
	Occupation	Farmer	234	48.0
		Labour	253	52.0
	Education	Illiterate	274	56.3
		Primary – I (1dt to 4th)	83	17.0
		Primary – II (5th to 7th)	81	16.6
		SSC	45	9.2
		HSC	3	.6
		Graduate	1	.2
	Income Group	Rs. 1786-2976 (SEC-III)	3	.6
		Rs. 893-1785 (SEC-IV)	25	5.1
		<= Rs. 893 (SEC-V)	459	94.3
	Family Type	Nuclear	360	73.9
		Joint	127	26.1

Table 2: Association between Self-medication practices and education of the respondents.

Sr. No.	Education	Self-Medication		Total	Pearson Chi-Square	
		Yes	No		Value	P- Value
	Illiterate	212	62	274	47.367	0.000*
	Primary	49	34	83		
	Primary	37	44	81		
	SSC	21	24	45		
	HSC	0	3	3		
	Graduate	0	1	1		

*Significant when p<0.05

RESULT

As depicted in above table literacy status was significantly associated with practice of self medication which was more in illiterates.

Table No. 3 Conditions commonly practiced for self-medication by the respondents

Sr. No.	Common conditions	Self medication	
		Yes	No
	Fever	315(64.7%)	4(.8%)
	Headache	297 (61.0%)	22(4.5%)
	Malaise	181(37.2%)	138(28.3%)
	Abdominal Pain	264(54.2%)	55(11.3%)
	Cough	272(55.9%)	47(9.7%)
	Cold	29(6.0%)	290(59.5%)
	Vomiting	77(15.8%)	242(49.7%)
8.	Diarrhoea	214(43.9%)	105(21.6%)
9.	Weakness	43(8.8%)	276(56.7%)
10.	Other Symptoms	15(3.1%)	304(62.4%)

RESULT

The above table shows that commonest 10 frequently reported conditions for seeking self-medication included fever and headache as reported by 315 (64.7%)

and 297(61.0%) followed by Abdominal Pain (264 respondents) (54.2%), Cough(272 respondents) (55.9%), Diarrhoea (214 respondents) (43.9%) respectively.

Table 4: Knowledge about medications among respondents.

Sr. No.	Knowledge	Self medication		Pearson Chi-Square	
		Yes	No	Value	P value
1	Dose	310 (63.7%)	9 (1.8%)	483.066 ^a	.000*
2	Duration	316 (64.9%)	3 (.6%)	482.589 ^a	.000*
3	Indication	316 (64.9%)	3 (.6%)	482.589 ^a	.000*
4	Contra indications	47 (9.7%)	272 (55.9%)	482.669 ^a	.000*
5	Expiry Date	3 (0.6%)	316 (64.9%)	484.050 ^a	.000*
6	Adverse Effect	19 (3.9%)	300 (61.6%)	480.804 ^a	.000*

**Significant when p<0.05*

This table shows that the knowledge about medications among respondents where 63.7% respondents having correct knowledge regarding dose, 64.9% about duration, 9.7% regarding contraindication, 0.6 regarding expiry date, & 3.9% regarding Adverse Effect respectively and the maximum population 55.9%, 64.9% and 61.6% still significantly lack appropriate knowledge about contra indication, Expiry Date and Adverse Effect respectively.

DISCUSSION

Majority of the respondents 384 (78.9%) were male and 103 (21.1%) were female (table No1). Meaning that more men were compounded in the research than women, may be due to the nature of jobs men entail in that may not give them the time to relax and participate in other activities. This result matches with the study done by Mohamed saleem T.K 2011³ where majority male respondents were found compared to females.

This study showed higher prevalence among the age group between 41 to 50 years which was similar findings (35.9%) seen in the study conducted by Afolabi (2008) Banerjee; Bhadury & other (2012)⁴, Patil S.B & other⁵; Santosh Kumar; Binjawadgi; Kanakhi (2014), Stein & other^{4,5,6}.

Another study conducted in Mexico⁷ revealed that females practiced more self medication (61.9%) than

males did (38.1%) and identified women as fundamental element in the consumption of drugs and employment of self medication. Studies conducted in Spain showed that Self-medication is more prevalent among women, persons who live alone, and persons who live in large cities. Inappropriate or unsafe use should be properly addressed and managed⁷.

The study done by Nitin kumar, Stein et al. showed prevalence more in the female (82.2%) & (55.5%) respectively which contradicts to our study.

Overall educational status was found less though educated individuals seems to take physicians advice. In the present study majority of the respondents had not attended even primary school education 274 (56.3%) followed by 83 (17.0%) had achieved primary level 1 education, and only 81 (16.6%) had attained primary level 2 education and only 45 (9.2%) had secondary school. This shows the high number of primary school drop outs and attendance level as well as a reduce illiteracy and increased drop out level which is stipulated by a reduced. Respondents who attended primary level and a further reduction in secondary school attendance. This study however contradicts a study done by Azeem AK et al. 2011 in USA where majority of the respondents had completed was attending secondary education.

Various studies on the relationship between educational status and attitude towards self-medication

commonly found that differences in educational levels may be responsible for the finding that more young and middle-class patients regard medication as not always being essential for every illness and concluded that the difference between social classes is statistically significant⁸.

World-wide, consumers commonly reach for self-care products to help them solve their common health problems which include fever, body pains, indigestion, diarrhoea, vomiting, cough, and upper respiratory tract infections^{9,10}.

Self medication with drugs is an economical choice of treatment for common self limiting illnesses all over the world.¹¹ Certain studies^{12, 13, 14} amongst different populations reveal that the population had a fairly good knowledge on the advantages of self medication, as they correctly perceived it as time-saving and economical, doing away with the need to go to a doctor for minor illness and providing quick, easy and convenient relief¹⁵.

The relationship between educational status and attitude towards self-medication commonly found that differences in educational levels may be responsible for the finding that more young and middle-class patients regard medication as not always being essential for every illness and concluded that the difference between social classes is statistically significant⁷³.

The study showed a positive correlation between the education level of the respondents and the tendency to obtain medications from the hospital/pharmacies. The prevalence among the illiterates was 7.5%, 30.6% in those who had primary education, 42.2% in those with secondary and 62.5% in those who had post-secondary school education. In contrast, there was a negative correlation between the education level of the respondents and the tendency to obtain medications from patent medicine stores and local hawkers.

SUMMARY & CONCLUSION

This was a community based cross sectional study conducted in hilly area of Patan Taluka of a sub centre kachni under PHC Kalgaon from Nov. 2013 to Dec.2014 among 487 heads of families as a study subjects.

Among the 487 respondents 319(65.5%) were using self medication. Out of which 41-50 yrs. of age group

which was an economically productive age group was practicing more (35.5).

Comparatively all respondents who were practicing self medication were illiterates (77.37%) belonged to nuclear family.

The respondents had better knowledge about dose, duration and Indication as compared to its contraindication and adverse effect. This study intention to continue this practice in the future and recommend to others should be an alarming wake up call to all the doctors, health care providers, pharmacists and policy makers of Government of India.

Conflicts of Interest: Author declared that no conflicts of interest.

Abstract

Background & Objective: Diabetes Mellitus is one of the most common progressive and disabling diseases. Population affected with Diabetes may experience numbness or insensitivity to pain and temperature, a tingling, burning or prickling sensation, sharp pains or cramps, extreme sensitivity to even a light touch, loss of balance and coordination. Low-Level laser therapy (LLLT) has been advocated for the treatment of chronic pain disorders. This therapy has been suggested for relief of symptoms of pain, inflammation and utilized in wound healing & nerve regeneration. With this evidence Laser has been advocated in this study. The aim of this study is to evaluate the effectiveness of Low-Level Laser Therapy for relieving the symptoms of Diabetic Sensorimotor Polyneuropathy. **Methodology:** This randomized controlled trial was conducted in a private Medical College Hospital, Chennai. The materials required for conducting the study includes Tuning Fork, Reflex Hammer, 10gm Semmes Weinstein monofilaments, Goggles and a Ga As LASER unit. The study was conducted among 40 subjects satisfying selection criteria in the age group of 40-60 years and was randomly assigned in to control(Group-A) or experimental group(Group-B) and was assessed for degree of neuropathy and pain using Toronto clinical neuropathy score and Numerical Pain Rating Scale (NPRS) respectively. Participants in the respective groups are treated for five weeks with 4 joules for 4 days in a week. **Results:** Within-group analyses showed a significant difference in both outcome measures with $p < 0.05$. The pre-test mean in Group-A was 9.80 and post-test mean value of Toronto Clinical Neuropathy Score is 8.25 and in the Group-B the pretest mean was 10.10 and post-test mean was 6.30 this shows that Toronto Clinical Neuropathy Score in group B were comparatively significantly less than group A, $P < 0.05$. The Post Test mean value of Numerical Pain Rating Scale in group A is 5.15 and in the group, B is 3.90 compared to their pre-test values of 6.25(Group-A) and 6.30(Group-B) respectively. The Numerical Pain Rating Scale analysis in Group B were comparatively significant than Group A, which indicates a significant difference between groups with $p < 0.05$. **Conclusion:** This study concludes that Low-Level Laser Therapy is more effective in patients with Diabetic sensorimotor Polyneuropathy in reducing Pain and relieving symptoms.

INTRODUCTION

Diabetes is one among the most progressive and disabling disease. Recently 150 million people were with diabetes all over the world and in the year 2025, their number is expected to increase to 300 million (WHO)

[1]. Diabetic sensorimotor polyneuropathy is 27.6% prevalent among those with diabetes [2]. It was also noted that 13% of persons with glucose tolerance impairment had polyneuropathy, which suggests that neuropathy can also be developed due to the pre-diabetic state caused by impaired glucose tolerance [3]. In another population-based study conducted among diabetic cohorts, it was recorded that 25-30% had peripheral neuropathy graded to be either moderate or severe. [4]

Distal symmetrical neuropathy is also termed as sensorimotor neuropathy and is one of the most common types of diabetic neuropathy. The affected individual develops pain which may be worst at night, impaired or loss of sensation, disturbance in balance and coordination. The symptoms may be predominant in the distal part of the leg and hands which may progress later proximally. The Lower limb is likely to be affected first than the upper limb. Diabetic Peripheral neuropathy can also produce hyperalgesia. Chronic painful neuropathy symptoms may affect the individual's quality of life and can be a factor to induce stress, anxiety, depression and reduced mobility. [5] Sensorimotor neuropathy or distal symmetrical neuropathy is often termed based on their clinical appearance as a stocking-glove neuropathy and in this case, distal long nerves are affected first and later progress proximally [6].

Painful symptoms of Diabetic neuropathy is often resilient to medications. Analgesics and various other drugs are recommended to manage symptoms of pain, such as phenothiazine's, anticonvulsants, and tricyclic antidepressants, which might induce numerous adverse effects. Low-level laser therapy (LLLT), is a form of physiotherapy practice which is widely used for tissue healing, pain, and inflammation, and this therapy is classified in the group of "Other physical therapies in the management of diabetic peripheral neuropathy" [7].

Symptoms associated with early pathophysiological stages of Diabetic Sensorimotor Polyneuropathy can be measured using the Toronto Clinical Neuropathy Score because of its content validity and of construct validity towards nerve conduction velocity measures [8, 9]. The Toronto Clinical Neuropathy Score has been used widely in clinical trials because of its reliability, user-friendliness, and acceptability by patients and also essential for its ability to identify the intensity of clinical stages associated with Diabetic Sensorimotor Polyneuropathy and its progression [10].

The objective of the study is to find out the effectiveness of low-level laser therapy in the management of distal symmetrical diabetic neuropathy.

METHOD

The study was conducted in the Physiotherapy Out Patient Department of a private medical college teaching Hospital at Chennai. The study was approved by the Institutional Human Ethical Committee of the University. The participants were selected randomly and assigned to the groups based on a block randomization procedure. The materials required for conducting the study includes Tuning Fork, Reflex Hammer, 10gm Semmes Weinstein monofilaments, Goggles, and a LASER therapy unit. The Population who satisfy the selection criteria attending the outpatient department of the study centre were included in the study. They were grouped into two, one as control N=20 (Group-A) and the other as intervention group N=20 (Group-B). The selection criteria include Participants with known type2 diabetes mellitus with more than 10 years duration aged between 40-60 years, presenting with diabetic neuropathy symptoms based on the Toronto Clinical Neuropathy Score [11]. Population presenting with gangrene, unstable medical conditions (e.g., malignancy, active/untreated thyroid disease), and other neurologic problems that might interfere with the assessment of neuropathy, Metallic implants, Chronic Alcohol or illicit drug abuse were excluded from the study [12].

All participants were explained about the procedure and informed consent was obtained. The outcome measures used were Toronto clinical neuropathy score to measure the degree of neuropathy [6, 7] and Numerical Pain Rating Scale (NPRS) to measure pain [13]. Both outcome measures were tested by a clinical physiotherapist blinded to group allotment before and after an intervention.

Intervention:

The control group-A did not receive any Physiotherapy intervention, they received only standard drug routine as prescribed by the physician to alleviate the symptoms associated with Diabetic neuropathy. The interventional group-B received LLLT along with the standardized medications to alleviate the symptoms associated with Diabetic neuropathy. All the participants of the group-B were explained about the nature of the

treatment and need to wear goggles throughout the treatment to obviate any risk of accidental application of laser beam into the eye was informed. Laser apparatus is positioned and goggles were given to the patient. The patient is made to lie down in a comfortable position. Treatment area was cleaned with alcohol to remove any material that might absorb or reflect the radiation. The following parameters were used with laser source by a Gallium Arsenide: wavelength of 904 nm, the maximum power of 25 W, a pulse duration of 100 ns and frequency of 1,000 Hz. The treatment was for 4days/week for 5 weeks with an energy dose of 4 joules ^[14] for 60 sec. at each point. The therapy was applied by positioning the diode applicator with 1 cm² diameter and at four

located points along the sciatic nerve in each lower extremity. The Laser was kept in contact with the tissues and the beam was applied at right angles on treatment areas. Single point or spotting method of application was applied. Laser was spotted around the neck of the fibula just below the head of the fibula for common peroneal nerve, for deep peroneal nerve Laser was spotted between extensor hallucis longus and extensor digitorum longus, for posterior tibial nerve Laser was spotted just behind and distal to the medial malleolus, for superficial peroneal and Laser was spotted over lateral aspect of the Achilles tendon across the lateral malleolus and medial malleolus to the medial aspect of the Achilles tendon. The device is switched off before removing the applicator from the skin ^{[12], [15]}.

Clinical findings and Results:

Table -1:Pre-test & Post-test values comparison between Groups –A (Control group)

Group A		Mean	Standard deviation	t value	Significance
Toronto Clinical Neuropathy Scores	Pre-test	9.80	1.54	7.33	<0.05
	Post-test	8.25	1.21		
Numerical Pain Rating Scale	Pre-test	6.25	1.01	5.39	<0.05
	Post-test	5.15	0.81		

Table- 2: Pre-test & Post-test values comparison between Groups –B (Interventional group)

Group B		Mean	Standard deviation	t value	Significance
Toronto Clinical Neuropathy Scores	Pre test	10.10	1.51	15.67	<0.05
	Post test	6.30	1.59		
Numerical Pain Rating Scale	Pre test	6.30	0.86	7.05	<0.05
	Post test	3.90	1.25		

The student t-test is used for statistical analysis. From statistical analysis, the quantitative data revealed a statistically significant difference between the Group A & Group B, and also within the group. The post-test mean value of Toronto Clinical Neuropathy Score in Group A is 8.25 and in the Group, B is 6.30 this shows that Toronto Clinical Neuropathy Score in Group B

was comparatively significant than group A, P<0.05. The Post Test mean value of Numerical Pain Rating Scale in Group, A is 5.15 and in the Group, B is 3.90. This pain outcome results also proves that the mean score of Numerical Pain Rating Scale in Group B was comparatively significant than Group A, P<0.05.

Table- 3: Post-test values comparison between Groups A & B

The post-test measure of mean and standard deviation for Toronto Clinical Neuropathy Score, Numerical Pain Rating Scale in Group A and Group B in respect with 't' value (student 't' test)

Parameter	Post Test Values				't' test	Significance
	Group A		Group B			
	Mean	Standard deviation	Mean	Standard deviation		
Toronto Clinical Neuropathy Score	8.25	1.21	6.30	1.59	5.86	<0.05
Numerical Pain Rating Scale	5.15	0.81	3.90	1.25	3.74	<0.05

Statistical Analysis of Toronto Clinical Neuropathy Score and Numerical Pain Rating Scale post-test scores analyzed with unpaired t-test showed significant difference between Group A and Group B. The analyzed data reveals that the interventional group(A) had better recovery in pain and symptoms compared to control group(B).

DISCUSSION

The study results showed significant improvement with LLLT with 4 joules of irradiation, no significant adverse effects were reported in any of the groups. Therefore, LLLT could be offered safely to patients with diabetic neuropathy.

The Toronto clinical neuropathy scale and numerical rating scale was followed as outcome measures to analyze the alleviation of symptoms associated with distal symmetrical sensorimotor neuropathy. The outcome of the study proved a significant decline in symptoms and pain associated with diabetic neuropathy in all the participants.

Despite various pharmacological treatment approaches to manage the symptoms associated with diabetic neuropathy is available, the safety of long-term advocacy of drugs without side effects is arguable. Moreover, physical measures of treatment for this condition has a dearth in literature support and there is a lacuna in physiotherapy intervention for managing diabetic neuropathy. In this study, LLLT with a dosage of 4j/cm² was taken and studied for its significance in the selected population based on its proven neuro-regenerative effects.

Further multidimensional studies would be very beneficial since diabetes induced peripheral neuropathy is a condition involving multiple symptom which may affect autonomic function, sensation and motor function and future studies may direct towards functional outcome through this modality.

Anders et al. underwent study on Neuro regenerative and Neuroprotective effects of low-level laser and concluded that there is massive axonal sprouting and increase in various molecules such as growth associated protein – 43 (GAP- 43), calcitonin gene-related (CGRP) and transforming growth factors beta1. They concluded that laser irradiation activates the proliferation of the Schwann cells which will help in process of nerve regeneration.^[16]

Various other studies have also reported the effect of Laser irradiation in diabetic neuropathy and the physiological association related to its pathological changes provides evidence of laser irradiation facilitating collagen synthesis, altering DNA synthesis, and improving the function of degenerated neuron and also by facilitating ATP synthesis, improving serotonin and endorphins, promotion of anti-inflammatory mechanisms by reducing prostaglandin synthesis. This process of cellular alterations may also help tissue in improving local circulation, by reducing inflammation which in turn reduces pain^{[17], [18], [19]}

Peric et al^[11], and Zinman et al^[12] from their study results concluded that LLLT does not produce significant improvement in symptoms and pain associated with Diabetic polyneuropathy. In contrary this study

established a significant effect of LLLT on relieving symptoms and decreasing pain on distal symmetric polyneuropathy. In a study done by Enwemeka et al. reported that laser therapy was highly effective for tissue repair and pain relief^[20].

Morshedi et al. demonstrated that the low-level laser therapy is an effective mean of treatment for pain and inflammation to a target tissue without any adverse effects if the criteria of therapeutic parameters are followed appropriately^[21]. Similarly our study also did not show any adverse reactions to laser therapy. Considering the absence of any significant adverse event with LLLT, Further studies are needed to investigate the effect of LLLT on Distal Symmetric Polyneuropathy of varied sternness. One of the significant limitation of our study was small sample size and follow up. Upon further follow-up studies, LLLT can be a recommendable choice of modality in treating Distal Symmetric Polyneuropathy of diverse severity. Although this study demonstrated a significant improvement in pain and symptoms associated with diabetic neuropathy with low-level laser therapy, the observed trend warrants further investigation. The exact mechanism related to the progression of the condition is still debatable.

CONCLUSION

Results of the present study recommend Low-Level Laser Therapy as an effective treatment procedure for Diabetic sensorimotor Polyneuropathy in reducing Pain and relieving symptoms.

ABSTRACT

Cancer is the word that is scaring the humanity. With the increase in the consumption of tobacco and related products the incidence of Oral cancer is increasing globally. Late diagnosis, invasion and metastasis are factors that contribute to poor prognosis of oral cancer. Early diagnostic markers and targeted therapy are the need of the hour to reduce the morbidity and mortality caused owing to oral cancer. MicroRNAs are emerging biomarkers for both diagnosis and prognosis of various human cancers. The present study aimed at quantification of microRNA21 (miR-21) and expression of Bcl-2 in oral squamous cell carcinoma (OSCC) and their paired normal tissues. miR-21 was significantly upregulated in OSCC compared to its paired normals ($p < 0.00$). Increased expression of Bcl-2 was noted in miR-21 upregulated cases of oral squamous cell carcinoma. The expression of miR-21 was associated with tobacco use (smoking) and nodal metastasis. Our results suggest that miR-21 is upregulated in the OSCC and controls apoptosis by upregulating Bcl-2 gene thereby playing a major role in disease progression.

Keywords: MicroRNA, Oral cancer, Apoptosis, miR-21, qRT-PCR

INTRODUCTION

Oral cancer is a major health burden; ranking the third most common cancer in the Indian subcontinent, accounting for 30% of the global incidence of new cases per annum¹. Oral carcinoma includes the carcinomas of lip, oral cavity and oropharynx of which the oral squamous cell carcinoma(OSCC) accounts for 90% of cases². The highest risk factors of the disease include tobacco; in both smoking and smokeless forms, betel quid, areca nut and alcohol^{3,4}. Early diagnosis is still challenging in developing countries due to lack of awareness. Even with combined treatment modalities,

the five-year survival rate has remained less than 50% which can be attributed to the late diagnosis, disease spread and lack of molecular markers for early diagnosis and targeted therapies⁵.

MicroRNAs are small group of non-coding RNAs that possess the ability to regulate gene expression post transcriptionally. Though microRNAs do not code for proteins they control protein synthesis by pairing with the target mRNAs and affect the translation process. They simultaneously control hundreds of genes with their partial complementarity thereby influencing vital physiological processes from cell division to apoptosis^{6,7}. A wide range of studies have shown deregulation of microRNAs in cancer and their expression signatures are associated with tumor type, grade and clinical outcomes⁸. Located on chromosome 17q 23.2 MicroRNA 21 is a widely studied oncogenic RNA which targets various downstream regulators like Fas-L, PTEN, PDCD4, AKT, TPM1, BCL2, MMPS ETC that involve in carcinogenesis and its upregulation has been

demonstrated in hematologic and solid malignancies. Furthermore, miR-21 resists anticancer drug therapy in pancreas, colon, lung and bladder cancer⁹. Having acquired the above knowledge, we evaluated the expression of miR-21 and its target gene Bcl-2 in OSCC with a motive to evolve a clinical biomarker for oral cancer.

MATERIALS AND METHOD

Patient and tissue Samples

The study was approved by the Institutional ethical committee [IEC-N1/12/MAR/27/10] before the commencement of sample collection. Twenty-five Tumor samples and paired normal tissue were collected from the patients during surgical removal of the lesion with prior informed consent. Tissues were immersed in RNAlater (Sigma Aldrich) and stored in -40°C until further PCR analysis. Remaining lesion was fixed in formalin and routinely processed and embedded in paraffin wax blocks for IHC staining. The clinic-pathological data was obtained from the medical records department. (Table 1)

Quantitative Reverse Transcription PCR

The tissues were homogenized with 1ml of trizol (Invitrogen) and the total RNA extracted was quantified using Nano Drop 2000 Spectrophotometer (ThermoScientific). cDNA was synthesized from 1µg of total RNA using stem loop RT primers with primescript RT kit (Takara Bio Inc-Japan). The PCR amplification was performed using the Applied Biosystems 7500 Real-Time PCR Detection System according to the manufacturer's instructions. Primers for mir21 was 5'-UAGCUUAUCAGACUGAUGUUGA-3'. U6(snRNA) was used as reference gene for normalization. Results were expressed as mean and standard deviation. Standard curves were generated and the relative amount of miR-21 was normalized to U6 snRNA. We analyzed the expression levels of miR-21 in Oral cancer tissues relative to non-tumor controls using the 2- $\Delta\Delta C_t$ method (Livak method). When the fold value was >1, there was an increased expression of miR-21 in the cancer tissues compared to their non-tumorous counterparts.

Immunohistochemistry

The tissue sections were deparaffinized in xylene and dehydration in a series of absolute alcohol each for 5 min. Peroxide block (Biogenex life sciences Pvt Ltd)

was used to block endogenous peroxide and antigen was retrieved using pressure cooker. The Sections were incubated with rabbit monoclonal antiBcl-2 primary antibody (clone-100) (Biogenex life sciences Pvt Ltd) for 45 mins at 25°C followed by secondary antibody for 30 minutes. Subsequently the sections were washed, stained with DAB chromogen, counterstained with Harris hematoxylin, dried and mounted with DPX. Tonsil tissue sections were used as positive control. An internal negative control was used to validate the staining.

In the Bcl2 positive cells the antibody stained the cytoplasm brown against a blue background. The staining was scored as 0 (negative staining), 1+ (mild), 2+ (moderate) and 3+(intense). The slides were scored by two pathologist and H (Histo) score was calculated for all the sections¹⁰.

Statistical Analysis

All the statistical analysis was performed using SPSS software version 17.0. The values were represented as mean and standard deviation. Correlation between miR-21 expression and the clinic-pathological features was analyzed using chi-square test. The interobserver variation was calculated with Cohen's kappa coefficient. Kruskal-Wallis Test was performed to calculate the fold change in microRNA expression. A p-value less than 0.05 was considered statistically significant.

RESULTS

Expression of miR-21 in OSCC patient

Only 23/25 samples were quantified by PCR analysis. 2 samples did not work even after multiple trials. The study results showed a significant upregulation ($p < 0.00$) of miR-21 in OSCC tissues relative to its adjacent normal samples. With a relatively stable expression of miR-21 in the paired normal tissue, a mean fold change of 17.39 was noted in its expression in the OSCC samples ($p < 0.000$). (Figure 1)

Immunohistochemistry

Bcl-2 expression was higher in tumor tissues compared to normal ($p < 0.02$). About 92.3% of miR-21 upregulated cases showed a positive expression for Bcl-2 with a highly significant miR-21/ Bcl-2 ratio ($p < 0.000$). Though 40% of normal tissues were positive for Bcl2 only the basal cells of the epithelium showed the expression of the protein. (Figure 2) The interobserver

variation or the measurement of agreement (kappa score- 0.828 & 0.940) between the observes was statistically analyzed and was highly significant (p < 0.000)

Association of mirR-21 and Bcl-2 expression and clinical features:

We also analyzed the association between miR-21 and Bcl-2 expression with the clinico-pathological parameters. The mean age of the samples was 55.16 years with 19 males and 6 females. A significant upregulation of miR-21 was noted among men (76.5%) compared to women (p < 0.001) and miR-21 expression was strongly associated with smoking (p < 0.001). Though it was not statistically significant it was observed that patients with moderately differently OSCC(MDOSCC) exhibited higher expression of miR-21(77.8%) compared to other grades of tumor. upregulation of miR-21 was noted in tumors with nodal metastasis (p < 0.007). Expression of Bcl-2 was higher in men (73.7%) (p < 0.01) and smokers (91.7%) (p < 0.002) and increased significantly with increasing grade of nodal metastasis (p < 0.006). There was no correlation between the age, tumor site, tumor size and tumor grade with the Bcl-2 expression. (Table2)

DISCUSSION

MicroRNAs are novel gene regulators that play major role in development and physiology¹¹. Studies have shown that miR-21 is significantly upregulated in head and neck cancers and is associated with disease progression and patient survival¹². In this study we analyzed the expression of miR-21 in OSCC and found that it is significantly overexpressed in tumors compared to its paired normal proving a possible role played in the initiation of the disease. A similar study conducted on laryngeal SCC published results which demonstrated a significantly higher expression of miR-21 in cancer tissues than the normal tissue which was consistent with our data¹³. miR-21 was 17.39 fold elevated in OSCC than its paired normal in our study. This value is intermediate between 8.29-fold and 37.89-fold elevation in early and advance tongue SCC as reported by Li et al¹⁴.

Current Study results showed that 100% of the smokers had a higher miR-21 expression when compared to the patients who did not smoke. Smoking tobacco is one of the major risk factors for OSCC and recent study by Zhang et al has demonstrated a nicotine induced upregulation of miR-21 in esophageal cell line by targeting the EMT transforming growth factor beta (TGF- β)¹⁵. Thus it can be hypothesized that upregulation of miR-21 could be one of the process by which tobacco initiates oral carcinogenesis. In addition to tumor initiation, miR-21 plays a vital role in cancer cell migration, invasion and lymph node metastasis¹⁶. Our study showed that patients with lymph node metastasis exhibited higher expression of miR-21 suggesting that

miR-21 is related to cancer progression as demonstrated by Li et al in tongue Squamous cell carcinoma. Over-expression of miR-21 promoted proliferation, migration, and invasion of colorectal cancer cells which could be the justification for increased lymph node metastasis in miR-21 upregulated cases of our study¹⁷. In relation to the grade of the tumor and microRNA expression, it was found that the miR-21 expression was higher in MDOSCC and PDOSCC whereas WDOSCC cases showed comparatively low expression of miR-21. This kind of expression pattern suggests the role of miR-21 in the progression of the disease and eventually poor prognosis.

Evasion of apoptosis aids in cancer cell survival. Upregulation of miR-21 is indirectly involved in apoptosis by regulating the genes that are responsible for these processes in a variety of tumors¹⁸. Knockdown of miR-21 in glioblastoma cells triggered an increase in apoptotic cell death, suggesting that miR-21 acts as an anti-apoptotic factor¹⁹. Bcl-2 is a gene that codes for a specific protein that inhibits apoptosis. Our results showed an increased expression of Bcl-2 (60%) in OSCC compared to the paired normal tissue (48%). About 90% of the miR-21 upregulated cases showed positive expression for Bcl-2 which proves an association between the genes. MicroRNA 21 upregulation increased the expression of Bcl-2 and miR-21 knockdown induced apoptotic cell death in lung Squamous cell carcinoma cells²⁰. Inhibition of miR-21 resulted in significantly lower levels of Bcl-2 protein in human gastric and pancreatic adenocarcinoma cells^{21,22}. Our study proves that Bcl2 is a direct target for miR-21. These data suggest that miR-21 exerts a potential role in oral carcinogenesis

CONCLUSION

In conclusion, miR-21 promotes oncogenesis and is overexpressed in oral squamous cell carcinoma tissues compared to their adjacent normal tissue. Increased expression of anti-apoptotic gene Bcl-2 is noted in miR-21 upregulated cancer tissues suggesting its possible role in evading apoptosis thereby favoring cancer progression. Higher lymph node metastasis in miR-21 positive cases addresses the role of this microRNA in tumor invasion and metastasis. Therefore, miR-21 can be considered as important clinical biomarkers for OSCC and their implications in targeted therapies is a new avenue for Oral cancer research.

²Associate Professor, Department of MBA, Vidya Knowledge Park, Meerut

ABSTRACT

Online Shopping in India is an emerging trend for marketers for promoting their merchandise in a wide geographical area using the Internet. India acquired 283.8 million Internet users by 2017. India is now the third largest Internet user after the U.S. and China. Lack of trust is the biggest obstacle to the success of online shopping. The present study focused upon the relationship of trust antecedents with consumer trust and consumer trust with online shopping activities with the help of cross-sectional survey conducted in Delhi. Structural equation modeling (SEM) was used to achieve the results of this research. The results revealed that knowledge and privacy protection did not have a significant relationship with consumer trust. The results revealed that security protection, perceived risk, and perceived benefits are very important antecedents for building trust among the consumers towards online shopping. Consumer trust was found to have a significant relationship with online shopping activities. Finally, some useful implications have been offered for the marketers at the end.

Keywords: Online shopping, privacy, security, risk, and online trust.

INTRODUCTION

Online shopping has become very popular for the consumers. This is the new and innovative pattern of shopping. It is not only provides a wide range of products to the consumers, but it also offers a huge market and business opportunities. In the past 05 years, there has been rapid expansion of the Internet and huge growth of Internet users.

Review of Literature

(1) Internet in India: The Internet performs an imperative role in enhancing the level of convenience and novelty. The application of the Internet is boosted significantly due to the speed and level of comfort. It has gained importance as a way of marketing and promotion. It provides a common platform of business transactions for sellers and buyers (Joshi & Achuthan, 2016)¹. This has given a new dimension to marketing. India gained 290 .8 million Internet users by 2017. India is now the third largest Internet user after the U.S. and China.

(2) Online Shopping: Online shopping is a form of electronic commerce in which a customer buys a products or service by using the Internet instead of going to a traditional brick and mortar store. E-web store,

e-shop, Internet shop, online stores are the alternative names of online shopping (Padmanabh, Jeevanda, & Jose, 2016) ²

Online shopping becomes popular during the Internet boom in 1999-2000. Amazon.com is the first online bookstore. It was founded by Jeff Bezos and created a history by becoming the first bookstore with presence only on the Internet. In India, online transactions are only 8%; whereas, internationally, it is 18%. Hence, there is a lot of potential for the growth of online shopping; 8 million Indians are shopped online in 2018 (Chellappa, R.K. & Pavlou, P.A, 2012)³

OBJECTIVES OF THE STUDY

To examine the relationship between knowledge, privacy protection, security, protection, and trust in online shopping.

To ascertain the relationship between perceived risk, perceived benefits, and trust in online shopping.

To examine the influence of consumer trust on online shopping activities.

To develop and validate a comprehensive model on

consumer trust in online shopping activities

Hypothesis of the Study:

H1: Knowledge is positively associated with consumer trust in online shopping.

H2: Privacy protection is positively associated with consumer trust in online shopping.

H3: Security protection is positively associated with consumer trust in online shopping.

H4: Perceived risk has a significant relationship with consumer trust in online shopping.

H5: Perceived benefits have a significant relationship with consumer trust in online shopping.

H6: Consumer trust in online shopping is positively associated with online shopping activities.

Research Methodology and Data Collection

To test the theoretical framework, we examined the influence of trust on online shopping activities. The research participants were online shoppers of Delhi. The research study follows the descriptive research design. A thorough literature review has been done on online shopping in order to identify the antecedents of consumer trust in online shopping. A sample of 300 respondents participated in the study. A well structured and undisguised questionnaire was used for primary data collection. The respondents were requested to assign ratings on a 5-point likert scale from 1=strongly disagree, 2=disagree, 3=neutral, 4=agree, 5=strongly agree. A total of 400 responses were received. After eliminating incomplete and inappropriate responses, a total of 300 usable responses were included in the sample

Table 1. Discriminant Validity

Constructs	Knowledge	Privacy Protection	Security Protection	Perceived Risk	Perceived Benefits	Consumer Trust	Online Shopping Activities
Knowledge	0.80	0.071	0.297	0.194	0.061	0.244	0.036
Privacy Protection		0.56	0.154	0.244	0.037	0.089	0.187
Security Protection			0.70	0.532	0.129	0.272	0.329
Perceived Risk				0.65	0.298	0.266	0.251
Perceived Benefits					0.84	0.228	0.074
Consumer Trust						0.92	0.089
Online Shopping Activities							0.89

for construction validation and hypotheses testing.

Reliabilities and Validation: This study measures the seven constructs including knowledge, privacy protection, security protection, perceived risk, perceived benefits, consumer trust, and online shopping activities.

Reliability: Cronbach's alpha value was calculated in order to measure the reliability of these constructs. The Cronbach's alpha of knowledge, privacy protection, security protection, perceived risk, perceived benefits, consumer trust, and online shopping activities are 0.793, 0.789, 0.883, 0.874, 0.938, 0.899, and 0.929, respectively. The construct reliabilities are all within the accepted range, exceeding 0.70.

Content Validity: To ensure content validity, a thorough review of the literature on the subject of the study was conducted. The questionnaire was also pilot tested by expert's review, after which necessary changes were made to improve both content and clarity of the questionnaire.

Construct Validity: Construct validity was examined by assessing convergent validity and discriminant validity. Convergent validity is considered acceptable when all item loadings are greater than 0.50. The cumulative percentage of variance explained by each factor was greater than 63% for all constructs.

Discriminant Validity: The average variance extracted (AVE) can also be used to evaluate discriminant validity. Discriminant validity is checked by examining whether the correlations between the variables are lower than square root of the average variance extracted. All square roots of each AVE value are greater than the off diagonal elements as indicated in the Table 1. It indicates discriminant validity among variables.

Data Analysis and Results

To test the proposed research model, and for the data analysis of both the measurement model and structural model, we used structural equation modeling (SEM). AMOS analyzes structural equation models, including measurement and structural models with multi item variables.

(1) Demographic Profile of the Respondents:

The profile of the respondents is shown in the Table 2. A judgmental sample of 300 respondents was surveyed and their demographics comprised of the following:

Gender Wise: Male respondents: 166 (55%) and female respondents: 134 (45%). Mean is 1.45 and the standard deviation is 0.498.

Age Group Wise: 17-25 years: 64 respondents (21%); 26-35 years: 113 respondents (38%); 36-45 years: 77 respondents (26%); and 45 & above years: 46 respondents (15%). The mean is 2.35 and standard deviation is 0.982.

Occupation Wise: Employees: 95 respondents (32%); Business owners: 111 respondents (37%); Students: 43 respondents (14%); and other occupations: 51 respondents (17%). The mean is 2.17 and the standard deviation is 1.056.

Income Wise (in INR): Below 4 lakhs: 94 respondents (32%); 4-8 lakhs: 91 respondents (30%); 8-12 lakhs: 75 respondents (25%); and 12 lakhs & above category: 40 respondents (13%). The mean is 2.2 and the standard deviation is 1.029. The demographic profile of the respondents is summarized in the Table 2.

Table 2. Demographic Profile of the Respondents.

Categories	Sub categories	Frequency	% age	Mean	Standard Deviation
Gender	Male	166	55	1.45	0.498
	Female	134	45		
	Total	300	100		
Age	17-25 yrs	64	21	2.35	0.982
	26-35 yrs	113	38		
	36-45 yrs	77	26		
	45 & above	46	15		
	Total	300	100		
Occupation	Employee	95	32	2.17	1.056
	Business owner	111	37		
	Student	43	14		
	Other	51	17		
	Total	300	100		
Income	Below 4 lac	94	32	2.2	1.029
	4-8 lac	91	30		
	8-12 lac	75	25		
	12 & above	40	13		
	Total	300	100		

(2) Structural Equation Modeling (SEM):

The study developed a theoretical model to study the influence of consumer trust on online shopping activities in Delhi. To confirm whether the following constructs: Knowledge, privacy protection, security protection, perceived risk, and perceived benefits measure consumer trust and consumer trust measures online shopping activities or not, confirmatory factor analysis was used. Confirmatory factor analysis (CFA) was conducted by using AMOS Statistical Software Package version 18. The method adopted in CFA was maximum likelihood extraction to estimate the CFA model. Various goodness-of-fit measures can be produced by CFA by which a model can be evaluated. CFA is the base of measurement modeling in SEM.

(i) Measurement Model:

The present model examines the various relationships among the measures of constructs including: knowledge, privacy protection, security protection, perceived risk, perceived benefits, trust, and online shopping activities. The value of chi square, degree of freedom, Normed chi square, and other model fit indices including: RMR (root mean residual), GFI (goodness of fit index), AGFI (adjusted goodness of fit index), CFI (comparative fit index), and RMSEA (root mean square error of approximation) are calculated.

The values of RMR, GFI, CFI, and RMSEA are

close to the threshold level. The value of RMR (0.057) is close to 0. The values of GFI (0.755), CFI (0.820), and RMSEA (0.104) reach the cut off criterion. The Normed chi square value is close to the threshold level, but is not satisfactory, and the p-value (0.000) shows the significance. These model fit indices are very important to be taken into consideration because based on these model fit indices values, we were able to ascertain whether the model is fit or not. These values can be improved. Therefore, it leads to another modification of the measurement model.

Further validation of the measurement model was done with the following constructs: Knowledge, privacy protection, security protection, perceived risk, perceived benefits, consumer trust, and online shopping activities. One item of knowledge (K2) has low regression weight less than 0.5. This item is deleted from the model. All the remaining items have regression weight less than 0.5. This item is deleted from the model. All the remaining items have regression weight more than 0.5, so there is need to delete only one item.

The Table 3 shows the values of RMR, GFI, AGFI, RMSEA, and Normed chi-square that are essential to check the model fit. There are different cut off criteria for each value. The model comprising the measurement items shows adequate fit – RMR (0.058) close to 0, CFI (0.823), and RMSEA (0.107).

Table 3. Fit indices of Multiple Group CFA Analysis for the Measurement Model

GOF Index/Absolute Measure	Measurement Model 1	Measurement Model 2
χ^2 (chi-square)	1396.835	1338.394
Degree of Freedom	329	303
Probability	0.000	0.000
GFI	0.755	0.755
RMSEA	0.104	0.107
RMR	0.057	0.058
Normed chi-square (χ^2/df)	4.24	4.41
Incremental fit Measures/CFI	0.820	0.823
Parsimony Measures/AGFI	0.698	0.694

There are small changes that occur in the values because only one item was deleted from the model; otherwise, all the values reached the cut off criteria and are significant at p-value. Next was to evaluate the psychometric properties of the model in terms of reliability, convergent validity, and discriminant validity. The AVE value is 0.5, which meets the cut-off criterion.

(ii) Structural Model: Once the validity of the measurement model has been done, then we moved to ascertain the validity of the structural model. Structural theory explains the transition from the measurement model to the structural model in a series of relationships among constructs.

The structural model examines the specifying relationship of the constructs and the nature of each relationship. The relationship between the different variables is represented by a two-headed arrow, but in the structural model, it shows a dependence relationship and a single headed arrow represents it. After employing structural equation modeling (SEM), we need to confirm

the relationship between knowledge, security protection, privacy protection, perceived risk, and perceived benefits with consumer trust.

The preliminary analysis of the structural model was tested upon with the final items of the measurement model II. Knowledge, privacy protection, security protection, perceived risk, and perceived benefits are in a relationship with each other. This is shown by covariances between them. This leads to consumer trust and consumer trust further leads to online shopping activities. The model was tested like this for achieving different model fit indices.

Table 4. Fit indices of Multiple Group CFA Analysis for the Measurement Model

GOF Index/Absolute Measures	Measurement Model 1	Measurement Model 2
χ^2 (Chi-square)	1484.083	819.938
Degree of Freedom	309	215
Probability	0.00*	0.000*
GFI	0.738	0.825
RMSEA	0.113	0.097
RMR	0.106	0.085
Normed chi-square(χ^2/df)	4.8	3.6
Incremental fit Measures/CFI	0.799	0.859
Parsimony Measures/AGFI	0.680	0.694

*5% Level of Significance

The Table 4 shows the parameters, which are considered in declaring the overall model, fit. The values of the parameters are close to the threshold levels. The values of chi square, degree of freedom, Normed chi-square, and other model fit indices including: goodness of fit index (GFI), adjusted goodness of fit index (AGFI), root mean residual (RMR), comparative fit index (CFI), and root mean square error of approximation (RMSEA) are examined. It can be seen from the Table 4 that the values of RMR, GFI, and RMSEA are close to the threshold level and the p-value (0.000) shows significance at the 5% level.

However, the other fit indices could not close enough to conclude the fitness of the model. Hence, the above values can be modified to re-specify the above

model. Where RMR is close to 0, RMSEA is less than 1, and the Normed chi-square value should be near to 3, but the Normed chi square value is 3.6, which is very close to the threshold level, and which is significant at p-value (0.000). All other model fit indices are also very close to the threshold level and thus, they represent a moderate fit and are significant. The factors loading along with reliability are very high for all the constructs.

DISCUSSION

This study proposed six hypotheses. The H1, H2, and H3 hypotheses help to achieve the first objective of the study, that is, to examine the relationship between knowledge, privacy protection, security protections, and consumer trust in online shopping. H1 helps to examine the relationship between knowledge and trust in online

shopping; H2 helps to examine the relationship between privacy protection and trust in online shopping; and H3 helps to examine the relationship between security protection and trust in online shopping. The results reveal that H1 is rejected, which implies that knowledge is not positively associated with trust in online shopping. Next, H3 is accepted, which implies that security protection is positively associated with trust in online shopping.

The hypotheses H4 and H5 helps us to achieve the second objective, that is, to examine the relationship between perceived risk, perceived benefits, and trust in online shopping. The hypothesis H4 supports that perceived risk has a significant relationship with consumer trust in online shopping. Hypothesis H5 supports that perceived benefits have a significant relationship with trust in online shopping.

The last and the sixth hypothesis, H6 helps us to achieve the third objective, that is, to examine the relationship of consumer trust with online shopping activities. The results of this study show that trust is positively associated with online shopping activities. The last objective to examine the influence of consumer trust on online shopping activities is fulfilled by the R-square value.

CONCLUSION

The results reveal that knowledge and privacy protection are not positively associated with consumer trust. It means there is no effect of knowledge and privacy protections on the consumers' trust. Security protection is positively associated with trust with intention to increase online shopping Activities; perceived risk has a significant relationship with consumer trust in online shopping; perceived benefits are also found to have a significant relationship with trust in online shopping; and consumer trust is positively associated with online shopping activities. Thus, the model and results have many important implications for merchants who wish to build their online businesses by increasing consumer trust.

Managerial Implications

Online vendors can distribute free samples or free subscription for the online shoppers to test their products or services.

The research findings provide data to the marketers about the importance of perceived risk in online shopping.

Security protection is importance to build consumer trust in online shopping.

Managing online customer reviews and feedback are another way to build trust among the customers.

After sales services to the customers can lead to the formation of a magical relationship with customers.

ABSTRACT

Objective: Methyl methacrylate (MMA) monomer is one of the most widely used chemical in the dental laboratory and handled frequently by dental students. This study was done to assess the knowledge, awareness and handling practices of MMA among the undergraduate dental students of the Faculty of Dentistry, Melaka Manipal Medical College and Manipal College of Dental Sciences, Manipal of Manipal Academy of Higher Education, Manipal.

Methodology: The study sample comprised of 273 dental students. A validated questionnaire with questions pertaining to the knowledge about MMA, facilities of the lab where MMA is handled, personal protective aid to be used while manipulating MMA and any history of allergic experience was distributed among the students. Frequency of response to individual question in the questionnaire was analysed.

Results: 81.2% of the students who participated in the study were aware of the allergic potential of MMA and 89.8% were aware of its highly inflammable nature however, 92.7% were not aware of its neurotoxicity. 64% of the participants were aware of the ventilation system in the lab. 60.4% were aware of the proper storage method and 30.7% of proper disposal technique. More than half of the subjects used safety goggles (62.6%) and gloves (53.4%); but less than half of them used lab coat (21.9%) and mask (29.6%) while handling MMA and 71% of them changed the gloves every day.

Conclusion: Most of the students were aware of the facilities available in their laboratory, protective equipment required while handling and proper storage method of MMA. However, dental students need to enhance their knowledge of Methyl Methacrylate (MMA) in terms of its route of exposure, local and systemic side effects and proper disposal methods.

Keywords: Methyl methacrylate, MMA, protective equipment, dental laboratory,

INTRODUCTION

Acrylic resin is used for a variety of applications in dental laboratories. Its major use is in the fabrication of complete or partial dentures. Acrylic resin is

supplied in a variety of forms, such as powder: liquid, gels, and sheets. The powder-liquid system of methyl methacrylate (MMA) is the most common form used in dental laboratories¹. The liquid monomer is a clear, colourless, and flammable chemical and has strong odour described as acrid or pungent². MMA has been reported as a lung, skin, and eye irritant³, and causes mild axonal degeneration of digital nerves when handled with bare hands before polymerization⁴. In animal studies, after chronic oral exposure to high concentrations of MMA monomer systemic effects, including damage to the central nervous system and liver have been noted⁵. In the

Associate Professor, Faculty of Dentistry, Melaka Manipal Medical College, Manipal Academy of Higher Education, Manipal – 576104, Karnataka.

Mobile no : 9740824678

dental laboratory setup, the primary route of exposure of MMA is inhalation⁶.

The toxicity of MMA has been largely studied. However, not many studies have been conducted to assess the knowledge and awareness of handling Methyl methacrylate monomer among dental students. The aim of this study was to thus to assess the awareness and handling practices of acrylic resin among dental students of Melaka Manipal Medical College and Manipal College of Dental Sciences, Manipal.

MATERIAL AND METHOD

A descriptive cross-sectional study was conducted

with the help of a validated questionnaire among the undergraduate dental students of Melaka Manipal Medical College and Manipal College of Dental Sciences, Manipal. The study was conducted among 273 dental students. Institutional ethical committee clearance was obtained for the same. An informed consent was taken from the students involved in the study. A validated questionnaire was prepared with questions pertaining to the knowledge of MMA, facilities of the lab where MMA is handled, personal protective aid to be used during the manipulation of MMA and any history of allergic experience which was then distributed among the students. Frequency of response to individual questions in the questionnaire was analysed.

FINDINGS (RESULTS & DISCUSSION):

Results:

Demography:

Among the 273 participants 76.2% (no=208) were female and 23.8% (no=65) were male.

Table 1 : Knowledge and awareness of handling Methyl methacrylate monomer

Questions pertaining to Methyl methacrylate (MMA)	Percentage of participants who gave the right response (n= 273)
Inflammable nature of MMA	89.8
Primary route of exposure (Inhalation)	55
Maximum threshold level in air (100 ppm)	48.3
Half-life of MMA in blood (10-15 hours)	52.01
Allergic nature of MMA	81.2
Neurotoxicity	7.3
Penetrates latex gloves	50.1
Storage method of MMA	64.4
Proper disposal method	37.3
Trimming of acrylic prosthesis releases monomer vapor	68.8
Presence of fire extinguisher in the lab	67.3
Presence of first aid kit in the lab	59.3
Presence of eye wash station	67.3

Knowledge on MMA (Table 1):

89.8% (no=245) of the study group were aware of its highly inflammable nature. 45% of them did not have any prior knowledge of its primary route of exposure. The accepted maximum threshold level for MMA is 100 ppm and 48.3% (no=132) of them were aware of the

same. 52.01% (n=142) participants had prior knowledge of the half-life of MMA in blood which is about 10-15 hours.

81.2% (no=222) were aware of the allergic nature of

MMA however, 92.7% (no=253) were not aware of its neurotoxicity. Majority of the participants were aware of the proper storage methods which is in a tightly closed 64.4% (no=176) amber coloured bottle 60.4% (no=165). 37.3% (no=102) aware of proper disposal method which is atomizing in a combustion chamber. 68.8% of the participants knew that monomers vapours are released during trimming of acrylic prosthesis.

Awareness of the facilities in the laboratory (Table 1):

Dental labs have windows for ventilation, but about 46% (no=126) of the participants were aware of the same.

All the dental labs have emergency facilities in the form of Fire extinguisher, First aid kit and eye wash station. 67.3 (no=184) were aware of the presence of Fire extinguisher, 59.3 (no=162) were aware of the presence of First aid kit and 67.3 (no=184) aware of the eye wash station inside the lab.

Use of personal protective aids (Table 2):

Safety goggles, Mask, Gloves and Laboratory coat are the protective aids that can be used while handling MMA. 62.6% of the total participants used safety goggles, 53.4% of them used gloves, 21.9% used lab coat and 29.6% used masks while handling MMA.

Among the personal protective equipment, 71% of them changed their gloves every day, 6.9 % once a week, 4.76% once a month and 15.3% changed it at a frequency other than the ones mentioned above. Masks were changed by 68.8% of the participants on a daily basis.

Table 2: Use of personal protective aids among dental students

Protective aids	Participants (%age)
Goggles	62.6
Gloves	53.4
Mouth masks	29.6
Lab coat	21.9

History of allergic reaction:

A small percentage of the participants (16.11%) experienced allergic reaction like irritation and skin

rashes. None of the participants had experienced any systemic effect.

DISCUSSION

Methyl Methacrylate monomer is highly inflammable and has to be handled carefully. The laboratories where MMA is handled should be equipped with appropriate fire and safety measures. In the present study, majority of the participants were aware of the fact that MMA monomer is highly inflammable in nature. The dental students should be sensitized regarding the basic fire safety procedures such as operating a fire extinguisher. Emergency contact numbers should be displayed in the right area and fire evacuation drills should be regularly conducted in order to tackle a fire in laboratory.

Safety goggles, Mouth mask, Gloves and Laboratory coat are the basic protective aids that can be used while handling MMA⁷. Approximately half the students were using safety goggles and mouth mask, but only one fourth of them were using lab coat and latex gloves. Since the primary route of exposure of MMA is inhalation, followed by direct skin contact, dental students should be advised to wear mouth masks and Polyvinyl alcohol gloves or butyl rubber gloves while handling MMA. Latex gloves are not advisable for use as monomer can penetrate it. Allergic reaction such as irritation and skin rashes were experienced by a very small proportion of the participants of this study. The use of personal protective equipment can help avoid the occurrence of allergic reactions by protection from exposure.

MMA monomer should be stored in tightly closed amber colour bottles to avoid unwanted polymerization and three fourth of the subjects knew this fact⁸. Accepted maximum threshold level for MMA in air is 100 ppm⁷ and thus is mandatory to have proper ventilation to reduce the level of MMA in the laboratory.

MMA can cause local effects such as skin rashes to severe systemic effect like neuro- toxicity. Thus, students should take measures to reduce the exposure to MMA by using personal protective aids and work in a well-ventilated setup. In this study majority of the participants were aware of the local allergic nature of MMA but not aware of its neurotoxicity.

In case of exposure to MMA the first aid procedures include the following:

If inhaled, move person into fresh air; In case of skin contact, wash off with soap and plenty of water. In case of eye contact, flush eyes with water as a precaution; If swallowed, Do NOT induce vomiting. Nothing should be administered orally to an unconscious person. Rinse mouth with water and consult a physician⁹.

In case of spillage appropriate personal protective equipment should be used and the material that has spilt over should be absorbed onto sand or vermiculite; any source of ignition must be removed from the proximity of the spill. The absorbed material must be scooped and collected in a plastic bag which is further placed into another plastic bag for double protection later to be delivered to the next chemical waste pick-up. The disposal is by atomizing in a combustion chamber⁸. One third of the participants of this study were aware of the above-mentioned procedure.

Dental labs should be well ventilated with windows and exhaust fans, vacuum suction and fume hood. The dental labs must possess emergency facilities such as the fire extinguisher, first aid kit and running water supply. One third of the students using the dental laboratory were not aware of the same.

CONCLUSION

Most of the students were aware of the facilities available in their laboratory, protective equipment required while handling and proper storage method of MMA. However, dental students need to enhance their knowledge of Methyl Methacrylate (MMA) in terms of its route of exposure, local and systemic side effects and proper disposal methods so that any incident of spillage or exposure can be handled appropriately.

In an attempt to increase the awareness and enhance the knowledge of handling methyl methacrylate among the participants an interactive session was conducted. The session comprised of briefing the students about the properties of MMA pertaining to storage, its inflammable nature and first aid measures in case of spillage and exposure with emphasis on the use of personal protective equipment while handling MMA. A bookmark containing the highlights of the session was also distributed among the participants for future reference and reinforcement.

Conflict of Interest – None

ABSTRACT

1/4th of what we eat keeps us healthy and 3/4th of what we eat , keeps the doctors wealthy is the recent highlighted quote. With developing lifestyles and its proportionate increase in stress levels leads to so many diseases. This study is focussed on the serum calcium levels as a risk factor in individuals who have recurrent ankle sprains. The serum calcium levels of 80 individuals (Male - 47, female 33) who had recurrent ankle sprains were taken as Cases and 80 volunteers were taken as the control group (1:1)who were age and sex matched with that of the cases. Chi square value was found to be 5.48 (P <0.05) which means there was an association between serum calcium level and ankle joint instability and odds Ratio value was found to be 2.22 (95 % C.I:1.07-4.60). This interpretation concludes that there is a higher likelihood of ankle joint instability associated with serum calcium deficiency. Among the 80 subjects of group I , 34 had low serum calcium levels and they were put into a follow up study and the values of the serum calcium levels were measured again. On comparison of Serum calcium mean levels in the pretest and post test among 34 patients, The mean level in the pretest was 7.59 mg/dl as compared to 8.95 in the post test. The difference in the mean levels (1.36) was statistically significant (P<0.001) ,and the recurrence rate of ankle sprain also reduced.

Keywords : Serum calcium levels, Joint instability, calcium supplements.

INTRODUCTION

Calcium accounts for 1 to 2 percent of adult human body weight. Over 99 percent of total body calcium is found in teeth and bones. With aging, fractional absorption gradually declines. Research has shown that adequate calcium intake can reduce the risk of fractures, osteoporosis, and diabetes in some populations. Dietary requirements for Ca are determined by the needs for bone development and maintenance, which vary throughout the life stage, with greater needs during the periods of rapid growth in childhood and adolescence, during pregnancy and lactation, and in later life¹⁷. Calcium (Ca²⁺) release from intracellular stores

controls numerous cellular processes, including cardiac and skeletal muscle contraction, synaptic transmission and metabolism¹⁸. Many studies have shown that an increased phosphorus (P) intake may have negative effects on the skeleton, whereas calcium (Ca) intake may have a protective effect on it. As there may be an optimal balance between the 2 in relation to bone health, interest has been focused on the dietary Ca:P ratio (Virpi Kemi May 2017) Thyroid gland with its parafollicular cells secreting calcitonin has an effect over calcium metabolism. Calcitonin is involved in helping to regulate levels of calcium and phosphate in the blood, opposing the action of parathyroid hormone. This means that it acts to reduce calcium levels in the blood. Thyroid hormones profoundly alters bone turnover by a direct action on the bone cells and by influencing calcium compartment sizes as well as flow to and from these compartments. Considering all the above factors, we can see that, the word sprain/joint instability is not a MERE word these days , but has a complexed meaning of all the above said

factors or much more influencing its occurrence and recurrence.

Aim : The aim of this present study is to find the effects of serum calcium levels on ankle joint instability

Objective : The serum calcium levels of the individuals who have recurrent ankle sprains are measured and interpreted to check if there is any significant role of calcium in determining the bone stability.

Hypothesis:

- Low serum calcium levels have considerable effect on bone instability

- Low serum calcium levels can affect bone strength and can cause recurrent ankle sprains

- Normal serum calcium levels can considerably help in reducing the chances and frequency of recurrence of ankle sprains.

MATERIALS AND METHOD

A designed prospective study was done at the Nathan Super speciality hospital , Salem, Tamilnadu , India. With the estimated odds ratio, a total of 160 patients were selected (March 2017- May 2018)by random sampling technique. They were divided into two groups. Group I who visited the hospital with the history recurrent ankle sprains (minimum 2sprains/month), group II who did not have ankle sprains, but visited the hospital for other complaints. The individuals were explained the importance of the study , the importance of calcium levels and all the potential risk factors were explained to them. The entire study was explained to the

individuals in the local language. Approximately 2ml of blood sample was obtained after getting the consent form duly signed by the individuals of both the groups. The individuals of both the groups were age and sex matched.

Inclusion criteria :Group I

Patients with recurrent ankle sprain

Age group between 25-45 years

Exclusion criteria (For both the Groups)

Pregnant women

Any congenital diseases influencing the thyroid levels

Any surgery involving the lower extremities

Individuals who are already in thyroid and calcium supplements

Any metal implants

Any fracture in the lower extremities.

who are not willing to be a participant

Limitations of the study:

Limited only to patients with recurrent ankle sprain, and age group of 25-35 years.

RESULTS

The normal human serum calcium level is found to be in the range of 8.2-10.5mg/dl ^{1,2} The results were tabulated for each group and the statistical analysis was done with the help of SPSS software.

Table I- The mean values, standard deviation, minimum and maximum values of serum calcium levels of Male and Female subjects of group I

Serum calcium levels (8.2-10.5mg/dl)	Normal	Minimum	Maximum	Mean	Std. Deviation
Male	47	7	13	9.67	1.563
Female	33	7	11	8.33	1.217

Table II- The mean values, standard deviation, minimum and maximum values of serum calcium levels of Male and Female subjects of group II

Control - Group II					
Serum calcium levels	N	Minimum	Maximum	Mean	Std. Deviation
Male	47	6.6	12.0	9.238	1.1528
Female	33	6.6	12.1	9.109	1.2360

Table III- Showing association between Serum calcium level and ankle joint instability

Serum calcium deficiency	Ankle joint instability		Total
	Yes	No	
Yes	34	20	54
No	46	60	106
Total	80	80	160

Chi square results were found to be 5.48 (P <0.05) and Odds Ratio was found to be 2.22 (95 % C.I:1.07-4.60) at 95% confidence interval.

In group I, 34 subjects had low serum calcium levels. With informed consent, the needed calcium supplements were given to them. A follow up study was done for a period of three months and again the blood samples were collected and checked for the serum calcium levels. The results were tabulated as below.

Table IV Comparison of Serum calcium levels among the patients before and after the medication

Variables	Test	Mean	SE	Mean difference	SE (Mean difference)	Paired 't'	P value
Serum calcium	Pre test	7.59	0.08	1.36	0.12	11.06	<0.001
	Post test	8.95	0.07				

DISCUSSION

Calcium is an important component of the skeletal mass of the human body, seen almost 99% in bones and 1% in the teeth. Calcium constitutes of 1% of total body weight. It is also an essential nutrient required for nerve conduction, muscle contraction, hormone and enzyme secretion, and blood clotting. Adequate calcium intake is essential for normal growth and development of the skeleton and teeth and for adequate bone mineralization^{14,15}. The values of serum calcium level may vary with various parameters like socioeconomic status³, gender differences⁹, hormonal factors etc. In

adulthood, low calcium intake has been associated with increased risk for osteoporosis, bone fractures, and falls^{6,7,8}

The risk of spraining an ankle depends on both intrinsic factors (hind foot alignment, ligament laxity, muscular force, neuromuscular control and so on) and extrinsic factors (shoes worn, type and intensity of sport, warm up and so on).^{12,13}

Coming to the group II, 14 of the subjects had low serum calcium levels, but did not show any signs of ankle joint instability. These subjects in group II may

also fall under the risk of joint instability. The values of Chi square= 5.48 (P <0.05) means that there is an association between serum calcium level and ankle joint instability. Odds Ratio =2.22 (95 % C.I:1.07-4.60). This interpretation shows a higher likelihood of ankle joint instability significantly associated with serum calcium deficiency.

There have been numerous trials and meta-analyses of calcium supplementation for fracture reduction, and associations with risk of myocardial infarction have been suggested in recent years¹⁰. In the current study, among 80 subjects of group I, 34 subjects showed low calcium levels. They were put into a follow up study for three months with needed changes in lifestyle, calcium supplements. After a period of three months, blood sample was taken again for the 34 individuals and tested for the serum calcium levels. The mean serum calcium level in the pretest was 7.59 mg/dl as compared to 8.95mg/dl in the post test. The difference in the mean levels (1.36) was statistically significant (P<0.001). There was a significant increase in the level of serum calcium and this showed that the intervention was effective. Also the frequency of spraining the ankle was reduced among the subjects.

CONCLUSION

The ankle joint also forms the main weight bearing area of the body next to the knee joint. It needs lots of factors to stabilize its proper functioning¹³. The current study shows calcium as one of the potential risk factor in recurrence of ankle sprain/ ankle instability. It also shows that there is significant increase in serum calcium levels post medication and decrease in the frequency of ankle sprains. Calcium, vitamin D are important mutual factors in strengthening the skeletal mass^{11,16}. Calcium with its role in muscular control, when checked for its normal levels periodically, can help in avoiding risk of spraining a muscle, stabilisation of joint compartment and also in muscle strengthening. Orthopaedicians should have a vision on these parameters along with other treatment procedures.

Conflict of Interest - There was no conflict of interest during the period of study

Source of Funding - None - declared

Informed Consent Form - The research was conducted after obtaining informed consent form for the

respective subjects who took part in the research (both for group I and group II)

Ethical Clearance : Declared clear and approved by the Research Department, Saveetha University (Feb 2017)

Impact of Service Quality on Customer Satisfaction Special Reference to Retail Outlets in Tamil Nadu

Varadarajan Rangarajan¹, K Thulasi Krishna²

¹Associate Professor, ²Assistant Professor, Department of Management Studies,
MITS, Madanapalle, Chittoor District AP

ABSTRACT

Retail store profitability is dependent on the conversion rate of footfalls. One of the critical aspects that consumers use to make a buy, or no buy decision is the service quality offered by the store they choose to visit. This research provides insight into relationship between demographics of consumers, specifically age group, gender, marital status, and income group. The findings of the research suggest that the top priority of consumers seems to be: Loyalty Cards, Equipment/Fixtures, Timely Home Delivery, Merchandise quality, Packaging/ labeling, Error free transactions, and Error free home delivery. Further reliability and Policy have a greater impact on consumer satisfaction. Gender and Age do not seem to impact perceived or expected quality of services at retail outlets

Keywords: service quality, SERVQUAL, RSQS, Retail, hierarchical measurement, expectation, perception

INTRODUCTION

Retailing in India has metamorphosed from an industry dominated by traditional stores to an industry that now has a mix of traditional and modern format stores. Consumers choose among these different types based on the kind of purchases, namely durables, non-durables, and white goods. They also discriminate among the stores based on purchase volume and total spend. Consumer expectations of service quality differ between traditional and modern formats, for example consumers do not expect electronic modes of payment when they visit a traditional store, whereas they expect electronic payment facility when they shop at modern stores. Similarly, consumers do not expect ambience in a traditional store but when they visit a modern format store they do expect the ambience to be good

(Air conditioning for example). Given this differences in expectations service quality becomes an important aspect of modern retail outlets.

Modern retailing has expanded quickly in the last two decades and competition has intensified in industry. It has been reported in the newspapers and magazines that modern retailers are running huge debts in order to keep themselves afloat. Many retail giants have expressed that the cost of operations is big chunk of their total cost. Operations cost includes supply chain management cost, real estate cost, and human resources cost. All these have direct linkage with the four major elements of service quality, namely, tangibles, reliability, responsiveness, and store policies. These four elements can be further divided into 18 measurement items as shown in the table below:

Table 1 : Service Quality Measurement Items

S. No.	RSQ Dimension	RSQ sub Dimension	Perception item
1	Physical aspects	Appearance	P1: This store has modern looking equipment and fixtures
2	Physical aspects	Appearance	P2: The physical facilities at this store are visually appealing

Cont... Table 1 : Service Quality Measurement Items

3	Physical aspects	Appearance	P3: Materials associated with this store’s service are visually appealing
4	Physical aspects	Appearance	P4: This store has clean, attractive, and convenient public areas
5	Physical aspects	Convenience	P5: The layout at this store makes it easy for customers to find what they need
6	Physical aspects	Convenience	P6: The Layout at this store makes easy for customers to move around in the store
7	Reliability	Promises	P7: When this store promises to do something by a certain time it will do so
8	Reliability	Promises	P8: This store provides services at the time it promises to do so
9	Reliability	Doing it right	P9: This store performs the service right the first time
10	Reliability	Doing it right	P10: In this store merchandize are available when the customer wants it
11	Reliability	Doing it right	P11: This store insists on error free sales transaction and records
12	personal interaction	Inspiring confidence	P12: Employees in this store have the knowledge to answer customers questions
13	personal interaction	Inspiring confidence	P13: The behavior of employees in this store instills confidence in customers
14	personal interaction	Inspiring confidence	P14: Customers feel safe in their transaction with this store
15	personal interaction	Courteous/helpfulness	P15: Employees in this store give prompt service to customers
16	personal interaction	Courteous/helpfulness	P16: Employees in this store tell customers when exactly services will be performed
17	personal interaction	Courteous/helpfulness	P17: Employees in this store are never too busy to respond to customer’s request
18	personal interaction	Courteous/helpfulness	P18: This store gives customer individual attention

Source: Researcher’s Compilation

Given this linkage to the operations costs, it is pertinent that retailers focus on these in order to extract maximum mileage for their investment. This translates into providing superior service quality. Excelling on all the areas of service quality could be a vision but seldom achievable. Hence the best option for retailers is to match the expectation of the consumers in the areas of service quality that matter most to them. Differently said retailers need to identify service quality aspects that

consumers use to differentiate between stores. In order to facilitate this process this research attempts to identify the store attributes that are used by consumers to choose shops for fulfilling their wants.

Literature

Economic activities performed to fulfil needs of one party to another are called services. Commonly services are time bound and result in satisfying some needs of the recipients. Services comprise financial

exchange, expense of resources such as time, and effort. Customers' expectations from service providers include value from goods, labor, specialized skills, amenities, networks, and arrangements. While service encounters result in fulfilment of customer expectation but do not involve change of ownership of physical components involved. The essential feature of services is the ubiquity of intangible elements and the absence of ownership exchange.

Services quality is measured as a gap between customers' expectation and what is actually provided by the services provider. Services are an essential component of many businesses and retail business is no exception. services play a major role in retail ecosystem towards customer satisfaction and loyalty. While quality of goods can be measured easily based on the performance of the goods and their attributes, the same is not true for services due its intangible nature. Further, the fact that expectations vary from one customer to another, the situation becomes even more complex. In view of the supremacy of intangible components, services quality measurement includes subjective and objective methods. Hence service quality measurement is an indirect measurement of customer satisfaction. Subjective methods of measuring service quality are critical incident method, SERVQUAL, and Relevance method. SERVEQUAL or a modified version of it is most widespread method used by researchers. Objective elements of service quality can be divided into primary processes and secondary processes. In the primary process, service encounters of customers are observed. In the secondary, countable factors such as numbers of customer complaints or numbers of goods returned are evaluated to make inferences about service quality.

Numerous models have been developed to measure customer perception of service quality. Most of these models employ direct interaction between customers and the personnel of the service providers. As per Lewis and Booms¹ (1993) "service quality is a measure of how well the service delivered matches customer expectations". Conceptually service quality is defined as the over-all conclusion or outlook relating to the excellence or superiority of the service² (Parasuram et al., 1988). It encompasses the evaluation of customer expectation against customer perception of actual service performance³ (Parasuram et al., 1985, 1988). They have developed a measurable scale termed SERVQUAL, in which, five dimensions namely –

Tangibles, Reliability, responsiveness, Assurance, and Empathy. The SERVQUAL instrument has been widely recognized and applied to various service settings such as health care, large retail chains, banks and restaurants. However, the generalizability of the dimensions of SERVQUAL across different service industries has been questioned. Further, the two-battery tool to measure expectation and perception has been viewed as inapt in terms of scale reliability and questionnaire length⁴ (Carman, 1990). Although SERVQUAL has been empirically tested in a number of studies involving pure service such as banking, credit card service, etc. it has not been successfully adapted to and validated in a retail store environment⁵ (Dabholkar et al., 1996) they reason that a measure of retail service quality must capture additional dimensions. As a result of numerous focus groups experiments, they have developed the RSQS (Retail Service Quality Scale) that includes the 4 dimensions namely – Physical Aspects; Reliability; Personal Interaction; problem solving; and Policy. They believe that their scale is able to serve as a analytic tool for retailers to determine which service areas need improvement so that store managers can deploy resources for improving those specific features of service quality.

Service quality has been found to be an important predictor of consumer behavior such as repeat purchase intentions, likelihood of recommendation, switching, and complaining⁶ (Bittner, 1990). Woodside et al., 1989 Significant association between service quality and repeat purchase behavior has been observed⁵. Dabholkar et al. (1996) similarly significant relationship between service quality and the likelihood of recommending and repeat purchase has also been observed⁵. Therefore, the objective of the study is to study the impact of service quality on customer satisfaction for retail shop customers in Tamil Nadu. The following are the sub-objectives of the study:

To find if customer satisfaction is independent of gender

To find if the customer satisfaction is independent of Age group to which the respondents belong

To find out the elements of retail service quality that are most relevant to the cusom

Though there is a absence of harmony on the service quality measurement concept, academicians do agree to it being multidimensional in nature and

involvement of higher order ideas^{7, 5, 4, 3, 8} (Brad and Cronin, 2001; Dabholkar et al., 1996; Carman, 1990; Parashuraman et al., 1988; Gronroos, 1984). Brady and Cronin's (2001). Findings of research on service quality suggest that customers' perceptions are a multidimensional hierarchical construct consisting of customers' overall perception of service quality, the primary dimension and the sub-dimensions. The sub dimensions are considered as first order factors of service quality construct and the primary dimensions are considered as second order factors of the service quality construct. The hierarchical approach has been adopted by many marketing academics for measuring the service quality in various service contexts such as agribusiness⁹ (Gunderson, Gray, and Akridge, 2009), airport¹⁰ services (Fodness and Murray, 2007), education¹¹ (Clemes, Gan, and Kao, 2007), electronic services¹² (Fassnacht and Koese, 2006). However, no study could be found in the literature which construes service quality in retail outlets as a hierarchical construct.

Retail Service Quality Scale (RSQS)

The retail Service Quality scale was developed by Pratibha A. Dabholkar, Dayle I. Thorpe, Joseph O. Rentz in 1996 to measure the services provided by retail outlets. The RSQS25 uses a hierarchical structure to evince customers' perceptions as well as expectations. This allows the determination of gap between the two and hence the need for improvement can be assessed. Additionally, the scale is divided into primary and secondary and sub-dimensions. The scale can be used either to study only the secondary and sub-dimension or can be used to study the overall measurement of service quality. The RSQS has the following dimension and sub-dimensions in an hierarchical fashion:

1. Physical Aspects
2. Appearance
3. Convenience
4. Reliability
5. Promises
6. Doing it right
7. Personal Interaction
8. Inspiring confidence
9. Courteous/helpful
10. Policy

Physical aspects – includes functional elements like layout, comfort and privacy and also aesthetic elements such as the architecture, color, materials and style of the store.

Reliability – a combination of keeping promises and performing services right.

Personal interaction – the service personnel being courteous, helpful, inspiring confidence and trust in customers.

Problem-solving – the handling of returns and exchanges as well as complaints.

General Policy – a set of strategies, procedures and guiding principles which the store operates

METHODOLOGY

Mall encounter method was used to run the survey using RSQS along with some demographic variables. The sample size was 750 customers who visited and completed their shopping in a modern format retail store. SPSS package was used to run a correlation analysis to discern if there are any relationship between demographics, store attributes and customer satisfaction. The results indicate a strong correlation between tangible aspects of store and customer satisfaction. It seems that tangible attributes of stores are of paramount importance to customer while choosing a store.

Exploratory factor analysis was run on the gap between expectation and perception averages along with demographics, which resulted in the extraction of 4 components consisting of Age and Marital Status as first component, Income and Average Score of Tangibles as second component, Store policy and Reliability as third component, Gender and Responsiveness as fourth component.

Further a categorical regression was run to estimate an equation relating the RSQS elements, demographics and customer satisfaction. All variables except marital status were found to be significant at an alpha of 0.05

RESULTS AND DISCUSSION

Since the variables in RSQS are measured on a 5point scale a categorical regression was deemed appropriate. The relevant tables from SPSS output are given below. The regression is highly significant with an R square of 0.65 indicating sufficiently high predictive power.

Table 2: Regression Coefficients for Customer Satisfaction Vs Gaps and Demographics

RSQS Elements	Standardized Coefficients	df	F	Sig.
Equipment/Fixtures	0.231	4	16.413	0
Layout	0.141	4	7.55	0
Aisle space	0.109	4	3.636	0.007
Packaging/ labeling	0.181	4	11.283	0
Ambience	0.112	4	3.16	0.015
Merchandise quality	0.183	4	10.71	0
Parking Space	0.136	4	6.382	0
Billing time	0.165	3	11.236	0
Error free transactions	0.18	2	12.206	0
Merchandise availability	0.159	3	11.644	0
Timely Home Delivery	0.218	3	16.128	0
Error free home delivery	0.179	3	12.235	0
Returns/ Exchanges	0.116	1	5.458	0.02
Complaint Handling	0.116	3	4.904	0.003
Operating hours	0.096	2	3.111	0.047
Accepts CC/DC	0.121	2	5.854	0.003
Loyalty Cards	0.24	3	18.657	0
Source: Researcher's Computations				
Dependent Variable: overall satisfaction				

Since all the coefficients are positive and significant it is clear that an increase in the perception about RSQS elements leads to greater customer satisfaction. The top priority of consumers seems to be: Loyalty Cards, Equipment/Fixtures, Timely Home Delivery, Merchandise quality, Packaging/ labeling, Error free transactions, and Error free home delivery

The Categorical regression output for gaps between Expectation and Perception reveals that all the

coefficients are negative indicating that an increase in gap leads to decrease in customer satisfaction. From the coefficients table it is observed that the regression coefficients for all the variables except Gender and Age are significant. Further reliability and Policy seem to have a greater impact on consumer satisfaction. Since Gender and Age are not significant it can be construed that consumer satisfaction is independent of gender and age as far as service quality is concerned.

Dependent Variable: Customer satisfaction string				

CONCLUSION

The research findings confirm that services at retail outlets are important in general and specifically Physical aspects of the store along with, Timely Home Delivery, Merchandise quality, Packaging/ labeling, and Error free transactions are important for the consumers and they seem to use these for making a selection of stores for their purchases. Further reliability and Policy have a greater impact on consumer satisfaction. In view of this it is suggested that retailers focus on creating an environment inside the store that will provide a satisfying experience for the consumers. Retailers should not focus on a few aspects of service delivery, they should manage the total shopping experience of consumers.

ABSTRACT

Aim: To assess and compare the cytotoxic potential of Chlorhexidine, Listerine and Povidone –Iodine antimicrobial agents on Chinese hamster lung fibroblast V79 cells.

Materials and Method: Chlorhexidine (0.2%), Listerine, Povidone iodine were diluted with DMEM medium under sterile conditions to obtain the required concentration. V79 cells were used for the experimental procedures. The cells were cultured in DMEM media supplemented with 10% FBS and 1% Gentamycin at 37°C in a humidified 5% CO₂ incubator. For all the assays, cells were maintained at 80-90% confluency in T-25 cm² flasks and used as per requirement. V79 cells were seeded onto 96 well plates at a density of 104 cells per well and allowed to incubate overnight at 37 °C in 5% CO₂ incubator. The following day the cells were treated with different concentrations of Betadine, Hexidine and Listerine for 12, 24 and 48 hours. Following the treatments, the drug containing media was discarded and 100µl of freshly prepared MTT stock prepared in DMEM media was added in to each well and the plates were incubated at 37°C in 5% CO₂ incubator for 4 hours. Viability was determined by the ability of the cells to reduce MTT, a water soluble tetrazolium dye to produce violet crystals of formazan. Formazan crystals formed were solubilized by the addition of 100µl of (Di Methyl Sulfoxide). Optical density which is directly proportional to cell viability, was measured at 540nm using a multi well spectrophotometer. Viability curves were plotted using origin.

Percentage cell viability was obtained using the formula given below:

Percentage viability= [(OD Test – OD Blank)/ (OD Control – OD Blank)] *100

Results: V79 cells treated with serially diluted test compounds showed a decrease in cellular viability in a concentration as well as time dependent manner. Hexidine exhibited maximum toxic effect when compared to Listerine and Betadine; betadine possessing the least toxic nature as obvious by the IC₅₀ values for different time durations.

Conclusion: Chlorhexidine was found to be most toxic when compared to Listerine and Povidone iodine. Povidone iodine being the least toxic amongst the three mouth rinse. All the compounds exhibited toxic effect in a dose dependent as well as time dependent manner. The result of this study showed that all three given mouth rinses caused V79 proliferation inhibition.

INTRODUCTION

Good oral hygiene is said to be the mirror of individual's systemic health. Maintaining good oral hygiene plays an important role in the overall systemic health and wellness of an individual. Deliberating systemic health conditions may lead to poor oral hygiene

with the associated periodontal breakdown. The oral health maintenance can be achieved by chemical and mechanical methods¹. Medicated mouth rinses offer a simple, easy and effective solution for maintenance of oral hygiene in patients whose ability to do so otherwise is compromised. Mouthwashes are commonly incorporated for oral hygiene maintenance because of their capability to inhibit dental plaque. Plaque forms initially with the accumulation of Gram positive streptococci, and continues with the deposition of gram-negative microorganisms².

Mouthwashes contain various active agents in their chemical structure that help inhibit the accumulation, growth and the enzymatic reactions of the microorganisms to help reduce their levels in the mouth³. A lot of research has been conducted documenting the ability of the mouthwashes in inhibiting biofilms⁴.

The aim of this study was to assess and compare the cytotoxic potential of three commonly used antiseptic mouth rinses on Chinese hamster lung fibroblast V79 cells.

MATERIALS AND METHOD

Chlorhexidine (0.2%), Listerine, Povidone Iodine were diluted with DMEM medium under sterile conditions to obtain the required concentrations. V79 cells were used for the experimental procedures. The cells were cultured in DMEM media supplemented with 10%FBS and 1% Gentamycin at 37°C in a humidified 5% CO₂ incubator. For all the assays cells were maintained at 80-90% confluency in T-25 cm² flasks and used as per requirement. V79 cells were seeded on to 96 well plates at a density of 10⁴ cells per well and allowed to incubate overnight at 37°C in 5% CO₂ incubator. Next day the cells were treated with different concentrations of Betadine, Hexidine and Listerine for 12, 24 and 48 hours. Following the treatments, the drug containing media was discarded and 100µl of freshly prepared MTT stock prepared in DMEM media was added in to each well and the plates were incubated at 37°C in 5% CO₂ incubator for 4 hours. Viability was determined by the ability of the cells to reduce MTT, a water soluble tetrazolium dye to produce violet crystals of Formazan. Formazan crystals formed were solubilized by the addition of 100µl of DMSO. Optical density which is directly proportional to cell viability, was measured at 540nm using a multi well spectrophotometer. Viability

curves were plotted using origin 8.

Percentage cell viability was obtained using the formula given below:

$$\text{Percentage viability} = \frac{[(\text{OD Test} - \text{OD Blank}) / (\text{OD Control} - \text{OD Blank})] * 100}{}$$

RESULTS

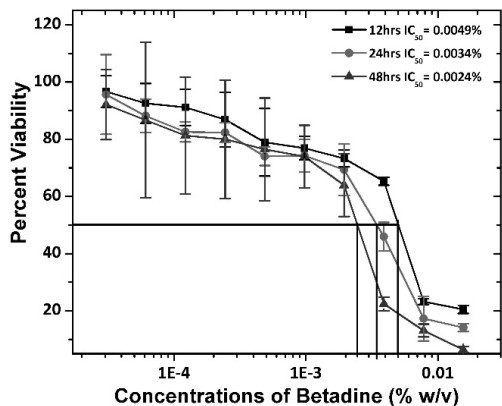

Graphs showing the response of V79 cells treated with different concentration of betadine (A), hexidine (B) and Listerine (C) for 12, 24 and 48 hours. X-axis represents log concentrations of test compounds and the Y-axis represents the % viability respectively. The present study was designed to evaluate the cytotoxicity of three different compounds namely betadine, hexidine and Listerine which are commonly used as oral mouth washes. A comparative analysis on the cell viability has been represented in Graph1,2&3. V79 cells treated with serially diluted test compounds showed a decrease in cellular viability in a concentration as well as time dependent manner. Hexidine exhibited maximum toxic effect when compared to Listerine and betadine; betadine possessing the least toxic nature as obvious by the IC₅₀ values for different time durations.

Test compounds	Inhibitory concentration (IC ₅₀) values (in %w/v)		
	12 hours	24 hours	48 hours
Betadine	49x10 ⁻⁴	34x10 ⁻⁴	24x10 ⁻⁴
Hexidine	9.2x10 ⁻⁴	4.1x10 ⁻⁴	1.9x10 ⁻⁴
Listerine	28x10 ⁻⁴	26 x10 ⁻⁴	23x10 ⁻⁴

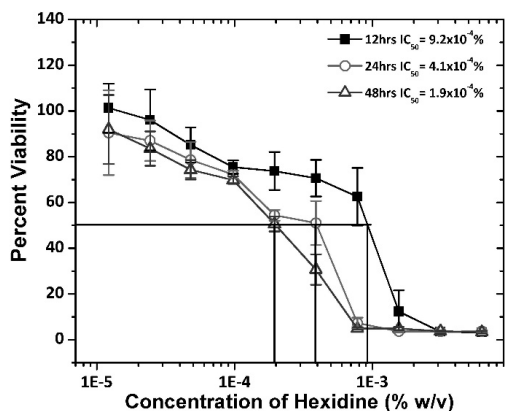

Table:1 Showing the IC₅₀ values of betadine, hexidine and Listerine in terms of %w/v.

Also, from the IC₅₀ values represented in table 1, it clearly indicates that hexidine exhibited maximum toxicity when compared to Listerine and betadine; betadine possessing the least toxic effect when compared to the other two compounds when compared for all the time durations.

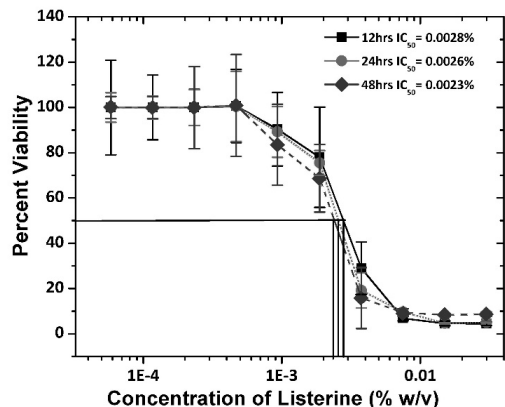

Thus, from the study the above experiment it was clearly observed that Betadine was safest when compared to Listerine and hexidine.

Graph 1: Effect of different concentrations of Betadine on the viability of the V79 cells

Graph 2: Effect of different concentrations of Hexidine on the viability of the V79 cells

Graph 3: Effect of different concentrations of Listerine on the viability of the V79 cells

DISCUSSION

Results from the study showed that Hexidine was the most toxic among the three mouthwashes even in low doses. Listerine and Betadine were comparatively

less toxic.

It was observed in this study when fibroblasts were exposed to different concentrations of Chlorhexidine, the fibroblast cell death increased as the concentrations increased. This result was in accordance with previous studies which stated that Chlorhexidine reduced gingival fibroblast proliferation in a dose-dependent manner.

Also Mariotti et al.⁴ suggested that Chlorhexidine will induce a dose-dependent reduction in cellular proliferation and that concentrations of Chlorhexidine that have little effect on cellular proliferation can significantly reduce both collagen and non-collagen protein production of human gingival fibroblast in vitro. Wilken et al.⁵ in their study have proved the in vitro cytotoxicity of Chlorhexidine on human gingival fibroblast.

It was also found in this study that Povidone–Iodine at commercially available concentration is cytotoxic to fibroblast cells. This study was in agreement with a previous study, which found that Povidone –Iodine at concentration of 5.0% to 0.05% was lethal to canine embryonic fibroblast in vitro. The findings were in accordance with studies conducted by Lineaweaver et al.⁶ and Barnhardt et al.⁷ who proved the cytotoxic effect of Povidone-Iodine on human gingival fibroblasts.

In a study conducted by Pucher and Daniel, human fibroblasts derived from oral and skin tissues were used to test the effects of chlorhexidine on viability, growth, collagen gel contractions, and total protein synthesis. The results demonstrated that chlorhexidine is highly cytotoxic to cells in vitro and various cell functions such as proliferation, collagen gel contraction, and protein synthesis are affected to different degrees by the drug⁸.

In an in-vitro study conducted by Heinz-Dieter Müller et al. exhibited the cytotoxic effects of the oral rinses. They concluded that oral rinses are heterogeneous with respect to them in vitro antimicrobial activity against bacteria and their effects on oral cell viability⁹.

There have been extensive clinical studies using Chlorhexidine, Listerine and Povidone-Iodine showing significant effect on preventing dental plaque accumulation and gingival inflammation. The results obtained in this study demonstrate the detrimental effect of these three mouth rinses on gingival fibroblast proliferation, which could interfere with wound healing.

CONCLUSION

Chlorhexidine was found to be most toxic when compared to Listerine and povidone iodine. Povidone iodine being the least toxic amongst the three mouth rinses. All the compounds exhibited toxic effect in a dose dependent as well as time dependent manner. The result of this study showed that all three given mouth rinses caused V79 proliferation inhibition.

ABSTRACT

Mobile ad hoc Network have no base station wireless network and a decentralized way for a large network¹. The network topology of MANET is in general movable, because the connectivity among the mobile nodes may change location with time due to node mobility and change communication range¹; therefore, the secure connection established between source nodes to the destination node is very difficult. Some challenges of MANET are congestion control; overhead control and established connection between intended node and recipient node and provides secure data transmission among the nodes. This paper has focused on design an efficient and adaptive subnetting hybrid gateway discovery mechanism on the basis of dynamic time to live value adjustment² such that congestion and unnecessary overhead is reduced selecting the subnet head on the basis of one parameters will increase the performance of networks and throughput of the network and provide secure communication³.

Keywords: AODV, TTL, PDR, MANET, RREQ, RREP, HYBRID GATEWAY.

INTRODUCTION

Mobile Ad hoc networks is a complex distributed system. Mobile Ad hoc networks are very useful in current Wireless Technology, it is associated to business, education, socially and in some critical applications like Military etc, The network which is self-configuring wireless links which are connected to each other. However in such Wireless Network will be more exposed to different types of security attacks⁴. Several existing protocols for handling issues of mobile ad hoc network There are three different approaches to gateway discovery first approach is proactive this approach used for the small and less movable network. In proactive routing protocol, each node maintains the information about the other nodes in the form of a table. The second approach is reactive in this approach network is movable but increases the number of nodes then increase delay for search the gateway for a route discovery. The third approach is Hybrid routing protocols in this protocol we combine the best features of proactive and reactive algorithms.⁵ Proposed protocol has to divide large networks into small sub network and each sub network has a subnet head and this subnet control all nodes those are in subnet range.

Each subnet head node broadcast the message nearest gateway and communicates to each other nodes and selection of subnet head after a periodic interval.⁶ For secure communication this paper proposed algorithm Data transmission Evidence and Report, **it contains four phases first communication phase, in which nodes communication is sessions and Evidence and token as a security for authenticating nodes which submits in the form of report to Trusted Party (TP), Classifiers phase, involves in classifying fair and cheating reports**⁷. In this approach the Subnet Members (SM) submits a report to the Subnet Head (SH) and temporarily stores Evidence as a security token. The reports contain digital signatures. The SH will verify the consistency of the SM report and updates to Accounting Centre (AC). AC will verify the uniformity of reports and clears the cryptographic operations for attacker nodes, the security tokens are requested to classify and expel the attacker nodes which submits wrong reports.^{8,9}

Voting based Subnet

Voting based subnet mechanism invalidates the attacker report through votes from valid nodes. URSA¹⁰ proposed the eviction of malicious node using

voting based. Arboit et al.¹¹ proposed scheme, where all the participating nodes can vote together. There is No Certification Authority required. The participating nodes itself will monitor the activity and behavior of neighboring nodes. The nodes with variable weight vote in URSA method. Trustworthiness of the participating node is calculated as its weight.

Non-Voting-Based Mechanism

Clulow et al.¹² proposed self destruction of node strategy, in which malicious node behavior can be evocated in one accusation. The attacker node is removed from the network by the accused node in the network. Park et al.¹³ proposed a Cluster-based certificate scheme is nonvoting based mechanism, in which the Subnet Authentication is responsible for controlling and managing those node which is enter in the sub network.¹⁴ in this scheme each participating node stores and manages its own credit account.

Methodology for the proposed protocol

Implementation for this proposed model divided into three sections- (i) In the first section we will describe adaptive hybrid subnet protocol, subnet creation, minimum dropped packets and maximum network throughput. In the second section, we will describe the proposed subnet based adaptive hybrid energy efficient algorithm for increasing the efficiency of the battery, in the third section we will describe proposed algorithm data transmission evidence and report for secure communication in a mobile ad hoc network

Proposed Adaptive Hybrid Subnet Protocol

Subnet Formation

Step1. In the beginning each node is subnet head. Initially the network contains only single node subnet and this state is aceived when the nodes in the network boot up for the first time. Node is considered as subnet Head

Step2. Each node broadcast SH subnet Hello Packet. Each node will broadcast an initial Subnet hello packet (SH). This packet is the basis for determining both the nodes in the subnet and links between the subnet

Step 3. Receiving a SH Packet node generate Subnet Hello Reply Packet SHR if both nodes are not the same member of Subnet. Subnet Hello Reply packet (SHR)

is generated by a node, n, when n receives a SH packet from a node in the same subnet as n. The SHR packet for each node is propagated back to the subnet head for that nodes subnet

Step 4. If a node in the same subnet then rebroadcast SH Packet and wait a specified amount of time.

Step 5. The node will send out a Subnet Merge Request Packet (SMR). The SMR packet is sent to a subnet Gateway and is always forwarded up to the subnet head in the recieving subnet. The receiving subnet head then must make the decision of whether or not to merge with the requesting subnet.

Step 6. The Receiving subnet head then must make the decision of whether or not to merge with the requesting subnet. If the decision to merge is reached, then the receiving subnet head will send a Subnet Merge Preapproval packet (SMP) back to the original subnet

Step 7 Receiving a SMP Packet the requesting subnet head must now decide to merge, and then a Subnet merges Approved packet (SMA) is sent. At this point, if requesting subnet head will either be the new subnet head of the merged subnet or will become the new backup subnet head for the merged subnet.

Step 8. If the requesting subnet head will remain the subnet head, then a Subnet Head Backup Packet (SBH) will be sent out to the subnet.

Step 9. If requesting subnet head will become the backup subnet head and will sent out a subnet Head Takeover Packet (SHT) and Merge Subnet A & B and SHT instructs all nodes to set the backup subnet head to be the current subnet head and to set the subnet head as the subnet head node that originated the SHT packet.

The Proposed Adaptive Hybrid Energy Efficient Algorithm [AHEEA] for MANET

THE PROBLEM FORMALIZATION

- Let $S_H = \{1, \dots, H\}$ be the set of subnet-heads,
- $S_N = \{1, \dots, N\}$ be the set of ordinary nodes to be assigned to the subnets
- Let d_{ik} =distance between subnet-head i and node k($i=1, \dots, H$; $k=1 \dots, N$)
- $r_i = d_{ij}$ when j is the farthest node controlled by subnet-head i

- Matrix $L = \{l_{ij}\}$, dimension = $|S_H| \times |S_N|$ where each entry l_{ij} represents the lifetime of subnet-head i when its radius is set to $r_i = d_{ij}$ and it covers $n_{ij} = \{k \in S_N | d_{ik} \leq d_{ij}\}$

$S_s = \{1 \dots S\}$, set of subnet-heads and $S_N = \{1 \dots N\}$ be the set of ordinary nodes to be assigned to the subnet. The lifetime is calculated according to the following equation:-

$$l_i = \frac{E_i}{\alpha r_i^2 + \beta |n_i|}$$

Where E_i is the initial amount of energy available at subnet-head i , r_i is the coverage radius of subnet-head i , n_i is the number of nodes under the control of subnet-head i , and α and β are constants.^{15 16} Considering that the limiting factor to the network lifetime is represented by the subnet-head's functioning time, the lifetime is defined by

$$L_s = \min_i \{L_i\}$$

The main objective is to maximize L_s . The Algorithm for assignment of the nodes is as follows

Step 0 Begin **Assignnodes**

Step 1 All nodes i is set of subnetwork

Step 2 calculate the initial Energy of subnet head

Step 3 Every j nodes is the member Subnetwork

Step 4 Compute $d_{ij}, |n_{ij}|, l_{ij}$

Step 5 $L_s(\text{new}) = L_s(\text{old}) = L_s$

Step 6 Difference energy $\Delta = 0$

Step 7 while($L_s(\text{new}) \leq L_s(\text{old}) - \Delta$)

Step 8 $\Delta = \Delta + 1$

Step 9 All nodes i is set of subnetwork

Step 10 Every j nodes is the member Subnetwork

Step 11 Recompute $E_i = E_i - \Delta(\alpha r_i^2 + \beta |n_{ij}|)$

Step 12 Update $l_{ij} \forall i \in S_s, j \in S_N$

Step 13 **Selectsubnet** and update L_s

Step 14 $L_s(\text{new}) = L_s$

Step 15 end while

Step 16 end **Assignnodes**

Proposed Algorithm for Data Transmission Evidence and Report

START

Step 1- Initialize node n_i in the network

Step 2- if (n_i is the source node) then encrypted message send

Step 3- $E_x \leftarrow [R, X, \text{Timestamp}, \text{Massege}_x, \text{Signature}_x(R, X, \text{Timestamp}, H(\text{Massege}_x))];$

Step 4- send (E_x)

Step 5- else

Step 6- if (($R, X, \text{Timestamp}$ are correct) and Verify ($\text{Signature}_x(R, X, \text{Timestamp}, H(\text{Massege}_x)) = \text{TRUE}$))

Step 7- if (n_i is an intermediate node) then

Step 8- Relay the packet;

Step 9- Store ($\text{Signature}_x(R, X, \text{Timestamp}, H(\text{Massege}_x))$);

Step 10- end if

Step 11- if (n_i is the destination node) then

Step 12- send ($h^{(x)}$);

Step 13- end if else

Step 14- Drop the packet;

Step 15- Send error packet to the source node;

Step 16- end if end if

Step 17- if (P_x is last packet) then

Step 18- Evidence = $\{R, X, \text{Timestamp}, H(\text{Massege}_x), h^{(0)}, h^{(x)}, H(\text{Signature}_x(R, X, \text{Timestamp}, H(\text{Massege}_x))), \text{Signature}_D(R, Ts, h^{(0)})\};$

Step 19- Report = $\{R, \text{Timestamp}, F, X\};$

Step 20- Store Report and Evidence;

Step 21 end if

Step 22 STOP

SIMULATION AND RESULTS

Aggressive research in this area has continued since then, with prominent studies on routing protocols such as AODV, DSR, TORA and OLSR.¹⁷ we evaluate the performance of AODV, OLSR, DSR, TORA and AHEEA ad hoc routing protocols in NS2 ¹⁸. In addition, the mobile nodes were randomly placed in the network to provide the possibility of multihop routes from a node to the server. The performance of these routing protocols is evaluated in terms of power consumption and routing overhead.

battery power than the other five protocols for most network sizes. Most importantly, AHEEA, the based network is more energy efficient in comparison to the other proposed adaptive subnetting algorithm. The AHEEA, protocol based network use less battery power especially in small size networks. The battery power of nodes using DSDV and OLSR protocols decreases steadily starting from fairly high levels. With an increasing number of nodes, the battery power of OLSR based networks decreases faster than those for the other protocols.

Figure 1 shows that, on average, Adaptive Hybrid Energy Efficient Algorithm (AHEEA), remaining

Figure 1: The average remaining battery power

Figure 2 shows the performance of the protocols based on data throughput. It shows that AHEEA, Adaptive Hybrid Subnet, AODV and DSR achieve comparable performance for network sizes greater than 10 nodes. However, Adaptive Hybrid Subnet shows superior performance in larger networks. In Adaptive Hybrid Energy-Efficient Algorithm, Adaptive Hybrid Subnet and AODV protocols, every node does not need

to keep information regarding the route between two nodes. This reduces the amount of signaling required for route discovery and maintenance. OLSR and DSDV both show poor performances compared to the other three protocols. This is because both are proactive protocols and require table updates that generate relatively high large Networks, especially in mobile networks, and reduces data rate performance of the network.^{19 20}

Figure 2: Comparison of data throughput for various network sizes (number of nodes)

Communication and Overhead

In secured communication the authentic nodes communicate with correct reports, thus reducing their node overhead by using light cryptographic techniques. In this approach compute between time versus packet delivered then find some malicious activity like packet drop, this approach tries to manipulate report, and submits report by reducing node overhead.

CONCLUSIONS

This Paper has presented the simulation results and comparison of existing Ad Hoc routing protocols with proposed protocols Adaptive Hybrid Sub netting Protocol and Adaptive Hybrid Energy-Efficient Algorithm (AHEEA). All the results have been presented in terms of the number of packets dropped, remaining battery power, consumed power, throughput, routing load, and dropped packets. Proposed Algorithm AHEEA, the based network is more energy efficient in comparison to the other existing protocol like AODV, DSDV, DSR, and OLSR. Simulation results and a report based submission to AC is defined to classify the fair and cheating nodes. The report based decreases the node overhead by reducing the cryptographic operations. In the case of cheaters a nodes the Evidence is requested and processed and our simulation result shows the node process low overhead Communication for submitting fair reports, the node submitting the correct reports to AC, increasing throughput by delivering the packets.

Health Information Administration, Dept. of Health Information Management, ⁴Associate Professor, Dept. of Health Information Management, School of Allied Health Sciences, Manipal Academy of Higher Education, Manipal, Karnataka, India

ABSTRACT

Privacy and Security of patient health records is a matter of concern in India, as we gradually move from manual to electronic methods of data management in healthcare. Studies on understanding the awareness about privacy and security among healthcare professionals is a method of identifying the preparedness of the healthcare team and knowing their attitude. A cross-sectional study done using a questionnaire survey among 601 healthcare professionals working in private clinics, handling patient health information, in a specific district of Southern India, showed limited awareness about privacy and security of patient health information. The limiting barriers found were mainly insufficient funds to put security measures, inadequate space, shortage of qualified health information professionals and unenforced laws. Concluding, this study definitely calls for directing attention towards creating awareness about Privacy and Security of Patient Health Information handling.

Keywords: Privacy, Security, Patient Health Records, Patient Data, Health Information

BACKGROUND

Privacy refers to those practices which keeps a patient's information protected; it is about a patient's right. Security, on the other hand, is the ability to control access and protect any patient-related information from accidental or intentional disclosures to unauthorized persons, often using various technical controls. ⁽¹⁾

Privacy and security of patient information is of great concern to the medical fraternity and the patients themselves as India rapidly transits from manual to electronic health records. Also, increased statutory regulations, and need for exchange of information between various end users of health information has

given added importance to this topic. Experts point towards the fact that these transitions have often not been matched with a legal framework on data collection, processing, analysis, dissemination, use and breaches. ⁽²⁾ Regular reporting of incidences of breach of health information all over the world, definitely points to a gap between the availability of measures to safeguard health information and supporting attitude in that direction, leaving the medical industry vulnerable to instances of regular data breach. The US Department of Health and Human Services, under which the Office of Civil Rights functions, has estimated that in the year 2015 alone there were over 100 million records that were breached. ⁽³⁾ A leading news daily reported in December 2016 about 35,000 patient records being hacked and sensitive information leaked online in the state of Maharashtra in India. ⁽⁴⁾ Similar incidences of breach of privacy were reported from other states of India as well during the recent years. ^{(5), (6)} In the light of such incidences, it is often pointed out that unavailability of separate laws governing data protection and privacy could be the major reasons. Of note here is the fact that India has various laws and acts to ensure protection and privacy

of information provided by the patient to the doctor, including that related to their personal and domestic lives, like IT Act of India 2008 and The Indian Medical Council (Professional Conduct, Etiquette and Ethics) Regulations, 2002, Consumer protection act 1986, Indian evidence act, Law of privileged communication, Law of Torts, and IPC section 52 (good faith), section 80 (accident in doing lawful acts) section 89 (for insane and children) section 90 (consent under fear) section 92 (good faith/consent), section 93 (communication in good faith), which are intended to protect the privacy and security of the patient health information. It has also been argued that these legal frameworks are seldom enforced and most importantly the lack of awareness about these acts and laws among the healthcare professions cannot be negated either.

The present study, conducted among the healthcare professionals working in clinics and nursing homes of a district in southern India, captures the awareness among the healthcare providers about Privacy and Security of patient health information.

MATERIALS AND METHOD

Study setting—Clinics and Nursing homes of a community in southern India, which has 17 nursing homes and 247 clinics, governed by the District Health Office (DHO).

Study design—A cross sectional study was carried out from February to May 2016

Study population—Doctors, nurses, allied health professionals, pharmacists, and laboratory technicians handling patient health information.

Sampling method—For the questionnaire survey, the samples were selected through convenience sampling method, employing healthcare professionals who consented for participating in the study and were available during the data collection. For in-depth interview, simple random sampling, using random number table, was used to identify the participants.

Sample size—For survey, 601 participants, consisting of 113 doctors, 320 nurses, 43 pharmacists, 76 laboratory technicians, and 49 Allied Health professionals participated and for in-depth interview, 7 participants, 2 doctors, 3 Nurses, 1 pharmacist, 1 laboratory technician and 1 physiotherapist consented to participate from the list drawn.

Exclusion criteria—Individuals not willing to participate and not handling patient health information

Data collection—Data was collected from clinics and nursing homes of a community in southern India, using a structured questionnaire. Investigator's observation and in-depth interviews supplemented the data findings. The study questionnaire was developed in English according to the objective of the study. Written consent was obtained from each participant before administering the questionnaire. The principal investigator was present throughout to explain and provide clarifications, if any, during administration. The completed questionnaires were then collected, coded and included for analysis. Observations were made and field notes were made to supplement our findings. For added information on data breach and barriers to privacy and security of patient health information, 7 participants who consented to participate were included and interviews conducted with the selected participants.

Data analysis—The data was analysed based on the study objectives using descriptive and inferential statistics, employing SPSS version 20. The data was presented in terms of frequency and percentage.

RESULT

Demographic details

Out of the total 601 respondents who participated in the study 135 (22.5 percent) were Male and 466 (77.5 percent) were Females. Mostly the Nurses, who constituted 53.4 percent of the sample size, and the Allied Health professionals were females. The healthcare professionals in this community were mostly in the age-group of 20 to 35 years, with 32 percent of respondents having work experience of 1-5 years while 23.6 percent of respondents had work experience of 6 to 10 years.

Ownership

In our survey, we found that only 3.3 percent of the respondents knew that healthcare facilities are the actual owners of the medical records/files; while 30.3 percent thought that doctors are the owners, 64.7 percent presumed that the medical records officers/managers are the owners and rest told that patients are the owners. When asked if they knew "who is the owner of health information contained in the medical records," only 2 percent (12) of these respondents knew that the patient is the owner of their own health information contained

inside the medical records maintained by the hospitals/healthcare facilities. There are laid down policies in this regard and an awareness in this regard is of utmost importance.

Privacy and Security – what does it mean to them?

More than 99 percent respondents of our study said the terms privacy and security means the same for them and 97 percent of the respondents felt that it is acceptable to discuss the details of a patient's condition freely in a cafeteria. Also, paper based medical records were found on the counter with no safety of information ensured.

The study revealed that most healthcare professionals did not bother much about these aspects. They discussed the case with other providers in presence of other patient and sometimes even carried out physical examination in the vicinity of other patients. They discussed their case in the cafeteria of their facilities and did not think it was unacceptable. The acceptance could be due to the notion that the discussion takes place to find solutions to a clinical problem. Lack of space and heavy patient load were cited as the main reasons for not being able to follow all privacy and security norms. To quote a Physician in this regard, "tending to the patient is more important for me"

Storage, Disposal and Data breach

Surprisingly, 97 percent of the respondents said that patient health information can be viewed by anyone who wants the information. According to Medical Council of India's code of ethics, chapter 1, B-1.3.2, "If any request is made for medical records either by the patients/authorized attendant or legal authorities involved, the same may be duly acknowledged and documents shall be issued within the period of 72 hours," thus making it mandatory to obtain consent of the owners of health information and restricting access to such information. ⁽⁷⁾ Though the justification given by most of respondents were that the information is only viewed by healthcare staff of their own center and this is for the continuity of the care; still making patient health information available to all increases the susceptibility to violation of patients' right to privacy of "sensitive information".

The study found that most clinics and nursing homes in this district still relied on paper-based medical records, but they have started migrating to a computer-

based system. Computers mostly had brief history of the patient and also discharge summary at many centres. Most respondents (78 percent) did not find any problem in storing patient data in computers, with or without specific security features. Many healthcare personnel were also found to operate computers without any passwords; this practice can lead to breach of privacy of sensitive information. The respondents were of the opinion that their settings are safe, and 81 percent respondents did not feel the need to have any separate internal security measures to protect Medical records in their settings. They felt that the existing measures are good enough and any additional measures would only mean additional expense. Computer-based health information is more susceptible to hacking than manual records. Rindfleisch classified privacy threats into organisational threats and systemic threats; further the National Research Council detailed the levels of organisational threats as accidental disclosure, insider curiosity, data breach by insider and data breach by outsider with physical intrusion. Strong and updated security measures are the only ways to keep patient health information safe. Section 43(a) and section 72 of the Information Technology Act provide the broad framework for the protection of personal information in India. ^{(8), (9)}

Since the medium of storage or transmission of such electronic medical record will be owned by the healthcare provider, it is the duty of the provider to notify a patient of any data breach that the nursing home or clinic comes to know about and no accidental disclosure can be neglected. Most of the respondents were aware of this fact. It is the duty of healthcare facility to notify a patient of any data breach (unauthorized access or leak) that comes to their notice. A similar incident had occurred in Sentara Healthcare, where they notified 5,454 patients regarding their data breach. The data breach affected vascular and thoracic patients who received medical services at Sentara Healthcare's Virginia hospitals between 2012 and 2015.

Campbell et.al (2007) found that around 28-35 percent of patients showed neutrality towards their health information being used by physicians for storage, disposal or other purpose. ⁽¹⁰⁾ The perspective of the healthcare professionals in our setting showed that 92 percent of them agreed that health information can be given to external agencies for storage or disposal with de-identification. This difference in the acceptance of disseminating health information to external agencies

among two different categories of population in two countries can be accounted to their awareness about the consequences of unethical use of patient health information.

India makes it illegal to disclose gender of the foetus even to the parents. According to the The Pre-Conception and Pre-Natal Diagnostic Techniques (Prohibition of Sex Selection) Act (PCPNDT Act), which prohibits the sex selection for preventing the misuse of prenatal diagnostic techniques for sex determination leading to female foeticide. ^{(11), (12)} More than 95 percent of the healthcare professionals were aware of this.

Limiting factors to privacy and security of patient health information

Observations and key themes generated from the in-depth interviews with the healthcare personnel, pointed towards some factors which are the major barriers to the practice of privacy and security at the nursing homes and clinics of this community.

Patient load: Owners of nursing homes and clinics expressed that there is ever-increasing patient load that visit them as the patients, and it is always about providing services first. They said that they hardly find time to think about any other aspect of healthcare.

Cost factor: Most healthcare professionals felt that incorporating security measures involves investing in additional infrastructure, which often leads to additional cost. Most of them felt that the patients might not be willing to pay extra and increased cost can actually result in losing clients.

Lack of knowledge on the issue: The healthcare professionals were not very clear about the issue to privacy and security. They were more worried about perfecting their documenting and reporting activities.

Lack of ownership: The clinics and nursing homes in this area rely on “Visiting healthcare professionals,” who are employed elsewhere or are freelancers and come to these settings depending on the requirements. These personnel are often less informed about the regulations that are to be adhered to and many of them even do not bother.

IMPLICATION OF STUDY

The study encompasses a multidisciplinary

group which includes doctors, nurses, pharmacists, lab technicians and other health related professionals who handle patient health information. Thus the result could be generalized for all healthcare professionals handling health information. The study also points to the fact that awareness programmes to propagate the privacy and security related issues among the healthcare professionals working in Clinics and Nursing homes are the need of the hour.

Ethical Consideration: Ethical clearance was obtained from the institutional review board of an Indian medical college prior to the administration of the survey. Permission to carry out the study was formally obtained from the District Medical Officer (DHO) of the region. Further permissions were taken from each clinic, and nursing home before approaching for the study. Written consent from the respondents were also obtained before interview, after explaining the implications. It was assured to all, that the information collected for this study will be strictly used for academic purpose only, without disclosing individual identity.

CONCLUSION

This study throws light on the existing state of awareness of the healthcare professionals working in private Nursing homes and Clinics about the ownership, storage and disclosure of patient health information. Factors like work pressure, shortage of professionals, or even outlook towards issues like privacy and security are the main barriers identified in the study. Based on the evidence generated in this study we draw the attention of public health policy makers to empower the private healthcare providers across the geographical area about the basic principles of health information handling, thus contributing to improved protection of patients’ right to privacy and security of health information. Training programs could be the immediate solutions which can empower as well as bring the change in attitude of the healthcare professionals.

Correlation between Type of Diet and Periodontal Parameters

Harshit Atul Kumar¹, Neetha J Shetty²

¹Former Student, ²Associate Professor, Department of Periodontology, Manipal College of Dental Sciences, Mangalore, Manipal Academy of Higher Education

ABSTRACT

Introduction: Investigations about the Correlation between type of diet and periodontal parameters are very few and with less sample size. The main objective of this study was to establish the possible co-relation between type of diet and Wear patterns (erosion, abrasion, attrition) periodontal status (gingival index, periodontal pocket depth), plaque index and oral health parameters along with the help of questionnaire survey.

Materials and Method: Sample sizes of 260 healthy male and female subjects within the age group of 18-50 years were equally distributed into vegetarians and non-vegetarian groups. Clinical checkup will include examination of all the parameters. A questionnaire has been prepared for the participants for assessing the oral habits, dietary habits and the knowledge of oral health care. Statistical analysis of the data was conducted using pearson chi-square tests

Results: Periodontal findings comparing both the groups were not statistically significant. In the questionnaire survey, it was found that halitosis was greater in non-vegetarians when compared to vegetarians which were statistically significant. The remaining findings were not statistically significant.

Conclusion: Type of diet does not really affect the periodontal status of an individual. Both vegetarians and non-vegetarians show almost same level of gingival index, plaque index and periodontal pocket depths with dental education slightly lower in non-vegetarians than vegetarians with equal amount of regular dental visits. However, with proper oral hygiene procedures such as vertical brushing, brushing twice daily, using interdental aids and regular dental visits alone one can maintain good periodontal health regardless of diet being followed.

Keywords: Vegetarian, Non-vegetarian, Periodontal parameters, full mouth examination, questionnaire, wasting diseases

INTRODUCTION

Relation between diet and oral health is the most basic and often controversial subject and also there are increasing number of individuals complaining about oral health. Eating habits in developed and developing countries have changed in recent years. Various food stuffs have been introduced into diet that previously did

not form a part of nutritional choices. This has resulted in an enrichment of daily diet, with the opportunity to vary foodstuffs more often and moreover this has led to the assumption, at least apparently, of wider spectrum of nutrients required for the wellbeing of the body.¹ Considering the relevance of effects of diet and food habits on oral health care, recent research reports have showed an actual co-relation between diet with that of parameters such as erosion ,attrition ,abrasion, gingivitis, periodontal status, amount of plaque etc. To understand this relation and promote better oral health , better knowledge of diet is very important.

However, there is a lack of established facts and knowledge with regard to the concerned co-relation of

diet and oral health parameters². The purpose of this clinical study was mainly to understand and establish a better pathway to improve oral hygiene among the people in society with different food habits.

MATERIALS AND METHOD

Sample size of 260 healthy male and female subjects within the age group of 18-50 years, equally distributed in both the groups (vegetarians and non-vegetarians) respectively have participated in this study. Taking into consideration the possible risk factors affecting the parameters taken for the study, the exclusion criteria were: subjects with medical disorders, undergoing antibiotic or other anti-microbial therapy.

The inclusion criteria were subjects who were smokers and alcoholics. The subjects received verbal and written information about the study.

This study was a randomized controlled clinical study which included 260 participants, divided into two groups. Clinical checkup included examination of the following parameters: wearing of teeth, plaque index, periodontal status apart from which also the other parameters like color of gingiva, depth of periodontal pockets if present, gingival inflammation, bleeding on probing, number of decayed, missing teeth ; that is a full mouth assesment².A questionnaire was prepared for the participants for assessing the habits and the knowledge of oral health care among them. This was also done to sub categorize participants under the major study groups to narrow down the results obtained to a more accurate conclusion.

Baseline data on the medical history and previous hospital visits of the participants was recorded to minimize the factors affecting the results of the study and maintain the exclusion criteria. The participants were asked to answer the questionnaire.

Following this, clinical check-up was done on subjects for all the parameters included in the study using mouth mirror, an explorer and a periodontal probe². The subjects were examined mainly for plaque to calculate plaque index, periodontal status, wearing of

teeth which included abrasion, attrition and erosion and also for other parameters such as gingival inflammation, bleeding on probing and depth of gingival pocket.

Based on the clinical check-up the participants were asked to undergo dental treatment if needed or advised to take necessary oral prophylactic measures.

Clinical assessment of plaque index and gingival index was performed on four sites (buccal, lingual, mesial, distal) of the six key teeth (FDI tooth number 16,12,24,36,32,44) according to Loe H & Silness J.³⁻⁶. Each of the sites was given a score from 0-3 depending on the severity of the gingival condition.

Periodontal pocket depth and clinical attachment loss was recorded using William's graduated periodontal probe

Statistical analysis-

The calculation of the sample size was carried out using nQuery Advisor 6.0 (Statistical Solutions, Saugas, MA, USA). The analysis showed that a sample size of 160 in each group had a power of 80%. The recorded data were documented and analysed by the data procession program SPSS 17.0 for Windows (SPSS, Chicago, IL, USA).

RESULTS

In this study, 130 healthy male and female subjects aged 18-50 years for both the groups were included as participants. The prevalence of smoking and alcohol consumption was statistically similar in both the groups, with the non-vegetarian group being slightly greater.

Mean and range values of periodontal parameters are presented in table-1. There was greater probing depth in the vegetarian group compared to the non-vegetarian group, which was statistically not significant. While comparing the plaque index, it was higher in the vegetarian group and was statistically non-significant. But, even though statistically non-significant, the gingival index was seen to be a little greater in the non-vegetarian group when compared to the vegetarian group.

Table-1: Results of T-test for plaque index, gingival index and probing pocket depth among vegetarians and non-vegetarians

	1. DIET	N	Mean	Std. Deviation	t	df	P VALUE
PI	VEGETARIAN	129	1.22062	0.473661	1.299	258	0.195
	NON VEGETARIAN	131	1.14313	0.487665			
GI	VEGETARIAN	129	1.02744	0.560884	-0.173	258	0.863
	NON VEGETARIAN	131	1.03977	0.588518			
PPD	VEGETARIAN	129	2.7669	0.677827	0.506	238.97	0.614
	NON VEGETARIAN	131	2.71626	0.920669			

The wear pattern was not same among both the groups. Vegetarians had greater amount of attrition as compared to non-vegetarian group out of which occurrence of generalized attrition was found more in non-vegetarians. The cervical abrasion was more in non-vegetarian group as compared to vegetarians. This was also associated with the increased horizontal technique of brushing seen in non-vegetarian group.

Analysis of questionnaire showed that vegetarians and non-vegetarians had similar frequency of oral hygiene maintaining practices. It revealed that both the groups had similar number of dental visits. The brushing technique among the non-vegetarian group was more of horizontal technique when compared to the vertical technique used by vegetarian which was statistically significant. Also another statistically significant finding in the questionnaire was that halitosis was a more common complaint among the non-vegetarian group when compared to the vegetarian group. Level of dental education was about the same in both the groups apart from the type of brushing.

DISCUSSION

The effects of a vegetarian diet on systemic diseases like cancer, type 2 diabetes and coronary heart diseases have been studied by various authors and revealed predominantly less systemic diseases in vegetarians.^{8,9} Studies investigating correlations between vegetarianism and oral health are rare. Most authors assessed dental

parameters or performed a saliva test.¹⁰⁻¹⁴ In this study, emphasis on effect of diet on periodontal parameters is given. A very few studies have shown effect of diet on periodontal parameters as most of them compare oral health care among vegetarians and nonvegetarians.¹⁵⁻¹⁸ Also, the studies done earlier have a comparatively smaller sample size (20-60), whereas this study has a significant sample size (n=130).

In addition, this study along with investigation of plaque score, gingival status, wear pattern have also gathered data regarding brushing technique, oral habits (smoking, alcoholism), oral hygiene practices, level of dental education and oral health problems via a multiple choice based questionnaire.

Our data indicates plaque index is slightly higher in vegetarian compared to non-vegetarian but it is not statistically significant. In our study the gingival index among non-vegetarians is slightly greater than vegetarians, yet statistically not significant. Since both the interrelated indices are inconsistent in both the groups and are almost similar, we believe that type of diet does not affect the periodontium in further causing gingivitis or periodontitis. In contrast a recent study by I Staufenbiel et al² in 2013 showed that gingival inflammation was significantly lesser in vegetarians. In addition, a study by Linkosalo et al.¹⁶ revealed less bleeding on probing in vegetarians.

There are several pathways, which may lead to less inflammatory signs. Generally, vegetarians show more physical activity and a lower BMI. Hence, the prevalence of obesity, which may cause an increased local inflammatory response is lower.¹⁹ Additionally, vegetarians consume a higher amount of antioxidants, which improves immune response,²⁰ and may lead to less inflammation.

Second, according to our study the average periodontal pocket depth in vegetarians was slightly higher than non-vegetarians. This is explained by the gingival score for vegetarians which was found slightly higher suggesting the presence of plaque causing slight loss of attachment, increasing the pocket depth. This may suggest chance of developing periodontal destruction irrespective of the type of diet and both vegetarians and non-vegetarians are equally susceptible to periodontal destruction. This is in contrast to the importance of an adequate nutrition for a healthy periodontium which was documented by Jenzsch et al.²¹ They demonstrated that solely a dietary change from non-vegetarian to vegetarian, according to the recommendations of Korber et al.²² leads to better periodontal conditions. Jenzsch et al.²¹ showed that 1 year after a dietary change without affecting dental hygiene and without dental therapy, patients had lower PPDs, less inflammatory signs and lower concentrations of interleukin-1 β and interleukin-6 in the gingival crevicular fluid.

Third, the wear pattern observed among both the groups revealed that generalized attrition was more prevalent in non-vegetarians compared to vegetarians, but attrition of selected teeth was more common in vegetarian group. However, prevalence of cervical abrasion was notably greater in non-vegetarians than vegetarians. The potential etiological factors for such non-carious cavities are not very clear but it can be attributed to improper horizontal brushing technique. Interestingly, increased use of horizontal brushing technique in non-vegetarians was seen which was statistically significant.

This is in contrast to the recent study report given by Herman et al in 2011^{1, 15}, stating that vegetarians are more susceptible to non-carious cavity. He reported horizontal brushing technique is more in vegetarians than in non-vegetarians to his conclusion. In contrast, other authors could not find a different prevalence of erosion between vegetarians and non-vegetarians.

Herman et al.²³ evaluated the prevalence of erosion and the consumption of acidic products in vegetarians and non-vegetarians. Regarding the prevalence of erosion, they could not show significant differences between the groups, although a significantly more frequent consumption of acidic products was observed among vegetarians.

Questionnaire analysis revealed equal level of dental education among both the groups and also similar frequency of regular dental visits. In contrary to this, various authors have showed higher level of dental education in vegetarians^{24, 25} and also several studies have reported a lower use of prescription medications and health services by vegetarians.²⁵ Statistically significant finding obtained from questionnaire reveals greater horizontal brushing in non-vegetarian group, this can be co-related to the increased amount of cervical abrasion seen in non-vegetarian group than in vegetarian group. This gives us quite a clear picture of how dental education is related to brushing technique which if faulty may cause cervical abrasion as seen in the non-vegetarian group.

Another statistically significant result from the questionnaire tells us halitosis was more common in non-vegetarians, which could probably arise because of the basic biochemical degradation of major component which constitutes an individual's diet. Meat being rich in protein undergoes putrefaction unlike carbohydrate that undergoes decomposition. Vegetarians usually tend to have high carbohydrate and low protein diet. When the results of smoking and alcoholism were matched in between vegetarians and non-vegetarians, both the group had similar distribution of smokers and alcoholics. This is in contrary to a study which states that Vegetarians consume less tobacco and alcohol, are physically more active and have a lower BMI compared with nonvegetarians.^{21, 22}

CONCLUSION

Type of diet does not really affect the periodontal status of an individual. Both vegetarians and non-vegetarians show almost same level of gingival index, plaque index and periodontal pocket depths with dental education slightly lower in non-vegetarians than vegetarians with equal amount of regular dental visits. However, with proper oral hygiene procedures such as vertical brushing, brushing twice daily, using interdental

aids and regular dental visits alone one can maintain good periodontal health regardless of diet being followed.

ABSTRACT

Background: Non-alcoholic fatty liver disease (NAFLD) has been reported recently as the most frequent liver disease among obese children and adolescents in industrialized countries. **Objective:** Nutritional status of obese children with and without NAFLD. **Methodology:** We studied 160 obese children of 5-18 years age. Their anthropometric, biochemical measurements and ultrasonography were carried out to identify NAFLD in them. Z-score of body mass index (Z- BMI), mid arm circumference (MAC), waist circumference (WC) and triceps skinfold thickness (TSF) were done. Serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), gamma-glutamyl-transferase (GGT) low-density lipoprotein cholesterol (LDL-c), high-density lipoprotein cholesterol (HDL-c), triglyceride (TG), cholesterol, FBG (fasting blood glucose), high sensitivity C-reactive protein (HSCRP) and uric acid were measured. Their eating habits and dietary intake were recorded. **Results:** These patients were divided into two groups: group 1: without NAFLD (n= 54) and group 2: with NAFLD (n=106). NAFLD was detected in 66.2% of obese children. Median Z-BMI, MAC, TSF, WC and ALT, AST, GGT, TG, FBG, HSCRP, uric acid were significantly higher in NAFLD group as compared to without NAFLD ($p < 0.05$). HDL-c was significantly lower in NAFLD group ($p < 0.001$). Daily consumption of soft drinks (60.4 %) and fried chips (58.5%) were more in NAFLD group than without NAFLD group. **Conclusion:** Z-BMI, MAC, TSF, WC and ALT, AST, GGT, TG, FBG, HSCRP and uric acid were significantly higher in NAFLD and HDL-c was lower but most significant associated risk factors with NAFLD were TG and Z-BMI. Calorie intake was more in obese children but excess in NAFLD group. Early lifestyle interventional approach for the treatment of NAFLD can prevent nonalcoholic steatohepatitis (NASH) and cirrhosis.

INTRODUCTION

Obesity is one of the major public health threats that is increasing worldwide. Currently, World Health

Organization (WHO) globally estimated that more than 340 million children and adolescents aged 5-19 years are overweight or obese. Overweight or obesity is most prevalent in north Indian children according to epidemiology survey conducted in different states of India and found that 19% combined prevalence of overweight or obesity.⁽¹⁾ Recent researches proved that the development of non-alcoholic fatty liver disease (NAFLD) in children is vigorously associated with

Correspondence author:

Professor & Head, School of Bioengineering & Biosciences, Lovely Professional University, Phagwara, Punjab (India)

obesity and its prevalence is up to 70-80%.^(2,3) NAFLD is the one of the common upcoming causes of chronic liver disease in pediatric population with an incidence of 3-10%.⁽⁴⁾ It is macro vesicular fat accumulation in more than 5-10% of hepatocytes and it encompasses spectrum of liver disease ranging from steatosis, steatohepatitis, fibrosis to cirrhosis.⁽⁵⁾ Sartorio et al. concluded that Z score of body mass index (BMI), serum alanine aminotransferase (ALT), uric acid, glucose during oral glucose tolerance test (OGTT) and insulin during OGTT were independent predictors of NAFLD in obese children but most predicted by ALT and Z-BMI.⁽⁶⁾ However, significantly high levels of triglyceride (TG), glucose, insulin, serum ALT, increased BMI and waist circumference (WC) are all possible clinical features of NAFLD in pediatric obesity.⁽⁷⁾ Moreover, the diet of children with NAFLD is rich in high fructose corn syrup (HFCS), meat, saturated fat and cholesterol and low in consumption of dietary fiber, fish, omega-3 fats and vitamin E.⁽⁸⁾ Excessive dietary fructose consumption in form of soft drinks is associated with NAFLD and it affects carbohydrate and lipid metabolism cause hepatic steatosis by increasing lipid peroxidation.⁽⁹⁾ HFCS (mixture of glucose: 42% and fructose sugars: 53-55%) has been directly linked with growth of fat cells, produce oxidative stress and nitric oxide synthase inhibition.^(10,11) More recently, another study showed excess intake of refined carbohydrates and sedentary lifestyle are the major significant risk factors for NAFLD occurrence in obese children.⁽¹²⁾ Central adiposity and higher BMI is widespread in Punjab, because of excessive adoption of western diets among children and poor dietary patterns may be related with pathogenesis of NAFLD. Therefore lifestyle-based intervention has emerged as cornerstone modality for the prevention of NAFLD in obese children. Before planning the dietary intervention, nutritional screening is essential in these children so that treatment could be given according to their risk factors. In present study, we assessed the nutritional status of obese children with and without NAFLD and have also highlighted the risk factors and dietary intake in them.

MATERIAL AND METHOD

A cross-sectional study was conducted from December 2016 to October 2017, 160 obese children of age group 5-18 years were enrolled on the basis of BMI ($\geq 95^{\text{th}}$ percentile) for study from schools of Jagraon city, Punjab, India. Fasting blood tests for predicting NAFLD were performed at Babe Ke Medical Hospital, Moga,

Punjab.

Inclusion criteria: 160 children of age group ranging from 5 - 18 years with a BMI of $\geq 95^{\text{th}}$ percentile for age and gender using WHO standard reference and without alcohol intake.

Exclusion criteria: Secondary obesity, patients on medications, Hepatitis B (HBV) and Hepatitis C (HCV), Hepatitis A & E infection, wilson disease, autoimmune hepatitis (AIH).

Ultrasonography (USG) (convex transducer 2-5MHz probe) was performed by radiologist by using following criteria:

1: Mild steatosis: Slightly increased echogenicity of liver parenchyma, normal visualization of diaphragm and intrahepatic blood vessels.

2: Moderate steatosis: Markedly increased echogenicity of liver parenchyma, slightly impaired visualization of diaphragm and intrahepatic vessels.

3: Severe steatosis: Severely increased echogenicity of liver parenchyma, with poor or no visualization of diaphragm and intrahepatic vessels and posterior part of the right liver lobe.

Normal liver was defined by the absence of fatty liver. On the basis of this, children were divided in two categories: Obesity with NAFLD (n=106) and obesity without NAFLD (n=54).

Nutritional Assessment: Anthropometric measurements: weight was measured by Dr. Diaz digital weighing scale to the nearest 0.1kg. Height was measured by measuring tape to the nearest 0.1cm. BMI was calculated by weight (kg)/height (m²). Z-BMI was calculated from WHO reference data.⁽¹³⁾ TSF(triceps skinfold thickness) was measured to the nearest 0.2 mm by Harpenden skinfold caliper (Holtain Ltd.). MAC (mid arm circumference) and WC (at the midpoint between the lowest rib and iliac crest) both were measured by measuring tape to the nearest 0.1cm. Laboratory measurements: Fasting serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), gamma-glutamyl-transferase (GGT) low-density lipoprotein (LDL)-cholesterol, high-density lipoprotein (HDL)-cholesterol, triglyceride (TG), cholesterol, high sensitivity C-reactive protein (HSCR), uric acid and fasting blood glucose (FBG) were measured using

standard laboratory methods. Three days dietary recall was taken by registered dietician to evaluate their dietary intake. Average three days intake of calorie, protein, fat and carbohydrate were calculated by using Diet-Cal, software a tool for dietary assessment and planning (version-1). Their baseline calorie was compared with revised RDA calorie (recommended dietary allowances for Indians) released in 2010.⁽¹⁴⁾ Lifestyle pattern: food habits and physical activity of participant's were examined with a self reported questionnaire which indicated the daily consumption of junk food especially soft drinks(coke, sprite, mountain dew, fanta, pepsi), french fries or fried chips and others(pizza, burger, noodles) over a week. The study protocol was approved by Institutional Ethics Committee (IEC), Post Graduate Institute of Medical Education and Research Chandigarh and informed consents were taken from their parents before assessment.

Statistical analysis; Statistical analysis was performed by SPSS version-16, Most of the variables were skewed and Mann-Whitney U test was applied for abnormal distribution of variables. All data were expressed in medians with interquartile ranges IQR in [square brackets] and minimum- maximum values were given in (round brackets) for biochemical parameters. Chi-square test was used for categorical data. Multinomial logistic regression analysis to assess variables associated with predictor of NAFLD i.e. soft drinks consumption, BMI Z- score, serum ALT, TG, uric acid (unadjusted) in obese children. Results were presented in odds ratio (OR), p value<0.05 was considered statistically significant.

RESULTS

Out of the 160 obese children, 106(66.2%) children were diagnosed with NAFLD. Among NAFLD children, 41(38.6%) had mild, 54(51%) had moderate and 11(10.4%) had severe form of NAFLD. There were no age difference in both the groups (p= 0.778). Z-BMI, MAC, TSF, WC were found higher in NAFLD children than without NAFLD (p<0.001) (Table1). Serum AST, ALT, GGT, FBG, TG (p<0.001) and HSCRP (p= 0.001), uric acid (p= 0.027) were found higher and HDL-c was lower in NAFLD group (p<0.001) as compared to those without it (Table 2). In multinomial logistic regression analysis, the most significant factors affecting NAFLD were TG (p<0.001) and Z-BMI 2, 3SD (standard deviation) (p =0.005, 0.004) (Table 3).

Daily consumption of soft drinks (60.4%), fried chips or french fries (58.5%) and others (30.2%) were higher in NAFLD group as compared to those without NAFLD i.e (37%), (38.9%) and (25.9%) over a week. NAFLD children were taking +310 kilocalories (kcal) and Non NAFLD group were taking +110 kcal more than RDA. The difference in energy intake was 200 kcal between the two groups. The energy intake in NAFLD and Non NAFLD group from fat and CHO was comparable i.e 32% vs. 31% from fat and 58.4% vs. 56.3% from CHO (Table 4). 85.5% children with NAFLD were physically inactive. These children were more inclined to playing video games, watching television or surfing on internet. The rest 14.5% does physical exercises (aerobics, jogging and sports) at least three times a week for 30 minutes. 58.2% of obese children without NAFLD were not doing physical activity and 41.8% children were physically active.

DISCUSSION

In the present study, USG detected NAFLD in 66.2% of obese children. Previous studies reported that NAFLD was present in 44% to 75% of obese children and had high intake of junk food with physical inactiveness.^(6, 15) Our study results indicate that high consumption of soft drinks and fried food are responsible for obesity and

NAFLD. Their calorie intake increased due to visible or invisible sugars and fats present in junk food items that promotes lipid per oxidation, insulin resistance (IR), increase in advance glycation end products and hepatic inflammation.⁽¹⁶⁾ Siddiqi et al. reported that students with NAFLD who were taking >2 soft drinks per day had significantly higher BMI, WC and also had elevated TG, FBG, ALT and lower HDL-c.⁽¹⁵⁾ In present study,

daily soft drink consumption of NAFLD children was 60.4% and also had significantly higher Z-BMI, MAC, TSF, WC and elevated serum AST, ALT, GGT, TG, FBG, with lower HDL-c (Table 1,2). Moreover uric acid was also significantly higher in NAFLD. Interestingly, in another study uric acid was the independent predictor of NAFLD in obese children and adults because of high fructose intake caused ATP depletion.⁽¹⁷⁾ Excess visceral fat and free fatty acid accumulation in liver increases the production of HSCRP in NAFLD patients. NAFLD group had significantly higher HSCRP as compared to those without NAFLD (2.10 vs. 0.88, mg/L p= 0.001). In accordance with our findings, Kitsios et al. saw that obese and overweight children with NAFLD had significantly higher levels of HSCRP compared to without NAFLD (0.78 vs. 0.34 mg/dl, p= 0.016).⁽¹⁸⁾

In the current study, 10% obese children with NAFLD had higher FBG > 100mg/dl putting them at the risk of IR. In similar study, EI-Koofy et al. found that 73% of NAFLD children had IR with higher prevalence of metabolic syndrome and obesity including half of NAFLD children had higher ALT.⁽¹⁹⁾ In our study, children who consumed soft drinks daily (1-2 standard glass) had 4.1 folds higher chances of NAFLD and its risk factors (Table 3). All obese children were taking more calories from fat and CHO rather than protein. In present study, observation about the physical activity in obese children with NAFLD was closely identical with previous study of Felix et al.⁽¹²⁾

This is the first study done on nutritional assessment in obese children with and without NAFLD in India.

CONCLUSION

Z-BMI, MAC, TSF, WC and ALT, AST, GGT, TG, FBG, HSCRP and uric acid are significantly higher in obese children with NAFLD and HDL-c is lower but most significant associated risk factors with NAFLD are TG and Z-BMI. Daily higher consumption of soft drinks with fried foods and sedentary lifestyle among obese children are major risk factor of NAFLD. Most of the calories they consumed from carbohydrate and fat that may play a role in the pathogenesis of NAFLD and its risk factors. Generally, untreated NAFLD in children will subsequently suffer full blown metabolic syndrome as they become young adults. Nutritional screening is the first step to identify the risk factors of NAFLD and lifestyle-based interventional approach could be defined

before its occurrence.

ABSTRACT

Introduction: One of the most mystifying problems faced by individuals who are exposed to high levels of noise (either occupational or recreational) is the slow deterioration of hearing that takes place. Evidence from the literature also indicates that noise exposure causes a significant sensory neural hearing loss. Hence we planned to compare the hearing of priests and workers of temples using Pure tone Audiometry and the fine spectral DPOAEs.

Method: Twenty three male participants between the ages of 20 to 65 years were included in the study. Group 1 participants worked in the temple premises for more than 5 years and all the individuals had reported to have been exposed to noise during work. Group 2 was not exposed to noise.

Results: The temple workers had poor thresholds and significantly reduced SNRs compared to the control group.

Conclusions: Temple noise has impact on individuals working in the temple premises presence of NIHL.

Keywords: - NIHL, Temple Noise, hearing Loss

INTRODUCTION

Slow deterioration of hearing that takes place in individuals who are exposed to high levels of noise (either occupational or recreational) is one of the most mystifying problems. Noise-induced hearing loss (NIHL) is the second most common form of sensorineural hearing loss, after presbycusis. The damage caused by the noise is imperceptible, painless, and enormously slow, that the individual is unaware of his loss of hearing for a long time, and hence it is the most pervasive of all the

occupational health hazards. Noise exposure is perhaps the most common etiology of preventable hearing loss. Generally, this prolonged exposure to sounds as high as 85 dBA is hazardous even though the most important factor is the amount of sound exposure. Both the levels as well as the length of exposure are important and are interrelated [1-2].

The pathophysiology of the ear damage due to the noise exposure has been widely studied in humans and the mechanism whereby excessive sound exposure damages the ear is very well understood. Lesser levels of damaging sound exposure results in a temporary threshold shift (TTS). If this TTS occurs regularly, there is a poor recovery resulting in a permanent threshold shift (PTS). This PTS occurs as a consequence of persistent exposure to such sounds resulting in some hair cells not able to recover from damage. The outer hair cells in the basilar part of the cochlea which is the area that responds to 4 kHz and also the adjacent areas

of 3 and 6 kHz, are the first to fail permanently. This area of the ear is identified to be most sensitive, because of the harmonic amplification by the ear canal and also because of the absolute sensitivity. Once these hair cells start degenerating they are less likely to recover and a permanent hearing loss is expected. Characteristically thus, following a long duration of noise exposure, hearing loss is presented as an audiometric notch, which is usually greatest at 4 kHz but can also be anywhere between 3 kHz and 6 kHz. With higher noise exposure for prolonged duration, the loss starts extending to the neighbouring frequencies. Moreover, if the sound is intense, it produces a more severe pattern of TTS which may result in a PTS more rapidly [3].

Outer hair cells are more susceptible to noise exposure than inner hair cells. Noise exposure causing TTS is anatomically correlated with decreased stiffness of the stereocilia of outer hair cells. The stereocilia become disarrayed and floppy. Presumably, in such a state they respond poorly. These are associated with fusion of adjacent stereocilia and loss of stereocilia. With more severe exposure resulting in PTS, injury can proceed from a loss of adjacent supporting cells to complete disruption of the organ of Corti. Histopathologically, the primary site of injury appears to be the rootlets that connect the stereocilia to the top of the hair cell. With loss of stereocilia, hair cells die. Death of the sensory cells can progressively result in Wallerian degeneration and further loss of the primary auditory nerve fibres. Hence, it becomes important to study the effect noise exposure in individuals working in different areas as they are exposed to different types of noises, with similar pattern of cochlear loss [3].

NIHL has been studied extensively in various occupational groups and using various testing procedure [4-6]. Silva and Cabral studied the Noise Exposure Levels of Priests and Worshippers in Churches and found that the exposure level varied between 95.4 to 99.5 dBA which also poses risk to the worshipper, so they reported that hearing conservation programs with adequate acoustical sanitation measures must be implemented [7]. Nevertheless, the impact of noise in temples has not been studied, even though pujas (worships) in temples are usually associated with lot of noise. This includes sounds of drums, bells, people shouting prayers, the sounds from various instruments like Saxophone, Nadhaswara, Thaal, Dholki, Drums, etc. The temple workers and worshippers are thus exposed to sounds of

high intensities (as high as 100 dB) and of a wide range of frequencies. Hence, these individuals could be prone to have hearing loss due to this kind of noise exposure. This makes it important for us audiologists to evaluate the level of hearing so that a good Hearing Conservation Program can be implemented.

Pure-tone audiometry has been a gold standard in evaluating the hearing status since decades based on which the Boyler's notch has been the most commonly reported pattern in NIHL [8]. However OAEs are also gaining popularity due to the type of information it gives regarding outer hair cells (OHC) functioning, which is essential for a healthy hearing, but are most vulnerable part of the ear in response to noise. It is also commonly agreed that the onset and gradual development of NIHL is mainly a consequence of OHC loss [9]. The spectral changes in DPOAEs were employed in this study as DPOAEs identify the slightest changes in the cochlear function, and DPOAEs were reported to be more reliable than PTA, ideal for monitoring the cochlear functioning in those exposed to noise [10]. Hence, it was decided to carry out this present study using fine spectral changes in DPOAE in addition to the PTA and immittance measures.

Need: NIHL is a more prevalent disorder among hearing disorders. Evidence from the literature also reports that noise exposure causes a significant sensory hearing loss. We hypothesised that noise exposure (due to exposure to sounds of drums, bells and other sounds) would have a negative impact on hearing health of individuals working in the temple premises throughout the day. Pharmacological line of management is not an effective choice in bringing the hearing back to normal level in individuals with NIHL. Hence, it is important to assess the hearing in this group, so that appropriate preventive measures may be advised either by using globalised hearing conservation programme or by other means like shifting of the work area away from noise.

Aim: To evaluate the hearing of priests and workers of temples using Pure tone Audiometry and the fine spectral changes in DPOAEs.

Subjects and Method

Participants: Twenty three male participants (Group 1: 9 workers from the temple and group 2: 14 controls) between the ages of 20 to 65 years (mean age of group 1 and group 2 was 40.11 and 41.11 respectively) were included in the study. All the individuals in group 1

worked in the temple premises for more than 5 years and all the individuals had reported to have been exposed to noise during work. All participants did not have history of/presence of neurological problems, middle

ear pathology or vestibular problems. In figure 1 hearing threshold of all the participants from each group across the octave frequencies are shown.

Figure 1: Shows PTA mean thresholds across the frequencies for all the participants.

Procedure: The participants were first seated in a sound treated audiometric laboratory. A brief case history was taken followed by an otoscopic evaluation. Immittance audiometry was conducted to rule out middle ear pathology because the transmission properties of the middle ear directly influence OAE characteristics. Then, pure tone audiometry using the instrument GSI 61 clinical audiometer was performed and audiometric thresholds were obtained at 250 Hz, 500 Hz, 1 kHz, 2 kHz, 4 kHz and 8 kHz for both ears. The pure tone average (average of thresholds obtained at 500 Hz, 1 kHz, 2 kHz & 4 kHz) for each participant was calculated for both ears. The participants were then evaluated using fine spectral changes in DPOAEs using a computer-based DPOAE analyser (GSI AUDERA). DPOAEs were recorded for a total 49 pairs of frequencies with a resolution of 12 points per octave between 1 kHz to 8 kHz. With f2:f1

ratio of 1.20 in all occasions and Intensities of f1 and f2 kept at 65/55 dB SPL [11]. In this study, data was represented with reference to f2 with rejection criterion set at 30 dB SPL or if L1 and L2 differed by > 2 dB from the target values beyond which a frame was rejected [12].

RESULTS

The frequency specific thresholds revealed that the temple workers had poor hearing thresholds indicating the presence of hearing loss. The DPOAE values showed that the SNRs were poorer in the temple workers compared to the control group. The mean and standard deviations as shown in Table 1 were higher in the control group compared to the temple workers.

Table 1: Showing the mean and standard deviation of the DPOAE amplitude and SNRs at the four octaves.

Frequency in octaves	Temple Workers (dB)	Control Controls (dB)
	Mean & SD	Mean & SD
500 Hz – 1kHz signal amplitude	2.40 ± 3.33	2.72 ± 4.52
500 Hz – 1kHz SNR	8.92 ± 3.49	12.10 ± 6.37
1kHz – 2kHz signal amplitude	4.76 ± 5.60	7.19 ± 5.65
1kHz – 2kHz SNR	17.31 ± 5.94	23.51 ± 6.59
2kHz – 4kHz signal amplitude	-2.64 ± 7.61	3.02 ± 5.72
2kHz – 4kHz SNR	18.41 ± 7.92	26.52 ± 5.25
4kHz – 8kHz signal amplitude	-13.29 ± 6.30	-10.90 ± 6.34
4kHz – 8kHz SNR	7.98 ± 6.33	12.09 ± 5.81

On applying Mann Whitney U test for the values, a statistically significant difference was observed between the two groups which was specific to the octaves 1 kHz to 2 kHz, 2 kHz to 4 kHz and 4 kHz to 8 kHz at $p < 0.05$.

Pearson’s product moment correlation was employed to observe the degree of correlation between the age, PTA and DPOAEs. The results revealed a good degree of positive correlation between Age and the PTA at $p = 0.004$, $r = 0.64$ which suggests that the PTA increased as age increased. It was also observed that there was a good degree of negative correlation between the age and the DPOAE values specific to the octaves 2kHz – 4kHz at $p = 0.00$, $r = -0.771$ and 4kHz – 8kHz at $p = 0.01$, $r = -0.712$ which indicates that as age increased the DPOAE SNRs at the higher octaves reduced. In addition, a good degree of negative correlation was observed between the PTA and the DPOAE SNRs between 2 kHz – 4 kHz octave at $p = 0.00$, $r = -0.771$.

DISCUSSION

This study aimed at investigating the hearing sensitivity among temple workers using PTA and DPOAE. The results showed that most of the Temple workers had pure tone thresholds higher than the normal limit with majority showing a notch at high frequencies between 3 - 6 kHz. This particular pattern is typical of the Boyler’s notch observed in individuals with NIHL [8] which is attributed to the OHCs dysfunction which takes place maximally in this frequency region as a result of the harmonic amplification by the external ear and absolute

hearing sensitivity, secondary to noise exposure [13].

The results also showed that the temple workers had lower DPOAE signals and SNRs at all the three octaves in comparison to the controls. This can be attributed to the impact of the temple noise on the hearing sensitivity of the individuals working in the temple leading to outer hair cell dysfunction indicative of Sensory-neural Hearing loss.

A significant positive correlation between age and PTA was observed which suggested that older individuals working in the temple premises had higher thresholds which could be due to the longer years of exposure to the damaging noise leading to higher degree of hearing loss and also permanent threshold shifts. The age also showed a negative correlation with the DPOAEs at higher octaves indicative of the DPOAEs (at high frequencies 2 kHz to 4 kHz & 4 kHz to 8 kHz) reducing as the age advances. These particular findings could be attributed to an interaction of the noise NIHL and age related loss. The noise NIHL owing to years of exposure to loud noise which impacts the higher frequencies specifically, as well as age related loss of hearing sensitivity as a result of the deterioration in the structural aspects and functional metabolism of the inner ear. An influence of presbycusis on noise induced hearing loss has been suggested [13]. The effect of noise is hence equivocal. The interactions between NIHL and age related hearing loss are complicated, difficult to determine, and poorly understood [13]. Hence poorer pure tone thresholds and reduced DPOAE SNRs were

obtained as age advanced.

The PTA also significantly correlated with the DPOAE SNRs specific to 2 kHz to 4 kHz which indicates more loss in those frequencies which is associated with the Boyler's notch, a typical characteristic of NIHL. This specific finding lessens the chances of age related hearing loss while supporting the presence of NIHL in this population. This in accordance with the findings that the outer hair cells (OHCs) in the most basilar part of the Cochlea are the first to get damaged permanently, the area that responds for sound frequencies between 3 and 6 kHz. This has been attributed to the absolute sensitivity as well as the harmonic amplification by the ear canal in response to the noise. Hence, after a long period of noise exposure, sensory neural hearing loss is presented as an audiometric notch, which is usually maximal at 4 kHz but may also range anywhere from 3 kHz to 6 kHz³ at par with the observations in these temple workers. All these findings increase the possibility of NIHL in the individuals working in the temple premises, in line with the reports by the other researchers on the various populations^[4-6]. The findings of this present study are also in coherence with the findings of the study done on individuals working in the churches who are reported to have hearing loss due to noise exposure^[7]. This present study provides valuable insight about the effect of the damaging noise on the hearing in the individuals working in the temple premises. This may be helpful in understanding the impact of noise on the hearing of these individuals. The present findings stress the need to implement good preventable measures for individuals working in the temple premises.

CONCLUSION

These results could be attributed to the impact of the temple noise on the hearing sensitivity of the individuals working in the temple leading to a hearing loss, demonstrating the presence of NIHL among the individuals working in the temple premises. However study needs to be replicated using a larger sample for generalisation of finding.

Effect of Sudarshankriya Yoga on Some Auditory Processing Abilities and Speech Perception in Noise among Middle Aged Adults

Meenakshi Gopinath¹, Jayashree S Bhat², Rajesh Ranjan³

¹Post graduate Student, ²Professor, ³Assistant Professor (Senior Scale), Department of Audiology and Speech Language Pathology, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education, Manipal, Karnataka, India

ABSTRACT

BACKGROUND AND OBJECTIVES: Auditory transduction is the process by which sound is converted to neural impulses to pass via the auditory pathway structures to reach the auditory cortex and for with this auditory physiology oxygenated blood supply is a necessity. SudarshanKriya Yoga (SKY) is known to improve lung functioning and oxygen level in blood circulation. Hence objectives of the present study was to compare the performance of modulation detection threshold, gap detection threshold, pitch discrimination threshold and speech perception in noise among middle aged adults who practice and do not practice SKY.

MATERIALS AND METHOD: Middle aged individuals who practiced SKY for a minimum of 1year were considered in the experimental group and who did not practices any form of yoga formed the control group. Auditory processing tests of modulation detection threshold, gap detection threshold and pitch discrimination threshold were assessed along with speech perception in noise.

RESULTS: The mean modulation detection threshold and SNR 50 scores showed no significant difference between the groups whereas the pitch discrimination and gap detection thresholds showed a significant difference between the groups.

CONCLUSION: SKY has a variable effect on the auditory processing abilities.

Keywords:- SudarshanKriya Yoga, Auditory processing abilities, Speech in Noise

INTRODUCTION

Perception and interpretation of auditory information is referred to as auditory processing. Temporal and spectral processing abilities are important aspects within the umbrella term of auditory processing.

Speech perception is the process by which the sounds of language are heard, interpreted and understood. Decline in temporal processing has been correlated with reduced performance in speech recognition as well as longer gap to perceive the stop consonant within a word among middle aged adults in comparison to younger adults. (1,2) Sudden sensorineural hearing loss with slow blood flow in the vertebrobasilar system in humans has been reported. (3)

Auditory transduction is the process by which sound is converted to neural impulses to pass via the auditory pathway structures to reach the auditory cortex. Oxygenated blood supply is a necessity for this process to take place. (4) SudarshanKriya Yoga (SKY) is one of the popular forms of yoga practice which

involves cyclical controlled breathing practiced in four distinct consecutive segments separated by 30 second periods of normal breathing: Ujjayi – 3 cycles of slow breathing per minute; Bhastrika - 20-30 cycles of rapid exhalations per minute; Om chanting with prolonged expiration and SKY – slow, medium and fast cycles of rhythmic, cyclical breathing. Rhythmic breathing variations which is the last step of the SKY is practiced in the seated position with eyes shut and complete focus on the breath.^(5,6) In short, SKY involves different kinds of pranayama along with rhythmic breathing practices. According to Ramdev ⁽⁷⁾, the outcome of pranayama practices is known to improve lung functioning and blood circulation. Research in the past has been able to explore the effects of SKY on cognition, oxygen saturation level, vital capacity, and other ailments. ^(5,8,9) However, there is a dearth of studies on the effect of SKY practices on human auditory behaviors. Hence we aim to assess the effect of SKY on some auditory processing abilities and speech perception in noise among middle aged adults.

MATERIALS AND METHOD

A total of 40 middle aged individuals in the age range 40-65 years participated in this research who were recruited by convenient sampling. 20 individuals comprised the experimental group (mean age=49 years, SD=±6.9) and 20 individuals formed the control group (mean age=51 years, SD=±5.5). All the individuals considered for the study had hearing thresholds within normal limits and were free of circulatory, neurological and renal issues. Any individual who scored less than 25 on the Mini-Mental State Examination (MMSE) was excluded from the study.⁽¹⁰⁾ The experimental group consisted of individuals who practiced SKY for atleast 1 year and the control group did not practice any form of yoga. All the individuals for the study were native kannada speakers. All the stimuli for the psychophysical and speech perception tests were presented from a Dell Inspiron 14 64-bit laptop. The output from the laptop was routed through a Focusrite Scarlett solo sound card and the stimuli were presented through Sennheiser HD 280 headphones binaurally. The mlp (maximum likelihood procedure) toolbox using the MATLAB code was used for the temporal and spectral processing tests.⁽¹¹⁾ All the auditory processing tests employed a three alternative forced choice (3afc) paradigm using a 2-down 1-up staircase procedure.

Modulation detection threshold (MDT). Sinusoidal

amplitude modulated 500ms Gaussian noise was presented at the rate of 8Hz, 20Hz and 60Hz. Modulated and unmodulated stimuli were equated for total RMS power. Noise stimuli had two 10msec raised cosine ramps at onset and offset. The MDT was based on the smallest level or depth of modulation that the participant identifies. The carrier was presented in three consecutive intervals separated by silent intervals of 200ms. In the randomly chosen interval, the carrier was sinusoidally amplitude modulated. The participant was asked to indicate if the modulation was present in the first, second, or third intervals. The starting level was reduced to -9dB for 8Hz modulation rate and -15dB for 20Hz and 60Hz respectively. The modulation depth was decreased by a factor of 3 for 2 consecutive responses and was increased by a factor of 1.5 for a single incorrect response. 12 reversals were measured from which the last 8 reversals were arithmetically averaged for threshold estimation. 3-4 practice trials were given before the commencement of the test.

Gap Detection Threshold (GDT). The standard stimulus used was a 750ms broadband noise with 0.5ms cosine ramps at the beginning and end of the gap which was presented for 500ms. Interstimulus interval was 1500ms. The variable stimuli contained the gap and the two standard stimuli did not contain any gap. The participants were instructed to indicate if the gap was present in the first, second or third interval. For two consecutive correct responses, the gap was reduced by a ratio of 2. Similarly, for a single incorrect response, the gap was increased a factor of 1.41421. The starting level of the gap duration was kept at 50ms. Similar to the modulation detection threshold procedure, the last 8 reversals from the 12 reversals were arithmetically averaged for threshold estimation.

Pitch Discrimination Threshold (PDT). 3 successive complex tones of 250ms were presented, which had the same power spectrum but differed only in pitch. The standard stimulus was a complex tone ($F_0=330\text{Hz}$) with 4 harmonics (lower harmonics, 2-5). The stimulus had 10ms cosine gated onsets and offsets. The starting level was set to a difference of 50Hz from the standard stimulus. A 2 down 1 up paradigm was used. The difference in pitch was decreased by a factor of 2 for successive two correct responses whereas the difference was increased by a ratio of 1.41421 for a single incorrect response. The participants were asked to indicate whether the first, second or third interval had

the higher pitch than the standard tone.

SNR 50. The QuickSin test in Kannada was used. (12) For the current study, three lists of sentences were presented at a comfortable level. The SNR (signal-to-noise ratio) was varied from +20dB to -10dB in 5dB steps per sentence in each list. The listener was asked to repeat the key words in the respective sentences. The number of correctly identified keywords from each list were calculated. Using the Spearman and Karber equation, total scores were converted to SNR 50 and averaged for 3 lists. The minimum signal to noise ratio at which one can repeat words 50% of the time is referred as SNR 50.

$$SNR\ 50 = i + (1/2 * d) - (d * correct / w),$$

Where, i = initial presentation level

d = step size

correct = number of keywords identified

w = number of keywords per decrease in SNR

Statistical Analysis.

Using SPSS 17 descriptive statistics was done to obtain the mean and standard deviation measures. Independent sample t-test was done to compare the mean thresholds for the auditory processing abilities and speech perception in noise scores between the groups. Correlation between years of SKY practice and auditory processing abilities and speech perception in noise was calculated using the Pearson’s correlation coefficient.

RESULTS

Figure 1 shows the mean modulation detection threshold for both groups across the modulation rates. The mean threshold at the three modulation rates was almost alike in both groups.

Figure 1: M ± 1 SD of Modulation detection threshold at 8Hz, 20Hz and 60Hz for the experimental and control groups (M-Mean, SD-Standard deviation)

Figure 2 shows the mean GDT scores for experimental and control groups. The mean gap detection thresholds for the experimental group was better than the control group and this difference was found to be statistically significant (p ≤ 0.05).

Figure 2: M ± 1 SD of GDT scores for experimental and control groups (M-Mean, SD-Standard deviation)

Figure 3 shows the mean PDT scores for experimental and control groups. The mean pitch discrimination thresholds was better in the experimental group which is suggestive of better discrimination abilities in the experimental group in comparison with the control group and this difference was statistically significant (p ≤ 0.05).

Figure 3: M ± 1 SD of PDT scores for experimental and control groups (M-Mean, SD-Standard deviation)

Figure 4 shows mean SNR 50 scores for experimental and control groups. The mean SNR 50 scores was almost equivalent between both the groups.

Figure 4: M ± 1 SD of SNR 50 scores for experimental and control groups (M-Mean, SD-Standard deviation)

Independent samples t-test was done to compare the mean scores of modulation detection threshold, GDT, PDT, and SNR 50. Table 1 below depicts the F and p values of the independent t-test done to compare modulation detection threshold at the 3 modulation rates, GDT, PDT and SNR 50 between the experimental and control groups.

Table 1: F values and p values of independent t-test for modulation detection threshold (at modulation rates 8Hz, 20Hz, 60Hz), GDT, PDT and SNR 50

Parameters	F value	p value
MDT at 8Hz	0.051	0.79
MDT at 20Hz	0.02	0.35
MDT at 60Hz	5.76	0.54
GDT	0.06	0.04*
PDT	11.98	0.00*
SNR 50	1.95	0.53

The association between years of experience of SKY practice and the performance on the tasks was assessed using the Pearson correlation coefficient, controlling for age as a confounding variable. All the measures showed no significant correlations with years of experience of SKY practice. Table 2 represents the R values for the correlation studied between years of experience of SKY practice and modulation detection threshold (at 3 modulation rates), GDT, PDT and SNR 50.

Table 2: Correlation between years of practice and modulation detection threshold (at 8Hz, 20Hz, & 60Hz), GDT, PDT, and SNR 50

	Parameter	Correlation coefficient
Years of SKY practice	MDT at 8Hz	0.35
	MDT at 20Hz	0.05
	MDT at 60Hz	0.16
	GDT	0.39
	PDT	0.01
	SNR 50	-0.05

DISCUSSION

SKY practice showed no significant effect on MDT which can be attributed to unknown reasons. Contrary to our study improved blood circulation due to physical exercise resulted in better modulation detection abilities for lower carrier frequency (500Hz) at three modulation rates (16Hz, 32Hz and 64Hz) except for 8Hz modulation rate has been reported, in old aged adults who engaged in physical exercise compared to age matched peers

who did not engage in any form of physical exercise. However, no significant difference for higher frequency carrier tone (4000Hz) across the modulation rates was reported among old aged adults practicing physical exercises.⁽¹³⁾

GDT in the group of participants who practiced SKY showed significant improvement compared to the group of participants who did not practice SKY. This improvement can be attributed to improved oxygenated blood supply to the auditory system due to SKY practice. However, there is no literature available affirming improvement on auditory processing measures in effect to SKY practices. Temporal envelope processing those assessed through MDT and GDT, the findings from these measures are not comparable due to the within subject variability observed for these measures.⁽¹⁴⁾

Pitch discrimination was measured for a 330Hz fundamental frequency tone with lower harmonics (2 to 5 harmonics). The better performance on pitch discrimination abilities in the middle aged participants who practiced SKY could be attributed to better TFS coding due to improved oxygenated blood supply to the auditory system due to SKY practice. A high degree of variability was observed in pitch discrimination abilities between the participants and this finding is in accordance with literature.^(15, 16)

SNR 50 which is a measure of speech perception in noise, was almost identical between both the groups. There is no available literature to support the current finding. Pitch discrimination of a complex tone with lower harmonics and speech perception in noise both make use of temporal fine structure processing. However, there are various other factors which are important for speech perception in noise. Understanding speech in noise depend on fundamental frequency and other acoustic features such as formants, fine structure, etc.⁽¹⁷⁾ In the present study, the fundamental frequency of the QuickSin sentences (F= 233Hz) was lower than the fundamental frequency of the complex tone stimuli (F= 330Hz) used in the pitch discrimination task. So the findings from these two measures cannot be compared with each other.

The years of SKY practice failed to show any correlation with the performance on the auditory processing and speech perception in noise abilities. All the participants considered in the research had a

minimum of 1 year of experience in SKY practice. Probably, the improvement in auditory measures due to improved oxygenated blood circulation would have already taken place which maintained as the years of experience increased. Similar findings have also been reported among participants practicing meditation.⁽¹⁸⁾

CONCLUSION

From the present study, it can be implied that SKY practice has a beneficial effect on some aspects of auditory processing abilities. This can pave way for an alternative strategy to offset the decline in auditory processes and maintain a healthy auditory system.

Influence of Family Structure and Gender on Oral Health Behavioral Characteristics in Siblings, a Narrative Review

Ramprasad Vasthare¹, Sunaina Puri², Ravindra Munoli³

¹Associate Professor, Dept. of Public Health Dentistry Manipal College of Dental Sciences, ²Dental Intern, Manipal College of Dental Sciences, Manipal, MAHE, Udupi, Karnataka, India. ³Assistant Professor, Dept. of Psychiatry, Kasturba Medical College, Manipal, MAHE, Udupi, Karnataka, India

ABSTRACT

Aim: To comprehensively address the concerns regarding the influence of family structure and gender on sibling oral health behavioral characteristics.

Background: The maintenance of one's oral health is influenced by the behavioral characteristics and structure of a family, parental attitudes, presence or absence of siblings, paternal and maternal behavior and the gender of the child. The intricate, subtle and sensitive directives a child's mind perceives and receives on a daily basis within the home environment plays a vital role in determining the mind set of a child in relation to oral health.

Clinical significance: Psychology, Psychiatry, Sociology, Developmental Physiology, Sibling behavior patterns and background family factors are key related fields in the formative years which guide us for a comprehensive understanding. Comprehending the intricately networked branches of behavioral sciences and sibling behavior helps us to refine our response to patients, for improved oral health counsel and advise.

Conclusion: Adoption of the best practices for improving oral health related interaction at home and for bringing about a sensitive and constructive approach in the mindset of siblings contribute to improved health outcomes.

Keywords : family, gender, oral health

INTRODUCTION

It is known that a family environment does play a role on the health and oral health of a child . What needs to be further explored is the role of family, gender differences and the influence of sibling behavior on oral health. This narrative review attempts to throw light on the family structure, parental, paternal, maternal and

related perspectives of gender, age and adolescence.

It has been established that the mother is of the utmost influence when it comes to the oral health of the child, however there are some variables which are not well explored.

Parents' oral health habits have a direct influence on the children, and this has been documented to be slightly stronger in sons, when compared to daughters. Among girls, the father's high occupational level influences oral health for the better¹, a possible explanation which could be awareness and access to better facilities and care. A lesser known dynamic of families is the gender tilt, as illustrated by Milevksy. Families with a male tilt i.e families with more males in the home, have reported higher levels of family hostility and lower levels of family satisfaction than female-tilted families². This patriarchal influence has been shown to have an indirect

correlation with oral health and dental injuries. Sanders et al attempted to understand this by scrutinizing various parental rearing styles and the stress experienced by adolescents, which increases their likelihood to sustain dental injuries and poor periodontal/gingival health. Adults who described their rearing as unsupportive, reported lower levels of control, life satisfaction, and greater stress³ which would then increase their predisposition to poor oral and general health. Parental co-habitation was not seen to have a significant association with the adult's psychosocial profile. Sole parent status may not disadvantage the child's psychosocial development in the event that the parent provides a sense of security (provided the socioeconomic profile is adequate) when compared to children in two parent households who are exposed to conflict³. More experienced and more educated parents have been expected to exhibit a higher awareness when it comes to oral health, but no correlation exists between parental age/level of education and compliance of children in specific issues when asked to use a mouthguard in a study conducted by Matalon V et al⁴.

Family size is yet another influencing variable which directly impacts the division of labor and finances which go towards attaining education and maintaining good oral health. Smaller families have more effective communication and are able to monetarily concentrate on each member including the children, owing to greater nurturing, education/awareness, access to dental treatment and dental aids. In a larger family, additional effort must be invested in order to maintain smooth daily functioning, and such families have more diversified roles as well as less likelihood of conflict² despite the need to cut down on expenses at the cost of poorer attention to dental health, owing to higher caries rates⁵.

Studies on birth order and sibling relationships have consistently found that elder siblings in the family often take on a semi-parental role by offering support, advice, and mentorship to the younger child. Consequently, younger siblings admire and venerate their older siblings². It has been shown that the eldest children bear the burden in cases of a chronically ill sibling, thus lowering their educational attainment- while the younger siblings are insulated. **Having a brother works in favor of this insulation from negative impacts of household hospitalizations**⁶. The study of gender differences in children and siblings in regard to general and oral health has showcased some interesting findings. A study in

older unlike sex twins showed females to have more total health conditions, most of which were not life threatening, whereas males had lesser health conditions though most were life threatening⁷. As per the general consensus over the years, females have been shown to have a greater awareness and concern for their dental health which is concurrent with the rates of decline in dental visits during the transition from childhood to adulthood, the risk being more in males as described by Brocklehurst P⁸. This is further illustrated by more frequent toothbrushing habits in girls across all age groups, countries and regions. Due to certain baseless societal norms, girls in the past have grown to be more conscious of their physical appearance when compared to boys. This assumption is concurrent with findings from a study conducted by Matalon et al, which showed a higher compliance to wearing mouthguards in boys, and a significantly lower compliance with girls⁴. It showed that the reason for the difference was not entirely clear but it was not a result of societal standards of beauty, but in fact due to how individuals view areas for beauty.¹⁰. A survey conducted in Hiroshima University, Japan has shown that the average number of teeth present in those over 75 years of age, were more in males than in females¹¹.

Gender, however is not the only factor influencing oral health compliance behaviors. A study by Mak KK in Hong Kong, showed that the male gender as well as Chinese background are significantly associated with lower odds of regular toothbrushing, annual dental visits and use of dental floss¹².

Sibling relationships are impacted by their gender composition, dyads of brothers have been found to be more aggressive and hostile rather than the supportive and intimate and nurturing relationship shared by sisters². Mixed sex dyads as well as brothers have been repeatedly shown to harbor less supportive and less intimate relationships than sister dyads.

Sister dyads have displayed increasing closeness at the age of adolescence with more reciprocal advice and trust than the other dyad combinations, owing to higher sibling relationship satisfaction when compared to males. Mixed sex dyads can be assumed to show a higher propensity for conflict. Literature highlights more harmony between same sex dyads, more so in sister dyads leading to the further assumption that **gender does impact the quality of sibling relationships**

and behaviors. However, mixed sex dyads have been shown to develop a closeness during the age of middle adolescence, more than the same sex dyad siblings. Kim et al have proposed that this could be perhaps due to a developing desire to learn about the opposite gender in the beginning of early romantic relationships at this age².

Caregivers/ Teachers oral health attitudes and their effect on siblings :

At a young age, children mostly interact with their parents/siblings/other caregivers at home, and teachers in school. A large portion of oral health practices acquired by the child are imparted by the school teachers which are then passed on to their siblings at home. An excellent example of this in Japan, is by the prevalence of Yogo Teachers who are equivalent to school nurses and care for the child by promoting health. Certification for the same can be procured in the field of dentistry and oral health and is existing in many institutes such as Hiroshima University, Baika Women's university, Kyushu University of Nursing and Social Welfare etc. Caregivers with a positive attitude towards oral health such as frequent visits to the dentist, use of fluoride varnish etc, would no doubt extend these behaviors and attitudes to the children they care for^{13,15,16} and such children would be more aware and display better oral care patterns which their siblings would try to emulate. Most of the participants in school based studies, to evaluate oral health attitudes of school teachers, have been female staff^{15,16,17} They have shown better oral hygiene scores as well as awareness, most of the knowledge being received from their dentists, followed by books and then television¹³. Since school teachers are teaching children about oral hygiene maintenance, they themselves must be well versed with the principles and techniques of oral care. It has been shown that nearly 80% teachers use potentially traumatic techniques for interdental cleaning, many do not regularly visit the dentist, and eat high amounts of refined sugar¹⁸. It would be detrimental if they were to pass on this information to children, and it can be prevented by carrying out organized training to demonstrate proper use of tooth cleansing aids to strengthen their oral health knowledge. This would likely be a success due to the positive attitudes towards oral health education exhibited by primary school teachers^{16,17} especially towards learning more about dental trauma management¹⁹. Two potential paths which the siblings may be led down are worth discussing here. One situation would be one where one sibling attempts to

emulate what the other has learned from his/her teacher, and the other could be that the sibling tries to defy the same. In both these scenarios the impact on the sibling's oral health would largely depend on what the child has been taught at school, and if accurate dental care methods are expressed. Further, two or more siblings, learning from two different teachers at school, may be taught differently and upon discussion and comparison, the siblings could help improvise on each other's oral behaviors thus developing an oral care pattern which is a combination of two, or bettered version of one.

Media and sibling behavior :

The only inanimate entity a child learns from at this age is various forms of media, be it advertisements in magazines, posters and television. Thus it is crucial what a child watches on television, whether it is their favorite programs or the advertisements in between. The information children gain from watching programs on television are then transmitted to their friends and siblings who often watch with them. An interesting study by Rodd and Patel, described the nature of television advertisements and their effects on pediatric viewers. In this study, over a 2 month period, 984 ads were transmitted, out of which on average 24 adverts were shown per hour of children's television broadcasting. Shockingly among the 41 hours of recording, there was seen to be only one advertisement for an oral hygiene product, and nearly 95% of ads were centered on high sugar and/or acid products. Children are being overwhelmed with harmful information via TV advertisements and being targeted for the marketing of these harmful products²⁰ which has an impact on sibling attitudes towards oral health. A positive outcome that can come from tweaking these advertisements is through motivational interviewing which is shown to benefit siblings and adolescents in particular²¹. Creative exploration of bringing about such positive outcomes is illustrated by an app called Toothsavers which has a virtual brushing game for children with instructions, available in English and Spanish. The use of such a modality has shown to impact children as well as sibling behavior, and leads to regular twice daily brushing within a year of use²².

CONCLUSION

The major influencer in learning of oral behaviors is the mother followed by one's siblings. The impact is far more with the elder sibling in a family with multiple

children. Children learn a majority of their behaviors including sleep habits, oral hygiene habits such as tooth brushing, from their parents but even more so from their elder siblings in an attempt to emulate their behavior and gain parental approval. This is concordant with modeling.

The presence of siblings in a child's life has intangible benefits owing to superior emotional maturity, closer friendships, healthier competition, **preemptive support** and higher fulfillment when compared to those without siblings. Modeling is successfully used in the dental clinic to alleviate dental anxiety in a child with the help of a sibling model who then encourages positive and cooperative behavior from the previously anxious child.

Closeness between siblings is influenced by the gender of the children, of which sister dyads have the closest and healthiest relationship, and the older brother-younger sister pair are the least intimate. Female tilted families (with more female members) display more harmony and less hostility, and aggression than male tilted families. This is more conducive in acquiring and maintaining health behaviors.

Comparison of the Influence of Different Tooth Tapers on Retention of Metal Crowns Luted with Two Resin Cements

Pankaj Kulkarni¹, Veena Hegde², Lokendra Gupta³

¹Former Post graduate Student, ²Professor, ³Associate Professor, Department of Prosthodontics, Manipal College of Dental Sciences, Manipal Academy of Higher Education MANIPAL

ABSTRACT

Background: Taper of the prepared tooth is one of the most important factor for retention while luting cements are weak but a critical link for retention

Aims: Compare the influence of different tapers of prepared teeth on retention of metal crowns when luted with two commercially available adhesive resin cements

Materials and Method: 48 extracted human premolars were used in this study. Each tooth was mounted in a PVC ring with auto polymerizing acrylic resin. A customized device was used to standardize the tooth preparation. Teeth were divided into 3 equal groups representing taper 6°, 12°, and 30°. Metal crowns were fabricated for each tooth. Prepared teeth were luted with either RelyX Ultimate Clicker or Multilink Automix. Specimens were subjected to 'Crown Pull Off' test using Universal Testing Machine

Statistical analysis used: One way ANOVA with Tukey post-hoc and Independent 't' test

Results: Statistically significant difference was found in the mean failure stress at 6° degree taper angle compared to 30° with p value ≥ 0.003 for both the adhesive resin cements. There was no significant difference of mean of failure stress for metal crowns luted with RelyX Ultimate Clicker and Multilink Automix

Conclusions: Mean failure stress was highest at taper at 6° with a steady decrease at 12° and significant decrease at 30° taper. It is utmost important for clinician to prepare the tooth within the range of 12° taper. While adhesive resin cements RelyX Ultimate and Multilink Automix are equally effective in terms of retention of the crowns

Key-words: Crown retention, Failure stress, Luting agent, Resin cements.

INTRODUCTION

Tooth preparation is an art and requires lot of skill and planning and is governed by biological, mechanical and esthetic principles. A prepared tooth should receive a crown in such a manner that it should restore the function in harmony with adjacent soft and hard tissues.

Retention is one of the most important mechanical principle of tooth preparation. It is the quality of prepared tooth that prevents the restoration from being dislodged by forces acting parallel to the path of placement.¹

Taper is defined as the convergence of the two opposing external walls of a tooth preparation viewed in a given plane. Recommended taper is 6 degrees.¹ Although in practice various studies have shown dentists to produce taper angles ranged between 12.2 to 27 degrees.²

On the other hand luting cement is a weak but a critical link for retention of an indirect restoration. Function of luting cement is to 1) fill the space between

Corresponding author:

Veena Hegde

Professor, Department of Prosthodontics
Manipal College of Dental Sciences, Manipal Academy
of Higher Education MANIPAL
Email: veena.hegde@manipal.edu

the crown and the prepared tooth; 2) provide retention resisting dislodgement; and 3) provide good aesthetical conditions for the indirect restoration.^{3,4,5}

Luting cements consists of two types⁶

1. Conventional water based luting cements
2. Anhydrous or polymerizing cements

Polymerizing cements are usually composite resins in conjugation with adhesive or self-adhesive systems. Self-adhesive systems are now been popular due to ease in manipulation but show less bond strength than cements with additional adhesive systems. On the other hand method of curing also plays important role. Self-cured cements shows less bond strength than light cured cements.⁷ This is especially true for metal crowns where light curing is not an option due to the opacity of the metal. Adhesive resin cement retention can be enhanced by using a bonding agent in such cases. The adhesive properties consists of both, the bond to the prepared tooth as well as bond to the indirect material that covers the tooth.

Present study determines the effect of tapers 6°, 12° and 30° on metal crowns luted with two commercially available cements adhesive resin cements Multilink Automix (Ivoclar Vivadent) and Rely X Ultimate Clicker (3M ESPE) . It also compares retentive ability of two adhesive resin cements.

MATERIALS AND METHOD

Specimen preparation

48 freshly extracted human pre molar teeth were collected. Roots of each tooth were notched with grooves for added retention. Autopolymerizing acrylic resin was mixed in thin consistency and poured in PVC ring of 2.5 inch height and 1 inch diameter. Each tooth was embedded in acrylic resin in the PVC ring by centering it in the ring and covering the root until 2 mm apical from cement enamel junction.(Fig 1) PVC ring was held firmly on a surveyor base with a cast holder and complete crown preparations were done using a high speed hand piece which was stabilized by a specially fabricated customized holding device(Fig 1) that can be moved around a rotational axis to obtain the desired degree of taper for the preparation.

Figure 1. Mounting of extracted premolar with acrylic in PVC Ring

Figure 2. Tooth preparation with customized device

Straight diamond points with a rounded tip were used to prepare axial surfaces and to establish a chamfer finish line. With the hand piece rigidly secured, the axial surface was prepared by rotating the surveyor base against the diamond point. (Fig 2) Occlusal surface of the teeth

were made flat, parallel to the floor and Occlusocervical dimension (h) of the teeth were standardized at 3 mm for all the specimens according to study done by Sekar et al.⁸ The crown preparation with different tapers 6, 12, 30 degrees respectively were achieved by tilting then

hand piece to their respective degree. (Fig 2) Angulation of each specimen was verified by using tool room microscope.

The prepared tooth was considered as truncated cone for surface area calculations. Zidan et al ⁹ used a mathematical formula for calculation of surface area.

D= diameter of the base of conical frustum

d= diameter of the apex of conical frustum

h= axial height

A1= the conical surface of the frustum of a right cone

A2= Surface area of top of frustum

The surface area A = A1 + A2

$A1 = \pi (r1 + r2) [h^2 + (r1 - r2)^2]^{1/2}$ where $r1 = D/2$, $r2 = d/2$, and A2 the surface area of the top of frustum was calculated according to the following equation: $A2 = \pi(r2)^2$. Impressions of all the specimens were made with 2 step technique with polyvinyl siloxane putty and light body (Flexceed).

All the impressions were poured in type IV stone or die stone (Pearlstone). Wax patterns were made in form of uniform copings with type 2 inlay wax (Starwax). with loop on the occlusal surface to facilitate crown pull off test. Copings were then invested with phosphate bonded

investment material (Bellasan). Casting was done using nickel chromium metal pellets (Wiron 99) in a centrifugal casting machine (Bego). 48 Specimens were divided into 24 (6, 12, 30 degrees) each for cementation with either Multilink Automix or RelyX Ultimate Clicker. All the specimens were then kept in water for 7 days before testing. On 8th day the samples were subjected to testing. Samples were connected to universal testing machine with the help of U shape orthodontic wire passing through the loop of the cemented crowns. Crowns were subjected to pull off test with a crosshead speed of 1mm/min

The force of removal was noted and was recorded in newtons. The force was then converted from newtons into failure stress as Megapascal (MPa) by the following formula *Failure stress (Megapascal) = Force (Newtons) / Surface area of prepared tooth in sq.mm* The data obtained was subjected for statistical analysis.

RESULTS

Statistical analysis was executed using IBM SPSS statistics 20. A parametric test; One-way ANOVA presenting the mean values of force of retention with standard deviations of RelyX Ultimate Clicker resin cement and Multilink Automix resin cement on the three different tapers is provided in Table 1 and Table 2 respectively.

Table 1. Comparison of force of removal with RelyX Ultimate Clicker resin cement on the three different taper angles 6°, 12° and 30°

Taper angles	6°	12°	30°	*p-value	Post hoc test
	Mean ± SD	Mean ± SD	Mean ± SD		
Force(Mpa)	5.42 ± 0.98	4.76 ± 0.76	3.97 ± 0.81	0.016	6° > 30°

*One way ANOVA with post hoc Tukey’s test

There was a significant difference between the force of removal for Relyx Ultimate at 6 and 30 degree taper.

Table 2. Comparison of force of removal with Multilink Automix resin cement on the three different taper angles 6°, 12° and 30°

Taper angles	6°	12°	30°	*p-value	Post hoc test
	Mean ± SD	Mean ± SD	Mean ± SD		
Force(Mpa)	5.23 ± 0.69	4.44 ± 0.82	3.75 ± 0.72	0.003	6° > 30°

*One way ANOVA with post hoc Tukey’s test

There was a significant difference between the force of removal for Multilink Automix at 6 and 30 degree taper group IIA and IIC.

The mean values with standard deviations of the retentive properties of both the cements were obtained using Independent 't' test, provided in Table 3.

Angle	RelyX Ultimate	Multilink	p – value
	Mean ± SD	Mean ± SD	
6°	5.42±0.98	5.23±0.69	0.65*
12°	4.76±0.92	4.44±0.82	0.47*

The influence of three different tapers; 6°, 12°, and 30° on the mean forces of removal of the metal crowns from the prepared teeth when tested individually with two cements, displayed statistically significant differences ($p < 0.05$). Within the three different convergent angles, post hoc Tukey test was carried out, the results demonstrated greater degree of force of removal with 6° convergent angles when compared to 30° convergent angle.

However, the two adhesive resin cements; RelyX Ultimate Clicker resin and Multilink Automix when compared and evaluated for the retentive properties did not show any statistically significant differences. ($p > 0.05$)

DISCUSSION

The present investigation was conducted to determine the effect of the taper of the tooth 6°, 12° and 30° on retention of metal crowns when luted by the resin cements. Two commercially available adhesive resin cements RelyX Ultimate Clicker and Multilink Automix were chosen. The failure stress was assessed by the use of crown pull off test. The other method to assess the adhesive properties of cements include tests for bond strength, tensile strength, and micro-tensile strength.³ Bond strength test is reliable test and easy to conduct but is criticized as it does not simulate clinical situation. Crown pull of test simulates the clinical condition better than other tests. Various studies have been published where crown pull off test was used.⁷

The influence of taper angle on retention of metal crowns using resin cements was noted in the present study. The study showed that mean retentive failure stress on metal crowns luted with Relyx Ultimate and Multilink Automix showed statistically significant decrease when taper angle of prepared tooth was 6 degrees compared to taper angle of 30 degrees. But mean retentive crown pull off failure stress on metal crowns showed no statistically significant difference at 12 degree taper when compared to either 6 degree taper or 30 degree taper. Rosensteil et al¹ described and various studies explained that when the taper is less it limits the path of withdrawal. While as taper increases free movement of restoration increases and results in decreased retention. Studies by Jogrenson¹⁰, Kaufman et al¹¹, Dodge WW et al¹², Hovijitra et al¹³ had reported these results earlier. Wilson et¹⁴ recommended taper of 6 as ideal taper, however some studies reveal that many dentists show tendency to overtaper the tooth preparation especially in posterior teeth with limited access. The present study therefore took in account taper angle as high as 30°

Zidan et al⁹ reported that increase in taper angle from 6 degrees to 24 degrees decreased the mean failure stress value by 20 percent for resin cements and 40 percent for the glass ionomer cement. Omar mowafy et al¹⁵ found out significantly higher failure stress at 12 degree convergence angle compared to at 35 degrees.

In contrary to the present study Osman et al 2010 et al¹⁶ found no statistically significant difference in failure stress values for metal crowns luted with Panavia Resin Cements for taper angle as low as 12 degrees and as high as 120 degrees.

Present study also compared the influence of adhesive resin cements on failure stress. There was no statistically significant difference when the mean of value of failure stress for Multilink Automix and RelyX ultimate clicker at all the taper (6, 12, 30) were compared. (Table 3).

In similar study Zidan et al⁹ did not find significant difference between two adhesive resin cements (C&B Metabond and Panavia) at different taper angles (6, 12, 24). Ernst et al¹⁷ compared different commercialy adhesive resin systems and found no significant difference in retentive properties between them.

Even though RelyX ultimate showed better results than Multilink automix there was not much of difference

between retentive qualities of the two cements. As oral conditions are difficult to simulate in the laboratory, the results obtained should be interpreted with caution and clinical validation. Also in this study metal castings were used which limited the use of light curing option, therefore retentive properties of these cements may vary when used in all ceramic crowns

CONCLUSION

Within the limitation of the study it can be concluded that angle of convergence for the tooth preparation should be as minimal as possible (6 degree), but angle until 12 degrees is acceptable for good retention. Whereas when the taper angle increases as high as 30 degrees the retention is affected even with the use of adhesive resin cements.

RelyX Ultimate Clicker and Multilink Automix are equally effective as luting agents for cementation of metal crowns.

ABSTRACT

Sustainable development(SD) practices has been adopted by organizations from various sectors to improve their socio-environmental performance. This is because, these days improved socio-environmental performance is key to ensure sustainability in long and gain competitive advantage. Hence, the health care industries are also trying to exploit the benefits of SD practices. SD policies stress on incorporation of sustainability concepts on every stage of organizational activities starting from procurement to disposal of waste. Success of implementation of SD practices in any industry depends on how efficiently it identifies the factors influencing it, their interdependence and degree of influence on SD practices. This study explore the influential pressures of sustainability practices in management of waste in health care sector. Grey relational approach(GRA) is used to prioritize these factors according to their degree of influence on health care waste management (HCWM) practices.

Keywords: HCWM, Enablers of HCWM, GRA, SD

INTRODUCTION

Hospitals and allied health care facilities have been established to provide services required for the treatment of sick people. However, there has not been much awareness that these units produce significant amount of waste material during the process of rendering health care related services which have a potential to degrade environment and cause many dreaded disease in humans or animals when exposed to it. Health care or biomedical waste consists of materials that include syringes, needles, used bandages, disposable gloves, human tissues, blood, used culture media along with food materials, packaging materials and scraped medical equipment. Direct exposure to these waste lead to blood, skin, respiratory, eye and intestinal infections even transmission of dreaded diseases like typhoid, cholera, HIV, Tuberculosis, Hepatitis B and C^[1]. Prior studies

reveals many HCUs either dump their waste in low lying areas or burn in open air or allow the untreated liquid waste to flow through sewerage water. These lead to contamination of soil with heavy metals and toxic chemicals killing useful organisms and reducing soil fertility. Mixing of liquid waste lead to water pollution and burning of these waste without proper precaution lead to contamination of air with carcinogenic gases like dioxin. HCUs have begun to realize the importance of proper waste management practices towards their sustainability and gaining economic advantage as well. In this context, an understanding of influential factors of HCWM and their degree of influence on HCWM practices assumes its importance. Hence, this research focused on investing these factors and evaluating their degree of influence using GRA method.

LITERATURE REVIEW

Sustainable Development

Sustainability which has been found to be good not only for the society and environment, but also for economic health of any organization by enabling the them in reducing risks of environmental accidents, avoiding or reducing generation of waste, increasing energy and material efficiency^[2] and innovating new eco-friendly services and process^[4] has increasingly become important to businesses^[3].

Sustainable Development in Health Care Sector

A sustainable development concept in the context of health care sector is gaining importance these days. HCUs have started procuring devices and equipment which could be either recycled, reuse or safely disposed of after their useful life. Similarly, for safe disposal of wastes several guidelines have been formulated. SD practices could enable the HCUs to reduce their expenditure on material, energy and penalties as well. Aside from the cost investment funds, usage of legitimate SD practices benefits the health care units to get ISO certification and in addition letter of thanks from regional as well as governments which thus will improve the general public image and brand value of the hospitals and empower them to draw more number of patients and remain separated from rivalry. Patients even don't hesitate to pay higher hospital services charges in these health care units(HCUs).

Previous Studies.

Review of literature on sustainable development practices revealed that in Indian context few researchers^{[18][8][19][20][21][1][26]} have studied HCWM practices. However, these studies mostly, employed either questionnaire based survey or field research and personnel interviews for investigating HCWM issues and ignored analytical studies on various influential factors of HCWM. From the literature review it has been identified 10 enablers and 13 barriers of HCWM.

The enablers are being categorised as strength, opportunities and Barrier as Threats. Different enablers

as being identified(internal) are anticipated economic benefit^[11]. Competitive advantage, CSR Activities, Top management vision and Involvement^[21]. Policies to comply legislative requirement^{[(11),[27]}. Identified enabler categorized as external opportunities are Reduction in landfill capacities, Availability of Advanced Technology, Support and Initiatives from Various Organizations^[21], Pressure from socially responsible groups, Awareness and training programs^[18]. The barriers variables as identified from the literature review are Poor Segregation Practices^{[(16)[26]}, Inappropriate Waste Management Operational Strategy, Lack of Green Procurement Policy^{[(18)}, Financial Constraints^[21], Deficient in Accountability of Authorities of Health Care Facilities towards HCWM, Resistance to Change and Adoption, Less Priority to Waste Management issues and Policies^[1]. Lack of Waste Treatment Facilities^[21]. Insufficient Support from Government Agencies^[26]. Unavailability of Adequate Waste Management Equipment and Facilities, Inadequate Awareness and Training Programs^[1], Lack of coordination between municipality, Pollution Control Board and hospital authorities^[19], Lack of Strict implementation of infection control measures like sterilization and disinfectant techniques.^[1]

MATERIALS AND METHOD

The degree of importance of influential factors of waste management practices in health care sector is evaluated with the help of GRA approach. GRA approach is mainly used when there is an uncertainty in decision making. In general, GRA has five steps and they are as follows:

Step one: Collection of initial assessment values from experts and make decision matrix.

Step two: Performing data normalization of the variables using either "Smaller - the better" or "larger is the better" using equations (1) and (2) respectively depending upon their nature.

$$r_{ij} = \frac{\max_i(x_{ij}) - x_{ij}}{\max_i(x_{ij}) - \min_i(x_{ij})} \tag{1}$$

$$r_{ij} = \frac{x_{ij} - \min_i(x_{ij})}{\max_i(x_{ij}) - \min_i(x_{ij})} \tag{2}$$

Step 3: In addition, the reference sequence for the variables is calculated using equation (3).

$$\Delta_{ij} = |r_{oj} - r_{ij}| \tag{3}$$

Step four: Determining the grey relational coefficient:

$$\gamma_{ij} = \frac{\Delta_{\min_{ij}} + \xi \times \Delta_{\max_{ij}}}{\Delta_{ij} + \xi \times \Delta_{\max_{ij}}} \tag{4}$$

Where, $\xi (0 \leq \xi \leq 1)$ is the distinguishing coefficient i.e., used to control the range of the grey relational coefficient; usually $\xi = 0.5$ [18].

Step five: Determining the grey relational degree and rank the factors.

$$\Gamma_i = \sum_{j=1}^n [w_j \times \gamma_{ij}], \tag{5}$$

$$\sum_{j=1}^n w_j = 1$$

where, W_j is the weight of the jth criterion. On the basis of grey relational degree the priority ranking can be estimated. The one with the highest grade of relation is recognized as the best solution.

RESULTS AND DISCUSSION

7 point scale was used to collect data from doctors, nurses, lab technicians and hospital administrators

working in hospitals. Five numbers of respondents from each group were requested to suggest their perception regarding the degree of influence of the barriers and enablers on waste management practices. This study considered 10 numbers of enablers and 13 number of barriers. The numerical value assigned by experts' of each category for a particular variable are summed and shown in table 1.

Table 1: Responses of experts regarding HCWM enablers and Barriers

CONCLUSION AND SCOPE OF FUTURE WORK

This study is conducted with an objective to explore various influential factors for implementation of sustainable practices in health care waste management. Through review of literature and expert consultation 23 such factors were identified. The identified factors were further classified as enablers those encourage adoption of HCWM practices and barriers those offer resistance to its adoption. Both the enablers and barriers were further categorized as external and internal. External enablers were termed as opportunity while the internal as strength similarly the internal and external barriers were categorized as weakness and threat respectively. All the factors identified in this study were prioritized with respect to their degree of influence

on HCWM practices using GRA methodology. The factors with rank 1 indicates its higher influence on HCWM practices. Similarly, a factor with rank 10, 11, 12 and 13 indicates lesser influence of these factors on HCWM. The results revealed that Awareness and training programs are perceived as the most important factor while Top Management vision and involvement is the second most important factor for success of HCWM practices. Analysis of the barriers claimed that Inadequate Awareness and Training Programs and Lack of Green Procurement Policy were observed as the major hindrances. Hence, Organizations interested for implementation of HCWM practices should conduct intensive training and awareness programs. Proactive involvement of top management should be implemented in green procurement policies. Though, this study quantified the degree of influence of various influential pressures yet failed to capture the vagueness in human judgement. Hence, a fuzzy GRA analysis may be performed in future to capture the vagueness.

Mineral Trioxide Aggregate Apexification a Novel Approach for the Tooth with Open Apex – A Case Report

Vinod Jathanna¹, Shreya Hegde¹, Shivangi Vats²,

¹Associate Professor, ²Post Graduate, Department of Conservative Dentistry and Endodontics, Manipal College of Dental Sciences, Mangalore, Affiliated to Manipal Academy of Higher Education(MAHE), Manipal

ABSTRACT

Mineral Trioxide Aggregate (MTA) was introduced as an alternative to traditional materials for the pulp-capping, repair of root perforations and as a retrograde root filling due to its superior biocompatibility and ability to seal the root canal system. Traditionally, calcium hydroxide has been the material of choice for the apexification of immature permanent teeth but MTA holds significant promise as an alternative to multiple treatments with calcium hydroxide. The inadequacy of calcium hydroxide apexification due to its long time span and re-infection because of temporary seal led to the use of MTA. In this case report of MTA apexification along with backfilling using thermoplasticised Gutta Percha and coronal rehabilitation of a fractured upper central incisor with open apex.

Keywords : *Open-apex, mineral trioxide aggregate, apexification*

INTRODUCTION

Trauma to the tooth during the eruption period may damage the Hertwig's epithelial root sheath leading to cessation of root end development, resulting in an open apex. Generally root development continues for 3- 4 years after eruption.^{1,2} American Association of Endodontists in 2003 defined apexification as 'a method to induce a calcified barrier in a root with an open apex or the continued apical development of an incomplete root in teeth with necrotic pulp'. The main objective of apexification was to prevent the passage of toxins and bacteria into the periapical tissues by forming a barrier at the root apex, and also to allow the compaction of the root filling material.³

Even though Calcium hydroxide has been widely used over the years for the stimulation of hard tissue

barrier, it requires 5–20 months to form the barrier.⁴ Studies have also shown an increased risk of tooth fracture with prolonged exposure to calcium hydroxide.^{5,6,7}

In recent times, mineral trioxide aggregate (MTA) has replaced calcium hydroxide as the most popular material for the apexification procedure, as it has shown a greater consistency in producing apical hard tissue when compared to calcium hydroxide.⁸ In this case report of MTA apexification along with backfilling using thermoplasticised Gutta Percha and coronal rehabilitation of a fractured upper central incisor with open apex.

Case report

An 18 year old female patient reported to the dental clinic with a fractured central incisor, Figure 1 (A). Patient gave a history of trauma 12 years back. There was no relevant medical history. On clinical examination, there was a blackish discoloration associated with tooth #21 along with fracture of the incisal edge extending into the dentin. The tooth was tender on percussion. Periapical radiograph showed a wide open apex with a well-defined periapical radiolucency in relation to tooth #21. Figure 1 (B)

Figure 1:
A: Pre-operative clinical picture, note the discoloration w.r.t tooth #21
B: IOPA showing open apex

Access opening was done under rubber dam isolation and working length was determined using the radiographic method (Figure 2-A). Chemo mechanical preparation of the root canal was done using the no. 80 K-file and 0.5 % sodium hypochlorite solution was used for irrigation of the canal along with saline and 17% EDTA.

Figure: 2 A: Working length determination B: MTA plug at the apex

White MTA Angelus (Angelus, Londrina, PR, Brazil) was mixed according to manufacturer’s instructions and gently condensed using hand pluggers, gently condensed to form 4 mm of apical plug. [Fig: 2(B)]. Moist cotton pellet was placed and a temporary restoration done using Zinc oxide eugenol cement. Patient was recalled after one week for obturation. Gutta percha obturation was with using the backfilling technique with Obtura thermoplastic obturation system (figure 3-A). AH plus sealer was used. Post operative clinical picture is as shown in figure 3(B). Post endodontic restoration was

done using Filtek Z 350 (3M ESPE, USA) and tooth was prepared to receive ceramic crown fused to metal. (Figure 4)

Figure: 3

DISCUSSION

Over the years, calcium hydroxide has been the considered as the gold standard material for apexification;

since it has bactericidal effect with an alkaline pH, which is considered responsible for stimulating apical calcification.⁹

The basic disadvantage of calcium hydroxide is the formation of necrotic zone, therefore its usage and popularity has drastically reduced. Other drawbacks include delayed treatment, multiple visits, low patient acceptance, unpredictability of apical closure and difficulty in patient follow-up.¹⁰ An alternative to calcium hydroxide is MTA.

Thorough irrigation, and proper disinfection protocol has to be followed for the success of the root canal before the obturation. When compared to completely closed apex, the root canals with open apices have more communication. So disinfection of canal was done using 0.5% sodium hypochlorite in this case and calcium hydroxide dressing was given for periapical healing and eliminating the survived bacteria after cleaning and shaping.^{11,12} MTA is condensed using Endodontic pluggers at the root end, followed by obturation.

The mineral trioxide aggregate (MTA) in 1998 was considered as a therapeutic endodontic material for humans by US Food and Drug Administration.¹³⁻¹⁵ MTA has been proved to have superior sealing ability compared to amalgam, zinc oxide eugenol and super-ethoxybenzoic acid.¹⁶⁻¹⁹ Because of its superior properties, MTA has shown effective results as direct pulp-capping agent when compared with Ca(OH)₂.²⁰⁻²²

MTA has a good sealing ability which results in less microleakage, better antibacterial properties making it biocompatible, high marginal adaptation, and a pH of 12.5. MTA has also been used for scaffolding for hard tissue formation. It helps in the production of interleukins and cytokines release. Hence, it is capable of promoting hard tissue formation. Clinicians may restore the tooth after setting of MTA. Thus, the fracture resistance of teeth with thin dentinal walls increases.²³

CONCLUSION

Selection of material as an apical plug for the formation of the hard tissue barrier and the thickness of MTA apical plug plays a crucial role for the clinical success of procedure. A 5mm apical plug of MTA is considered better when compared to 2mm apical plus as it produces less microleakage. In this present case report, MTA as an apical plug helped in root end closure and

good healing which resulted in successful treatment out

Goal Directed Physiotherapy Treatment Program for Improving Lower Extremity Function in a child with Spastic Paraplegic Cerebral Palsy. A Case Report

Kovela Rakesh Krishna¹, Mukesh Kumar Sinha²

¹Assistant Professor, Nitte Institute of Physiotherapy, Nitte (Deemed to be university) Deralakatte, Mangaluru, India, ²Assistant Professor, Department of Physiotherapy, School of Allied Health Sciences, Manipal Academy of Higher Education, Manipal, Karnataka, India

ABSTRACT

Spastic Paraplegic Cerebral Palsy (CP) involves both the lower limbs which effects balance and gait in children. These individuals are treated by physiotherapy with various means like Stretching, Strengthening, application of Neurodevelopmental Therapy (NDT), Task oriented approach and Proprioceptive Neuromuscular Facilitation (PNF) but there is no evidence on goal oriented physiotherapy program using various approaches for the treatment of spastic paraplegic CP children. Here we report a case of a 9-year-old boy diagnosed with spastic paraplegic CP, who underwent 5 months of Goal directed Physiotherapy Program. Documented improvements in muscle tone, balance and various parameters of gait reveal promising outcome. Hence we propose goal directed physiotherapy treatment might improve balance and gait in children with spastic paraplegic CP.

Keywords: Spastic Paraplegic CP, Physiotherapy, Rehabilitation, NDT, PNF, Physical activity, Paediatric Rehabilitation.

INTRODUCTION

Cerebral palsy describes a group of permanent disorders of the development of movement and posture, causing activity limitation, that are attributed to non-progressive disturbances that occurred in the developing fetal or infant brain. The motor disorders of cerebral palsy are often accompanied by disturbances of Sensation, Perception, Cognition, Communication and behavior: by epilepsy, and by secondary musculoskeletal problems.¹ Prevalence in general population is found to be 2-2.8/1000.²

Children with spastic paraplegic cerebral palsy suffers with spasticity of lower limb muscles.³ Spasticity associated with cerebral palsy can lead to

musculoskeletal complications, such as contractures, pain and subluxation⁴. which affects the pelvic movements and thereby causing alterations in the lower trunk control which leads to functional limitations. Most of these limitations will affect the individual's physical, socially and emotional health leading to decline in their health related quality of life⁵.

Children with spastic CP involving lower limbs have a very good upper limb function but the disability involving the lower limbs hinders the child to involve with the peer group and participate in various outdoor activities.⁶

There is a paucity in the literature related to spastic paraplegic cerebral palsy. Studies regarding goal directed treatment for improving lower limb function is also scarce. Bobath concept aims to improve Gross Motor Function and Postural Control by facilitating muscle activity through key points of control assisted by the therapist.⁷ The purpose of this case report is to explain the importance of goal directed physiotherapy program involving NDT, Task oriented approach, PNF Techniques in the treatment of balance and gait issues in

children with spastic paraplegic CP.

Case Report:

The child was a 9 years old boy diagnosed with Spastic Paraplegic Cerebral Palsy. He was presented with the following problems in Physiotherapy department of Justice KS Hegde Charitable Hospital, Deralakatte Mangaluru, Karnataka, India

Problem List:

Spasticity Grade 1+ in Bilateral hamstrings, Hip adductors, hip flexors Grade 1 was noted in bilateral plantar flexors according to Modified Ashworth Scale. Final 10 degrees of active Extensor lag was noted in left knee joint and 5 degrees was noted in right knee joint Lacks ability to shift weight in standing posture, weakness of bilateral gluteus maximus, hip abductors, knee extensors, and dorsiflexors of ankle. Cannot maintain balance in activities involving transitions in positions. Difficulty in walking independently not even 5 steps, scissoring was noted in gait.

On the day 1, assessment was taken where spasticity was measured by modified ashworth scale (MAS)⁸, balance was measured by Paediatric Balance Scale (PBS)⁹, parameters of gait like Stride length (by chart paper), Cadence (number of steps using stop watch) and Speed (by 10 meter walk test) were measured. Child was at Stage III of GMFCS.¹⁰

Child was treated from June 2017 to October 2017 at Justice K S Hegde Charitable hospital for 1-and-a-half-hour session, 6 days a week for 5 months. Task oriented training and NDT were given together followed by strength training by PNF the next day.

Treatment goals are the basis for treatment planning, gives direction to the treatment and helps in planning discharge.

Long term goal (5 months): Mr. X will walk from his bedroom to washroom (approx.30 meters) at his home independently for five consecutive days without scissoring of lower extremities

Short term goal 1(6 weeks): Mr. X will stand independently by holding a ball with both hands and throw it in basket which is kept at 5 meters' distance without losing balance at least 5 times in 2 mins

Short term goal 2 (12 weeks): Mr. X will walk for

10 steps independently without scissoring while entering home from parking area

Treatment goal 1: Mr X will be able to maintain balance in kneeling position to lift a ball from ground and to throw it in a basket kept at 3 meters' distance.

Treatment goal 2: Mr. X will be able to do transition from kneeling to half kneeling with minimal assistance progressed to independent transition to get up to standing position.

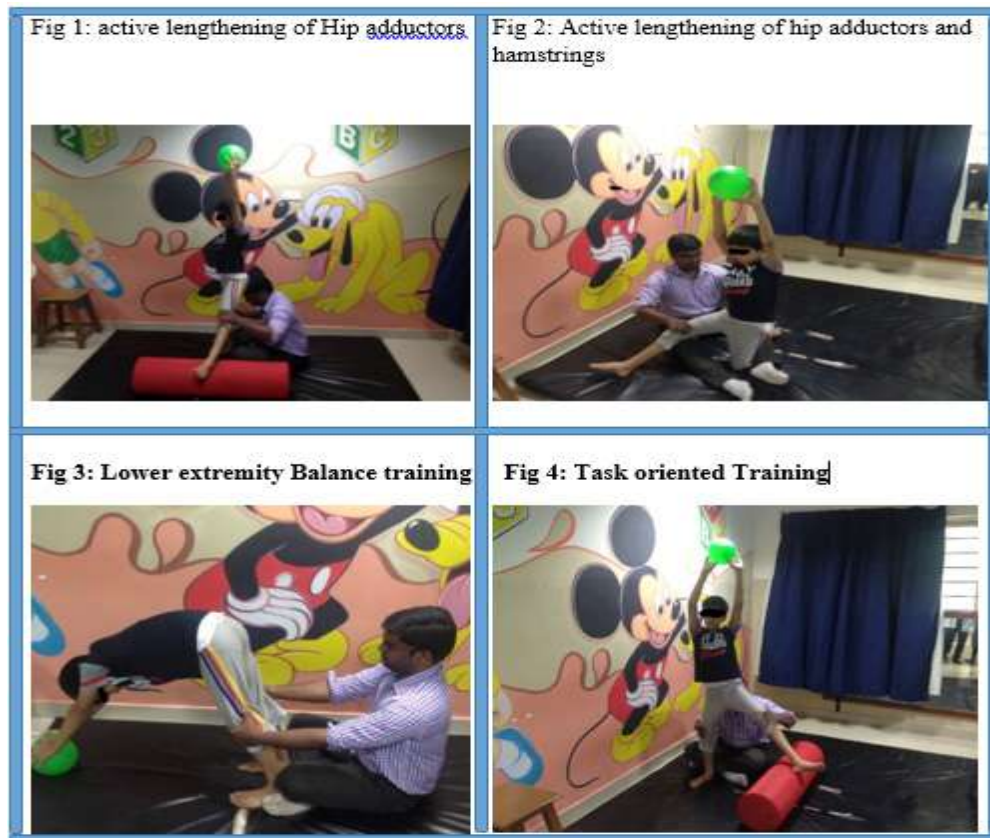

Treatment goal 3: Mr. X will shift the weight on his left leg and place the right leg on a stool of 15 cms height with minimal support of therapist without losing balance

Treatment goal 4; Mr. X will walk 20 steps in parallel bar with mirror without support for 10 steps.¹¹

Our first priority was to normalize the tone and it was achieved by prolonged lengthening with various functional positions it was followed with application of various strategies using principles of NDT in task oriented environment targeting transitions involving lower limb. Rhythmic initiation and dynamic reversals were used to strengthen the antagonists to achieve controlled mobility of lower limb in various positions. Task oriented training in standing and walking were used for improving balance. Treatment goals were given priority and timely achievement of treatment goals helped us to achieve short term goals and long term goals in time. Tone was measured by (Modified Ashworth Scale), stride length was measured by chart paper and ink, cadence was measured by using stop watch, gait velocity was measured by using 10 meters walk test, balance was measured by using Paediatric Balance Scale (PBS) on day 1 and after 5 months. Differences in outcome measures before and after treatment Shown in **table 1**, various treatment strategy is shown in **figure 1-4**.

Table 1: Outcome measures before and after treatment

Balance/ gait parameters	Pre intervention	Post intervention
Stride length (Inches)	55	60
Cadence (Steps/min)	72	100
Gait velocity (m/min)	54	63
Paediatric balance scale	35	48

DISCUSSION

NDT is defined as a client centered, hands-on, problem solving approach. It is used in the management and treatment of children who have disorders of function, movement or postural control because of damage in their central nervous system. This approach uses clinical reasoning rather than a series of standardized techniques.⁷ We have followed principles of NDT in International classification of functional disability and health (ICF) format. Long term goal is the therapist professional judgement of how long a client requires to achieve the functional task our long term goal was based on the priority of child and parents. To achieve the controlled mobility Spasticity, strength and range of motion of joints were our primary concern. To achieve them we used Task oriented strength training, focused on strengthening the lower extremities and practicing functional tasks similar to those the child performs during daily activities. Task-oriented training is defined as the repetitive training of significant, functional activities or element of such activities, to acquire well-organized and effective motor skill.¹² Proprioceptive Neuromuscular Facilitation (PNF) techniques stimulates the proprioceptors of the muscle to enhance the

performance, flexibility and balance. PNF has been proven to be effective in improving the lower limb function in cerebral palsy children with spastic diplegia.¹³ Rhythmic initiation and dynamic reversals were used to strengthen the weak muscles to achieve controlled mobility of lower limb. Weight shifting training and controlled stepping helped in improving stride length. Improved strength of bilateral gluteas maximus, hip abductors and knee extensors along with dorsiflexors of ankle helped in improvement of cadence and gait velocity thereby balance. The child's active participation helped in the faster recovery. Accurate planning, continuity of treatment and periodic measurements of outcome helped in successfully achieving the treatment goals. Short term goals and Long term goals. Hence application of evidence based approaches by setting a proper goal and achieving it stepwise is proved to be beneficial rather than targeting the impairments alone.

CONCLUSION

Goal directed treatment using NDT, Task oriented approach and PNF proved to be effective in the management of children with spastic paraplegic cerebral palsy.

What is the Nature of the Activities Used for Children in Kindergarten?

Saniya Sidhesh Nadkarni¹, Namita Narayanan², Jithin John C K³, KR. Banumathe⁴

¹Occupational Therapist, Dvruddhi Center, Mumbai, Maharashtra, ²Junior Occupational Therapist, Ummeed Child Development Centre, Navi Mumbai, Maharashtra, ³Occupational Therapist, Centre for Rehabilitation, Calicut, Kerala, ⁴Assistant Professor- Selection Grade, Department of Occupational Therapy, School of Allied Health Sciences, Manipal Academy of Higher Education, Manipal, Karnataka

ABSTRACT

Aim: To do the analysis of the activities used for children in kindergarten

Material and Methods: A cross-sectional study was undertaken to do activity analysis of the activities used for children in kindergarten from Manipal, Udupi district, Karnataka. The proforma based on Occupational Therapy Practice Framework, third edition was used and the teachers were interviewed to collect the list of activities. The activities were analyzed and results were interpreted.

Findings: The descriptive statistics was used to analyse the activities conducted for children based on observed performance with respect to expected performance. The activities were focusing on the performance skills as follows: process skills (59.76%), motor skills (52.53%) and social interaction skills (50.2%).

Conclusion: The results of the current study conclude that the activities conducted in the kindergarten classrooms do focus on process skills, motor skills and social interaction skills.

Keywords: Performance skills, kindergarten school, activity analysis, school children, occupational therapy, activities.

INTRODUCTION AND BACKGROUND

The early school environment seems to be a pivotal aspect in children's social development, motor development, and for enhancement of cognitive skills¹. Kindergarten forms the foundation for a more structured setting for learning with their peers². Authors of the book 'Eager to learn - educating our pre-schoolers' believe that the first five years are crucial for development of all performance areas. The teachers or educators may notice

many variations in the children's social, cognitive, motor or physical skills and it is essential for them to understand that these differences are connected to the functional characteristics of the child³.

Adequate functioning in the school is one of the main performance tasks of any student and the role of occupational therapy in any school environment is to first achieve adequate performance skills to improve student performance. Suggestion for activity adaptations, activity and/or task modifications and assistive devices may be necessary to optimize the child's performance in the school setting⁴. A document made by the authors Gloria Frolek Clark, Leslie Jackson and Jean Polichino states that the occupational therapy services in early school based programs helps the child to participate in activities of daily living, education, work, play, leisure, and social interactions⁵.

A study conducted by the Chief Medical Health Officer of the Saskatoon Health Region showed that about

30.1% of kindergarteners in this region were considered developmentally delayed or 'not ready for school' at the time of entry to primary school⁶ in the Western countries. However, reviewed literature showed that no data was available in India related to school readiness in kindergarteners and/or whether the activities conducted in kindergarten focused on the performance skills. Hence, the current study was initiated as a preliminary study to capture this concept in India with the following aim and objectives.

Aim: To do the analysis of the activities used for children in kindergarten

Objectives:

To collect the list of activities used for children in kindergarten.

To do the activity analysis of the collected activities used for children in kindergarten.

Material and Methods:

Research design: A cross sectional study

Sampling method: Convenience sampling

Sample size: 13 kindergartens out of 16 in Manipal were included in the current study. 3 were excluded as the permission was denied.

Selection criteria: Kindergartens which follow Central Board of Secondary Education (CBSE), Indian Certificate of Secondary Education (ICSE), State Board or Matriculation curriculum and within 5 kilometer radius of Manipal were included in the study.

Tool used:

The Occupational Therapy Practice Framework (OTPF): Domain and Process, third edition was used in the current study. The proforma that was developed based on performance skills of OTPF that include motor skills, process skills and social interaction skills was used to analyze the activities.

Procedure

Principals of the 16 kindergartens were approached to obtain permission out of which 13 consented to conduct the study. The study was reviewed and approved by Institute Ethics Committee (KMC, IEC 51/2016). The Principals and the teachers were informed about

the study and written consent was taken from them. Appointments were fixed for interviewing the teachers and the school Principals were assured that the name of their institution would be kept confidential. Teachers were interviewed and list of activities were collected from them. The activities were analyzed and results were interpreted.

DATA ANALYSIS

The descriptive analysis was used to find out the percentage of performance skills in 83 different activities. The collected 83 activities were initially analyzed individually by the three of the investigators to avoid bias (as shown in the Table 1). The total number of sub-categories based on performance skills of OTPF were considered as expected performance which was derived by multiplying the individual subcategories of each performance skill by the number of activities and converted to percentage. The data was included for interpretation only when two of the investigator consented for a particular performance skill to be present in the analyzed activity which was considered as the observed performance. The same pattern was followed for all the 83 activities to collect data for interpretation. The percentage of each component was taken to check for expected performance and observed performance.

Table 1: Example of Activity Analysis

FINDINGS

The aim of the study was to collect the list of activities that were used in kindergarten and to analyze the performance skills that these activities demand. A list of 83 activities was obtained and analyzed by three investigators separately and then compilation of the data was done. Literature on kindergarten, describes that children need to have access to good quality kindergarten experiences that focus upon all areas of development as

required for their optimal achievement throughout the early childhood years^{7,8}.

Out of 13 kindergartens, 4 were CBSE and ICSE each and 5 were state board. As seen in the table 2, the activities were categorized based on approach to activity (individual/group), settings of activity (home-based/school-based) and location of activity (indoor/ outdoor). These details were provided by the kindergarten teachers and this helped us to develop some characteristics about the activities used. An article written by Bassok, Latham and Rorem compared the kindergartens classrooms through 1998 to 2010 and found that the whole class activities was about 15% in 1998 and by 2010 it increased to 32%⁹ Our study findings are contrary to the above mentioned study, and it concludes that most of the mentioned activities were individual based (55.38%) as opposed to group based (44.62%). An assumption can be made that this shift is majorly seen because in India it is seen that the classrooms generally consist of a large number of students and it might become difficult for one teacher to monitor big groups hence they prefer to conduct individual activities, but no data as such was found to support the current assumption.

Table 2: Descriptive Characteristics of Activities used in Kindergarten

Characteristics of activities	Frequency	Percentage
Approach to activity		
Individual	72	55.38%
Group	58	44.62%
Setting of activity		
Home based	18	13.84%
School based	112	86.16%
Location of activity		
Indoor	97	74.61%
Outdoor	33	25.39%

A total of 83 activities were then analyzed by three individuals separately and the analysis showed that 59.76% of the activities demanded process skills, 52.53% demanded motor skills and 50.2% demanded social interaction skills as observed performance against the expected performance of 100% as shown in Table 3.

Table 3: Percentage of Expected Performance and Observed Performance among Performance Skills

Performance Skills	Expected performance	Observed performance
Motor skills	100%	52.53%
Process skills	100%	59.76%
Social Interaction skills	100%	50.2%

In the current study, the results showed that the kindergarten activities are focused on process skills (59.76%) with reference to Table 3. A lot of kindergarten teachers believe that process skills are fundamental and that kindergarten is the time when children learn the behaviors of teacher directed tasks and learn the rules of the classroom. Hence, it could also be said that kindergartens are now developing a culture of learning related behaviors^{10,11}. Thus, it is seen that many other studies support the findings of the present study that most kindergartens are concentrating upon process skills.

According to Table 3, 52.53% of the activities demanded motor skills in the current study. There are still some differences seen in the expected and observed performance for motor skills. The lack in motor skills could be attributed to the fact that most of the activities are indoor activities which focus more on the fine motor skills than the gross motor skills.

Kindergarten is assumed to be the time when the child learns the ropes of social conventions which assist in communicating with peers, adults as well as in social situations¹². However, the present study showed that social interaction skills (50.2%) has some deficiency in the expected and observed performance level as can be determined from Table 3, and this could be ascribed to the fact that most teachers assign individual activity and so the interaction factor may be comparatively less.

Strengths and limitations

The activity analysis was done by the three investigators independently is one of the strengths of the current study. This was a preliminary study which could aid in further research in this field. The number of schools that were a part of this study were relatively less and hence more number of activities could not be

collected. The study was done on the basis of convenience sampling to get an understanding of the current scenario of kindergarten classrooms and concrete conclusions cannot be drawn from the study because of the fact that the study participants are not randomized. The list of activities analyzed were on a hearsay basis and not on an observational basis because this would have been more time consuming and the investigators had time restraints.

Recommendations

Future studies analyzing the minimum percentage requirement of performance skills for school readiness may be conducted. A longitudinal study with random sampling could also be conducted to get a broader understanding of the scenarios in the kindergarten classrooms. As an occupational therapist who are aware of the developmental stages, we could assist in making universal guidelines for preparatory stages of school readiness.

CONCLUSION

The results of the current study conclude that the activities conducted in the kindergarten classrooms do focus on process skills, motor skills and social interaction skills.

ABSTRACT

Introduction: Acinetobacter (gram-negative bacteria) has become a threat in all the hospitals, especially in the Intensive Care units, being mainly treated with Carbapenem. But now, Carbapenem-resistant bacteria have evolved, Thus, treatment of such a patient with Carbapenem-resistant Acinetobacter infection becomes more difficult. This study will compare the factors that may cause Carbapenem-resistant and Carbapenem-sensitive Acinetobacter infection thereby helping in management of multidrug resistant Acinetobacter infections.

Materials & Method: This study is retrospective hospital based study executed in hospitals associated with Kasturba Medical College, Mangalore, Karnataka. Records of, 75 patients with Carbapenem-resistant Acinetobacter infection and 75 patients with Carbapenem-sensitive Acinetobacter infection were evaluated using a Proforma prepared after extensive literature review. The collected data were entered in, and analysed using SPSS version 16.0. For qualitative analysis of data, statistical Chi-square test was used and $p < 0.05$ was taken as statistically significant.

Results: Among 75 reports, with Carbapenem-resistant Acinetobacter 3 (4%) of the 75 reports had Acinetobacter resistant to Meropenem and Imipenem. 56 of the 75 reports had Acinetobacter resistant to all the Carbapenems. More than three quarters of individuals with Resistance had Co-morbid conditions present compared to 64% in Sensitive.

24% of Carbapenem-resistant individuals had pneumonia compared to 4% in Carbapenem-Sensitive. ICU admissions were less (26.3%) in sensitive cases compared to resistant (49.3%). Recovery was better in Acinetobacter Sensitive individuals (42.7%) when compared to Resistant which was just 11%.

Keywords: acinetobacter, carbapenem resistance, co-morbid conditions, ICU Admission.

INTRODUCTION

Acinetobacter (gram-negative bacteria) has become a threat in all the hospitals, especially in the Intensive

Care units, all over the world ^[1]. It is more common in patients who are intubated, catheterized etc. They mainly colonize skin, oropharynx, respiratory tract and urinary tract. They colonize (not so frequently) the gastrointestinal tract ^[2]. Meningitis, peritonitis, urinary tract infections, endocarditis (native valve infective endocarditis and prosthetic valve endocarditis), community-acquired pneumonia, and cholangitis are very rare association of infection of Acinetobacter. It has been found that patients who undergo liver

Correspondence author:

Department of Medicine, Kasturba Medical College, affiliated to MAHE, Mangalore, India.

Email id : drpavanmr@yahoo.co.in

transplantation^[3] or cardiac surgery^[4] get Carbapenem-resistant *Acinetobacter* infection.

Predisposing Factors:

Colonization of *Acinetobacter* is of high tendency when agents of antimicrobial therapy have insignificant or no action against *Acinetobacter*.

Staying where other patient (like ICUs) are infected with *Acinetobacter*.

Clinical symptoms: There are no specific clinical symptoms.

Many patients get colonized by *Acinetobacter*, but all patients do not suffer from infection. It depends on the immunity of the patient.

Acinetobacter species (mainly, *Acinetobacter baumannii*), are usually treated with Carbapenem. But now, Carbapenem-resistant bacteria have evolved, and treatment is given with a combination of Carbapenem and Cephalosporin or Carbapenem and Colistin.^{[4],[5]}

Thus, treatment of such a patient with Carbapenem-resistant *Acinetobacter* infection becomes all the more difficult. This study will compare the factors that may cause Carbapenem-resistant and Carbapenem-sensitive *Acinetobacter* infection. Carbapenem-resistant and Carbapenem-sensitive *Acinetobacter* infection treatment outcomes have not been analyzed and compared in nearly all the studies^[5]. So, the data obtained from this study will bring forth such a comparison, as well, thereby helping in management of multidrug resistant *Acinetobacter* infections.

OBJECTIVES

To compare various parameters between the two categories (Carbapenem-sensitive *Acinetobacter* infection and Carbapenem-resistant *Acinetobacter* infection) namely, age, number of days of hospital stay, number of co-morbid conditions, number of antibiotics taken, which can lead to the infection.

To compare the outcome of treatment in both the groups of patients

LITERATURE REVIEW

In 2016, a study by C Q Aline et. al, retrospective in nature, was carried out to find out if there were lower

chances of survival in patients who had *Acinetobacter* spp. bacteremia compared to those who had bacteremia due to other pathogens, aiming the critically ill patients. There was no dissimilarity found between patients with *Acinetobacter* spp. and other pathogens, regarding age, sex, APACHE II score, Charlson Comorbidity Score and type of infection according to the investigation done. Diabetes mellitus, Age above 60 years and *Acinetobacter* spp. infection were allied with poor prognosis. From the multicomponent model, *Acinetobacter* spp. infection (HR=1.93, 95 % CI: 1.25–2.97) and more than 60 years of age were individualistic prognostic factors.

In 2015, a study by Avkan-Oguz V et. al, microorganism's effect was the basis of investigations, which were found in culture of recipients of liver transplant with infection of the surgical site on antibiotic treatment. Findings were that, eighteen (25.4%) cases were polymicrobial especially, *Acinetobacter baumannii* and *Enterococcus* species.

In 2014, a study by Nguyen Thi Khanh Nhu et. al, retrospective in nature, done over an 11-year period, aiming at understanding and documenting changes in the agents causing VAP and their susceptibility to antimicrobials in a major infectious disease hospital located in southern Vietnam. A prominent shift from *Pseudomonas* to *Acinetobacter* spp. was observed, as the most prevalent bacteria and was also found in ventilator's tracheal aspirate associated with Pneumonia patients. Though resistance to antimicrobials was a common occurrence, there was a proportional annual rise in carbapenem-resistant *Acinetobacter* spp. as recorded from 2008 upto next 3 years (annual trend; odds ratio 1.656, $P=0.010$).

In 2014, a study by Pascale G D, a retrospective study of data, collected prospectively, was performed in a teaching hospital's ICU in Rome, to find the safety and efficiency of Tigecycline doses that was higher than the normal standard dose. Among the main isolated pathogens (mostly *Acinetobacter baumannii* and *Klebsiella pneumoniae*), the use of higher than standard doses of tigecycline was the only individualistic predictor of clinical cure (odds ratio (OR) 6.25; 95% confidence interval (CI) 1.59 to 24.57; $P=0.009$).

In 2014, a study by Balkhy H H, retrospective in nature, to examine the extent of resistance to multiple

drugs among common microbial causes of VAP in the adult intensive care unit (ICU), showed that *Acinetobacter* spp. was highly (60-89%) resistant to all antimicrobials including carbapenems (three- and four-class MDR prevalence were 86% and 69%, respectively). There was a worse profile of ICU patients with resistant *Acinetobacter*, but not patients' outcomes.

In 2008-2009, a retrospective study comparing the results of carbapenem-resistant *A. baumannii* VAP treated with colistin or with ampicillin-sulbactam, were analysed and it was established to have same results.

In 2003-2004, a retrospective, matched, cohort study by Sunenshine R H et. al, was carried out to study the effect on mortality rates, hospital stay duration and intensive care unit (ICU) stay duration of patients infected with multi - drug resistant strains of *Acinetobacter*. Healthcare-acquired and community-acquired *Acinetobacter* infections were taken into consideration. In-hospital mortality rates with MDR *Acinetobacter* infections (26%) were higher than susceptible references (18%) or uninfected ones (11%). Antimicrobial drug therapy (discordant) was more customary for MDR *Acinetobacter*-infected patients than for susceptible ones (91% vs. 65%, $p < 0.001$). On the other hand, patients with MDR *Acinetobacter* infection, who were treated with conflicting antimicrobial drug therapy, initially were five times more likely of an increased duration of stay in the ICU.

MATERIALS AND METHOD

This study is retrospective hospital based executed in hospitals associated with Kasturba Medical College, Mangalore, Karnataka. Records of, 75 subjects for Carbapenem-resistant *Acinetobacter* infection and 75 subjects for Carbapenem-sensitive *Acinetobacter* infection were evaluated using a Proforma prepared after extensive literature review and based on information available from records of patients who were admitted to the hospital. The study population included patients admitted to the hospital with hospital-acquired or community-acquired Carbapenem-sensitive or Carbapenem-resistant *Acinetobacter* infection.

The collected data were entered in, and analysed using SPSS version 16.0. For qualitative analysis of data, statistical Chi-square test was used and $p < 0.05$ was taken as statistically significant.

RESULTS

TABLE 1: Carbapenem-resistance variation:

Name of carbapenem to which the bacteria is sensitive	Number of individuals (N=75)
None	56 (77.7%)
Meropenem	2 (2.7%)
Imipenem	13 (17.3%)
Ertapenem	0
Both Meropenem and Imipenem	3 (4%)

In the study, it was found that among all the 75 reports collected, of patients with Carbapenem-resistant *Acinetobacter*, their respective laboratory specimens, were sensitive to one or the other Carbapenems, while 3 (4%) of 75 reports had *Acinetobacter* resistant to Meropenem and Imipenem. 56 of the 75 reports had *Acinetobacter* resistant to all the Carbapenems. The above data was highly significant, statistically (p value < 0.05).

There was presence of co-morbid conditions in both the categories of individuals, Carbapenem-resistant and Carbapenem-sensitive. An association between the presence of co-morbid conditions and acquitting of Carbapenem-resistant or Carbapenem-sensitive *Acinetobacter* infection, was proved statistically (Pearson's chi-square test: $df=1$, p value =0.047).

Though the presence of co-morbid conditions had an association with Carbapenem resistance, the total number of Co-morbid conditions didn't have any statistical significance with Carbapenem resistance or sensitivity.

In the study, it was found that among the 75 individuals who had Carbapenem-resistant *Acinetobacter* infection, DM was present in 20 (26.7%) patients. In 75 individuals with Carbapenem-sensitive *Acinetobacter* infection, DM was present in 15 (20%) patients.

In the study, out of the 75 individuals with Carbapenem-resistant *Acinetobacter* infection, 21 (28%) of them had Hypertension, and out of the 75 individuals with Carbapenem-sensitive *Acinetobacter* infection, 22

(29.3%) had Hypertension.

It was noted, only individuals with Carbapenem-resistance also had bronchial asthma as one of the comorbid conditions. Among the Carbapenem resistant individuals who were 75 in number, 5(6.7%) of them had bronchial asthma (Pearson’s chi-square test: df-2, p value < 0.05).

There was a strong association (Pearson’s chi-square test: df-2, p value = 0.001), found between Carbapenem-resistant and Carbapenem-sensitive Acinetobacter infection, and presence of other comorbid-conditions (which did not include Hypertension, Diabetes Mellitus, COPD, bronchiectasis). These co-morbid conditions which were taken into account were cancer, CKD, RVD, anemia, IHD, CVA, respiratory problems, hypothyroidism, ALL, IHD, alcohol dependence syndrome, cardiac disorders, urinary incontinence, acute coronary syndrome, encephalitis.

Following Bar Graphs show invasive procedures that were done which shows a strong statistical significance. There was an association between the invasive procedures and Carbapenem-resistant or Carbapenem-sensitive Acinetobacter infection.

Graph 1: Comparison of Invasive Procedures done in Carbapenem Resistant Vs Sensitive Groups

Pneumonia was present in quite a few individuals, both with Carbapenem-sensitivity and Carbapenem-resistance.

The following Bar Graph Number 2 shows a comparison between pneumonia in Carbapenem-sensitive and Carbapenem-resistant patients

Graph 2 : Comparison between pneumonia in Carbapenem-sensitive and Carbapenem-resistant patients

49.3% of Carbapenem-resistant were admitted to ICU compared to 20.6 % of Carbapenem-sensitive. There was high statistical significance (Pearson’s chi-square test: df-1, p value = 0.004) among individuals with Carbapenem-resistant or Carbapenem-sensitive Acinetobacter infection and ICU admission.

There were varied specimens from which Carbapenem-resistant Acinetobacter and Carbapenem-sensitive Acinetobacter were obtained.

Out of these samples sputum samples had the highest frequency of Acinetobacter prevalence. Among the 49 sputum samples which had Acinetobacter, 21 (28%) samples contained Carbapenem-resistant Acinetobacter and 28 (37.3%) samples contained Carbapenem-sensitive Acinetobacter.

TABLE 2: Outcome of Treatment

Outcome	Carbapenem-resistant (n=75)	Carbapenem-sensitive (n=75)
Recovered	1 (11%)	32 (42.7%)
Improved	31 (41.3%)	31 (41.3%)
Unchanged	6 (8%)	6 (8%)
Deteriorated	5 (6.7%)	2 (2.7%)
Expired	18 (24%)	4 (5.3%)
Unknown	4 (5.3%)	0

The outcomes of treatment showed high statistical significance (Pearson’s chi-square test: df- 5, p value <0.05). Among the 75 patients with Carbapenem-sensitive Acinetobacter infection, maximum, i.e., 32 (42.7%) of them recovered. Among the 75 patients with Carbapenem-resistant Acinetobacter infection, maximum, i.e., 31(41.3%) improved. Among the Carbapenem-resistant patients, 18 (24%) expired while

among the Carbapenem-sensitive patients, 4 (5.3%) expired.

DISCUSSION

The aim of the study was to compare various parameters between the following two categories of patients - Carbapenem-sensitive Acinetobacter infection and Carbapenem-resistant Acinetobacter infection. The various parameters which were considered included, age, number of days of hospital stay, number of comorbid conditions, number of antibiotics taken, which can lead to the infection and to compare the outcome of treatment in both the groups of patients. The study was retrospective in nature, and was carried out in Karnataka, in two tertiary care hospitals in Mangalore. Data was collected in a proforma prepared after extensive literature review that would help, gain information on all the above mentioned objectives.

The current study included 150 patients' records, of whom 75 were of patients with Carbapenem-resistant Acinetobacter infection and 75 were from patients with Carbapenem-sensitive Acinetobacter infection. In the study by Aline C Q et. al [1], which was also retrospective in nature just like the present one, it was found that critically ill patients who were of age more than 60 years and who had Diabetes Mellitus had significantly poorer prognosis when combined with Acinetobacter infection. But in the present study, it was seen that Diabetes Mellitus or age more than 60 years had no such association with Acinetobacter infection. In this study, it was seen that, bronchial asthma had an association with Carbapenem-resistant Acinetobacter infection. And, it was seen that only individuals with Carbapenem-resistant Acinetobacter infection also had bronchial asthma. There was a high statistical significance ($p=0.001$) noted with other comorbid conditions(as mentioned previously) and Carbapenem-resistant Acinetobacter infection.

In the study by Balkhy H H , it was seen that there was a worse profile of patients with ICU admission who had Multidrug-resistant Acinetobacter infection. Same was the case with the present study. The current study compared ICU patients with Carbapenem-resistant Acinetobacter infection and ICU patients with Carbapenem-sensitive Acinetobacter infection. It was found that, for Carbapenem-resistant Acinetobacter infection, ICU admission was a strong risk factor. It

was seen that, out of the 75 Carbapenem-resistant Acinetobacter infected patients, 37 (49.3%), had been admitted to ICU. In the aforementioned study, there was a worse profile of patients with drug resistant Acinetobacter infection, but not with patients' outcomes. But the present study showed that outcomes of treatment and Carbapenem-resistance had a high significance.

In the study by Gurjar M et. al, it was seen that Carbapenem-resistant Acinetobacter infection with Ventilator Associated Pneumonia (VAP) acted as a strong risk factor for the former. Same was the result with the present study. But in this study, risk factors of Carbapenem-resistant Acinetobacter infected patients were compared with Carbapenem-sensitive Acinetobacter infection. Also, presence of pneumonia at ICU admission has an impact on the outcome of the patients, according to the mentioned study. In this study also, when pneumonia was taken as a factor, it proved to be a high- risk factor for both Carbapenem-sensitive and Carbapenem-resistant Acinetobacter infection.

In a study by Rebecca H Sunenshine et. al [5], first of its kind, that it directly assessed the outcomes of patients with drug-resistant Acinetobacter infection. But in the current study, the treatment outcomes of patients with Carbapenem-resistant Acinetobacter-infected patients were compared with Carbapenem-sensitive Acinetobacter-infected patients. It was seen that, patients of the former category improved after treatment but those of the latter category recovered completely.

So, all the above mentioned studies mostly assessed drug-resistant Acinetobacter infection or drug-sensitive Acinetobacter infection. But the two categories were never compared. The present study compared the two categories of patients, those with Carbapenem-resistant Acinetobacter infection and Carbapenem-sensitive Acinetobacter infection. The co-morbid conditions like cancer, CKD, etc. did act as strong risk factors for both the categories of patients. But bronchial asthma was a risk factor for only Carbapenem-resistant Acinetobacter-infected patients, as no patients were found in the study of 150 patients' records, where a patient had Carbapenem-sensitive Acinetobacter infection and bronchial asthma alongside. Previous studies [1] showed that DM was a risk factor for Acinetobacter infection. But, in the current study DM did not prove to be a risk factor for any of the two categories of patients.

CONCLUSION

Co-morbid conditions like cancer, CKD, ARDS, anemia, cor pulmonale, etc acted as risk factors for both Carbapenem-sensitive Acinetobacter-infected patients and Carbapenem-resistant Acinetobacter infected patients.

For patients infected by Acinetobacter that is resistant to Carbapenem, bronchial asthma is a risk factor.

ICU admission was a risk factor for both the categories of patients.

No importance was found in the number of days of hospital stay, number of antibiotics taken, or incidence of hospital-acquired and community-acquired infections in the two categories of patients.

Maximum patients with Acinetobacter infection that is resistant to Carbapenem recovered after treatment while maximum patients with Acinetobacter infection that is resistant to Carbapenem infection recovered after treatment. So, the outcomes of treatment for the two categories of patients were different.

RECOMMENDATIONS

Patients with bronchial asthma should be looked after, specifically so that they don't acquire Carbapenem-resistant Acinetobacter infection. Prophylaxis can be an option, especially for those admitted to the ICU, or who are intubated, or getting mechanical ventilation or those who have tracheostomy done.

Patients with co-morbid conditions should be looked after specifically, so that they don't acquire Carbapenem-sensitive or Carbapenem-resistant Acinetobacter infection.

ICUs should be disinfected and monitoring of all patients in the ICU should be done for Acinetobacter infection (both Carbapenem-resistant and sensitive).

Monitoring (especially, culture and sensitivity) of intubated, mechanically ventilated patients for Acinetobacter infections should be done. Tracheal aspirates should also be cultured for Acinetobacter in tracheostomy patients.

Conflict of Interest – None

ABSTRACT

BACKGROUND: Diabetes mellitus, a chronic metabolic disorder, may have a negative effect on the quality of life of diabetics.

AIM: To evaluate the gender differences in quality of life (QOL) of type-2 diabetics with metabolic syndrome (MS).

METHOD: The cross-sectional study was conducted at the outpatient clinic of a tertiary hospital in Madurai, on 166 type-2 diabetics with MS. Baseline characteristics, anthropometric measurements and biochemical profile were elicited through a pre-tested questionnaire. QOL of the diabetics was evaluated using the WHOQOL-BREF questionnaire. Gender comparisons were statistically tested.

RESULTS: The overall mean QOL scores were 28.08±6.95 and 32.35±12.08 for male and female diabetics respectively which differed significantly ($P<0.001$). Women diabetics had better perception of QOL compared to men.

CONCLUSIONS: QOL as reported by the diabetics was poor, with women scoring better than male diabetics.

Key-words: Diabetes, Metabolic syndrome, Quality of Life, Gender

INTRODUCTION

Type-2 diabetes mellitus is a complex, heterogeneous metabolic condition with serious short-term and long-term consequences¹. Metabolic syndrome (MS) indicates a cluster of unfavourable health factors such as obesity, insulin resistance, dyslipidemia and hypertension that increase the risk of developing cardiovascular diseases, especially in type-2 diabetes^{2,3}. Metabolic syndrome is recognized as a reliable long-term predictor of adverse health outcomes⁴. The long-term complications of

diabetes, with their considerable impact on health, may as a result also have a negative impact on quality of life.

Quality of life (QOL) is defined by WHO⁵ as “individuals’ perceptions of their position in life in the context of culture and value systems in which they live and in relation to their goals, expectations, standards and concerns”. It is a broad ranging concept affected in a complex way by the person’s physical health, psychological state, level of independence, social relationships, personal beliefs and their relationship to salient features of their environment.

SUBJECTS AND METHOD

The study was based on a cross-sectional representative sample of 1126 adult type-2 diabetics attending the outpatient clinic in Southern Tamil Nadu.

The subjects were selected based on the inclusion criteria of being able to read the questionnaire and provide informed consent, were >18 years of age, diagnosed as suffering from type-2 diabetes mellitus for at least one year and an exclusion criteria of having severe comorbidities or psychiatric disorder. Institutional ethical clearance was obtained for the study, conducted between April and October 2017. A pre-tested questionnaire was used to elicit information on the demographic and socio-economic profile of the subjects. Anthropometric measurements were obtained directly from the patients at the outpatient department and the biochemical data were collected from the hospital records. The definition of MS used in the study adhered to the National Cholesterol Control Program Adult Treatment Panel (NCEP ATP-III) definition modified for Asian Indians⁶: central obesity measured by waist circumference(WC) ≥ 90 cm in men and ≥ 80 cm in women; fasting plasma glucose(FPG) ≥ 100 mg/dl or diagnosed with type-2 diabetes; hypertension with systolic BP ≥ 130 mmHg or diastolic BP ≥ 85 mmHg; elevated triglyceride level ≥ 150 mg/dl; reduced HDL-cholesterol level < 40 mg/dl for men and < 50 mg/dl for women.

From the identified type-2 diabetics with MS, a sub-sample was chosen for the study on quality of life. The Tamil version of the WHOQOL-BREF questionnaire was used to facilitate better understanding by the respondents. Prior permission was obtained from WHO and the questionnaire was field tested for reliability. The WHOQOL-BREF questionnaire consists of 26 questions: two questions from the overall QOL and general health and 24 questions of satisfaction, divided into four domains: physical and psychological health, social relationships and environmental health. The response of each question was rated on a 5-point Likert scale and the raw scores in each domain were transformed to a

4 - 20 score according to WHO guidelines⁷. The mean score of questions in each domain was used to calculate the domain score that was finally transformed linearly to a 0-100 scale⁸. The total score and hence QOL was classified by the investigators as poor (<33), average (33-66) and good (>66).

Data Analysis

Data were analysed using SPSS version 22.0 for Windows (SPSS Inc., Chicago, USA). Based on normality test, all continuous data were found to be normally distributed and were presented as descriptive statistics i.e., mean and standard deviation, and gender comparisons using unpaired 't' test. The statistical significance was assumed at a p-value of < 0.05 . The level of correlation between the overall QOL scores and MS parameters was examined using Pearson's correlation coefficient. Independent t-test and chi-square test were used to investigate the relation between the QOL scores and baseline characteristics.

RESULTS

Prevalence of Metabolic Syndrome among the type-2 diabetics

The overall prevalence of metabolic syndrome among the type-2 diabetics (N=1126) was above three fourth (77.44%) of the sample population, higher among women (84.67%) as compared to men (72.40%). The sub-sample for QOL study was selected based on the presence of more than three positive parameters of MS. A sub-sample of 166 (14.74%) adult type-2 diabetics with metabolic syndrome (**92 female and 74 male**) were identified for the QOL study. The profile of the selected sub-sample of type-2 diabetics with metabolic syndrome is presented in the following table.

Table 1: Gender-wise comparison of MS components in type-2 diabetics with MS

Parameters	Female (n=92)	Male (n=74)	P value
	Mean \pm SD	Mean \pm SD	
Age (yrs)	50.78 \pm 11.66	53.77 \pm 11.39	0.099
BMI (kg/m ²)	28.73 \pm 4.54	27.16 \pm 4.002	0.021*
Waist Circumference (cm)	96.75 \pm 9.84	81.34 \pm 9.81	P<0.001***
BP-Systolic (mmHg)	144.34 \pm 19.18	140.27 \pm 14.14	0.130

Cont... Table 1: Gender-wise comparison of MS components in type-2 diabetics with MS

BP-Diastolic (mmHg)	87.8±11.3	87.0±10.84	0.643
Fasting Plasma Glucose (mg/dl)	188.9±61.5	198.22±66.52	0.352
LDL Cholesterol (mg/dl)	132.04±38.43	119.29±42.02	0.043
HDL Cholesterol (mg/dl)	38.68±5.03	33.51±2.95	P<0.001***
Triglycerides (mg/dl)	255.88±98.48	265.97±121.93	0.556

*p<0.05 - Significant , **p<0.01 and ***p<0.001 highly significant.

The mean age of the subjects was comparable between genders. A mild significant difference (p=0.021) in BMI was noted between the male and female subjects. The mean WC of the male subjects was lower than the cut-off for men (P<0.001). Women diabetics had a higher mean WC and lower HDL level when compared to men which may explain the higher prevalence of MS in women. The mean values of parameters such as BP, FPG and TG were above the cut-off values as per MS definition and were comparable between genders.

The quality of life measure were tested for the reliability and the Cronbach's Alpha was 0.801 which well exceeds the minimum value of 0.70^{9,10}.

Gender comparison of association between overall QOL scores and baseline characteristics

Most of the male (59.5%) and female (65.2%) subjects were in the age range of 41 to 60 years and women in this age range had highest overall mean QOL scores (33.5±12.4) when compared with men (26.4±2.4). Men had higher mean QOL score (31.3±6.1) in the age range of 21 to 40 years when compared to women (29.3±11.6) in this age group. Marital status led to significant (P<0.001) difference in QOL scores within the male group. Most of the female (71.7%) and male (59.5%) subjects belonged to joint family which contributed to higher QOL scores. The QOL scores had no significant association with religion. A majority (64%) of the subjects in both genders had professional education and almost 42% of each gender group belonged to upper middle class.

Table 2: Comparison of overall QOL scores and demographic variables between genders

Parameters	Overall Quality of Life scores within groups					
	Female (n=92)		P value	Male (n=74)		P value
	n(%)	Mean±SD		n(%)	Mean±SD	
Age ≤20yrs	0	0	0.405	1(1.3)	58. ±0	P<0.001***
21-40yrs	18(19.6)	29.3±11.6		6(8.1)	31.3±6.1

Upper	6(6.5)	30.7±6.56		6(8.1)	26.04±1.87	

Significant association was observed between QOL scores and age (p<0.001), marital status (p<0.001) and occupation (p<0.05) respectively in male subjects. This observation may explain the reason behind the low QOL scores among the male diabetics since QOL is a subjective measure, influenced by the dependent variables.

Comparison of mean QOL scores of each domain between genders

QOL scores of each domain were tested for significance using an independent sample t-test.

Table 3: Comparison of QOL domain scores between genders

QOL Domains	Gender(n)	Mean QOL scores	P value
Physical health	Male(74)	30.85±9.25	0.041*
	Female(92)	34.45±12.50	
Psychological health	Male(74)	34.17±7.58	0.02*
	Female(92)	37.47±10.45	
Social relationship	Male(74)	22.31±9.97	0.01*
	Female(92)	27.54±16.16	
Environment health	Male(74)	24.97±6.82	0.007**
	Female(92)	29.62±13.34	
Overall QOL	Male(74)	28.07±6.95	0.009**
	Female(92)	32.35±12.08	

Women diabetics had significantly higher scores than that of men within each domain. The highest score was obtained in the psychological domain and the lowest score for social relationships among both groups. Although a significant difference (P=0.009) was noted in the overall QOL scores between groups, the differences in the individual domain scores were not highly significant, except for the scores in the environment domain (P=0.007). The higher scores by women may be attributed to the younger age range when compared to men in the study group. Further, an equal percentage of women subjects had professional education compared to men, which may have contributed to their better perception of QOL.

A majority of male diabetics with MS had low levels of perception of quality of life in all domains while the women diabetics had better perception of QOL especially in variables such as physical and psychological health domains. Highest proportion (95.9%) of male subjects had poor perception of their social relationships, followed by 94.6% with poor scores in the environmental domain.

The correlation of quality of life scores with the individual parameters of MS was analysed using Pearson’s correlation coefficient and the values were compared between genders. WC, BMI and TGL in male, and HDL and TGL in female subjects showed a positive correlation with QOL compared to the other parameters

of MS. Although WC was negatively correlated with QOL in female subjects, BMI showed negligible positive correlation. It may be inferred that the overall occurrence of MS had more impact on the QOL scores than individual parameters of MS.

DISCUSSION

The study aimed to compare the QOL of male and female type-2 diabetics with metabolic syndrome in a tertiary out-patient diabetic clinic. Metabolic syndrome was present in majority (77.44%) of the type-2 diabetics, also stated by various studies^{11,12,13}. Women had a higher prevalence rate which maybe a result of difference in the cut-off values of individual parameters of MS^{14,15}.

A majority of the male and female diabetics were in the age group of 41-60 years with a mean overall QOL score of 26.4±2.4 in men and 33.5±12.4 in female subjects. It is observed that younger type-2 diabetics had significantly higher QOL scores than older persons^{16,17}. However, a study embarked on an elderly population in a small town in Tamilnadu¹⁸ showed a better mean QOL score. Association of QOL scores with marital status, exhibited in unmarried male subjects (2.7%) have negligible implication. It may be noted that QOL was not influenced by any specific demographic parameter in women. However, the QOL scores were significantly associated with age, marital status and occupation in male diabetics¹⁸. Among the MS parameters, WC and HDL had varying correlations with QOL scores for male and female subjects. Women diabetics had significantly higher waist circumference which may have influenced the negative correlation ($r = -0.10$) with QOL. HDL cholesterol had mild negative correlation in men (0.07). It was found that dyslipidemia had the lowest correlation with QOL¹⁹. Blood pressure was the only parameter that had similar negative correlations in both genders.

The individual domain QOL scores were significantly higher in women than among men diabetics in contrast to most findings^{20,21}. However, other studies support our observation of higher QOL in female than male diabetics^{22,23}. Both genders perceived lowest levels of QOL in the social domain followed by the environmental domain. This suggests that external factors exhibit greater influence on QOL of diabetics than their personal factors such as physical and psychological influences, irrespective of gender. Thus, diabetic individuals with MS were more likely to have poor scores in the domains

of general health, vitality, social functioning and role limitations due to emotional problems. QOL can be enhanced among people with diabetes by interventions that improve glycaemic control, changes in insulin delivery systems, and educational and counselling sessions that support the development of diabetes specific coping skills²⁴.

Limitations:

In this study, sample was limited to diabetics with MS in a tertiary hospital and hence the findings cannot be generalised to populations. Diabetics without MS were not included in the study, therefore impact of MS in diabetes on QOL could not be compared. Other associated factors related to QOL, such as, behavioural characteristics, social wellbeing and environmental health were not included in the study owing to paucity of time

CONCLUSION

The cross-sectional study measures the burden of MS on type-2 diabetics and its effect on their quality of life. These findings suggest that MS as a constellation of conditions has a greater impact on QOL than the individual disorders. Quality of life of diabetics is a strong indicator of the patient care process, influenced by the available healthcare facilities, family support, social and environmental influences. Further, longitudinal studies are recommended to assess the effect of social and environmental factors on quality of life of diabetics.

ABSTRACT

Purpose - The purpose of this study is to explore relationship between entrepreneurship and deviant behavior.

Design - Conceptual development using cases as illustrative examples.

Findings- Clearly, deviant and unethical behavior issues are of surprising situation to companies, which need to find a way to determine m, on equivalent time as encouraging ethical culture. Feels that furthermore research is required using more qualitative and definitive estimations to research extra about one's practices.

Value- This study finds that there is an overlap between way deviant behavior is defined and way entrepreneurship is conceptualized in literature. It also finds that previous research, distinguishing between desirable and undesirable deviant behavior based on intentions or outcomes of behavior, insufficient in relation to entrepreneurship as deviant behavior. Reason is that for entrepreneurial ventures, underlying intentions are often good, but outcomes often not; and that making assessments of outcomes of entrepreneurial ventures a prior is notoriously difficult. Assessing deviant behavior based only on organizational level evaluations is likewise insufficient in relation to entrepreneurship.

Research limitations - The cases used to illustrate overlap between entrepreneurship and deviant behavior are conspicuous and not necessarily representative of entrepreneurship and deviant behavior in general.

Originality - This is an attempt at merging deviant behavior and entrepreneurship literature, which highlights an important niche with a great promise for future research.

Keywords — *Entrepreneurship, deviant behavior, Deviance, Norm and Institution.*

INTRODUCTION

Although deviant behavior is risky, it can also have positive consequences for organization, its members, or both. Research on positive consequences of deviant behavior is a neglected area of literature and requires further research. In order to develop previous conceptualizations of deviant behavior, this study draws on emerging strand of research that focuses on dark side of entrepreneurship and limited work that emphasizes positive aspects of deviant behavior as deviance and

rule-breaking. In doing so, it explores links between entrepreneurship and deviant behavior theoretically and empirically.

We suggest that it is necessary to broaden view of which institutions determine whether a venture classifies as deviant behavior, when analyzing entrepreneurship. Reason for this is that support for venture may be needed also from actors outside of organization, and what constitutes relevant organization is not always clear. Therefore, we develop a framework for assessing entrepreneurship as deviant behavior based on reviewed literature. This framework captures potential inconsistencies in institutional frameworks by which behavior is assessed. In addition to se

conceptual developments, study discusses links between entrepreneurship and deviant behavior and uses a number of noticeable instances of independent and corporate entrepreneurship in order to illustrate how institutional constraints affect entrepreneurial ventures. Lastly, we discuss study's findings and assess them critically and conclude with suggestions for further research.

What is Entrepreneurship?

Entrepreneurship has been defined in a myriad of ways not only by practitioners but also by academics. Perhaps archetypal description of entrepreneurship is a process where someone starts a firm, combining means of production and labor; process or output is novel.

More recent research has re-framed scope of entrepreneurship. In their seminal paper, Shane and Venkataraman defines entrepreneurial opportunities as "those situations in which new goods, services, raw materials, and organizing methods can be introduced and sold at [a price] greater than their cost of production"²³. They acknowledge that entrepreneurship occurs for reasons other than for profit, but limit their discussion to for-profit situation and to capitalist paradigm. In order to provide a more general definition of entrepreneurial opportunities, Davidson and Wiklund's discussion is helpful. In their view, entrepreneurship is about "emergence of new economic activity"⁹. They highlighted that entrepreneurship takes place not only in new organizations, but also in existing organizations and in cooperation of less formal. Therefore, what separates entrepreneurial opportunities from opportunities in general, is that they are associated with emergence of new economic activity. Although Shane and Venkataraman's discourse²³ is framed in a capitalist paradigm and assumes legality, there is nothing, in principle, that prevents phenomena of opportunity recognition and exploitation from taking place in either settings.

Although most people have norms that roughly correspond to legal framework, in some respects norms, beliefs, and values of large groups in society deviate from laws and regulations. For example, using undocumented labor and sharing copyrighted files over Internet are examples of activities that are illegal (in most countries), but nevertheless deemed legitimate by large parts of population. Consequently, some entrepreneurial opportunities may exist and may be pursued in what Webb et al.²⁶ refer to as informal

economy. Informal economy is part of economy that is illegal but considered legitimate by a large portion of population. Renegade entrepreneurs operate outside of both formal and informal institutions. Although Webb et al.²⁶ do not give a name to type of economy that is legal but considered illegitimate by large parts of population, activities falling into this category are clearly conceivable. For example, prostitution is legal in many countries, but is still considered illegitimate by large parts of population. We term this category offensive entrepreneurship. Separation between formal and informal types of entrepreneurship is likewise found within corporate entrepreneurship literature²⁷. Corporate entrepreneurship denotes entrepreneurial processes within already established firms²⁴. Within this literature it is emphasized that entrepreneurial initiatives often originate from bottom-up processes^{6,7,16}. At times these bottom-up ventures are informal, that is, they are not sanctioned formally by organization²⁷.

As illustrated in Table 1, entrepreneurs can break norms or laws (or both) in their pursuit of entrepreneurial opportunities. In other words, entrepreneurial action (i.e., pursuing entrepreneurial opportunities) is only partly constrained by institutions²⁶. In addition, strategies employed by entrepreneurs to respond to institutional pressures may influence very institutional framework in which they find themselves and their organizations²⁰. Thus, some scholars use term institutional entrepreneurship in reference to entrepreneurial actions that reshape our institutional frameworks^{1, 2}. Conspicuous firms like Ford, IKEA, and McDonalds have reshaped not only peoples' habits but also their view of reality¹². However, these processes are not predictable. As humans are myopic to impact of their ventures in market place¹⁹, they are even more so with regards to their impact on institutions^{1, 2}. Of course, this has neither stopped people from starting firms, nor from trying to influence institutions. In other words, despite being unable to control and foresee outcome of their actions, entrepreneurs start ventures, which inevitably involve uncertainty¹⁵ and great variance in outcomes²³. As entrepreneurs strive to introduce new products, services, methods, or to reach new groups with existing ones, they often find themselves in conflict with existing norms and rules. These conflicts sometimes stifle entrepreneurial ventures, at or times redirect entrepreneurial effort⁵ and sometimes lead to emergence of new institutions such as norms, rules, and laws.

Table-1. Typology of Entrepreneurship Based on

	Legality	
	Legal	Illegal
Legitimacy		
Legitimate	Formal entrepreneurship	Informal entrepreneurship
Illegitimate	Offensive entrepreneurship	Renegade Entrepreneurship

Institutional Trespassing

Deviant Behavior and Institutional Frameworks

This general framework (summarized in Table 2) allows for different types of deviant behavior depending on which institutions are trespassed against. Separating kind of institutions people can trespass against also removes blind spot created by a monolithic view of institutions. For example, where as Robinson and Bennett have argued that dumping toxic waste in a river should not be considered deviant behavior if organizational norms encourage such behavior, framework suggested in this study captures both unlawfulness and societal illegitimacy of such behavior²². In or words, this study’s framework captures potential inconsistencies in institutional frameworks in which people exist.

In addition to misalignment of societal and organizational institutions, re may also be discrepancies between formal and informal institutions within same level of analysis (i.e., organizational or societal). Webb et al. highlight discrepancy between how large parts of population and people in some countries view sharing of copyrighted files²⁶. Furthermore, within organizations, formal and informal institutions may be contradictory. Returning to toxic waste—it is unlikely today that formal rules of any organization would condone dumping, although informally norms may encourage it. In such cases, employees find m-selves between a rock and a hard place. Regardless of their actions, y will misbehave from some perspective. In fact, this discrepancy may be used as a buffer for managers, who, in case of external exposure, can blame particular employees who got caught.

Table-2. Institutions defining Deviant behavior.

Level	Type of Institution	
	Formal	Informal
Societal	Laws	Societal norms
Organizational	Rules	Organizational norms

Links between Entrepreneurship and Deviant Behavior

According to definitions provided above, entrepreneurship is deviant behavior if it involves trespassing against organizational or societal formal or informal institutions. Our definition of entrepreneurship makes distinction between entrepreneurial action and non-entrepreneurial action possible. Entrepreneurial actions are associated with pursuing entrepreneurial opportunities, which in turn are associated with emergence of new economic activity. Thus, seizing opportunity to steal cash or some products from organization is not entrepreneurship, where as seizing opportunity to produce a new type of product or finding a new use for old products is. Stealing cash from organization would fit neatly under wide deviant behavior umbrella, where as a new use for old products could be deviant behavior, but need not be necessarily. For example, reusing pace makers from dead people would not be in accordance with US institutions if reuse takes place in United States²¹ and would therefore constitute both deviant behavior and entrepreneurship.

Recycling plastic bottles to produce fleece fabric, on other hand, would be entrepreneurship but not be deviant behavior as it would be in accordance with both formal and informal institutions. Therefore, according to definitions discussed in this study, re is a conceptual overlap between deviant behavior and entrepreneurship as some entrepreneurial ventures break rules and norms and Therefore qualify also as deviant behavior In addition to discussed conceptual overlap between entrepreneurship and deviant behavior, re is a range of potential empirical commonalities between two phenomena. Such commonalities can stem from organizational factors that enable both entrepreneurship and deviant behavior. For example, autonomy is positively

related to entrepreneurial behavior^{17, 18}, but it has also been found to be positively related to deviant behavior²⁵. Consequently, attempts at supporting entrepreneurial behavior can unintentionally enable deviant behavior. Another source of overlap may be common characteristics of entrepreneurs and entrepreneurship. For example, Wright and Zahra portray entrepreneurs as rule breakers²⁷; Klofsten, M claims that entrepreneurs are often suspicious of authority¹⁴; Johannisson that entrepreneurs frequently assume role of an anarchist in relation to existing institutional framework¹²; and Kramer, Cesinger, Schwarzinger, and Gelle'ri find that narcissism and psychopath are positively related to entrepreneurial intentions^{17, 18}. Furthermore, Shane draws upon a substantial body of research when he claims that many entrepreneurs are uninterested in working for others²³. However, successful business start-ups regularly employ people and consequently owner-managers often end up with substantial power over firm's employees. This power can corrupt and in doing so promote both deviant and harmful acts by entrepreneur. In order to exemplify how entrepreneurship can clash with existing norms and rules and how these clashes are viewed by entrepreneurs, managers, and society, we draw on some noticeable cases of entrepreneurship. These examples are all prominent and large-scale ventures that have been represented as controversial. They range from rather mild organizational deviant behavior, via examples involving both legal and social complications, to those that members of general public have branded outrageous deviant behavior. These examples are chosen because they are conspicuous and are therefore not necessarily representative for entrepreneurship and deviant behavior in general.

Defending Project against Project Review Procedures

Ulcer drug – Losec – is most successful product developed by pharmaceutical group Astra. From its introduction in 1988 until expiry of patents, Astra had income from Losec as a mainstay. Still, while now competing with generic drugs, worldwide sales in 2010 amounted to almost \$1 billion⁴. However, Losec was not developed as a consequence of corporate top management strategy nor even a continuously accepted development effort. In fact, it was developed in defiance of corporate management research portfolio norms, and development project was saved from premature termination five times between 1966 and 1984¹⁰.

Innovating Social Networking to Find a Successful and Legal Solution

Like most or entrepreneurial ventures, idea behind internationally renowned social networking site Facebook developed during an extended period of time including experimentation and interaction with many people¹⁴.

Some early experimentation started with Zuckerberg obtaining photos of female Harvard students from student Houses' online archives and creating website Facemash, where users could rate relative attractiveness of students based on their photos being presented two at a time. Also, representatives of Harvard female student associations sharply criticized site as Zuckerberg did not have permission from either those photographed or from organizations that stored files online. Entrepreneurial action is consequently based on illegal use of photos (violating copyright and violating individual privacy) and for purposes deemed unethical by Harvard administration and by a number of female students. Venture Facemash could thus qualify for label renegade entrepreneurship in terms of Table 1, and it violated all four types of institutions in Table 2. However, view of violation of social norms is not universal. Large amount of users at Harvard obviously did not see system as violating its norms sufficiently to refrain from using it¹¹.

Innovating Sharing of Digitized Material in Legal Borderlands

Pirate Bay is one of world's largest sites facilitating file-sharing and, according to web information company Alexa's traffic ranking, 75th most accessed website in world³. Unlike our other examples, it was intended to be controversial, as an active part of anti-copyright movement. It is an Internet site upon which general public can post and follow links, called Torrent files or, more recently, Magnet links, which direct users to chunks of another file, potentially allowing them to download it. Because site does not itself contain copyrighted material, it is likely that it was legal when it was first founded. However, after a change in law, a Swedish court deemed founders to be guilty of facilitating copyright infringement, a sentence they have appealed. Pirate Bay was an example of legal entrepreneurship when it first started, but ceased to be legal after a change in law and current court rulings.

Monetizing Healthcare Too Far

Like Pirate Bay, our final example is played out in an area where public opinion is divided. However, unlike entrepreneurs in Pirate Bay case, entrepreneurs behind for-profit healthcare provider Capiro, did not wish to provoke opponents or upset feelings. Capiro Group, with annual sales of approximately 1,100 million EUR, comprises about 60 operating units with some 9,000 employees and operates in Sweden, Norway, France, Germany, and United Kingdom. In Sweden, firm has been one of front runners in establishing for-profit care and healthcare when politicians started to allow such ventures to expand. Capiro's official ambition is to be healthcare provider that best fulfills demands imposed by patients, public healthcare, companies, and organizations. In order to fulfill that ambition, they claim to focus on high-quality and effective care services and place individual patient's needs and expectations in center⁸.

DISCUSSION

From a purely analytical perspective, most entrepreneurship could be viewed as deviant behavior, if we hold that entrepreneurship involves breaking of habits, norms, or rules^{12, 27} and that ventures expose organization hosting m to risk because of their uncertain outcomes^{1,2,26}. As illustrated by examples in preceding section, most ventures of any importance have proponents and opponents, and assessments of character of entrepreneurial ventures tend to differ between people and over time. For example, Ostholm's persistence in pursuing development of Losec in face of corporate top management opposition and in violation of standard evaluation rules in pharmaceutical group breached corporate institutions. However, in retrospect, when Ostholm's faith in research path and subsequent drug turned out to be warranted, success silenced concerns, and few would any longer view it as a case of deviant behavior, even if y did before success became evident.

Similarly, Zuckerberg's early defiance of norms appears more forgivable given subsequent success of Facebook. Had he quenched his entrepreneurial urge after Facemash, those who had learned about his actions would probably have considered m as offensive or even renegade entrepreneurship.

Pirate Bay intentionally challenged laws and copyright norms, championing free-content norms

pervasive in parts of society. By launching themselves into a contested area, it was obvious that there would be people condoning and people condemning their venture. This case illustrates how public opinion was influenced by relationship between law making, case, and people's own behavior and positions. Swedish voted Pirate Party into European parliament, partly in protest against changes in law that strengthened position of copyright holders and decreased individual's right to privacy.

Capiro case, finally, illustrates how actions of individual entrepreneurs can influence proponents of general principles. In Sweden, re has been a political divide between those proposing that for-profit operation can help vitalize healthcare sector and make it more efficient, and those who maintain that it is unethical to make money from peoples' need for care and treatment.⁶

As illustrated by these examples, rather than being objective and static, assessment of entrepreneurship as deviant behavior depends on perspective of assessor, which in turn can change over time and both influence and be influenced by laws and societal norms. Judgment of where entrepreneurship is deviant behavior rests on people's emotional and moral assessment of venture. This judgment is influenced, but not determined, by (assumed) intentions of entrepreneurs and/or noted consequences, and relations to or acts.

An important risk in this regard is that successful ventures end up in entrepreneurship literature and unsuccessful ones in deviant behavior literature. Losec case is not unique. In fact, entrepreneurship literature highlights informal nature of many entrepreneurial ventures in existing organizations^{6, 7, 16, 27}. However, deviant behavior literature tends to omit successful ventures as post hoc evaluations tend to be skewed by outcomes. For example, development of laptop computer by Toshiba, mentioned earlier, was a clear example of both deviant behavior and entrepreneurship. However, it ends up in entrepreneurship literature and not in deviant behavior literature.

Another issue in assessment of deviant behavior is that of organizational versus societal norms. In a start-up, norms will be built around entrepreneur's idea (l) s, and are thus highly unlikely to clash with entrepreneurial venture. For entrepreneurs acting in existing firms, on or hand, re will be established norms, rules, and routines that, at least to some extent, can be expected to be

compromised by entrepreneurial venture. Indeed, if no such clashes occurred, venture would hardly qualify as entrepreneurial. Entrepreneurial venture might or might not clash with societal norms surrounding organization.

CONCLUSION

In this attempt to explore entrepreneurship as deviant behavior, this study has suggested that entrepreneurship is often in conflict with organizational and societal institutions, such as norms and rules. In fact, we have found that there is an overlap between definitions of deviant behavior and conceptualizations of entrepreneurship in previous literature. In addition, study has found previous research, distinguishing between desirable and undesirable deviant behavior based on intentions or outcomes of behavior, insufficient in relation to entrepreneurship as deviant behavior. Reason is that for entrepreneurial ventures, underlying intentions are often good, but outcomes are often not^{1, 2, 19}; and that making assessments of outcomes of entrepreneurial ventures a priori is notoriously. Assessing deviant behavior based only on organizational level evaluations²² is likewise insufficient in relation to entrepreneurship. Reason for this is that support for venture may be needed also from actors outside of organization. Furthermore, what constitutes organization is not always clear. Therefore, we argue that it is necessary to broaden view of what institutions determine where a venture classifies as deviant behavior when analyzing entrepreneurship. Doing so highlights frequent inconsistencies between various institutions' assessments. Such inconsistencies can put employees in situations where they have to choose which institutions to trespass against. In this regard, exiting organization to pursue venture elsewhere is not a guarantee against being classified as deviant behavior. Considering emphasis that entrepreneurship literature puts on informal nature of many entrepreneurial ventures within existing organizations^{16, 23} and lack of research on deviant behavior with positive consequences overlap between entrepreneurship and deviant behavior seems to be fertile ground for future research.

ABSTRACT

Background: Listeriosis a serious food-borne illness, most often affects pregnant women, the unborn, newborns and the immunocompromised. Infection in pregnant women results in intrauterine infection, preterm labor, spontaneous abortion, still birth and neonatal meningitis/ sepsis leading to high morbidity and mortality. The present study aimed to detect human listeria antibody in pregnant women and neonates visiting Government general hospital, Puducherry, India using a rapid serological assay (ELISA).

Study Design: A cross sectional study.

Method: A total of 269 samples which includes 125 serum samples from pregnant women, 34 serum samples from women with bad obstetric history, 91 serum samples from neonates and 19 CSF samples from neonates collected were tested for Human Listeria Antibody IgM (LST-IgM) ELISA.

Results: Out of 269 cases tested 51 (19.0 %) were found positive for listeria antibody. Of the 125 pregnant women tested 43 (34.4%) were seropositive, Among the 34 women with bad obstetric history 7 (20.6%) and of the 110 neonatal cases only 1(0.93%) case showed seropositive for Listeria antibody. 16/34 (47.1%) of pregnant women in first trimester, 5/18(27.8%) women with preterm labor were reported seropositive for Listeria. 35/51 (68.6%) of seropositive cases had only fever.

Conclusion: The overall seropositivity of Listeriosis in pregnant women and neonates was to the tune of 19.0%. To conclude any pregnant women with a fever or flu like symptoms with or without gastrointestinal symptoms needs to be diagnosed for Listeriosis. Moreover Listeriosis being a foodborne infection, information regarding avoidance of certain foods in Pregnancy can be incorporated into formal antenatal education in addition pregnant women need to be cautioned regarding the feto-maternal consequences of Listeriosis infection in pregnancy.

Keywords : Seroprevalence, Listeria, Pregnancy, newborns.

INTRODUCTION

Listeriosis a serious emerging food-borne illness most commonly caused by the ubiquitous gram-

positive organism *Listeria spp*¹. *L. monocytogenes* is of major concern as it accounts for about 98% of human Listeriosis cases². Pregnant women, newborns infants, immunocompromised individuals and geriatric population are high-risk groups primarily affected with Listeriosis than healthy individuals³. Listeriosis infection in pregnancy can lead to intrauterine infection resulting in severe complications such as preterm labor, spontaneous abortion, still birth and neonatal infection / neonatal meningitis/ sepsis resulting in high morbidity

and mortality ^{4,5}. There has been global increase in incidence of Listeriosis from foods and humans mainly due to widespread use of refrigerated foods, consumption of processed foods and the long shelf-life of foods ^{6,7}. In India most often the naturally occurring cases of human Listeriosis is unrecognized or unexposed mainly due to lack of rapid, suitable and a reliable diagnostic tool. Moreover reports on Listeriosis in humans are very few mainly because of failure to isolate the pathogen, due to its rarity or lack of awareness or low incidence rate or many a times its been missed owing to lack of identification ⁸. Many Conventional serological / serodiagnostic assays have been used for screening the animal and human Listeriosis cases employing the somatic(O), flagellar (H) and L. monocytogenes-specific ELISAs ⁹, more recently the serodiagnosis of Listeriosis has been improved by the introduction of assays for the detection of antibodies in serum ¹⁰. Listeriosis incidence in pregnancy has been reported 18 times greater than in the general population. Moreover Listeriosis infection in pregnancy shows poor prognosis for fetuses ^{6,11}. With the increasing industrialization, changing food habits, drug resistance, non-availability of suitable vaccine, capability of this bacterium to survive at refrigeration temperature and its case fatality rate ¹². Considering all the above mentioned facts and the zoonotic nature of this pathogen the present study aimed to detect the seroprevalence of *Listeriosis* among pregnant women and neonates visiting Government general hospital, Puducherry, India.

METHOD

A cross-sectional study conducted over a period of 1 year from June 2014 to May 2015 in the Department of Microbiology, Sri Lakshmi Narayana Medical College, Hospital and Government General Hospital, Puducherry, India. This study was approved by the Institutional Human Ethics Committee and Informed consent was obtained from all participants included in the study. In order to accomplish the objective a total of 269 samples collected from pregnant women and neonates were analyzed for detection of antibodies to listeria by enzyme linked immunosorbent assay (ELISA) which includes 125 serum samples from pregnant women, 34 serum samples from women with bad obstetric history, 91 serum samples from neonates and 19 CSF samples from neonates collected were screened for seroprevalence of Listeriosis using qualitative human listeria antibody IgM (LST-IgM) ELISA kit- marketed by My BioSource

Cat.No.MBS109141. Study design and study population includes 250 blood samples collected from pregnant women, neonates and women with bad obstetric history presented with either diarrheal or flu like symptoms or symptoms of sepsis. All blood samples collected were centrifuged at 3000 rpm for 20 minutes for collection of serum and stored at -20°C until processed. 19 CSF samples were collected from neonates with clinical presentation of meningitis/ meningoencephalitis / encephalitis were centrifuged at 3000 rpm for 20 minutes. The particulates were removed and the supernatant was stored at -20°C until processed. The ELISA for qualitative detection of human listeria antibody was performed using (LST-IgM) ELISA kit- marketed by My BioSource Cat. No.MBS109141, the Optical Density (OD) value was measured and the results were interpreted according to manufactures instructions.

RESULT

In the present study attempt has been made to detect the seroprevalence of Listeriosis among pregnant women and neonates. Further attempts have also been made to analyze the clinical condition with the seropositivity potentials. A total of 269 symptomatic pregnant women and neonates were screened for detection of antibodies against Listeria. From (Table No. 1) it is evident that out of 269 cases screened 51 (19.0%) showed seropositivity for Listeria. (Table No. 2) shows the category of patients screened for Listeria antibody. Out of 125 pregnant women tested 43 (34.4%) were seropositive. The seroprevalence among women with bad obstetric history was 7 (20.6%) and of the 110 neonates tested only 1 case (0.9%) showed seropositive for Listeria. From (Table No. 3) it is evident that out of 34 pregnant women in first trimester who were tested 16 (47.1%) of cases were found seropositive for Listeria. Among the 35 pregnant women in second trimester who were tested only 5 (14.3%) showed seropositivity and of the 38 pregnant women in third trimester screened 15 (39.5%) were reported positive for listeria antibody. 5 out of 18 women (27.8%) who had preterm labor were found seropositive for Listeria antibody and 7 out of 34 (20.6%) women who had miscarriage/ spontaneous abortion showed seropositive. Among the 86 neonates who had early onset sepsis only 1 (1.2%) case showed seropositive for Listeria antibody and out of 24 neonates who had late onset sepsis none were found positive for listeria antibody (Table No.3). Comparison of seropositive cases with clinical symptoms is given in (Table No.4)

Among the 51 seropositive cases reported in this study nearly 35 cases (68.6%) had only fever and 14 (27.5%) cases had symptoms of fever and diarrhea. Only 1 (1.9%) case who had symptoms of sepsis were found seropositive and one case (1.9%) who also had symptoms of sepsis and meningitis were found seropositive to listeria.

Table No.1 : Overall seroprevalence of Listeriosis in Pregnant women and neonates

No. of cases	No. positive	% Percentage
269	51	19.0%

Table No.2: Distribution of Listeria seropositive cases.

Patient category	No. of cases	No. of cases positive for Listerial antibody	% positive
Pregnant women	125	43	34.4
Women with bad obstetric history	34	7	20.6
Neonates	110	1	0.9

Table No.3: Analysis of Listeria seropositivity cases.

Category	No. of cases	No. of seropositive cases (%)
Pregnant women in first trimester	34	16 (47.1%)
Pregnant women in second trimester	35	5 (14.3%)
Pregnant women in third trimester	38	15 (39.5%)
Preterm labor	18	5 (27.8%)
Miscarriage/ Spontaneous abortion	34	7(20.6%)
Early onset sepsis	86	1 (1.2%)
Late onset sepsis	24	0 (0%)

Table No.4: Comparison of Listeria positive cases with clinical symptoms.

Clinical symptoms	No. of seropositive cases (%)n=51
Only fever	35(68.6%)
Fever + diarrhea	14 (27.5%)
Fever + sepsis	1 (1.9%)
Fever + meningitis	0 (0%)
Fever + diarrhea + sepsis	0 (0%)
Fever + meningitis + sepsis	1 (1.9%)
Fever + meningitis + diarrhoea	0 (0%)
Fever + meningitis + diarrhea + sepsis	0 (0%)

DISCUSSION

The study on seroprevalence of Listeriosis among pregnant women and neonates revealed seropositivity for listeria antibody to the tune of 51 (19.0%) by (LST-IgM) ELISA. This finding is endorsed by several studies^{13,14,15}; nearly 16-27% of all *Listeria* infections has been reported in pregnant women^{6,14}. The seroprevalence of Listeriosis in neonates was very low in the present study, it was to the tune of 0.9%. Similar observation has been made in a study from North India where the incidence of neonatal Listeriosis was reported as 0.2% in total births and 2.2% in meconium stained babies^{16,17}. Similarly reports on Perinatal Listeriosis prevalence varies between 8.6 and 17.4/100,000 of live births^{11,18}. The present study reveals close association of pregnant women and neonates with seroprevalence against Listeriosis which also indicates the presence of this bacterium in the food chain. Listeriosis being a food borne illness steps must be taken to prevent pregnant women from consumption of food known to be at higher risk of contamination with *Listeria*.

A total of 34.4% of pregnant women and 20.6% of women with bad obstetric history were found to be seropositive for Listeriosis. The results are well correlated with a study carried out by Krishna et al. in 1966 who reported 14% Listeriosis in 150 cases with poor obstetric history in Mumbai¹⁹. Whereas the results of the present study was quite higher when compared to studies carried out in India by Bhujwala et al. in 1973 who reported 3% of listeriosis in women with bad obstetric history from Delhi²⁰. In another study 1.34% screened were positive for listeria²¹. The reasons for the recent increase in pregnancy-associated Listeriosis could include the poor food hygiene practices, the pathogen, environmental and host factors^{6,22}. Serodiagnosis being a quick method of detection could be employed for cases with high clinical suspicion². In the present study pregnant women in first trimester showed higher seropositivity 47.1% followed by pregnant women in third trimester 39.5%. Most of the earlier studies have reported higher incidence in third trimester^{6,23,24}. In the present study 14.3% of pregnant women in second trimester was found seropositive to *Listeria*. Mylonakis et al., in 2002 in their study reported out of 11 cases 2 pregnant women in the second trimester with *Listeria* infection ended in a spontaneous abortion²⁵. Pregnancy-associated Listeriosis can occur at any stage of gestation, though widely reported or detected in the third trimester^{6,23}. In this study 27.8% of

women who had preterm labor were tested seropositive for listeria and 20.6% of women who had spontaneous abortion or miscarriage showed seropositivity to *Listeria*. Earlier studies have reported 1 of 5 pregnancies with Listeriosis infection results in stillbirth or spontaneous abortion and poor prognosis in early pregnancy⁶. Giraud et al in 1973 reported Listeriosis infection in 2.1% miscarriages and in 1.6% of cases with preterm births or spontaneous abortions²⁶. Only one neonate out of 86 cases with early onset sepsis was found seropositive for Listeriosis. Since there more chance of preterm delivery and abortion in pregnancy associated Listeriosis, differential diagnosis of Listeriosis in pregnant woman should be considered⁷.

Pregnant women are at high risk for Listeriosis, but symptoms are non-specific and diagnosis is difficult¹⁹. In the present study nearly 68.6% of listeria seropositive cases presented only with fever and 27.5% presented with fever and diarrhea. In a study on 191 cases of Listeriosis in pregnancy 32% of women had symptoms of a flu-like illness, 65% had only fever and only 7% had vomiting/diarrhea. Diagnosis of maternal Listeriosis is difficult due to the lack of GI symptoms generally associated with food-borne pathogens^{6,14,25} and Fever is the most common symptom reported in several studies²⁷. Investigation and treatment of any women during antenatal period presenting with either fever or flu like symptoms, with or without GI symptoms for Listeriosis is essential in order to prevent fetal loss, stillbirth, preterm labor, neonatal sepsis and meningitis^{7,14}. This study mandates the awareness for diagnosis / detection of pregnancy associated Listeriosis among obstetricians.

CONCLUSION

In the present study the overall seroprevalence of Listeriosis among pregnant women and neonates was 19.0% which was found to be higher. Further research is required to establish the causes for the current increase in pregnancy associated Listeriosis. 34.4% of pregnant women and 20.6% of women with spontaneous abortion/miscarriage showed seropositivity to Listeriosis. About 47.6% of pregnant women in first trimester were found seropositive for Listeriosis and 27.8% of women who had preterm labor were positive for *Listeria* antibody. Hence this study concludes that a high index of clinical suspicion is a required for the diagnosis of maternal Listeriosis, which may occur at any stages in pregnancy. A close collaboration among obstetrician, pediatrician,

microbiologists and epidemiologists is needed to investigate the increasing epidemiology of Listeriosis and to modulate the signs and symptoms of this infection.

ABSTRACT

Background: Alcohol related deaths and death due to disease related to alcoholism are major concerns in India. Persistent use of alcohol not only affects the individual but also the spouse who faces stressful life events and emotional problems **Aim:** The study aimed to determine the Quality of life, stress and coping among wives of alcohol dependent clients and to find the relationship among them. **Settings and Design:** The study was conducted in selected tertiary care hospitals of Udupi district with descriptive survey approach. A total of 60 wives of alcohol dependent individuals were selected based on nonprobability sampling. **Materials and method:** Stress rating scale, Coping scale and BREF-QOL by WHO were used to collect the data. **Statistical analysis used:** Karl Pearson coefficient of correlation was used with the help of SPSS 16 version. **Results and conclusions:** The obtained WHOQOL-BREF scores were converted to WHOQOL-100 for all the domains. The mean score for the physical domain was 22.05 ± 10.51 . The psychological domain and social relations domain got a score of 24.63 ± 10.44 and 84.45 ± 19.48 respectively, whereas the environment domain got a mean score of 16.53 ± 8.50 . The relationship between domains of quality of life and stress showed that physical domain ($r = -0.524, p < 0.001$) psychological domain ($r = -0.527, p < 0.001$), social relations ($r = -0.460, p < 0.001$) and environmental domain ($r = -0.480, p < 0.001$) have a moderate negative correlation. No statistical relationship was found between quality of life and coping, though a low positive correlation exists ($r = .265, p = .041$) between physical health and withdrawal coping.

Keywords: Alcohol dependent syndrome, stress, coping, quality of life

INTRODUCTION

Alcohol was an inherent part of the human culture for many years. Before the modern era the fermented alcohol was available in tribal and village societies where it was consumed traditionally in an occasional manner ^[1]. During early modern industrialization the production and consumption of the alcohol changed drastically and replaced the traditional patterns of

drinking ^[2]. Distilled spirit was available and marketing strategies were developed and implemented in the same period. The consequences of this were catastrophes in various part of the world by causing substantial social and health problem.

Alcohol is considered as a psychoactive substance with properties of producing dependence ^[3]. Alcohol use disorders are one of the major leading causes of disability in many countries ^[4] and it is not just a health problem; it is a social and public health problem which can have an adverse impact on the family involved in care giving ^[5].

The recent WHO data showed that the total per capita consumption of alcohol was 6.2 litres of pure alcohol per year and 13.5 grams of pure alcohol per person per day. The Global data of consumption of alcohol showed that 50.1% was consumed in the form of spirits, 34.8%

was consumed in the form of beer. This resulted in approximately 3.3 million deaths each year [6].

Alcohol related deaths and death due to disease related to alcoholism are major concerns of developing countries. In India, every year 3.3 million deaths attributed to alcohol consumption that puts her in a precarious score of 4 out of 5 in the 'Years of life lost scale' which means that a large number of people lost their lives in the early stages due to alcohol consumption and fell out [7].

Indian drinking habits were greatly different from state to state. During the period of 1992-2012, the per capita consumption of alcohol has increased to the third highest in the world by 55%, after Russian Federation and Estonia [8]. Persistent use of alcohol not only affects the individual but also affects the family members, especially the spouse who faces stressful life events and emotional problems. The effects of substance abuse frequently extend beyond the limit of spouse and children. The feelings of anger, abandonment, anxiety, concern, embarrassment, fear and guilt may be experienced in the extended family members [9]. Female partner of male alcoholic suffers from various stressors due to the alcohol dependence. The psychological consequences of this include denial or protection of the male partner with the hopelessness, neglected health, shame, stigma and isolation. The wife of a person abusing substances is likely to protect the children and assume parenting duties that are not fulfilled by the husband who abuses substances [9].

The female partners of the alcoholics show maladaptive behaviour as a reaction to stress [10]. The common coping behaviour reported were avoidance, discord, indulgence and fearful withdrawal while marital breakdown, taking special action, assertion and sexual withdrawal [11]. The female partners of the alcoholics are exposed to high rates of domestic violence which include physical, verbal and sexual abuse. [12]. The marital dissatisfaction, high economic burden, poor familial and social support are some other major issues faced by the spouses of alcoholics [13] [14]. To decrease the burden and improve the coping skills and quality of life of the spouses of clients with the alcohol dependence syndrome, a thorough understanding of their various issues are essential.

On this background, the study was designed with the following objectives:

1. To determine the quality of life, stress and coping among wives of Alcohol-dependent patients
2. To find the relationship between quality of life, stress and coping
3. To find the association between quality of life, stress, coping and selected variables.

MATERIALS AND METHOD

Sixty wives of clients diagnosed with Alcoholic Dependence Syndrome admitted in selected psychiatric wards of tertiary care hospitals of Udupi district were included in the study by non-probability convenient sampling. The participants were selected based on the criteria such as the ability to read any one the languages -Kannada, English and Malayalam, age within 20-65 years and living with the Alcohol dependent person for the past one year.

The study proposal was submitted to the ethical committee members of Kasturba hospital, Manipal and ethical clearance were sought. Permission was also taken from the administrators of the institutions from where the subjects were selected. On the days of data collection, the researchers introduced themselves and the purpose of the study was explained to the subjects and written consent was taken. After ensuring the confidentiality a written consent was taken from the participants who were willing to participate in the study.

The data collection materials are described below.

Background Proforma:

The researchers developed the background proforma to get details from the participants as well as their spouse. It has two sections, the first section with eight items was used to collect the details from the wives of alcohol dependent person and the second section with nine items was used to collect data from alcohol dependent persons.

World Health Organization Quality of Life (WHOQOL)

The World Health Organization Quality of Life (WHOQOL) [15] was used to determine the quality of life of the spouse of the alcoholic dependent person. It is a 5 point Likert rating scale of 26 items with forward and

reverse scoring. Also, two items from the Overall Quality of Life and General Health facet have been included, among which question one asks about an individual's overall perception of quality of life and question two asks about an individual's overall perception of their health. It has four domains namely physical health, psychological, social-relationship and environment. The four domain scores denote an individual's perception of quality of life in each particular domain.

Stress Rating Scale

The researchers developed the Stress rating Scale to measure the stress of the wives of clients with the alcohol dependence syndrome. It is a 33 item Likert scale and with responses as never, rarely, sometimes and always. The reliability of the tool was done with Chronbach alpha ($\alpha=0.872$) and found to be reliable. The maximum possible score is 99 which is arbitrarily classified into "No stress" (0-33), moderate stress (34-66) and severe stress (67-99).

Coping Scale

It is a standardized tool with 30 items [16]. The maximum possible score is 90. The scale also includes three subscales namely "Engaged coping", "Tolerant coping" and "Withdrawal coping".

RESULTS

Data were analyzed using Statistical Package for Social Sciences (SPSS) version 16. SPSS Inc software. Descriptive statistics included the mean and standard deviation for quantitative variables. The Karl Pearson coefficient of correlation was used to determine the relationship between the quality of life, stress and coping. The Chi-square test was also used to determine the association between the quality of life, stress, coping and selected variables.

Socio-demographic characteristics of wives of alcohol dependent clients

The data regarding the socio demographic characteristics of the participants showed that 91.7% of the wives of alcoholic dependent clients belong to Hindu religion and the majority of the participants ie, 61.7 % were living in a nuclear family. Majority of the wives ie, 60% were living with the alcoholic dependent husband for 11 to 40 years.

Socio-demographic characteristics of alcohol dependent individual

The age of the men who were admitted for de-addiction was ranged between 28 and 59 years with the mean age being 42 ± 7 years. Most of the participants were having primary education and self-employed. Many participants history of the previous admission for de-addiction, 30.0% of them were admitted once and 26.70% were admitted two times. Twenty percent of the participants had been admitted for more than 2 times in the de addiction centres. Twenty-one percent of them have the habit of drinking alcohol once every day where as 55% drank thrice or more than three times a day. The mean age at which they had their first drink was 26 ± 8 years with a range of 12 to 56 years.

Quality of life

The mean score obtained for WHOQOL- BREF domain 1 –physical- was 7.5 with a standard deviation of 1.68 which was later converted into WHOQOL-100 with a mean score of 22.05 and standard deviation of 10.51. Similarly mean score of domain 2 -psychological domain- was computed (18.27 ± 10.29) and later converted into WHOQOL-100 (24.63 ± 10.44).

Domain 3- social relations- got a mean score of 17.51 ± 3.11 was converted into 84.45 ± 19.48 . Environment domain got a mean score of 10.00 ± 1.37 was later converted into 16.53 ± 8.50 .

Stress

The wives of alcoholic patients with ADS had a mean stress score of 53.8 ± 17.12 with a minimum score of 2 and a maximum score of 83. Majority of the participants ie, 36 (60%) showed moderate stress and 16 (26.67%) showed severe stress.

Coping

The coping ability of the wives of patients with alcohol dependence syndrome showed a mean of 46.48 with a standard deviation of 15.68. The subscale analysis showed that the mean score of "Engaged coping" and "Tolerant coping" is 23.05 ± 7.75 and 13.41 ± 5.74 respectively. Meanwhile "Withdrawal coping" showed a mean of 11.45 ± 3.20 . When comparing the coping strategies 44.32 % is "Engaged coping", 49.69% is tolerant coping and 63.61% is withdrawal coping.

Relationship among quality of life, stress and coping among wives of alcohol dependent individual

To assess the relations between quality of life, stress and coping among wives of alcohol dependent patients, Karl Pearson coefficient of correlation was calculated with alpha set at 0.05 for each calculation. The relationship between quality of life and stress among wives of alcoholic dependent individual showed a moderate negative relationship ($r = -0.575$ $p < 0.001$). The relationship between domains of quality of life and stress showed that physical domain ($r = -0.524$ $p < 0.001$), psychological domain ($r = -0.527$ $p < 0.001$), social relations (-0.460 $p < 0.001$) and environmental domain ($r = -0.480$ $p < 0.001$) have a moderate negative correlation with stress.

The correlation analysis also found that there is no statistical relationship between quality of life and coping, though a low positive correlation ($r = .265$, $p = .041$) is observed between withdrawal coping and physical health (domain 1) of quality of life. No significant relationship between stress and coping was found.

DISCUSSION

In the present study, the researchers found that the majority of wives of patients with alcohol dependence had moderate stress. Severe stress among them was found to be 26.67% and this was in accordance with a clinical study which showed that 26% female spouses living with lifetime at-risk male drinkers have psychological distress^[17]. The wives also experienced more life stressors and had lower mental/psychological quality-of-life and show a significant relationship with the substance use among their partners^[18].

The present study revealed that physical domain ($r = -0.524$ $p < 0.001$), psychological domain ($r = -0.527$ $p < 0.001$), social relations (-0.460 $p < 0.001$) and environmental domain ($r = -0.480$ $p < 0.001$) had a moderate negative correlation. The relationship between coping and stress showed that there was no significant correlation exists between them. This was contradictory to the findings of a study conducted at Chennai where there was a positive correlation between the level of stress and coping strategies among the wives of alcoholics ($r = .312$) showed that there was a high statistical significant at $p < 0.01$ level^[19]. Also, the spouses of alcoholic patients may benefit from coping skills training to deal with these situations.

CONCLUSION

This study brings light to the stressful lives of spouses of alcohol dependence syndrome patients. There is a need for continuous and sustained support from family, community and health care professionals to remove the alcohol abuse, strengthen the coping abilities and Quality of life of spouses.

Four Vital Capacity Breaths Can Delay the Onset of Haemoglobin Desaturation Following Nasopharyngeal Oxygen Insufflation

Sa Ribeiro Karl N¹, Misquith, Julie C R², Upadya Madhusudan³

¹Assistant Professor Father Mullers Medical College, Mangalore (Former Resident Of Kasturba Medical College, Mangalore, ²Assistant Professor, ³Professor, Kasturba Medical College, Mangalore

ABSTRACT

Introduction. Prolonged apnoea occurring during endotracheal intubation leads to a fall in oxygen saturation. Preoxygenation helps in delaying the onset of fall in saturation

Aim The aim of the study was to determine whether insufflation of oxygen via a nasopharyngeal catheter would prolong the duration of apnoea (fall in SpO₂<95%) after preoxygenation with 4 vital capacity breaths.

Methods and materials Patients were divided into two groups of 20 each. Group 'case' received additional insufflation with oxygen during the period of apnoea while Group 'control' did not. O₂ saturation was monitored during the period of apnoea and the study was terminated with a fall in O₂ saturation to 95%, following which patients were ventilated.

Results Time to fall in SpO₂ to 95% in group 'case' was 6 mins (360 seconds) compared to group 'control' which was 4.1 mins (246 seconds) with a P value <0.05. The rise in EtCO₂ in Group case was 16.6 mm of Hg as compared to the 11.7 mm of Hg rise in the Group control during the apnoeic period which was attributed to longer period of apnoea. The average rise in the EtCO₂ per minute during the period of apnoea was 2.8mm of Hg.

Conclusion Thus we concluded that nasopharyngeal O₂ insufflation during the period of apnoea, after preoxygenation with 4 VC breaths, does delay the onset of O₂ desaturation during apnoea and can be used as an effective tool in difficult airway management.

Keywords: saturation, apnoeic diffusion, difficult airway, preoxygenation, end tidal carbon dioxide

INTRODUCTION

Until the airway has been secured, an Anesthesiologist, is frequently faced with the challenging task of maintaining adequate arterial oxygenation in apnoeic patients, after the induction of general anesthesia and muscle relaxation. While this is less likely to be a major factor while dealing with normal healthy individuals, pregnancy¹ and obese individuals² tend to desaturate

faster during the period of apnoea. Before critical haemoglobin desaturation sets in, preoxygenation has long been proven to help in prolongation of the duration of apnoea^{3, 4,5}. Preoxygenation fills the functional residual capacity with oxygen, thus increasing the patients' oxygen reserves. Preoxygenation using tidal volume breathing for three minutes has been shown to be far superior to the four vital capacity breath technique in prolonging the duration of apnoea^{6, 7, & 8}. Holmdahl in 1956⁹ introduced the term Apnoeic Diffusion Oxygenation⁹. This was achieved by preoxygenation with 100% oxygen followed by oxygen insufflations during the subsequent apnoeic period. He proposed the fact that during apnoea, oxygen was extracted from the alveoli (functional residual capacity) at the rate of 250

Balmatta New Road, Mangalore 575001
Phone numbers +91 994559891

ml/minute, which is the basal oxygen consumption. CO₂ being highly soluble in the blood, is added to the alveoli at a meager 10 ml/minute. This causes the functional residual capacity to decrease to the rate of 240ml/minute. The ambient gases were drawn en masse into the lungs⁹, at this sub atmospheric pressure. If oxygen were to be insufflated into the nasopharynx, this oxygen would be drawn in en masse thus maintaining the oxygen content of the functional residual capacity, which would help maintain PaO₂ of blood for a longer period during subsequent apnoea as compared to en masse diffusion of ambient air, the nitrogen content of which would further dilute the existing stores. The functional residual capacity body weight ratio was inversely proportional to the rate of nitrogen accumulation. This is based on the term introduced by Holmdahl in 1956 known as *apnoeic diffusion oxygenation*⁸. Apnoeic diffusion oxygenation is defined as the en masse diffusion of oxygen into the lungs during apnoea following preoxygenation and nasopharyngeal oxygen insufflation. Thus onset of haemoglobin desaturation⁴ is delayed by the insufflation of oxygen via a nasopharyngeal catheter as shown in **Figure 1**.

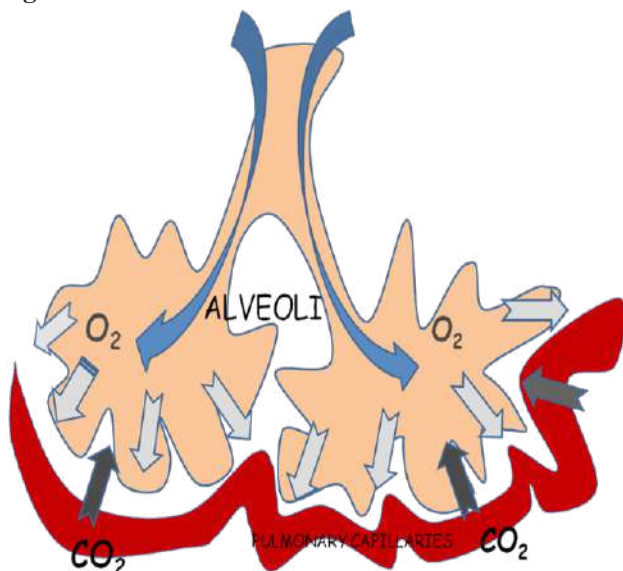

Figure 1. *En Masse* diffusion of gases during apnoea as proposed by Holmdahl in 1956. The white arrows indicate the uptake of oxygen (at the rate of 250ml/minute). The grey arrows indicate the carbon-di-oxide release from the pulmonary capillaries into the alveoli (at the rate of 10ml/minute). A net deficit of 240ml/minute occurs in the alveoli and this leads to the development of a sub atmospheric pressure in the alveoli. This causes the ambient gases to diffuse *en masse* into the lungs, which is represented by the blue arrows.

The objectives of this study were to

Study the effect of nasopharyngeal oxygen

insufflation, in the presence of an open airway, following preoxygenation by four vital capacity breath technique.

To study the duration of apnoea which is defined as time from stopping preoxygenation to fall in SpO₂<95% or 6 minutes of apnoea.

The rise in end tidal carbon dioxide (EtCO₂) following apnoea and the effect of the duration of apnoea on the end tidal carbon dioxide.

METHOD AND MATERIALS

This was a prospective observational study conducted after obtaining approval for the study from the Institutional Human Ethics committee and an informed consent was obtained from all patients. The study was performed on 40 patients of American society of Anesthesiologists (ASA) physical status 1 and 2 with an age range of 20-50 years scheduled for elective surgery under general anesthesia. All the patients who refused, had difficult airway predictors, had upper or lower respiratory tract infections, chronic disease of the airways or history of allergies were excluded from the study. Patients were assigned to one of the two groups, being the group 'control' who did not receive nasal oxygen insufflation during the period of apnoea following preoxygenation and group 'case' being the group receiving nasal insufflation. All patients were assessed by a detailed history, general physical and systemic examination with appropriate investigations. On the day of surgery, an infusion of ringer lactate solution was started in the recovery room. Patient was explained previously the face mask breathing and the four vital capacity breath preoxygenation technique. The study patients were monitored using electrocardiography, non-invasive blood pressure monitoring, pulse oximetry and end tidal capnography (EtCO₂). Baseline vitals were noted. The patient was preoxygenated with 8 L/min oxygen using four vital capacity breaths in 30 seconds using a well fitted face mask. Anesthesia was induced using inj. fentanyl 2µg/kg IV, inj. Propofol 2mg/kg IV and neuromuscular blockade was achieved with inj. rocuronium 0.6mg/kg i.v. Boluses of Propofol 10mg was administered two minutes after the induction dose and then every one-minute to avoid awareness in patients. With the disappearance of the carbon dioxide waveform, which indicated onset of apnoea, the face mask was removed. A 10 Fr catheter was inserted nasally into the nasopharynx after measuring the length of the catheter

from the distance between the angle of the mouth and the tragus of the ipsilateral ear. In group case (n=20) oxygen was insufflated at the rate of 5L/minute via the nasopharyngeal catheter and in group control no oxygen was used. The time from the onset of apnoea which was identified by the disappearance of the carbon dioxide waveform to the fall in SpO₂ to 95% was recorded. Apnoea was allowed to continue till SpO₂ either fell to 95% or apnoea of 6 minutes' duration had occurred, after which the patient were ventilated using 100% oxygen, and tracheal intubation using direct laryngoscopy was performed. Inspired oxygen (FiO₂), EtCO₂ after four deep breaths and on initiation of positive pressure ventilation were recorded using a gas monitor.

Statistical Analysis

To determine the number of subjects required for the study a power analysis was conducted. For data analysis, we considered that a 5% change in oxygen saturation was clinically significant. We also considered Type I and Type II errors of 5% and 15 %, respectively (With 95% confidence interval and power of 85%). From a previous study, we determined that the standard deviation of oxygen saturation was 1.15% as such, the power analysis indicated that at least 17 patients were needed in each group. Student's t-test was used for statistical analysis (SPSS 10.0 for Windows Software).

Data are expressed in Frequency, Percentage, and Mean & Standard deviation. The inferential associations and comparisons between different parameters were done using Chi Square Test which was used as the non-parametric test. Student's t test was used to compare the mean value between 2 groups. To compare different groups with each other, non-parametric Mann Whitney's U test was employed. For all statistical evaluations, a two tailed probability 'p' value of < 0.05 was considered significant.

RESULTS

From Table 1 it is observed that the patients in both the groups were comparable with regard to the demographic data as no significant difference was observed between these two groups with respect to the age, sex, weight, height and ASA physical status.

Table 1. Demographic Data and ASA physical status

	Control (N=20)	Cases (N=20)	
Age in years	35.4 ± 10.1	32.9 ± 8.2	p=0.407
Weight in kgs	60.7 ± 8.6	55.9 ± 5.5	p=0.055
Height in cms	168.4 ± 8.9	163.5 ± 6.2	p=0.058
Sex M:F	11:9	8:12	p=.342
ASA physical status I:II	20:0	18:2	p= 0.147

Table 2 shows the time to the onset of apnoea in the two groups after the administration of rocuronium. This was indicated by the loss of chest wall movements clinically and by the loss of the EtCO₂ tracing on capnograph

Table 2. Time to onset of apnoea

	Group	N	Mean (seconds)	p
Time to apnoea	Case	20	24.5 ± 4.1	0.543
	Control	20	25.2 ± 3.0	

Data are presented as mean ± SD

The SpO₂ values obtained initially and at the onset of apnoea showed no statistical significance as seen in figure 2. Thus indicating that the saturation in the two groups were identical prior to the onset of apnoea. The SpO₂ obtained in the first minute after the onset of apnoea was similar. However, from the second minute onwards there was a statistically significant difference occurred in the SpO₂ values between the groups only and this increased in significance in the subsequent duration of the study, with the maximum difference observed in the third minute of the study.

Figure 2. Distribution of oxygen saturation

Figure 3 shows the graphical representation of the rise in the EtCO₂ during the period of apnoea. The rise in the case group was 16.6 mm of Hg as compared to the 11.7 mm of Hg rise in the control group during the apnoeic period (p of 0.013). The average rise in the EtCO₂ per minute during the period of apnoea was 2.8mm of Hg, and this is comparable to the results obtained by Baraka et al.⁸

Figure 3. Rise in the End tidal carbon dioxide during apnoea time

DISCUSSION

The present study proved that nasopharyngeal insufflation of oxygen after preoxygenation with the four vital capacity breaths, during the period of apnoea can significantly delay the onset of Hb desaturation in an

apnoeic patient, which is after the induction of anaesthesia and muscle relaxation.

Delay in the onset of hypoxemia after nasal oxygen insufflation, in preoxygenated patients, has numerous applications such as in difficult mask ventilation in

patients with craniofacial anomalies. Insufflation of oxygen can provide additional time for laryngoscopy should tracheal intubation be difficult. Otolaryngologists can safely be provided with a minimum of 10 minutes to visualize the airway⁴, unimpeded by the presence of ET tubes or patients' respiratory movements. However, the fact that insufflation always postpones the development of hypoxemia¹⁰ suggests that this qualitative finding may be applicable to most preoxygenated patients whose airways remain patent between the alveoli and the pharynx.

The present study showed that patients in both groups were comparable with regard to age, weight, height and sex and involved ASA grade physical status 1 & 2 patients, and thus the quantitative data of this study are only applicable to such patients.

The SpO₂ after the four vital capacity breaths was 100% and was similar to the findings of Valentine et al¹¹. This was comparable to the O₂ saturation produced by 3-minute tidal volume ventilation^{12,13}. The duration of apnoea was comparatively shorter, even though the preoxygenation by the four vital capacity breath technique produced comparable PaO₂ and O₂ content to that produced by 5-minute tidal volume ventilation, as demonstrated by Norris in 1985¹⁴. The reasons being, in the four vital capacity breath technique the minute ventilation far exceeds the FGF of 10ltrs/min, which leads to rebreathing. This in turn causes the dilution of the FRC by nitrogen content of air which in turn decreases the O₂ stores in the FRC. Hamilton et al¹⁵ demonstrated that at flows of 10 liters/min, at 28±6.9sec the nitrogen content of the FRC was 30% and this reduced to 5% at 144±24sec. The four vital capacity breath technique causes faster desaturation as it requires a longer duration for tissue and venous compartments to fill with oxygen than while breathing room air. If the sum of the alveolar, arterial and tissue compartments is considered, they collectively can store 1200ml and 800ml, from the end of the first half minute and 60 seconds to 180 seconds respectively¹³. This is worth 3 to 4 minutes of O₂ consumption. Thus pre oxygenation using the four vital capacity breaths technique is considered to be inferior to tidal volume ventilation with the eight vital capacity breaths in 60 seconds^{16,17}. However, in case of emergency when the five-minute tidal volume ventilation cannot be applied, such as in obstetric emergencies¹ or in critically ill patients¹⁰, nasopharyngeal O₂ insufflation would help delay the onset of haemoglobin desaturation and provide

added safety time of desaturation free apnoea till the trachea is secured.

The FiO₂ and the SpO₂ were not significantly different in both groups following the preoxygenation with the four vital capacity breath technique. Following the onset of apnoea, the SpO₂ values recorded in the first minute of the study was similar in both groups. However, from the second minute onwards, the fall in the oxygen saturation in the control group was significant with the maximum fall occurring in the third minute after the onset of apnoea. This indicated that the oxygen stores provide by the four vital capacity breath technique was sufficient to provide for a maximum period of 246 seconds when considering a haemoglobin desaturation to 95%. The results of the present study contrasted with those obtained by Baraka et al⁸. Baraka et al obtained a mean time of 219 seconds. This could be explained by the absence of uniformity in the monitoring equipment used and also do to the use of fingertip pulse oximetry in the present study.

The case group was able to maintain SpO₂ in excess of 99% for 360 seconds at which the study was terminated, indicating that nasopharyngeal insufflation of oxygen was capable of prolonging the duration of desaturation free apnoea to a significant extent. This occurred due to the en masse diffusion of the insufflated gases from the nasopharynx into the lower respiratory tract due to the development of a sub atmospheric pressure in the alveoli as the period of apnoea increased. This correlates with the findings of Baraka et al 2006.⁸

The EtCO₂ in the control group was 27.4 mm of Hg as compared to the case group which was 27 mm of Hg and there was no statistically significant difference between the two groups at the onset of apnoea. However, the increase in the EtCO₂ at the termination of the study when positive pressure ventilation (PPV) was initiated showed a rise of 16.6 mm of Hg in the case group as compared to an 11.7 mm of Hg rise in the control group. This showed a significant difference with a 'p' value of 0.013. The average rise in the EtCO₂ per minute was 2.8mm of Hg. The greater rise in the EtCO₂ in the case group occurred due to a longer period of apnoea in this group of patients⁸. However, none of the patients in the study showed any ill effects due to a rise in the EtCO₂ with the six minutes of apnoea. The average rise in value of EtCO₂ in the case group B was 43.6 mm of Hg as compared to the control group which showed an average

maximum value of 39.2 mm of Hg. A study done by Rudolf¹⁸ in 2013, found that insufflating low flow oxygen insufflation via the nasal route into the trachea of patients undergoing endoscopy reduced the rate of CO₂ rise by approximately 50% to 1.8mm/ min. Thus, if high flow nasal cannulation could achieve a flow of just 1L/min in the trachea this might just be sufficient to achieve significant ventilation and not just oxygenation. In 2015, Patel¹⁹ et al and Miguel-Montanes²⁰ published supporting the use of high flow nasal cannula for preoxygenation and apnoeic oxygenation. Patel et al additionally found that high flow nasal cannula provided apnoeic ventilation.

Limitations of the study

The study population was limited to two academic medical centers

The sample size was fairly restricted in number

CONCLUSION

The present study concludes that

1. Nasopharyngeal oxygen insufflation following preoxygenation by the four vital capacity technique can significantly delay the onset of haemoglobin desaturation after the induction of general anesthesia and muscle relaxation.

2. The duration of desaturation free apnoea in the case group was 6 minutes.

3. The fall in the SpO₂ in the apnoeic patients is the maximum in the third minute of apnoea.

4. The rise in the EtCO₂ is on an average at the rate of 2.8mm of Hg per minute

ABSTRACT

Introduction- Oral health is an integral part of the general health and well-being of an individual and is now recognized as an equally important criterion. Among the common oral diseases, dental caries and periodontal diseases are the two foremost conditions that remain widely prevalent and affect all populations throughout their life span. Poor oral health in childhood often continues into adulthood, affecting economic productivity and quality-of-life.

Methodology- Present cross sectional study was conducted among 12 years old children of rural school in the catchment area of Sri Aurobindo Institute of Medical Sciences, Indore. 400 children were included in the study and oral cavity examination was done by trained personal. Data was analysed using SPSS19.0 and frequency were calculated for quatitative variables and chi square test was applied for categorical variables.

Results- The present study srevealed that out of 400 participants 140(35%) were female and 260(65%) male. Decay teeth were more in male(36.05%) than the female(34.08%) and the difference was found statistically significant ,it was more in lower socioeconomic class as 64%of male and 59% of female of this were affected with decay teeth and developmental defects of enamel was more in male in comparison of female, it was found statistically significant.

Conclusion-The study reveals that dental caries still remains as a major oral health problem among school children of all age group. Oral health education should be organized in schools to maintain proper oral health.

Keywords- Oral health status, 12 years old children, Rural, school, Indore

INTRODUCTION

Dental caries can be traced to be as old as civilization with its evidence seen even in skeletal remnants of prehistoric humans¹. Dental caries is the most prevalent dental affliction of childhood. In spite of credible advances in dentistry, the disease continues to be a major public health problem. Untreated oral diseases in children frequently lead to serious general health problems, significant pain, interference with

eating, and lost school time². Dental caries is highly prevalent among children and persists to be a significant public health problem. It has detrimental consequences on children's quality of life by inflicting pain, premature tooth loss, and malnutrition, eventually influencing overall growth and development. The children suffering from poor oral health are twelve times more likely to have restricted activity days as compared to their healthy counterparts³. It has been observed that during 1940, the prevalence of dental caries in India was 55.5%, and during 1960, it was reported to be 68%⁴. The National Oral Health Survey and Fluoride Mapping 2003 reported that the prevalence of dental caries among 12 year old children was 72.5% and among 15 year old children was 75.4% in India⁵. Decreased prevalence of dental caries

in developed countries can be attributed to changing lifestyle and behavior patterns, fewer intakes of refined sugars, and widespread use of fluoridated toothpaste and utilization of the dental care services. Contrary to this, increase dental caries in developing countries can be related to factors, such as economic development, changing living standards, rapid urbanization, and changing of dietary patterns to more refined carbohydrates⁶. India, a developing country, faces many challenges in rendering oral health needs. The majority of Indian population resides in rural areas⁷. Decayed, missing, and filled teeth (DMFT) and SiC of 1.8 and 3, respectively. The majority of children aged 12 years had experienced caries in one or more of their total number of teeth⁸. Study of this age group is important as India is a country of widespread diversity in the socioeconomic status and oral health status in rural and urban areas of same country⁹. India is a rapidly growing nation in terms of population and economic growth almost 31% of the total population belongs to the 0–14 years of age group¹⁰ Children <18 years constitute about 40% of the Indian population¹¹. There is lack of organized school health programs in our country. The children in schools are relatively easily accessible, compared to any other population groups for any health promotion programs aimed at effecting the lifestyle changes. School health programs have proven effective in promoting health in many developed countries^{12,13}. This age group forms a significant proportion of Indian population today and is likely to further increase in the years ahead. Further, 12 years is a WHO recommended index age group for oral health survey. The objective of present study to assess the oral health status of children going in government schools.

METHODOLOGY

This study was conducted among 12 years old children of government rural schools in the catchment area of Sri Aurobindo Institute of Medical Sciences, District Indore. After getting the ethical approval from the institute ethical committee, list of schools was obtained from the office of District Education Officer of District Indore. The schools were stratified into primary, middle, high school and of which middle and high schools were selected. A pilot study was conducted to get the prevalence of dental caries and on this basis sample size was calculated by using $4pq/L^2$ where prevalence of caries 52.3% was used and sample size came 400. Sample was collected by including 12 yrs of student

from the schools and the age of students was verified by school records. The selected students were then evaluated for oral health status by a trained examiner who took training in department of community dentistry and Pedo-odontology.

All the children were examined under adequate illumination in the school premises. WHO criterion was used for evaluation of dentition status and treatment needs. The criterion recommends examination for dental caries using mouth mirror and community periodontal index (CPI) probe. The examination was conducted with a plain mouth mirror and CPI probe as given by the WHO 1997. The examination proceeded in an orderly manner from one tooth or tooth space to the adjacent tooth or tooth space. Clinical examination included the assessment of dentofacial anomalies according to the WHO Oral Health Assessment form (1997)¹⁰ by recording: Enamel hypoplasia Development defects of Enamel Index¹⁰, Dental fluorosis Index Modified criteria, Dental Aesthetic Index (DAI). Oral Hygiene Index Simplified (OHIS)¹¹ was used to assess oral hygiene. The school authorities were requested to pass on this information to all the parents/guardians so that children could be taken to dental college for availing free treatment through the referral cards given to them at the time of study.

RESULTS

Figure -1 Distribution of participants

Above figure shows that 400 participants were included in the study out of which 140 (35%) were female and (65%) male.

Figure-2 Distribution of participants according to socioeconomic class

Above figure shows that 113 (28.25%) belonged to upper lower of socioeconomic class and 220 (55%) of them from the lower socioeconomic class.

Table 1- Association of DMFT with gender

S. No.	Variables	Gender		Total	Chi-square value	P value
		Girls	Boys			
1.	Decay Teeth				4.3	<0.05
	Present	40(34.08%)	112(36.05%)	152(38%)		
	Absent	100(65.92%)	158(63.95%)	258(62%)		
2.	Missing Teeth				0.19	>0.05
	Present	3(2.23%)	4(1.5%)	7(1.67%)		
	Absent	137(97.77%)	256(98.5%)	393(98.33%)		
3.	Filled teeth				2.4	>0.05
	Present	8(5.71%)	27(10.38%)	35(8.75%)		
	Absent	132(94.29%)	233(89.62%)	365(91.25%)		
4.	Traumatic Teeth				3.7	=0.05
	Present	3(2.15%)	20(7.08%)	23(5%)		
	Absent	137(97.85%)	240(92.02%)	380(95%)		

Above table depicts that out of 400 participants 152 (37.5%) had decay teeth and of which 40(34.08%) were female and 112 (36.5%) boys. decay teeth was more in male than female and the difference was found statistically significant. Above table describes that 35(8.75%) of participants had filled teeth and filled teeth was found more in males than females but the difference was not statistically significant. Table shows that 19(4.75%) of participants had decay teeth and decay

teeth was found more in boys than girls but the difference was not statistically significant and also describes that only 7 (1.67%) of participants had filled teeth and filled teeth was found more in males than females but the difference was not statistically significant. Above table depicts that 20(5%) of participants had trauma teeth and teeth was found more in males than females but the difference was statistically significant.

Table 2- Distribution of 12-year-old students by CPI score and gender

CPI Score	Gender		Total
	Girls	Boys	
Healthy	132(47.15%)	148(52.85%)	280(70%)
Bleeding	3(75%)	1(25%)	4(1%)
Calculus	34(29.31%)	82(70.68%)	116(29%)
Total	169(42.25)	231(57.75%)	400(100%)

Above table shows that majority of children (70%) had healthy gums only 1% of participants had bleeding gums and 29% had calculus.

Table 3-Association of developmental defects of enamel with sex

Sex	Developmental defect of enamel				Total
	Healthy	Hypoplasia	Diffuse opacity	Demarcated Opacity	
Female	107 (84.9%)	17(7.64%)	16(4.14%)	1(.32%)	140(100%)
Male	221(84.98%)	26(10.09%)	9(3.65%)	3(1.29%)	260(100%)
Total	328(82.25%)	36(9.00%)	15(3.75%)	4(1%)	400(100%)

Chi square value=10.5, pvalue <.05

Above table describes that boys has more developmental enamel defects and hypoplastic enamel was found 10.09% among the boys than the girls 7.64% and prevalence of diffuse opacity was slightly more in girls (4.14%) than the boys (3.65%), demarcated opacity was found more among boys (1.29%)than the girls (0.32%) and this difference was found statistically significant.

Table 4-Association of oral mucosal condition with sex

Sex	Oral mucosal condition			Total
	Normal	Ulcerated	Abscess	
Female	136(97.45%)	3(1.91%)	2(.62%)	140(100%)
Male	253(97.42%)	7(2.58%)	1(0%)	260(100%)
Total	389(97.25%)	10(2.5%)	1(.25%)	400(100%)

Chi square value=1.4, pvalue >.05

DISCUSSION

Present study was conducted in Government middle schools of District Indore the catchment area of Sri Aurobindo Institute of Medical Science, Indore. 400 participants were included in the study out of which 140 were females and 260 males. Similar findings were found in a study conducted by Sarve et-al. Majority of participants were from lower socioeconomic class. Study carried out by George and Mullanmottill¹²and also found that majority of the children were from lower

socio-economic class. Prevalence of decay teeth was found 38% among the participants. Study conducted by Thakur et al¹⁵ found that the prevalence of decay teeth was 35.2% in rural schools. Decay of teeth were more in boys compared with girls and the difference was found statistically significant. Prevalence of Missing teeth was 1.67% and filled teeth was 4.75% similar finding was found in a study by Zafer Azizi¹⁶. Majority of children had healthy gums (70%) and similar findings were observed in study conducted by George and Mullanmottill

in Kerala. In present study 24% of girls in the age group of 12 years suffered from gingival problems which was less (50.8%) compared to a study conducted in Chennai⁷. 27% percent of boys in the same age group suffered from gingival problems which was lower (51.7%) compared to school children in Chennai.

This study observed that 82.25% of children had normal, 9% hypoplastic, 3.75% diffuse opacity and 1% had demarcated opacity in enamel. Hypoplastic enamel was dominant type of developmental enamel defects. Enamel defects were dominant in girls than boys and this difference was found statistically significant. Similar finding has observed in a study conducted by Fabiana vargas and Ferreira¹⁷.

ABSTRACT

Aim And Objectives: To determine the effects of Neuro Muscular Electrical Stimulation in improving Muscles Function of Swallowing among subjects with post stroke dysphagia. **Methodology:** Quasi experimental study design was used this study. Total 30 Post stroke dysphagic patients were selected and all 30 patients underwent sEMG study for massator, sub mental and infra hyoid muscles. Neuromuscular electrical stimulation over the Pharyngeal muscles given for 4 weeks. End of the fourth week post test measurement was taken values were tabulated and statistically analyzed. **Results:** surface electro myography of bilateral massator, submental and infrahyoid muscle function in amplitude is improved in between pre and post intervention, test values that is P value is 0.001. **Conclusion:** Neuro muscular electrical stimulation is more beneficial effect in swallowing muscle activity in measures of amplitude on post stroke dysphagia.

Keywords: Post stroke dysphagia, sEMG, NeuroMuscular electrical stimulation

INTRODUCTION

Dysphagia is defined as an impairment of the complex and integrated sensorimotor system. Neurogenic dysphagia (ND) typically occurs in patients with neurological diseases of varying etiologies, and it is associated with high mortality, morbidity, and social costs because of the increased risk of aspiration pneumonia and its sequelae.¹⁻⁶ Immediately, after stroke oropharyngeal dysphagia is seen in 50% of stroke patients. Of these, up to 40% remain dysphagic a year later⁷. Complications of dysphagia includes aspiration, pneumonia, and malnutrition⁸ for which patients require enteral sustaining through a nasogastric tube or percutaneous endoscopically presented gastrostomy tube, which frequently requires long term institutional care⁹. Post Stroke Dysphagia is thought to be due to damage to the cortex and sub cortical structures

¹⁰. In spite of the fact that dysphagia might be dealt with utilizing a few physical procedures, there is no conclusive medications¹¹. Dysphagia usually follows stroke that affects the predominant swallowing muscles that is bilateral massator, submental and infrahyoid. In the last 20 years, physiotherapy techniques in which neuromuscular electrical stimulation (NMES) is the usually used technique for swallowing function but very minimal literature is found regarding the electromyography activity of swallowing muscles after NMES. In this study, we concentrate on the electromyography activities of swallowing muscles.

METHODOLOGY

Participants: the sample will be drawn from Physiotherapy department OPD and IP at Saveetha Medical hospital. The subjects will sign an informed consent form after a elaborate education about the study purpose, duration and other aspects by the researcher. The subjects who fulfill the criteria's of inclusion will be selected for the study. Inclusion criteria: Age group: 50 – 55 years, both genders. Post stroke subjects with difficulty in swallowing. Subjects confirmed swallowing difficulty with positive water swallow test. Exclusion criteria: Recent trauma, unstable vital signs, recent surgeries around the neck. Subjects with any other

neurological disorders, Symptomatic cardiovascular diseases, Skin allergies.

Ethical consideration: The study was approved by the Institutional Ethics Committee (Number 015/02/2017/IEC/SU on 28/02/2017) and done in accordance with the Ethical Guidelines for on Human Participants, The study protocol was approved by institutional ethical committee.

Procedure: The patient willing to participate in this study were explained about the safety and simplicity of the procedure and informed consent and information sheet were obtained. 30 subjects were selected according to the inclusion and exclusion criteria. All the 30 subjects underwent surface electromyography as a pre test measurement. The Patient position was sitting and three muscle groups were investigated and muscle activity recorded. Three muscle locations were examined in the study: (1) masseter (2) submental (3) Infrahyoid. All EMG recording were made using surface electrode which was made up of silver chromium. Allengers Scorpio EMG EP NCS, computer based EMG system with software. The Electrodes have wide band pass filter band with (RMS) - of 30 to 500 Hz and a 60 Hz Notch filter. It consists of two bipolar electrode and ground electrode. Specific electrode positions were as follows the interelectrode distance was 10 mm in all locations except sub mental. For massator muscle two bipolar electrodes were placed parallel to the massator muscle fibers on the left side of the face. Sub mental muscle two surface electrodes were attached to the skin beneath the chin on the right side of midline to record submental myoelectrical activity over the platysma. And two electrodes were placed on the left side of the thyroid cartilage to record from the infrahyoid muscle group. Electrical impedance at sites of electrode contact was reduced because target areas were lightly scrubbed with alcohol gauze pads, followed by application of an electrode gel. All the 30 subjects received Electrical stimulation with the frequency of 30 Hz, duration of

100ms, intensity was increased till minimal palpable observable contraction and interrupted direct current was used. The patient position was supine lying and pillow kept under the head. And inactive electrode was placed nape of the neck, active pen electrode was placed pharyngeal muscles either side of the hyoid bone for 5 days/week for 4 weeks. The post test measurement was taken similar to pre test measurement. The surface electromyography measures in amplitude. All the data were tabulated and statistically analyzed.

RESULT

In surface electro myography left massator Muscle Amplitude Pre test Mean-16.952mv, standard deviation-1.435, Post test mean-64.215mv, standard deviation-3.859, t value-86.580, P value <0.001, extremely statistically significant. left Submental Muscle Amplitude Pre test Mean-24.5013mv, standard deviation-3.0071, Post test mean-121.9050mv, standard deviation-6.0513, t value-116.1416, P value <0.001, extremely statistically significant. left Infrahyoid Muscle Amplitude Pre test Mean-22.0040mv, standard deviation-1.8564, Post test mean-74.1043mv, standard deviation-17.5628, t value-15.9395, P value <0.001, extremely statistically significant. (table-1)

Right massator muscle amplitude pre test mean 16.9970mv, standard deviation-1.360 and post test mean-64.229mv, standard deviation-3.811. t value-86.9896, P value is <0.001, extremely statistically significant. Right Submental muscle amplitude pre test mean 24.3210mv, standard deviation-3.0902 and post test mean-121.9257mv, standard deviation-6.0063, t value-115.7434, P value is <0.001 extremely statistically significant. Right Infrahyoid muscle amplitude pre test mean 21.9440mv, standard deviation-1.7722 and post test mean-74.4547mv, standard deviation-18.0887. t value-15.5360, P value is <0.001 extremely statistically significant. (table-2)

Table-1- Left Massator, submental, Infrahyoid sEMG Pre and Post test values

Name of the Muscle		Mean	Standard deviation	t value	p value
Left massator	Pre	16.952	1.435	86.580	<0.001
	Post	64.215	3.859		
Left Submental	Pre	24.501	3.0071	116.1416	<0.001
	Post	121.9050	6.0513		
Left Infra hyoid	Pre	22.004	1.8564	15.9395	<0.001
	Post	74.1043	17.5628		

Table-2- Right Massator,submental,Infrahyoid sEMG Pre and Post test values

Name of the Muscle		Mean	Standard deviation	t value	p value
Right massator	Pre	16.9970	1.360	86.9896	<0.001
	Post	64.229	3.811		
Right Submental	Pre	24.321	3.0902	115.7434	<0.001
	Post	121.925	6.0063		
Right Infra hyoid	Pre	21.944	1.7722	15.5360	<0.001
	Post	74.454	18.0887		

DISCUSSION

The purpose of the study is to determine the effect Neuro Muscular Electrical Stimulation in facilitating the swallowing muscle activity. Several earlier studies have been directed to show the viability of NMES treatment strategies for dysphagia.¹² It was predicted that repeated neuromuscular electrical stimulation will improve the muscle function in swallowing. This was based on the previous study pharyngeal electrical stimulation for neurogenic dysphagia¹³. EMG data is collected and supported this hypothesis. The result shows significant increase in the pharyngeal muscle activity.

The previous study conducted in Japan on the effect of pharyngeal electrical stimulation on swallowing performance by Ryosuke Takeishi and Jin Magara as an effective function in swallowing muscle activity on post stroke dysphagia. The Limitations in this study were that the study was conducted in only one hospital, the results were derived from a small sample of stroke patients and only one technique to facilitate swallowing was done. The data collection took longer than expected. Larger numbers are needed in future investigations, as are variations in treatment regimens. In a future study, different electrical stimulation can be given with variations in duration, and intensity.

CONCLUSION

This study showed that Neuro Muscular Electrical stimulation is effective in improving swallowing Muscle function in Electromyographic activity on patients with Post stroke dysphagia.

ABSTRACT

AIM: To prove that gingival crevicular blood can be used as a novel, minimally- invasive, diagnostic tool to screen undiagnosed diabetic population with gingivitis and periodontitis as compared to invasive phlebotomy and finger puncture blood collection procedures.

OBJECTIVES: To estimate random blood glucose levels from gingival crevicular blood through glucometer. To compare the random blood glucose levels from venous blood by laboratory glucometric methods. To prove that gingival crevicular blood is a minimally invasive diagnostic tool as compared to phlebotomy and finger puncture procedures with good patient compliance.

METHODOLOGY & RESULT: 75 Out-patients with gingivitis and periodontitis who are unaware of their diabetic status undergoing routine intraoral clinical examination will be subjected to periodontal probing after isolating the area to be examined. Blood oozing through the gingival crevice from the anterior maxillary region will be collected by a glucometer for random blood glucose. Samples obtained by phlebotomy technique will be analyzed for random blood glucose through calorimetric methods in the laboratory. Results obtained from both the gingival crevicular blood and venous blood will be compared and statistically analysed. 25 Out-patients who have already been diagnosed as diabetic are included as controls in the study. Correlation between Gingival crevicular blood glucose (GCBG) and Venous blood Glucose (VBG) in total samples were statistically analyzed using SPSS version 11. Highly significant correlation between GCBG & VBG ($r=0.993$) in total was found. Correlation is highly significant at $p<0.01$.

CONCLUSION: Random blood glucose levels measured in GCBG is almost equal to that of VBG. Hence we conclude saying that GCB can be used as a minimally invasive and easy to collect tool for screening diabetes in our routine dental practice as early diagnosis of diabetes helps to prevent its long-term complications, high morbidity and mortality.

Keywords : Diabetes mellitus, Gingival Crevicular Blood, Minimally invasive, Random Blood Glucose.

INTRODUCTION

Diabetes mellitus (DM) is a chronic metabolic disorder with an estimated prevalence of 7% in industrialized countries of which nearly half the cases are undiagnosed.¹ India has nearly 33 million diabetic

subjects today with an overall prevalence rate of 4.3%.² Type 2 DM .i.e. NIDDM constitutes nearly 70% of population in any country, with a prevalence of 2.4% in rural population and 11.6% in urban population.³ The chronic hyperglycemia of diabetes is associated with a wide range of complications like diabetic retinopathy, atherosclerotic cerebrovascular, cardiovascular and peripheral vascular diseases, peripheral neuropathy, progressive renal dysfunction, delayed wound healing and periodontitis.⁴ Recent evidence indicates that diabetic complications such as retinopathy, cardiovascular disease and neuropathy may begin several years before the diagnosis of type 2 diabetes mellitus is established. The early diagnosis of diabetes, therefore, might help to prevent its long-term complications that are responsible for the high morbidity and mortality of these patients.⁵ Early diabetes detection could identify diabetes-related complications at an earlier stage, suggesting the value of screening to discover unrecognized illness, manage existing complications, and prevent the progression of disease.⁶ Periodontal disease is considered to be the sixth complication of diabetes. The interrelationship between diabetes mellitus and periodontitis has been studied for many years. Diabetes and Periodontitis seem to interact in a bidirectional manner⁵.

For over 100 years, various methods have been used to measure glucose level in biological fluids, but the search for more specific, sensitive and simple method continues. Since centuries, the clinicians are sending venous blood, or urine samples for determining glucose levels to clinical biochemistry laboratories. But these days portable glucose monitors are in use both as a bedside testing of glucose⁵. Portable glucose monitors can be used for the estimation of blood glucose in dental set up also. Periodontal disease itself is associated with gingival bleeding and if the patient is diabetic, it is more severe. Bleeding from the gingival tissues is found to be further pronounced if the diabetic patient's condition is poorly controlled or is in association with undiagnosed diabetes⁶. Thus ample extravasated blood is produced during routine diagnostic procedures. Probing during a periodontal examination is more familiar to the practitioner and less traumatic than a finger-puncture with a sharp lancet. This blood oozing during routine periodontal examination can be the source for the estimation of blood glucose is more severe. Glucometers are commonly used by diabetic patients for home monitoring of blood glucose levels. Recently, more

sensitive self-monitoring devices have been developed for testing small amounts (<2microlitre) of blood obtained from areas much less sensitive than fingertips, such as the forearm, upper arm, thigh, or base of thumb. In general, accuracy of these novel glucometers has been acceptable.⁷ The conventional laboratory methods that are employed to screen for diabetes are time consuming and elaborative equipment are needed to employ these techniques. The advent of blood glucose monitors allows the clinician to assess blood glucose at the chair side. In contrast to laboratory methods, results are obtained instantaneously, which helps the clinician to decide if further confirmatory test are required to diagnose diabetes.⁸ Inflammatory markers are seen raised markedly in undiagnosed diabetic population which signify the severity and progression of the disease. Three most common markers are C-Reactive Protein, TNF-alpha and IL-6. Studies show that elevated CRP levels are a strong independent predictor of type 2 diabetes and may mediate associations of TNF-alphaR2 and IL-6 with type 2 diabetes⁹.

MATERIALS AND METHOD

75 patients who were not aware of their diabetic status and 25 patients who were Type II Diabetic and were under medication who reported as outpatient to the Department of Oral Medicine and Radiology, Sree Balaji Dental College and Hospital, Chennai were included in the study. Inclusion criteria were the same mentioned above. Exclusion criteria were patients with known bleeding and clotting disorders like hemophilia, thrombocytopenic purpura, etc.

All the patient's detailed case history were recorded followed by routine intraoral examination where the patient's periodontal status was recorded examined intraorally and the area to be examined was isolated with cotton rolls to prevent contamination with saliva. A detailed periodontal status was recorded with graduated periodontal probe (Williams) and classified according to the American Academy of Periodontology. The degree was moderate if periodontal depth was 3- 5mm and severe if periodontal depth was greater than 6mm. Bleeding on probing was elicited 1-2minutes after probing. An appropriate site with profuse bleeding was chosen for collecting the gingival crevicular blood (GCB).

Probing was repeated until sufficient bleeding was there in the sulcus. A plastic capillary tube of 2mm bore

marked was used to collection of blood from the gingival sulcus after probing force of approximately 0.2N was used to elicit bleeding from the site.

The Accu-chek Active Glucometer (Roche Diagnostics, Germany) monitoring device was loaded with the active test strip (impregnated per cm² with glucose dye oxidoreductase 0.7μ) 2μl of blood was transferred on to the test strip. The testing time is about 10 seconds. Then venous blood was collected by routine phlebotomy technique for measurement of Random Blood Glucose levels. All the 100 samples were analyzed and readings were recorded and tabulated.

STATISTICAL ANALYSIS

Statistical analysis was performed by SPSS 20.0. Statistical test used was Pearson Correlation Coefficient.

RESULTS

100 patients comprising 54 males and 46 females took part in the study with a mean age of 49.99 years (Table 1). No significant difference between RBS(GCB) and RBS(VB) when compared to age and sex group were found (Table 2). The mean RBS(GCB) and RBS(VB) derived from all samples were 199.25 mg/dl and 197.83 mg/dl respectively with a Standard Deviation of 50.2 in both groups. (Table 3). Correlation between RBS (GCB) and RBS(VB) of the 100 samples were analyzed with Pearson correlation coefficient using the SPSS version 20.0 and scatter plot was done. Highly significant correlation between RBS (GCB) and RBS(VB) ($r=0.993$) in total samples was found. The correlation was significant at $p<0.01$ (Table 4).

Table 1: Sex Distribution

		Frequency	Percent
Valid	Male	54	54.0
	Female	46	46.0
	Total	100	100.0

Table 2: Age distribution

Frequency		Percent
21-30	4	4.0

DISCUSSION

Testing for Type 2 Diabetes Mellitus at should be carried out in individuals who are obese, have a 1st-degree relative with diabetes, are members of a high-risk ethnic population, have delivered a baby weighing 4.05 kg or have been diagnosed with gestational diabetes mellitus are hypertensive (>140/90), have an HDL cholesterol level <35 mg/dl and/or a triglyceride level >250 mg/dl, had on previous testing an impaired glucose tolerance or an impaired fasting glucose⁴. Undiagnosed diabetic patients are at significantly increased risk for development of complications and the bidirectional relationship of diabetes with periodontitis underscores the necessity for early detection of diabetes¹⁷.

Testing crevicular blood glucose level with the Accu-Chek self monitoring device is sensitive, since it can provide results with just 2- 3ul of blood within 10 seconds. With regard to the development of painless and non-invasive methods to measure blood glucose, considerable effort has been made in the past few years. Since periodontal inflammation with or without the complication factor of diabetes mellitus is known to produce ample extravasate of blood during diagnostic periodontal examination¹. As we compared our study with the similar studies 1, 5, 6, 7, 8, 10, 14, the results obtained were much consistent with highly significant correlations ($r= 0.993$, $p<0.01$) were found between RBS(GCB) & RBS (VB).

The strong correlation ($r=0.993$, $p<0.01$) between the random blood glucose levels from the gingival crevicular blood(GCB) and venous blood(VB) that was obtained from our study clearly shows that easy availability of GCB as an alternative to the VB as GCB can be collected by a minimally invasive painless method as compared to the later. In contrast to a study⁷ in which the results did not show any evidence for the usefulness of GCB for testing random blood sugar during routine periodontal examination, our study showed accurate results as the

blood was collected from the gingival cervical after thorough cleaning and probing thus avoiding the chance of contamination to get accurate results.

From the above discussion, we can say that gingival crevicular blood from probing may be an excellent source of blood for glucometric analysis using the technology of portable glucose monitors. Subjects can reliably be screened for diabetes by measuring glucose levels in gingival crevicular blood, since probing and sample collection takes a very little time and there is no discomfort to the patient. Thus, a dental clinician can use this crevicular blood to test for glucose levels instead of puncturing the patient's finger tip to obtain a blood sample and can make a referral to a physician for further evaluation for diabetes when warranted⁵.

The incidence rate of DM in India is increasing at an alarming rate. Hence if the dentist participate in the challenge of undiagnosed diabetes by the routine screening of patient especially those with pronounced gingival inflammation, it would be a major role and life saving service¹⁸.

CONCLUSION

From our study we found that random blood glucose levels measured in GCB is almost equal to that of VB. Hence, GCB can be used as a minimally invasive and easy to collect tool for screening diabetes in our routine dental practice as early diagnosis of diabetes helps to prevent its long-term complications, high morbidity and mortality. However as the incidence of Diabetes Mellitus is increasing in our nation, the study can be carried out in a larger sample size.

ABSTRACT

Background and Objective: Nitric oxide (NO) is a gaseous, colorless, highly reactive, shortlived free radical plays a pivotal role in the regulation of various physiological and pathological mechanisms in the body. The pathogenesis of periodontal diseases may be affected by alterations of the inflammatory response by smoke. The aim of this study was to assess the levels of salivary NO among both the smokers and nonsmokers having chronic periodontitis and also to compare them with periodontally healthy controls.

Method: Sixty subjects who were in the age group of 30-55 years, who participated in this study participated and were divided into three groups: group I, which includes 20 healthy nonsmoking subjects; group II, 20 subjects who are Non-smokers with Chronic periodontitis ; Group III 20 subjects who are smokers with Chronic periodontitis. The biochemical estimation of NO in the collected saliva was performed using the Griess colorimetric reaction.

Statistical Analysis and Results: The statistical comparisons were done under the Griess Reaction. There were statistically significant salivary levels of NO in the groups of periodontitis (group II and III) as compared to those in the healthy controls (group I). The salivary nitric oxide levels are statistically significant among smokers than non-smokers in chronic periodontitis patients.

Conclusion: NO play an important complex role in the immuno-inflammatory process and in the remodeling and maintenance of osseous structures. As smoking increases the risk of periodontitis, the present study aimed to evaluate the effect of smoking among periodontitis patients, that is, the NO levels in these patients.

Keywords: Chronic periodontitis, Nitric oxide, Smoking.

INTRODUCTION

Nitric oxide (NO) is an ubiquitous intercellular messenger molecule with important cardiovascular, neurological and immune functions. Nitric oxide, a free radical gas, is a noxious chemical in the atmosphere, but in small controlled concentrations in

the body, it acts as a physiological and pathophysiological mediator and it plays an important role in the biological systems¹. It is formed in almost all cell types and despite the fact that it has a short half-life of approximately 4 seconds in vivo, it penetrates the surrounding tissues and activates a variety of cellular signaling pathways. NO is synthesized by the oxidative process of the guanidine of

the amino acid Larginine by a family of enzymes named NO synthases (NOS) ².

In mammalian cells, NO is produced by a group of isoenzymes which are collectively termed as the NO synthases (NOS). The endothelial NOS and neural NOS are constitutive and they release small amounts of NO for a short period following the stimulation of their receptors. In contrast, iNOS is expressed in response to proinflammatory stimuli and it produces large amounts of NO for sustained time periods ³.

Saliva may contain biomarkers which are specific for the unique physiological aspects of periodontitis, and the qualitative changes which occur in the composition of these biomarkers could have diagnostic and therapeutic significance ⁴.

Periodontitis, a chronic inflammatory disease of the periodontal tissues, is a multifactorial disease of bacterial origin ^{5,6}. The products of the bacteria and proinflammatory cytokines produced by inflammatory cells trigger the expression of iNOS, which is involved in inflammatory processes and accelerates periodontal disease ⁷.

Risk factors for periodontitis may be systemic or local, and among them, smoking is the most significant^{8,9}. Thus, cigarette smoke increases the oxidative burden, as it contains a large number of free radicals, and it has been suggested that it may increase the susceptibility to periodontal pathogens ¹⁰.

As smoking increases the risk of periodontitis, the present study aimed to evaluate the effect of smoking on oxidative stress in gingivitis and chronic periodontitis patients and also compare the levels to prove the significance of salivary NO levels on smoking which increases with increasing disease.

MATERIALS AND METHOD

The present study was conducted in the Department of Periodontology, Sree Balaji Dental College And Hospital, TamilNadu, Chennai, India. The institutional ethical committee of the faculty approved the study.

This cross-sectional study was performed to evaluate and compare the salivary NO levels of smokers and Non-smokers among the chronic periodontitis patients to those of clinically healthy patients as controls.

Sixty subjects who were in the age group of 30-55 years, who participated in this study participated and were divided into three groups: group I, which includes 20 healthy nonsmoking subjects; group II, 20 subjects who are Non-smokers with Chronic periodontitis ; Group III 20 subjects who are smokers with Chronic periodontitis.

Clinical examinations

This was performed using the plaque index (PI), gingival index (GI), probing pocket depth (PD) and clinical attachment level (CAL). The pocket depth was measured as the distance from the gingival margin to the base of the pocket in millimeters. Informed consent was obtained from all of the patients before participating in the study

Inclusion Criteria And Exclusion Criteria

The inclusion criteria which was followed generally were the patients of both genders who were in the age group of 30-55 years, with a dentition of at least 20 functioning teeth.

I. CONTROLS:

Inclusion criteria

Healthy subjects in the age group of 30 – 55years, with no probing pocket depth, with no bleeding on probing and no attachment loss.

Exclusion criteria

Patients who have received any topical or systemic antimicrobial treatment or steroid therapy in the past six months. Patients who had periodontal treatment in the past six months. Smokers- both past and present. Patients with any systemic diseases and Patients with salivary gland disorders.

II. STUDY GROUP: NON SMOKERS WITH CHRONIC PERIODONTITIS

Chronic periodontitis patients (nonsmokers) Subjects with $\geq 30\%$ of sites with the presence of a PD of ≥ 4 mm along with a CAL of ≥ 4 mm .

III. STUDY GROUP: SMOKERS WITH CHRONIC PERIODONTITIS

Chronic periodontitis patients (smokers) Subjects having a smoking habit for the past 6 months or more

and smoking at least 10 bidis or cigarettes per day, and with $\geq 30\%$ of sites with the presence of a PD of ≥ 4 mm along with a CAL ≥ 4 mm.

Exclusion criteria

Patients who have received any topical or systemic antimicrobial treatment in the past six months including the use of mouthwash

Patients who had periodontal treatment in the past six months.

Patients on anti-oxidant supplements in the past six months.

Patients with salivary gland disorders

Collection of samples:

4 mL of unstimulated saliva was collected in a sterile plastic vial, from all of the subjects and controls. The saliva samples were then centrifuged at 2,500 rpm,

for 5 minutes. The biochemical estimation of NO in the collected supernatant obtained from the saliva was performed using the Griess colorimetric reaction by Green et al.¹¹ These solutions were added to the Griess reagent for measurement on a spectrophotometer and their optical densities (OD) were recorded^{12,13}. The optical densities were then correlated in the standard curve and the corresponding concentrations of nitrite were observed.

RESULTS

The detailed data on the salivary levels of NO between the three groups have been listed in [Table/Fig 1]. The detailed data BY t-test for inter comparison three groups for Salivary Nitric oxide Levels have

been listed in [Table 2]. Clinical parameters used for clinical examinations of the three groups have been listed in [Table 3].

Table 1. ANOVA test for Comparison between three groups for Salivary Nitric oxide

Groups	N	Mean	SD	Minimum	Maximum	F-value	P Value
Group I	20	5.69	0.93	4.34	8.16	234.021	0.001
Group II	20	15.43	2.42	10.48	18.94		
Group III	20	16.53	1.51	13.54	20.34		
Total	60	12.55	4.86	4.34	20.34		

P<0.01 Significant

Post Hoc Test of Salivary NO

Comparing the above three Groups, Group II & III has got highest mean value of Salivary levels of nitric oxide when compared to Group I. The above distribution of data shows statistical significance (p<0.01)

Table 2 - Scheffe Test: t-test for inter comparison three groups for Salivary Nitric oxide

Groups	N	Mean	SD	Minimum	Maximum	t-value	P Value
Group I	20	5.69	0.93	4.34	8.16	19.859	0.001
Group II	20	15.43	2.42	10.48	18.94		
Group I	20	5.69	0.93	4.34	8.16	27.352	0.001
Group III	20	16.53	1.51	13.54	20.34		
Group II	20	15.43	2.42	10.48	18.94	1.108	0.001
Group III	20	16.53	1.51	13.54	20.34		

P<0.01 Significant From the above table ,the inter comparison among three group for Salivary levels of NO Shows,

t-test comparing group I and group II reveals group B has statistically significant higher mean value compared to group I (p<0.01)

t-test comparing group I and group III reveals group III has statistically significant higher mean value compared to group I (p<0.01)

t-test comparing group II and group III reveals group III has statistically significant higher mean value compared to group II (p<0.01)

Table 3. Clinical parameters used for clinical examinations of the three groups.

Parameter	Group 1 (n=20)	Group 2 (n=20)	Group 3 (n=20)
Plaque index	0.64±0.18 (0.40–1.00)	1.70±0.19 (1.30–2.10)	1.92±0.18 (1.60–2.20)
Gingival index	0.44±0.10 (0.30–0.60)	1.71±0.21 (1.30–2.20)	1.38±0.18 (1.10–1.70)
Probing pocket depth (mm)	0.84±0.21 (0.40–1.20)	4.35±0.56 (3.40–5.20)	4.59±0.48 (3.80–5.80)
Clinical attachment levels (mm)		6.51±0.40 (5.80–7.20)	6.53±0.41 (6.00–7.20)

Values are presented as mean±standard deviation (range).

Group 1: normal, group 2: nonsmoker, group 3: smoker.

There was positive significant increase in the salivary NO levels among smokers than non-smokers induced chronic periodontitis. the results indicated that there was a significant correlation on the effects of smoking in increased periodontal diseases.

DISCUSSION

Periodontal disease is a chronic bacterial infection characterized by persistent inflammation, connective tissue breakdown and alveolar bone destruction¹⁴.

Nitric oxide (NO) is a gaseous free radical with a short biological half-life, which is generated enzymatically from L-arginine by a family of the NO synthase (NOS) isoforms. Nitric oxide (NO) is formed from the amino acid, L-arginine by a 2-step oxidation of L-arginine to L-citrulline. Nitric oxide is synthesized by a family of enzymes which are called nitric oxide synthases¹⁵. Excessive levels of NO, and consequent modification of proteins, lipids, and nucleic acids by reactive nitrogen species formed in the reaction of NO with O₂⁻. NO reacts rapidly with O₂⁻ to form peroxynitrite, a highly toxic metabolite and a potent oxidant. Controlled generation of peroxynitrite may play a role in host defense, but excessive generation can lead to tissue damage. However, there is also peroxynitrite-independent mechanisms by which nitrotyrosine can be

formed. The complexity of NO chemistry in part may help explain the sometimes opposing results obtained in the research of the role NO in pathogenesis of the diseases¹⁶.

The expression of iNOS has been investigated in salivary gland-related diseases¹⁷, temporomandibular joint disorders and oral cancer as well¹⁸. Several studies suggest that tissue injury in inflammation involves induction of iNOS by certain cytokines or endotoxin, which leads to production of large quantities of NO¹⁹.

As smoking increases the risk of periodontitis due to the destructive molecular and genetic factors²⁰, the present study aimed to evaluate the effect of smoking on oxidative stress in gingivitis and chronic periodontitis patients and also compare the levels to prove the significance of salivary NO levels on smoking which increases with increasing disease .

In the present study, we made an attempt to evaluate the roles of smoking and its effects in increasing periodontal diseases. Various studies have reported the significance of NO as an inflammatory marker, but the present study has correlated the salivary elevated levels of NO among the smokers and non-smokers in gingivitis and chronic periodontitis.

The source of salivary nitric oxide was studied by Sato H et al., 2006²¹. Many of the oral microorganisms express enzymes that can effectively reduce nitrate. The

facultative anaerobic bacteria in the oral cavity reduce the salivary nitrate to nitrite and this nitrite enhances the gastric generation of NO in acidic conditions. Although nitrite is converted non-enzymatically to NO at a low pH, the rate of this conversion at the physiological pH (about 6.2–7.6) in the oral cavity is fairly low and, hence, the mechanism of the oral production of NO remains obscure.

The source of serum nitric oxide was studied by Menaka et al., 2009¹². The results of this study showed significantly increased concentrations of nitrite in the patients with periodontitis, as compared to those in the healthy control group. The significantly higher levels of NO in this study group had contributed to the development of the frequently found clinical symptoms of periodontitis. The increased alveolar bone resorption may be due to the stimulatory effect of NO on the activity of the osteoclasts.

Interestingly, a study report of Aurer A et al., 2001²², showed that salivary nitrite, a stable metabolite of NO, was decreased in the saliva of the periodontitis patients than in the healthy subjects. This may be due to the fact that NO is relatively unstable in the presence of oxygen and that it quickly autooxidizes to produce nitrogen oxides. Moreover, because of NO's reactivity and shortlife, directly measuring NO in the cells and tissues is very difficult.

Biochemical and immunological markers present in saliva, serum or GCF can partially determine the extent of periodontal disease and even may predict its progression (Ugar-cankal D et al 2006)²³. Study resulted by Deeptiwadhwa et al., 2013 showed a positive correlation with the present study with significant increased concentrations of salivary nitric oxide in patients who have smoking habits in chronic periodontitis patients than non-smokers which was supported now with the present study that levels have increased with smoking and in increasing disease⁶.

This study was performed to investigate the role of smoking as well to prove the influence of smoking on increasing periodontal disease by using a noninvasive tool as saliva to estimate the levels of NO as a potential bio marker for periodontal diseases.

CONCLUSION

To summarize, as the studies which have highlighted

on effects of smoking in the role of increasing diseases are lacking and as for the biochemical tests, this study utilized easy chair side diagnostic tools i.e, saliva, this study was indicated to focus on the relationship of the salivary levels of NO among smokers and non-smokers in chronic periodontitis patients. The results of our study indicated that there was a direct positive correlation among smokers which may throw light on the future research to evaluate the effects of tobacco on various diseases effectively.

ABSTRACT

Introduction: *Staphylococcus aureus* is one of the most common causes of nosocomial infections, especially pneumonia, surgical site infections and blood stream infections and continues to be a major cause of community-acquired infections. Methicillin Resistant *Staphylococcus aureus* (MRSA) is resistant to the majority of antimicrobial agents available for clinical use, the glycopeptides vancomycin has been proposed as the drug of choice for treating such infections. The glycopeptide vancomycin was considered to be the best alternative for the treatment of multi drug resistant MRSA⁴. However, there are increasing numbers of reports indicating the emergence of vancomycin-resistant *S. Aureus*. Methicillin Resistant *Staphylococcus aureus* (MRSA) is resistant to the majority of antimicrobial agents available for clinical use, the glycopeptides vancomycin has been proposed as the drug of choice for treating such infections. **Materials and Method:** The present study was carried out to find out the presence of VISA and VRSA among 186 MRSA strains isolated from clinical specimens. Minimal inhibitory concentration (MIC) of vancomycin was determined by agar dilution method in Muller Hinton agar. **Results:** The MIC for 169 of 186 isolates (90.86%) for vancomycin was ≤ 2 mg/l indicating VSSA. 11(5.91%) isolates showed an MIC range between 4-8 mg/l, indicating VISA. Out of 11 VISA isolates the MIC for 6 (0.32%) isolates was in the range of >16 mg/l indicating that VRSA. **Conclusion:** The present study reveals the emergence of VRSA in tertiary care hospitals. Continuous efforts should be made to prevent the spread and emergence of glycopeptides resistance by early detection of the resistant strains and using proper infection control measures in hospital settings.

Keywords: *Staphylococcus aureus*, MRSA, MIC, VRSA, VISA,

INTRODUCTION

Staphylococcus aureus is considered as a major pathogen causing a diversity of infections including bacteremia, pneumonia, skin and soft tissue including osteoarticular infections. Since 1961, Methicillin Resistant *Staphylococci aureus* (MRSA) emerged

has one of the major and common cause of hospital acquired infection.^{1,2} The emergence of *Methicillin-resistant S. aureus* (MRSA) has posed a serious therapeutic challenge.³ The first case of MRSA was reported in 1961, these MRSA isolates are usually resistant to multiple classes of antimicrobial agents including macrolides, lincosamides, tetracyclines, fluoroquinolones and aminoglycosides and it has made the therapy of staphylococcal disease a global challenge. The glycopeptide vancomycin was considered to be the best alternative for the treatment of multi drug resistant MRSA.^{4, 5, 6, 7}

Since the emergence of vancomycin resistance in enterococci in 1988 and its *in vitro* demonstration that its resistance genes (*Van A and Van B*) are transmissible

to other bacterial species including *S.aureus*. In 1997, the first case of vancomycin intermediate *S. aureus* (VISA) was reported in Japan, exhibiting two different resistance mechanisms. Initially vancomycin-intermediate *S. aureus* (VISA). From that time forward, more cases of VISA, and of vancomycin resistant *S. aureus* (VRSA). The resistance was believed to be due to the thickened cell wall, where many vancomycin molecules were trapped within the cell wall. The trapped molecules clog the peptidoglycan meshwork and finally form a physical barrier towards further incoming vancomycin molecules. The second, noted in United States in 2002 among *S. aureus*, was identical to the mechanism seen in vancomycin-resistant *Enterococcus*. Vancomycin-resistant *Enterococcus faecium* harbours the vanA operon, which contains five genes, *VanS*, -R, -H, -A and -X. But Tiwari and Sen have reported a VRSA which is van gene-negative. Subsequent isolation of VISA and VRSA isolates from other countries including Brazil, France, United Kingdom, Germany, India and Belgium has confirmed that the emergence of these strains is a global issue.^{7,8}

The aim of the present study was to determine the Minimum Inhibitory Concentration of vancomycin to *Staphylococcus aureus* strains isolated from different clinical specimens exhibiting reduced zone of inhibition with vancomycin(30 µg) by disc diffusion test and to determine the antibiogram of these isolates to different antimicrobial agents.

MATERIALS AND METHOD

Staphylococcus aureus isolates: A total of 186 consecutive isolates of *S.aureus* were obtained from clinical specimens (pus, urine, sputum, throat swabs, blood, C.S.F, catheter tip, and body fluids) were collected between January 2014 to April 2017 in the Department of Microbiology, Sri Lakshminarayana Institute of Medical Sciences, Pondicherry, were included in the study. All the isolates were identified as *S. aureus* by culture and biochemical tests which included test for clumping factor, slide and tube coagulase test and mannitol fermentation.

Antibiotic susceptibility testing: Antibiogram was determined by the Kirby–Bauer disc diffusion method using different antimicrobial agents e.g., Penicillin (10 units), Ampicillin (10µg), Amikacin (30µg), Cefotaxime (30µg), Cefoxitin (30µg), Clindamycin

(2µg), Ciprofloxacin (10µg), Erythromycin (15µg), Gentamicin (50µg), Linezolid (30 µg), Oxacillin (1µg), Vancomycin (30µg), (Hi-media).

S.aureus isolates showing reduced zone of inhibition to vancomycin (30µg) were subjected to MIC determination by agar dilution test. The diameter of zone of inhibition was compared with CLSI zone size interpretative chart. ATCC 29213 was used as reference strains for VSRA. The test strain was considered as sensitive if zone size was ≥ 15 mm and was considered as resistant if zone size was <15 mm.

Determination of MIC: Minimal inhibitory concentration (MIC) of vancomycin was determined by agar dilution method in Muller Hinton agar according to the guidelines of CLSI (9). Vancomycin gradient plates were prepared in Mueller-Hinton agar (Hi-media) concentration ranging from (0.5-256 mg/l). Compare 18-24 h old culture with 0.5 McFarland standard. Spot 0.01 ml of inoculum using a calibrated loop on to gradient plates. Plates were incubated at 37°C for 48 h. before assessing the visible growth, *S. aureus* ATCC 25923 was used as control. Before reading and interpreting the results, growth control and results with quality controls mains were checked. The lowest concentration that inhibited visible growth is the minimum inhibitory concentration (MIC) of vancomycin.

CLSI MIC interpretative criteria for vancomycin in *S.aureus* is, Vancomycin susceptible *S.aureus* (VSSA): $\leq 2\mu\text{g/mL}$, Vancomycin intermediate *S.aureus* (VISA) : 4-8µg/mL Vancomycin resistant *S.aureus* (VRSA) : $\geq 16\mu\text{g/mL}$.^{9,10}

RESULTS

Out of 186 clinical isolates, 127 (68.2%) patients were from male and 59 (31.7%) were female patients. The male to female ratio in the present study was 2:1. Majority of the patients were of age 51-60 years.

Out of the total 186 samples 329 samples were pus, 216 samples were urine, 26 blood samples, 23 sputum samples, 65 catheter tip samples, body fluids 59 sample, 7 from throat swabs, CSF sample 9, as shown in (**Table: 1**).

Table- 1: Characteristics of specimens

Characteristics	No.	Percentage
I. Age(yrs):		
1 -10	78	9.0%
11-20	87	10.0%
21-30	64	7.4%
31-40	89	10.3%
41-50	116	13.4%
51-60	157	18.3%
61-70	139	16.1%
71-80	131	15.1%
81-90	1	0.11%
II. Distribution of samples		
Pus	52	27.9%
Urine	64	34.4%
Sputum	23	12.3%
Blood	3	1.6%
Body fluids	22	11.8%
Catheter tips	16	8.6%
Throat swab	6	3.2%

The Minimum inhibitory concentration for 169 of 186 isolates (90.86%) for vancomycin was ≤ 2 mg/l indicating that all were sensitive to vancomycin (VSSA). 11(5.91%) isolates showed an MIC range between 4-8 mg/l, indicating vancomycin intermediate resistance (VISA). Out of 11 VISA isolates 7 were from urine, and 3 from pus and 1 from blood sample. For the remaining 6 (0.32%) isolates, the MIC was in the range of >16 mg/l indicating that these six isolates were vancomycin resistant (VRSA) (**Table: 2**). VRSA strains was isolated from urine, pus and blood samples. All these 6 isolates were sensitive to Linezolid, Imipenem and Clindamycin in common.

Table- 2: Distribution of MIC of Vancomycin of VRSA and VSSA among MRSA Isolates Detected By Disc Diffusion Method.

MIC (μ g/ml) of Vancomycin						
	<2mg/l	4 mg/l	8mg/l	16mg/l	32mg/l	Total
VSSA	169 (90.86%)	-	-	-	-	169 (90.86%)
VISA	-	7(3.76%)	4(2.15%)	0	0	11(5.91%)
VRSA	-	-	-	4(2.15%)	2(1.07%)	6(0.32%)

Antibiotic Susceptibility Pattern: Antibiogram of S.aureus showed highest resistance to Ampicillin 92%, followed by, VRSA isolates were susceptible to Tetracyclin, Erythromycin, Gentamicin, Cotrimoxazole and Linezolid. All the six Vancomycin Resistant

Staphylococcus aureus were sensitive to Linezolid and Imipenem in common.

DISCUSSION

Infections caused by methicillin-resistant *S. aureus*

have been associated with high morbidity and mortality rates. Vancomycin is the main antimicrobial agent available to treat serious infections with MRSA but unfortunately, decrease in vancomycin susceptibility of *S. aureus* and isolation of vancomycin-intermediate and resistant *S. aureus* have recently been reported from many countries. Different methods available to determine the vancomycin MIC to *S. aureus* vary in their sensitivity and specificity. Broth microdilution (BMD) recommended by the CLSI is considered to be the gold standard. Agar dilution method is also recommended.^{5,12}

Among the 186 isolates 127 (68.2%) were from male patients and 59 (31.7%) were female patients. Male to female ratio was 2:1. The high frequency of infections among males could be due to their outdoor occupation, more prone for injuries, smoking and due to exposure to contaminated environment. A similar findings has been reported by T.N.Ravi et al., who has reported a male to female ratio of 2:1.¹³

Majority of cases are between 51-60 years, this may be because of waning immunity. The MIC value of 186 isolates varied from 0.5-32 µg/mL. 169 strains had MIC between 0.5-2 µg/mL (VSSA), 11 strains had MIC between 4-8 µg/mL (VISA) and 6 strains had MIC of 32 µg/mL (VRSA).

In our study 169 (90.86%) out of 186 showed susceptibility at < 2mg/l, by agar dilution, indicating sensitive to vancomycin. A study by Jyothi Kumari et al from manipal reported almost similar findings 94/98 (95.9%) were vancomycin susceptible (MIC ≤2 µg/ml) by agar dilution method.¹²

We reported 11 VISA and 6 VRSA in our study, similarly A study by Venubabu Thati et al from south India studied 358 isolates showing reduced zone of inhibition. They reported and seven isolates as VRSA vancomycin MIC in the range of 16-64 mg/L.⁸

CONCLUSION

The present study reveals the emergence of VRSA in tertiary care hospitals. Continuous efforts should be made to prevent the spread and emergence of glycopeptides resistance by early detection of the resistant strains and using proper infection control measures in hospital settings. Hospital infection control committee should be formed in every tertiary health care centres for immediate response from the concerned

authorities to check further emergence and spreading of these notorious VRSA strains.

Effect of Intravenous Dexmedetomidine on Spinal Anaesthesia with Hyperbaric Bupivacaine in Lower Limb Orthopedic Surgeries - A Randomized Controlled Study

Adithya Jayaprakash¹, Shaik Gulam Osmani², Anupama Suresh Y³, Suresh Y.V⁴

¹Registrar Dept. of Anesthesiology, Columbia Asia Hospital, Bangalore, ²Assistant Professor Dept. of Anesthesiology, ³Associate Professor Dept. of Obstetrics & Gynecology, ⁴Professor Dept. of Anesthesiology, Kasturba Medical College, Mangalore

ABSTRACT

Introduction: Alpha -2 adrenoceptor agonists such as Clonidine, dexmedetomidine both have analgesic and sedative properties when used intravenous. Unsatisfactory regional anesthesia necessitates supplementary intravenous analgesia and deep sedation to relieve anxiety

AIM: To observe the effect of intravenous dexmedetomidine in spinal anaesthesia with respect to sensory block, motor block, depth of sedation and the time to first analgesic requirement in lower limb orthopedic surgeries.

Materials and Method: 60 consenting patients undergoing lower limb orthopaedic surgeries were selected. Dexmedetomidine group (D) received a loading dose of 0.5 mcg/kg dexmedetomidine over 10 mins before spinal anaesthesia followed by an infusion of 0.5 mcg /kg/hr till the end of surgery. Control group 'C' received similar volume of normal saline infusion. The parameters observed were the highest sensory level achieved, time to two segment regression, duration of motor block and time to first requirement of analgesia. Ramsay score was used to assess sedation and hemodynamic parameters noted.

Results: The maximum sensory level achieved was higher in group 'D' than in group 'C'. The time to two segment regression, The duration of motor block and The time to first requirement of analgesia was prolonged in dexmedetomidine then in control group. Also the sedation score were higher in group 'D'.

Conclusion: I.V. Dexmedetomidine as an adjuvant in spinal anaesthesia prolongs the duration of both sensory and motor blockade and also delays the time to rescue analgesia, thus eliminating the need to use multiple drugs for sedation and analgesia.

Keywords: α -2 Adenoreceptor, Dexmedetomidine, Spinal anaesthesia, Ramsay sedation score, analgesia.

INTRODUCTION

Spinal anesthesia has the advantage of avoiding the difficulties in airway management and also is superior to general anesthesia in post anesthesia pain relief. But failures in regional anesthesia is attributable more to inadequate sedation and relief of anxiety than technical

faults. Adequate sedation will not only relieve the anxiety of the patient but also improves physiological and psychological stress and the satisfaction of both the surgeon and patient.^[1]

Several additives such as opioids, alpha agonists among others have been used with local anaesthetics to prolong the duration of spinal anaesthesia. Alpha -2 adrenoceptor agonists such as clonidine have been studied as adjuvants to spinal anaesthesia with promising results. They have both analgesic and sedative properties when used as an adjuvant to regional anaesthesia.^[2-4]

Dexmedetomidine is a more selective alpha-2 adrenoceptor agonist with sedative and analgesic properties. The analgesic action of dexmedetomidine has been found to be exerted both at spinal and supraspinal levels.⁵ It has been found to reduce the anaesthetic requirements and have opioid sparing properties upto 90% when used as an adjunct to general anesthesia [6-8]. Dexmedetomidine when used intravenously as an adjuvant to spinal anesthesia with prilocaine or ropivacaine has also been reported to prolong the duration of sensory and motor blockade.^[9-10]

The primary aim of our study was to assess the duration of spinal anesthesia (sensory and motor blockade). In this study we are hypothesizing that intravenous dexmedetomidine as an adjuvant to spinal anesthesia could provide prolonged post-operative pain relief.

MATERIALS AND METHOD

A randomized double blinded control study was conducted in 60 consenting patients undergoing lower limb orthopedic surgeries. After approval of institutional ethics committee 60 patients were randomly allocated to study or control group using computer-generated random list. Patients of ASA physical status I and II, aged between 18 and 75 years were included in the study. Patients with hypersensitivity to local anesthetics, coagulation disorders, significant co-existing cardiovascular or hepatorenal diseases, pre-existing neurological diseases and local infection at the puncture site were excluded from the study.

A written and informed consent was taken from all patients. A detailed history and thorough physical examination was done in all consenting patients. The patients were explained about the methods for assessing the sensory and motor blockade. Inside the operating room, intravenous line was secured with appropriate gauge cannula and ringer's lactate infusion started prior to the commencement of the procedure at the rate of 10ml/kg body weight. Standard monitors were connected namely electrocardiography, pulse oximeter and non – invasive blood pressure and baseline vitals were noted.

The study group 'D' received a loading dose of intravenous dexmedetomidine of 0.5 mcg/kg diluted to 20ml in normal saline over 10 minutes. The control group 'C' received same volume of normal saline. Immediately

after the loading dose the patient was positioned in either lateral or sitting position. Subarachnoid block was performed at L3- L4 level. After skin infiltration with 2% lignocaine, 14mg (2.8 ml) of 0.5% heavy bupivacaine was injected intrathecally through 25 gauge spinal needle. Then the patient was positioned supine on the operating table. After subarachnoid block the patients in group 'D' received dexmedetomidine infusion at 0.5 mcg/kg/hour till the end of surgery. The patients in group 'C' received normal saline infusion at the same rate till the end of surgery.

The anesthesiologist marking the sensory level was blinded to drug given intravenously. Pulse rate, blood pressure and oxygen saturation was recorded every 2 minutes for first 10 minutes and every 5 minutes for next 30 minutes and every 10 minutes for next 40 minutes and at end of procedure. Hypotension (defined as systolic blood pressure <90 mm Hg or 20 % fall in blood pressure from baseline or mean arterial pressure lower than 60 mm hg) was treated with additional ringer lactate and bolus dose of intravenous mephentermine 6mg. Bradycardia defined as heart rate less than 50 per minute was treated as per ACLS algorithm. Nausea or vomiting was treated with antiemetics intravenous ondansetron 4 mg and hypoxia defined as decrease in SpO₂ to 90% was treated with supplemental oxygen by mask.

Assessment of sensory blockade was by loss of temperature sensation to cold using a cotton swab soaked in spirit. Sensory level was checked every 2 minutes and the level noted at 20 minutes after the block. Highest level of sensory blockade after the drug given, time for two dermatome regression (duration) was noted. Assessment of motor blockade tested by Bromage scale and degree of motor blockade and duration of motor blockade were noted.

Motor block in the lower limb was assessed by using a modified Bromage scale.^[11] Assessment of sedation was done using Ramsay sedation score^[12]

Score was evaluated every 10 minutes for 30 minutes after the drug is given and every 15 minutes for next 30 minutes and at the end of procedure. Excessive sedation was defined as a score greater than 4/6. All the above tests were performed while monitoring and recording hemodynamic status of the patient.

Pain score was done using visual analogue scale in postoperative period. Patients were educated pre-

operatively on the usage of Visual Analogue Scale (VAS) and reminded in the postoperative period to alert the investigator when the VAS is greater than 3. First dose of analgesia was given when VAS score was greater than 3. The choice of the drug was deemed appropriate by the treating consultant. Time required for the first dose was noted. The time required was calculated from the time of administration of subarachnoid block to the first complaint of pain.

Statistical analysis; analysis was performed using SPSS 17 software. Student’s unpaired T-test was used for analysis of mean age, height and weight distribution, duration of surgery, duration of motor blockade, time to 2 segment regression, rescue analgesic time, Ramsay sedation score. Fisher’s exact test was used for gender, level after 20 minutes, highest sensory level. P value <0.05 was considered statistically significant.

OBSERVATIONS AND RESULTS

All the demographic data were comparable in both the groups [Table 1]. Using fisher’s exact test as the statistical comparison between the two groups it was found p value=0 .0001. It signifies level after 20 minutes of spinal block in the study group to be highly significant with 43.3% of the patients achieving T8 level. Whereas in control group 46.7% of the patients achieved only

T9 level [Table 2]. Highest Sensory level achieved was very highly significant in study group compared to that of control group based on statistical analysis (p value< 0.001). 43.3% of the patients in the study group achieved T6 level and 40% of the patients achieved T7 level whereas in the control group 70% of the patients achieved T9 level.

Mean duration of motor blockade was significantly higher in study group 191.8 mins than in control group where the mean duration was 160.73 mins. [Table 3]. Applying student unpaired t test, p value was found to be <0.0001 implying time to two segment regression was very highly significant in study group. The mean time was 157.9 mins in the study group compared to 111.0 mins in the control group. [Table 3]. Ramsay sedation score intraoperatively was 4.033 mean in the study group significantly higher than the control group where the mean was 2.033, [Table 3]. Mean time for analgesic dose was found to be higher in study group and p value < .0001 implying time for first requirement of analgesia was significantly prolonged in study group. Three patients in study group were found to have bradycardia. Using fisher’s extract test it was found that p value=.119 implying statistically not significant. [Table 4]. Five patients in study group had hypotension which was significant with p value of 0.026 using fisher’s extract test. [Table 4]

DISCUSSION

Dexmedetomidine has been used as an intravenous adjunct to spinal anesthesia in this study to observe the effect on the characteristics of spinal anesthesia.

All the patients in this study were comparable with respect to demographic profiles. The sensory level after 20 minutes of spinal block and the maximum sensory level achieved in the study group was found to be higher and statistically significant. Similar results were observed by Kaya *et al*¹³ where the highest sensory level achieved was more in dexmedetomidine group. Harsoor *et al*¹⁴ found that dexmedetomidine hastens the onset of sensory blockade but no statistically significant difference in the maximum sensory level achieved. The dose of bupivacaine used in our study was higher (14mg) compared to 12.5mg of bupivacaine used by Harsoor *et al*¹⁴. Dexmedetomidine's actions at alpha-2 receptors in the spinal cord by inhibiting nociceptive impulse transmission both pre-synaptically and post synaptically might probably be the reason for the higher sensory level achieved in our study.

Single loading dose of dexmedetomidine at 1 mcg/kg as an adjunct to spinal anesthesia has been found to prolong the time for two segment regression by Hong JY *et al*.¹⁵ Tekin *et al*⁹ found the two segment regression time to be significantly prolonged in the dexmedetomidine group (loading dose of 1mcg/kg followed by infusion at 0.4mcg/kg/hr). Our study also corroborates the findings of previous studies in that the mean time for two segment regression was 157.9mins as compared to 111.5mins of control group.

Kaya *et al*¹³ used a single loading dose of 1mcg/kg of dexmedetomidine and did not find any significant increase in motor blockade in their study. Similarly Lugo *et al*¹⁶ did not report any effect on motor blockade though they had used dexmedetomidine bolus 1mcg/kg followed by infusion at 0.5mcg/kg/hr. The mean duration of motor blockade in our study group (191.8mins) was significantly higher than control group and these findings correlate Well with those of Harsoor *et al*¹⁴ and Al Mustafa *et al*¹⁷. The prolongation of motor blockade observed in our study might be attributed to the continuous infusion of dexmedetomidine throughout the duration of surgery.

In our study, the sedation scores were significantly higher in the study group (mean 4.03) compared to control group (mean 2.03). But there was no respiratory depression observed in any patient in our study. Tekin et al⁹ have observed that deeper sedation was induced in study group than control group, indicating that dexmedetomidine may reduce the need for extra sedative agents. The sedative and hypnotic effects of dexmedetomidine may be due to its inhibition of norepinephrine release in locus ceruleus.

The mean time for rescue analgesia in our study in dexmedetomidine group was 241.0 mins whereas in control group the mean was 129.4 mins. This shows dexmedetomidine also provides sufficient analgesia in postoperative patients, similar results also seen by Kaya et al¹³ concluded that the addition of intravenous dexmedetomidine before spinal block provided similar pain relief with delayed-onset of postoperative pain and significantly less analgesic requirements. This may be attributed to the fact that the stimulation of the alpha2-adrenoceptors at Locus Ceruleus, which is the site of origin for the descending medullospinal noradrenergic pathway, known to be an important modulator of nociceptive neurotransmission, terminates the propagation of pain signals leading to analgesia¹⁸.

Postsynaptic activation of alpha-2 adrenoceptors in the CNS results in decrease in sympathetic activity leading to hypotension and bradycardia¹⁸. In our study 5 patients in the study group had hypotension accounting to 16.7% incidence. This was found to be statistically significant with p value 0.026. Whereas only 3 patients in the study group had bradycardia with incidence of 10% and this was not statistically significant (p value 0.119). Elcicek et al¹⁰ found the incidence of bradycardia in study group to be 30% and the mean arterial pressures were significantly lower in group I (study) than group II. Kaya et al¹³ observed no biphasic change or significant cardiovascular variability in their study.

CONCLUSION

Dexmedetomidine when used as an intravenous 0.5mcg/kg loading dose followed by 0.5mcg/kg/hr. intravenous infusion in spinal anesthesia prolongs the duration of both sensory and motor block, provides sufficient sedation and also delays the time to rescue analgesia thus eliminates the need to use multiple drugs for sedation and analgesia

ABSTRACT

Objective: This study was performed to evaluate the effect of menopause on saliva and oral health. Salivary flow rate and pH of stimulated whole saliva, oral sign of dryness were determined in regularly menstruating and postmenopausal women who are not on hormone replacement treatment.

Study design : A cross-sectional study design was undertaken with a sample size of 60 subjects from whom Paraffin stimulated whole salivary samples were collected to record salivary flow rate and pH. sixty subjects are divided equally into two groups:-GROUP A The control group included 30 regularly menstruating healthy women (premenopausal women) (age range: 25-40 years).GROUP B The study group included 30 post menopausal women (age range: 45-52years).Immediately after collection, pH was determined by dipping pH test paper directly into the sample of oral fluid. Oral sign of dryness was recorded respectively.

Statistical Analysis and Results: Salivary flow rate and pH values of the postmenopausal women were significantly lower than those of the control group ($p=0.0001$). Clinical Sign of oral dryness is significantly higher among the post menopausal women than that of the control group ($p\leq 0.0001$). In our study we found salivary flow rate significantly lower in the post-menopausal women in comparison with the menstruating women and it was also observed that the salivary pH of the post-menopausal group was significantly lower than that of the control group

Conclusion: Saliva being an easy diagnostic tool would serve as a diagnostic tool of hypo-salivation which is the most commonest oral changes during menopause.

Keywords: menopause, saliva, flow rate, dryness, hypo salivation.

INTRODUCTION

DEFINITION: Natural menopause is defined as a spontaneous cessation of natural menstruation for 12 consecutive months at 45-55 years of age (mean 50-52) ¹. Formally, menopause is the moment of the final menstruation, directly preceded by the permanent cessation of ovarian follicular function ^{2,3}. The average age of a woman at menopause is 51 years ⁴.

Menopause results from reduced secretion of the ovarian estrogen, which takes place when ovarian follicles are depleted through genetically controlled apoptosis of the ovarian cells. During the menopausal transition the level of inhibin B originating from the follicles decreases and the levels of pituitary follicle-stimulating hormone (FSH) and luteinizing hormone (LH) increase. Nevertheless, hypoestrogenism is the ultimate outcome of menopause. With increasing age, the levels of FSH and LH continue to rise for several

years, but in later menopause these levels decrease ⁵.

WHO has defined three age stages of midlife age for women (Research on the menopause. WHO 1997)⁶: “1) Menopause is the year of the final physiologic menstrual period retrospectively designated as 1 year without flow (unrelated to pregnancy or therapy) in women aged ≥ 45 years.

2) Premenopause begins at ages 35 to 39 years; during this stage, decreased fertility and fecundity appear as the first manifestations of ovarian follicle depletion and dysfunction, despite the absence of menstrual changes.

3) Perimenopause includes the period of years immediately before the menopause and the first year after the menopause.”

The term postmenopause is defined as the prolonged period of hypergonadotrophic hypogonadism after menopause. Postmenopause is further divided into two different stages: early postmenopause, when estrogen is swiftly declining, and late postmenopause, when prolonged hypoestrogenism exists ⁷.

The principal peri- and postmenopausal oral symptoms are dry mouth, sensation of painful mouth (PM) due to various causes and less frequently burning mouth syndrome (BMS). Other symptoms which are commonly linked to the climacteric stage are mood swings, urogenital dryness, tiredness, joint and muscle pains, dizziness, irritability and insomnia^{8,9}.

The sensation of Dry Mouth or xerostomia is defined as a subjective sensation of dryness in the mouth ¹⁰. Xerostomia is a major complaint for many elderly individuals and Women seem to suffer from xerostomia or hyposalivation more often than men¹¹. However, there is no convincing evidence that age alone is a significant cause of xerostomia. The prevalence of xerostomia is difficult to determine. According to a review article by ¹², the prevalence of self-reported sensations of DM (dry mouth) vary between 0.9% and 64.8%. Xerostomia has various causes, and this symptom is often associated with an unpleasant feeling and other symptoms in the mouth and throat ¹³. Hence this study was performed to evaluate the effects of menopause on salivary flow rate and dryness.

DESIGN :

The protocol was approved by the ethics committee of University and all participants gave informed consent before participation in the study.

A cross-sectional study design was undertaken with a sample size of 60 subjects from whom stimulated whole salivary samples were collected to record salivary flow rate. Salivary pH were measured electrometrically. Oral sign of dryness was recorded respectively. Sixty subjects are divided equally into two groups:-

GROUP A The control group included 30 regularly menstruating healthy women (premenopausal women) (age range: 25-40 years).

GROUP B The study group included 30 post menopausal women (age range: 45-55 years).

CRITERIA:

Women with normal chewing ability and who are not under hormonal replacement therapy are included. In study Women without the history of early menopause are included in specific. Patient under systemic medication, who is already under treatment of xerostomia and other mucosal diseases and women consuming any forms of tobacco and any other history of adverse habits are excluded from the study. This study aimed to determine the evidence of salivary dryness among premenopausal and post-menopausal women with the estimation of salivary flow rate and PH with the complaints of oral dryness.

SALIVA COLLECTION

Paraffin Stimulated whole-salivary samples were collected in a quiet room between 9 AM and 12 PM, and at least 2 hours after the last intake of food or drink. Salivary samples of the control group were collected within the first three days of menstruation Stimulated salivary samples were obtained by allowing the Participants to chew a piece of paraffin of standardized size. The flow rate was measured as ml/min. Stimulated whole-saliva samples were collected into a preweighed and dry plastic tube. By subtracting the empty tube weight from the saliva-filled one, saliva sample weight was determined to calculate the salivary flow rate. The flow rate was calculated in grams per minute, which is almost equivalent to milliliters per minute¹⁴. Stimulated saliva flow rates in healthy individuals have found the

average value for whole saliva to be about 1.0 - 3.0 ml/min. Stimulated whole saliva flow rates of < 0.7 ml/min is indicated as salivary hypo function .

ASSESSMENT OF THE PH

After assessing the consistency the pH of the saliva was determined by dipping the pH test strip provided in the kit in to the sample of resting saliva collected for

10 seconds and then the color of the strip was checked with the testing chart provided with the saliva check kit. Accordingly the pH of the saliva was determined and given highly acidic, moderately acidic or healthy saliva comparing with the chart and the color of test strip, if intermediate color was seen in the strip then a higher value was assigned

Table 1. The xerostomia inventory (XI)¹⁵

I sip liquids to help swallow food.
My mouth feels dry when eating a meal.
I get up at night to drink.
My mouth feels dry.
I have difficulty in eating dry foods.
I suck sweets or cough lozenges to relieve dry mouth.
I have difficulty swallowing certain foods.
The skin of my face feels dry.
My eyes feel dry.
My lips feel dry. The inside of my nose feels dry.

Response options: never (scoring 1), hardly (2), occasionally

TABLE II: Comparison of Salivary flow between two groups

SALIVARY FLOW RATE	Group I		Group II	
	NO	%	NO	%
4ml	0	0.0	13	65%
5ml	0	0.0	7	35%
>5ml	20	100.0	0	0.0
Total	20	100.0	20	100%
Inference	Incidence of Salivary flow >5.0 ml significantly associated with Group I while <5 ml is significantly associated with Group II with p<0.001**			

TABLE III: Comparison of Salivary PH between two groups

SALIVARY pH	Group I		Group II	
	NO	%	NO	%
<7.0	4	20%	20	100%
7.0	9	45%	0	0
>7.0	7	35%	0	0
Total	20	100.0	20	100%
Inference	Incidence of Salivary pH <7.0 Is predominant significantly in Group II than group I with p<0.0001**			

From the obtained clinical Questionnaire, the data collected has high statistical significant of ($p \leq 0.0001$) with incidence of salivary hyposalivation among post menopausal women than pre menopausal women. Spearman correlation was performed to see if any relationship existed between severity of OD feeling (XI score) and salivary flow rate. There was significant positive correlation between XI score and saliva flow rate ($r = 0.468, p = 0.039$).

DISCUSSIONS

Different phases of a woman's life: Puberty, menses, pregnancy, and menopause have varied influence on her oral health. During the menopause, women go through biological and endocrine changes, particularly in their sex steroid hormone production, affecting their health. Because the oral mucosa contains estrogen receptors, variations in hormone levels directly affect the oral cavity. A few oral conditions and or diseases are seen more frequently during post menopausal years¹⁶. Estrogen can affect oral mucosa directly or through neural mechanism thus altering the periodontal health in menopausal women¹⁷. The oral problems may include a paucity of saliva leading to xerostomia, burning mouth syndrome, increase in incidence of dental caries, dysesthesia, taste alterations, atrophic gingivitis, periodontitis, and osteoporotic jaws¹⁸.

Saliva acts as a defense mechanism for prevention of caries and reduced salivary flow can encourage oral microbial colonization thus affecting the dental health¹⁹. Salivary glands contain sex hormone receptors and these hormones have been estimated in the saliva²⁰.

In the present study, the salivary flow rate, pH, were evaluated in pre-menopausal, post-menopausal and also comparing the clinical correlation of xerostomia with the flow rate. As saliva is essential for the maintenance of oral health and the number of women receiving HRT is increasing, we excluded the patients under hormonal replacement therapy.

Studies have shown the average age of women attaining menopause being 50 years though it also states that women may attain early menopause in certain conditions where the women are thin in stature and women who smoke attain early menopause than their counter parts, also racial and geographic variations are seen. Hence women who are under smoking habit and also women who revealed history of early menopause are excluded from our present study. In our study we

came across women who had attained menopause in the range of 45-52 years.

Minicucci et al. studied salivary flow rates in menopause and compared them with those of

premenopausal women. Salivary flow was evaluated by a chemical absorption stimulation test. Each subject provided three saliva samples: S1, nonstimulated saliva; S2, saliva initially stimulated with two drops of citric acid 2.5%; and S3, saliva super stimulated with two drops of citric acid 2.5% every 30 s for 2 min. Salivary flow was lower in menopausal group only in S2 and S3. Reduction in salivary flow rate can be responsible for xerostomia.²¹

During the study we also observed that few individuals also had complaints of oral burning sensation, halitosis, and some with complaints of decreased taste acuity which has been also discussed in the study done by studies^(21,23,24).

In our study it was also observed that salivary pH of the postmenopausal group is statistically significantly lower than that of the control group. However, the study done by Yalçın²⁵ disagrees with the findings, which was performed using unstimulated saliva. Studies have demonstrated alterations in various salivary components, such as mucin, IgA, phosphates, alterations in salivary pH and electrical resistance have also been reported²⁵. Our study showed significant reduction of salivary pH among post menopausal women. The changes may result from hormonal alterations taking place in menopausal women, altered sympathetic output related to stress, or from alterations in interactions between the cranial nerves serving taste and pain sensation²⁶.

Women with dry mouth usually are referred to dental personnel. In recent years, dental personnel have made significant contributions to the diagnosis and management of medical disorders. In future years, they will probably be included in the management of various systemic diseases. Because many women visit a dental office more often than a medical office²⁷.

CONCLUSION

It has been observed that life expectancy of women has increased significantly during the last decade, and most women spend one third of their lives after menopause. Our result suggests that there is a marked decrease in the salivary pH and flow rate in postmenopausal women which in turn leads to many

increased oral complaints of which oral dryness is the commonest finding.

ABSTRACT

Application of physiological and biological ethics to clinical practice is called medical science or Biomedicine. This branch includes biochemistry, molecular biology, biological engineering neuro science, immunology, pathology and other life science applied to medicine. In this paper, a review has been done for creating a new path and motivation in this field for the new researchers as an application of fuzzy logic in life science areas. Since medical field has uncertainty in nature this topic will be very useful for the future research.

Keywords : Type-2 Fuzzy, Biological Systems, Biomedicine, Image Processing, Chemical Engineering, Fuzzy Logic Controller

INTRODUCTION

Biological systems are generally too complicated as they are so complex since developing automated systems are not truthful effort always. An explicit model for biological systems may not prevail or may be very difficult to design. Since human minds perform from rough data, condensed relevant information and carrying out crisp solutions, fuzzy logic may be considered as an optimal tool¹. Logic and mechanism of Fuzzy logic approach does not have unperturbed boundaries such as human logic and it is not like sure or binary logic. Fuzzy logic control system is one of the most common application with this concept. This system do not demand complete knowledge based model like PID control system. With the knowledge of medical experts and their experience with the imprecise data Fuzzy systems can be designed^{2,3}.

This model has been used for an automatic control of drug delivery in surgical environment. There is a difficulty of identifying abdominal organs in anticipating the structure of the organ in clinical training, teaching, diagnosis and retrieval of medical image. Fuzzy logic inference system can conquer these problems with the

use of automatic identification from a set of slices of CT image. A precise central segmentation may be useful in analyzing microscope images for detecting pathology. This can be done with the use of semi-supervised training fuzzy logic engine^{4, 5, 6}.

Adaptive nonlinear predictive control can be used to control glucose concentration during fasting subject to type-1 diabetes. Where the controller employs a section model which represents the gluco supervisory system and cover sub models to represent digestion of vaccines and medication regulated short-coming insulin Lispro and interior absorption with the use of Bayesian parameter calculation for determining time varying parameter changes⁷.

Diagnosis of disease associates various levels of imprecision and uncertainty which is essential to medicine. In general precise description of disease individuals uses linguistic terms which is also imprecise and vague and hence fuzzy logic can be used for an optimal result. Segmentation of medical image is a complicated and challenging task due to inherent nature of images. For example brain has a specific complex structure and its exact segmentation is very crucial for identifying edema, tumors and dangerous tissues for applying proper therapy. For the early detection of unusual changes in organs and tissues can be diagnosed by the diagnostic image technique called Magnetic

Resonance Imaging (MRI)^{8,9}.

Control algorithm combines the expert's knowledge about the treatment of any disease can be treated by using Mamdani-Type fuzzy logic controllers to control the blood glucose level. Fuzzy logic is used to handle uncertainties using natural language and hence it is an approach of qualitative computation. Since impreciseness exists in the field of medicine and huge data in bioinformatics, fuzzy logic is recommended to handle the situation for getting a desired solution. Bioinformatics is also a knowledge based computer analysis of biological data and contains the details stored in the genetic code and empirical results from different sources. Here also impreciseness will occur and hence fuzzy logic will be very useful^{10, 11}.

MR images have a good comparison resolution for various tissues and have an advantage of automatic tomography for brain studies. Thus majority of research concerns about MR images. Threshold determination is very difficult for brain images as the allocation of tissue intensities are complex and hence logic is used for brain segmentation^{9-15, 23-30}.

Even in chemical engineering fuzzy logic plays a vital role to handle the system uncertainties while the process of changing chemicals into valuable forms. In all the above cases the role of fuzzy logic has been explained. While getting more uncertainties in those mentioned cases, type-1 fuzzy cannot give the appropriate result as the consequences may have uncertainties^{16-22, 31-33}. At this junction, Type-2 fuzzy logic can be used for its adaptivity and stability. In the following chapters, literature study and the role fuzzy in different field have been reviewed.

Fundamental Concepts

Role of Fuzzy Logic

In Medicine¹

The difficulty of medical process makes conventional quantitative methods of analysis incorrect. Incomplete information, impreciseness and conflict nature are natural. In the field of medicine impreciseness can be classified by the following sources.

- Patient information
- Patient's medical history which is usually highly subjective and uncertain

- Uncertainty of the physical examination where the boundary between normal and pathological condition is uncertain
- Mistakes in the laboratory results due to patient's lack of support.
- Incomplete information given by the patient like understated/exaggerated

Fuzzy logic can be applied in the following experiments:

- To analyze the reaction to the treatment for alcohol dependence
- To evaluate diabetic neuropathy and early symptoms
- To measure the volume of the brain tissue
- To enhance decision making in radiation therapy
- To stabilize hypertension during unconscious stage due to anesthesia
- To diagnose breast cancer
- To estimate significant estimates of usage of drug
- Also fuzzy logic plays an essential role in clinical support systems.

In Bioinformatics¹¹

Bioinformatics is an automatic analysis of biological data which includes the information saved in genetic code and results of the experiment from different sources, scientific literature and patient statistics. This branch incorporates computer science, principles of chemical and physical thing, biology, methodologies of modelling huge sets of biological data, cloning, training approach of bio-automatic systems etc. Molecular biology is presently employs project of uncertain data collection. DNA microarrays are the high methodologies with rapidly huge amount of data and it is difficult to apply traditional approaches whereas fuzzy logic deals this problem very easily as it handle multiple membership functions.

In Chemical Engineering²²

This branch handles with the physical science and life science application such as biochemistry, biology

and micro biology. Naturally uncertainty occurs in the mentioned areas and obviously fuzzy logic can handle the impreciseness and can produce the desired result.

In Image processing³³

In Image segmentation, Edge detection, feature extraction fuzzy logic plays a vital role whereas Type-2 fuzzy sets can deal with more uncertainties as there is a chance of having the inference may be uncertain.

Review on application of Fuzzy Logic in Bio Medicine

The authors, analyzed the usage of fuzzy logic control and auditing in medical sciences with the possible future diffusion¹. Presented about fuzzy pharmacology with theoretical and applications aspect². Proposed a combined method for automatic diagnosing abdominal organs from a sequence of CT image portions³. Used Bayesian parameter calculation to decide model parameters where there is a fluctuation in time⁴.

Proposed a novel methodology for filtering framework called two-component adaptive vector filters which enables processing cDNA micro array images⁵. Have done a segmentation on cell nuclei using fuzzy logic engine with fuzzy rules under semi supervised training⁶. Used fuzzy c-means clustering for image segmentation as MR images always have noise due to performance of the operator, environment and equipment and analyzed the robustness of the proposed method⁷. Classified multi class cancer using fuzzy support vector machine and binary decision tree with the choice of gene⁸.

Extracted generic feature using fuzzy c-means clustering⁹. Presented a general view of the applications of fuzzy logic in medicine and bioinformatics and presented geometrical perception of fuzzy sets in a fuzzy hypercube¹⁰. Presented a control algorithm subject to type-1 diabetes mellitus and this algorithm connect the expert's knowledge of the treatment for the disease¹¹. Presented classification system using technique of pattern recognition with ARTMAP classifiers to produce a numerical vector representation of a sequence of protein and finding the nature of the sequence into number of given families. And they proved that the proposed system able to classify the protein sequence with an accuracy of 93%¹².

Applied interval type-2 fuzzy logic system to help radiologists to identify micro categorization in mammograms for Brest cancer¹³. Have done an electron tomographic data sets segmentation using the principles of fuzzy set theory¹⁴. Surveyed about the process of fuzzy expert systems in medical area such as the risk of coronary heart disease, prostate cancer, degree of child anemia, determining the level of anemia with iron deficiency, examination of periodontal dental disease, decision on drug dose etc which will helpful for the physicians¹⁵.

Discussed physical fuzzy confidence curves for the natural unusual activity of falling and used modelling and monitoring human activity¹⁶. Presented a way of diagnosing thyroid cancer disease using fuzzy-neural networks¹⁷. Investigated more details on the application of fuzzy logic in chemical engineering¹⁸. Applied a system of telecardiology to help practitioner doctor when clinical data of patient suspect heart failures¹⁹. Developed a diagnostic alarm for clinical purpose based on fuzzy logic to detect diagnostic events when anesthesia is given²⁰.

Presented cost effective method for feature selection for diabetes diagnosis using genetic algorithms and fuzzy logic²¹. Used fuzzy entropy measure along with similarity classifier for feature selection²². Presented a novel approach by combined data mining and fuzzy logic for heart disease diagnosis²³. Used weighted fuzzy rules to predict the risk level of heart disease as a clinical decision support system²⁴.

Used fuzzy c-means algorithm for image segmentation on MR Brain image²⁵. Presented an automatic method based on fuzzy connectedness for extracting an object by segmenting jaw tissues and process of morphology for various views of pseudo orthopantomographic²⁶. Discussed the importance of fuzzy logic in medical field. Presented the common idea for fuzzy logic publications with the applications in different fields of biology²⁸.

Detected breast cancer using fuzzy c means approach²⁹. Have done a performance analysis of derived rule base multivariate type-2 self-organizing fuzzy logic controller employed to anesthesia³⁰. Presented a work on automatic topic spotting in biomedical literature³¹. Generalized triangular fuzzy numbers are applied in medical decision making³². Interval Type-2 Fuzzy has

been Inference System and adaptive filter on raw tumor MRI edge detection³³.

CONCLUSION

Field of Biomedicine includes all the main areas like biological and life science as well. According to the review it is found that fuzzy logic plays an effective role in all the areas and there is not enough research on application of Type-2 Fuzzy in those areas. Hence it is concluded that this review process will give a motivation for the new researchers to do their research on Type-2 fuzzy in the mentioned areas.

ABSTRACT

Breast cancer is the most life-threatening disease among women. The best way to decrease the mortality is early detection of cancer from digital mammogram. The diagnosis can be successful if the pre-processing and segmentation of the digital mammograms identifies the suspicious area correctly. In this paper, the Butterworth bandpass filter along with fusion of FCM and K-means clustering followed by morphological operations is used for the segmentation of calcification areas from the mammogram images.

Keywords: Breast cancer, diagnosis, digital mammogram, pre-processing, Butterworth bandpass filter, segmentation, fusion, FCM, K-means, Cluster, morphology.

INTRODUCTION

The deadliest diseases that threatens human life in modern days is Cancer. Breast cancer is the leading disease in women which increases the mortality rate^[1]. The early detection of breast cancer is the only solution to decrease mortality rate. The screening of breast cancer is done by digital mammogram which aids early detection. Researchers have developed many Computer Aided Detection and Diagnosis methods for detecting the cancer in digital mammographic images^[2]. In general, the CAD systems consists of the following steps: pre-processing, segmentation, feature extraction, feature selection and classification. The classification process classifies the given mammographic image as cancerous and non-cancerous. The quality and performance of the CAD system depends on the initial steps that includes pre-processing and segmentation.

The pre-processing is done on the raw image in order to remove the unwanted details that are present in

the mammographic image^[3]. There are several types of pre-processing filters available which can be categorized into spatial domain and frequency domain filters.

The pre-processed image is given as input for the segmentation process. Segmentation is the process of dividing the image on the basis of grey levels. Segmentations can be achieved using many techniques like thresholding, region-based, edge detection, and hybrid techniques^[4]. Clustering is a region-based segmentation and unsupervised learning technique. Clusters divides the image into groups wherein the members of the same cluster are similar in some manner and shows difference among the members of other clusters. Clustering is an unsupervised segmentation which groups the image based on the grey level value of the image pixels. This method provides meaningful insight over the grey level distribution in image which helps in classifying different features. The Clustering can be broadly classified as soft clustering and hard clustering. This paper uses the fusion of FCM, a soft clustering method and the K-means, a hard clustering and the output image is subjected to iterative morphological operations like erosion and dilation manually to obtain the segmented feature.

LITERATURE SURVEY

Nayan et. al^[5] have applied mean, adaptive median

Applications, VISTAS, Chennai,

E-mail: poonguzhali.research@gmail.com

ananthi.research@gmail.com

and wiener filtering techniques on the mammographic images and proved using mean square error (MSE) and peak to signal noise ratio (PSNR) that the adaptive median filter is best in reducing noise. Further to segment calcification^[6] Butterworth bandpass filter in Fourier domain with the frequency band between 2.891 mm^{-1} to 0.391 mm^{-1} was used. The Butterworth band pass filter was used as an edge detection technique and they proved to be working well in comparison to other standard edge detection techniques. Jabbari H et.al.^[7] has proposed a hybrid algorithm using wavelet algorithm, genetic algorithm and mathematical morphological operations for segmentation of mammographic images. They compared with the existing optimization ant colony and particle swarm optimization and proved that there proposed algorithm gives a classification accuracy of 91.4% and hence better than the other algorithms.

Four methods, gray level stretching and morphological operations, K-means clustering based on intensity and position, FCM and FCM cluster centre passed to K-means clustering based on FCM cluster was compared^[8]. They compared the area of tumour and have suggested for further work for improving segmentation using supervised classification methods. In another technique^[9] authors have used the centroids obtained from subtractive cluster as initial cluster to K-means algorithm. Before subjecting to K-means algorithm they have increased the quality of image using partial contrast stretching. The output of K-means is fed to median filter for removing the unwanted region and for achieving better segmentation. RSME and PSNR were used to compare classical K-means and there proposed model, and found that there proposed model showed better performance. Also, they have suggested for using the morphological operations for improving the segmentation and also performance.

Nalini Singh et al^[10] has proposed a novel approach for segmentation by combining the K-means clustering and FCM clustering. Theoretically authors^[11] tried using principal component analysis (PCA) for initial clustering. The resulting clustering was next fed to K-means for segmentation. Wiener filter was used to remove the noise and then subjected to pillar algorithm for initial centroids optimization^[12]. After applying wiener filter, it was subjected to color transformation using hybrid color systems CIELAB AND HSL and then it was subjected to data normalization using softmax algorithm followed by segmentation using pillar algorithm. The

pillar algorithm was used to optimize the K-means clustering to increase the precision and decrease time for segmentation. This Pillar-Kmeans was compared with conventional K-means and Gaussian Mixture Model and proved to give better results in terms of precision.

Sadhana Tiwari et. al^[13] has proposed optimized K-means clustering in which they have saved the distance and the cluster label of each pixel which reduces the time complexity by not calculating the distance for the pixels every time. It hence reduces the time complexity of the standard K-means clustering technique. S. M. Aqil Burney et. al.^[14] has discussed the various performance evaluation measures that are used for evaluating the results of the K-means cluster analysis. The Silhouette curve is used as one metric which provides an insight of the tightness and separation within and among clusters. The value above 0.71 proves to do best clusters. The Confusion matrix is the other metrics which provides a 2x2 matrix from the actual (TP and TN) and the predicted (TP and TN). From this matrix the accuracy, precision, sensitivity and specificity are calculated. The Precision to Recall graph is drawn in which the performance is considered high if the classifier falls in top left and poor if it is in bottom right.

In the automatic detection of lesions in breast image segmentation algorithm was proposed in which the image is subjected to adaptive median filter followed by adaptive thresholding using local and global thresholding and then continued by the morphological operations of opening and closing to obtain the segmented image^[15]. This proposed method is compared with the manual ROI done by experts and was proved to give better results using dice coefficient, Jaccard coefficient, Hausdorff distance, accuracy, sensitivity and specificity. FCM and K-means clustering for segmentation of mammographic images in terms of Contrast, Energy, Homogeneity, Correlation were compared and also they bring out the strengths and weaknesses of the FCM and K-means clustering algorithms^[16].

P.D.Yadav et al^[17] has proposed an algorithm wherein the image is filtered using tracking algorithm to remove labels and unwanted area, erosion, dilation and median filter and then it undergoes segmentation using k-means clustering, followed by FCM and watershed algorithm followed by erosion and dilation morphological operations. J. Quintanilla-Dominguez et al^[18] has used morphological operation using Top-Hat

morphological transform and a proposed segmentation using K-means, FCM and possibilistic FCM based on the proposed threshold value and conclude that the segmentation results depend on the appropriate threshold value selection.

Rajeev Kumar et al [19] has used adaptive median filter on the image and an edge preservation technique by adding 0 and 1 to the image pixel. Later the author used their proposed segmentation method by combining k-means followed by the morphological operations. This proposed method is compared with FCM, K-means, EM and K-means with FCM and proved to give better results in terms of TP, TN, FP, FN, Accuracy, Precision, Recall with less execution time.

METHODOLOGY

This paper describes the pre-processing of mammography image along with the segmentation of cancerous tissues. For pre-processing of mammography images various filters were used. If the mammogram is RGB image then it is converted to grey level image before subjecting it to processing. Histogram of the image is plotted to understand how the grey levels are distributed. It is used to understand the grey level of background, structural features and cancerous tissues. To enhance the required features and to suppress the unwanted details, the image is then subjected to Butterworth bandpass filter, a frequency domain filter. This filter was analysed

with other filters and was observed that it yielded superior results [20].

The filtered image was next subjected to region-based segmentation technique. A fusion of Fuzzy C-Means clustering, and K-Means clustering is used to segment the calcified region. First the FCM algorithm is used to iterate maximum 100 times or till convergence occurs to produces 4 clusters. All the iterated images are displayed and best clustered image is selected manually and passed to the next stage of K-means clustering. K-Means clustering algorithm is iterated 10 times to produce 4 clusters. The clustered image which reflects the best segmentation is selected using the K-means energy (iteration at the elbow point is selected) to undergo the morphological operations dilation, erosion, opening and closing and to obtain the resultant segmented image. This image segments the calcified region only and serves as the input to calculate the area and other parameters required.

Fuzzy C-Means algorithm uses both fuzzy logic and fuzzy sets. In FCM, a data object belongs to two or more than one clusters. When a specified number of clusters are given, the FCM clusters groups the data elements based on distance measure from the centers. The data object is grouped to the nearest centers. Now the cluster center is recalculated for each cluster. Then these steps are repeated until the cluster centers remains unchanged. The objective function is given by

$$J_m = \sum_{i=1}^N \sum_{j=1}^c u_{ij}^m \|x_i - c_j\|^2 \quad \text{----- (1)}$$

Where m =any real number > 1 , u_{ij} =degree of membership of x_i in the cluster j , x_i = the i th of d -dimensional measured data, c_j = d -dimension center of the cluster

The equation used for calculating the cluster centre in FCM is given below

$$c_j = \frac{\sum_{i=1}^N u_{ij}^m x_i}{\sum_{i=1}^N u_{ij}^m} \quad \text{----- (2)}$$

The membership function is updated using the following equation

$$u_{ij} = \frac{1}{\sum_{k=1}^c \left(\frac{\|x_i - c_j\|}{\|x_i - c_k\|} \right)^{\frac{2}{m-1}}} \quad \text{----- (3)}$$

The process end when,

$$\max_{ij} |M_{ij}^{(k+1)} - M_{ij}^{(k)}| < \delta \quad \text{----- (4)}$$

Where δ =termination value or constant between 1 & K=no to iteration steps

The k-means objective is to minimize the cluster members and cluster centroids. It first selects the number of clusters k and then it randomly generates clusters to determine the cluster centres. After this process it assigns each data point to the nearest cluster centre and then it recomputes the new cluster centres. These steps are iterated until the minimum variance criterion is achieved. To verify this k-energy minimization graph is plotted in the graph where x-axis represents iterations

and y-axis represents the energy. This energy of the cluster k is calculated using the formula

$$E(k) = \text{Sum (all } X(I) \text{ in cluster } k) \| X(I) - Z(k) \|^2$$

The morphological operations are the operations performed on the image to extract its boundaries. These operations are applied on a binary image only. Dilation and Erosion are two operations which are applied iteratively. Erosion is applied twice followed by Dilation

in our process. The segmented image thus obtained identifies the calcified area correctly.

algorithm. In this paper we have considered 136 images obtained from a scan centre. From these four sample images (Fig.1) are shown below

RESULTS AND DISCUSSIONS

Matlab was used to implement the proposed

Fig 1. Real-time mammographic images (A), (B), (C), (D)

The size of the images taken for this study is 8584 x 4784. These image size couldn't be processed with the normal system. Henceforth the images are resized to 256 x 256 pixels for easy processing.

i. Image A

The Image A is considered and image comparison of raw image and Butterworth bandpass filtered image is brought out in Fig. 2.

Fig 2. (a) Raw mammographic image (b) Butterworth bandpass filtered image

The filtered image is subjected to FCM and the output of the selected clustered image is brought out in Fig.3.

Fig 3. Selected FCM cluster image

The images are manually visualized for selecting the input to k-means algorithm. The selected clustered image is subjected to k-means and using k-means energy as shown in Fig. 4(b) the image obtained at the elbow point is selected for convergence and is shown in Fig. 4(a).

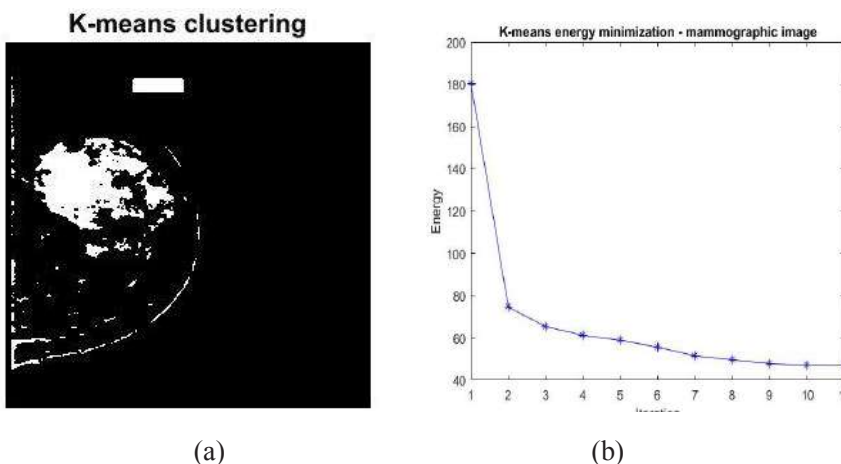

Fig 4. (a)The K-means cluster output, (b) k-means energy graph

The resulting k-means clustered image is cropped to avoid unnecessary spaces and then subjected to iterated erosion and dilation morphological operations and the resultant segmented image is brought out in Fig5.

Fig 5. (a) The cropped k-means cluster image (b)Output image after morphological operations

In similar manner the other three images were processed and their outputs are obtained to calculate the calcified area and is compared with the classical FCM and K-means algorithm. The results are tabulated in

table1 given below. It can be observed that the segmented region in proposed algorithm isolates the calcified region and hence area computed reflects only this region and it is minimum in comparison to others

Table1. Area of segmented image using FCM segmentation, K-means Segmentation, Fusion Segmentation

IMAGE	FCM	KMEANS	FUSION ALGORITHM
A	1.18e+05	1.21e+05	2.42e+04
B	1.22e+05	1.29e+05	3.83e+04
C	1.20e+05	1.25e+05	3.35e+04
D	1.24e+05	1.28e+05	3.56e+04

CONCLUSION

The segmentation and the pre-processing are the important phases in the detection and diagnosis of breast

cancer from the mammographic images. In this paper, a fusion algorithm for segmentation is proposed. The image is initially pre-processed with the Butterworth bandpass filter and is then segmented using the fusion

algorithm based on FCM, K-means clustering and morphological operations. The area of the segmented image is calculated and is compared with the standard FCM, K-means algorithm and is evident that the fusion algorithm followed by morphological operations identifies calcification areas as diagnosed by the medical practitioner.

Conflict of Interest – Nil

Source of Funding – Self

Ethical Clearance – Taken from the Saravana Scans and Labs who provided us the mammographic images required for the study.

Twenty years' (1996-2015) Trends in Deaths Caused by Poisoning in the Transkei sub-region of South Africa

B L Meel

Master's in HIV/AIDS Management (Stellenbosch), Faculty of Health Sciences, Walter Sisulu University, Mthatha, South Africa

ABSTRACT

Background: Poisoning is a serious public health problem worldwide. Acute poisoning in South Africa from traditional medicine is a known cause of death. Members of the Xhosa tribe in the Transkei region frequently consult traditional healers and use herbal medicine, when they fall ill.

Objective: To study the trends in deaths caused by poisoning in the Transkei sub-region of South Africa from 1996 to 2015.

Method: An autopsy record review study at the Forensic Pathology Laboratory at Mthatha for a period of 20 years (1996-2015).

Results: Over a period of 20 years, 24 693 autopsies were conducted. In 1139 (4.61%) of these cases, death was caused by poisoning. Male victims numbered 609 (53.46%). The male-to-female ratio was 1.1:1. More than one third 360 (32.78%) were aged between 21 and 30 years of age.

The average number of poisoning-related deaths was 8.9 per 100 000 of the population per year. The highest rate of death, 16.6 per 100 000, was recorded in 2012.

Conclusion: There has been an increasing trend in death as a result of poisoning in the Transkei sub-region of South Africa.

INTRODUCTION

The global incidence of poisoning is not known. It is speculated that up to half a million people die each year as a result of various kind of poisoning, including natural toxins.¹ Poisoning is a significant global health problem. According to World Health Organization (WHO) data, in 2012 an estimated 193 460 people died worldwide from unintentional poisoning.² Of these deaths, 84% occurred in low-and middle-income countries.² Each year, the WHO estimates that almost a million people die from suicide worldwide, and chemicals account for a significant number of these deaths.² It is estimated that deliberate ingestion of pesticides causes 370 000 deaths each year.² Cases of acute pesticide poisoning account for significant morbidity and mortality worldwide, especially in developing countries.³ Poisoning continues to be an important public health problem in the United States. In 1995, two million human poison exposures were reported to all poison centres.⁴

Data on poisoning-related mortality in Africa is inadequate. In South Africa, a report suggest that acute poisoning is responsible for up to 17% of ward admissions of children.⁵ A selected hospital admissions-based study conducted in South Africa by Malangu et al in 2009 showed that the case fatality rate was 2.4%, mainly due to drug abuse and poisoning by carbon monoxide and agricultural chemicals.⁶ Although mortality from acute poisoning is low, it is often high in patients who are victims of suicide.⁷ A study conducted by the author showed that an increasing number of fatalities due to poisoning occur in the Mthatha area of South Africa, especially in the young age group (26.7%) between 21 and 30 years.⁸

A National Injury Mortality Surveillance System (NIMSS) report showed that poisoning is not among the top 10 causes of death in South Africa.⁹ In the Transkei sub-region, poisoning is the eighth most common cause of unnatural death.¹⁰ The major cause of mortality was

traditional medicines (51.7%).¹¹ The local Xhosa tribe that inhabits this area believes in the use of traditional medicines to cure their illnesses. The medicines are mainly herbal preparations. They are prescribed by sangomas or iZinyangas (local Xhosa word) - traditional healers from the African indigenous groups.¹² Alcohol-related mortality is also very high in this region. Approximately 25% of all hospital admissions in South Africa are directly or indirectly related to alcohol use.¹³ The traditional healing system deals with psychosocial stress associated with HIV/AIDS by using herbal medication as well. Sometimes, herbal medicine causes serious, life-threatening complications. For example, large amounts of herbal decoction taken to stimulate vomiting in the belief that cleansing the bowel would rid the system of disease result in gangrene of the large bowel, leading to death.¹⁴ The purpose of this study is to determine the trends in poisoning deaths, and to relate these with gender and different age groups in the Transkei sub-region of South Africa.

SUBJECTS AND METHOD

The retrospective descriptive study was carried out from the records of the post-mortem register of Mthatha Forensic Pathology Laboratory from 1996 to 2015. The Mthatha Forensic Pathology Laboratory is the only laboratory in this region catering for a population of about half a million in the region of Mthatha. It is attached to the Nelson Mandela Academic Hospital, which is the only teaching hospital in this province. It is associated with the Walter Sisulu University Medical School, and all medico-legal cases in this area of South Africa are dealt with at this facility. In total 24 693 autopsies were conducted between 1996 and 2015 and recorded in the post-mortem register at this laboratory. Between 1996 and 2015 the laboratory dealt with 1 139 victims of poisoning death.

The details of names, addresses, age, gender and date of autopsy, with cause of death, were recorded. Fourteen forensic officers are engaged in collecting corpses round the clock from 17 different police stations in four municipalities in the area. These are OR Tambo, Mhlontlo, Chris Hani and the Mbashe municipal area of about 200 square kilometres (Photograph 1). The OR Tambo municipality is the largest, and covered fully by 10 police stations. Mhlontlo municipality has four police stations, there are two in Chris Hani and Mbashe municipality has one. The combined population was

439 091 in 1996, but this number has been increasing at an average of 3% annually. In 2005 there were five police stations to be taken into account. Therefore, the population in the area of this study has increased. Population statistics were calculated with the help of the South African Statistics Department in Mthatha. However, it is difficult to estimate the total population involved. The data were collected in hard copies designed to reflect post mortem number, year, gender and cause of death. These data were transferred to the Excel computer program and analysed with the help of the SPSS computer program.

RESULTS

Between 1996 and 2015 medico-legal autopsies were performed on 24 693 victims of unnatural death (Table 1). Of these deceased, 1 130 (4.6%) died as a result of poisoning (Table 1). The average death rate as a result of poisoning was 8.9 per 100 000 (Table 2). It was highest (16.6/100 000 population) in 2012 and lowest (1.8/100 000) in 1996 (Table 2 and Figure 1). Among males the average death rate as a result of poisoning was 4.8 per 100 000, and among females 4.1/100 000 (Table 2 and Figure 1). It was highest (9.2/100 000) in 2012 among males, and in 2013 (7.9/100 000) among females (Table 2 and Figure 1). The male-to-female ratio was 1.1:1 (Tables 1, 2 and Figure 1).

The highest percentage (32.78%) of victims in this study were aged between 21 and 30 years, followed by 29.05% between 11 and 20 years (Table 3 and Figure 2). In this study 5.82 % were 10 years old or below the age of 10 years, and only 0.54% above the age of 80 (Table 3 and Figure 2).

DISCUSSION

Data on death as a result of poisoning around the world are scarce. After an extensive research on the internet, only a few studies were found, which contained very limited information. In South Africa, a few articles were also published, which were mainly hospital-based. The biggest challenge in South Africa is confirming poisoning deaths through tests at national laboratories. There are only a few centres in South Africa that handle medico-legal tests of tissue for poisoning, and these centres are overloaded with a large number of samples. Therefore, it has become difficult to determine the nature of poisoning.

Most of the Transkei region is rural or semi-rural. Most of the people are Xhosa; they are mostly illiterate and live on subsistence farming. They believe deeply in their culture and traditions. Although the area merged with South Africa soon after the democratic elections in 1994, but it is still not developed. People are ignorant and the illiteracy rate is high; therefore, they believe deeply in misconceptions such as witchcraft and the powers of the sangoma and traditional healers. It is surprising fact that how many literate, educated people still hold these beliefs. There are people who hold degrees, yet visit the sangoma. This is deeply ingrained into the psyche of many Africans. Education is probably the only way to deal with it, but it is going to take more than one generation. Poverty is severe in the Transkei region. Seventy-three percent of the rural people in the Eastern Cape were living on less than R300 per month in 2005/2006, and more than half of them on less than R220 per month.¹⁵

Poisoning ranked eighth among the causes of unnatural death in the Transkei sub-region, which is higher than the national average (Table 1). According to an NIMSS mortuary-based study in 2002, poisoning is not among the top 10 causes of death in South Africa.⁹ Xhosa people still believe in the efficacy of herbal medicine and prefer to use traditional remedies.¹⁶ People assume that because something is herbal (“natural”), it has no side effects, whereas the study found that it might have more side effects than conventional medicine and even, as you point out here, be deadly.

This could be the reason for the high percentage of poisoning in this region of South Africa. Medicinal plants are mainly used in making infusions and decoctions to be taken orally, or poultices.¹⁶ Traditional healers provide decoctions to their patient to clean their gut, but they are unaware of safe concentrations and doses, which leads to fatal poisoning.¹⁷ Although there is no scientific basis to prove the efficacy of these medicines, they may work to relieve symptoms. However, the traditional healers are ignorant of concentrations in the plant decoction. Xhosa people scrupulously obey the instructions of traditional doctors and keep on using the preparation, even if their symptoms do not disappear and continued use leads to toxicity and death.

The average poisoning-related death rate is 8.9 per 100 000 of the population in this study (Table 2 and Figure 1). Most poisoning is regarded as suicidal and

accidental in nature. Surprisingly, the average rate of poisoning (4.8/100 000) is higher among males than among females (4.1/100 000) (Table 2 and Figure 1). This is in contrast to an earlier study by the author, which found that hanging (82%) and shooting (89%) were the methods of choice among males, while females preferred poisoning (75%).¹⁸ Recently this trend has changed, and males prefer self-harm by poisoning rather than other methods. The emerging HIV infection and poor support system could be held partly responsible for several deaths, particularly in younger age groups.¹⁷ The rate of poisoning deaths has picked up from 2005 onwards. Among females it increased from 4.2 per 100 000 (2005) to 5.7 per 100 000 (2015), and among males from 4.7/100 000(2006) to 7.8/100 000 (2015) (Table 2 and Figure 1). The rate of HIV infection has also picked up in the same period in this region. A study of HIV seropositivity on victims of sexual assault in the Transkei region, carried out by the author (2005), showed that HIV seropositivity increased from 10.5% (2000) to 16.5% (2004).¹⁹

The highest percentage (32.78%) of deaths as a result of poisoning was recorded in people between 21 and 30 years of age (Table 3 and Figure 2). This is the most vulnerable group (21-30 years) and accounted for a high number of unnatural deaths.¹⁰ Young adult males are prone to more risk-taking behaviour and they do not want to be defeated in any circumstances. When they lose, they are heavily depressed and often attempt to take drastic measures, such as committing suicide. The incidence of suicide is increasing in the Transkei region of South Africa.¹⁸ Financial hardship is the main underlying reason, identified in 87% of victims of suicide.²⁰ A number of deaths were recorded among people with a history of aluminium phosphide poisoning, caused by what is commonly known as the ‘tank’ pill in this region. It is easily and cheaply available on the streets of Mthatha, and is deadly poisonous.²¹ Self-poisoning with agricultural pesticides is a major contributor to the global burden of suicide²² Alcohol and drug use is another contributing factor in deaths of young adults in this region of South Africa. Binge drinking, especially male binge drinking among 18-to-24-year-olds, is statistically related to offending behaviour.¹⁸

The history reveal that most deaths occurred because of deliberate ingestion of tank pills and organophosphate. Herbal poisoning is accidental, as herbal remedies are prescribed by traditional healers to

cure diseases. Furthermore, a large number of people suffer from mental illnesses in the Transkei region of South Africa. A study published by Chiumia et al in 2014 showed that a third of South Africans suffer from mental health disorders.²³ During his first address to Parliament in 1994, former President Mandela specifically singled out alcohol abuse as a major cause of crime, poverty, reduced productivity, unemployment, dysfunctional family life, political instability, the escalation of chronic diseases such as AIDS and TB, injury and premature death.²⁴

CONCLUSION

There has been an increasing trend of poisoning deaths in the Transkei sub-region of South Africa over a 20-year study period (1996-2015). More than two thirds (61.83%) were young adults between 11 and 30 years of age. Males and females were victims of poisoning in almost equal numbers (1.1:1) in this study. HIV/AIDS, alcoholism and poverty could be considered underlying factors. Education in this respect for both traditional healers and the community is necessary.

Acknowledgments and ethical approval

The author would like to thank all staff of the Laboratory for helping to collect data and providing information on police stations in this region. The author would also like to thank the statistics department for providing a population estimate of all the police stations. The author has ethical permission for collecting data and publication (approved project No. 4114/1999) from the Ethical Committee.

Declaration of conflict of interests

The author declared no potential conflicts of interest with respect to the research, authorship and /or publication of this article.

Funding

The author received no financial support for the research, authorship and/or publication of this article.

Informed consent

There is no scope of informed consent as data were collected from the post-mortem register.

Bestiality in Mthatha Region of South Africa: A Case Report

Banwari Meel

MBBS (University of Rajasthan), MD (AIIMS, New Delhi), DHSM (Natal), DOH (Wits), MPhil HIV/AIDS Management (Stellenbosch), School of Medicine, Walter Sisulu University, P/bag XI NMD, Mthatha, South Africa

ABSTRACT

The objective of this case report is highlight the problem of bestiality in the Mthatha region of South Africa. This is a retrospective report of a case that was referred from a veterinary doctor in Mthatha, 2009. A 25-year-old adult male was mentally unstable. He was also suffering from HIV infection and looking for a cure. A blood sample from the sheep was brought to Sinawe Centre for HIV testing. It was rejected for HIV testing, as the test is not meant for animal blood. The sheep was later killed by community members and the meat was discarded, as it was considered unfit for human consumption. There is a misconception and misbelief regarding bestiality and cure of HIV infection in the Mthatha region of South Africa.

Keywords: *bestiality, mental disorder, sexual assault.*

INTRODUCTION

Bestiality is an infrequent form of animal cruelty among young adults who live mainly in rural areas of the former Transkei. The incidence of bestiality cases is difficult to estimate, as they are underreported, and therefore remain unrecognised. The history of zoophilia (also known as bestiality) begins in the prehistoric era; depictions of humans and animals in a sexual context appear not frequently in European rock art.¹ The Hebrew Bible imposes the death penalty on both the person and animal involved in an act of bestiality.² Bestiality remains illegal in most countries and is condoned in none. It is argued that sex with animals is inherently abusive.³ Approximately 30 states have enacted laws that prohibit sexual contact between humans and animals.⁴ In a society where homosexuals and adulterers are stoned to death for “sexual immorality”, one would expect a similar outcome for someone caught having sex with an animal. Surprisingly, this is not the case.⁴ Only one published article is available in literature discussing paraphilia in the Bible, and that is in French.⁵ For readers of English, nothing is available on this interesting topic. The main forms of paraphilia, abnormal sexual behaviour and sexual crimes explicitly alluded to in the Holy Bible are adultery, homosexuality and bestiality.⁵

The Criminal Law (Sexual Offences and Related Matters) Amendment Act, 2007 is an act of parliament of

South Africa that reformed and codified the law relating to sex offences. It repealed various common law crimes (including rape and indecent assault) and replaced them with statutory crimes defined on a gender-neutral basis.⁶ Bestiality is also prohibited by the Act (section 13).⁶ In recent years a case occurred in the Transkei of a man who was sentenced to 12 months’ jail, without the option of a fine, for having sex with a sheep.⁷ It is very traumatic to write such a case report, but it is important to bring these issues to the notice of the academic community and professionals to prevent such incidents from happening. A published study showed that psychiatric patients were found to have a statistically significantly higher prevalence rate (55%) of bestiality than control groups (10%).⁸ The purpose of this case report is to bring the issues of misconception and misbelief regarding the problem of bestiality in the Mthatha region of South Africa.

CASE HISTORY

Mr B is a 25-year-old mentally unstable young man who was caught by a community man as he was engaged in a sexual assault on a sheep. This was reported to the police. The police registered a case of sexual assault against him and asked a veterinarian to examine the sheep. This young man was suspected of having HIV infection (not tested by a doctor) and looking for a cure by having a sex with an animal. This was advised by a

sangoma practitioner. The doctor examined the sheep, collected two vaginal samples for seminal fluid and blood for an HIV test. On genital examination he found superficial lacerations on the lips of the vagina, along with signs of inflammation. The doctor referred the case to Sinawe Centre (a centre providing a service in cases of sexual assault and rape) and sought an opinion on the sexual assault on the sheep. A blood sample from the sheep was also brought to Sinawe Centre for HIV testing. It was sent to the laboratory. The laboratory could not conduct the test, as it was not meant to test animal blood. The veterinary surgeon concluded that all the findings were consistent with forced vaginal penetration, leading to trauma to the vaginal orifice. Later on the sheep was killed by community members and the meat was discarded because sheep was considered as unholly. Police has registered the case against the perpetrator.

DISCUSSION

There are only few countries in the world without laws against bestiality. There is no specific law in South Africa on bestiality, but it is covered by common law offences. Bestiality violates the Animals Protection Act, which makes it an offence to ill-treat, torture or terrify animals and inflict unnecessary suffering on them. The Animal Protection Act (No. 11) of 1962 and Animal Matters Amendment Act (No. 42) of 1993 both deal with cruelty against animals, but are silent on sexual offences against animals. The National Council of the Society for the Protection of Animals is against bestiality and believes that a culprit must be punished, since it is wrong to force an animal into an unnatural act.⁷ Transkei is a poverty-stricken former black homeland with a high rate of unemployment and illiteracy. There is a strong belief in witchcraft and sangomas.⁹ Most of the people will take advice from traditional healers. Mr B was also advised by a traditional healer to have sex with animals to cure his HIV infection. The myth of the 'HIV/AIDS virgin cure' is prevalent in the community. A case was reported in which the perpetrator was an HIV-positive uncle of a 9-year-old girl, who was a victim of this misbelief.¹⁰ This incident could also ultimately be traced to the advice of a traditional practitioner in this region. It is a fact that those who are suffering from HIV are desperate to get some remedy. Mr B was also in search of a cure for his disease.

Homosexuality enjoys full protection under a post-1994 constitution that outlaws unfair discrimination

on the grounds of sexual orientation.⁷ No argument could be made for bestiality on the same grounds of sexual orientation. Both homosexuality and bestiality are unnatural, but homosexuality has been accepted especially in the western society. It is difficult to investigate the prevalence of bestiality in a community, but the veterinary surgeon concerned, in a telephonic interview stated that there were many cases of bestiality in this region, but they were unreported. The police are also not interested in pursuing cases such as that of Mr B. It is surprising that M. B was not punished in any way for the crime he committed. Bestiality is hardly seen in clinical practice, therefore the estimate of its prevalence is not possible in hospital-based studies.

The origin of HIV infection is suspected to be animals. There are several zoonotic diseases that are contracted either by eating meat of infected animals or coming into contact with animals. Sexual contact has greater chances of spreading infection from animals to humans and vice versa. The emergence of human immunodeficiency viruses HIV-1 and HIV-2 resulted from interspecies transmission from simian virus SIV.¹¹ Persistent habits of hunting and meat preparation in the bush still expose humans in Africa to SIV infection.¹¹ The AIDS epidemic is genetically most diverse where the prevalence of HIV reaches the highest levels. In view of the belief that HIV had its origins in cross-species transmission from non-human primates to man¹², Mr B, and many others who have sex with sheep or other animals, could also be exposed to some kind of cross-species infection. This may lead to other kinds of infection similar to HIV. Mr B could have transmitted infection to the sheep as well. Mittal et al (2000) reported a case of a 48-year-old male with a history of bestiality who presented with painful genital lesions.¹³ The patient was a known case of schizophrenia since he was 15 years old.¹³ Bestiality may be due to sex starvation, or the person could be suffering from some mental aberration.¹³ Mr B was mentally unstable, either because of his HIV infection or because he was suffering from some mental disorder. A case reported by the author has shown that HIV infection could lead to psychiatric disorders.¹⁴

Xhosa people strongly believe in superstitions.⁹ Traditional healers contribute significantly to the level of health-care systems in Africa. They could play an important role in the prevention and care of patients with HIV infection in the community.¹⁵ Superstitious belief is stronger in illiterate people than in educated ones.¹⁰

The practitioners of superstitions (witchcraft doctors, sangomas, and traditional healers) are earning their livelihoods by these practices. Some of these superstitions are very serious in nature, such as rape of a virgin to cure HIV infection.

CONCLUSION

There is a misconception and misbelief regarding bestiality and cure of HIV infection in the Mthatha region of South Africa. It is a serious problem that should be checked by educating people. Law enforcement agencies should play a role in enforcement of the law. The law must be amended to accommodate punishment for perpetrators of this kind of crime.

Discrimination in the Payment of Occupational-Specific Dispensation (OSD) Scale and other Allowances in a Rural University of Eastern Cape's Human Resource Department Malicious or Ignorance?

B L Meel

*Professor & Head of Forensic Division, Faculty of Health Sciences,
Walter Sisulu University, Mthatha, South Africa*

ABSTRACT

Background: When it was realised that South African medical specialists were getting much lower salaries than their foreign counterparts, the occupational-specific dispensation (OSD) scale was implemented as a retention policy from July 2009. This has had a significant impact on keeping doctors and medical specialists in South Africa. This case report is intended to highlight problems with the implementation of the OSD scale at a formerly disadvantaged university.

Case History: Mr X is a medical specialist registered with the Health Professions Council of South Africa, who works in a public hospital as well as in the university's medical school (joint establishment). He has received no annual increase in his basic salary. The OSD scale was implemented in 2009, but thereafter it has not been revised. Mr X's earnings have consequently dropped to 40% less than those of his professional colleagues. Mr X has written a number of letters to express his grievances to the human resource department of the university, but has received no satisfactory answer. The case history, salary scale and all other allowances are discussed in this case report.

Keywords: *occupation-specific dispensation, malicious, discrimination*

INTRODUCTION

The occupation-specific dispensation (OSD) scale has been regulated and implemented by way of collective agreements for health professionals, including medical specialists, since July 2009 to retain the expertise of health care service providers in South Africa. The aim of the OSD was to improve the conditions of service and remuneration of public service workers, including public sector health professionals.¹ The objective of the OSD was to improve the ability of the public service to attract and retain employees, to provide differentiated remuneration dispensations for the vast number of occupations in the public service, to cater for the unique needs of different occupations, to provide unique salary structures per occupation, to prescribe grading structures and job profiles to eliminate interprovincial variations and to provide adequate and clear salary progression and career path opportunities based on

competencies, experience and performance.² Medical and dental practitioners, specialists, pharmacists and emergency medical services (EMS) were identified for implementation, and the OSD was implemented in these fields in July 2009.³

The purpose of this report is to highlight problems with the OSD scale and other allowances at the Walter Sisulu University's (WSU) Medical School, and to determine whether underlying factors such as xenophobia in the human resource (HR) department of the university contribute to discrepancies.

RESULTS

The basic salary structure of Mr X from 2003 to 2018 at rural university is reflected (Table 1). The OSD scale was implemented in July 2009, but was subsequently not revised for four years (2010-2013) (Table 1). Again, there was an increase in basic salary in 2014, which

remained the same in 2015, without any increase (Table 1). There was an increase in salary in 2016 and 2017 (Table 1), but not in the part relating to OSD applicable to Mr. X.

Table 1. Non-payment of OSD scale in a rural university’s human resource department in Eastern Cape Province, South Africa.

Year	Basic salary received	Basic salary supposed to receive as per OSD scale	Remark
2009	R65682	R65682	Implemented & paid
2010	R65682	R89992	Not revised & not paid
2011	R65682	R111359	Not revised & not paid
2012	R65682	R123865	Not revised & not paid
2013	R65682	R132879	Not revised & not paid
2014	R72298	R143515	Not revised & not paid
2015	R72298	R153561	Not revised & not paid
2016	R88734	R165232	Not revised & not paid
2017	R95211	R177294	Not revised & not paid
2018	R95211	R188768	Not revised & not paid

DISCUSSION

South Africa has been liberated from apartheid, but there is a tough challenge in terms of transformation into a stable, equitable, and non-racial society. Universities are regarded as power houses regarding generation of knowledge, but are also victims of racism and xenophobia.⁴ Although only a few cases of racism and xenophobia have been reported, these constitute the tip of an iceberg.⁵ It is sad that racism and xenophobia are still prevalent in South African educational institutions. It may not involve physical attacks, but cause harm in the form of especially financial loss, such as discrimination in terms of salaries, non-payment of legitimate allowances, etc. This is no way less than physical harm as they are weakening your financial position. It is surprisingly that even when this is brought to the notice of higher management, they turn a blind eye. This has happened in the case of Mr. X. He has reported the matter repeatedly, but no action, and rather the perpetrators of injustice were promoted. Perpetrators of xenophobia in these institutions often get jittery and agitated when this topic of OSD scale is discussed. They started labelling that you are receiving the highest notch, without knowing the facts of OSD scale. It is not a matter of more or less. It is matter of legitimate claim of salaries. Unfortunately, the staff in university joint establishment are left only few, and those who are working are mostly foreigners

who borns out of south Africa. So they are vulnerable for this financial victimization. This has discouraged staff members to work to their full potential in tertiary institutes.

The University of Transkei (Unitra) was renamed WSU, but there were no changes in the policy of the joint establishment after this name change. Medical staff who are appointed by the Faculty of Health Sciences were obliged to work at both the university and the hospital. The university has incorporated an overtime allowance, which is part of the salary of those working for the joint establishment and providing services to the hospital. Mr X has always been paid less than his counterparts since his appointment at the university in 1996 as an acting head, but this matter became of more concern when his OSD payment was discontinued in 2010 after being implemented in 2009 (Table 1). Mr. X has received the report from a reliable sources that the HR staff received instruction from the faculty Dean, not to increase Mr. X salary. Salary implies not only monetary benefit, but also the pride of a human being among colleagues and peer groups. The HR department at WSU has always been the weakest link in this university.⁶ This was also pointed out by an independent assessor in a 2011 report. HR directorate is always worked as a ‘secretive society’, benefitting specific individuals and themselves. Unfortunately, the prevalence of xenophobia has

undermined even institutes of higher education, but it is probably more prevalent at WSU than at other universities. I have no hard proof to claim for this, but certainly need an investigation in the HR section of WSU. This has been requested from the present higher management, but has no response. An independent assessor has mentioned in his report that this university is like an Afghanistan.⁶ This resolution of this report still has not implemented despite the plea from an academic union (NTEU) repeatedly.

Since there is no way to access information on the matter, Mr. X only came to know of this fact in March 2012, when some staff members of the faculty received back pay and others were excluded. Mr. X wrote a letter to the HR department, which replied that it is the faculty that decides on his salary. It came as a surprise to Mr. X that colleagues of his rank decided on his OSD. When Mr. X asked HR who the specialist on salaries in the faculty was, they did not reply. Despite a dozen letters being written all levels, they did not reply. This year, the matter was also brought to the attention of the top management of the university, which took no action. Surprisingly, the HR has stopped the salary of Mr. X without informing him, on the instruction of the Dean, which was brought back after many weeks when union approached the HR.

Section 23(1) of the Constitution of the Republic of South Africa Act 108 of 1996 (“the Constitution”) states that everyone has the right to fair labour practice, and therefore medically qualified specialists who serve in hospitals must not be excluded from the OSD scale and equivalent overtime allowance. There has been clear discrimination in the approach of the faculty since 2010 regarding the differentiation in the salary and allowances paid to Mr X. An abstract accepted by the research Directorate in annual conference of WSU-UNIVES in 2016, was presented in East London has raised several questions during these three days meeting (WSU-Univest 2016), but again there was no response from the higher management of this university.

Mr. X is South African by naturalization, but this seems to make no difference in real terms. The reality seems to be that if one is different in look and colour, one is only South African in the eyes of the Home Affairs Department; outside that one will always be considered different. This was proved by the HR department of WSU in the case of Mr. X. People of

different nationalities work in different universities all over the world in almost all countries. They are assets rather than liabilities. They enrich the functioning and culture of the university. A single department in the faculty of health sciences produced 25% of all articles in the year between 2006 and 2009.⁶ Many times, health faculty was accounted as a flagship faculty by higher management of this university but its staff who made it flagship was downgraded financially and utilising services without implementing OSD scale. It is sad. This was the department of Mr. X where he worked almost all alone from 1996 to 2015. Despite of achievements, the university has treated differently in the HR office. Top management must understand that all over the world university employees are regarded as the best in their field, which is why they are appointed at universities. They carry huge responsibilities, not only in terms of teaching and research, but also in service delivery to communities. The least they can expect is not to be paid less than their counterparts who are employed in hospitals. Surprisingly, many of the hospital staff are even former students of the professor employed at the university, yet they are paid more than their better qualified teachers. When Mr. X wanted to have copy of his personal file in HR, they replied it as they lost the file. There were almost 20 years information in the file of Mr. X has lost, and there is nothing to trace it. Mr. X is hearing a lot of irregularity in the office of HR, regarding irregularities in salaries without any confirmation. But one thing is certain the salaries of an individual must be investigated.

Moreover, the HR department at WSU takes unilateral decisions without consultation. This also happened in the case of Mr. X’s reduction in salary and allowances, about which he was not even informed. The only conclusion is that malicious gross discrimination and inconsistency are evident in the payment of Mr X. Since labour laws were disregarded by the HR department in the case of Mr. X, this matter must receive urgent attention.

Limitations

This is a short case report with minor inconsistencies in salary calculations. The author has tried to keep confidentiality of the staff of HR, but if anything has revealed in it, is not considered personal to anyone. It is a failure of system, not any individual.

Ethical issue: This report was presented as a poster at WSU's annual conference in East London in 2016, and therefore ethical clearance was granted in this case presentation.

Conflict of Interest: None

Source of Funding: It is self-funded.

Development of Word Awareness Skills in Typically Developing English Language Learners During Early Primary Grades

Somashekara Haralakatta Shivananjappa¹, Shwetha Prabhu², Jayashree Sunil Bhat³

¹Assistant Professor (Selection Grade), ²Junior Project Fellow, ³Professor, Department of Audiology & Speech-Language Pathology, Kasturba Medical College, Mangalore, Manipal Academy of Higher Education (MAHE), Mangalore, Karnataka, India

ABSTRACT

Background: The paucity of developmental data on phonological underpinnings in English Language learners in the Indian context poses a special concern to professionals in the identification of reading disabilities.

Aim: To explore the developmental trends of phonological awareness at word level amongst English language learners during the early years of schooling.

Method: 50 children each from Grade I, II and III attending English medium schools for typical learners were assessed for word awareness skills and the performance across the Grade was compared.

Results : The results showed a significant ($p < 0.05$) increase in the scores in all the tasks with Grade depicting an ascending trend. The performance of Grade I children was poorer, Grade III was better and Grade II remained intermediate.

Conclusion: Improved scores with the absence of floor and ceiling effect on all the tasks indicate an active development of word awareness skills in English language learners during the first three years of schooling and they mature beyond Grade III.

INTRODUCTION

Indian educational system constrained to consider bi/multilingual system. The language often used for the medium of instruction may or may not be the mother tongue. According to NCERT report in the year 2007, there is an upsurge in the number of schools offering English medium of instructions at primary, upper

primary and secondary school level over the past two decades and more importantly, the number is rapid for primary and secondary schools¹. Learning literacy skills in English signifies the better education, desirable employment, better culture and also superior intellect among Indian minds². In India, children lack in English language environment during preschool years at home, since the exposure is predominantly in the native language. Thus learning secondary linguistic skills in the English language in Indian educational context can be more challenging and enigmatic. In this context of literacy, the native speakers of given language learning to read and write English are called 'English language learners (ELL)'³. However, learning a language that is phonologically and orthographically different from the mother tongue with limited oral language proficiency poses an academic challenge and has direct implication to disability. In the homes of monolingual children, the studies have indicated a relationship existing between

the quantity and quality language exposure to their oral language and literacy skills⁴. Snow, Burns and Griffin⁵ suggests that, teaching children to read in a language in which they are not yet proficient has been identified as an additional risk factor for reading problems. Without a clear understanding of developmental aspects of literacy related cognitive-linguistic underpinnings in ELL, professionals encounter challenges in identifying the learning disabilities in them. An insight into the development of literacy related skills helps to control the dropout rates in school and better be able to identify the children who are at-risk to develop reading disabilities and ensure adequate intervention.

Various researchers in monolingual English speaking countries considered the assessment of phonological awareness skills during the early years of schooling and provided fruitful results in the identification of children at-risk to develop reading disability. Phonological awareness refers to the awareness of and access to, the sound structure or the phonology of one’s language⁶. Research conducted so far repeatedly demonstrated the existence of an association between phonological awareness and learning to read in typically developing children,^{7,8} and also in children with reading disabilities⁹. Additionally, this understanding was extended to dyslexia and suggested that deficits in phonological awareness is a main etiological factor for poor word recognition abilities, thus validating the criticality of phonological awareness in reading acquisition¹⁰ each compared with two control groups matched for reading level (8 years).

In the developmental hierarchy, awareness of words in the spoken language is considered to be the most primitive level of phonological awareness development. Phonological awareness at word level refers to, one’s

awareness that spoken language consists of series of distinct words^{11,12}. The research findings suggest that at the point of school entry children are not explicitly aware of words as units of spoken language, and also the meaning of the term ‘word’^{13,14}. Although, there is limited evidence of shallower phonological awareness influencing word decoding skills, the studies have shown that, the rudimentary phonological awareness skills such as word, syllable and onset-rime awareness sets the stage for more advanced phonological awareness skills such as phoneme awareness, which is proven to be crucial for learning to decode the words than former levels of phonological unit size¹⁵.

An understanding of the developmental aspects and the role of word awareness is understood has been possible from the studies conducted on monolingual English speaking children learning to read English and studies in the Indian context is meagre. Hence, it is essential to develop insights into the development of word awareness in English, before drawing any conclusion regarding its influence on advanced levels of phonological awareness as well as the development of literacy skills.

METHOD

Participants

The study incorporated a cross-sectional study design, with a convenient method of sampling to select the children. The ethical clearance from the institutional ethical committee, Kasturba Medical College, Mangalore was obtained before initiating the research. The study involved a total 150 typically developing children, 50 each from Grade I, Grade, and Grade III. Table 1 depicts the demographic details of the participants.

Grades	Number of participants		Age range (Years)	Mean age (Years)	S.D (Months)
	Males	Females			
I	25	25	5.6 to 6.6	5.19	0.4
II	25	25	6.7 to 7.6	6.10	0.3
III	25	25	7.7 to 8.6	7.19	0.2

The children were selected from five English medium schools for typically developing children affiliated to Karnataka state board. The permission from school administrative authority was obtained following which informed consent was obtained from parents. All the children spoke Tulu language at home and were exposed to English language only after entering Kindergarten. The children had adequate oral language proficiency for Tulu and are said to be ELL, because the children learn to speak and read the English language simultaneously from kindergarten. All the children attended nursery school in English medium of instructions which was ascertained through the parental interview. Further, the class teachers were interviewed to ensure all the children have above average academic performance, attending school regularly, and also had no history of class retention. The children were screened for gross speech, language, sensory, emotional/behavioral, neurological and cognitive deficits using WHO ten question disability screening checklist¹⁶. Normal receptive and expressive language development was ensured using 'Assessment of language development'¹⁷.

Measures

There is a dearth of an assessment tool which targets word awareness in the Indian context. Thus, the assessment was carried out using a specifically developed and content validated assessment tool. An extensive literature review was done to select the appropriate tasks to assess word awareness skills. Later the instructions, stimuli and scoring methods were evolved. All the assessment tasks consisted of 10 sentences each. The length of the sentences was varied in terms of a number of a syllable, type of words (content vs functional words), the position of the target word depending up on the task.

Sentence segmentation task

In this task the children were instructed to listen carefully to the sentence and count the number of words in the sentence provided. An example of the stimuli is "*We had dinner*" and the expected response was 3 words.

Word identification in sentence task

In this task the children were asked to listen to the sentence carefully and answer the subsequent question by saying 'yes' or 'no'. An example of the stimuli is "*The monkey is sitting on the tree*" Did you hear '*monkey*' in

that sentence? The expected response is 'yes'.

Word deletion in sentence

Here children were again asked to listen to the sentence and repeat the sentence after deleting the specified word in it. An example of the stimuli is "*Give me a pen*" Now, say it again leaving '*me*' in it. The expected correct response is '*Give a pen*'.

Word substitution in sentence

In this task the children were instructed to repeat the sentence after substituting the target word from a specified word. An example of the stimuli is "*Where is the bat?*" Change '*bat*' to '*ball*'. The correct response would be '*Where is the ball?*'

The tasks and stimuli were initially subjected to content validation by five speech-language pathologists (SLP) who had ten years of research and clinical experience in the field. The SLP's rated tasks, stimulus items, instructions, and scoring procedures using a continuum of the 5-point rating scale, with 0 indicating lower chance, and 4 indicating higher chance to be retained in the assessment tool. The items with the rating of '3' or '4' were considered as the desired rating since they indicate the higher relevance. The developed material was subjected to pilot study, on a small group of children (N=10 from each grade) in order to determine floor and ceiling performance. The ICC for test-retest reliability was found to be as high as 94% for 'sentence segmentation' and as low as 86% for 'word substitution in the sentence.' Similarly, for inter-rater, the ICC was found to be as high as 92% for 'word identification in the sentence' and as low as 85% for 'word deletion in the sentence.'

In order to determine whether the tasks used in the present study assess the same construct of 'word awareness,' the relationship between the tasks were determined using Pearson's correlation co-efficient. The Pearson's correlations were significant and ranged from $r = .28$ to $r = .73$. The lowest correlation was between 'word identification in the sentence' and 'word deletion in the sentence,' whereas the highest correlation was between 'word deletion in the sentence' and 'word substitution in the sentence'. The moderate to high correlations between the tasks suggests that the four tasks included in the assessment of word awareness tapped the same underlying construct.

Procedure

All the children were assessed for word awareness skills during the second half of the academic year. The sentences were presented verbally using live voice monotonously at normal conversation rate by the researcher. The tasks were initially familiarized using trial items. Corrective feedback was provided during the trial attempts, and no such feedback was given during the actual assessment. The correct responses were scored ‘1’ and incorrect responses were scored ‘0’ for all the task.

RESULTS

Figure 1 summarizes the children’s performance based on the mean and standard deviation (SD) across the Grade and task. The descriptive statistics indicate improved scores with Grade. Precisely, Grade I children

performed lower, Grade III performed higher, whereas Grade II children performed intermediate of Grade I and Grade III. The mean score comparison using one-way ANOVA revealed a significant main effect of Grade on ‘sentence segmentation’ [F (2,147) = 44.15, p<0.001], ‘word identification in the sentence’ [F (2,147) = 5.06, p=0.007], ‘word deletion in the sentence’ [F (2,147) = 38.12, p<0.001], and ‘word substitution in the sentence’ [F (2,147) = 35.64, p<0.001]. The subsequent post-hoc pair-wise comparisons with Bonferroni’s adjustment indicated that the performance of Grade III children was significantly (p<0.05) higher than Grade I and Grade II for all the word awareness tasks, except ‘word identification in the sentence’ task of Grade II. Further, Grade II children performed significantly better than Grade I on all the word awareness tasks except ‘word identification in the sentence.’.

Figure 1 Mean and SD for word awareness tasks for Grade I, Grade II and Grade III.

Note. SS= Sentence segmentation, WIS=Word identification in the sentence, WDS=Word deletion in the sentence, WSS=Word substitution in the sentence.

DISCUSSION

A significant increase in the scores with the grades indicates a clear developmental progression of word awareness skills during the initial three years of formal schooling. The steady reduction in the standard deviation with the Grades suggests less variability in the performance of all the tasks, indicating increasing

stability in performance with advancing Grades. The effect of Grade on word awareness skills was also reported earlier in monolingual English speakers^{13,18}. Researchers have acknowledged that word awareness skills are the gate-way to the development of finer aspects of phonological awareness, and therefore, a beginning reader must develop an insight into the speech consisting of a sequence of word units, which is spoken and comprehended for many years¹⁹. Young children learn to recognize the arbitrary nature of the phonological realization of the word and also the

comprehension of the metalinguistic term ‘word’¹⁹. The same notion can be endorsed from the present results that, the children become increasingly aware of clear-cut boundaries of words in spoken language. The present findings support Chaney¹³ observation that, the performance improves with age due to exposure to print that heightens metalinguistic knowledge of word boundaries. This would be the possible explanation for the developmental progression and also a high variability in the performance at lower grades and greater stability at higher grades that were observed in the present study. The errors in sentence segmentation in Grade I children were characterized by accurate counting of content words, often ignoring functional words or combining with preceding or the following word to make it as a word unit. Otherwise, the multi-syllable words within the sentence were counted correctly than the mono-syllable words. However, these errors reduced with grades and found to be highest in Grade I and lowest in Grade III, indicating the gradual maturity of word awareness and increased reliance on the word concept irrespective of suprasegmental constraint. Similar findings were reported earlier in Russian preschool children between three and a half to seven years of age²⁰. In monolingual English group it is indicated that, since the words are salient compared to syllable and phonemes, children develop phonological awareness at sentence level much before the school entry²¹. A possible explanation for the continued development of word awareness skill evidenced in the present study could be due to limited oral language skills in English during the school entry, with the acquisition of phonological representations at word level which is underway for the alphabetic language besides home language. Thus, it signifies that the word awareness emerges much before Grade I and continues to develop beyond Grade III³.

CONCLUSION

Based on the findings of the present study, it can be concluded that there is a clear indication that, there is a significant increase in word awareness skills with Grade suggesting the prevalence of active development in ELL during the first three years of schooling.

Twenty Years' (1996-2015) Trend in Lightning-related Deaths in the Transkei Sub-region of South Africa

Banwari Meel

MBBS (University of Rajasthan), MD (AIIMS, New Delhi), DHSM (Natal), DOH (Wits), MPhil HIV/AIDS Management (Stellenbosch), School of Medicine, Walter Sisulu University, P/bag XI NMD, Mthatha 5117, South Africa

ABSTRACT

Background: Lightning is the number one cause of weather-related death in the Transkei region of South Africa. Endemic poverty and illiteracy are the important contributors to the incidence of these deaths.

Objective: To study 20 years' trend in lightning-related deaths in the Transkei sub-region of South Africa.

Method: A record review descriptive study was undertaken of all medico-legal autopsies performed from 1996 to 2015 at Mthatha Forensic Pathology Laboratory.

Results: In total, 22 952 medico-legal autopsies were conducted at Mthatha Forensic Pathology Laboratory from 1996 to 2015. Of these, 465 (2.02%) were caused by lightning. This gives an average of 0.39 lightning-related deaths per million of the population in this region every year. The highest rate was 0.8 per million recorded in 2007, and the lowest was 0.15 per million in 1997 and 2013. Males outnumbered females at a ratio of 1.4: 1. Thirteen percent (13%) of the victims of lightning were young children of 10 years old or below in this study.

Conclusion: The number of lightning-related deaths has increased by more than one and a half times in the last 20 years (1996-2015) in the Transkei sub-region of South Africa.

Keywords: *Lightning, unnatural, disability, death*

INTRODUCTION

Worldwide, approximately 2000 thunderstorms occur every second.¹ It is estimated that a lightning flash occurs approximately 8 million times per day throughout the world.² Africa, South America and Southeast Asia have as many as 4 billion people who are vulnerable to the threat of lightning, as people are living in unsafe structures. If the annual rate of six fatalities per million is used for four billion people, a total of 24 000 deaths caused by lightning per year is calculated.³ If there are 10 injuries for every death, then 240 000 injuries occur every year in these areas.⁴ Lightning injury is associated with a global mortality rate of 1000 deaths per year, and is the second most common cause of weather-related deaths in the United States.⁵

In the early 1900s, the lightning fatality rate in the United States was six per million.⁶ In recent years, the

fatality rate has dropped to under 0.3 per million.⁷ This has happened because of the population shifting to urban areas, industrialisation of agriculture and improvement of construction.⁷ A similar reduction has occurred in developed countries.⁷ In Europe lightning kills a tiny fraction of the population each year, about 0.2 people in every 1 million, whereas in parts of Asia and Africa the number of lightning deaths may be 100 times higher. In Zimbabwe it is around 20 per million. In Malawi it is 84 people per million. While lightning may seem to strike and kill at random, it is mostly a problem of the poor.⁸

In South Africa it is estimated that between 1.5 and 8.8 people per million of the population are killed by lightning every year. If the population size of South Africa is taken to be 50 million, this means that between 75 and 440 people are killed by lightning annually.⁹ Lightning kills more people than other natural disasters such as floods, hurricanes and tornadoes, but

because lightning usually kills people one at a time, it tends to be an underrated hazard.¹⁰New research determining the impact of climate change on the world's lightning and thunderstorm patterns has found that for every one degree Celsius of long-term warming there will be a near 10 percent increase in lightning activity.¹¹ Lightning strikes are also a leading cause of wildfires and have been responsible in the past for some of the most devastating blazes in the south-west.¹²The purpose of this study is to highlight the problem of deaths related to lightning strikes in the Transkei sub-region of South Africa, and to relate these findings to different age groups and genders.

Subjects and Method

The retrospective descriptive study was carried out from the records of the post-mortem register of Mthatha Forensic Pathology Laboratory from 1996 to 2015. In total 22 952 autopsies were conducted between 1996 and 2015 and recorded in the post-mortem register at this laboratory. Between 1996 and 2015 the laboratory dealt with 465 victims of death as a result of lightning. In one case no age could be found in the post-mortem register, therefore this case was ignored and not taken into account in the age group study. Abortion cases (165) were also omitted in the category of unnatural deaths. In 2005 there were five police stations to be taken into account. Therefore, the population in the area of this study has increased. Population statistics were calculated with the help of the South African Statistics Department

in Mthatha. However, it is difficult to estimate the total population involved. The data were collected in hard copies designed to reflect post mortem number, year, gender and cause of death. These data were transferred to the Excel computer program and analysed with the help of the SPSS computer program.

RESULTS

In total 22 952 medico-legal autopsies were conducted at Mthatha Forensic Pathology Laboratory from 1996 to 2015. Of these, 465 (2.02%) followed deaths caused by lightning (Figure 1). This gives an average of four deaths (0.39) per million of the population annually in this region (Table 1). The highest rate of 0.8 per million was recorded in 2007, and the lowest, 0.15 per million, was observed in 1997 and 2013 (Table 1). Among males, the highest rate of 0.35 per million was recorded in 2005, and the lowest rate, 0.4 per million, occurred in 1997, while among females 0.39 per million was found in 2007 and 0.04 per million in 2013 in this study (Table 1). Males outnumbered females at a ratio of 1.4: 1 (Table 2). The highest percentage (31.46%) of deaths was recorded among young people between 11 and 20 years of age (Table 2). The number of lightning-related deaths was higher among males in all age groups, except above 80 years of age (Table 2). About 13% of victims were young children of 10 years old or below and only 0.86% were old people above the age of 90 years in this study (Table 2).

Table 1. Incidence of lightning related deaths in Transkei sub-region of South Africa by gender (1996-2015).

Year	Population estimated	Females (n= 192)		Males (n=273)		Total (n=465)	
		No. death	Death/million	No. death	Death/million	No. deaths	Death/million
1996	439 091	2	0.05	7	0.16	9	0.21
1997	452 264	5	0.11	2	0.04	7	0.15
1998	465 832	8	0.17	11	0.24	19	0.41

81-90	3(0.64)	3(0.64)	6(1.29)
>90	3(0.43)	2(0.43)	4(0.86)
Total	273(58.83)	191 (41.16)	464 (100)

DISCUSSION

This is a second report by the author in order to a deeper analysis according to the pattern of the world rate of death by lightning. Lightning is one of the major forces behind shaping mountains such as the Drakensburg Mountains in South Africa.¹³ Lightning, at temperatures of up to 54 000°F (almost 30 000°C), can burst rocks in milliseconds.¹³ Lightning-related deaths affect poor Transkeian communities, as they are

living in hilly rural areas, where there is always a danger of lightning. Poor people are always at high risk of lightning deaths, as their houses are poorly constructed and therefore they are unsafe.⁷ Poor people, men, women and children, regularly move out of their shelters in search of wood for fire and drinking water from nearby rivers. The Transkei region is one of the poorest parts of South Africa. Seventy-three percent of the rural people in the Eastern Cape were living on less than R300 per month in 2005/2006, and more than half of them on less than R220 per month.¹⁴

Figure 1. Ranking of percentage of cause of death in the Transkei sub-region of South Africa from 1996 to 2015 (n=22 952).

Lightning is the number one cause of weather-related death in the Transkei region of South Africa and ranks 11th in the list of causes of unnatural death in the Transkei sub-region of South Africa (Figure 1). About 24 000 people globally are killed by lightning every year.³ In this study 465 were killed over a period of 20 years, with an average of 23.3 deaths every year, contributing 0.97% of global deaths (Table 1). South Africa loses approximately 80 to 100 people per year due to lightning strikes.⁹ It means about a quarter (23.3%) of South African lightning deaths occur in the Transkei sub-region (Table 1). This indicates that the region is at high risk of lightning deaths. There is a need to explore the underlying factors contributing to these deaths. In developing countries, the incidence of lightning-related deaths is also higher, especially in rural areas, because of the lack of sufficient shelter against lightning.⁹ The Transkei region of South Africa is such a region where people are living in extreme poverty,¹⁴ and therefore cannot afford safe shelters.

The average rate of lightning deaths recorded was 0.39 deaths per million of the population per year in this study (Table 1). This figure is within range of the international average. Yearly worldwide death rates from lightning range between 0.2 and 1.7 per million of the population.¹⁵ In the United States, the reported rate is 0.42 deaths per million people per year, ranging from 0.3 to 2 per million people.³ The Australian death rate is 0.21 lightning-related deaths per million of the population.¹⁶ The highest rate of 0.8 per million of the population was recorded in 2007, and the lowest of 0.15 per million in 1997 and 2013 in this study (Table 1). It is difficult to explain this wide difference of 0.65 per million of the population in lightning fatalities in this

study (Table 1). Eriksson and Smith reported (1986) a mean rate of 1.5 deaths per million inhabitants among a largely urban population and 8.8 in a rural population during a four-year period.¹⁷ This is also difficult to compare, as there is a paucity of published data in South African medical literature on deaths related to lightning.¹⁸ Most reports come from the media without any authentication of data. Males are more frequently victims of lightning strikes than females in this region. For every three men involved, two women are struck by lightning, at a ratio of 1.4:1 in this study (Table 1). Males are more mobile, as they have to find food outside the home, and females generally cook it. In rural Xhosa communities, the women also work in fields and cook the food in open kitchen in rural area. Males are also more prone to risk-taking behaviour. This is consistent with most unnatural deaths, where males are more often victims than females.¹⁹ It is also consistent with the observation that young males between 11 and 30 years are more vulnerable to non-natural death.¹⁹

About one third (31.46%) of lightning-related deaths were recorded in the age group of 11 to 20 years in this study (Table 2). The reason is not known, but probably this age group is more likely to be outside in harsh weather than other age groups. It is surprising that in this age group (11-20 years), males were twice (20.9%) more often victims of lightning strikes than females (10.56%) (Table 2). Only 0.86 percent of lightning-related deaths were found among elderly age groups in this study (Table 2). It is understandable that this age group generally lives inside the house most of the time, and therefore they were relatively more protected from lightning deaths than the young age groups. Moreover, there is no gender difference in lightning deaths after

the age of 80 years, as an equal percentage of deaths occurred among both genders in this study (Table 2).

Several factors contribute to lightning deaths, but the main factors are poverty and illiteracy, which are entwined. There is also a misconception about lightning and witchcraft, which is caused by lack of education in this community. A few elderly women are killed every year on suspicion of witchcraft when there has been a lightning strike and somebody has been killed.²⁰ For any type of tragedy in the community, they immediately blame witchcraft activity. This belief is mainly propagated by the witchdoctors in that area, as they cannot explain the reason for tragedies such as lightning deaths.²⁰ The practice of witchcraft is mainly prevalent in rural areas, among the illiterate people of the region. Lightning has a great impact in the community. The most important societal impact from lightning is the annual deaths due to lightning. Lightning can also damage houses and livestock such as sheep and cattle, which in fact constitute the only wealth of the poor Xhosa community in this region. By 2009, the United States was experiencing damage due to lightning exceeding \$1 billion each year, while in 2008 South Africa reported damages of more than R500 million a year.⁹ Lightning will strike far more frequently in a world under climate change, but researchers can still not predict exactly where or when those strikes will occur.¹² One has to learn from countries such as the United States and Europe, where the incidence of deaths related to lightning was very high in 1900, but has come down to very low through providing safer houses and educating people on how to protect themselves from lightning strikes.⁸

CONCLUSION

The rate of lightning-related deaths has increased more than one and a half times in the last 20 years (1996-2015) in the Transkei sub-region of South Africa. About two-third (59.7%) of victims were young, 30 years of age or younger. Predominantly (37.92%) males were victims of lightning deaths in this study. Poverty and illiteracy among the people in this region are contributing factors in lightning deaths. Climatic changes could prompt more thunderstorms and therefore more frequent lightning strikes. Preventive steps must be taken to provide safer houses and particularly to educate the community, who hold traditional beliefs and are often completely unaware of what causes lightning and how they can protect themselves and their possessions.

University of Indonesia, Depok, Indonesia

ABSTRACT

Background : Previous studies have reported adverse effects of fine particulate on lung function. However, there has not been much research conducted in the construction industry area.

Objective : The study was to determine the relationship between exposure of ambient PM_{2.5} concentrations to lung function disorders in the ready-mix industry area.

Material & Method : The research used a cross-sectional study on sample size of 100 respondents. It was divided into two regions which were determined based on the dominant wind direction. Ambient PM_{2.5} concentration was measured using gravimetric method, and pulmonary function used a portable spirometry.

Results : PM_{2.5} concentration was obtained above the average of NAAQS provision (0.041 mg/m³). There was no significant association between lung function disorder and the average PM_{2.5} concentration both site A (p=0.583) and B (p=0.321), but from smoking behavior, there was a significant association with lung function disorder. This study found no evidence to suggest that living in the area of ready-mix industry is a major determinant of lung function disorder. Further research is needed to see early indications of health effect using other chemical methods and parameters.

Keywords: PM_{2.5}, lung, particulate matter, ready-mix

INTRODUCTION

Air pollution is one of the global problems that occur in almost all countries in the world and tends to increase every year. WHO said around 92% of the world's population live in places with air quality levels that exceed the safe threshold¹. Air pollution is a major environmental risk factor affecting human health in both developed and developing countries². Exposure to air pollutants may cause various health effects depending on the composition of contaminants (various particles and gases), exposure levels, duration, and frequency of exposure, as well as the associated toxicity of specific pollutants³. Urban ambient air pollution is a complex

mixture of gases and particles. Although several gases are irritants, it is widely assumed that particles play the crucial role in cardio-respiratory health effects of air pollution⁴.

The construction industry is still considered an important source of atmospheric pollution due to particulate matter emissions, causing negative impacts on human health and the environment⁵. Besides that, it has been investigated the adverse effect of traffic-road-related particulate matter (PM) on human health⁶. Particulate matter less than 2.5 µm in diameter (PM_{2.5}) is an important concern because the particulate can freely enter the respiratory tract and settle in the alveoli.

Worldwide, it is estimated that air pollution caused by PM_{2.5} in the atmosphere is responsible for approximately 0.8 million premature deaths and 6.4 million years of life lost annually⁷. Another research in Cement industry, Padang City, Indonesia found that PM_{2.5} exposure showed that less than 2.5 km of location

at risk to society⁸. The exposure of PM₁₀ in ready-mix industry area of PT. X Plant Kebon Nanas posed a risk to the industrial workers⁹. Lung function is a noninvasive measure of pulmonary health and has been frequently used in previous studies to assess the health effects of air pollution⁴.

According to Basic Health Research (RISKESDAS) 2013, it was found that the prevalence of upper respiratory tract infections (URI) cases in Indonesia was 25%¹⁰. URI and other respiratory tract disorders are caused by low biological, physical and chemical of home air quality both inside and outside. Based on Jagaraksa health center data period 2015-2016 states that cases of upper respiratory tract infections (URI) always occupy the top position compared to other cases (Puskesmas Jagaraksa, 2018). In this region, there is a ready-mix concrete industry that is large enough and adjacent to the residential population. The detrimental health impacts of PM emissions are not confined to the construction site, since fine particles (particulate matter smaller than 2.5 µm in diameter) can travel further than coarser dust (particulate matter between 2.5 µm and 10 µm in diameter), therefore it could affect the health of people living and work in the surrounding area⁵. High URI cases in Jagaraksa sub-district, one of which is suspected due to the contribution of PM_{2.5} exposure from ready-mix industry activities in Lenteng Agung area, South Jakarta. But not many studies that assess the risk of respiratory disorders in communities around the industry. Our study objective was to analyze the effect of PM_{2.5} exposure on lung function disorder in the community living in areas of the construction industry in Lenteng Agung, South Jakarta.

METHOD

Design and study participant

This study was an analytic observation with a cross-sectional design. It was conducted on 100 people who take daily activity around ready-mix industrial area, Lenteng Agung, South Jakarta in April - June 2018. The study participants were randomly selected, more than 17 years of age, having good health condition. We excluded people who have the history of respiratory disorder such as asthma and bronchitis. Anthropometry measurement, smoking status, family history of smoking, kitchen ventilation, and environmental tobacco smoking exposure were collected.

Ambient PM_{2.5} Concentration Measurement

PM_{2.5} concentration was measured using High Volume Air Sampler (HVAS) by gravimetric method¹¹ at 10 points in 1 hour at each observation point in the study area. Distribution of air sampling test results was grouped into location A and B. Location A was taken based on dominant wind direction from the data from the Climatology and Geophysics Meteorology Agency (BMKG) in May - June 2018, which comprised 4 points (point 1 to 4). Location B consisted of the points (point 5 to 10) which locations closest to the source of pollutants and the traffic road.

Pulmonary function test

Pulmonary function test was carried out in the participant's residence by using calibrated portable spirometry. Spirometry was used to measure the forced expiratory volume in 1 second (FEV₁), forced vital capacity (FVC), and FEV₁/FVC ratio. The respondent's body weight and height were measured using standard digital body scales and microtoise. Spirometry results were processed manually using the numerical data contained in the table of normal pulmonary values according to age and height of Indonesian¹², after the calculation it would result in the presentation of FEV₁ and FVC. Furthermore, the researcher categorized the final results where the ratio percentage of FEV₁/FVC ≤ 70% was included as a pulmonary disorder.

Data analysis

The data was processed and presented through a descriptive analysis, and chi-square test to identify the relationship between the dependent and independent variable. The relationship was considered as significant if the p-value was < 0.05.

RESULTS

Based on the monitoring of PM_{2.5} air quality test over 10 points, the highest concentration of 0.091 mg/m³ located at point 1, the value with the lowest concentration was point 3, which was 0.032 mg/m³ (Table 1). Point 1 was the location closest to the ready-mix industry so that the highest PM_{2.5} concentration was obtained compared to other measurement points. In addition, the area was the dominant wind direction from the data from the Climatology and Geophysics Meteorology Agency (BMKG).

Tabel 1. The concentration of ambient PM_{2.5} industrial area, Lenteng Agung, Jakarta

Air Sampling Site	PM 2.5 (mg/m ³)	Distance to Industry (m)	Wind direction
Sample 1	0.091	200	Northwest
Sample 2	0.037	600	Northwest
Sample 3	0.032	1000	Northwest
Sample 4	0.037	1400	Northwest
Sample 5	0.040	200	North
Sample 6	0.046	400	North
Sample 7	0.064	200	East
Sample 8	0.037	400	East
Sample 9	0.048	200	South
Sample 10	0.043	400	South

The overall distribution of data used for the calculation of risk analysis of PM_{2.5} concentration was the median value of 0.041 mg/m³. A median value of 0.037 mg/m³ was used to determined the level of concentration at location A and the average value of 0.0463 mg/m³ at location B. Based on age, people under the age of 45 years were at risk of lung function disorder by 4.48 times higher than people aged over 45 years. Women had 5.84 times higher risk of lung function disorder than men. According to the smoking status, people who smoked were 4.14 times more likely to experience lung function disorder compared to non-smokers. The effects related to body weight, height, family members who smoke, environmental tobacco exposure, and kitchen ventilation were weak or absent (Table 2).

Tabel 2. Characteristic of all study participants with pulmonary function disorder

	N	Lung Function Disorder (N)	Prevalence (%)	P Value	OR
Age, year					
≤ 45	60	16	26.7	0.03*	4.48
> 45	40	3	7.5

No	35	6	17.1		

OR= Odds ratio, * P-value < 0.05

The association of PM_{2.5} exposure with pulmonary function disorder showed that there was no relationship between ambient PM_{2.5} exposure between site A and B (p>0.05).

Table 3. Association of PM_{2.5} concentration with lung function disorder

Variable	Lung Function				Total	P Value	OR
	Disorder		Normal				
	N	%	N	%			
Site A							
PM2.5 Concentration							
> 0.037 mg/m ³	2	25.0	6	75.0	8	0.58	2.25
≤ 0.037 mg/m ³	4	12.9	27	87.1	31		
Site B							
PM2.5 Concentration							
> 0.046 mg/m ³	6	30	14	70	20	0.32	2.08
≤ 0.046 mg/m ³	7	17.1	34	82.9	41		

DISCUSSION

The measurement of PM_{2.5} concentration at 10 points in the study location resulted in various values. The observation point was getting closer to the ready-mix industrial location, so the concentration of PM_{2.5} was getting higher. When compared to the value of Ambient Air Quality Standard Indonesia Government Regulation this value has not passed the standard quality of 0.065 mg/m³, except point 1, but when we compared with National Ambient Air Quality Objectives Standard (NAAQOS), this value has exceeded the 0.035 mg/m³ quality standard¹³. According to WHO guidelines, this value also exceeds the threshold of 0.025 mg/m³¹⁴. The location of point 1 was the highest PM_{2.5} concentration compared to the others. It was because the location of the measurement point was quite sufficient with the ready-mix industry and it was dominant wind direction. This result was in line with research conducted in Nagasaki, Japan, which stated that meteorological conditions also influence the high concentration of PM_{2.5} in the environment, including wind direction and humidity¹⁵. In addition to its location at a radius of 200 m with ready-mix industry, this point was also adjacent to the main road with busy traffic. Particulate matter from road traffic comes from vehicle emission, tire wear, break-wear and vehicle-induced resuspension of road dust¹⁶.

Statistical analysis showed that age, sex, and smoking status were associated with the incidence of lung function disorder. Age, gender, body size, and ethnicity are strong predictors of lung function⁴. The result showed that under 45 years of age were found to have more lung function disorders. This finding is more because at the age more participants were found smoking. It is strengthened by smoking status, that the prevalence of people who smoke experienced pulmonary dysfunction was higher than those who did not smoke. Smokers have a higher prevalence of respiratory symptoms and lung function abnormalities than non-smokers^{17,18}. Some previous studies have demonstrated the effect of smoking on pulmonary function of adults^{18,19,20}. Gold et al. found in his research that the FEV1/FVC ratio decreased among adolescent smokers²¹. Female respondents were found more in the study area, and most experienced pulmonary function disorder as much as 26,2% compared to male respondents. It was probably due to housewives who were longer exposed to pollution in the neighborhood. Exposure to air pollutants that can cause various health effects is caused by levels, duration, and frequency of pollutant exposures³. Therefore, people who are longer and more often exposed to PM_{2.5} will be more at risk of developing lung function disorders.

In our analysis, the relationship between the concentration of PM_{2.5} exposure with lung function disorder was not found. We found no evidence that living closely to a ready-mix industry area was associated with an increased risk of lung function disorder. Based on the Indonesian Government Regulation concerning control of air pollution, the average value of concentration at the study site was still below the threshold. It is likely that the below-the-threshold concentration affects the absence of the relationship. We found similar results with Pujades-Rodríguez's study that there was no association between living closely to the main road or in an area of increased traffic-related pollution with an increased risk of asthma or COPD²². Another research found that the ambient exposure PM_{2.5} in Tangerang and Makasar was higher than the WHO recommended value limit, but there was also no significant relationship between air pollution and impaired lung function in both cities²³.

The limitations in our study were the measurement time of PM_{2.5} concentration was carried out for one hour so that it could not make the average concentration at 24 hours to observe the highest and also the lowest peak time of PM_{2.5} concentration. However, we have conducted a preliminary study before measuring air pollutant to determine the production time in the ready-mix industry, and measurements were taken when the ready-mix industry was operating. In addition, measurements in the outdoor only also did not represent all of the air inhaled by most participants, which were housewives who could have spent more time in the house or room than the outside.

CONCLUSIONS

In conclusion, we found no evidence to suggest that home proximity to ready-mix industry is a major determinant of the risk of lung function disorder. Further research is needed to see early indications of respiratory health problems using other chemical methods and parameters.

The Effect of Nutrition Counseling on Intake of Energy, Protein, and Nutritional Status of Chronic Kidney Disease with Haemodialysis

Usdeka Muliani¹, Roza Mulyani¹, Amrul Hasan¹, Ismi Rajiani²

¹Minister of Health Polytechnic Tanjungkarang, Indonesia, ²Department of Business Administration, STIAMAK Barunawati Surabaya, Indonesia

ABSTRACT

Background: Haemodialysis patients must get sufficient food intake to remain in good nutritional status, nutrition. Nutrition Counselling is an effort to accelerate the healing process and achieve optimal nutritional status. This study aims to determine the effect of dietary counseling on energy, protein, and nutritional status of Chronic Kidney Disease (CKD) patients with hemodialysis.

Method: This study included analytical research with quasi-experimental research design, which was carried out at general hospital Dr. H Abdul Moeloek Lampung Province. The number of samples was 61 people, consisting of 33 treatment groups and 28 controls. The variables examined were nutritional counseling, energy intake, protein intake, and nutritional status Independent t-test and Mann-Whitney test was employed to investigate the relationship.

Results: In the group that received the nutritional counseling intervention (treatment), poor energy intake decreased by 21.2% compared to the control of only 7.2%. For protein intake, the treatment group of unfavorable protein intake decreased by 6.1%, while the control group did not reduce. Nutritional status is not right in the treatment group while in control it increases by 7.1%. Bivariate analysis showed no significant difference between nutritional counseling with calorie intake, protein intake and nutritional status in both the treatment and control groups.

Conclusion: It is recommended that nutritional counseling is carried out more often by nutritionists to increase the respondent's knowledge and need further research operating variables such as appetite, and the duration of hemodialysis.

Keywords-: Energy Intake, Protein Intake, Nutritional Status, Haemodialysis

INTRODUCTION

Haemodialysis is a process of separating or filtering or cleansing the blood through a semipermeable membrane that is carried out in patients with chronic renal dysfunction⁽¹⁾. Haemodialysis is still the main kidney replacement therapy in addition to kidney transplants in some countries in the world⁽²⁾. Haemodialysis patients

must get sufficient food intake to remain in proper nutrition. Poor nutrition is a significant predictor of death in hemodialysis patients⁽³⁾.

Patients with a chronic renal disease who suffer from malnutrition require higher protein and energy. So it is concluded that the provision of energy intake must be as needed so that the body's tissues do not need to be broken down to produce energy⁽³⁾ and a high-protein diet is intended to maintain nitrogen balance and replace the amino acids lost during hemodialysis therapy⁽⁴⁾.

The results of previous research⁽⁵⁾ in chronic kidney disease patients with obtained the inappropriateness in the energy intake, protein intake, and the nutritional

Polytechnic, Tanjungkarang, Indonesia
email: inideka@yahoo.co.id

status. Similarly the results ⁽⁶⁾ in another Indonesian general hospital, it is obtained the poor proportion of respondents who have poor energy intake and protein intake.

Based on the background above, researchers are interested in researching the effect of giving nutrition counseling on energy intake, protein intake and nutritional status of chronic kidney disease patients with hemodialysis in the hospital of Dr. H. Abdul Moeloek Lampung Province in 2017. The hospital was chosen as the location of the study because it was the highest referral hospital in Lampung Province, Indonesia.

METHODOLOGY

This research is analytical with the quasi-

experimental design of pre-post-test control group design. The population in this study were all chronic kidney disease patients who underwent hemodialysis therapy at Dr. H. Abdul Moeloek Lampung Province. The number of samples was proportionally designed by two populations and met the criteria obtained by the treatment group 33 people and control group 28 people. Univariate data displayed in percentage and to determine the effect of the intervention on the nutritional status of respondents; the Mann-Whitney test was used..

RESULTS

Sample characteristics consisting of gender, age, and education level are summarized in the following table.

Table 1. Sample Characteristics

Variables	Sample				N	%
	Treatment		Control			
	N	%	N	%

The table shows that men sample is 50.8%, and the majority is in the age of 40-60 years (65.5%), and the highest education level is junior high (31.1%).

The result of univariate analysis of the variables of energy intake, protein intake, and nutritional status in the two sample groups before treatment and after treatment is depicted in Table 2. The table shows that the knowledge of energy intake in the treatment group increases by 21.2% while in the control group increases

by 7.2%. Also, the experience on good protein intake in the treatment group rises 6.1% while in the control group there is no increase.

Further, The nutritional status of the sample in the treatment group did not change after the intervention, while in the control group malnutrition increased 7.1%.

Table 2. Frequency Distribution of Research Variables Before and After Treatment

Research Variables			Respondents				N	%
			Treatment Group (n=33)		Control Group (n=28)			
			n	%	N	%		
Energy Intake	Before	Poor	31	93.9	25	89.3	56	91.8
		Good	2	6.1	3	10.7	5	8.2

		Good	25	75.8	21	75	46	75.4
	Total		33	100	28	100	61	100
	After	Poor	8	24.2	9	32.1	17	27.9
		Good	25	75.8	19	67.9	44	72.1
Total		33	100	28	100	61	100	

The effect of nutritional consultation on energy intake, protein intake, and nutritional status of samples in the treatment group and the control is observable on Table 3.

The table shows that the level of adequacy of energy intake that there is no significant difference in the level of appropriateness of energy intake between the treatment and control groups after the intervention, with a p-value of 0.595. The average percentage of energy sufficiency level after the intervention was 72.5 + 24.21% in the treatment group and 69.1 + 25.19% in the control group.

The independent t-test shows that the level of protein adequacy consumed by the respondents after intervention in the treatment group and control group indicates no significant difference (p-value 0.948) with a mean percentage of protein adequacy level after the intervention was 75.6 + 30.03% in the group treatment and 76.1 + 28.40% in the control group.

Further, before and after the intervention using the Mann-Whitney test showed that there were no significant differences in the two groups, with p-value values p= 0.789 and p= 0.954.

Table 3. Differences in Energy Intake, Protein Intake, and Nutritional Status Before and After Intervention

Research Variables		Treatment (n = 33)	Control (n = 28)	P
		Mean ± SD	Mean ± SD	
Energy Intake	Before	56.3 ± 21.45	54.7 ± 15.42	0.740
	After	72.5 ± 24.21	69.1 ± 25.19	
Protein intake	Before	66.1 ± 32.36	68.6 ± 18.29	0.723
	After	75.6 ± 30.03	76.1 ± 28.40	
Nutritional Status	Before	21.84 ± 2.25	22.07 ± 2.77	0.789
	After	22.67 ± 3.87	22.62 ± 3.91	

DISCUSSIONS

Giving nutritional counseling to CKD patients with hemodialysis can increase the number of good energy intake because the CKD patients with hemodialysis must get sufficient food intake to remain in proper nutrition. Poor nutrition is a significant predictor of death in hemodialysis patients. The results of good protein intake where all samples can reach 29.5% indicate a better achievement compared to the effects of previous research^(5,6).

The sharp protein intake in 31 treatment respondents increased by 6.1% before treatment, while in the control group there was no increase or decrease in good protein intake. This way, giving nutritional counseling to patients with CKD with hemodialysis also can change the number of inadequate protein intake into a better one. So it is recommended that nutrition counseling is more often done by nutritionists to increase the knowledge of patients with the hope that the protein intake can become better.

After the research, the decline in good nutritional status occurred in the control group, while the treatment group did not change the nutritional status. Thus, it can be concluded that the provision of nutritional counseling can prevent the decline in the good dietary state of CKD patients with hemodialysis, considering that patients with CKD tend to experience weight loss due to complaints of nausea and no appetite (anorexia) that often occur in patients⁽⁷⁾.

The differences in the level of adequacy of energy intake and protein intake before and after treatment samples were analyzed by independent t-test obtaining no significant differences between treatment groups and control groups with values p-value of 0.595 for energy intake and a p-value of 0.948 at the level of protein intake. Further, the differences in the state of the nutritional status of the sample before treatment and after treatment were analyzed by test Mann-Whitney denoting there was no significant difference between treatment and control groups with p-value values $p = 0.789$ and 0.954 respectively.

Although the results of this study did not show a significant difference in the intervention in the form of providing nutritional counseling services to energy intake, protein intake, and nutritional status of respondents, based on univariate analysis, there

was a better condition in the treatment group than the control group. The increase in good energy intake in the treatment group was 21.2%, while the rise in good energy intake in the control group was 7.2%, as well as an increase in good protein intake in the treatment group at 6.1%, while in the control group there was no increase in intake percentage good protein. In the nutritional status, the treatment group did not change the nutritional status percentage, while in the control group there was a functional decline in nutritional status from 75% before the study, to 67.9% of respondents with good nutritional status.

The success of nutrition counseling service activities is strongly influenced by patient compliance in undergoing diet therapy⁽⁷⁾, but from various studies in Indonesia mainly, shows that adherence to treatment of chronic diseases is generally low^(8,9,10). Thus, further research is needed on the things that affect the success of nutritional counseling services in CKD patients with hemodialysis.

CONCLUSION

Nutrition counseling services by nutritionists for Chronic Kidney Disease (CKD) patients with hemodialysis must be improved in terms of quantity and quality of service. Considering that CKD patients with hemodialysis mostly experience the decrease in appetite, it is expected that the family will motivate and pay attention to the patient's food intake. Further research needs to be done on other factors such as appetite, duration in hemodialysis, adherence to diet and gender therapy with nutritional status in patients for CKD patients with hemodialysis.

Association of Physical Workload with Salivary Cortisol in Clinical Pharmacist

Errisa Sulfiana¹, Abdul Rohim Tualeka², Noeroel Widajati²

¹Student in Magister of Occupational Health and Safety, ²Lecturer in Department of Occupational Health and Safety, Faculty of Public Health, Airlangga University, Campus C Mulyorejo, Surabaya-Indonesia

ABSTRACT

Objectives: Identify physical workload, identify salivary cortisol levels in clinical pharmacist, analyze physical workload and cortisol levels in clinical pharmacist **Method:** using calorimeter HR watch to measure physical workload specifically for work metabolic, and using ECLIA method to measure salivary cortisol **Results:** There was a 47.1% correlation between physical workload and cortisol levels.

Keywords : Pharmacist, Workload, Stress, And Salivary Cortisol.

BACKGROUND

Prolonged negative stress can affect physical and psychological health. Its called distress, can affects the intentions, appearance and daily behavior while working, if the level of distress increases in a company and industry, then there will be decreased performance and the emergence of several diseases caused by stress²⁷. Reaction to stress, in the defense mechanism of the body, physically and psychology known as General Adaptation Syndrome (GAS)²⁷. There are consist of, the first stage is the alarm stage, then the stage of survival and fatigue stage²⁷. At the alarm stage is notification to the body about events that are not in accordance with the expectations, it is necessary to adjust psychologically by physiological coping and adjustment mechanism, where this phase of the body began to secrete hormones for defense. In the autonomic nervous system there are two processes that must run simultaneously when the stress is approaching, the sympathetic nervous system that makes coping mechanisms and parasympathetic nervous system responsible for the increase of the hormone cortisol²⁷.

When stress comes, the kidney-parasympathetic kidney system (the adrenal cortex) secretes excessive hormones through the central nervous system of the pituitary gland. The hormone cortisol will affect the metabolism of proteins, carbohydrates and fats in the body. The protein synthesis is reduced and glucose production is enhanced by the mobilization of glycogen reserves, as well as the release of fatty acids into the blood. As a result of these changes, the body can adapt to stressful pressures that threaten it, and therefore cortisol plays an important role in the metabolism of carbohydrates. The effect of catabolism from cortisol causes the inhibition of protein formation of amino acids, whereas glucose conversion is accelerated, whereas potassium increases excretion by maintaining electrolyte and water balance.

Measurement of cortisol in the body especially in the salivary glands has been set as a bio indicator of individual stress response²⁰. There is a significant relationship between cortisol in saliva and the hormone cortisol in the body²⁸. Cortisol in saliva occurs as a result of activation by the adrenal cortex gland at the alarm stage of the general adaptation syndrome process. Therefore long-lasting stress will continuously increased with very different levels as normal cortisol as usual in the body. This will cause changes in function and hormones in the body that should be in a state of normal and down at night but levels remain high at night, especially the hormone cortisol¹¹.

The greatest factor of job stress in the pharmaceutical worker is the result of much work to be done. That Caused also by a change of mindset and the times, of which initially only aimed for an increase in drug services turn out to be an increase in services to patients¹³. In Johnson et al (2014) study due to overworked workload and the large number of duties of pharmaceutical workers, the turn-over rate increased as well as the occurrence of burn-out syndrome due to the very defeat, causing illness to the pharmaceutical workers. Physiologically, when pharmaceutical workers, are required to work effectively and efficiently, the body will release hormones to match the workload. The hormone release cortisol that is needed in the metabolism of carbohydrates and fats for energy formation will soon be adjusted to the needs of the worker's body. This situation is abnormal if the load exceeds the limit that is given that could not be tolerated to cause mental and physical stress, and ultimately change concentrations several hormones in the body quickly¹¹. The level of salivary cortisol before work and after work can be a biomarker of stress level of physical and mental effort pharmacy so that mistakes in work such as medication errors, and achieve productivity with efficiency and effectiveness in working on the recipe and do not damage the health of workers .

MATERIALS AND METHOD

The study conducted in Pharmacy Installation of Bhakti Dharma Husada General Hospital, Surabaya, East Java province, Indonesia. Population of the study were clinical pharmacist under the pharmacy installation, and worked on emergency unit, outpatient unit, inpatient unit, and drug warehouse, with total population of 20 clinical pharmacist. The variables in this study were cortisol in saliva as dependent variable, and physical workload as independent variable. The physical workload is measured using calorimeter HR watch. The calorimeter used for 4 hours as long as they work. Levels of salivary cortisol were measured using the ECLIA method (electron chemo luminescent immune assay) taken during and before work.

RESULTS AND DISCUSSION

Pharmaceutical activity such as pharmaceutical preparation, medical devices and medical consumables and clinical pharmacy services demanding very heavy and exhausting physical and mental activity. As a result of physical and mental activity there is an imbalance between

the tasks that must be done by pharmaceutical personnel with physiological capacity owned by pharmaceutical workers. This imbalance causes adaptation mechanism. At the time of the adaptation mechanism the body will activate the HPA axis, by producing a large cortisol and channeled to several organs for use as a mechanism of body adaptation to workload. This is done so that the body can perform metabolic processes to produce enough energy to meet the physical and mental demands of pharmaceutical personnel.

Physical work is an activity to complete a job requiring physical energy in the human muscle that will serve as a source of energy. Physical work will be entirely dependent on human efforts that serve as a source of energy and work control. Physical demands on pharmaceutical workers such as work stations, workplace layouts, work tools and equipment, working conditions or workplace, work attitude. Physical demands require muscle work during the working period, and energy consumption is a major factor in making the benchmark determinants of weight / light of a job.

The physical work load measuring instrument uses the ultimate gear calorimeter watch. Pharmaceutical workers in pairs of these tools when they start to work and released after the respondents use these watches for 4 hours they work. This HR watch calorimeter works by keeping track of the calories released by the user's body, the calories in the can from the results of metabolism. Metabolism is a chemical process to change some substances especially carbohydrates out heat, that heat will be recorded by the calorimeter. The metabolic process is strongly influenced by the body area then height and weight data is required. If the metabolism process occurs then the activation of HPA axis also occurs, because HPA axis is the activating process of metabolism.

The results of measurements of 16 pharmaceutical workers to remove calories of 100 -200 calories and included in the category of light workload, while 4 people remove calories from 201 to 350 calories and included the category of medium workload. Pharmaceutical work is a category of light work, because pharmaceutical work does not require much muscle activity. The results of the observation of the respondents are more like entering patient data, preparing recipe and communication to fellow colleagues. Activities that are not in a sitting position are when taking drugs on shelves, in warehouses,

counseling with patients and distributing drugs to the spaces and visit with other colleagues.

The measurement of the physical workload using the calorimeter becomes less precise because the number recorded on the monitor is the heat released by the body due to metabolism, while the pharmaceutical work in the cold and moist heat, so that the release of body heat is hampered by cold room. The cold room is required to maintain the stability of drugs stored in the same room where the pharmacy works. Physical workload will produce fairly accurate results if measured not only calories, but calculate the overall energy needs¹⁰. Energy requirements are needed for basal metabolism, metabolism rest and metabolism work.

The result of statistical analysis, the correlation coefficient of kendall-tau obtained is 0.228, with the strength of the relationship of 47.1%. Correlation coefficient is a test to see how the relationship between independent and bounded variables. Coefficient is 0.228 can be said to be closer to the number 0 which means having a weak relationship, with the strength of the relationship is only 47.1%. The relationship between the variables is weak because the researchers only perform the measurement of 1 metabolism results alone, while for measure physical workload in need calculate the total metabolism. Levels of cortical have metabolic functions throughout the body so it needs to be measured overall as basal metabolism and rest should also be measured. The researchers did not make the measurements because of the limitations of pulse measuring devices, heart rate measurers, and health workers in hospitals unlike workers who have hours of rest because the service to patients is preferred if doing a complete measurement will disrupt the pharmaceutical job.

Results from the measurement of cortical levels 20 pharmaceutical population of 5 people had elevated levels of cortical after work. When viewed from the workload that tends to be mild and moderate, 5 pharmaceutical workers are producing excessive levels of cortical. This abnormal level of cortical may occur because the pharmaceutical worker must continue to perform all of the pharmaceutical work to serve the patient, other peers, while in the body continuously activates the HPA axis pressure, causing cortical levels that do not follow the rhythm diurnal with the level high because it always activates cortical secretion.

According to Manauba (2000), task demands in this case the task and material characteristics, organizational characteristics and environmental characteristics must be balanced with a person's work ability, if the demands of work are too low or too high will cause stress. Judging from the demands of pharmaceutical work is in need of speed and accuracy, while the physiological ability of the pharmaceutical workers is cortical levels in abnormal circumstances, there is an upside down situation. This situation is turning to prepare a work full of pressure so that the body is always vigilant. Jobs that are too low because of the work of pharmacy is a job that is not much use of muscle, so that energy is not much for physical activity but mental activity, so it needs to do a review related to the pharmaceutical task in do 5 people. Working efficiently is expected to increase the rest time so that it can be productive again, while not working for 1 month, it is necessary to reduce the task because the pharmaceutical worker is still in the process of adjusting the given task.

CONCLUSION

Physical workload for clinical pharmacist in pharmaceutical installations in hospitals account for 16 pharmaceutical workers have calories of 100 - 200 calories in the category of light workload, while 4 people have calories from 201 to 350 calories and in the category of medium workload There is a weak correlation between the physical workload is 0,228 with the strength of the relationship is only 47.1%.

Knowledge and Attitudes of Nursing Staff in AL-Suwaira General Hospital about Cervical Cancer

Ahmed Kadhim Jawad

Technical Nursing Department, Technical Institute-Suwaira, Middle Technical University, Iraq

ABSTRACT

Objective(s): To assess level of knowledge and attitude to nursing staff about cervical cancer in Al-Suwaira general hospital.

Material and Method: A descriptive cross-sectional study using questionnaire include (150) female nursing staff selected from Al-Suwaira General Hospital. Sampling technique was simple random sampling. The data collection through direct interview by researcher with each sample lasted from 5th December 2017 to 1st March 2018. The study was approved by the Center Ethical Committee. The data analysis methods used in order to examine and evaluate the results of study by applied (SPSS) program: Frequency distributions, percent and mean of score were calculated to illustration nurse's knowledge and attitudes about cervical cancer.

Findings: This study indicated that (68.0%) of respondents recognized that Pap smear is used for recognition of cervical cancer. Only (31.3%) knew human papilloma virus infection as a risk factor, (60.7%) knew that cervical biopsy is used for diagnosis of cervical cancer, most of participants were (60.7%) knew the Pap smear test that can be used for prevention of cervical cancer. Approximately (70.0%) believed that cancer in cervix treated by Chemotherapy, (65.3%) were in absence of indication to responses for not screening patients and (65.3%) were no reason to reasons for not getting self-Pap smear. In all responses were inadequate knowledge of cervical cancer and negative attitude.

Conclusions: The majority of nursing staff in Al-Suwaira general hospital may have inadequate knowledge and their negative attitude about cervical cancer.

Recommendations: Emphasis on routine training through health education programs by seminars, lectures and courses about cervical cancer on a regular basis or as part of the orientation program for female nursing staff.

Keywords: Cervical cancer, knowledge, Nursing staff, Attitude.

INTRODUCTION

Cervical cancer is disease of public health concern world-wide. It's kind of cancer that arises in the cells of cervix that is inferior part of uterus that connect to vagina [1]. It's second greatest common cancer amongst women world-wide and appraised 530,232 new cases and 275,008 deaths, approximately 86% of cases arise in developing countries, representative 13% of female cancers [2,3]. Though, it's considered one of the most avoidable cancers. Population based cervical smear screening programs for cancer in cervix have shown the effectiveness of screening in decreasing mortality

[4]. Greatest woman with cervical cancer in countries existing with progressive disease, resultant in little cure rates. Numerous reasons contribute to great burden of disease and advanced phase at presentation including lowly knowledge about disease additionally there is an absence of screening amongst overall population [5].

Cervical cancer is essentially produced by persistent infection with certain kinds of human papillomavirus (HPV) are responsible for nearly 70% of cervical cancer cases in whole countries around the world [6,7]. Traditional hazard reasons for increasing cervical cancer such as numerous sexual partnerships, young

age at first pregnancy,oral-contraceptive use,smoking, immunosuppressive disease and sexually transmitted diseases [8].

Iraq have 10.74 million of population in women at the ages 15 years and older who may be danger of developing cervical cancer. Recent assessments that each year 291 women diagnosed with cervical cancer and die 142 from disease. Cervical cancer positions as 12th most recurrent cancer amongst women in Iraq and the 10th most recurrent cancer in women amongst (15) and (44) years of age [9].

Treatment of cervical cancer reliant on phase of disease, age and medical state of patient, features of tumor.Routes could be monotherapy or combined; they range from ionization of the cervix,simple hysterectomy with or without lymphadenectomy,radical hysterectomy with pelvic lymphadenectomy,pelvic exenteration, chemotherapy, radiotherapy, to palliative chemotherapy. Treatment in the early phase has the greatest prognosis with the maximum cure rates [10].

MATERIAL AND METHOD

A descriptive cross-sectional study carried out (150) female nursing staff selected from AL-Suwaira General Hospital, to study their knowledge and attitudes about cervical cancer. Selection of sampling Technique were simple random sampling were each member of a

population has the similar chance of being included within the sample.The data collection was through the direct interview by researcher with each sample lasted from 5th December 2017 to 1st March 2018.The study instrument (questionnaire) which contain three parts:**Part 1:** Socio-demographic characteristics,the questions in this module contains 4 items.**Part 2:** Nursing Staff knowledge,The knowledge question consist of (34) items, Correct response and incorrect response are distributed with (1, 2 and 3) scoring scale, answered know, not sure and don't know ,correct response were (know) while incorrect response were (not sure and don't know).**Part 3:** Nursing Staff Attitudes,The attitudes question consist of (11) items, assessment by scores scales (Yes, and No) in relative to (1 and 0) respectively.

The data analysis methods were used in order to examine and evaluate the results of the study under application of the statistical package (SPSS)ver. (21):Frequency distributions, percent and mean of score were calculated to display the knowledge and attitudes of nurses about cervical cancer. Knowledge scores ranged from 1–3 and the level of (1 – 2) was set for inadequate knowledge and (2.1–3) for adequate knowledge. The responses of participants over attitudes statement were measured on scores ranged from 1–3, Score of ≥ 1.5 was taken as positive attitude, while < 1.5 as negative attitude.

FINDINGS

Table (1): Distribution of the Socio-demographic Characteristics among samples

Socio-demographic characteristics		F	%
Age	19-23	69	46
	24-28	49	32.7
	≥ 29	32	21.3
	Total	150	100
Marital Status	Married	90	60
	Unmarried	51	34
	Widowed	4	2.7
	Divorced	5	3.3
	Total	150	100

Cont... Table (1): Distribution of the Socio-demographic Characteristics among samples

Educational Level	Nursing Secondary	75	50
	Nursing Institute	47	31.3
	Nursing Bachelors	25	16.7
	Nursing Master and above	3	2
	Total	150	100
Residence	Urban	113	75.3
	Rural	37	24.7
	Total	150	100

F = Frequency, % = Percentage.

Table (1) shows that the majority of sample at the age (19-23) years. The high percentage of participants were (60 %), (50 %) and (75.3 %) for married. "Education of level" at nursing secondary and "Residency" in urban respectively.

Table (2): Distribution the Knowledge of samples about Cervical Cancer

Items	Correct response		Incorrect response	
	F	%	F	%
Cervical cancer is a disease of public health concern	136	90.7	14	9.3
Pap smear used for detection of cervical cancer	102	68.0	48	32.0
If cervical changes are found early they are easily curable	61	40.7	89	59.3
Risk factors of cervical cancer

F = Frequency, % = Percentage.

Table (2) this table revealed that knowledge of nurses participants, the number that given a bold pattern illustrate the high percentage of correct and incorrect response.

Table (3):Distribution the Attitudes of samples about Cervical Cancer

Items	Yes		NO	
	F	%	F	%
Responses for not screening patients				
Absence of indication	98	65.3	52	34.7
Lack of vaginal speculum	67	44.7	83	55.3
Speculum examination and pap smear are doctors procedure	69	46.0	81	54.0
Not applicable	58	38.7	92	61.3
Reasons for not getting self pap smear				
No reason	98	65.3	52	34.7
Not feeling at risk	67	44.7	83	55.3
Lack of symptoms	70	46.6	80	53.4
If women is a virgin, pap smear test will affect virginity	74	49.3	76	50.7
Feeling shy to have pap smear	78	52.0	72	48.0
Afraid of outcome	86	57.3	64	42.7
Not applicable	64	42.7	86	57.3

F = Frequency, % = Percentage.

Table (3) shows that the responses for not screening patients, a (65.3%) of respondents thought absence of indication. Regarding to reasons for not getting self-pap smear, most (65.3%) of respondents cited “no reason” for not undertaking a Pap smear test.

Table (4): Measure the level of Knowledge and Attitudes to samples about Cervical Cancer

Knowledge			
Level	M.S	F.	%
Inadequate	1 – 2	118	78.6
Adequate	2.1 – 3	32	21.4
Total	1 – 3	150	100%
Attitudes			
Positive	≥ 1.5	65	43.3
Negative	< 1.5	85	56.7
Total	1 – 3	150	100%

F = Frequency, % = Percentage, M.S = mean of the score.

Table (4) this table indicate that the overall level of knowledge and attitudes to samples about cervical cancer was inadequate knowledge (78.6 %) and negative attitude (56.7 %).

DISCUSSION

Cervical Cancer is avoidable disease and key feature of its prevention is discovery of its premalignant form by screening at an early age [11]. The study showed that most of samples at age (19-23) years, were (46%). According to marital status the highest number of nurses were married (60%). These results were similar to study [12], showed (54.6 %) of participants were married. Relative to educational level a large percentage of nurses were (50.0 %) among nursing secondary. The study incompatible with result [5], suggested that the majority of nurses staff were (87.2%) among Bachelor. This difference may be due to presence of nursing secondary in the district of Al-Suwaira where graduated a number of nursing cadres be employed in the Al-Suwaira general hospital. Regarding to residency the majority of the participants were (75.3 %) in urban. These findings are consistent with previous study [13], found that highest percentage of nursing staff were (60.7%) in urban.

Regarding to knowledge of nursing staff about cervical cancer, from all participants, were (90.7%) knew cervical cancer is disease of public health concern. This result is agreement with results [14], mentioned that the high percentage were (63.2%) aware the cervical cancer is disease of public health concern, in all responses were (40.7 %) of them recognized that if cervical changes are found early they are easily curable. This results not

similar to study [14], found (75.9%) knew if cervical variations are establish early they are easily curable. This difference may be due to different educational level between countries.

Responses of nursing staff about risk factors of cervical cancer were (31.3%) correctly responses HPV infection as cause of cervical cancer and heredity (34.0%) as a risk factors for cervical cancer. This study result coincides with results [2], showed (38.6 %) and (31.0%) of participants knew that the HPV and heredity, respectively, as cause of cervical cancer.

A small proportion of the nurses had adequate knowledge of signs and symptoms of cervical cancer then were correct responses (27.3%), (30.7%) and (25.3%) as foul smelling excessive vaginal discharge, abnormal vaginal bleeding, post-coital vaginal bleeding respectively. The results of this study is compatible with study [5], found responses of nursing staff were small in excessive vaginal discharge, abnormal vaginal bleeding and post-coital vaginal bleeding as (20%), (40%) and (3%) respectively. This explained unaware the nursing staff about signs and symptoms of cervical cancer in countries.

According to who should be screened for cervical cancer, for each participants were low percentage gave correct response as (28.0%), (23.3%) and (28.0%) in married women, women \geq 30 years of age and women < 30 years of age respectively. This result is agree with finding [15], found small responses for who should be screened for cervical cancer then were (25.1%), (40.5%) and (34.3%) in married women, women \geq 30 years of

age and women < 30 years of age respectively.

Regarding to diagnostic modalities other than pap smear, were (22.7%) of participants knew around visual inspection after acetic acid application (VIA), (26.7%) knew about Colposcopy and the high proportion of respondents were (60.7%) knew about cervical biopsy used diagnosis of cervical cancer. These results are agreement with result ^[2], found (4.5%) knew around (VIA) and (19%) knew about Colposcopy. Also another studies were done by ^[14,15], showed a large number of participants were (89.5%) and (94.1%) respectively, knew about cervical biopsy used diagnosis of cervical cancer.

According to prevention of cervical cancer, a large proportion of participants were (60.7%) knew about Pap smear test can used to prevention of cervical cancer. This results is compatible with results ^[5], found the high response were (75%) knew about Pap smear test can used to prevention of cervical cancer.

The greatest common treatment of cervical cancer identified from all participants was chemotherapy (70.0%). The present study is consistent with results ^[13], showed chemotherapy was most common (77.2%) form of treatment recognized by the participants, another study is disagree with our results ^[10], found a high percentage of participants were (70.8%) gave correct response about radiation therapy. This difference may be due to the belief of the majority of nursing staff in Iraq that the treatment of most cancers is using chemotherapy.

Regarding to attitudes of nursing staff about cervical cancer, responses for not screening patients, a (65.3%) of participants thought absence of indication, followed by speculum examination and pap smear are doctors procedure (46.0%), lack of vaginal speculum (44.7%) and (38.7%) were response for not applicable. This study is incompatible with results ^[14], found most responses were (79%) in speculum examination and Pap smear are doctors procedure, followed by not applicable (53.4%), absence of indication (16.1%) and (8%) were in lack of vaginal speculum. This difference may be due to the different belief of the respondents between countries, as well as the reason, according to the examination conducted in each country.

Responses of participants about reasons for not getting self-pap smear were (65.3%) to no reason for concern a Pap smear test. This result is similar to study

^[15], showed a large number of participants were (43.5%) gave answered for no reason to Pap smear test. This means that in every country there is not enough reason not to have self-examination or a Pap smear test.

Regarding to overall level of knowledge to nursing staff about cervical cancer was inadequate knowledge (78.6 %). This study is consistent with result ^[15], found the level of knowledge to nursing staff about cervical cancer were inadequate (73.3%) of respondents, also another study done by ^[12], showed the nursing staff have a moderate level of knowledge regarding cervical cancer. This may explain the lack of understanding of the nursing staff about importance and severity of cervical cancer, and also may be due to similar educational level between countries. According to the overall level of attitudes to nursing staff about cervical cancer was negative. This result is similar to results ^[14], found attitudes to nursing staff about cervical cancer were negative of all responses. This may illustrate due to comparable education level between countries.

CONCLUSIONS

The majority participants were nursing staff at the age of 19-23 years, most of them were married and have completed their nursing secondary. The overall level of knowledge and attitudes were inadequate knowledge and their negative attitudes about cervical cancer.

RECOMMENDATIONS

Emphasis on routine training through health education programs by seminars, lectures and courses about cervical cancer on a regular basis or as part of the orientation program for female nursing staff. Furthermore, if nurses themselves undertake screening test repeatedly, they can be part models for the other females.

ABSTRACT

Background: Pneumonia is an acute infection of the lung tissue (*alveoli*) most prevalent in infants. Home physical environment that does not meet the health requirements is to trigger the occurrence of the disease. This study aims to determine the relationship between the home physical environment with pneumonia in infants.

Method: The method used is a case-control with an analytical approach. 60 respondents are selected where 30 respondents serve as a treatment group, and the rest is as a control one. The research was conducted in Baturaden, Banyumas Regency, Central Java, Indonesia. The variables studied are living room ventilation width, window width, wall type, floor types, and room occupation density. The research employs Chi-Square test to find the relationship between variables.

Results: The results showed the physical environment of the house that has a significant relationship with the incidence of pneumonia among children.

Conclusion: Since the physical environment of the house still risk factors for pneumonia ignored by the community, the community health center must play more active roles in disseminating the information to the society about the importance of proper physical environment condition.

Keywords: *Physical environment, house, pneumonia, children, window*

INTRODUCTION

Factors affecting the health of both the individual and the public are an environment, behavior, services, and descent ⁽¹⁾. Environmental factors are the most prominent factor to do with the transmission of diseases, especially infectious diseases. The closest environment to the human being is housing as people spend time sitting at home making the house as a residence must always consider the aspects of health.

Pneumonia kills more children than any other disease, covering nearly 1 in 5 deaths of children and infants, killing more than 2 million children under five each year and the majority occur in developing countries ⁽²⁾. World Health Organization (WHO) estimates that the incidence rates of pneumonia in countries with infant mortality rates above 40 per 1,000 live births are 15% -20% per year in the toddler age group. The incidence of

pneumonia in Indonesia in infants is estimated between 10% - 20% per year.

Central Java Province ranks the fifth in the number of pneumonia of children under five around 18, 477 cases, and when seen from the case fatality rate (CFR)'s infants, the province is ranked the 16th with numbers of CFR approximately 10% ⁽³⁾.

Banyumas District as one of the regencies in Central Java displays the of cases of pneumonia with were 860 where the highest position was found in the area of Baturaden with the prevalence of 87 cases. Previous research ⁽⁴⁾ showed that the physical environment of the house that has a relationship with the incidence of acute respiratory infections are the humidity, ventilation, types of floor, and occupant density but the temperature and lighting of the house that does not have a significant relationship but risky. As such, this research would like to expand the previous study by identifying factors

related to pneumonia in children by observing the physical condition of the houses.

METHODOLOGY

This research is an analytic observational study using a design of *case-control* comparing the physical environment of respondents homes or patients with non-cases ones. The research was conducted with the physical condition of houses regarding the total area of ventilation, spacious windows, type of wall, floor types and density of occupants with children under five years of age. The population in this study were all toddlers in Health Community Service or *Pusat Kesehatan Masyarakat* Baturaden II with the sample size of 30 infants diagnosed suffering from pneumonia and the control as many as 30 healthy infants. Data collected then tabulated and analyzed descriptively with a frequency distribution table as well as Chi-Square to see the relationship between the dependent and independent variables.

RESULTS

Ventilation of family room in case group showed 27 respondents (90%) include the category of not eligible (<10% of floor area) and three respondents (10%) include the suitable (floor area \geq 10%). Further, 30 measurements in the control group showed 16 respondents (53.3%) including ineligible categories (<10% of floor area) and nine respondents (15%) including in the category of meeting the requirements (\geq 10% of floor area). Further, the results of chi-square test showed p-value 0.004 less than $\alpha = 0.05$, revealed the significant association between the family room ventilation with the incidence of pneumonia in young children. Besides, the calculation of odds ratios indicates the value of 7.875 meaning toddlers in the family room ventilation conditions that do not meet the requirement will have 7.875 times (rounded to 8) higher risk for pneumonia than the family room ventilation conditions complying to the health requirement.

Window size in the case group showed 29 respondents' (96.7%) property were in ineligible (< 20% of floor area) and only one respondent (3.3%) meeting the requirement of health standard (\geq 20% of floor area). In the other hand, in the control group, there were 25 respondents (83.3%) included into ineligible categories (<20% of the floor area) and five respondents (16.7%) included in the group of eligible (\geq 20% of floor area).

The results of chi-square test showed p-value 0.001 smaller than $\alpha = 0.05$ indicating there is a significant relationship between the window size with pneumonia in young children. The calculation of odds ratios report the value of 5.800 meaning toddlers with an odd volume of windows are risky 5.800 (rounded to 6) times higher to be infected with pneumonia.

The wall condition in a case group indicated four respondents' (13.3%) walls are not eligible and 26 respondents (86.7%) had suitable family room walls (waterproof). Besides, in control group there were three respondents (10%) had ineligible family room walls and 27 respondents (90%) had waterproof wall room. The results of chi-square test showed p-value 0.001 smaller than $\alpha = 0.05$ indicating there is the significant relationship between the condition of living room wall with the incidence of pneumonia in young children. The calculation of odds ratios indicate the value of 1.385 meaning toddler with improper living room wall will be at risk 1.385 (rounded to 1) time greater than those in the waterproof living room.

The conditions of the floor in case group revealed two respondents (6.7%) had a property floor that is not waterproof and 28 respondents (93.3%) had the waterproof floor. In control group only one respondent (3.3%) with the non-waterproof floor. The results indicates that both control and case groups have been in compliant with the requirement. Chi-square test showed p-value= 0.001 smaller than $\alpha = 0.05$ suggesting there is a significant relationship between the type of living room floor with the incidence of pneumonia in young children. The calculation of odds ratios indicate the value of 2.071 meaning toddlers with the non-waterproof floor will be at risk 2.071 (rounded to 2) times greater to be affected by pneumonia.

The room occupation density refers to the number of people sleeping in the bedroom (maximum 3). In case of the group, there are 28 respondents (93.3%) whose bedroom was crowded and only two respondents (6.7%) included in the category of eligible occupant density. In the control group, there were 27 respondents (90%) fall into not qualified occupant density, and three respondents (10%) fall into the category of eligible occupant density. Results categorization generally indicate that bedroom in both control and case groups are occupied by many people which is typically in rural areas due to big family members. Chi-square test shows the p-value 0.000 less

than $\alpha = 0.05$, revealing the significant relationship between the density of occupancy with the incidence of pneumonia in young children. The calculation of odds ratios indicate the value of 1.556 meaning the toddler sleeping with many family members are at risk 1.556 (rounded to 2) times greater to be affected by pneumonia.

DISCUSSION

Spacious living room ventilation has a significant relationship with the incidence of pneumonia in infants. The result of the study is in line ⁽⁵⁾ which shows that large family room ventilation associated with acute respiratory infection in infants.

Spacious house ventilation function for setting the air, because the condition of the walls of the house can contribute to the creation of humidity and temperature that allows germs will die or multiply. Spacious house ventilation air circulation is beneficial for the entry of ultraviolet light to reduce evaporation in the room. High humidity can be caused by moisture from human sweat and breathing which is dangerous to health if there is a cause of pneumonia ⁽⁶⁾.

Size of living room window has a significant relationship with the incidence of pneumonia in infants. The results are consistent ⁽⁷⁾ that the window size has an association with the occurrence of pneumonia in infants. Lack / insufficient ventilation (<10% of the floor area of the room) would make the pollutants in the room are longer and will add to the risk of exposure to contaminants in the place ⁽⁸⁾. The window would not function properly if kept closed or are permanently made of glass that can not be opened. The window that cannot be opened would make the bedroom becomes stuffy and humid enabling the development of pathogenic microorganisms, one of the organisms that cause pneumonia. Therefore, the windows should also be impermanent to be open every day so that air can flow out smoothly ⁽⁹⁾.

Wall function is a supporting the roof to protect the house against rain, heat, and wind from outside. Type of wall has a significant association with the incidence of pneumonia in infants. The magnitude of the risk of suffering from pneumonia could be seen from OR = 2.9 means children under five living in the house with the condition of the wall, did not qualify with a risk of pneumonia was three times greater than toddlers who stay at home with the state of the house walls meet requirements. The results of this study differ ⁽¹⁰⁾ which

showed that no significant relationship between the type of wall with acute respiratory infection in infants.

The house with an earthen floor will cause home space hot, dusty, and more humid. Warm temperatures can increase evaporation in the room, so it's not just the humidity increased, but also the content of pollutants coming from home building materials. High humidity (> 80%) is a good condition for the growth and survival of bacteria cells (pneumococcus) so that the bacteria can multiply. State of the floor has a significant relationship with the occurrence of pneumonia. The magnitude of the risk of suffering from pneumonia could be seen from OR = 3.9, which means children under five living in the house with this type of flooring is not eligible with a risk of pneumonia was four times greater than toddlers who stay at home with this type of flooring qualifies. The risk of pneumonia would be higher if the toddlers often play on the floor that is not eligible ⁽⁶⁾.

House floor construction must be watertight and always dry so it can be easily cleaned of dirt and dust, but it can avoid the rising groundwater that can increase the humidity in the room. To prevent the ingress of water into the house, the floor should be raised approximately 20 cm from the ground. The floor made of the soil should not be used anymore because during the rainy season, this floor will be moist and can cause diseases to occupants. Therefore it is necessary to install tiles or waterproof coating ⁽¹¹⁾.

There is a significant correlation between the density of occupant with the incidence of pneumonia in infants. More and more residents are gathered in one room is a potential risk for the transmission of a disease, especially for children who are relatively vulnerable to disease transmission ⁽¹²⁾. The solution that can be given if the family really can not afford the room economically is to arrange the items in the room and not too much stuff in the places. Crowded house occupants allow transmission of bacteria, viruses that cause respiratory illnesses from pneumonia through which the occupants of the house to the other occupants of the house easily and quickly.

CONCLUSION

The results of house physical condition relationship with the incidence of hepatitis A in children under five in Community Health Center or *Puskesmas* I Baturraden in Central Java, Indonesia are summed up as follows:

There is a connection between family room ventilation with the incidence of pneumonia in young children. The odd ratios indicate that toddlers in the family room ventilation conditions that do not meet the requirement will have eight times greater risk for pneumonia than the family room ventilation conditions complying with the health requirement.

There is a significant relationship between the window size with the pneumonia in young children. The odds ratio indicate that toddlers with an odd size of windows are risky six times greater to be infected with pneumonia.

Type of wall has a significant association with the incidence of pneumonia in infants. The odds ratio indicate children under five living in the house with the condition of the wall did not meet the health requirement will have a risk of pneumonia three times greater.

There is a significant relationship between the type of living room floor with the incidence of pneumonia in young children. The odds ratios indicate that toddlers with the non-waterproof floor will be at risk two times greater to be affected by pneumonia.

There is the significant relationship between the density of occupancy with the incidence of pneumonia in young children. The odds ratios indicate that the toddler sleeping with many family members are at risk two times greater to be affected by pneumonia

Efficacy and Safety of Mirabegron in Treatment of Overactive Bladder (Dose Range Study)

Ali Abdulbaqi Ali Ismael¹, Hayder Hakim Saleh²

¹CABMS, Lecturer, College of Medicine, University of Thi-qar, Republic of Iraq

²FICMS, Urologist, Al Hussien Teaching Hospital, MOH, Republic of Iraq

ABSTRACT

Overactive bladder (OAB) is a condition characterized by urinary urgency, usually accompanied by frequency and nocturia, with or without urge urinary incontinence. This prospective study aimed to discuss the pharmacotherapeutic aspects of mirabegron in treatment of overactive bladder. Hence a total of 71 patients with diagnosis of overactive bladder were enrolled and randomly assigned into two groups; mirabegron 50 and 100 mg who received 50 and 100 mg mirabegron, respectively and patients were followed for 8 weeks.

Only 66 patients completed the study. Mirabegron at doses of 50 and 100 mg once daily demonstrated improvement from baseline to final visit in reducing the mean number of micturitions per 24 hours which increased with mirabegron dose but no significant improvement between mirabegron groups. There's significant improvement between mirabegron groups in mean baseline to end-of-treatment for urgency episodes ($p < 0.001$) and level of urgency incontinence ($p < 0.01$). In conclusion, Mirabegron at doses of 50 and 100 mg once-daily over 8 weeks demonstrated satisfactory balance between efficacy and tolerability in Overactive Bladder patients.

Keywords: Overactive Bladder, Mirabegron, urinary urgency, nocturia, urinary incontinence

INTRODUCTION

Overactive bladder (OAB) is a condition characterized by urinary urgency, usually accompanied by frequency and nocturia, with or without urgency urinary incontinence¹. Urgency with at least one other symptom is essential to diagnose OAB. Thus urgency is the pivotal symptom. In many OAB patients, urge incontinence occurs, defined as involuntary leakage of urine, accompanied or immediately preceded by urgency². Overactive bladder affects 10-16% of the population in the world³. Rates were similar in men & women, increasing with age in both sexes, but, OAB wet is more prevalent in women and OAB dry is more prevalent in men⁴. Chronic, bothersome OAB-associated

symptoms significantly impact quality of life (QOL) and increase the likelihood of sleep deprivation, depression, falls, and fractures⁵⁻⁸. There are three main hypotheses proposed for etiological pathogenesis of OAB, the first is the Neurogenic, myogenic and integrative hypotheses^{2,9}. Unfortunately, many OAB patients remain undiagnosed and untreated. Successful treatment of OAB depends on a detailed evaluation and treatment in a timely fashion with vigilant follow up. There are many facets of management of the OAB, including pharmacotherapy^{2,10}.

Pharmacotherapy

The Currently available oral agents for therapy of the OAB are summarized in table 1

Corresponding author:

Ali Abdulbaqi Ali Ismael

Email. ali_abdulbaqi@yahoo.com

Table 1. Currently available oral agents for therapy of the OAB¹¹⁻¹³

Drug	Special consideration
Antimuscarinics Oxybutynin Tolterodine Solifenacin Darifenacin	Increased CNS effects and dry mouth/constipation Renally cleared
Beta -3 AR Agonist Mirabegron	May elevate Blood pressure
Antidepressants Imipramine Duloxetine	Elderly patients are susceptible to many side-effects ,should be used, with close monitoring, particularly for psychiatric and cardiac side-effects. Tricyclic antidepressant drugs have antimuscarinic activity

Mirabegron

Mirabegron is an oral medication that actively selects beta3 adrenoreceptors. It is a lipophilic compound .it is metabolized in the liver by cytochrome P450 3A4 (CYP3A4)and 2D6 (CYP2D6) to form its active compound¹⁴. Stimulation of b3-adrenoceptors elicits direct relaxation of detrusor smooth muscle¹⁵; Mirabegron is rapidly absorbed after oral administration and circulates in plasma in its unchanged form, its glucuronic acid conjugates, and other metabolites, which are pharmacologically inactive. Mirabegron is metabolized in the liver via multiple pathways^{14,16}. Mirabegron indicated in Urinary frequency, urgency, and urge incontinence. Cautions when history of QT-interval prolongation and use with drugs that prolong the QT interval its contraindication is severe hypertension¹⁷ . It is administered in 25,50,100mg once daily in adults¹⁸ .

MATERIAL AND METHOD

This was a prospective comparative study including 71 patients diagnosed with overactive bladder ,on follow-up in urology consultation unit and department in Ghazi AL Hariri surgical specialty hospital in Baghdad medical city complex, during the period from October 2013 to October 2015 , only 66 patients completed the study 34 in mirabegron 50 (received 50 mg) Mirabegron and 32 patients in mirabegron 100 (received 100 mg) Mirabegron . Patients with Clinically significant bladder outflow obstruction, significant postvoid residual (PVR) volume (>200 ml). Stress urinary incontinence , Indwelling catheters or intermittent self-catheterization, diabetic neuropathy, symptomatic urinary tract infection, interstitial cystitis, bladder stones, malignancy, previous pelvic radiation , Known or suspected hypersensitivity to

mirabegron, or any ingredient and clinically significant cardiovascular or cerebrovascular disease, were excluded. Patients in both groups followed for 10 weeks. Patients asked to rate the degree of associated urgency on the five-point of Patient Perception of Intensity of Urgency Scale (PPIUS) at each micturition or incontinence episode. Then the scale evaluated according to the scores where zero indicated no urgency, one for mild, two for moderate and 3 for severe urgency score of 4 indicated urge incontinence. At each visit the PPIUS score was assessed and Blood and urine samples tested to monitor the safety. Statistical analysis: with the statistical package for social sciences version 20 and appropriate statistical tests and procedures were applied, level of significance set at 0.05.

FINDINGS

Only 66 out of 71 patients (93%) completed the follow up period and they were 34 in mirabegron 50 and 32 in mirabegron 100 . The baseline demographic characteristics are summarized in (Table 2). Mirabegron 50 and100 mg resulted in a mean baseline to end-of treatment reduction of 2.3 and 2.25 micturitions per 24 h, respectively. Responders at the endpoint were 26.4 % for mirabegron 50 and 31.2 % for the mirabegron 100. There's no significant difference in improvement between both groups but a significant difference in urgency episodes and level of urgency incontinence ($p < 0.05$). Responders for urgency incontinence episodes (patients who became dry) were 41.1% for mirabegron 50 mg; and 46.8% for mirabegron 100 mg. Responders for urgency episodes (grade ≥ 3) were 14.7% for mirabegron 50 mg; and 21.8% for mirabegron 100 mg and for nocturia episodes was 20.5 % for mirabegron 50 mg; and 18.7% for mirabegron 100 mg. (Table 3

and 4).The overall incidence of Treatment-emergent adverse events (TEAEs) was almost similar across treatment groups and there was no evidence of a dose–response relationship. The overall incidence of TEAEs in Mirabegron 50 mg was (47%), and in mirabegron 100 mg group it was (43.7%), (Table 5). In terms of vital signs seemed to increase in a dose-related manner. No differences between treatment groups were observed with respect to ECG parameters. (Table 4) There was no significant change in mean PVR volume at 4 , 8 ml for mirabegron 50, and100 mg, respectively. There were no clinically significant changes in laboratory parameters.

Table 2: Demographic and baseline characteristics.

Characteristic		Mirabegron 50 mg (n=34)	Mirabegron 100 mg (n=32)
Age (years) mean ± SD		52.24 ± 7.78	50.63 ± 8.62
Sex, n (%)	Male	12 (35.3)	14 (43.8)
	Female	22 (64.7)	18 (56.3)
Type of OAB, n (%)	Urge incontinence only	16 (47.1)	12 (37.5)
	Mixed incontinence	8 (23.5)	10 (31.3)
	Without incontinence	10 (29.4)	10 (31.3)
Duration of OAB symptom(months) mean ± SD		41.24 ± 26.12	45.38±25.35

SD: standard deviation

Table 3. Adjusted changes from baseline to endpoint and estimated differences for efficacy variables by treatment group (full analysis set).

Characteristic	Mirabegron 50 mg (n = 34)	Mirabegron 100mg (n = 32)	P value
Micturitions/24hr after treatment	2.3	2.25	0.374
Mean volume voided/micturition(ml)	26.7	25.9	0.348
Urge Incontinence episodes/24hr after treatment	1.055	1.034	0.795
Urgencyepisodesper24hr after treatment	-1.57	-2.23	<0.001
Nocturia episodes/24hr after treatment	0.551	0.582	0.418
Level of urgency / 24 hrs	-0.17	-0.28	< 0.001

Table 4. Proportions of responders for selected efficacy variables at the study endpoint.

Variable	Mirabegron 50 mg (n=34)	Mirabegron100 mg (n=32)	P. value
Micturitions / 24 h	26.4%	31.2%	NS
Incontinence episodes/24	41.1%	46.8%	NS
Urgency episodes (grade ≥3)/24 h	14.7%	21.8%	Sig
Nocturia episodes/24 h	20.5%	18.7%	NS

*Responder definitions: micturitions, <8 micturitions/24 h; no incontinence episodes, no episodes of either urgency and nocturia.
NS: not significant (P.value > 0.05), sig: significant (P.value < 0.05)

Table 5. Treatment-emergent adverse events (TEAEs)

TEAEs	Mirabegron 50 mg (n=34)	Mirabegron100 mg (n=32)
Overall	47%	43.7%
Dry mouth	5.8%	5.9%
Constipation	5.8%	3.1%
Headache	5.8%	5.9%
Eye disorder (blurred vision)	2.9%	3.1%
HT	8.8%	6.2%
Tachycardia	2.9%	5.9%
Urinary retention	0%	0%
Liver function (GGT)	0%	3.1%
Others*	29.4%	28.1%

* Others TEAEs: nausea ,dyspepsia ,dizziness, fatigue, pruritus and skin rash.

DISCUSSION

Mirabegron at different doses demonstrated improvement from baseline to final visit in reducing the mean number of micturition per 24 h which increased with mirabegron dose but no significant improvement between mirabegron groups, which disagreed findings of Scorpio and Aries ^{12,19}

In the dose-ranging Dragon study, the primary efficacy results showed dose dependent decreases in mean number of micturition in 24 hours, which were statistically significant improvement compared with placebo ²⁰. In TAURUS study, the 50- and 100-mg mirabegron groups showed numerical improvements in mean number of micturition in 24 hours ²¹.

The responders for micturition frequency were 26.4 % for mirabegron 50 mg, and 31.2 % for the mirabegron 100-mg group. In Dragon study, it was 27.5% for mirabegron 50 mg, and 32.7% for the mirabegron 100-mg group ²⁰. For Secondary efficacy outcomes ,there's significant improvement between mirabegron groups in urgency episodes (p<0.001) and level of urgency incontinence (p<0.01), but there's no significant improvement in volume voided per micturition, urgency incontinence episodes and nocturia episodes . For Scorpio and Aries studies ^{12,19}, a significant improvements were found for both doses of mirabegron compared with placebo in all secondary efficacy outcomes. In the Dragon study, there's a dose-dependent increase in the mean volume voided/micturition, and a decrease in the number of incontinence episodes, number of UII and

urgency episodes ²⁰. The TAURUS study was demonstrate a numerical improvements from Month 1 to Month 12 in incontinence episodes in 24 hours, and MVV/micturition in the 50- and 100-mg mirabegron groups²¹ . For urgency incontinence episodes , the responders were 41.1 % for mirabegron 50 mg; and 46.8% for mirabegron 100 mg ,for urgency episodes (grade ≥3) were 14.7% for mirabegron 50 mg; and 21.8% for mirabegron 100 mg and for nocturia episodes were 20.5 % for mirabegron 50 mg; and 18.7% for mirabegron 100 mg. At the final visit, the percentage of responders for zero incontinence episodes was 43.4% and 45.8% in the 50- and100-mg mirabegron groups, respectively in The TAURUS study ²¹, responder analyses showed a significant improvement with mirabegron 50 and 100 mg in terms of dry rates, > 50% reduction in mean number of incontinence episodes/24 h at final visit In Nitti V W study ²². Dragon study, showed 41.7 % for mirabegron 50 mg; and 55.9% for mirabegron 100 mg ,for urgency episodes (grade ≥3) was 14.5% for mirabegron 50 mg; and 19.6% for mirabegron 100 mg and for nocturia episodes was 23.9 % for mirabegron 50 mg; and 14.2% for mirabegron 100 mg ²⁰. The TEAEs with an incidence of (47%), and (43.7%) in the 50- and 100-mg mirabegron groups, respectively. There was no evidence of a dose–response relationship . Safety data from Scorpio and Aries studies showed that the overall incidence of TEAEs was similar across treatment groups ^{12,19} . In the 12-month TAURUS study, the incidence of TEAEs was similar across the 50-mg mirabegron (59.7%), 100-mg mirabegron

(61.3%).The most frequent TEAEs included hypertension, dry mouth, constipation, and headache,

occurring at similar incidence rates across the treatment groups²¹. In Dragon, the incidence of TEAEs was (43.8–47.9%) across the mirabegron treatment groups. The most common drug-related TEAEs were gastrointestinal disorders, occurring at (8.3%) and (9.5%) across the 50-mg mirabegron and 100-mg mirabegron treatment groups, respectively. While dry mouth about (1.8%) and (3%) across the 50-mg mirabegron and 100-mg mirabegron treatment groups, respectively²⁰. No significant drug effect on systolic or diastolic blood pressure was observed; the net changes blood pressure from baseline in both mirabegron groups, were <2 mm Hg. The adjusted mean change in morning pulse rate from baseline was 2.6 bpm for mirabegron 50 mg and 4.9 bpm for mirabegron 100 mg, pulse rate was seen to increase in a dose-related manner. In Nitti VW, study, mirabegron was associated with approximate increases of < 1 mmHg in blood pressure and >1 bpm in pulse rate. The incidence of hypertension was similar among the total mirabegron group²². In Novara G, et al study, data show a mirabegron-related dose response elevation in heart rates of 6.7 bpm and 11 bpm for the 50- and 100-mg dose groups, respectively, and 24-hour mean increases in systolic blood pressure of 3.0 mmHg and 5.5 mmHg, respectively²³. In the SCORPIO, ARIES and 12-month TAURUS studies, mirabegron was associated with an increase of <1 mmHg in blood pressure compared with placebo^{12,19,21}. There was no significant change in mean PVR volume, at 4, 8 ml for mirabegron 50, and 100 mg, respectively with no episodes of acute urinary retention. Safety data from SCORPIO and ARIES studies showed that the mean change from baseline to final visit in PVR volume was unremarkable across treatment groups^{12,19}. In the Dragon study, no episodes of acute urinary retention were reported²⁰. In the BLOSSOM study, no clinically relevant effects on post void residual (PVR) volume were reported²⁴.

CONCLUSIONS

Mirabegron at doses of 50 and 100 mg once-daily over 8 weeks demonstrated satisfactory balance between efficacy and tolerability in OAB patients, there's symptomatic improvement in the micturition frequency, urgency and urge incontinence in adult patients with OAB. However, There is the potential for interactions with other (CYP3A4) and (CYP2D6) substrates as well as a potential effect on the cardiovascular system.

Ethical clearance:

The participants' data were collected in accordance with the World Medical Association Declaration of Helsinki 2013, and each participant was informed about the nature and the main objective of the study and signed an informed consent. Analysis of Factors Associated with Blood Sugar Levels in Type 2 Diabetes Mellitus Patients

Bertalina¹, Amrul Hasan¹, Ismi Rajiani²

¹Minister of Health Polytechnic, Tanjungkarang, Indonesia, ²Department of Business Administration, STIAMAK Barunawati Surabaya, Indonesia

ABSTRACT

Background: The prevalence of diabetes mellitus in Indonesia ranks 7 under Russia and Mexico with diabetes rates as much as 10.0 million (8.7% -10.9%), Lampung Province ranks 8th. The purpose of this study was to determine the risk factors for blood sugar levels in type II diabetes mellitus patients.

Methods: This type of research was analytic with cross-sectional design in Persadia Bandar Lampung Hospital patients using a sample of 30 people. The research variables were blood glucose levels, knowledge, nutritional intake (carbohydrates, fiber, and vitamin C), physical activity, and dietary compliance. Chi-Square test was employed to examine the relationship.

Results: The results showed there was a relationship between simple carbohydrate intake ($p = 0.002$), fiber ($p = 0.000$) and vitamin C ($p = 0.002$), physical activity ($p = 0.000$), compliance between types of food consumed with blood sugar level ($p = 0.026$). There was no correlation between total adherence ($p = 4.48$), schedule compliance ($p = 1,000$), diet compliance with blood sugar levels. .

Conclusion: Hospital should be able to increase education about nutrition as well as encourage eating fiber and vitamin C food as recommended and motivate patients to be more adherent to the diet. Further research with different methods is necessary to explore what factors cause low levels of compliance.

INTRODUCTION

Diabetes eruptions (DM) is a metabolic disease which is a collection of symptoms that arise in a person due to an increase in blood glucose levels above average values. The prevalence of DM in Indonesia is based on the answer that the doctor had diagnosed at 1.5%, whereas DM based on symptoms was 2.1%. The prevalence of DM in women is based on a doctor's diagnosis of 1.7% while signs based on DM are 2.3%. Meanwhile, the determination of DM based on a doctor's diagnosis was 1.4% while DM based on symptoms was 2.0%, so based on this it is concluded that female sufferers of DM were

higher than men ⁽¹⁾.

Fiber can improve the response of blood glucose and insulin indices. The fiber can inhibit the passage of glucose through the walls of the digestive tract to the blood vessels so that levels in the blood are not excessive. The previous study showed a significant relationship between fiber intake and blood sugar levels in diabetic patients ⁽²⁾. Other studies have also demonstrated a link between fiber intake and blood sugar levels that the lower the fiber intake, the higher blood sugar levels ⁽³⁾.

In people with diabetes, it is essential to emphasize the importance of regularity of eating regarding meal schedule, type and amount of food, especially for those who use blood glucose-lowering drugs or insulin ⁽⁴⁾. Physical exercise in people with diabetes mellitus has a critical role in controlling blood sugar levels. Increased physical activity such as physical exercise (aerobics, casual cycling, jogging, swimming, and diabetes

Corresponding author:

Polytechnic, Tanjungkarang, Indonesia
email: ubertalina@yahoo.com

exercise) regularly results in increased use of glucose by active muscles⁽⁵⁾.

In Pesadia Hospital Lampung Province, out of 100 patients, 30 people were suffering from diabetes mellitus. Based on the description of data above, the authors wish to examine the analysis of risk factors for blood sugar levels in type II diabetes mellitus patients in the respective hospital.

METHODOLOGY

This study is an analytical study using a cross-sectional examines the risk factors for blood sugar levels in type II diabetes mellitus patients in Persadia Adventist Hospital Bandar Lampung Unit. The population in this study were all patients with type II diabetes mellitus who were members of PERSADIA Bandar Lampung Adventist Hospital Unit in 2017 obtained as many as 30 people. The sample of this study is the total population. Data analysis was carried out with univariate analysis carried out descriptively with a frequency distribution. Bivariate analysis was performed by Chi-square test using computerization.

RESULTS

Respondents mostly were aged > 60 years of the 22 respondents (73.3%), and respondents whose aged between 41-60 years were eight respondents (26.7%). The sex of the respondents was 7 male respondents (23.3%), and as many as 23 respondents were female (76.7%). The education level of the most respondents was tertiary institutions with a total of 11 respondents (36.7%).

Most respondents work as housewives or do not work as many as 13 respondents (43.3%), while the least jobs are other jobs as many as 4 respondents (13.3%), which are included in different positions of the cook, housemaid, and foreman.

As many as 14 respondents (46.7%) had bad blood sugar, and as many as 16 respondents had good blood sugar with a percentage of 53.3%. Distribution of respondents based on knowledge showed that those with fewer categories were 12 people (40.0%) and good as many as 18 people (60%). The simple carbohydrate intake of respondents was obtained which was not good (high) which was 15 people (50.0%), while the simple carbohydrate intake of respondents was good was found in 15 people (50.0%). Besides, most of the respondents' fiber intake is in quite a category was as many as 17 respondents (56.7%), while respondents who have less fiber intake are 13 respondents (43.3%). For consumption of vitamin C intake with less intake, there were 14 respondents (46.7%), while respondents who had good vitamin C intake were 16 respondents (53.3%). Physical activity of respondent inactive was found in 12 people (40.0%), whereas the physical movement of the respondent in the good category was in 18 people (60.0%). Distribution of respondents based on the type of food obtained results from 30 respondents whose intake of non-compliant foods was 16 people (53.3%), and respondents who obeyed 14 people (46.7%). Distribution of respondents based on the meal schedule obtained the results that the respondents whose eating schedule was not obedient as many as 16 people (53.3%), while respondents who obeyed 14 people (46.7%).

Respondents with insufficient knowledge revealed 75% had poor blood sugar levels and those with good knowledge indicated 27.8% with poor blood sugar levels. Based on the results of statistical tests, it is obtained a p-value of 0.030 ($p < 0.05$) indicating that H_0 is rejected. Thus, it is concluded that there is a meaningful relationship between knowledge and blood sugar levels.

Respondents with less fiber intake displayed 84.6% had poor blood sugar levels and respondents with adequate fiber intake indicated 17.6% had poor blood sugar levels. Based on the results of statistical tests, it is obtained a p-value of 0.001 ($p < 0.05$). This means that H_0 is rejected, so it is concluded that there is a significant relationship between fiber intake and blood sugar levels.

Respondents with less vitamin C intake were 12 (85.7%) with poor blood sugar levels, and respondents with good vitamin C intake were 2 (12.5%) whose poor blood sugar levels. The statistical test results displayed the p-value of 0.000 ($p < 0.05$). This confirms that H_0 is rejected showing the relationship between vitamin C intake and blood sugar levels.

There was 10 (83.3%) respondents who had activity inactive physical, not good (high) blood sugar while those who had operation 4 people active physical (22.2%) had bad blood sugar. Statistical test results obtained p-value 0.004 ($p < 0.05$) shows that there is a significant relationship between physical activity with blood sugar levels at the time.

12 (46.2%) respondents who did not adhere to the amount of food consumed had high blood sugar. Statistical test results obtained p-value 1.000 ($p > 0,05$) indicating that there is no significant relationship between compliance with the amount of food consumed with blood sugar levels.

11 (68.8%) respondents who did not comply with the type of food consumed had high blood sugar. Statistical test results obtained p-value 0.026 ($p < 0.05$) indicating that there is a significant relationship between adherence to the type of food with blood sugar levels.

9 (56.2%) respondents who did not adhere to the meal schedule, have poor blood sugar, while those who were obedient 4 (35.7%) had bad blood sugar. Statistical test results obtained p-value 4.48 ($p > 0.05$) showed that there was no significant relationship between adherence to the meal schedule and blood sugar levels.

13 (48.1%) respondents who did not comply with their diets, did not have good (high) blood sugar. Statistical test results obtained p-value 1.00 ($p > 0.05$) showed that there was no significant relationship between dietary compliance with blood sugar levels.

DISCUSSIONS

Based on the results of the study, there was a significant relationship between knowledge and blood sugar levels. This research is also not much different from the results that patients with a good level of knowledge are fully compliant with the DM diet ⁽⁶⁾. The results showed that there was a significant relationship between simple carbohydrate intake (sucrose) and blood sugar levels ⁽⁷⁾. The consumption of sugar (simple carbohydrates) in excessive amounts encourages the neurotransmitter system to try to find sugar as continuous dopamine (sugar opium) satisfaction ⁽⁸⁾. Therefore should the respondents with diabetes mellitus need to control the intake of sugar (sucrose), and use the alternative sugar or sweetening drinks or foods such as sugar diabetes, diabetes honey.

Based on the results of the study, it was found that there was a significant relationship between fiber intake and blood sugar levels confirming the previous research that there is a substantial relationship between fiber intake and blood sugar in patients with type 2 diabetes mellitus ⁽²⁾. Fiber can improve the response of blood glucose and insulin index. These fibers can inhibit the

passage of glucose through the walls of the digestive tract to the blood vessels so that levels in the blood are not excessive. Patients with type 2 diabetes must eat food following the conditions set in their diet therapy so that patients can remain productive because their sugar levels are always controlled within reasonable limits.

The study found that there was a significant relationship between intake of vitamin C and blood sugar levels. For diabetic patients, vitamin C is useful as an antioxidant. Antioxidants are helpful in reducing oxidative damage to prevent complications in patients with type 2 diabetes. Vitamin C helps prevent complications of type 2 DM by inhibiting sorbitol production. Sorbitol is a by-product of sugar metabolism that will be accumulated in cells. It is recommended for people with diabetes to consume a lot of foods containing high levels of vitamin C, including oranges, guava, green peppers, sprouts, and broccoli because high doses of vitamin C can prevent various complications of diabetes ⁽⁹⁾.

The significant relationship between physical activity with blood sugar levels supports the previous research ⁽¹⁰⁾ where the researchers explained if someone with a pattern of mild physical activity can lead to an increase in blood sugar levels in the body.

In contrary, the results showed no significant relationship between adherence to the amount of food consumed with blood sugar levels. Diet management in DM patients is to maintain blood glucose levels so that they are close to normal by balancing food intake with insulin with oral glucose medication and physical activity, achieving and maintaining serum lipid levels, preventing complications, and providing enough energy to keep or produce normal body weight ⁽¹¹⁾. Under this notion, it is sensible that the patients do not really with the amount of food consumed as long as they can maintain the close to average blood sugar level.

The results further showed that there was a relationship between patient adherence to the type of food consumed with blood sugar levels. Here the role of family is essential to becoming the supervisor to ensure the family members suffering from diabetes adhering to food consumed ⁽¹¹⁾. The family plays a role in reducing patient ignorance in the face of illness and disobedience caused by temptations from outside ⁽¹²⁾.

CONCLUSION

The hospital should be able to improve the education program through counseling and nutritional counseling and encourage eating fiber and vitamin C foods as recommended, and motivate patients to be in compliant with the amount and type food consumed as well as the schedule to consume the food. Also, the family members must be motivated to be more active in participating in monitoring food consumed by family members suffering from Diabetes Mellitus. Since the level of compliance is low, it is necessary to conduct further research with different methods to explore what factors cause low levels of compliance.

ABSTRACT

Background: Helminthiasis in Indonesia are still public health problems because the prevalence is still very high between 45% -65%. Even in certain areas with poor sanitation, the prevalence can reach 80%. This study aims to determine the relationship between the variables of the physical environment of the house with the incidence of infection of worm eggs in toddlers.

Method: This type of research uses a cross-sectional design. The location of this study was in Sumbang District, Banyumas Regency, Central Java, Indonesia. The size of the research sample was 237 toddlers (age 12 months to <60 months). The process of data analysis uses univariate and bivariate analysis. Chi-Square test was employed to examine the relationship.

Results: The results of this study indicate that there is a correlation between several variables of the physical environment of the house with the incidence of worm infections in the toddler including the home yard cleanliness ($p = 0.003$), house floor type ($p = 0.017$), wastewater disposal ($p = 0.000$), ownership of healthy latrines ($p = 0.042$), and house density ($p = 0.000$).

Conclusion: People can experience improved environmental sanitation conditions where toddlers have daily activities including having healthy latrines and improving access to sanitary restrooms for each family.

Keywords-: Home, Physical environment, Helminthiasis, Infection, Toddler

INTRODUCTION

In the village of Indonesia, worming attacks more children because their activities are more related to the soil where there are a number of species that are transmitted through the soil including roundworms (*Ascaris lumbricoides*), whipworms (*Trichuris trichiura*) and hookworms (*Necator americanus* and *Ancylostoma duodenale*) that infect humans the most⁽¹⁾. Indonesia is one of the endemic countries of *Soil-Transmitted Helminths (STH)* with the third largest number of children aged 1-14 years in the world after India and

Nigeria which is around 7%⁽²⁾ as in certain areas with poor sanitation; worm prevalence can reach 80%^(3,4). Given this, the approach to prevention of worm disease through the improvement of sound environmental quality and healthy behavior is needed, so that the health risks for humans to be infected with worms can be suppressed.

Research on helminthiasis in rural areas of Central Java Province showed high rates of morbidity due to worms intestine^(5,6).

Though worm disease is widespread in all rural and urban areas with a high prevalence and has the impact mainly on the quality of human resources, this is still a small concern for the community. Thus, this study aims to determine the relationship between the variables of the physical environment of the house with the incidence of infection with worm eggs in toddlers.

METHODOLOGY

This type of research was observational with a cross-sectional approach. The location of this study was carried out in Sumbang sub district randomly in one sub-district from five sub-districts under the coverage of Banyumas Regency, Central Java Province.

The population in this study were all to toddlers (aged 12 months to <60 months) in the Banyumas Regency with the number of 237 samples in Sumbang District.

The data collected was then tabulated and analyzed by univariate descriptively from each variable with a frequency distribution table, and bivariate analysis to see the relationship between variables with statistical tests of Chi-square.

RESULTS

The results of the univariate analysis of the house physical environment are summarized in the following table.

Table 1. Frequency Distribution of the House Physical Environment

No	Variables	Category	Total	%
1	Yard	Partially and wholly available	191	80.6
		No yard	46	19.4
		Total	237	100
2	Yard cleanliness	Dirty	125	52.7
		Clean	112	47.3
		Total	237	100
3	Floor type	Partially and wholly covered	137	57.8
		No floor	100	42.2
		Total	237	100
4	Water sources	Vulnerable	145	61.2
		Safe	92	38.8
		Total	237	100
5	Water disposal	Yard/garden	88	37.1
		River/pond	149	62.9
		Total	237	100
6	Sanitary toilet possession	No	203	85.7
		Yes	34	14.3
		Total	237	100
7	House density	< 10 m ²	63	26.6
		> 10 m ²	174	73.4
		Total	237	100

Most houses have yards in the form of soil, rocky and sandy (80.6%) and the rest is yard made from cement as much as 19.4%. The cleanliness of the yard observed from the presence of puddles, garbage, and the absence of sunlight is as much as 52.7% indicating the clean home yard is only 47.3%. The household floor in this study was found as much as 57.8% still made of soil and 42.2% of the floor of the house was made of

water-resistant material. Clean water sources are used for everyday purposes in the category of risky as it is taken from river or pond (61.2%) while the one in the class of safe is the source of water taken from dug wells, hand-pumped wells, springs and running water company (38.8%). The study showed that 62.9% of waste water was discharged into rivers/ponds, and 37.1% discharged it in the yard/garden around the house. Ownership of

sanitary latrines is 14.3% while 85.7% do not have ones and to make it worse, still many families that do not have latrines. Average house density is 14.82 m² with the category of occupant density <10 m² is 26.6%, and house density > 10 m² is 73.4%.

Table 2. Cross Tabulation of Physical Environment of The House and Helminthiasis

No	Variables	Category	Helminthiasis in toddlers				Total	
			Positive		Negative		Total	%
			Total	%	Total	%		
1	Yard	Partially and wholly	117	61.26	74	38.74	191	100
		No yard	25	54.35	21	45.65	46	100
		P = 0.391		OR = 1.33; CI (95%) = 0.79-2.54				
2	Yard cleanliness	Dirty	86	68.8	39	31.2	125	100
		Clean	56	50	56	50	100	100
		P = 0.003		OR = 2.205 ; CI (95%) = 1.298-3.744				
3	Floor type	Partially and wholly	91	66.42	46	33.58	137	100
		No floor	51	51	49	49	100	100
		P = 0.017		OR = 1.90 ; CI (95%) = 1.12-3.335				
4	Water sources	Vulnerable	86	59.31	59	40.69	145	100
		Safe	56	60.87	36	39.13	92	100
		P = 0.811		OR = 0.940 ; CI (95%) = 0.55-1.60				
5	Water disposal	Yard/ garden	78	88.64	10	11.36	88	100
		River/ pond	64	42.95	85	57.05	149	100
		P = 0.000		OR = 10.359 ; CI (95%) = 4.973-21.581				
6	Sanitary toilet possession	No	127	62.56	76	37.44	203	100
		Yes	15	44.12	19	55.88	34	100
		P = 0.042		OR = 2.117 ; CI (95%) = 1.016-4.411				
7	House density	< 10 m ²	48	76.19	15	23.81	63	100
		> 10 m ²	94	54.02	80	45.98	174	100
		P = 0.002		OR = 2.723 ; CI (95%) = 1.419-5.227				

The statistical test results for yard type obtained p = 0.391 indicating there is no difference in the proportion of toddler positively infected by worm eggs between houses that are partially or wholly having a yard or no yard. The results of statistical tests for yard cleanliness obtained p = 0.003 denoting there is a difference in the proportion of incidence toddler positive of worm egg infection between homes that do not clean the yard and a house with a clean yard. Oddity Value Ratio (OR) = 2.205 means that the dirty house has a chance of 2.205 times for toddlers to be infected by worm's eggs

compared to the home with a clean yard. Similarly, a positive relationship is found between floor types of the house with the incidence of infection of worm's eggs in the toddler with the OR = 1.90. The same trends also found in waste water disposal with OR = 10,359, sanitary latrine ownership with OR = 2.117, and house density with OR = 2.723. However, statistical test results for the water source obtained p = 0.811 meaning that there is no difference between the proportion of homes that have vulnerable water sources to the homes that have safe water sources.

DISCUSSIONS

Based on statistical tests on the variables of the physical environment of the house, seven variables allegedly related to the incidence of infection of the eggs flatulent there were five variables that were statistically significant, namely the cleanliness of the yard, type of floor of the house, ownership of sanitary latrines, disposal of liquid waste and density of homes. This is possible because the family's habit of defecating (toddler and family) is not in the toilet and has an impact on the presence of worm eggs on the ground, as a result of not having sanitary latrines as well as house density.

In planning to make latrines, attention must be paid to efforts to prevent breeding. The nature of positive phototropic flies, which are attracted to light and avoid darkness and dark surfaces, can be used for prevention efforts. The best latrine is a toilet where the fist immediately flushes into a hole or underground tank. Besides, all parts that are open to feces, including seating or squatting, must be kept clean and closed if not used⁽⁷⁾.

The existence of worm eggs on the ground is more optimal if the atmosphere of the surrounding environment is conducive to support. This happens as the yard is poorly maintained and the disposal of liquid waste is still to the yard/garden. Wastewater disposal facilities must meet the requirements of not contaminating drinking water sources, not contaminating surface water, not infecting disease-causing insects, closed, odorless and having disposal at the end of the channel⁽⁸⁾. Water can be a significant factor in various diseases such as *typhus*, *dysentery*, diarrhea, cholera, and worms⁽⁹⁾.

While the type of floor houses are still made from the soil extending worm breeding ground, thus increasing the contact of toddlers with contaminated soil worm eggs. Floor requirements of a clean house have a type of floor that is not dusty in the dry season and not wet in the rainy season. The kind of floor of the house that meets the requirements, namely: (1) plastered, tile, ceramic, board, or stilt house, (2) not dusty, and (3) kept clean. The type of floor of the house from the soil can cause worm disease because the ground is a factor in the spread of the disease⁽¹⁰⁾.

Several supporting studies^(11, 12) show that the condition of home sanitation (water source, water quality, the place to wash hands and cutlery, bowel movements, house floor, and house density) are related

to the incidence of helminthiasis. Also, poor sanitation conditions can worsen the prevalence of worm egg infection.

House density allows facilitating pollution and decreasing the ratio between the number of occupants and home sanitation facilities so that it supports the possibility of infection with worm eggs. Further, other environmental variables exacerbate soil pollution conditions making worm eggs will be more optimal in the soil which then provides an excellent opportunity for the infection of worm eggs in a toddler which is also supported by habits that are not good from the toddler and mother. Efforts need to be made to improve the physical environment of the house in general and to counsel on the prevention of worm disease.

CONCLUSION

For the community, it is expected to maintain the cleanliness of the surrounding house yard that is used to play toddlers and repair the floor of the house by using waterproof flooring material to reduce the risk of infection with worm eggs in a toddler in the home. Also, the community must make a means of storing wastewater that is closed and safe for the environment and does not pollute the environment. And the most important thing is for every family to have and be able to access a sanitary latrine to secure their dirt so as not to pollute the environment and not cause infection with worm eggs.

Knowledge and Attitudes of Academic Instructor Toward First Aid at the Technical Institute-Suwaira

Ammar A Okab

Assistant Lecturer, Technical Nursing Department, Technical Institute-Suwaira, Middle Technical University, Iraq

ABSTRACT

Objective(s): To assess the level of knowledge and attitude of academic Instructor toward first aid and to identify the relationship between the level of knowledge and attitudes of academic Instructor toward first aid and their socio demographic characteristic.

Material and Method: A descriptive study design was carried out to assess the level of knowledge and attitude of academic Instructor toward first aid and to identify the association between the level of knowledge and attitudes of academic Instructor toward first aid and their socio demographic characteristic. The study was started from March 5th, 2018 to September 4th, 2018. The sample was Non - probability (purposive) sample of (50) academic Instructor are selected according to the criteria of the study and its purpose who working Technical Institute-Suwaira. The study was approved by the Center Ethical Committee. The data were collected by direct interview using specific questionnaire. Data was analyzed by (SPSS) package version 20.

Descriptive data used to describe study variable: frequencies, percentages and mean of score. **Inferential statistical data analysis approach:** used by application of the **Chi –square test** used for determining the association between Socio-demographic characteristics and knowledge, attitude. Testing the significant of the contingency coefficient for this study the significant P-value ≤ 0.05 .

Findings: (28%) from them were 40-49 years old, (78%) were male, (88%) were married, the overall level of knowledge was poor (66%), highly statistical significant association between items which is related to knowledge and academic Instructor' educational level and highly statistical significant association between items which is related to attitudes and academic Instructor' department.

Recommendations: The study recommends that Academic Instructor need regular training about first aid. Establish of mandatory courses for academic Instructor on first aid and attention for quality of this courses and provide first aid box at each department and classrooms.

Keywords: *Knowledge, Attitude, Academic Instructor, First aid, Technical Institute*

INTRODUCTION

Sudden illnesses and injuries are an essential issue in public health and usually occurring at any times of daily life ⁽¹⁾.

Accidental injuries are usually categorized based on their happening, for example: poisoning, burns,

drowning and falls ,...etc ⁽²⁾.

First aid is an urgent attention delivered to victims of injury until medical helps arrive. Early procedures of such emergencies decreases morbidity and deaths ⁽³⁾.

Healthy environment is very vital to avoid these hazards besides competent teachers who can identify any health problem and able to provide first aid for commonly happening emergencies ⁽⁴⁾.

Corresponding author:

Ammar A Okab

MSc, Assistant lecturer, Technical Nursing Department, Technical Institute-Suwaira, Middle Technical University, Iraq , Email: amarabas4@gmail.com

Primary purpose of first aid to reduce suffering, make healing process possible and decrease damage. First action taken to deal with injuries and sudden

illnesses decide the upcoming sequences of illness and complication rates ⁽⁵⁾.

National First aid Science Advisory Board clarified, everybody can and must learn first aid, i.e. education and training in first aid should be worldwide. This is recognized by the fact that correctly directed first aid means the difference among life and death, early versus late rescue, and momentary versus long-lasting disability ⁽⁶⁾.

Teachers must know the basic rules for first aid and the students must be instructed on first aid ⁽⁷⁾.

First aid is complex and specific situation, so that more informed and better trained, first aid are more eligible to deal with unexpected sudden injury ⁽⁸⁾.

Identification of urgent situation and calling for help is an important issue in first aid, particularly in case of lack or insufficient basic knowledge about first aid measures for complex situations to be sure that the students will have a professional medical help ⁽⁹⁾.

Thus first aid must be medically sound and based on scientific knowledge, and when the knowledge is absence, consult the expert. First aid can be obtained by everyone and comprises self-care, first aider can be any person exist in the scene of emergency and provides such care like parents, teachers, policeman, fireman, first responder and professional medic, etc ⁽¹⁰⁾.

There are three main objectives for first aid, firstly: preserve life, not merely life of victims, but first aider's life as well. Because if first aiders put their life in danger might ends up struggling for his own life instead of the victim. Secondly: avoid worsening of condition. Thirdly: encourage recovery, which means first aider actions should assist injured person toward improvement, certainly after preventing situation from getting worse⁽¹¹⁾.

MATERIAL AND METHOD

A descriptive study design was carried out to assess the level of knowledge and attitude of academic Instructor toward first aid and to identify the association between the level of knowledge and attitudes of academic Instructor toward first aid and their socio demographic characteristic. The study was started from March 5th, 2018 to September 4th, 2018. The sample was Non - probability (purposive) sample of (50) academic Instructor are selected according to the criteria of the study and its purpose who working Technical Institute-Suwaira. The study was approved by the Center Ethical Committee. Content validity for the early develops instrument is determine through a panel of (7) experts who have more than 5 years of experience in their specialties to review the questionnaire clarity, relevance, and adequacy. The determination of reliability of the questionnaire is base on Split-half reliability; the correlation coefficient is (0.817). The data were collected by direct interview using specific questionnaire that composed of three parts (28) items which: **Part (1)** Socio-demographic characteristics were included (8) items (age, gender, marital status, department, educational level, scientific title, get information about first aid, experience of teaching). **Part (2)** which dealing with knowledge about first aid including (10) items and **Part (3)** which dealing with attitude about first aid including (10) items.

Data was analyzed by (SPSS) package version 20. **Descriptive data** used to describe study variable: frequencies, percentages and mean of score. **Inferential statistical data analysis approach:** used by application of the **Chi –square test** used for determining the association between Socio-demographic characteristics and knowledge, attitude. Testing the significant of the contingency coefficient for this study the significant P-value ≤ 0.05 ⁽¹²⁾.

FINDINGS

Table (1): Distribution of the study sample according to Socio-Demographic characteristics of academic Instructor

Age	F.	%	Department	F.	%
20-29	7	14%	Technical Nursing	9	18%
30-39	13	26%	Technical Computer system	3	6%
40-49	14	28%	Technical Machinery and equipment	8	16%
50-59	4	8%	Technical Accounting	12	24%
60- and more	12	24%	Technical Electrical	7	14%
Total	50	100%	Technical Plant production	6	12%
			Technical Mechanical Technology	5	10%
			Total	50	100%
Gender	F.	%	Marital status	F.	%
Male	39	78%	Single	6	12%
Female	11	22%	Married	44	88%
Total	50	100%	Total	50	100%
Education level	F.	%	Scientific title	F.	%
Bachelor	7	14%	assistant lecturer	31	62%
Master	34	68%	Lecturer	16	32%
Doctorate	9	18%	assistant professor	3	6%
Total	50	100%	Total	50	100%
Information about first aid	F.	%	Experience	F.	%
Yes	28	56%	1-10 years	22	44%
No	22	44%	11-20 years	14	28%
Total	50	100%	21-30 years	8	16%
			31 years -and more	6	12%
			Total	50	100%

F = Frequency, % = Percentage.

Results out of this table reveal the socio-demographic characteristic of (50) academic Instructor(28%) from them were 40-49 years old, (78%) were male, (88%) were married, (24%) from technical accounting department , (68%) were master degree, (62%) scientific title of them were assistant lecturer , (44%) the experience of them were 1-10 years, (56%) of them have information about first aid.

Table (2): Assess the level of knowledge to academic Instructor about first aid

Knowledge			
Level	M.S	F.	%
Poor	1 - 1.66	33	66%
Immediate	1.67 - 2.33	11	22%
Good	2.34 - 3	6	12%
Total	1 - 3	50	100%

F = Frequency, % = Percentage, M.S = mean of the score.

Results out of this table indicate that the overall level of knowledge was poor.

Table (3): Assess the level of attitudes to academic Instructor about first aid

Attitudes	M.S	F.	%
Negative	1 - < 1.5	30	60%
Positive	≥ 1.5 - 3	20	40%
Total	1-3	50	100%

F = Frequency, % = Percentage, M.S = mean of the score.

Results out of this table indicate that the overall level of attitudes was negative.

Table (4): Association between the Knowledge, Attitudes and Socio- Demographic characteristics of Academic Instructor

Socio-Demographic characteristics	Knowledge		Attitudes	
	P-value	C.S	P-value	C.S
Age	0.10	NS	0.08	NS
Gender	0.03	S	0.42	NS
Marital status	0.47	NS	0.78	NS
Department	0.50	NS	0.000	HS
Educational level	0.009	HS	0.33	NS
Scientific title	0.06	NS	0.01	HS
Get information about first aid	0.000	HS	0.26	NS
Experience of teaching	0.49	NS	0.35	NS

P: probability level, S: Significant at P < 0.05, HS: Highly Significant at P < 0.05, NS: Non-significant at P > 0.05, C.S: Comparative Significant

Results out of this table reveal highly statistical significant association between items which is related to knowledge and academic Instructor' educational level and get information about first aid, and highly statistical significant association between items which is related to attitudes and academic Instructor' department and scientific title

DISCUSSION

1: Socio-demographic characteristic of academic Instructor

In regard to socio-demographic characteristic of (50) academic Instructor according to age, the most (28%) were 40-49 years old; this result is agreed in this study⁽¹³⁾,

which reported that majority of participants were above 40 years of age. (78%) male were the dominant gender. (88%) were married; this result is agreed in this study⁽¹⁴⁾, that higher proportion of participants were married (more than four-fifth of participants), in addition, about 79.8% of teachers had children which reflects the nature of Iraqi society and its traditions, especially as confirmed by statistics of the Central Organization for Statistics of the Ministry of Planning. (24%) from technical accounting department. Educational level (68%) were master degree, (62%) scientific title of them were assistant lecturer; because the most of participants were have master degree. (44%) the experience of them were 1-10 years. (56%) of them have information about first aid; this result is agreed in this study⁽¹⁴⁾ [table 1].

2: Discussion of the knowledge of academic Instructor about first aid

The results of this table revealed that the overall level of knowledge was poor (66%), because the most of academic Instructor have information about first aid but this information is incorrect and not in standard level; this result is agreed in this study⁽¹⁵⁾, of the 100 participants, 4% had good knowledge, 19% had fair knowledge and 77% had poor knowledge [table 2].

3: Discussion of the attitudes of academic Instructor about first aid

The results of this table revealed that the overall level of attitudes was negative (60%), because when the information about first aid is incorrect that lead to the attitudes toward negative and the academic Instructor don't participate in first aid courses to learn practice at good way; this result is not agreed in this study⁽¹⁴⁾, the present study found that overall attitude of vast majority of teachers was positive [table 3].

4: Discussion of the Association between socio-demographic characteristic of academic Instructor and their knowledge and attitudes

The results of the present study reveal that statistical significant association between the knowledge with gender; this result is agreed in this study⁽¹⁶⁾, there is a significant difference between male and female ($p = .001$). While shows highly statistical significant association between the knowledge with educational level and information about first aid; in front of researcher view this is because the educational level

effect the knowledge and most of academic Instructor have high level education (master degree) and while shows highly statistical significant association between the knowledge with information about first aid; this result is agreed in this study⁽¹⁶⁾, there is a significant difference in information about first aid ($p = .014$) [table 4].

The findings of the present study shows that highly statistical significant association between attitudes with department; in front of researcher view this is because the some department give information about first aid to lecturer to deal with accident happened in training procedure and while shows highly statistical significant association between the attitudes with scientific title; in front of researcher view this is because associate with educational level of participants.

CONCLUSION

The most age of academic Instructor 28% in 40-49, 68% from them level of education was master, (56%) of them have information about first aid, the academic Instructor with poor level of knowledge about first aid, there is significant association between training and knowledge and significant association between gender and knowledge of academic Instructor about first aid.

Recommendations:

The study recommends that:

1. Academic Instructor need regular training about first aid.
2. Add first aid training to the curriculum of the institute.
3. Establish of mandatory courses for academic Instructor on first aid and attention for quality of this courses.
4. provide first aid box at each department and classrooms.

ABSTRACT

Objective: Probiotics has been tried as an adjuvant therapy for malignant tumors through their abilities to modulate intestinal microbiota, host immune response and gene expression. Further, there are emerging data supporting the role of probiotic lactic acid bacteria in prevention of early stages colon cancer development but data on their effect on advanced colorectal cancer and cervical cancer are limited. Therefore, the aim of this study was to evaluate the impact of *Lactobacillus crispatus* supernatant (LCS) on the human cervical cell lines (HeLa) proliferation and metastasis.

Materials and Method: Effects of *Lactobacillus* supernatant on cell invasion in vitro was assessed by Transwell migration and invasion assays (3-D culture). The cytotoxic activity of *Lactobacillus crispatus* supernatant were determined by MTT assay and compared to controls, De Man Rogosa Sharpe (MRS) media and MRS + lactic acid groups. Expression of Matrix Metalloproteinase-2 (MMP2) and -9 (MMP9) genes was performed by quantitative reverse transcriptase-polymerase chain reaction (qRT-PCR) following the cell synchronization.

Results: *Lactobacillus crispatus* supernatant had cytotoxic and anti-metastatic effect on HeLa but not on normal cells. Down-regulation of MMP2 and MMP9 genes expression was also observed post-LCS treatment as compared to controls, De Man Rogosa Sharpe (MRS) media and MRS + lactic acid groups ($P < 0.05$).

Conclusion: *Lactobacillus crispatus* Supernatant could be a potential therapeutic agent for the treatment of advanced human cervical cancer through cytotoxic and anti-metastatic mechanisms

Keywords: Cervical cancer, *Lactobacillus crispatus* supernatant, Cell Line, Metastasis.

INTRODUCTION

Probiotics are defined as live bacteria (microorganisms) that provide health benefits to the human body when consumed and may reduce potentially harmful bacteria in the intestine¹. Probiotics are used by women in the perinatal period and may improve balance of microbiota with possible health benefits for both mother and baby. Not only probiotics play an important role in immunological, digestive and respiratory functions, but they could have a significant effect on the alleviation of infectious diseases in children and other high-risk groups². Most probiotics belong to the

genus *Lactobacillus* which are part of the normal flora in healthy human vagina and have an important function in protecting the host from urogenital infections³. Further, probiotic bacteria have shown anti-tumor activities, leading to cancer risk reduction, by several mechanisms including production of anti-mutagenic compounds and degradation of carcinogenic compounds⁴.

Cervical cancer is the most frequently diagnosed cancer among women in developing countries and the second most frequent cancer affecting women worldwide⁵. There is considerable evidence supporting the potential role of probiotic lactic acid bacteria (LAB)

in prevention of early stages colon cancer development but data on their role in advanced stages of colorectal cancer and cervical cancer and specifically on metastasis are limited. Tissue invasion and metastasis is dependent on cell invasion through the extracellular matrix (ECM) and involves matrix metalloproteinase (MMPs) that degrade the ECM during the metastatic process⁶. Human Papilloma Virus (HPV) infection is a well-established risk factor for cervical cancer. However, HPV infection, environmental and host factor such as in vivo microbial environment collectively contribute for the pathogenesis of cervical cancer⁷. Several lactobacillus species produce compounds that kill or inhibit the growth of vaginally acquired pathogens⁸.

Lactobacillus crispatus (*L. crispatus*) and *Lactobacillus rhamnosus* (*L. rhamnosus*) are among the most abundant species in healthy women's vagina⁹. In addition, an inhibitory effect for probiotics on colorectal carcinogenesis was observed but there are limited data regarding their prophylactic capacity in the final stages of colorectal cancer, specifically in metastasis. That study has that cell-free supernatants (CFS) from two type of probiotics (*L. casei* and *L. rhamnosus*) inhibit colon cancer cell invasion by influencing MMP9 activity in cultured metastatic human colorectal carcinoma cell and the treatment with (CFS) from both lactobacillus species decrease MMP9 and colorectal cell invasion¹⁰. Therefore, the aim of this study was to evaluate the impact of lactobacillus crispatus supernatant (LCS) on the human cervical cell lines (HeLa) proliferation and metastasis.

MATERIAL AND METHOD

Cell culture

In this experimental work, human cervical cancer cell line (HeLa), were purchased from Pasture Institute, National Cell Bank of Iran. The cells were cultured for 24 hours in Roswell Park Memorial Institute (RPMI) medium containing 10% fetal bovine serum (FBS), and 1% penicillin/streptomycin (all provided from Invitrogen, USA) in a humidified 37°C atmosphere containing 5% CO₂.

Lactobacillus supernatant preparation

De Man Rogosa Sharpe (MRS) broth (pH=6.5, Merck, Germany) was used to grow *L. crispatus* strain SJ-3C-US at 37°C for 24 hours under microaerophilic conditions. Bacterial cultures (2×10^8 c.f.u./ml), which have been incubated for overnight, were centrifuged at 7000 rpm for 7 minutes. To remove remaining bacteria and debris the lactobacilli supernatants (LS) were filtered through a 0.2 mm membrane filter. In order to differentiate the effect of lactate produced by *L. crispatus* supernatant (LCS) with pH change impact, the pH in MRS (6.5) broth was adjusted to pH in LS (4.2 ± 0.1) with lactate, this control is called MRS. In this experiment, the following conditions were tested: LCS, pH=4.2; MRS, pH=6.5; in HeLa cells⁴.

Migration/invasion assay (3-D culture)

Migration assays were performed in 24-well Falcon tissue culture plate with non-coated membrane Transwells (pore size, 8.0 µm, Merck Millipore)¹¹. The migration and invasion abilities cells in four groups: HeLa cells without any treatment (group 1), treated by *Lactobacillus* supernatant (group 2), MRS media (group 3); MRS and HCL (group 4) for 12 h were assessed using the Transwell assay. Subsequently, cells were stained with crystal violet solution, and the numbers of cells that migrated were quantified by counting the cells in 3 fields under a phase-contrast microscope

Cell synchronization for RNA extraction

HeLa cells were seeded in RPMI medium containing 10% FBS, and 1% penicillin/streptomycin for 24 hours. Subsequently, each cell line was counted and equal number of the cells were sub-cultured in four 25-cm³ flasks and synchronized, three of which were selected to be treated with LS, MRS and MRS+ lactic acid (HCL) for 4 hours. The last flask was used as control, without any treatment⁴.

RNA isolation, cDNA synthesis and quantitative reverse transcriptase-polymerase chain reaction

These were performed according to method described by Nouri et. al., 2015⁴

Table1. Sequence of the primers applied for qRT-PCR used in this study

Primer	Primer sequences	Product size (bp)	References
<i>MMP2</i>	F: GGCAGTGCAATACCTGAACACC R: GTCTGGGGCAGTCCAAAGAACT	111	¹²
<i>MMP9</i>	F: GCACGACGTCTTCCAGTACC R: CAGGATGTCATAGGTCACGTAGC	124	¹³

Statistical analysis:

Statistical analysis was performed using ImageJ software (NIH, USA). Data were expressed as mean ± SD or proportions and ANOVA test was used to compare mean among groups. P < 0.05 was considered as statistically significant

invasion in vitro

Figure 1 shows the effects of *Lactobacillus* supernatant on cell invasion in vitro in HeLa cells without any treatment(A), treated by *Lactobacillus* supernatant (B), MRS media (C), MRS and HCL (D). *Lactobacillus* supernatant suppressed HeLa invasion abilities more than MRS and lactic acid (HCL) individually.

RESULTS

Effects of *Lactobacillus* supernatant on cell

Figure1: Effects of *Lactobacillus* supernatant (LS) on cell invasion in vitro. The invasion abilities of HeLa cells without any treatment (A) and treated by *Lactobacillus* supernatant (B), MRS media (C), MRS and lactic acid (HCL) (D) for 12 h were assessed using the Transwell assay. LS suppressed HeLa invasion abilities more than MRS and lactic acid (HCL) individually.

Invasion percent of HeLa cell by MRS, MRS+HCL and LCS are demonstrated in figure 2. Invasion inhibition of HeLa cell was higher for *Lactobacillus* supernatant as compared to controls, MRS and MRS+ lactic acid (HCL) groups (P<0.05).

Figure 2: Graph of Invasion percent of HeLa cell by MRS, MRS+HCL and LCS. Invasion inhibition of HeLa cell was higher for *Lactobacillus* supernatant as compared to controls, MRS and MRS+ lactic acid (HCL) groups (P<0.05) MRS, MRL and LCS.

The cytotoxic effect of *L.crispatus* strain SJ-3C-US culture supernatant on HeLa cell growth

Lactobacillus supernatant had a significant cell growth inhibitory effect on HeLa cell growth in comparison with the cells treated with MRS solutions indicating that the acidity was not the main cause of HeLa cell growth inhibition. In addition, the IC50 value of LCS against HeLa cells was 11% (v/v), suggesting that a substance, other than lactate, in LCS could only affect the cervical tumor cells (HeLa) but not the normal cells (Fig3).

Figure3: Cytotoxicity effects of LCS, MRS+ lactic acid (HCL) and MRS with different concentrations on HeLa cell line measured by MTT assay. The mean value is represented with three separate experiments for each point. MRS, MRS+HCL and LCS.

MMP2 and MMP9 genes expression in HeLa cells treated with LCS

mRNA expression levels of *MMP2* and *MMP9* genes were quantified by qRT-PCR after 4 hours treatment with LCS, MRL or MRS are shown in figure 4. mRNA level of *MMP2* and *MMP9* genes were down-regulated in the HeLa cells treated with LCS, compared to those cells treated with MRS+HCL or MRS. LCS, MRS+HCL and MRS for MMP2 (* P < 0.05), while for MMP9 the LCS is significantly deferent from the other 2 group, so there was no statistically significant deference between MRS+HCL and MRS in MMP9.

Figure 4: The effect of lactobacilli supernatant on mRNA expression level of MMP-2and MMP-9 genes in the treated HeLa cells with LCS, MRS and MRS+HCL ***; P<0.05, MRS; De Man Rogosa Sharpe, MRS+HCL and LCS; *Lactobacillus crispatus* supernatant.

DISCUSSION

It has been proven that probiotics could play anti-cancer roles by presenting several mechanisms, including induction of immune responses as well as anti-proliferative, anti-apoptotic or anti-microbial activities. Evidences shown that cervical cancer cells could reach to the other organs such as liver, lung and brain^{14,15} by activating MMP2 and MMP9 and subsequently degradation of the ECM¹⁶. In this study, different in vitro procedures were used to characterize the antagonistic and anticancer properties of vaginal *L. acidophilus* 36YL strain. This strain revealed the inhibition of the growth of potential human pathogens and other undesirable bacteria. The results showed that this strain can be considered as a probiotic that possesses the best antagonistic and anticancer properties¹⁷.

Previously we proved that *lactobacilli* culture supernatants caused valuable cytotoxic effect on cervical cancer cells¹⁸. In this study, we have examined the effects of *L. crispatus* culture supernatant treatment on HeLa and MRC-5 cell growth, using MTT assay and transcriptional analysis of some metastatic genes including MMP-2, MMP-9 genes and relevant inhibitors. We specified down-regulation of MMP2 and MMP9 genes expression in HeLa cell lines by treatment with LCS, submitting the inhibitory effect of this probiotic on cervical cell line. In accordance with our findings, *L. crispatus* were previously shown to have an inhibitory effect on MMP2 and MMP9 enzymatic activity¹⁰. In this study LCS indicated anti-proliferative effect on HeLa cell growth. Previously reported results¹⁸. Thus far, several studies marked that probiotic lactic acid bacteria, including *L. acidophilus*, *L. casei*, and *L. rhamnosus* supernatants, are able to prevent colorectal cancer progressions^{19,20}. Stimulating autophagy pathway is the other proposed anti-proliferative mechanism of probiotics while as we shown several genes with crucial autophagy roles were down-regulated in HeLa cells, due to treatment with LCS or LRS²¹. A recent study has examined *L. acidophilus* 36YL strain metabolites secretion on different cancerous cell lines including HeLa, AGS and HT-29 compared to the normal cells (HUVEC). The metabolites of these bacteria reduced viability in all of the cancerous cell lines with no toxic effect on the normal cells¹⁷. A study on the effect of LS on HeLa revealed that downregulation of CASP3 rather than lactate acidity plays a critical roles in cytotoxicity against HeLa¹⁸. Another study, however,

reported that probiotic activity is induced by alteration of pH of culture²². Interestingly, MRS+HCL showed a more potent inhibiting effect on cell lines than MRS despite having similar pH. Therefore, our study findings point to altered lactate production irrespective of pH range suggesting that lactate production is a crucial and independent inhibitory factor for cancerous cells.

CONCLUSION

Probiotics include the major normal flora of cervix. It can open a new way toward prevention or even suppression of cervical cancer cell invasions. Further investigations are required to focus on supernatant fraction and assess the effect of these fractions on different cancer cells. *L. crispatus* inhibits proliferation of HeLa cervical cancer cells. The underlying mechanism is unknown but could be partially attributed to down-regulation of HPV oncogenes. Our study findings suggest that lactobacillus is a potential therapeutic agent for the treatment of cervical cancer. Further studies are warranted to consolidate the evidence provided by this study.

Comparison between Echocardiography and Computerized Tomography Pulmonary Angiography in Detection of Pulmonary Hypertension in Advanced Chronic Lung Diseases

Atheer Adnan Fadhil¹, Mustafa Nema², Hayder Adnan Fawzi³

¹Consultant Radiologist, College of Medicine, Baghdad University, ² Consultant Chest Physician, College of Medicine, Baghdad University, ³Senior Clinical Pharmacist, Baghdad Medical City hospital

ABSTRACT

Objective: To compare between echocardiography and CT pulmonary angiography (CTPA) in the detection of pulmonary hypertension in patients with chronic advanced lung diseases.

Method: 45 patients with diagnosis of chronic advanced lung diseases were recruited in the study. Data of all patients were collected including patients' demographic characteristics, and the results of investigations which were performed for each patient which includes echocardiography and computerized tomography pulmonary angiography.

Results: mean age of patients 53.4 ± 8.3 years, with two thirds of patients aged >50 years. Males were relatively dominant than females; 24 (53.3%) vs. 21 (46.7%) respectively. Majority of the cases (75.6%) were smokers, 13 cases (28.9%) were employed. 71.1% of the cases had COPD. The mean pulmonary artery diameter of all cases was 26.3 ± 3.8 mm. The main pulmonary artery (MPA) to aorta (AO) ratio was elevated $> 1:1$ in 48.9% of cases. Right ventricle wall thickness ≥ 4 mm in 16 cases (35.6%).

Conclusion: This study has shown that although CT and echocardiographic measurements are both moderately strong correlates of mPAP in patients with a spectrum of underlying disorders, using these tests in combination is considerably more powerful in determining increased pulmonary arterial pressure than either test in isolation.

Keywords: *Computerized Tomography, Pulmonary Angiography, Echocardiography, Pulmonary Hypertension*

INTRODUCTION

Pulmonary Arterial hypertension (PAH) is a debilitating condition of the pulmonary vasculature that was first described in 1891 by a German physician E. Romberg⁽¹⁾. PAH is a hemodynamic state defined by a resting mean pulmonary artery pressure at or above 25 mm Hg⁽²⁾ and characterized by elevations in the pulmonary arterial pressure and pulmonary vascular resistance (PVR) leading to right ventricular failure and premature death⁽³⁾. While PAH remains a rare disease, it is being increasingly recognized. The estimates prevalence of category 1 PAH was 15.0 cases/millions of adult and incidence of 2.4 cases/millions of adult per year in France⁽⁴⁾, and 10.6 and 2.0, respectively in

the United States⁽⁵⁾. The age and gender distribution of the disease appears to have evolved over time. While the French registry confirmed the female-to-male ratio of 1.6⁽⁴⁾, the US registry depicts a much higher female preponderance, with a female to male ratio of 3.9⁽⁶⁾.

Chest scans have largely supplanted chest x-rays in patients with PAH, partly due to its ability to detect thromboembolism in some cases and to identify any diffuse parenchymal lung diseases that may not be evident in 15% of chest x-rays^(7,8). With advances in CT technology and its wide availability, there have been attempts to address the utility of CT to predict the presence of PAH; it is useful in delineating the anatomic detail of the pulmonary vasculature. Contrast-enhanced images

may show intraluminal abnormalities in the arteries and veins, which are useful for confirming etiologies such as thromboembolic disease^(9, 10). High-resolution CT may be helpful for the diagnosis of pulmonary hypertension in patients with suspected diffuse lung disease⁽¹¹⁾. It had been reported that a main pulmonary artery of 29 mm or larger, as shown on a CT scan, has a sensitivity of 69% and a specificity of 100% for predicting pulmonary hypertension^(7, 12).

The Doppler echocardiogram can simultaneously provide an estimate of right ventricular (RV) systolic pressure, functional and morphologic cardiac sequelae of PAH, and identification of possible cardiac causes of PAH⁽¹³⁾. Echocardiography facilitates the estimation of pulmonary artery systolic pressure, assessment of cardiac cause of PAH, assessment of severity of RV dysfunction, assessment of prognostic variables⁽¹³⁾. We aimed in the current study to compare between CT pulmonary angiography (CTPA) and echocardiography in detection of pulmonary hypertension in patients with advanced chronic lung diseases.

METHOD

A prospective study conducted at the Radiology department of Baghdad Teaching Hospital during the period from the 1st of February 2016 to the end of November 2016. A 45 adult patients with age range (37—70) years, male to female ratio (24:21), who were with approved diagnosis of advance chronic lung diseases by chest physician which is based on 2015 ESC/ERS guideline⁽¹⁴⁾. The following were excluded from the study: patients with acute lung disease, patients with diagnosed primary pulmonary hypertension, and patient's allergic to contrast media. All patients were referred from out-patients clinic in Baghdad teaching hospital.

Written informed consent obtained from all patients and the following information were recorded in a specially designed questionnaire paper: Socio-demographic Information: age, occupation, gender, smoking habit, detailed medical history about the type of chronic lung disease clinical data (ECG, Oxymetry) were obtained from all patients.

All patients enrolled in this study were examined by: echocardiography using (Phillips enviser), CTA pulmonary angiography using (Toshiba Aquilion 128 slice) multidetector with following parameters (kVp.

120), (mAs. 300) and 0.9 mm slid thickness. All the patients were examined in supine position and 90 cc of intravenous contrast media (Iohexol 755mg) injected through the cannula in anti-cubital vein with rate (4 ml/sec). Patients were scanned after predetermined period using a bolus tracking software and the following signs were reviewed; using electronic crosser pulmonary artery diameter was measured (3 mm) from the bifurcation in axial image in a mediastinal window, the diameter of the ascending aorta was measured at the same level, PA/Ao ratio was calculated (figure 1), right ventricular wall thickness measured at the mid wall of the Rt. Ventricle in 4 chambers view in axial image. the position of inter ventricular septum (normal, straitening or bowing to left) figure 2, the diameter of segmental PA equal or more to the adjacent bronchi in lung lobes, the patient or the absent of reflex of contrast media in Inferior vena cava (IVC) and hepatic veins, rericardial effusion if present or absent also reviewed, and lung and parenchymal changes reviewed in lung window (ground glass, emphysematous bullae, identical finding as cavitary lesion and Bronchiectatic changes) as illustrated in figure 1 and 2.

Figure 1: Show pulmonary artery diameter <29mm and increase Pa/Ao ratio at the level of PA bifurcation

Figure 2: Image show straightening of interventricular septum

STATISTICAL ANALYSIS

Data of the 45 cases were entered and analyzed by using the statistical package for social sciences (SPSS) software version 22, IBM, Chicago, US, for windows. Descriptive statistics were presented as mean, standard deviation (SD), frequencies (No.) and proportion (%). As we did not have a gold standard for the diagnosis of PAH, kappa statistics was used for the analysis and assessment of the agreement between CT and Echo results. Where the CT signs of PAH compared to the Echo results ⁽¹⁵⁾. Level of significance, P.value was set at 0.05. Finally, results were presented in tables and or figures with an explanatory paragraph.

RESULTS

There were 45 patients enrolled in this study with a mean age of 53.4 ± 8.3 (range: 37-70) years, moreover, about two thirds of the studied group aged more than 50 years. Males were relatively dominant than females; 24 (53.3%) vs. 21 (46.7%) respectively. Majority of the cases (75.6%) were smokers and only 13 cases (28.9%) were employed. Chronic obstructive lung disease (COPD) was the dominant type of chronic lung diseases among the cases, reported in 32 cases (71.1%), followed by bronchiectasis (20%) and the least frequent was interstitial lung diseases (ILD) in only 4 cases (8.9%). The clinical and radiological findings are illustrated in table 1.

Table 1: clinical and radiological findings

Variables	Value
Main pulmonary artery diameter (mm), mean \pm SD	26.3 \pm 3.8
≥ 29 mm	26 (57.8%)
< 29 mm	19 (42.2%)
Main pulmonary artery diameter by gender (mm), mean \pm SD	
In male (mm), mean \pm SD	27.2 \pm 1.9
In female (mm), mean \pm SD	25.3 \pm 2.4
Ratio of segmental pulmonary arteries to adjacent bronchi	
$> 1:1$	21 (46.7%)
Normal	24 (53.3%)
Ratio of MPA to AO	
Increased ($> 1:1$)	22 (48.9%)
Normal ($\leq 1:1$)	23 (51.1%)
Parenchymal changes detected by CT	
Ground glass	26 (57.8%)
Emphysematous bullae scattered throughout the lung	25 (55.6%)
Bronchiectatic changes	12 (26.7%)
Cavity lesion	8 (17.8%)
Parenchymal consolidation	4 (8.9%)
Thick interlobular septa	3 (6.7%)
PAH by echocardiography	27 (60.0%)
Right ventricle wall thickness (mm), mean \pm SD	3.42 \pm 1.56
≥ 4	16 (35.6%)
< 4	29 (64.4%)
Inter-ventricular septum left ward bowing or strained	15 (33.3%)
Right ventricle dilatation	16 (35.6%)
ECG finding	
RAD	21 (46.7%)
RAD + RVH	4 (8.9%)
Normal	20 (44.4%)
MPA: Main pulmonary artery, AO: Aorta, RAD: right axis deviation, RVH: right ventricular hypertrophy	

There was substantial agreement between echocardiography findings of PAH with main pulmonary artery diameter, MPA to adjacent AO, Right ventricle wall thickness, right ventricle wall thickness, and

Parenchymal changes, but there was poor agreement with PA to adjacent bronchi ratio, as illustrated in table 2. Figure 3 illustrate the different lung diseases compared by PAH diagnosed using echo.

Table 2: agreement between echocardiography results and CT findings

CT scene findings	Echocardiographic findings		Kappa	p-value
	PAH	No PAH		
	27	18		
Main pulmonary artery diameter			0.680	0.003
≥ 29	23 (85.2%)	3 (16.7%)		
< 29	4 (14.8%)	15 (83.3%)		
MPA to adjacent AO			0.780	0.002
Increased	22 (81.5%)	0 (0%)		
Normal	5 (18.5%)	18 (100%)		
PA to adjacent bronchi ratio			0.130	0.392
> 1: 1	14 (51.9%)	7 (38.9%)		
Normal	13 (48.1%)	11 (61.1%)		
Right ventricle wall thickness			0.620	0.001
≥ 4 mm	16 (59.3%)	0 (0%)		
< 4 mm	11 (40.7%)	18 (100%)		
Parenchymal changes			0.610	0.001
Present	26 (96.3%)	7 (38.9%)		
Absent	1 (3.7%)	11 (61.1%)		

AO: Aorta, OA: pulmonary artery

Figure 3: Comparison of pulmonary hypertension according to Echo findings in patients with different lung diseases

DISCUSSION

Pulmonary hypertension may be suspected based on the clinical history, physical examination and electrocardiogram findings but imaging is usually

central to confirming the diagnosis, establishing a cause and guiding therapy. The diagnostic pathway of PAH involves a variety of complimentary investigations (16). Computed tomography pulmonary angiography (CTPA)

and Echocardiography are important modalities in the assessment of PH and have established a central role both in helping identify an underlying cause for pulmonary hypertension and assessing resulting functional compromise. Echocardiography (ECHO) is an important noninvasive tool in assessment of PH and has been used to screen for the disease, determine right and left heart structure and function, and assess response to therapy in persons with PH^(2, 16, 17). Despite that Echocardiography and right heart catheterization are the main diagnostic method in PAH⁽¹⁷⁾, the main role of the CT scan to evaluate for any associated underlying diseases, however, there have been attempts to address the utility of CT to predict the presence of PAH⁽⁷⁾. Reliability of noninvasive estimation of pulmonary arterial pressure (PAP) and of PAH diagnosis with echocardiography was discussed extensively, nonetheless, Doppler estimates of systolic and particularly mPAP are imprecise in individual patients, this is likely because of the intrinsic limitations of echocardiography and its operator dependency⁽¹⁸⁾.

The current study tried to compare between CTA and echocardiography in detection of pulmonary hypertension in patients with advanced chronic lung diseases, therefore (45) patients were clinically assessed and examined using both Echo and CT scanning.

Regarding the demographic characteristics, the mean age of the studied group was 53.4 ± 8.3 (range: 37-70) years and (68.9%) aged more than 50 years. Males were relatively dominant than females; (53.3%) and (46.7%), respectively these findings go with the clinical picture of chronic lung diseases where pulmonary disease prevalence increases with age and contributes to morbidity and mortality in older patient^(19, 20). On the other hand, the gender differences in advanced lung disease are yet not well documented⁽²⁰⁻²²⁾.

The present study found that majority of the cases (75.6%) were smokers, this was not unexpected, because smoking is widely postulated as the main causal agent and cessation of smoking is the only method currently known to slow lung function decline^(23, 24). From Other point of view, smoking is a major risk factor of PAH, and PAH is common in smokers with COPD and thereby not correlated with the degree of airway obstruction⁽²⁵⁾, in a previous study from Switzerland in 2010 Schiess et al. documented that smoking is one of the major risk factors of PAH⁽²⁵⁾.

In the present study COPD was the dominant chronic lung diseases among the cases, it was reported in (71.1%), followed by bronchiectasis (20%) and the least frequent was interstitial lung disease (ILD) (in only 8.9%) of the cases, these findings supported by that documented by Akgün et al in 2012⁽¹⁹⁾. From other aspect of view, Shujaat et al.⁽²⁶⁾ found that PAH is more frequent in COPD and varies from 20 to 91% depending on the cut point of PAP used for the definition of PAH.

In the current study according to the echocardiography results (60%) of the cases had pulmonary artery hypertension (PAH) this finding is close to that reported by Iyer et al. study in 2014 in USA⁽²⁷⁾. However, estimates of the prevalence of PAH is vary widely from as low as 10% to as high as 85% depending on the severity of the underlying lung disease and the diagnostic criteria as well as approach used⁽²⁸⁻³⁰⁾, moreover, a previous study was conducted by Arcasoy et al⁽²⁹⁾ reported that the prevalence of PAH in patients with obstructive lung diseases compared with those with interstitial lung diseases or pulmonary vascular disease was 38%, 54%, and 67%, respectively, depend on the estimation of PAP⁽²⁹⁾. The variation among studies in the prevalence of PAH attributed to the population heterogeneity and the differences in the cutoff points of mPAP used for the diagnosis of PAH, where higher prevalence reported with the lower cutoff points⁽²⁹⁾, in addition to the method of diagnosis.

With regard to the main pulmonary artery diameter, the current study found that the mean main pulmonary artery diameter was (26.3 ± 3.8 mm) which was very close to the finding of Ussavarungsi et al.⁽⁷⁾ study which documented a mean of (26.6 ± 2.9 mm). From other point of view, our study with a cut-off point of 29 mm as of the mPA diameter was used. This cut-off was widely used in previous studies and documented to have good specificity value^(7, 31, 32). According to this cutoff point, out of the 27 patients with PH on echo, 85.2% had a mPA diameter of ≥ 29 mm giving good agreement of (84.4%) between the CT measurement of the mPA diameter and the Echo finding, this indicate that mPA measured by CT could predict PH and this sign is helpful in diagnosis of PAH. Moreover, our finding of the mean mPA diameter lower than (27.2 ± 0.6 mm) that reported in an earlier study by Edward et al⁽³²⁾. Nonetheless, many studies have tried to determine the normal range of the main PA size and found that the mPA diameter is easy to be defined anatomically and is highly reproducible,

in addition, the ascending aorta can also be measured to calculate the ratio of main PA to the aortic diameter (PA/Ao) (7, 12, 29, 32). Some authors used different cut-off point of PHT according to their clinical evaluation and studied population and different mean values of the mPA diameter were concluded; Kuriyama et al. reported a somewhat smaller mean PA size of 24.2 mm and used this value as a predictor for PH (12). The possible discrepancy may be due to the differences in CT techniques, race and patients characteristics (7, 12, 29, 32).

CONCLUSIONS

CT has the potential to provide the first pointer toward the diagnosis of the PAH in the patient with advance chronic lung disease, also CT and echocardiography are providing complementary information about increased pulmonary arterial pressure: CT offers anatomic information about the size of the pulmonary arterial tree, and echocardiography identifies the functional consequences of PH.

ABSTRACT

Background and Objective: Genetic risk factors associated with essential hypertension includes the polymorphism of AGTR1 A1166C. AGTR1, a gene of *Renin-Angiotensin-Aldosteron-System* has also been associated with dysfunctions in sodium absorption and natriuretic hormone. Therefore, the aim of this study was to investigate the correlation of AGTR1 A1166C and serum sodium level with essential hypertension within the specific ethnic group of Javanese in Sidoarjo - Indonesia.

Method: This case-control study was designed as a cross-sectional study, with 106 Javanese subjects. Genotyping for AGTR1 A1166C polymorphism was done using real-time PCR and DNA sequencing, while serum sodium level, blood glucose and lipid levels were determined by standard clinical laboratory methods.

Results: Our observations showed that AGTR1 A1166C, in particular the genotype AC, significantly correlated with high serum sodium level ($p = 0.001$) and appeared to be a risk factor for hypertension with OR 4.66 (95% CI = 1.065–21.51, $p = 0.0445$). Moreover, the serum sodium level was positively correlated with systolic blood pressure (SBP) or diastolic blood pressure (DBP) ($r = 0.3981$, $r = 0.4342$, respectively, $p < 0.0001$).

Conclusion: This study demonstrates that AGTR1 A1166C along with increased serum sodium level are major risk factors for essential hypertension in the Javanese population residing in Sidoarjo province in Indonesia.

Keywords: AGTR1, serum sodium, hypertension, genetic factors

INTRODUCTION

Hypertension is a significant health problem in Indonesia. The national data from 2007 to 2013 shows a 5.9% decrease in the average prevalence of hypertension, from 31.7% to 25.8%, suggesting that approximately 65,048,110 individuals are currently afflicted with hypertension.¹ However, the prevalence varies across

Indonesia, from as low as 16.8% in Papua to as high as 30.9% in Bangka-Belitung.¹ There are many elements that could contribute to this variation, including genetic factors and lifestyle.² Although genetic factors are hardly modifiable, studies have shown that lifestyle adjustment relevant to a specific pathway associated with a particular genetic factor may reduce the overall risk of hypertension.²⁻⁴ Therefore, it is essential to uncover potential genetic risk factors associated with populations afflicted with hypertension.

Angiotensinogen II Type 1 Receptor (AGTR1), in particular the allele A1166C genotype AC/CC (rs15186), has been shown as a predisposition factor for

hypertension in Asian and Caucasian populations in a meta-analysis study.⁵ AGTR1 is one of the major receptor protein in *Renin-Angiotensin-Aldosteron-System* (RAAS). By association with G proteins that activate a phosphatidylinositol-calcium second messenger system, AGTR1 mediates the classical biological actions of angiotensin.⁶ AGTR1 has been associated with dysfunctions in sodium absorption and natriuretic hormone function.⁷ It has also been associated with thickening of arterial walls, renal sodium reabsorption and retention.⁸⁻¹⁰

Certain lifestyle combined with a specific genotype may pose as a risk to promote, prevent, or at least modify hypertension severity.¹¹ If a specific variant of AGTR1 associated with high serum sodium level, it would be helpful to advise the individuals carrying that specific variant to adopt a low-sodium diet, thus, effectively lowering the risk for hypertension. With this in mind, we sought to identify AGTR1 A1166C allele frequencies and the risk conferred by specific genetic variants and associated biochemical factors for essential hypertension. As similar population genetic studies may reveal different, even conflicting conclusions, we conducted ours to see whether A1166C is a predisposition factor for hypertension in Sidoarjo, East Java Province, which has a reported hypertension prevalence of ~26%. We recruited specific ethnic Javanese patients that came to the Primary Health Centers, the lowest tiered health care provided by the government. A similar genetic population study has been reported,¹² although the subjects were from Central Java region, presented a rather different life style profile (e.g. consumption of sweet, instead of salty cooking habit), and were recruited from referral hospitals with higher level of health care facilities intended for more severe diseases.

MATERIALS AND METHOD

Participants

A cross-sectional study was conducted in unrelated adult individuals who had visited the Primary Health Centre of Sukodono, Sidoarjo, Indonesia. Participants were classified into two groups – hypertensive patients, if systolic and/or diastolic blood pressure (SBP and DBP, respectively) were ≥ 140 mmHg and ≥ 90 mmHg, respectively, and not hypertensive if SBP and DBP were < 140 mmHg and < 90 mmHg, respectively. A medical doctor diagnosed newly hypertensive patients

based on International Society of Hypertension Writing Group (ISWG, 2003). All participants were residents of Sidoarjo, Indonesia for at least three generations. Patients showing kidney or thyroid dysfunction, pregnancy, and those using contraceptive pills or other medications affecting blood pressure were excluded.

Interviews

All participants were interviewed using a questionnaire with regard to their lifestyle, smoking, alcohol consumption, food intake, and their family history of hypertension as part of demographic data collection.

Sample collection and assays

Five milliliter (5 mL) of peripheral venous blood was collected from all the participants in an ethylene diamine-tetra acetic acid (EDTA) vial after 12 h of fasting. One milliliter of whole blood was used for DNA extraction and the remaining for biochemical analyses related to hypertension risk factors, namely serum sodium, blood glucose and lipid level measurements. Serum sodium was determined using Ion Selective Electrodes (ISE), blood glucose using Glucose oxidase-Phenol Aminophenazone (GOD-PAP), and lipids using Cholesterol Oxidase-Phenol Aminophenazone (CHOD-PAP) standard methods.

Genotyping for AGTR1 A1166C polymorphism was performed by real-time PCR (ABI 7300 Real Time PCR System, Applied Biosystems, Foster City, CA) with SYBR green probe (Eurogentec, Seraing, Belgium) PCR Core reagents. The primers used were: Forward 5'-AGCCTGCACCAT GTTTTGAG-3' and Reverse 5'-TACCAGGTGCAAGTGTAGCA-3' (rs5186 flanking bases 1104-1610, SNP at probe 1218, or NM_032049.3 flanking bases 1314-1820 with SNP at 1428). Genotypes were classified into two groups i.e. wild type (AA) or mutant (AC/CC). Confirmation of the A1166C allele was accomplished using a DNA-sequencing kit (ABI Prism Big Dye Sequencing kit), according to the manufacturer's instructions. DNA sequences were aligned using BLAST-NCBI program against reference sequence NM_032049.3 to detect A1428C (A1166C).

Statistical analyses

The data were analyzed for differences by multiple *t*-test or One-way ANOVA, and comparisons were

made using Mann-Whitney or Kruskal-Wallis tests, as appropriate. Association among variables was tested by Pearson's *r*, linear regression, or Spearman correlation test, as appropriate. Fisher exact was used to test association of AGTR1 A1166C genotypes (A/C alleles) with hypertension. An odds ratio at [95% confidence intervals (CI)] was calculated as an index of the association of the gene with the disease. Data are presented as mean \pm SD or median \pm CI 95% (lower confidence limit; upper confidence limit). Statistical significance was defined as *p*-value $<$ 0.05. All statistical analysis was performed using GraphPad Prism version 7 (GraphPad Software, La Jolla, CA, USA).

Ethical Considerations: The study was conducted in accordance with the guidelines of the Helsinki Declaration. The study protocol was approved by the Ethical Committee for Health Research, Faculty of Medicine, Wijaya Kusuma University, Surabaya (No. 101109/SLE/FK/UWKS/2016). Written informed consent was also obtained from all the participants prior to the study.

RESULTS AND DISCUSSION

Baseline characteristics

From 306 individuals that were interviewed, 206 fulfilled the inclusion and exclusion criteria; however, during the study some individuals dropped out, leaving a total of 106 subjects in the current study. Of these, 66 individuals presented with essential hypertension and were slightly older than the remaining 40 normotension individuals (Table 1). The number of female subjects was higher as compared with the number of male subjects in both groups (*p*=0.302). SBP in hypertensive patients were significantly higher (157 ± 15 mm Hg) than that of normotensive controls (118 ± 9 mm Hg), *p* $<$ 1×10^{-11} . Similarly, DBP in patients were higher (93.79 ± 10 mm Hg) than in controls (76.9 ± 8 mm Hg), *p* = 5.1×10^{-14} (Table 1). Concomitantly, the serum sodium levels were also higher in hypertensive patients (141.6 ± 2.79 mg/dL) than in normotensive individuals (138.2 ± 2.56 mg/dL). Blood glucose, lipids, BMI, and smoking status were not different between patient and control groups, except for levels of low density lipoproteins (LDL), which was high in the hypertensive group (Table 1). Consumption of salt was statistically different between both groups, with a higher consumption seen among the hypertensive individuals.

Genotypes

Using real-time PCR and DNA sequencing we detected the polymorphic variant A1166C. In our sample population, the genotypes at 1166 were predominantly AA (85.8%), and AC (14.2%), whereas genotype CC was not detected. Others have reported similar results, with AA as the major genotype and AC as the minor one; CC was not detected in Malaysia (0/151) and Indonesia (0/60; 0/113).¹²⁻¹⁴ It is not clear why CC genotype was not detected. However, it is likely that due to a very small frequency, a larger sample size (more participants) may be required to detect it, or the CC genotype could be undergoing negative selection.¹⁵

Association of serum sodium, blood pressure and AC genotype with essential hypertension

Correlation of serum sodium level with SBP or DBP was analyzed using Pearson's *r* test. As shown in the scatter plots, a positive correlation was observed between serum sodium levels and SBP, with the Pearson *r* being 0.3981 (CI 0.2244–0.5473), *p* $<$ 0.0001, and equation of linear regression $y = 2.929x - 268.4$. A positive correlation was also seen with DBP, where the Pearson *r* was 0.4342 (CI 0.2644–0.5772, *p* $<$ 0.0001, and equation of linear regression $y = 1.778x - 162.1$. Correlation between polymorphism and serum sodium level was analyzed using the Spearman test, which showed a Spearman *r* of 0.5309 and *p* $<$ 0.0001. Genotype AC associated with higher levels of serum sodium, albeit still within normal range (*p* $<$ 0.001). Genotype AC was also associated with relatively higher mean of DBP (*p* = 0.0326). However, the SBP range did not differ between the AA and AC genotypes (*p* = 0.1296).

Although our observations are in line with majority of previous reports from Asian populations, they are contradictory to another Javanese-Indonesian study.¹² Our study showed that individuals carrying genotype AC have higher serum sodium level and blood pressure, in comparison with those carrying AA. In contrast, Irijanto et al. indicated that the genotype AA presented a risk factor for hypertension.¹² Such discrepancy may be due to the profile of the recruited patients, which may be complicated by organ dysfunctions and/or medications affecting blood pressure.

AGTR1 protein expression was positively correlated with SBP and DBP and negatively correlated with miR-155 expression level.¹⁶ Allele C has been functionally

associated with hypertension, where its presence impairs downregulation of AGTR1 by hsa-miR-155, thus elevating AGTR1 protein levels.¹⁷ The miR-155 expression was significantly decreased in subjects with CC genotype; however, the AGTR1 mRNA and protein expression were not significantly different in AA and AC genotypes.¹⁶

The level of serum sodium may be a result of salt consumption by an individual. Our study showed that

proportion of individuals with high salt consumption was higher in the hypertensive group than in the normotensive group. Furthermore, the AC genotype associated with high level of serum sodium and relatively higher mean of DBP. Thus, dietary salt consumption and/or genetic variation may predispose an individual to hypertension. Intervention such as low-sodium diet for individuals with genotype AC could lessen serum sodium and thus decrease hypertension risk.

Table 1: Average characteristics of the subjects.

Variables	Hypertension (n = 66)	Normotension (n = 40)	p value

Table 2. Association between AGTR1 A1166C and hypertension

Variables	Hypertension n (%)	Normotension n (%)	OR	95%CI Upper-Lower	p value
Genotype			4.66	1.065-21.51	0.0445
AC (mutant)	13 (12.3 %)	2 (1.9 %)			
AA	53 (50.0 %)	38 (35.8 %)			
Allele			4.261	1.059-19.33	0.0531
C (mutant)	13 (6.1%)	2 (0.9%)			
A	119 (56.1%)	78(36.8%)			

CONCLUSIONS

The present study demonstrated that AGTR1 A1166C, genotype AC, significantly correlates with high serum sodium level and DBP. In addition, serum sodium level also presented a positive correlation with blood pressure. Thus, the genotype AC, along with high serum sodium levels may pose a major risk for hypertension. Further studies are needed to see whether low-sodium diet for individuals with genotype AC could lessen serum sodium and blood pressure and thereby decrease the prevalence of hypertension among the Javanese population in the Sidoarjo province of Indonesia.

Analysis on Quality of Food Sanitation Hygiene and Escherichia Coli (*E. Coli*) Contamination at Restaurants around Commuter Line Stations in Central Jakarta, 2018

Dinda Ayu Ratnasari¹, I Made Djaja¹, Budi Hartono¹

¹Department of Environmental Health, Faculty of Public Health, University of Indonesia, 16424 Depok, Indonesia

ABSTRACT

Background A person's health condition and nutrition status is affected by the quality of food they eat. Therefore, everyone should be protected from any food that does not qualify food hygiene and sanitation requirements so it won't affect health. This research is to analyze the correlation between food sanitation hygiene according to standard for bacteriological quality of food at restaurants around commuter line stations in Central Jakarta. **Materials and Method.** A cross sectional study was conducted among 51 food handlers in Central Jakarta. Research data were analyzed using bivariate analysis with chi square test and multivariate analysis with logistic regression. **Results.** Bivariate analysis showed significant correlation between food ingredients ($p=0,019$: OR = 5,600: CI 95% 1,487-21,096), food ingredients storage ($p=0,006$: OR = 7,000: CI 95% 1,859-26,365), and cooked food storage ($p=0,008$: OR = 6,250: CI 95% 1,768-22,092) with *E. coli* contamination in foods. In addition, multivariate analysis indicated that food ingredients (OR=7,915) and cooked foods storage (OR=8,402) affected *E. coli* contamination in foods. **Conclusion** Authors suggest the restaurant owners should also improve their restaurant facilities such as kitchen renovation and washstand provision as the supporting elements to improve the quality of foods.

Keywords: hygiene sanitation, *E. coli* bacteria quality, restaurants

INTRODUCTION

People's lifestyle is shifting as the urbanization and industrialization develop. It includes the habit to buy food from the restaurants or street foods.¹ Unhygienic food processing in such places may cause food contamination by the bacteria which could lead to foodborne disease.²

Foodborne disease is a global public health problem with high morbidity and mortality rate.³ Foodborne disease might be caused by unhygienic food handling practices.⁴ The standard of hygienic foods can be measured based on the evaluation of *E.coli* bacteria contamination in food.³

E. coli bacteria is a normal microflora inhabiting the digestive tract of humans and warm-blooded animals which is usually non-pathogenic to humans.⁵ However, several types of *E. coli* could be pathogenic and its presence in foods indicating that the foods are contaminated by feces. *E.coli* bacteria in foods indicates the poor hygiene during food production or processing.⁶

KA Commuter line is a commuter rail system for Jakarta Metropolitan Area in Indonesia. Commuter train station is one of the popular public spots with average number of users per day reaching 993,804 passenger on weekdays, and the the largest number of users served in a single day recorded is 1,065,522.⁷ Based on the assessment result conducted by the Directorate of Environmental Health and Indonesian Railways Company in June 2017, 23% of food outlets at the station did not qualify the hygiene and sanitation requirements.⁸

According to the survey conducted at all commuter line stations in Jakarta, restaurants are the most dominant type of food, especially in Central Jakarta.

Central Jakarta is a strategic area where the National and Provincial Government runs. In addition, Central Jakarta also serves as a center of services, business, trade activities; which causes high activities in that area.⁹

The risk of foodborne disease is increasing as the people frequently eat and buy foods at the restaurants around the commuter line stations that did not properly follow the regulation to maintain the food hygiene or cook the foods in places with poor hygiene. Knowing that a research on the restaurants around commuter line station of Central Jakarta has never been conducted, the researchers are intended to identify *E. coli* contamination at the restaurants around commuter line train stations of Central Jakarta and its correlation with food hygiene and sanitation.

MATERIALS AND METHOD

The research design was cross-sectional with quantitative approach. The quality of *E. coli* bacteria on foods at the restaurants was determined through a direct food sampling and laboratory test using Total Plate Count (TPC) method with CCA (Chromocult Coliform Agar) as the medium. The data related to sanitary hygiene knowledge of the handlers was conducted through interview using questionnaires. While the data containing personal hygiene of the handlers, sanitation facilities, kitchen sanitation, utensils sanitation, food ingredients, food ingredients storage, food processing,

cooked food storage and serving was conducted using checklist instrument according to the observations.

The Research used total sampling technique with inclusion is restaurants around Central Jakarta commuter line stations that had high risk contamination foods including *E. coli*, that is the food with high protein and water rate. The samples of this research were 51 food handlers and 51 food samples.

The data were analyzed using univariate, bivariate, and multivariate analysis with SPSS Statistic 19 software. Univariate and bivariate tests were performed to obtain the frequency distribution of each research variable and to determine the correlation between independent and dependent variables in 95% confidence interval. In addition, a multivariate test was performed to determine the most dominant independent variable that affect dependent variable.

FINDINGS

Based on the results of *E. coli* examination in the laboratory, 18 (35.3%) of the food was positively contaminated with *E. coli*.

This research shows that from 51 interviewed food handlers, there were 9 (17.6%) food handlers having poor knowledge and 34 (66.7%) food handlers having poor personal hygiene. The results show that 14 (27.5%) restaurants had unqualified food ingredients.

	Knowledge	Personal Hygiene	Ingredients	Ingredients Storage	Food Processing	Food Storage	Food Serving	Kitchen	Sanitation Facilities	Utensils Sanitation
Qualified	42 (82.4%)	17 (33.3%)	37 (72.5%)	26 (51%)	21 (41.2%)	31 (60.8%)	33 (64.7%)	16 (31.4%)	23 (45.1%)	26 (51%)
Unqualified	9 (17.6%)	34 (66.7%)	14 (27.5%)	25 (49%)	30 (58.8%)	20 (39.2%)	18 (35.3%)	35 (68.6%)	28 (54.9%)	25 (49%)

From the univariate test results of hygiene sanitation of food ingredients storage, there were 25 (49.0%) restaurants that did not qualify the hygiene sanitation standard. For food processing variable, 30 (58.8%) were not qualified the standard and 20 (39.2%) of food storage were not qualified the standard.

As much as 18 (35.3%) restaurants did not qualify the hygiene sanitation requirements for serving foods. There were 35 restaurants (68.6%) that did not qualify the kitchen sanitation hygiene. While as much as 28

restaurants (54.9%) had poor sanitation facilities and 25 (49.0%) restaurants did not qualify hygiene standards for utensils sanitation (Fig.1).

Fig 1. Univariate Analysis on Food Hygiene Sanitation Variables at the Restaurants around Commuter line of Central Jakarta, 2018

Bivariate analysis was conducted to assess the correlation between hygiene sanitation of foods variables and *E. coli* contamination at the restaurants. From the results of chi-square test, the correlation among both variables can be examined by looking at the *p* value and Odd Ratio (OR). If the value of $p < 0.05$ and $OR > 1$, then both variables have a significant correlation. Based on Chi-square test results, there is a significant correlation

between food ingredients ($p = 0,019$: $OR = 5,600$: $CI 95\% 1,487-21,096$), food ingredients storage ($p = 0,006$: $OR = 7,000$: $CI 95\% 1,859-26,365$), and food storage ($p = 0,008$: $OR = 6,250$: $CI 95\% 1.768-22.092$) with *E. coli* contamination. Multivariate analysis was conducted to determine the most dominant variable. The variables included in the multivariate analysis were variables that having $p < 0,25$ based on the bivariate test.

Fig 3. Correlation between Food Ingredients Storage and *E. coli* Contamination at the Restaurants around Commuter line of Central Jakarta, 2018

Fig 4. . Correlation between Food Storage and *E. coli* Contamination at the Restaurants around Commuter line of Central Jakarta, 2018

From the final result of multivariate analysis using logistic regression by removing the variable with $p > 0.05$, it is known the variables that having correlation with *E. coli* contamination at the restaurant are food ingredients ($p = 0.010$: $OR = 7,915$: $CI\ 95\% 1,638-38,591$) and cooked food storage ($p = 0,005$: $OR = 8,402$: $CI\ 95\% 1,929-36,591$). Food storage variable is the most

significant factor since it has the largest OR value. From the logistic regression result, the equation of regression logistic model is as follows :

B value on food ingredients (b_1x_1), cooked food storage (b_2x_2) variables, and Constant (a), so that the equation is as follows (**Equation 1**)

$$\text{Logit (y)} = a + b_1x_1 + b_2x_2$$

B value on food ingredients (b_1x_1), cooked food storage (b_2x_2) variables, and Constant (a), so that the equation is as follows (**Equation 1**)

$$\text{Logit (E. coli bacteria quality)} = - 2,208 + 2,096 (\text{food ingredients}) + 2,128 (\text{cooked food storage})$$

After the logistic regression test, the next step was interaction test. Interaction test was conducted to determine whether or not there is a substantial interaction among the independent variables. From the test, there is no interaction among independent variable.

The research results show that 18 food samples (35.3 %) are positively contaminated with *E. coli* bacteria. The Government has regulated about restaurant hygiene sanitation on the Regulation of Minister Health 1098/MENKES/SK/VII/2003 listed the level of *E. coli* bacteria on food is 0/gr.¹⁰ Referring to it, this research indicates that 35.3% of food samples are not safe to eat since they are contaminated with *E. coli* bacteria.

E. coli bacteria on foods can be prevented by conducting good hygiene sanitation practices and the implementation of HACCP (Hazard Analysis and Critical Control Points).⁵ HACCP is one of the systematic approaches to identify and assess the hazards and risks that may arise during the production process.¹¹ A good hygiene and sanitation of food can be implemented by always maintaining personal hygiene, separating the food ingredients with the cooked one, cooking properly and maintaining the appropriate temperature for each type of foods as well as using clean water for cooking purpose.¹²

The quality of food ingredients has an important role in determining the food quality to be produced.¹³ There are 14 (27.4%) unqualified food ingredients and 9 (64.2%) of them are caused by *E. coli* bacteria contamination. Based on the analysis result, food ingredients are correlated with *E. coli* bacteria contamination in foods at the restaurants. Unsafe food ingredients are 5.6 times higher to be contaminated by *E. coli* compared to safe ingredients.

The food ingredients should be purchased from trusted suppliers, which are registered and licensed.¹⁴ In this research, it was found that 3 (5.9%) restaurants did not purchase their ingredients from licensed suppliers. In addition, the physical conditions of the ingredients should be also considered by selecting the fresh ingredients and having no sign of rot, as well as no color and shape changing. If the ingredients are in packaging form such as ketchup and soy sauce, the costumers should check the label registered on MoH RI.¹⁰ The research also found 6 (11.8%) packaged food ingredients are unregistered on MoH RI and did not have labels and brands.

The results show that there are 25 (49%) cases of improper ingredients storage and 14 (56%) of them resulting foods contaminated with *E. coli* bacteria. Based on analysis result, food ingredients storage are correlated with *E. coli* bacteria contamination on foods at the restaurants. Improper food ingredients storage has 7 times risks higher to be contaminated with *E. coli* compared to the one qualifying the standard.

Based on the observation, the restaurant owners purchase their food ingredients every day. However, not all of the ingredients were used at that day, so there are several types of ingredients stored up to the next day. The system of FIFO (First In First Out) can be implemented by writing up the purchasing date of each item and use it according to the purchase date.¹⁵

Temperature control is also important in food storage because bacteria can grow faster at critical temperatures or inappropriate temperatures.¹⁴ Based on the observation, there were 14 (27.5%) restaurants that did not have refrigerator for storing the foods that are easily spoiled. It led to the finding of several types of spoiled ingredients such as rotten chillies and moldy vegetables. Therefore, the control to the usage period of ingredients should be taken into account, especially for the restaurants that do not have refrigerator.¹⁶

Food ingredients storage should be protected from contamination sources such as insects and rodents, while the placement should be separated from the cooked foods. However, it was found that 16 (31.4%) restaurants storing their ingredients together with the cooked food.

The results show that there were 20 (39.2%) restaurants having poor food storage and 12 (60%) of them are contaminated with *E. coli* bacteria. Based on analysis result, foods storage is correlated with *E. coli* contamination on foods at the restaurants. Inappropriate food storages can increase the risk of *E. coli* bacteria contamination on foods, 6.25 higher than the good food storage.

In addition, cooked food storage also require a proper handling to prevent food contamination.⁶ Proper food storage can control the bacterial growth.¹⁷ Based on the observation result, 27 (52.9%) restaurants did not store their foods in a closed food display. Consequently, the foods were not protected from vermin such as cockroaches, flies, and rats.

In this research, the samples were foods with high protein and water content which is favored by the bacteria and also known as fast spoiled foods. Therefore, the storage needs to be considered importantly as well as the storage period.¹⁸ The longer food is stored, the higher the risk of spoiled foods occurrence. If the foods are stored for more than 4-6 hours, then it should be kept in cold temperature and reheated for serving.¹⁶

CONCLUSION

Based on the research results, 18 (35.3%) types of food are positively contaminated with *E. coli*. Research also shows that there is a statistically significant correlation between food ingredients, food ingredients storage, and cooked food storage variables with *E. coli* bacteria food contamination at the restaurants. Multivariate analysis shows that there are two factors affecting *E. coli* contamination on foods, i.e. factors of food ingredients and shared food storage.

Efforts to improve hygiene and sanitation in restaurants can be performed by the cooperation of related parties such as Public Health Office and Health Department with the restaurant owners by conducting training and counseling for food handlers regarding good hygiene sanitation practices by implementing HACCP system. In addition, sticker attachments program may also be implemented to restaurants that meet the requirements on sanitary hygiene inspection and monitoring. Moreover, the restaurant owners should also improve their restaurant facilities such as kitchen renovation and washstand provision as the supporting elements to improve the quality of foods.

Focal Interictal Epileptiform Discharges in Idiopathic Generalized Epilepsies

Gheyath Al Gawwam¹, Akram Al-Mahdawi², Seevan Ali³, Hayder A Fawzi⁴

¹Department of Neurology, College of Medicine, Baghdad University, Baghdad, Iraq,

²Head of Neurology Department, ³Department of Neurology, ⁴Department of Clinical Pharmacy, Baghdad Medical City, Baghdad, Iraq

ABSTRACT

Background and Objective: Idiopathic Generalized epilepsies (IGE) constitutes 15-20% of all epilepsies in adult and children. IGEs are electroclinical syndromes sharing specific clinical and EEG features, with their seizure phenotypes indicate the involvement of both hemispheres from the onset, both clinically and electrographically. Their EEG expression consists of initially generalized, bilaterally symmetrical discharges, whereas the background patterns are normal for age. We aimed to look at the presence of focal interictal EEG abnormalities in idiopathic generalized epilepsies and further analyze their characteristics, obviating misdiagnosis of focal epilepsy because of their presence.

Method: about 109 patient diagnosed as IGE enrolled in prolonged EEG. Focal EEG discharged were defined IEDs according to "The American Clinical Neurophysiology Society's Standardized Critical Care EEG terminology", further analyzed and correlated with different IGE subtypes, and with other clinical and EEG variables.

Results: About one third (34.8%) of the patients had focal IEDs, most of them were JME subtype. Location of most (65.8%) was frontal, the pattern of occurrence was frequent in (50.0%), (81.4%) were affected by provocative manoeuvres.

Conclusion: Focal interictal epileptiform discharges found in one third in EEG of idiopathic generalized epilepsies, they are frequent, and there is a high possibility of their appearance in routine EEGs.

Keywords: *Epileptiform, Epilepsy, Focal, Idiopathic, Interictal*

INTRODUCTION

A seizure is defined as "a transient occurrence of signs and/or symptoms due to abnormal excessive or synchronous neuronal activity in the brain⁽¹⁾. The seizures are either generalized or focal. Generalized epileptic seizures are conceptualized as originating at some point within, and rapidly engaging, bilaterally distributed networks. They can include cortical and subcortical structures but do not necessarily include

the entire cortex. Whereas, focal epileptic seizures are conceptualized as originating within networks limited to one hemisphere. These may be discretely localized or more widely distributed⁽²⁾.

Idiopathic generalized epilepsies (IGEs) are electroclinical syndromes sharing specific clinical and electroencephalographic (EEG) features, with their seizure phenotypes indicate the involvement of both hemispheres from the onset, both clinically and electrographically⁽³⁾. Focal clinical, electroencephalographic, and neuropathological features of IGE have been reported. The study of these focal electroencephalographic abnormalities is not devoted of clinical importance. Focal abnormalities especially focal interictal epileptiform discharge (IED) could potentially

lead to delayed diagnosis and misdiagnosis of IGE as focal epilepsy resulting in inappropriate antiepileptic drugs (AEDs) Choice and it may be a predictor of the clinical behaviour of the IGE syndrome^(4, 5). The IGE show no evidence of structural brain lesions, in contrast to the secondarily generalized group of epilepsies, and no known or suspected aetiology other than the contributions of polygenic factors. Their EEG expression (ictally or interictally) consists of initially generalized, bilaterally symmetrical discharges, whereas the background patterns are normal for age⁽²⁾. IGE constitutes 15-20% of all epilepsies in adult and children cohorts⁽⁶⁾. We aimed in this study to look over the presence of focal interictal EEG abnormalities in idiopathic generalized epilepsies and further analyze their characteristics, obviating misdiagnosis of focal epilepsy because of their presence.

METHOD

A cross-sectional observational study conducted at the epilepsy clinic of Baghdad Teaching Hospital for the period from Oct 2016 to Oct 2017, the study involved One hundred and nine patients who were diagnosed as IGE in the epilepsy clinic of Baghdad Teaching hospital, and they were classified as IGE according to the ILAE 2001⁽⁷⁾. Clinical history and examination, MRI (epilepsy protocol with 3 Tesla techniques), biochemical investigation, the neuropsychological assessment were all reviewed when available. The study received institutional approval from the Iraqi Council of Medical specialization and was done in accordance with Helinesky Declaration.

Patients included if they have seizure phenotypes according to ILAE2001 classification, EEGS with interictal bilateral, synchronous S/W polyspike wave normal background, normal neurologic examination and normal 3-Tesla brain MRI. The exclusion criteria were history of complex febrile convulsions, subjects with status or convulsions (>15 min) If those occurred before or during the study, previous history of CNS infection, patients with abnormal neurological examination, clear evidence of cognitive dysfunction (however no specific test was, performed only depending on routine clinical history and examination), patients with aura or any focal features in seizure semiology, brain structural abnormality on MRI.

Long-term EEG recording (3 hours) was done for all patients in video EEG unit using, Nicollet™

VikingQuest Desktop, (code: NCM12503, CareFusion v32 channel), Silver disc electrodes “sPes media (SA)” – Italy, were used. According to the modified 10-20 international system of electrode placement by the addition of 10 extra electrodes, 6 in the inferior temporal areas, inferior temporal chains, left side F9T9P9 on right side F10T10P10 electrodes), 2 anterior temporal electrodes T1T2 in some patients and 2 EKG electrodes⁽⁸⁾. Scalp skin prepared, using Nuprep skin preparation gel (Weaver and Company, A0006 rev.07 .USA) and electrode attached using Ten20 EEG paste (Wavear and Company: A0002 rev.06: USA) for all patients.

Figure 1: Headbox

The electrode impedance was kept below 5 K ohm. All EEGs were carried out under normal standard conditions, i.e., with the patient relaxed, awake with eyes closed, eye-opening and eye closure during which lying supine in a quiet room. All patients were partially sleep deprived, the usual dose of their anti-epileptic drugs (AEDs) was regularly taken.

Provocation manoeuvres include:

Hyperventilation: By asking the patient to breathe deeply at a rate of 20 breath / min for 3 min; sometimes even for 5 min patient sitting; the procedure was done for age older than 3 years⁽⁹⁾, when needed the hyperventilation was repeated after 20 min from sleep at the moment of arousal (HV in drowsiness)⁽¹⁰⁾.

Intermittent photic stimulation: Awake with dim room light simultaneous video record was recruited. Lump intensity of 1 joule a distance of 30 cm. patient instructed to look at the centre of the lump, IPS sensitivity was determined in three eye conditions with separate trains of flashes of 5 sec duration each during

eye closure, eyes closed, and eyes open. The following flash frequencies used separately and in this order – 2 – 8 – 10 – 15 – 18 – 20 – 25 – 40 – 50 – 60 Hz. If there was a generalized response at a certain frequency the lower and upper threshold for the response was defined⁽⁸⁾.

The patients were categorized into two groups; one with focal IEDs and the other does not have focal IEDs. Both groups were compared regarding the syndrome, clinical data including age, age at disease onset, disease duration, family history of epilepsy, syndrome type, frequency and timing and no of AEDs.

Statistical analysis

Data tabulation, input and coding, were done by the use of IBM® SPSS® (Statistical Package for the Social Sciences) Statistics Version 22 (Chicago, IL) and Epi Info™ 7. For descriptive statistics, the percentage was applied, Chi-square was used, and non-parametric test (Mann-Whitney) test was used for numerical data that did not follow a normal distribution and T-test for normally distributed data. Z-score; the difference between two samples proportions was used. A p-value less than 0.05 was considered significant throughout data analysis.

RESULTS

This study enrolled 109 patients; their mean age was 22.78 ± 10.24 years, with 43 (39.4%) male versus 66 (60.6%) females, as illustrated in table 1.

From total 38 patients, 11 had focal IEDs without provocative tests. In The rest 27 patients focal IEDS enhanced by the propagative tests 27 (27.55%), and the difference between the two proportions was found to be statistically significant (p -value < 0.001), which meant that propagative tests was an important tool to show focal IEDS Most patients showed focal IEDS on REM sleep 22 (81.47%), 2 (7.40%) on HV, and 3 (11.12%) on IPS, as illustrated in table 2.

Mixed SWD had 5.7 folds increase the risk of having focal Epileptiform Discharge compared to symmetrical SWD, and it was statistically significant, while asymmetrical SWD had a slight increase in the risk of focal Epileptiform Discharge compared to symmetrical SWD but it not statistically significant, as illustrated in table 2.

This study did not show the statistically significant difference between IGE subtypes and focal IEDS presence (see table 3).

Table 1: Relationship between Focal Epileptiform Discharge and various predictors

DISCUSSION

In the current study the overall incidence of focal IEDS was 38.4%, which was quite comparable to a large number of studies on this topic; on the other hand, it was higher than, and lower than some others. Focal IEDs was 34% in a study of adults with proven absences⁽¹¹⁾, and 35% in another study in IGEs⁽³⁾, and 30-35% in a study done on JME patient. Other work is done showing 38% the rate of focal IEDs in EEG of IGE Patients. The rate of 16 -37% of patients with absence had focal IEDS⁽¹²⁾. Even though higher per cent's, 56% was observed in a study done on patients with primary generalized epilepsy monitored for two decades⁽¹³⁾, while a study detected 91% of 11 children with CAE had Focal EEG features⁽¹⁴⁾, another study showed 47% of 41 patients had focal interictal epileptiform discharges⁽¹⁵⁾. The dissimilarity between the studies highly related to patients character, sample size, a period of the study, protocol and time of recording, inclusions and exclusion criteria and syndrome vs seizure choice.

Results maybe anecdotal if criteria of patient's selection were not harsh, as for previous CNS infections, head trauma, or patients with coexistence of clinical focal seizure elements. The elimination of frontal absences and EEGs with the phenomena of secondary bilateral synchrony in this study affected the no of records with focal IEDSs, but Focal IEDs the selection and allowed to confidently address the sample as idiopathic Standards of our work in nominating the activity as focal keeps out the asymmetrical SWDs and lateralized SWDs, this is in distinctions to other studies⁽¹³⁾, who allowed for those to be labeled as focal EEG features.

In the current study age, the age of onset and family history failed to elicit differences between focal IEDS presence and absence; this is compatible with studies done on the same points^(11, 15).

This study established the statistically important difference between patients with focal IEDS in the record, having more number of AEDs than patients with no focal IEDS. This detailed information about the type

of medication and possible interaction with their impact on the EEG may be needed to be studied to doubtlessly decide basis of the relation between focal IEDS and no. of AEDs. Studies pointed to the relation of the existence of focal IEDS and polytherapy in JME patient^(16,17). The difference between these studies and our work is the IGE subtypes which included. In which we employed ILAE task force classification 2001, which included updates in some syndromes in IGE phenotypes than ILAE 1989, e.g., EGTCS- alone which allow the studying of GTCS not necessarily at waking, to establish that focal discharges results in appropriate AED choice leading to poor seizure control and hence polytherapy.

Focal IEDS in IGE is highly state-dependent, and it affected by provocative tests in distinguished degree. The effect was in the form of increased amplitude and frequency, not affecting its field. Only 11 patients out of 38 their FOCAL IEDS was found regardless of provocative tests. Effect of sleep and HV were studied by S Koutroumanidis, M showing similar results⁽¹⁴⁾.

Patients with asymmetrical GSWD associated with focal IEDs than patient with symmetrical GSWD, voltage asymmetry between both hemispheres regional in well-known feature of GSWD of IGEs. Usually, occur during non-REM sleep and called fragmented SWD, drawback on our work was that state of each patient with asymmetrical GSWD was not labelled to analyze the information we observed. Could this focal IEDSs especially when are focal spike slow wave complexes are fragmented GSWD.

Studying focal feature in different IGE domain showed JME to be the most subtype with focal IEDS, (34.2%). Followed by JAE (23.7%), GTA (23.7%), CAE (13.2%), EMEA (5.3%). Results might be different from the only few studies which investigated each IGE subtype separately. A study on patients with absence seizure found JAE most common IGE subtype with focal IEDS⁽¹¹⁾. Another found GTCSA the most common IGE subtype with focal IEDS⁽¹⁵⁾. However, this difference could be explained by that their small sample size which compared ours and that not all IGE subtypes were included. In general focal IEDS in IGE studied as a whole category⁽¹²⁾ or taking only one syndrome like^(14,18) or selecting patients with IGE with specific seizure semiology⁽¹¹⁾.

CONCLUSIONS & RECOMMENDATIONS

Focal IEDs are almost present in one-third of the records of IGE's EEG. They are frequent, and there is a high possibility of their appearance in routine EEG. Further studies on the correlation of the presence of these focal discharges with the clinical behaviour in the setting of seizure frequency in each sub-syndrome and responses to AEDs.

Conflict of Interest: None

Ethical Clearance: Informed written consent obtained from all the participants in the study, and the study and all its procedure were done by the Helsinki Declaration of 1975, as revised in 2000. The Iraqi Council of Medical specialization approved the study.

Quantitative Fire and Explosion Risk Assessment of Fuel Tanker Truck: Preliminary Case Study at Fuel Terminal X Jakarta

Laksita Ri Hastiti¹, Fatma Lestari¹, Indri Hapsari Susilowati¹

¹Occupational Health and Safety Department, Faculty of Public Health, Universitas Indonesia, Kampus Baru Universitas Indonesia, Beji, Depok, Jawa Barat, Indonesia

ABSTRACT

The distributions of fuel using tanker truck have been increasing in terms of complex risks related to the potential of fire and explosion. Various studies and case reports have proven that the level of accidents or fire and explosions of fuel tanker trucks is rising. The objective of this study is to calculate personal and societal risk levels. Preliminary case study was conducted in filling shed of the Fuel Terminal X Jakarta. Data on locations, materials, meteorology hazard identification, activities and process, case reports, and installation were collected from measurements, observations, or interviews processes, as well as provided by the company and from existing literatures. Individual Risk per Annum (IRPA) for individual risk and Potential Loss of Life (PLL) for societal risk were calculated from frequency analysis using Event Tree Analysis (ETA). Furthermore, the consequences were analyzed using Areal Location of Hazardous Atmosphere (ALOHA® 5.4.4) software of fire and explosion based on a worst-case scenario modeling. The individual risk per year for office workers, field workers, society and road users were 4.16E-09; 6.99E-09; 1.73E-08 and 6.59E-13, respectively. The societal risk was 1.49×10^{-5} per year. Compared to the UK HSE Risk Criteria, the findings showed that the individual and societal risks of each category were still acceptable and tolerable.

Keywords: *Quantitative Risk Assessment (QRA); fire; explosion; tanker truck; fuel.*

INTRODUCTION

Dangerous chemicals, including oil and gas products, are distributed in enormous number daily. Center for Chemical Process Safety (CCPS), the transportation systems have the high potential to release the dangerous chemical material which has the effects for the society, property, and the environment¹. In 2004, Major Hazard Incident Data Services/MHIDAS report states that 43% of 12,179 accidents occurred during the transportation process². The hazardous chemical transportation volume in Europe between 1990-1998 show that its number reach 35 % of land transportation number. Cars are the main dangerous chemical transportation in Europe, and its number is expected to increase every year³.

The number of traffic accidents is seven times higher than railway or water accidents. Brenck and Mondry (1998) states that the accidents often happened to the transportation modes with the capacity exceeding 10,000 L⁴. German Federal Statistic Office (2000) reported that the traffic accident involving dangerous chemical transportation with or without the release's effects had caused injury and serious property damage. The study conducted in 1999 shows that most of the accidents involving dangerous chemical release (34 of 52 cases, or 65 %) occurred while transporting the materials under category 3 (combustible liquid)⁵.

On 2011, crude oil uses amounted to 32.7 % of the total energy use in Indonesia. Those number increased by 4.04 % from 2010 and it is expected to increase every year⁶. Fire can cause an explosion and vice versa⁷. Fire, explosion, and environmental pollution are relevant with hydrocarbon industry, and they may cause financial loss and other damages^{8,9}.

Correspondence author:
Laksita Ri Hastiti,
email: laksitahastiti@ui.ac.id

Fuel oil transportation activities use various modes of transportation, including tanker trucks. In 2012, an explosion of a tanker truck killed 22 people and injured 111 people in Riyadh¹⁰. Similar to that case, on 29 August 1998, a tanker truck transporting 23,000 L of gasoline got into an accident in Zurich, causing fire and many injuries¹¹. Unfortunately, there is no adequate relevant statistical data in Indonesia yet.

Center for Chemical Process Safety (CCPS) has created the guidelines for hazardous chemical transportation risk assessment. The assessment process includes determining the scenario and its incident potential, the consequence evaluation, the accident estimation, the accident's effects estimation, and the risk level estimation^{1,12}. Fuel Terminal X is one of national company's fuel terminals involved in upstream and downstream oil and gas industries. Furthermore, the company is one of the largest companies with high frequency of fuel oil transportation activities.

Therefore, Quantitative Fire and Explosion Risk Assessment (*QFERA*) must be implemented as a proper precaution to determine and control the hazard and risk of fire and explosion in tanker trucks. The purpose of the study is to perform a fire and explosion quantitative risk assessment on fuel tankers to decide the most appropriate risks in one of the Fuel Terminal X Jakarta's case study.

METHOD

The preliminary case study was conducted at the Jakarta Fuel Terminal from April to July 2015. The object of research was in the form of a fuel tank with the largest capacity (40000 liters) transporting the premium fuel. Data concerning locations were collected using GPS. Meteorological data were generated from the Indonesian Agency for Meteorological, Climatological and Geophysics. Data concerning hazard identifications, chemical materials, tanker truck specifications, activities and process, case or accidents reports, employees record and company assets were collected from observation, and interview. Data were evaluated then analyzed using Quantitative Risk Assessment (QRA) method to determine the individual and societal risk levels. The data analysis was done by identifying the risks of fire and explosion, and then verifying the field to set a fire and explosion scenarios. Individual Risk per Annum (IRPA) of individual risk and Potential Loss of Life (PLL) of societal risk were calculated from frequency

analysis using Event Tree Analysis (ETA). Furthermore, the consequences were analyzed using Areal Location of Hazardous Atmosphere (ALOHA® 5.4.4) software of fire and explosion based on a worst-case scenario modelling.

RESULTS

The tanker trucks in company X were managed by a third party with 13 subcontractors. The tanker trucks activities including loading, distributing and unloading. Every day, 240 units of tanker trucks distribute 6,000 KL of fuel. The distribution route covers Jakarta, Bogor, Depok, Tangerang, and Bekasi.

The fuel leakage from the tankers in the filling shed area is considered having a high-risk danger level. In fact, there has been a fire accident in the area. The filling process itself takes 1 hour. Fuel Terminal X Jakarta have 12 filling sheds, each of which can accommodate 3-6 tanker trucks. Therefore, every hour, almost 72 tanker trucks stand by in the area. Every tanker truck was operated by 1 driver and 1 crew who filled the tanker with fuel during loading process in the filling shed new gentry.

According to OSHA and NIOSH, Pentane density is 2.48 times higher than the air^{13,14}. The baseline event is in accordance with the risk identification result, which is the leakage from the bottom loading valve in the tank with the rate of 4×10^{-5} per hour which is then converted to 6.08×10^{-4} per year. The immediate ignition probability is determined according to Purple Book (2005) for road tanker continuous, which is 0.1. The delayed ignition probability is 0.9 because it happened in the chemical plant area or oil refinery¹⁵. Another probability is determined in accordance with the observation result toward the existing fire safety system. The ETA result can happen if the scenario preconditions are fulfilled. The ETA frequency calculation can be used to calculate the risk level.

Table 1. The Summary of Risk Level Calculation According to Scenario

Scenario	Frequency	Type
Fire Ball	5,490E-05	Immediate Fire
BLEVE	2,890E-06	Immediate Fire
UVCE	4,213E-04	Explosion
Dispersion	4,928E-05	Dispersion
Flash Fire	2,341E-06	Delayed Fire

The fire and explosion risks calculation can be used to determine the worst-case scenario. The failure scenarios which are most likely to occur are: fire from the spreading flammable vapor cloud, thermal radiation from the flammable area, BLEVE, and vapor cloud explosion (VCE) (Table 1). The scenario modeling results are shown on Table 2.

The simulation results from some of the fire and explosion scenarios show that there is hazard potential

that threaten the safety of the society around Fuel Terminal X Jakarta. Fuel Terminal X Jakarta, which is located at Koja District, North Jakarta, occupies 483,520,000 m² of land area. Individual and societal risks assessments using population data from the area show that the population density is 10,811.78 people/km² in 2013. The assumed numbers of daily public transportation users in the area in 2013 amounted to 20,971 people/day¹⁶.

Table 2. The Consequences Modeling Result

Scenario	Threat Zone	Reach	Effects	Affected Area
Flammable vapor Cloud	Red	38.405 m	8400 ppm =60% LEL= Flame Pockets, fire if ignition sources present	Filling shed 1
	Yellow	119.786 m	1400 ppm = 10% LEL, no fire potential	All filling shed area, tanker truck queue
Fire with thermal radiation	Red	24.689 m	10 kW/m ² = may cause death in 60 seconds	Filling shed 1-4
	Orange	34.747 m	5 kW/m ² = may cause 2 degree burn level in 60 seconds	Filling shed 5-6
	Yellow	53.035 m	2 kW/m ² = may cause injuries in 60 seconds	Until filling shed 9
BLEVE	Red	311.81 m	10 kW/m ² = may cause death in 60 seconds	Control room, filling shed, 13 storage tanks, buildings, society, traffic user
	Orange	440.741 m	5 kW/m ² = may cause 2 degree burn level in 60 seconds	4 storage tanks, buildings, society, traffic user
	Yellow	686.714 m	2 kW/m ² = may cause injuries in 60 seconds	5 storage tanks, buildings, society, traffic user
Explosion/VCE	Red	37.490 m	> 8.0 psi = may cause the damage of the car and surrounding building	Filling shed 1-6
	Orange	55.778 m	> 3.5 psi = may cause serious wound	Filling shed 6-7
	Yellow	128.016 m	> 1 psi = may cause the glasses shattered	Filling shed, 3 storage tanks, buildings

Quantitatively, the risks are calculated based on the individual and societal risks. Risk actions calculated from the quantitative risk assessment are: Potential Loss of Life (PLL); Individual Risk Per Annum (IRPA); and Societal Risk Criteria. The risk calculation are compared with the risk criteria from HSE UK¹⁷. The individual risk calculation result shows that all of the workers and tanker truck crews are in the acceptable level based on

Table 3. The individual risks for society and traffic users are in the acceptable level as well. However, the society individual risk level is higher than that of the workers. It is supported by the estimation that the society members stay at home for 24 hours for the worst-case scenario. Therefore, continuous dissemination to workers and society members must be performed to make their safety, especially related to fire and explosion, as a priority.

Table 3. Potential Loss of Life. Individual Risk, and Societal Risk Calculation

No	Category	Amount (person)	IR for Immediate Fire	IR for Delayed Fire	IR for Explosion	IRPA	PLL (per year)
1	Office employees	72	4,160E-09	0,000E+00	0,000E+00	4,160E-09	2,995E-07
2	Shift employees	1071	5,719E-09	1,849E-12	1,269E-09	6,990E-09	7,487E-06
3	Societies	409	1,733E-08	0,000E+00	0,000E+00	1,733E-08	7,089E-06
4	Traffic users	292	6,595E-13	0,000E+00	0,000E+00	6,595E-13	1,926E-10
	Total	1844					1,487E-05

The cumulative risk has to be below the tolerable individual risk that has been approved (Societal Risk Criteria) showed in Figure 1. The cumulative risk which is over the Societal Risk Criteria can be categorized as unacceptable and must be reported. The mitigation plan must be initiated as well to reduce the risks in the tolerable area. However, it is important that the activities' risks between the tolerable and the avoidable must be reduced in accordance with the 'As Low As Reasonably Practicable' (ALARP) concept.

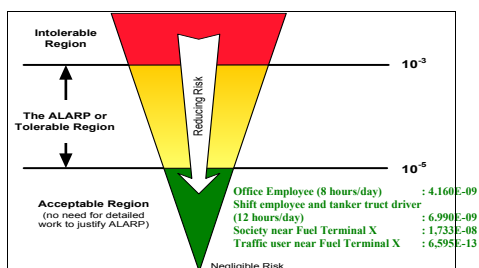

Figure 1. Individual Risk Criteria Fuel Terminal X Jakarta

Societal risk can be compared between every employees' group, namely the workers with office hour and the workers working under shift system. The societal risk for employees with 8 working hours a day is 2.995×10^{-7} per year, which is still considered acceptable. The societal risk for employees with 12 working hours a day is 7.487×10^{-6} per year, which is also considered acceptable. The fire and explosion training and dissemination program must be continuously well maintained.

Overall PLL with the frequency of 1.487×10^{-5} per year is within ALARP risk or tolerable area according to the worst-case scenario. Although it is within the

ALARP category, even the smallest fire and explosion risks must be considered.

DISCUSSION

The tanker trucks have also been supplied with safety standard system and emergency response equipment for any accidents, such as in the cases of fire and explosion. In the filling process, there is a high risk of fuel leaking or overflowing during the filling process, especially at the filling sheds which have not implemented the automatic system. Besides the interlock system, the tankers must be equipped with a tank to contain the fuel overspill to reduce the risks.

According to the simulation system on the effects of tanker leakage, an emergency response system and an evacuation route in the area must be considered. The worst case that can happen is the failure of the detection and control systems. An advanced detection system must be installed at the filling shed area to reduce the effects. The main detector that must be installed is flame detector, so the flame source can be easily found and controlled.

The existing administrative control in the Fuel Terminal X is a limitation to the filling shed entry area. In addition, Fuel Terminal X also implements various procedures and actions in their emergency response, inspection, maintenance, and other activities. The company holds fire and explosion trainings in collaboration with third parties and disseminates information to the workers and tanker trucks crews.

The company documents show that there are some factors affecting the transportation safety, especially tanker truck crews' behavior. The tanker truck staff,

especially the driver, must be healthy both physically and psychologically and must have adequate understandings on occupational health and safety, fuel distribution and handling, the use of Protective Personal Equipment and tanker truck installation, and emergency response.

Implementing proper dissemination to surrounding community and the traffic users must also be considered. The surrounding community must know about the safe zones from fire and explosion incidents. The restriction beyond the safe zone must be considered as well to minimize any possible external threat. The company must improve the cooperation with the relevant organizations, such as the Fire Agency, the Police Department, the Ministry of Transportation, Jasa Marga, and the society members. This cooperation will ease the evacuation and mitigation process.

The findings of this study are expected to serve as an initial assessment and a consideration for the improvement of fire safety related to tanker trucks. Further study can be conducted to understand the fire and explosion risk levels in the distribution route. However, if the emergency conditions do present, the company is expected to give an adequate response and run a rehabilitation and reconstruction program after the incident.

CONCLUSION

The risk assessment results show that the individual risk for the company workers and the society around Fuel Terminal X Jakarta are in the Acceptable category according to Risk Acceptance Criteria HSE UK. The overall societal risks for the individual and the society are at the 'Tolerable' level or ALARP. Existing fire safety system involving fire and explosion preventions and controls that the company already implemented must be well maintained. Further risk assessment along distribution route must be implemented as well.

Conflict of Interest: None

Ethical Clearance: Completed

Smile Card as a Breakthrough to Increase Dental and Oral Hygiene Level in Primary School Students in Jakarta

Jusuf Kristianto¹, Ita Yulita¹, Dwi Priharti¹, Heru Santoso Wahito Nugroho²

¹Health Polytechnic of Jakarta I, Indonesia, ²Health Polytechnic of Surabaya, Indonesia

ABSTRACT

School dental health services are implemented in an integrated manner through primary dental and oral health activities at the Public Health Center with the activities in the form of the School Dental Health Unit (UKGS) program. Various methods are used to achieve maximum dental and oral health, such as promotion and demonstration of toothbrushes for elementary school children. One way to improve children's behavior in maintaining dental and oral hygiene is by providing dental health education on how to brush teeth properly and correctly by using appropriate and appropriate aids or media. A Smile Card is one of the right methods to change children's behavior in maintaining dental and oral hygiene. This study aims to determine the effect of Smile Card on the oral and dental health of children. The sample were 150 people divided into groups of intervention and control. The results showed that there were differences in the influence of knowledge and the role of parents in improving dental and oral hygiene between the groups given the Smile Card intervention with the group not given the Smile Card, where $p = 0.001 < 0.05$. It can be concluded that the knowledge and role of parents influence the improvement of children's oral and dental hygiene.

Keywords: Smile cards, Oral and dental hygiene, Elementary school students

INTRODUCTION

School Dental Health Unit (UKGS) activities are part of the activities of the School Health Unit (UKS) which are routinely carried out in schools with the aim of fostering and realizing student independence for healthy living that enables the realization of optimal community health.

The presentation of the population who had dental and oral problems according to Basic Health Research (Riskesdas) in 2007 and 2013 increased from 23.2% to 25.9%. Among people who have dental and oral health problems, the percentage of the population who received dental medical care increased from 29.7% in 2007 to 31.1% in 2013. Similar to the Effective Medical Demand (EMD) which is defined as the percentage of the problematic population with teeth and mouth

in the last 12 months multiplied by the percentage of residents who received dental care or treatment from dental medical personnel increased from 6.9% in 2007 to 8.1% in 2013. Most of the population aged ≥ 10 years (93.8%) brush their teeth every day. Most residents also brush their teeth during an afternoon shower, which is 79.7%. Most residents brush their teeth every day during a morning shower or an afternoon bath. The true habit of brushing the Indonesian population is only 2.3%⁽¹⁾. The proportion of people who brush their teeth every day after breakfast is only 12.6% and before going to bed at night only 28.7%. This may be due to a lack of knowledge and awareness of the teeth-mouth hygiene, as well as areas that are still difficult to reach information due to varying geographical conditions. Three provinces that had the highest percentage in brushing their teeth were DKI Jakarta Province (98.5%), West Java Province (95.8%), and East Kalimantan Province (95.5%), while the lowest was in NTT Province (74.7%) and Papua Province (58.4%)⁽¹⁾. Factors of economic and income levels, as well as knowledge, show that low socioeconomic conditions have little awareness and knowledge of the importance of maintaining dental health compared to people who have a higher socioeconomic life. Other

Email: heruswn@gmail.com

factors are attitudes and behavior towards dental health maintenance such as oral hygiene related to the frequency and habits of brushing teeth, the number and frequency of cariogenic foods that cause caries (2).

MATERIALS AND METHOD

This research was an attempt to create a new method by using a Smile Card to improve the degree of dental and oral hygiene in elementary school students in Jakarta. This research was conducted in Elementary School in Jakarta in 2016 with a total sample of 150 people. The first group was the intervention group that was given dental health education with a demonstration of brushing their teeth with a jaw model aids and accompanied by a Smile Card and the control group was given a tooth brushing education using a jaw model without Smile Card. The main sources needed in this study are 1) toothbrush, 2) students, 3) parents of students, and 4) Smile Cards.

The making of this new method was carried out in several steps: 1) promotion by demonstration and giving a Smile Card, 2) improving the family’s ability in early prevention of cavities, 3) monitoring brushing teeth with the Smile Card, 4) testing methods through field research, 5) conclusion and submission of recommendations.

FINDINGS

The Role of Smile Card to Knowledge of Dental and Oral Care

The choice of method is based on the theory that dental health care by brushing teeth using a jaw model, as well as mentoring using a Smile Card has better results than without mentoring. Parental participation is very necessary for caring for, educating, encouraging and supervising. Mother plays an important role in maintaining the health of the child’s teeth in underlying the formation of positive behaviors that support children’s dental health. The attitude and behavior of parents in maintaining dental health has a significant influence on children’s behavior(3). Giving a Smile Card will help in monitoring the child’s brushing habits by the teacher and parents. Children’s oral and dental health depends on children’s adherence and mentoring parents in caring for them(4). With the willingness of parents to start treatment on the child’s teeth, a better child’s oral and dental health will be obtained(5). For more details, see Table 1.

Table 1. Distribution of knowledge of respondents given smile cards with control group respondents against dental and oral health elementary school children in Jakarta

Variable	Mean	SD	p-value	n
Knowledge				
Treatment	14.2800	1.0042	0.001	75
Control	13.4733	1.6777		75

The Table 1 shows that there was a significant difference of knowledge between the respondents given the Smile Card intervention with the respondents who are not given the Smile Card (control), namely $p = 0.001$. The mean score of knowledge of the respondents given the smiling card $14.2800 + 1.0042$ and control group $13.4733 + 1.6777$. Thus granting a Smile Card can increase elementary students’ knowledge about dental and oral health.

Effect of Smile Cards on the Role of Parents in the Dental and Oral Care

With the health promotion intervention program by demonstrating and giving a Smile Card, as well as improving the ability of families to make early prevention of cavities with the habit of brushing their teeth regularly, will improve the ability of the community, especially elementary school students and can be observed the habit of brushing their teeth. Health promotion intervention program with the resulting Smile Card can be used as dental and oral health services in order to carry out various promotive and preventive activities in dental and oral health. This intervention will be strongly related to family empowerment as the smallest group in society, as an effort to improve the quality of dental and oral health in various dental and oral health services, both in rural and urban areas. Therefore, knowledge, especially of the mother’s knowledge of dental and oral hygiene, greatly determines the cleanliness of the child’s teeth and mouth(6),(7). For more details can be seen in Table 2.

Table 2. Distribution of parent roles in children given a smile card with control group on dental and oral health of primary school children in Jakarta

Variable	Mean	SD	p-value	n
The role of parents				
Treatment	6.63	0.700	0.001	75
Control	5.84	0.883		75

The results of the analysis showed that there were significant differences in the role of parents between students who were given a Smile Card intervention and those who were not given a Smile Card (control), namely $p = 0.001$. The mean score of role of parents was given Smile Card $6.63 + 0.700$ and control group $5.84 + 0.883$. Thus giving Smile Card can improve the role of parents in maintaining oral hygiene.

Recommendations

From the results of the analysis, it was concluded that the Smile Card accompanied by a demonstration of brushing teeth proven to improve the dental and oral hygiene of elementary school students in Jakarta. The most powerful influence in improving oral hygiene is the sole factor of parents and is shown to interact strongly with knowledge in efforts to improve dental hygiene of primary school students in Jakarta. It is recommended that educators or extension workers, both dental health workers and dental health cadres, conduct dental and oral health promotions and demonstrations to be accompanied by a Smile Card so that optimal goals can be obtained for improving the level of dental and oral hygiene of elementary school children.

DISCUSSION

This study presents the use of smile cards as a method to improve the dental and oral health of elementary school students. Child and parent knowledge about dental and oral health is very important in shaping behaviors that support oral and dental hygiene of parents' children with low knowledge of dental and oral health are predisposing factors for behavior that does not support children's oral and dental health^{(4),(8)}. This can happen because parents are the main social force that influences children's development, including dental and oral health care for children^{(3),(9),(10)}. Knowledge is influenced by education, especially promotion and demonstration of dental and oral hygiene care. Health education is the simplest and

most cost-effective approach^{(11),(12)}. Extension education in the form of promotions and demonstrations equipped with a smile card will make it easier for children and parents, especially mothers, to adhere to children's oral and dental health care. Health education increases awareness of the importance of dental and oral health⁽⁶⁾. Therefore the existence of a smile card will help children and mothers to care for the health of their teeth and mouth. The attention of parents, especially mothers, to the health of the teeth and mouth of children begins early so that a habit is obtained to obtain general health.

Likewise, the role of parents has an influence on the cleanliness of the teeth and mouth of children. Family, that is, the attitude of parents to the importance of oral hygiene, plays a major role in the preservation of healthy children's teeth. The family creates the environment necessary for a healthy lifestyle, increases self-confidence, and helps shape habits⁽⁷⁾. This can occur because the behavior and health practices of parents generally have an influence on the dental health of children⁽⁵⁾. The role of parents has a big influence because children also learn from what they see, hear, and from experience about an event. Children learn through their observations of an activity carried out by their mother-father or teacher. Children learn from what they hear from parents and people around them and their environment. Children will imitate mother-father activities so that they gain experience about an event⁽¹³⁾. The more active the role of parents towards their children, the better the behavior of children. In this case, parents not only play a role but also act. Dental health status is influenced by health behavioral factors which include factors of knowledge, attitude, and action (practice). Therefore, the role of parents is very important in guiding, understanding, reminding and setting an example so that children are able to develop their personal growth, parental responsibilities, and loving care and provide facilities for children so that children can maintain the health of their teeth and

mouth. Parents, especially the mother, are the closest figure to the child since the child was born, besides that the child's behavior also plays a role in maintaining the health of his teeth and mouth⁽¹⁴⁾.

CONCLUSION

This study has recommended the Smile Card method as a breakthrough in improving dental and oral hygiene in elementary school students. This method can be used in promotions accompanied by tooth brushing demonstrations to improve the degree of dental and oral hygiene of elementary school students. The results of the study prove that the knowledge and role of parents have an influence on improving children's oral hygiene.

Statement of Conflict of Interest: The authors declare that there is no "conflict of interest" related to this research and publication.

Analysis of Determinant Factors of Exclusive Breastfeeding in Indonesia: A Case of Ulakan Tapakis District

Marisa Lia Anggraini¹, Arni Amir^{1,2}, Hardisman Dasman³

¹Master of Midwifery Program, ²Department of Biology, ³Department of Public Health and Community Medicine, Faculty of Medicine of Andalas University, Indonesia

ABSTRACT

Background and Aim: Infant's nutritional needs for optimal growth and development up to of 6 months can be supplied by exclusive breastfeeding because it contains all the nutrients as the infant needs. However, the exclusive breastfeeding practice has been relatively low in Indonesia, including Tapakis District in West Sumatera Province. The study aimed to explore the determinant factors related to this practice.

Method: A cross sectional study was conducted in Uakan Tapakis District, on 88 mothers who have a child aged 0-12 months. To understand the determinant factors, the data was analyzed both using bivariate and multivariate analysis.

Result: The result shows that exclusive breastfeeding is associated to knowledge ($p=0.025$), attitude ($p=0.038$), motivation ($p=0.044$), occupational status ($p=0,025$), health resource availability ($p=0,028$), health officer role ($p = 0,013$) and family support ($p= 0,038$). Moreover, the most dominant variable is the role of health workers in supporting the breastfeeding practice ($p= 0.013$, $OR=8.772$).

Conclusion: The health workers, especially midwife plays significant role in supporting breastfeeding practice. It is necessary to have good communication and health education from health workers for the succeed implementation.

Keywords: *Exclusive breastfeeding, determinants, health workers*

BACKGROUNDS

The standard of health in a country can be seen from Infant Mortality Rate (IMR) and the life expectancy of its population.¹ Globally, the World Health Organization (WHO) states that the number of infant deaths is about 1 million stillbirths and 2.7 million deaths in the first week of life. More than 63 countries in the world, including in the Asian region, are in dire need of efforts to reduce the infant mortality in order to achieve the Suitable Development Goals (SDGs) target, namely 12 deaths per 1,000 live births in 2030.²

In Indonesia especially, the IMR is also relatively higher than neighboring countries. The data of Indonesian Demographic and Health Survey (IDHS) has shown that the IMR dropped from 68 to 32 deaths per 1,000 live births in 1991 and 2012 respectively.³ In West Sumatra Province especially, the cases of infant mortality was found 392 cases in 2014.⁴

WHO and the United Nations Children's Fund (UNICEF) lead global breastfeeding advocacy initiatives to ensure that exclusive breastfeeding rates increase by at least 50% by 2025.⁵ WHO and UNICEF in Infant and Young Child Feeding, recommend the gold standard for feeding infants and children are (1) early breastfeeding initiation at 1 hour of birth, (2) Exclusive breastfeeding in the first 6 months, and (3) introduction to complementary solid food with adequate and safe nutrition at 6 months together with continuing breastfeeding for up to 2 years or more.⁶ World Breastfeeding Week Guide in

2016 states that exclusive breastfeeding has a large contribution to growth and endurance. Children who are given exclusive breastfeeding will have optimal growth and development and are not easily get ill. This is in accordance with several global studies and facts.⁷

The coverage of exclusive breastfeeding in West Sumatra Province was relatively low, and did not reach the target, such as 60.0% in 2011 from the target of 67.0%, and 75.1% in 2015 from the target of 83.0%.⁸ The exclusive breastfeeding practice in Padang Pariaman Regency was even lower, which was only 56% and 57.4% in 2014 and 2015 respectively. Among all districts in Padang Pariaman, Ulakan Tapakis Districts was the lowest with exclusive breastfeeding rate 29.8% in 2015.⁹ Therefore, the study aimed to explore the determinant factors related to exclusive breastfeeding in this district as a case study, that can be inferable data for Indonesia.

METHOD

A cross sectional study was conducted in Ulakan Tapakis District, with the data collection between June and November 2017. The participants of the study was 88 mothers who had a baby 06-12 months, which selected randomly.

The instrument was developed by using Ministry of Health of Indonesia guidelines on breastfeeding practice. Later the data analyzed quantitatively both using bivariate and multivariate analyses.

RESULT

The result shows that there are 21.6% participants who do an exclusive breastfeeding. The distribution of knowledge, attitude, education and other variables are comparable between high and low (as can be seen in table 1).

Table 3 Dominant Factor The Implementation of Exclusive Breastfeeding

	Variable	p value	OR	95 % CI
Last Step	Motivation	0,004	8,560	1,978 – 37,054
	Availability of health resources	0,998	1,778	0,000
	Affordability of health resources	0,998	0,000	0,000
	The role of health workers	0,013	8,772	1,584 – 48,596

Multivariate analysis shows that the most dominant variable is the role of the health worker, with p value 0.013 and OR of 8.772 (CI=1.584 – 48,596).

DISCUSSIONS

Based on the results of the study, it is found that only a small proportion (21.6%) of respondents who carry out exclusive breastfeeding on their babies. This result is very far from the achievement target of exclusive breastfeeding which is supposed to be 83.0%. According to research conducted by Rhokliana¹⁰ mother, family, and community have little understanding about exclusive breastfeeding. Not a few mothers who still throw colostrum away because it is considered dirty. In addition, the habit of giving food and drinks early to baby in community also cause unsuccessful exclusive breastfeeding. Some mothers also lack of confidence to be able to breastfeed their babies. This encourages mothers to easily stop breastfeeding and replace it with formula milk.

The study it reveals that the knowledge of mother is associated to the implementation of exclusive breastfeeding. Another research conducted by Kusumaningrum¹¹ states that the poor knowledge is thought to be due to lack of information, lack of clarity of information, and lack of ability to understand the information received. The research conducted by Kusumaningtyas¹² states that poor knowledge in Exclusive breastfeeding can be caused by other factors that influence knowledge, including non-supporting environmental factors that can prevent a person from having poor knowledge.

The study also shows that there is a significant relationship between the attitudes of respondents and the implementation of exclusive breastfeeding. This is in accordance with Haryati's¹³ opinion, that a mother who has never received advice or experience, breastfeeding counseling and the ins and outs of others, as well as from reading books, the mother will have less knowledge and influencing her attitude so that it becomes negative

towards exclusive breastfeeding.

The motivation is also significantly associated to the implementation of exclusive breastfeeding. Sopiyan's study¹⁴ in Klaten District found a very significant positive relationship between social support and motivation to provide exclusive breastfeeding. That is, the higher (stronger) the social support, the higher the motivation for giving exclusive breastfeeding.

Level of education is also associated to implementation of exclusive breastfeeding significantly. The results of this study are not in line with Atabik¹⁵ in his research, which states that there is a significant relationship between the level of maternal education and the implementation of exclusive breastfeeding in the Pamotan village of Rembang Regency. Mothers who have higher education generally also have better nutrition knowledge and have greater attention to the nutritional needs of children.

Meanwhile occupational status is also associated to exclusive breastfeeding practice. It means that good environment very much influence the mother in their feeding baby practice. As Satino's research¹⁶ in Surakarta City, explained that environmental factors support exclusive breastfeeding and the environment did not support exclusive breastfeeding.

The study also shows that the availability and access to health resources very much associated to the implementation of exclusive breastfeeding. Likely due to lack of information about exclusive breastfeeding from childbirth helper in the place of the mother giving birth. It can be expected that the combination of these two components is the key to the success of the lactation process.¹⁷ In order to be able to achieve a wider community health service, a Health Center (Puskesmas) was established *Posyandu* (Integrated service post). Particularly in the field of midwifery with the aim

of accelerating the reduction of maternal and infant mortality, the idea of a midwife in the village.¹⁸

The role and support of health workers is significantly associated to implementation of exclusive breastfeeding. The results of this study are in line with Tesy Mamonto's research¹⁹ in the work area of Kotobangun Public Health Center, West Kotamobagu Subdistrict, Kotamobagu City, where the results of the study stated that there was a relationship between the role of health workers and exclusive breastfeeding, where most respondents did not exclusively breastfeed because of the lack of role/ support from health workers. Based on the results of research conducted by Josefa²⁰ in the District of West Semarang, it turns out that the support of health workers in the period before and after childbirth, such as education and counseling, has not been as expected.

Moreover, the family support, including husband and relatives who stay at the same house with participants is very much influenced them to have exclusive breastfeeding practice. Research conducted by Hedianti²¹ states that family members who play the most role in providing support in terms of informational support and assessment support are husbands, while family members who play the most role in instrumental support and emotional support are husbands and parents. From all of aspects of support, the family members who have the most role in providing support are husband and parents (67.9%).

About myth and false beliefs variables about baby food, based on the results of the study concluded that there was a significant relationship between the myths with the implementation of exclusive breastfeeding. One of the obstacles for breastfeeding mothers is their belief in myth. In fact, the myth cannot be proven true.²² Myth is the fruit of ancient thought where analysis of a certain condition is still very limited. In line with the term 'not all myths are wrong', then not all myths can be held true.²³ Formula milk promotion variable, based on the results of the study concluded that there was no relationship between the promotion of formula milk with the implementation of exclusive breastfeeding. This study is in line with the research conducted by Isnaini²⁴, in which the mothers with poor education is at risk giving formula milk. Maternal education, in addition as the main asset in the household economy, also plays a role in the initial feeding of the baby.

Multivariate analysis result shows that the most dominant variable related to the implementation of exclusive breastfeeding is the role of health workers. In contrast to the research conducted by Tesy Mamonto¹⁹ in the work area of Kotobangun Health Center, Kotamobagu Timur District, Kotamobagu City, stated that the most dominant variable is respondent attitude towards exclusive breastfeeding. And research conducted by Astuti²⁵ in the work area Serpong Health Center, said that the most dominant variable is the parent role related to the behavior of giving exclusive breastfeeding.

CONCLUSIONS

Based on the results of the research and discussion that refers to the research objectives, it can be concluded that the factors related to the implementation of exclusive breastfeeding are including predisposing factors (knowledge, attitudes, motivation, and work), enabling factors (the availability of health resources), and reinforcing factors (the role of health workers and the role of the family). The most dominant variable is the role of health workers, which implies that good communication and health education from health workers is necessary for the succeed implementation of exclusive breastfeeding practice.

ABSTRACT

After a decade of war, Iraqi government embarks in the strengthening of private firms after years of sanctions. The government of Iraq for the preceding period after the international war and a series of several sanctions that negatively affected medical system focused on the development of the old medical system. Studies show that strategic foresight contributes to the success of organizations. Hence, this study aims to identify the impact of strategic foresight on the success of healthcare marketing in Iraq. A total of 171 respondents collected from private hospitals and clinics. The results revealed that strategic foresight with customer, market, competitive and technology foresight has a positive impact on healthcare marketing.

Keywords: *Iraq Healthcare, Customer Foresight, Market Foresight, Competitive Foresight, Technology Foresight.*

INTRODUCTION

Iraqi economy and general healthcare system are emerging from a long term conflict that dwelled for many decades. The government has the role of providing medical services to its citizens through government-owned hospitals or facilitation of the private hospitals and healthcare firms¹. The marketing of the private medical firms in Iraq was put on course after the subsidence of the 2003 US invasion². The medical system of Iraq is run by the Iraqi government, but the more substantial portion is left to the private sector³. The growth of the private health sector in Iraq depends on the invitation of the private investors who will facilitate the growth and development of the customer-driven medical system⁴.

Many authors and researchers have written articles and journals regarding Iraqi future medical system. The researchers have focused on the independent topics of patient's foresight, market prediction and competition⁵. Others have significantly focused on the needs of the technology and the roles it plays in impacting needs of the Iraqi medical market amid the rising number of private hospitals⁶. Private hospitals market themselves with three different purposes. First, they want to

understand their patients well. The hospital search to have a deeper insight into their customers and buyers⁷. Marketing helps in identifying the needs of customers and finding a suitable fit for the need. Marketing ought to communicate in a clear way that provides enough information and customers decide to make purchases by been convinced that the product will fulfill their needs. There is a need to improve the marketing of private hospitals in Iraq. The reason has been that most of them have been ineffective for various reasons⁸. This includes lack of cohesion between business strategy and the marketing strategy employed, and failure to establish a marketing strategy that is unique⁹. The purpose of this study is to show how a private hospital can use strategic foresight to improve its marketing¹⁰. The private hospitals market their services with an aim of increasing their revenues. These hospitals have not done all there is to do in there marketing¹¹. Thus, there is a need to improve the current marketing models by applying appropriate strategic tools.

LITERATURE REVIEW

Strategic Foresight

According to (Rohrbeck et al., 2013)¹², they voiced

out that strategic foresight originates from the two words strategy and foresight. Foresight is the ability of an institution or a firm to judge and predict correctly what is going to happen in the future and so as to plan its actions based on this knowledge¹³. In studies, termed strategic foresight as a strategy tool that gives a clear picture of the true nature of something of product. He went ahead and explained that strategic insight entailed the act of carrying out product testing sessions to clearly evaluate and get a clear insight of a type of product. According to (David,2012)¹⁴ Strategic foresight includes four dimensions (Customer (CUF),Market (MAF),Competitive (COF),Technology (TEF)) as it shown in figure 1.

Figure 1. Strategic Foresight Dimensions

The aspect of customer foresight can be observed from a different perspective, but for marketing purposes, private medical firms are driven by a single agenda of profitability. A private hospital in Iraq partners with international pharmaceutical firms in the provision of medical services¹⁵. Market foresight is one of the key factors in the formulation of the organization's strategy. It varies with the nature of the organization and its needs when it comes to strategy but the essence of any strategy must be about building the future. Thus, strategic planning should always include consideration of potential and potential scenarios in the relevant business environment; hence the market foresight must be systematic and planned¹⁶. Technology is a significant component of the medical facility. As an independent variable, technology influences the growth of medical and healthcare growth. For instance, communication plays a significant role in connecting people and medical facilities. The awareness's need for private hospitals to reach people depends on the level of technology. Competitive foresight is an important tool for developing the strategic vision required by analyzing competitors and developing future solutions that can represent a future competitive advantage that contributes to improving the competitive position of the organization¹⁷.

Healthcare Marketing

Some scholar has an opinion that the marketing strategy model is not adequate to market both goods and services¹⁸. Goods and services have different characteristics like goods are tangible whereas services are intangible¹⁹. According to Hill & Alexander (2017)²⁰, strategic priorities are concerned with long-term goals and highly rank customers satisfaction. Organizations have their vital focus on the customer and provide the goods and services which will satisfy their needs so as to create customer loyalty²¹. To achieve this. The marketing manager is at the pivot to ensure a proper marketing is conducted to convince customers that the product will satisfy their needs.

Private hospitals market themselves with three different purposes. First, they want to understand their patients well. The hospital search to have a deeper insight into their customers and buyers⁷. Marketing helps in identifying the needs of customers and finding a suitable fit for the need.

MATERIAL AND METHOD

Instrument

The instrument of this study was the survey it was used and conducted in private hospitals and clinics, the population for this study comprises of the physicians, random sample has been selected among them, the sample size is 171. The first section deals with demographic sample. the second section deals with strategic foresight and its dimensions (CUF ,MAF,COF,TEF), depending on the scale was developed and standardized by (David,2012)¹⁴, the third section deals with healthcare marketing, depending on the scale was developed and standardized by (Kumar et al.,2014)²². Cronbach's Alpha coefficient was used to determine the internal consistency and it is refer to a good value of all the items and the value of Cronbach's Alpha was 0.952 in general which insures the reliability of the instrument.

Normality

The normality test used to deciding use parametric or non-parametric tests, for this purpose Kolmogorov-Smirnov test is used for normality test, and when data is normal distribution, non-parametric statistical tests can be used to analyze and verse versa if distribution is not normal, parametric tests can be used. Results in Table 1 refer to that the data are normally distributed.

Table 1: Normality Test

Factor Analysis

The questionnaire items of SF for each of dimensions were factor analyzed to establish the dimensions of the responses, as it shown from Table 3 the confirmatory factor analysis exceed 0.5 and refer to that the items relating to each of SF factors loaded onto the anticipated factors as it shown in Table 2.

Table 2: Factor Loadings

Item	Path	Factor	Loading	Item	Path	Factor	Loading
CUF 1	<---	CUF	0.647	COF 11	<---	COF	0.786
CUF 2	<---	CUF	0.741	COF 12	<---	COF	0.835
CUF 3	<---	CUF	0.726	COF 13	<---	COF	0.635
CUF 4	<---	CUF	0.766	COF 14	<---	COF	0.758
CUF 5	<---	CUF	0.676	COF 15	<---	COF	0.575
MAF 6	<---	MAF	0.703	TEF 16	<---	TEF	0.654
MAF 7	<---	MAF	0.630	TEF 17	<---	TEF	0.621
MAF 8	<---	MAF	0.778	TEF 18	<---	TEF	0.705
MAF 9	<---	MAF	0.716	TEF 19	<---	TEF	0.725
MAF 10	<---	MAF	0.621	TEF 20	<---	TEF	0.697

Conceptual Framework

The Conceptual framework developed shall further conceptualize the impact of SF dimensions on HM, and it developed according to the literatures and scales, as it is presented in Figure 2.

Figure 2: Conceptual Framework

FINDINGS

The results of Table 3 show that there is a positive significant relationship between SF and HM ($r=0.795$, $t=17.050$, $P<0.05$). This result is consistent with (David,2012)¹⁴ study where SF has been considered as a success factor to improve the performance. Regarding the dimensions the results show that there is a positive significant relationship between CUF and HM ($r=0.620$, $t=10.272$, $P<0.05$). This result is consistent with (Rohrbeck et al., 2013)¹² study where CUF has been considered as critical success factor of HM. Moreover, the obtained results point out that there is significant association between MAF and HM ($r=0.732$, $t=13.970$, $P<0.05$), and this result is compatible with (David,2012)¹⁴ recommendation where it stressed that MAF has a high effect on HM. Regarding COF the results show that there is a positive significant relationship between COF and HM ($r=0.691$, $t=12.416$, $P<0.05$). This result is consistent with (Rohrbeck et al., 2013)¹² study where COF has been considered as critical success factor of HM. Moreover, the obtained results point out that there is significant association between TEF and HM ($r=0.685$, $t=12.217$, $P<0.05$), and this result is compatible with (David,2012)¹⁴ recommendation where it stressed that TEF has a high effect on HM.

Table 3: Correlation Coefficient Results

IV	r	T	sig	DV
SF	0.795	17.050	P<0.05	HM
CUF	0.620	10.272	P<0.05	
MAF	0.732	13.970	P<0.05	
COF	0.691	12.416	P<0.05	
TEF	0.685	12.217	P<0.05	

Table 4: Regression Analysis Results

IV	β_0	β_1	R ²	Adj-R ²	F	sig	SE
SF	0.874	0.805	0.632	0.630	290.686	0.000	0.315
CUF	1.738	0.591	0.384	0.381	105.509	0.000	0.408
MAF	1.765	0.609	0.536	0.533	195.166	0.000	0.354
COF	1.826	0.583	0.477	0.474	154.155	0.000	0.376
TEF	1.822	0.590	0.469	0.466	149.263	0.000	0.379

Table 4 results show that SF has a positive impact on HM, SF explains 63.2% of the variance and predict 0.805 increase in HM, the significant level is <0.05 and ($F=290.686$), and the regression equation is ($HM=0.874+0.805 SF$) therefore the results support the hypothesis 1. Regarding the dimensions the results show that there is a positive impact of CUF on HM, CUF explains 38.4% of the variance in HM and predict 0.591 increase in HM, the significant level is <0.05 and ($F=105.509$), and the regression equation is ($HM=1.738+0.591 CUF$) therefore the result support the hypothesis 2 there is statistically significant impact of CUF on HM. Moreover, the obtained results point out that there is a positive impact of MAF on HM, MAF explains 53.6% of the variance in HM and predict 0.609 increase in HM, the significant level is <0.05 and ($F=195.166$), and the regression equation is ($HM=1.765+0.609 MAF$) therefore the result support the hypothesis 3 : there is statistically significant impact of MAF on HM. Also results refer to positive impact of COF on HM, COF explains 47.7% of the variance in HM and predict 0.583 increase in HM, the significant level is <0.05 and ($F=154.155$), and the regression equation is ($HM=1.826+0.583 COF$), therefore the result support the hypothesis 4 : there is statistically significant impact of COF on HM. Finally, the results show that there is a positive impact of TEF on HM, TEF explains 49.9% of the variance in HM and predict 0.590 increase in HM, the significant level is <0.05 and ($F=149.263$), and the regression equation is ($HM=1.822+0.590 TEF$) therefore the result support the hypothesis 5 there is statistically significant impact of TEF on HM. Accordingly, the results support the study hypothesis and sub hypothesis.

DISCUSSION AND CONCLUSION

In recent years, the public healthcare sector in Iraq has suffered from the conditions of the war on terror, which have affected the provision of logistical and financial capabilities; Therefore, the private healthcare sector has emerged as a competitive alternative, requiring effective strategic tools²³. Many studies ensure that it is beyond doubt that there is indeed a need to bridge the knowledge gaps by examining the relation between SF and HM . as such this study aims to identify the relationships that are significant for SF and HM , including the notion of how such this relationship can enhance HM. Iraq has undergone decades of war and unwavering sanctions from the United Nations. For example, Power failure grids as a result of the Gulf War in the 1990s and a decade of sanctions²⁴ were among the side effects on the hospitals and water; sanitary installations on which it depends on sufficient electricity supply.

Iraq is in the middle of the desert and therefore, traveling for most households and families in search for medical services is a huge challenge. The future of the Iraqi population is heavily dependent on the out of the pocket medical services which is provided by private firms²⁵. Therefore having a medical system that is regulated by the government through subsidies and the provision of necessary facility promotes the growth of private sectors. The re-emergence of the medical facilities of Iraq is faced by many challenges among them is inadequate medical personnel⁶. The future of the Iraq medical system and marketing of private firms is positively modified by the factor of technology, competition, and clients. The results indicate that customer and market foresight have a positive impact on the success of healthcare marketing. Paying attention to the customer, providing good service, with a true vision of marketing positively affects the success of healthcare marketing. In addition to employing technology and enhancing competitiveness. Consequently, It is pretty clear that these tools play a vital role in healthcare marketing and therefore the health institutions should try all means available to invest on these four tools.

Study of the Organic Pollution in Euphrates River, Southern of Iraq

Ali Abdulhamza Al-Fanharawi¹, Ahmed Sabah Al-Jasimee²

¹Department of Environment & Pollution, College of Science, Al-Muthanna University, Al-Muthanna, Iraq,

²Department of Biology, College of Science, Al-Qadisiyah University, Al-Qadisiyah, Iraq

ABSTRACT

Water pollution is one of the main problems that cause harm to man and his environment. In order to evaluate the quality of our inland water and the extent of its contamination with organic matter, this study was conducted.

Water samples were collected monthly from six selected stations on Euphrates river, three of them in Nasiriya city are Al-Sindinawiya, Al-Fadhliya and Souk Al-Shuyuk district. The other three were in Abu Al-Shulan, Al-Medana city center and Qurna district for the period from October 2017 to May 2018. Samples collected in 500 ml polyethylene bottles. The biological oxygen demand (BOD) was determined by the BOD Sensor after calibration and processing.

The results of the study showed that the values of BOD₅ had recorded the highest concentration in the first site of the study and amounted 47.5 mg/l either the lowest value was recorded in the fourth site (4.87) mg/l, as well as the values in the other four stations were 6 in S2, 7.12 mg/l in S3, 7.62 in S5, and 6.75 mg/l in S6, respectively. The values of BOD₅ during the months of the study ranged from 2 to 54 mg /l as lowest and highest value during the months of March 2018 and May 2018, respectively. The river water classified according to Hynes scale as doubtful clean in the fourth station, bad in the second, third, fifth and sixth stations, and very bad at the first station. In general, all study sites assessed as very bad (13.31) mg/l.

Statistically, there were significant differences between the values of the BOD₅ between stations at the probability level ($p \leq 0.05$), these significant differences not showed between the months.

Keyword: Organic pollution, BOD₅, Euphrates river, Iraq.

INTRODUCTION

Pollution is the contamination of the Earth components environment with materials that interfere with human health ⁽¹⁾, either water pollution maybe it can be said that any undesirable change in the physical, chemical or biological properties of water lead to loss of favorite water qualities for living organisms ⁽²⁾. Sewage is the main water pollution, which can be defined as a mixture of organic waste from several human activities such as food preparation, washing dishes, latrines, baths, laundry, house cleaning and bathing ⁽³⁾, and when discharged to water systems show a lot of problems in the water body.

Biochemical oxygen demand (BOD) forms the key indicator of organic load in any wastewater system. This

property is expressed as the amount of dissolved oxygen required by aerobic biological organisms for degrading organic materials present in a given water sample at certain temperature over a specific time period ⁽⁴⁾. When any type of organic material reaches the water body, the living organisms begin to break down and analyze this material. During this process, oxygen amount in the water is consumed through the breathing of aerobic organisms. The amount of consumption depends on the concentration of the organic load in the water. Thus a low BOD is an indicator of good quality while high BOD indicates polluted water ⁽⁵⁾. Water quality classified depending on BOD₅ values to five class were very clean, clean, fairly clean, doubtful clean and bad ⁽⁶⁾.

As a result of the absence of any previous

environmental study on Euphrates river at Nasiriyah and Basra cities, this indicator has been used to determine the water quality and organic pollution, and our current idea was selected.

MATERIALS AND METHOD

Description of study sites

Euphrates river is one of the main rivers in Iraq. The importance of Euphrates river has been highlighted since ancient times due to its varied uses in agriculture, fishing, water transport and trade. It penetrates most of Iraq's provinces. It has a length about 3000 km and penetrates the Iraqi cities with a length of 1160 km, equivalent to about 38.7% of the total length of the river.

Six sampling stations were identified along the river in Nasiriyah and Basra governorates (Figure 1). Three sites were selected within the geographical area of Dhi Qar, including the sample S1, this sample was taken from the area of Al-Sindinaoui near the center of Nasiriyah and this area is contaminated with sewage, there was a sewage station in the center of Nasiriyah, whose waste is drained into the river water. This area is characterized

as an agricultural area. The sample site (S2) was taken from the center of Fadhliya area. This area is dominated by the agricultural character, where the sugarcane plant is abundant on the river, there are also cages for raising fish. Third sample (S3) was in the center of the Souk al-Shuyuk district near (Al-Sabra Bridge). This area is characterized by occurred a large number of human activities and large quantities of city waste discharged to the river.

In Basra province, three sites were selected within this geographical area. The site of sample (S4) was within between Chabaish and Medina district in an area called Abu Shulan, this area is an extension of the marshes in Dhi Qar and Basra provinces. The location of the sample S5 was at Medina district center (below the bridge). This area is characterized by many sources of pollution from sewage, waste accumulated as well as operations water from oil companies located near the river and its waste. Finally, the location of sample S6 was in Qurna district in Oujan Pasha area, about 4 km from the confluence of the Tigris River in the Euphrates in the Shatt al-Arab and This area is characterized mostly as agricultural areas free from sources of pollution, both civil and industrial.

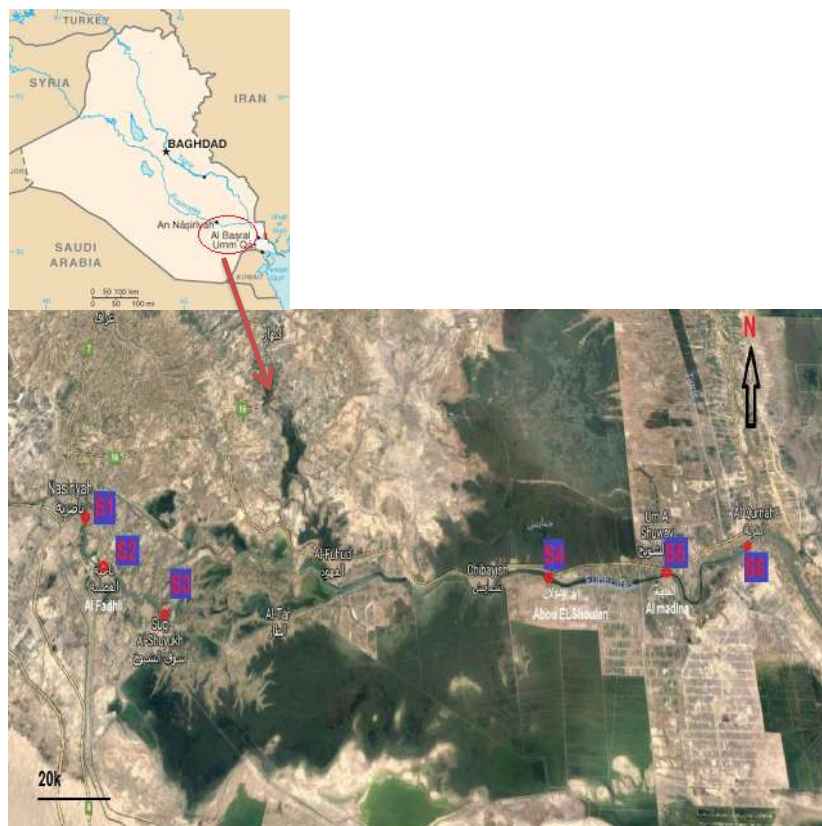

Figure (1): Study sites on Euphrates river in Nasiriyah and Basra provinces.

MATERIALS AND DEVICES

In the present study, the BOD sensor method, which includes a set of substances and tools such as nitrification inhibitor, NaOH, bottle for setting sample size, dark sample bottle, magnetic stripe, rubber cover, the base of carrying the bottles, specific incubator and sensor, was used to determine the biological oxygen demand in the water of Euphrates river.

Procedures

The test is conducted in airtight bottles 500ml capacity in the absence of light and under a controlled temperature ($20 \pm 1^\circ\text{C}$) for 5 days by take 432ml from water samples, the results take directly from sensor display and multiplying suitable factor, were expressed as (mg/l).

Statistical analysis

The significance of the differences, whether study site differences or monthly differences, were determined by variance analysis method, using the Statistical Package for the Social Sciences (SPSS) version 20 at the probability level ($p \leq 0.05$)⁽⁷⁾.

RESULTS AND DISCUSSION

The results of the study showed a difference in the values of the biological oxygen demand between stations (4.87-47.5 mg/l) (Fig. 2). Statistical analysis results indicate that there were significant differences between the stations ($p \leq 0.05$), and the values varied within the study months and recorded the highest in May 2018 in S1 (54 mg/l), and the lowest in March 2018 at the second sites (2 mg/l) (Fig. 3).

The results of S1 recorded clearly changed compare with other sites, BOD₅ values in this site was 47.5 mg/l as mean (Fig. 2), and the water quality was very poor according to Hynes due to its proximity to the wastewater treatment plant in Nasiriya about 200 meters from the treatment plant and this shows not found true treatment processing or may exist but inefficient, as well as increasing the concentration of phosphates causes appearance eutrophication phenomenon which adversely effects on the values of oxygen in river water and this was confirmed by⁽⁸⁾.

Second site results indicated that the value of BOD₅ was bad (6 mg/l) as mean (Fig. 2), although this area was free from human activities and industrial pollutants, but agricultural pollutants which discharge to river water may contribute significantly to organic pollution, which effects on the value of BOD₅ in the waters, this is consistent with⁽⁹⁾ which show in his study that spread of fish ponds in water body contribute significantly to the growth of neighborhoods that causes deplete dissolved oxygen in the water and that's appearing during the study period.

The third site recorded relatively high BOD₅ values compare with S2, the value was 7.12 mg/l (Fig. 2) and this value is classified as bad water may be the reason was characterize the study area with increasing human activity and discharge large amounts of city waste to the river water. Research showed that population and industrial activities to contribute significantly in the emergence of organic pollution in nearby water bodies on such activities⁽¹⁰⁾, and this is consistent with the current study results.

The fourth site recorded the lowest rate of BOD₅ values (4.6 mg/l) (Fig.3), this may be caused by dilution factor as this region was extension for marsh area and low organic contamination which may result from the activities of the same organisms that live in the study area⁽¹¹⁾.

BOD₅ values in S5 was 7.62 mg/l as mean (Fig. 2), this due to the sources diversity of pollution which arrived to the river water such as sewage and waste accumulated as a result of population activities, may be the main reason for organic pollution increasing⁽¹²⁾, as well as, the high proportion of salt and the oil companies remnants up to river water which may directly affect the percentage of oxygen dissolved in water through the formation of oily layers that act as soundproofing affects BOD₅ and dissolved oxygen values in river water.

The results mean of BOD₅ in the sixth site was 6.75 mg/l (Fig. 2), the study area was marked as agricultural area, fertilizers and pesticides were used in it and near the banks of the river, which leads to high concentration of organic substances and various nutrients. As results indirectly organic pollution leads to an increase in the values of BOD₅.

Figure 2: Variations in BOD₅ values between sites during the study period on Euphrates river.

The result of BOD₅ values during the months of October 2017, November, December, January 2018, February, March, April and May were 12.66, 14, 14.83, 13.16, 11.33, 10.66, 12.83 and 17 mg/l, respectively. BOD₅ values results during the months of study were fairly close together (Fig. 3, 4) and did not show any significant differences ($p \leq 0.05$) and were generally tend to decline in values during winter season (Fig. 4). These decreasing may be related with water temperature which recorded low degrees when moving from autumn to winter months, beside an increase in dissolved oxygen concentrations, which in turn effect on the BOD₅. In March month, the decline may be linked to increased rainfall which worked as dilution factor although high temperature resulting a significant increase in water levels which in turn led to a decrease in the BOD₅ values, this pointed out by ⁽¹³⁾ in his study.

Figure 3: Variations in BOD₅ values between months during the study period on Euphrates river.

Figure 4: Variations in BOD₅ values between seasons during the study period on Euphrates river.

CONCLUSIONS

The water of the Euphrates River in the studied area is questionable in terms of its organic content and the quality of water in some stations is very bad.

The results showed significant differences between the studied stations, while the climatic conditions had no significant effect on BOD₅ values.

The river has high energy through self-purification and disposal of pollutants.

Conflict of Interest: Nil

Source of Funding: Self-funding.

Ethical Clearance: The current research aims to assess the quality of the Euphrates river and determine the level of organic pollution within the study areas and during the research period to identify the state of the river health and protecting the human from the damage that may be caused by the consumption of contaminated water. If you have additional questions or clarifications, please contact us by e-mail: alialfanharawi@mu.edu.iq

International Patients Safety Goals (IPSG) based on Knowledge Management of SECI (Socialization, Externalization, Combination and Internalization) on Adverse Events at Jakarta Islamic Hospital

Harif Fadhillah¹, Nursalam², Muhammad Hadi³, Ferry Efendi², Rr Dian Tristiana²

¹Doctoral Nursing Program Student, Faculty of Nursing, Universitas Airlangga, ²Faculty of Nursing, Universitas Airlangga, ³Faculty of Nursing, Universitas Muhammadiyah Jakarta

ABSTRACT

Introduction: The performance of nurses determines patient safety and also a contribution of the knowledge possessed by nurses. Proper Knowledge Management will improve nurse performance. There have been many types of research about nurses' work, but research on the performance of knowledge management nurses: Socialization, Externalization, Combination and Internalization (SECI), does not yet exist. The purpose of this study was to determine the effect of performance on the goal of patient safety based on *knowledge management of SECI* on the adverse events in Jakarta Islamic Hospital. **Method:** The research design used a *quasi experiment pre post-test with the control group*. The number of samples in the intervention group was 24 respondents and the control group was 37 respondents. Instruments that are used for patient safety and adverse events with performance interventions based on *knowledge management of SECI* patient safety goals. The analysis used the *Mann Whitney* and *Willcoxon* statistical tests. **Result:** the study showed that work duration was a factor that affected patient safety, there were changes in patient safety before and after the intervention in the intervention group compared to the control group. There is a difference between the intervention group and the control group after being given performance interventions in *Knowledge Management: SECI* patient safety goals. **Conclusion:** this study recommends regular training for nurses about performance in patient safety: *SECI*-based patient safety goals and further research for different control groups of hospitals with the intervention group.

Keywords: Target of patient safety, knowledge management: SECI, performance, nurse

INTRODUCTION

The quality of hospital health services is largely determined by the quality of nursing services as a determining factor in the image of health care institutions. As nurses are the most number of professional groups, the foremost, closest and longest with patients and their families⁽¹⁾ in the process of achieving their health. One indicator of the quality of nursing services is patient satisfaction. Satisfaction is a comparison between the quality of service obtained with the desires, needs

and expectations⁽²⁾. In addition, satisfaction Indicators of service quality can also be seen in efforts to achieve *patient safety*.

The high quality of nursing services can be achieved by increasing nursing services⁽³⁾, namely providing health services efficiently and effectively in accordance with professional standards, carried out service standards comprehensively in accordance with patient needs, utilising appropriate technology and research results in the development of health services so that an optimal level of health is achieved⁽⁴⁾. The final results that will be measured are patient satisfaction and safety efforts of patients conducted by a nurse at the hospital, and these efforts demonstrate the achievement of the work in line with expectations, known as performance.

Corresponding author:

Nursalam

e-mail: nursalam@fkip.unair.ac.id

Nurses performance will provide high results of work achievement that is strongly influenced by various factors, including the work system that is applied to the hospital⁽⁵⁻⁷⁾, adequate employment resources and the characteristics of nurses in the form of *knowledge*, skills, abilities to act, motivation, attitudes, norms and values adopted. Nurse knowledge is the main element of nurse characteristics in achieving performance explain that service quality is related to effectiveness, timeliness, benefits, efficiency, sustainability and consistency of nursing services provided to patients, families and society^(8,9). This shows that the quality of nursing services is influenced by the performance of nurses. Nurse performance is based on guidelines and standards that have become a reference in nursing services. As a reference, performance can also be seen from the aspects of *patient safety*, which is the achievement of *patient safety* goals.

The concept of managing knowledge (*Knowledge Management*) is currently getting much attention from researchers as a new study to find other models in solving nursing management problems⁽¹⁰⁾. Knowledge of the nurses in *patient safety* regarding the six goals of patient safety will be a positive impact for nursing services in general⁽¹¹⁾.

Previous study in patients with elective surgery in the operating room ward of the Central General Hospital found the error of commission at 60% prophylactic antibiotics and 90.5% error of omission⁽¹²⁾. Previous study in 2011 found a unexpected incident of 26.3% and a near-injury incident of 73.7%. The forms of those incidents are non-conformity of patient identification, errors in drug administration (wrong patients, types of drugs), blood samples of patients exchanged and patients falling⁽¹³⁾. Based on the preliminary study in December 2015 obtained the number of patient safety indicators based on patient safety reports in 2014 that there were Potential Injury Incidence of two events (18%), for Events of Near Injury were two events (18%), Non-Injury Events were three events (27%), there were four Unexpected Events (36%), and Sentinel was 0%.

Based on the background, to improve the performance of nurses so that the quality of nursing services is better, there have been many studies on the performance of nurses, but research on the effect of nurses' performance in *Knowledge Management*-based Patient Safety: SECI on the Quality of Nurse Nursing

Services, does not yet exist.

MATERIAL AND METHOD

This study is aimed to answer specific objectives: analysis of the effect of nurses' performance in the *Knowledge Management*-based Patient Safety Goals: SECI on Nursing Service Quality (patient safety, unexpected events), after being given intervention.

Research design

The design of the research is a *quasi-experiment* with *pre- and post-test with control group* research design which aims to test the effect of nurses' performance in patient safety goals based on *knowledge management*: SECI on service quality in nursing by measuring the quality of nursing services before (*pre-test*) and after (*post-test*) giving intervention (14,15).

Data Collection

The preparation stage was then developed to prepare a training module in the form of nurse performance in patient safety goals and *knowledge management* based on patient safety goals: SECI. Furthermore, at the implementation stage, training was held for two (2) days in providing knowledge of nurses' performance in the goals of patient safety and patient safety goals based on *knowledge management*: SECI. After getting the training this was followed by an independent learning process, in the form of the application of the training results on their own for one week in order to apply the knowledge gained about the performance of nurses in the patient safety goals based on *knowledge management*: SECI. After the independent application is carried out, an evaluation of the knowledge about the results that have been obtained can be found by looking at the patients' safety and unexpected incident index.

RESULT

The results of the study are based on the characteristics of respondents, which include age, income and length of work, as described in Table 1.

Table 1. Respondent equality test based on age, income and length of work at Jakarta Islamic Hospital Pondok Kopi (n1 = 24, n2 = 37)

Based on the results of the analysis of Table 1, it was found that the average age of the intervention group

and the control group were in the early adult range and entered middle adulthood; the average income of the intervention group is greater (Rp. 5,529,166.67) compared to the control group (Rp 4,313,514,51) and the duration of the intervention group was longer (15.88 years) than the control group (11.08 years). Equivalence statistical test results of the intervention group and control group are equivalent to $p\text{-value} > 0.05$.

The results of research based on patient safety include the accuracy of patient identification, effective communication improvement, increased drug safety monitoring, precise location (side), proper procedure and right patient surgery, reduction of risk of infection through the six steps of hand washing, and reduction of risk of patients falling before getting intervention in Jakarta Islamic Hospital ($n_1 = 24$, $n_2 = 37$) as described in Table 2.

Table 2. Respondents distribution of Patients Safety Performance ($n_1 = 24$, $n_2 = 37$)

Variable	Intervention group		Control group	
	F	%	F	%
The accuracy of patient identification				
Less precise	6	25	6	16.2
Right	18	75	31	83.8
Improved effective communication				
Less precise	13	54.2	9	24.3
Right	11	45.8	28	75.7
Improved drug safety that needs to be monitored				
Less effective	14	58.3	3	8.1
Effective	10	41.7	34	91.9
The certainty of exact location (side), proper procedure and right patient surgery				
Less precise	0	0	1	2.7
Right	24	100	36	97.3
Reducing the risk of infection through the six steps of hand washing				
Less risk of infection	0	0	2	5.4
Risk of infection	24	100	35	94.6
Reducing the risk of patients falling				
Less risk of falling	4	16.7	8	21.6
Risk of falling	20	83.3	29	78.4

Based on the results of Table 2, statistical tests obtained the highest value of the intervention group and the control group close to the same as regard to exact location (side), proper procedure and right patient surgery, reduction of risk of infection through the six steps of hand washing and reducing the risk of patients falling. The aspects that are still lacking are in the accuracy of patient identification, improved

effective communication, improved drug safety that needs to be monitored in the intervention group, and are perceived to be less than in the control group. *The cut off points* use the median due to abnormal distribution For the relationship between characteristics of patient safety and the interaction between characteristics, see Table 3.

Table 3. Analysis of the relationship of characteristics with patient safety in Jakarta Islamic Hospital (n1 = 24, n2 = 37)

Variable	p value
Patient safety in the intervention group - Age - Length of working - Income - Education - Work - Gender	0.863 0.953 0.869 0.692 0.625 0.620
Control group patient safety - Age - Length of working - Income - Education - Work - Gender	0.159 0.129 0.563 0.380 0.692 0.225
Intervention group - Age with work duration - Age with income	0,000 0,000
Control group - Age with work duration - Age with income	0,000 0,000

Based on the results of the statistical test shown in Table 3. it was found that, in both the intervention group and the control group, with patient safety there was no

significant relationship ($p > 0.05$). While the results of the interaction test between age and length of work and income have a significant relationship ($p = 0,000$) both in the intervention group and the control group.

Table 4. Statistical test changes in patient safety before and after being given intervention (n1 = 24, n2 = 37); n1 = intervention group, n2 = control group

Variable	Positive differences	Negative differences	Elementary school error	SD test statistics	p value
Patient safety before and after the intervention in the intervention group	18	6	26,091	3.53	0,000
Patient safety before and after giving intervention to the control group	12	25	26,384	1.57	0.116

Based on the statistical test results in Table 4 it was found that the change in positive understanding of patient safety in the intervention group after the intervention was increased compared to the control group, with the standard deviation error approaching the same. The results of the analysis showed that there were changes in

patient safety before and after the intervention of nurses' performance in the *knowledge management* target of patient safety: SECI in the intervention group ($p = 0.000$), whereas in the control group there was no change in changes in patient safety before and after the nurse performance intervention in the patient safety goals based on *knowledge management*: SECI ($p = 0.116$).

Table 5. A statistical test of differences in patient safety in the intervention group and control group after being given intervention (n1 = 24, n2 = 37) n1 = intervention group, n2 = control group

Variable	Mean rank	Statistical test	Elementary school error	SD test statistics	p value
Patient safety after giving intervention to the intervention group and control group					
- Less	16.28				
- Good	10.23	33.5	14.67	-2.32	0.021

Based on the results of statistical test shown in Table 5, it was found that the difference in understanding patient safety in the intervention group was better than the control group after being given intervention in the performance of nurses in patient safety goals based on *knowledge management*: SECI, with a standard deviation error of 14.67. The results of the analysis showed that there were differences in patient safety in the intervention group and the control group after

being given intervention in the performance of nurses in patient safety goals based on *knowledge management*: SECI ($p = 0.021$).

The results of statistical tests about events were not expected in the intervention group and the control group after being given intervention in the performance of nurses in the patient safety goals based on *knowledge management*: SECI.

Variable	percentage
Drug safety that needs to be monitored	100
The certainty of location, procedure and patient surgery	100
Infection prevention and control	0.08
The accuracy of patient identification	0
Risk of infection	0
Risk of falling	0
Decubitus event number	0
Restrain injury incidence rate	Not monitored
Phlebitis event figures	0
Near injury events (KNC)	0

Table 6 Unexpected event statistical tests after being given intervention in the performance of nurses in the patient safety goals based on *knowledge management*: SECI in Jakarta Islamic Hospital. Based on the results of the statistical test in Table 6, it was found that only 0.08% of infection prevention and control about unexpected events was still found after the intervention, while others were not found

CONCLUSIONS

The conclusion of the study is that the initial knowledge about the target of patient safety in the intervention group and the control group is less different. The factor that most influences patient safety is the length of work, whereby the longer they work the respondent is expected to understand more about patient safety. Changes in patient safety before and after giving intervention to the performance of nurses in the Patient Safety Target based on *knowledge management*: SECI in the intervention group was better and more significant than the control group. The difference in understanding patient safety in the intervention group was better than the control group after being given intervention in the performance of nurses in the patient safety goals based on *knowledge management*: SECI. The results of the analysis found that there were differences in patient safety in the intervention group and the control group after being given intervention in the performance of nurses in patient safety goals based on *knowledge management*: SECI. Concern is still found in unexpected events about infection prevention and control that needs to be corrected

RECOMMENDATIONS

Nurse Performance in Patient Safety Goals based on *knowledge management*: SECI, can be suggested as follows:

- Nurses' knowledge through scientific activities in the form of training, learning from literature sources, discussions of abilities that have been carried out related to the performance of patient safety goals

- Nurse leaders to hold regular training on the performance of nurses in the Patient Safety Goals based on *knowledge management*: SECI

- Education can develop educational applications in the form of subjects that teach about nurses in the Patient

Safety Goals based on *knowledge management*: SECI

- Nurse Ability in Patient Safety Goals based on *knowledge management*: SECI can improve with effective communication and teach the six steps of hygiene

Conflict of Interest: No conflict of interest during the study.

ABSTRACT

Side effects of Anti-Tuberculosis Drugs is a problem in the treatment of tuberculosis patients. In Barru Regency, the number of pulmonary TB patient visits in the outpatient and inpatient units in 2014-2016 was still high. Based on these data, it is deemed necessary to conduct research on the causes of cure rates in only 73% of the total users of pulmonary TB drugs, in terms of the side effects of anti-tuberculosis drugs, pulmonary disorders and gastric disorders. This study was conducted on Agustus, 2017 to January, 2018; using cross sectional approach. Subject of this study were 75 tuberculosis patients with BTA+ and side effects of Anti-Tuberculosis Drugs on the lungs and stomach, selected by total sampling. Data were obtained through interview, then analyzed by using path analysis. It is known that the pathways of influence were significant ($T\text{-value} > 1.96$) were knowledge on immune system, type of drug on immune system, knowledge on side effect of drug and type of drug on side effect of drug. Thus, the level of knowledge and types of drugs directly affect the immune system, as well as the side effects of drugs. Several factors that directly affect the side effects of anti-tuberculosis drugs are the level of knowledge and type of drug. Increased knowledge will reduce the side effects of the drug, because the patient makes an effort to neutralize the effect.

Keywords: Side effects, Anti-tuberculosis drug, Tuberculosis, Knowledge

INTRODUCTION

Tuberculosis (TB) is a chronic granulomatous infectious disease caused by the bacillus *Mycobacterium tuberculosis bacilli* (Mtb) which was discovered by Robert Koch in 1882.^{(1),(2)} TB is an age old dreadful disease and globally, there were an estimated 10.4 million new TB cases with 1.8 million TB deaths in 2015.⁽¹⁾ Twenty five percent of all deaths caused by pulmonary tuberculosis disease and it has become the leading cause of death on infectious diseases.³

The high incidence of pulmonary TB is a major problem for many countries in the world. WHO (2015) explains that 9.6 million of the world's population

are infected with TB bacteria and the most cases of pulmonary TB are in Africa (37%), Southeast Asia (28%), and the Eastern Mediterranean (17%). Indonesia ranks fifth in the world as a contributor to TB sufferers after India, China, Nigeria and Pakistan⁽⁴⁾.

TB prevalence in Indonesia in 2013 (297 / 100,000 population) was higher than in 2010 (289 / 100,000 population). regions with the highest TB cases were West Java, East Java and Central Java, with smear positive cases of almost 40% of the total cases in Indonesia⁽⁵⁾. Morbidity and mortality due to TB are serious problems, especially due to the emergence of side effects of anti-tuberculosis drugs and most The patient felt unable to resist the side effects of the drug⁽⁶⁻⁸⁾. It was noted that 69.01% of patients experienced side effects of the drug⁽⁸⁾. Side effects that often arise are stomach disorders (loss of appetite, nausea, stomach ache). Other disorders include joint pain, tingling and burning in the legs and redness of the urine. More severe side effects include tightness, severe hemoptysis, collapse, bronchiectasis, pneumothorax, and cardio pulmonary insufficiency,

Corresponding author:

Health Polytechnic of Ministry of Health at Surabaya, Jl. Pucang Jajar Tengah 56 Surabaya, Indonesia (heruswn@gmail.com)

itching and redness of the skin, deafness, balance disorders, visual disturbances, confusion and vomiting, purpura and shock⁽⁹⁾.

The number of TB patients with smear + is 8.470%, the Case Notification Rate (CNR) of new cases of TB with smear + per 100,000 population is 97.98%, while the total number of TB cases in South Sulawesi is 12.625%⁽¹⁰⁾. The partnership effort to reduce TB prevalence is an effort to eliminate pulmonary TB. Pulmonary TB prevention strategy is Directly Observed Treatment Shortcourse (DOTS) and has been implemented thoroughly in Indonesia since March 24, 1999. The impact or side effects of anti-tuberculosis drugs is one of the risk factors for default⁽¹¹⁻¹²⁾.

Pulmonary TB treatment aims to cure patients and improve productivity and quality of life, prevent death, prevent recurrence, break the chain of transmission and prevent the transmission of drug-resistant pulmonary TB. Handling of the high prevalence of pulmonary TB must be done to control this disease, one of which is treatment. Drug therapy problems in pulmonary TB patients require special attention because patients consume a lot of drugs and in large doses. In one study, the incidence of drug therapy problems in the category of unwanted drug reactions or adverse drug reaction (ADR) was quite high⁽¹³⁾.

Figure 1. Trend of New Pulmonary TB Patient in Barru Regency 2011-2016⁽¹⁴⁾

The number of pulmonary TB patient visits in the outpatient and inpatient units in 2014-2016 was still high. Based on these data, it is deemed necessary to conduct research on the causes of cure rates in only 73% of the total users of pulmonary TB drugs, in terms of the side effects of anti-tuberculosis drugs, pulmonary disorders and gastric disorders.

METHOD

This study was conducted on Agustus, 2017 to January, 2018; using cross sectional approach. Subject of this study were 75 tuberculosis patients with BTA+ and

side effects of Anti-Tuberculosis Drugs on the lungs and stomach, selected by total sampling. Data were obtained through interview, then analyzed by using path analysis.

RESULTS

Note: X1 = knowledge, X2 = type of drug, X3 = dose of drug, Y1 = immune system, Y2 = drug side effects

Figure 2. Path coefficient of path analysis

Note: X1 = knowledge, X2 = type of drug, X3 = dose of drug, Y1 = immune system, Y2 = drug side effects

Figure 3. T-value of path analysis

Based on Figures 2 and Figure 3 it is known that the pathways of influence were significant (T-value > 1.96) were X1→Y1, X2→Y1, X1→Y2 and X2→Y2. Thus, the level of knowledge and types of drugs directly affect the immune system, as well as the side effects of drugs.

DISCUSSION

The results of data analysis showed that the level of knowledge directly affects the side effects of TB drugs on the lungs and stomach. The effect given is a negative influence, which means that if the level of knowledge increases then the side effects of the drug will decrease. In this regard, Handarini reports that respondents with good knowledge are more likely to be more obedient to taking medication⁽¹⁵⁾.

This research is also in accordance with Notoatmodjo's (2010) statement that one's actions about a health problem will basically be influenced by one's knowledge of the problem. In this case, the higher the level of knowledge possessed by TB patients, the higher the patient's compliance with treatment⁽¹⁶⁾.

The results showed that the type of drug did not affect the side effects of the drug. This is because most patients stop taking the drug because they cannot stand the side effects of the drug.

The anti-TB drug exhibits greater level of efficacy with a satisfactory degree of toxicity; however combination treatment, especially during the intensive phase of therapy may produce severe adverse events⁽¹⁷⁾. There may be considerable morbidity, even mortality, particularly with drug-induced hepatitis. These events may include substantial costs due to added visits, tests, and in more serious instances of hospitalizations⁽¹⁸⁾.

Standard anti-TB therapy typically continues for six months. For the first 2 months, three to four drugs receive patients, namely rifampin (R), isoniazid (H), pyrazinamide (Z), and, in some cases, ethambutol (E). During the final 4 months, they continue with rifampin and isoniazid⁽¹⁹⁾.

Tuberculosis is considered a serious disease, it can even be fatal if not treated properly. The treatment step given is the administration of antibiotics that must be spent by tuberculosis patients for a certain period of time according to a doctor's prescription. Common types of antibiotics are isoniazid, rifampicin, pyrazinamide and ethambutol. Like other antibiotics, antibiotics for tuberculosis also have side effects, especially rifampicin, isoniazid, and ethambutol. Rifampicin can reduce the effectiveness of hormonal contraceptives, ethambutol can interfere with the function of vision and isoniazid has the potential to damage nerves. A number of other side effects of anti-tuberculosis drugs are nausea, vomiting, decreased appetite, jaundice, dark urine, fever, rash, and skin itching^(9,20).

The healing period for tuberculosis varies depending on the patient's health condition and the severity of the disease. The condition of the patient generally starts to improve and stop contagious after taking antibiotics for 2 weeks. To ensure complete recovery, TB patients must use antibiotics given by doctors for 6 months. If the patient does not take the medicine as recommended or stops taking it before the recommended time, the bacteria may not be able to completely disappear, even though the patient feels that his condition has improved. Patients with tuberculosis have the potential to become resistant to antibiotics. If this happens, the condition becomes more dangerous and difficult to treat. Thus, the

healing period also becomes much longer.

The results showed that the dose of the drug had no effect on the side effects of the drug, either directly or indirectly, because the number of tuberculosis patients who stopped taking the drug due to the occurrence of disturbing side effects, so that many patients felt that they did not fit the drug⁽²¹⁻²²⁾. This causes a healing failure so the patient must repeat the treatment. Another thing that causes no side effects of drugs when taking anti-tuberculosis drugs is because the dosage of tuberculosis medication is adjusted to the patient's weight, and there is prevention to using a single drug. The immune system does not play a role in resistance and side effects of anti-tuberculosis drugs⁽²¹⁻²⁴⁾.

Treatment with anti-tuberculosis drugs also concerns the suitability of the number of tablets swallowed by the patient's body weight, which consists of 4 groups, namely 30-37 kg, 38-54 kg, 55-70 kg, and ≥ 71 kg. The more weight the patient has, the more tablets must be swallowed and the higher the dose. The administration of anti-tuberculosis drug dosage is seen from the presence or absence of the patient's physiological and pathological conditions that prevent the use of drugs (contraindications)⁽²⁵⁻²⁶⁾.

The results showed that the immune system had no effect on the side effects of the drug. The results of this study are different from the results of research conducted by Inez Clarasanti, Marthen CP Wongkar, Bradley J. Waleleng (2016) that in the use of anti-tuberculosis drugs (rifampicin, isoniazid, pyrazinamide and ethambutol / streptomycin) side effects complicate treatment targets. Common liver function tests include aspartate transaminase (AST) or more commonly referred to as serum glutamic-oxaloacetic transaminase (SGOT), and alanine transaminase (ALT) which is usually referred to as serum glutamic-pyruvic transaminase (SGPT). SGOT and SGPT show improvement if damage or inflammation occurs in liver tissue. SGPT is more specific to liver damage than SGOT. A slight increase (up to twice the normal rate) of SGOT and SGPT concentrations is often found. If the concentration of SGOT and SGPT is more than twice the normal number, it is considered meaningful and requires further examination. If there is an increase in transaminase enzyme concentration, there is an indication of malnutrition⁽²⁷⁾.

CONCLUSION

Several factors that directly affect the side effects of anti-tuberculosis drugs are the level of knowledge and type of drug. Increased knowledge will reduce the side effects of the drug, because the patient makes an effort to neutralize the effect.

The Effects of Cold Compress and Warm Compress on β -Endorphin Levels, IL-6 and TNF α among Adolescent with Dysmenorrhea

Mukhoirotin¹, Kurniawati¹, Diah Ayu Fatmawati¹

¹Faculty of Health Science, University of Pesantren Tinggi Darul Ulum Jombang

ABSTRACT

Non-pharmacological efforts to treat dysmenorrhoea are include cold compresses and warm compresses. The aim of this study was to determine the differences effect of cold compresses and warm compresses to β -Endorphin levels, IL-6 and TNF α among adolescents with dysmenorrhoea. The research was Post Test Only with Control Group. β endorphin, IL-6 and TNF α were measured by ELISA, then analyzed by Independent Sample T-Test. The average β level of Endorphin in cold compress group was 143.03 pg/ml, in warm compress group was 171.43 pg/ml; the average IL6 level in cold compress group was 1352.60 pg/ml, in warm compress group was 961.14 pg/ml and the average TNF α level in cold compress group was 345.75 pg/ml, in warm compress group was 262.50 pg/ml. The results of Independent Sample T-Test showed that there was no difference in β levels of Endorphin IL-6 and TNF α in both of the warm and cold compresses group. Cold compress and warm compress can stimulate loose of Endorphin β levels and regulate uterine hypercontractility during menstrual pain. Cold compress and warm compress can be used as an alternative to treat dysmenorrhoea.

Keywords: Cold compress, Warm compress, β -Endorphin levels, IL-6 levels, TNF α levels

INTRODUCTION

Dysmenorrhoea is a painful sensation with cramps sensation in the lower abdomen, and commonly followed by sweating, tachycardia, headache, nausea, vomiting, diarrhea, and back pain before or during menstruation⁽¹⁻³⁾. The intensity of menstrual pain was varies from mild, moderate and severe⁽⁴⁾. Severe of dysmenorrhea give affects physical, psychological and social consequences⁽⁵⁾.

The prevalence of dysmenorrhoea in the world was varies from 37% to 90.1%, in China there were 37%⁽⁶⁾, 55.5%-70% in adolescents and young adults in Turkey⁽⁷⁻⁸⁾, 60.9% of female medical students in King Abdulaziz University⁽⁹⁾, 74.4% in teenage girls in

Ghana⁽¹⁰⁾, 74%-86.1% in Iran, 77.6% among University of Gondar Students, Northwestern Ethiopia⁽¹¹⁾, 90.1% among Jordanian University students⁽¹²⁾. In Indonesia an estimated 55% of women in productive age were experienced menstrual pain⁽¹³⁾. In East Java, the number of reproductive young women aged 10-24 is 56,598 and about 11565 (1.31%) of those experienced dysmenorrhea and come to the obstetrics⁽¹⁴⁾.

Factors that can increase the risk of dysmenorrhoea are include age and age of younger menarche, longer duration of menstruation, menstrual volume⁽¹⁵⁻¹⁷⁾, low of BMI, smoking and alcoholism^(16,18-19), low social support, family history of dysmenorrhoea, high caffeine consumsion⁽²⁰⁾, depression, anxiety and stress^(7,21). Primary dysmenorrhoea has a biochemical basis and doe to prostaglandin loose during menstruation. During the luteal and menstrual phases, prostaglandin F2-alpha (PGF2- α) were excretion. Excessive release of PGF2- α will increase the amplitude and frequency of uterine contractions and causes vasospasm of the uterine arterioles, causing lower abdominal ischemia

University of Pesantren Tinggi Darul Ulum Jombang,
Indonesia

and cramps⁽²²⁾ and back pain⁽²³⁾. Psychiatric factors also play a role in the occurrence of primary dysmenorrhea. Stress can increase the levels of vasopressin and catecholamines and it will make vasoconstriction and ischemia in cells⁽²⁴⁾. Peripheral blood analysis in women with dysmenorrhoea shows excessive synthesis and concentration of oxytocin, PGF2-a, vasopressin, IL-6 and TNF⁽²⁵⁻²⁸⁾. Dysmenorrhoea is a major cause of activities problem⁽²⁹⁾ such as absent from work or school⁽³⁰⁻³¹⁾ and decreased quality of life^(8,32-33).

Pharmacological interventions for dysmenorrhoea use nonsteroidal anti-inflammatory drugs (NSAIDs) and oral contraceptive. The side effects including dependence⁽³⁴⁻³⁵⁾, diarrhea, abdominal pain, nausea⁽³⁶⁾, kidney and liver complications, sleep disorders⁽³⁷⁾, digestive disorders⁽³⁸⁾. The failure rate of pharmacological treatment is 20-25%⁽³⁹⁾. Non-pharmacological interventions include cold and warm compress. Cold compress is ice therapy that can reduce prostaglandins which strengthens pain sensation and other subcutaneous at the injury place by inhibiting the inflammatory process. This is because cold compress can reduce blood flow to a part and reduce bleeding edema which is it cause analgesic effects by slowing the speed of nerve delivery so the pain impulses will less reach to the brain⁽⁴⁰⁾. Warm compresses with hot jars cause conduction, where there is transfer of heat from the bladder into the body and it giving dilation for blood vessels and decreased muscle tension so that dysmenorrhoea pain will be reduced⁽⁴¹⁾. Skin stimulation causes the release of endorphins, thus blocking the transmission of pain stimuli⁽⁴¹⁾. The results of previous studies showed that Moxibustion can reduce

the levels of PGF2 α , oxytocin, vWF and increasing the levels of β -EP. The effect of cold and warm compress on β -Endorphin, IL-6 and TNF α has not been clearly known, so the researchers are interested to conducting the research about The Effects of Cold Compress and Warm Compress on β - Endorphin levels, IL-6 and TNF α among Adolescents with Dysmenorrhoea.

MATERIALS AND METHOD

The design of this research was Pretest-Postest. The population were all students at FIK-Unipdu Jombang who experienced dysmenorrhoea. Sample size was 40, selected by purposive sampling, then divided into cold compress group (n=20) and warm compress group (n=20). The instrument of data collection were thermometer, a hot jar and ice bag. Numeric Rating Scale used to measure pain level. ELISA indirect method to measure the levels of β Endorphin, IL-6 and TNF α using the. Data were analyzed by T-Test.

FINDINGS

The intensity of dysmenorrhoea before giving cold compress were mostly at moderate. However, in warm compresses group were more than half of participant at severe level. Intensity of dysmenorrhoea after giving treatment in cold compresses group were mostly at mild, while in warm compresses group were mostly at moderate level. Homogeneity of variances test results showed that the intensity of dysmenorrhoea before and after giving treatment in both of groups were not have a significant difference.

Table 1. The differences of β -Endorphin levels, IL-6 and TNF α after giving intervention

Variable	Cold compress Mean-(SD)	Warm compress Mean-(SD)	Mean Difference (95%-CI)	P
β -Endorphin	143.03(3.97)	171.43(2.59)	-28.40(-59.88=3.08)	0.074
IL-6	1352.60(3.57)	961.14(3.79)	39.46(-38.15-821.01)	0.070
TNF α	345.75(1.55)	262.50(6.14)	83.25(-42.85-209.35)	0.179

There were no have significant differences levels of β Endorphin, IL-6 and TNF α after giving treatment

β -endorphin levels after giving cold and warm compress had no significant differences. Cold and warm compress are the techniques for cutaneous stimulation. Cutaneous stimulation is skin stimulation carried out to relieve pain, works by encouraging the release of endorphins, so it will block the transmission of pain stimuli⁽⁴¹⁾. Changes in β -Endorphin levels can be explain on the basis of Opiate Endogenous theory, where opiate receptors in the brain and spinal cord were determine the central nervous system to activate morphine substances called endorphins and enkephalin when pain is received. This endogenous opiate can be stimulated by skin stimulation and muscles. These opioid receptors are located on peripheral sensory nerve extremity⁽⁴²⁾.

Cold compress was given by using an ice bag filled with ice, compressed to the abdominal area for 20 minutes and a warm compress was given by using a bag filled with warm water at a temperature of 40-45 C $^{\circ}$ and compressed to the abdominal area for 20 minutes. The average β -endorphin level at cold compress group was 143.03 pg/ml, the warm compress group was 171.43 pg/ml. Giving cold and warm compresses can increase β -endorphin levels to relieve pain production. The higher of endorphins level make the level of pain at mild⁽⁴³⁾. Endorphins inhibit fiber C in pre and post synapses and A δ fibers in the dorsal horn and activate the larger of A β (A-beta) sensory nerve fibers, thus blocking the pain signals when enter to spinal cord so the pain perception will decreases⁽⁴⁴⁾. After intervention, the intensity of dysmenorrhea among respondents will decreased. This because of the release of β -endorphins levels that inhibit C fiber and activate A β sensory nerve fibers so it will inhibits the pain signals to spinal cord and decreased perception of pain. The result was in accordance with previous studies which showed that β -endorphin levels in primary dysmenorrhoea increased after moxibustion therapy. Moxibustion therapy is a warm moxa stimulation at Guanyuan, Shenque and Sanyinjiao acupuncture points, the treatment giving for 10-15 minutes a day during 7 days before menstruation in 3 menstrual cycles⁽⁴⁵⁾.

IL-6 and TNF α levels had no difference. In primary dysmenorrhea, the level of genes expression of cytokine pro-inflammatory (IL1B, TNF, IL6 and IL8) at the first

day of menstruation will significantly increases⁽²⁸⁾. IL-6 functions to increase oxytocin secretion at the first day of menstruation⁽⁴⁶⁾, where TNF α functions to increase prostaglandin and oxytocin at the first day of menstruation⁽⁴⁷⁻⁴⁸⁾. Increased prostaglandins and oxytocin have an impact to excessive uterine contractions, decrease endometrial blood flow and cause pain during menstruation⁽²⁸⁾.

Cold compresses provide physiological effects to reduce the inflammatory response, blood flow and edema, local pain⁽⁴⁹⁾. Heat will stimulates the vascular reaction by increasing blood flow, resulting in delusions of prostaglandins, bradykinin and histamine. Increasing blood flow also can increase oxygenation⁽³⁹⁾. Local heat will give the abdomen to increasing gastrointestinal motility and relaxation to the uterus. Local heat is as effective as NSAIDs⁽⁵⁰⁾. NSAIDs can reduce the accumulation of prostaglandins and reduce spasmodic contractions caused by prostaglandins and inhibit the activity of COX-2 and COX-1 enzymes⁽⁵¹⁾.

The results of previous studies showed that the giving of warm stimuli (moxibustion) can regulate uterine hypercontractility during menstrual pain by set of the mediator pain level serum where occur the decreasing levels of PGF2 α serum and oxytocin⁽⁴⁵⁾. The effect of moxibustion treatment works like electroakupunctur⁽⁵²⁾. Several studies have shown that electroacupuncture can reduce the expression of prostaglandin levels⁽⁵³⁾, peripheral blood lymphocytes among rat as the samples with primary dysmenorrhoea⁽⁵⁴⁾. T-cells are the main source of cytokine secretion (TNF, Interleukin, interferons)⁽⁵⁵⁾. Thus the cold compresses and warm compresses interventions can reduce pro-inflammatory cytokines IL-6 and TNF α .

CONCLUSION AND RECOMMENDATION

The results of this study showed that after giving warm and cold compresses in both group there were no differences in levels of β Endorphin, IL-6 and TNF α among adolescents with dysmenorrhoea. Cold compresses and warm compresses can be used as an alternative treatment to dysmenorrhoea.

Mediating Effects of Wisdom in the relation between Lifestyle Habits (LH) and Health Conservation (HC) of Middle-aged Men

Hee Kyung Kim

Professor, Department of Nursing, Kongju National University, Gongju, South Korea

ABSTRACT

Purpose: The purpose of this study was to identify the mediating effect of wisdom in relation between LH and HC of middle-aged men. **Methods:** The design of this study was secondary analysis research using the data of Kim's research. Subjects in the primary study were 134 middle-aged men residing in C and M city. Data were analyzed using descriptive statistics, Pearson's correlation coefficients, and multiple regression analysis. **Results:** There were statistically significant relationship between HC and the following independent variables: LH ($r=.30$, $p=.001$) and wisdom ($r=.71$, $p<.001$). Wisdom affected relation between lifestyles habits and HC of middle-aged men as a complete mediation effect variable, and the variable's explanation power was 50.3%. LH, which is independent variables, are not directly effective in HC. It works only through the mediating variable of wisdom. It was confirmed that in relation between LH and HC, wisdom was a significant mediating variable ($Z=6.40$, $p<.001$). **Conclusion:** This study showed that wisdom has a mediating effect. LH was not directly effective in preserving health, but only through wisdom. Wisdom has a complete mediation effect on the HC of middle-aged men. Therefore, in order for middle-aged men to preserve their health, nursing intervention is needed to make LH right and to increase wisdom.

Keywords: Mediating effect, Middle-aged men, Health conservation, Lifestyle habits, Wisdom.

INTRODUCTION

Health conservation (HC) is the act of maintaining a state of balance and well-being as a being that has physical, mental and psychological capacities.¹ When HC is achieved, the individual can achieve harmony and adjustment from the perspective of uniformity and integration. As such, health needs to be well preserved in order to improve the quality of life as one adjusts to life. However, middle-aged men in Korea experience a higher rate of sudden death compared to those in other age groups and are at risk to their health due to an unhealthy lifestyle, a heavy burden of responsibility at home and work, and excessive stress, lack of rest or exercise. A study conducted on middle-aged men to identify the factors affecting HC showed that the variables of stress, life style habits, self-concept, self-efficacy and wisdom

are correlated with HC, with wisdom in particular being an important factor affecting HC.² Wisdom has already been identified as an important factor that improves the quality of life or preserves health in middle-aged adults, women or the elderly.³⁻⁶ Throughout life, wisdom serves as a function that includes the understanding of the principles of things, the good and bad, judgment, interpersonal skills and a thorough grasp of life. As such, it is often considered as a key to successful human development.⁶ In addition, wisdom is associated with health habits. The elderly with wisdom did not smoke or drink alcohol, had a high satisfaction with sleep and practiced appropriate exercise.⁷ But studies that reviewed the effect of life style habits and wisdom on HC in middle-aged men are rare, and this is especially the case for studies that reviewed the mediating effects of wisdom.

As there is a need for nurses to provide nursing that can help middle-aged men promote health, prevent illness and preserve health throughout the course of their daily life³, this researcher plans to analyze the mediating

effects of wisdom in the association between daily life style habits and HC of middle-aged men, using the data from the primary study conducted by Kim⁸, and thus provide a basic set of data for the development of an intervention program on wisdom.

MATERIALS AND METHOD

Research design

This study is a secondary analysis research conducted to identify mediating effect of wisdom in relation between LH and HC of middle-aged men using data of Kim's research.⁸

Subjects

The data on the subjects of the primary study were used. The subjects of primary study data⁸ were convenience extraction of middle-aged men who live or work in Gyeongbuk C and M cities. It was approved by the K University Institutional Research Board. The sample size was 134 people.

Instruments

The instruments used in the primary study⁸ were as follows.

LH

LH instrument which was an adaptation by Ro⁹ from the health promotion behavior evaluation index by Wilson and Ciliska¹⁰ was used. It was composed of a total of 25 questions. It was composed of a Likert five-point scale from 1 to 5 and higher points represent healthier LH. At the time of development, also in the research by Wilson and Ciliska,¹⁰ reliability Cronbach's α was .88. In this study, reliability was .74.

Wisdom

To measure the wisdom of middle-aged men, this study measured it with the 'wisdom scale of Korean elderly people' developed by Sung, Lee and Park.¹¹ The tool was consisted of a total of 27 questions. The scale ranged from 1 point of 'very unlikely' to 4 points of 'very likely'. A higher score indicates that the degree of wisdom perceived by the middle-aged men were higher. Cronbach's α was .80 at the time of the development of tool. In this study, it was .90.

HC

HC is a physically, mentally, socially and psychologically integrated object that maintains the

balance.¹² To measure the HC of elderly people, this study measured it with the HC scale developed by Sung¹. This tool was consisted of a total of 37 questions. Each question was based on a 4-point scale. The scale ranged from 1 point of 'very unlikely' to 4 points of 'very likely.' A higher score indicates that the degree of HC was higher. Cronbach's α was .94 at the time of the development of tool. In this study, it was .85.

Data collection

The data collection in the primary study⁸ was as follows.

The data for the primary study were collected from May to June in 2018. We visited the parks and sports facilities located in C and M city in Gyeongbuk to explain the purpose of the research to the people who met the standards of the targets of the survey and received written agreement from them. After that, we distributed the structured questionnaires and had the respondents fill them out on their own.

Ethical Consideration

This study obtained an approval from the IRB of K University on the content and methodology (IRB No. KNU_IRB_2018-64).

Data analysis

Data were analyzed using IBM SPSS Statistics 23 program as follows. The general characteristics of the subject were analyzed with frequency and percentage. HC and related variables of the subjects were analyzed with descriptive statistics. The correlation among the wisdom, LH and HC was analyzed with Pearson's correlation coefficient. To identify the mediating effect of wisdom in relation between LH and HC of the subject, the multiple regression analysis was used.

FINDINGS

The General Characteristics of Subjects

In the primary research, the general characteristics of the subjects were shown in Table 1.

The subjects participated in this study were 134 and the person of 50-59 years old were 82 persons (61.2%), the persons of under 49 years old or over 60 years were 52 persons and the average age was 52.17(5.22) years old. The education level of the subjects was 70 (52.2%)

in the case of having a university or higher education level. Most had jobs, and 89 people (66.4%) exercised regularly. The number of respondents who answered that the economic status was bad was 89 (66.4%).

Table 1: The General Characteristics of the Subjects (N=134)

Variables	Categories	N (%)
Age	Under 49 years	40(29.9)
	50~59	82(61.2)
	Over 60 years	12(9.0)
Educational level	Below primary school graduate	2(1.5)
	Middle-High School graduate	62(46.3)
	College graduate or higher	70(52.2)
Job	Yes	123(91.79)
	No	11(8.21)
Regular exercise	Regular	89(66.4)
	None	45(33.6)
Economic status	Good	45(33.6)
	Bad	89(66.4)

Degree of LH, Wisdom and HC of Subjects

In the primary paper, degree of LH, wisdom and HC of subjects were as shown in Table 2. LH was 3.49 out of 5 points. Wisdom was 3.00 out of 4 points. HC was 2.78 out of 4 points.

Table 2: Degree of LH, Wisdom and HC of Subjects (N=134)

Variables	Possible range	M(SD)
LH	1-5	3.49 (0.39)
Wisdom	1-4	3.00 (0.28)
HC	1-4	2.78 (0.25)

Correlation of LH, Wisdom and HC of Subjects

The correlation of lifestyles habit, wisdom and degree of HC of subjects was as shown in Table 3.

HC in middle-aged men, LH ($r=.30$, $p=.001$), and wisdom ($r=.71$, $p<.001$) were statistically relevant at a significant level. Wisdom and LH were statistically relevant at significant level ($r=.42$, $p=.001$). The better

the LH, the higher the wisdom, the higher the HC of them.

Table 3: Correlation of LH, Wisdom and HC of Subjects (N=134)

Variables	LH r(p)	Wisdom r(p)	HC r(p)
LH	1		
Wisdom	.42 (.001)	1	
HC	.30 (.001)	.71 (<.001)	1

Mediating effects of wisdom in the relation between LH and HC

To find the mediating variable of wisdom in the process of LH of subject affecting HC, the study used 3-step regression equation. Before confirming the mediating effect of wisdom, the assumption of regression analysis was confirmed, and the Durbin-Watson index regarding autocorrelation was 1.570~1.838, which indicated no autocorrelation of outlier. As for the

multicollinearity among independent variables, the VIF index was 1.00~1.216 which is less than 10, confirming no multicollinearity, indicating this data was appropriate for regression analysis.

At first step regression analysis, LH, the independent variable significantly affected wisdom, the mediating variable ($p<.001$). Thus, this study suggests mediating effect of wisdom in relation between LH and HC. According to first step regression analysis, LH, the independent variable significantly affected wisdom, the mediating variable ($\beta=.42, p<.001$), the explanation power of wisdom was 17.1%. At second step regression analysis, the independent variable significantly affected LH, the mediating variable ($\beta=.30, p=.001$), and explanation power of HC was 8.0%. To verify the influence of wisdom, the mediating variable to HC, the independent variable in third step, the study conducted regression analysis with LH and wisdom as predictor and HC as dependent variable, it was confirmed that the LH ($\beta=-.007, p=.916$) and wisdom ($\beta=.72, p<.001$) were significant predictors of HC.

In other words, the direct influence of LH of middle-aged men to HC was $\beta=-.007$. And multiplication of influence of LH to wisdom ($\beta=.42$) and influence of wisdom to HC ($\beta=.72$), the value 0.302 refers to indirect influence of LH to HC via wisdom. At this point, β value $-.007$ of LH, the independent variable which is the direct influence was fewer than entire influence β value (.30) of first step, indicating the mediating effect of wisdom. Thus, wisdom affected relation between lifestyles habits and HC of middle-aged men as a complete mediation effect variable, and the variable's explanation power was 50.3%. LH, which are independent variables, are not directly effective in HC. It works only through the mediating variable of wisdom. For significance verification regarding the size of mediating effect of wisdom, the study conducted Sobel test. As the result, it was confirmed that in relation between LH and HC, wisdom was a significant mediating variable ($Z=6.40, p<.001$). [Table 4]

Table 4: Mediating effects of Wisdom in the relation between LH and HC

Step	Variables	B	β	t	p	Adj. R ²	F	p
Step 1	Lifestyle habits → Wisdom	.30	.42	5.34	<.001	.171	28.47	<.001
Step 2	Lifestyle habits → Health conservation	.18	.30	3.55	.001	.080	12.60	.001
Step 3	Lifestyle habits, Wisdom → Health conservation					.503	68.32	<.001
	Lifestyle habits → Health conservation	-.004	-.007	-.11	.916			
	Wisdom → Health conservation	.63	.72	10.65	<.001			
Sobel test : Z=6.40, p<.001								

DISCUSSION

The purpose of this study was to analyze the mediating effects of wisdom in the relation between LH and HC of middle-aged men, and to find an integrated nursing approach to preserve the healthy life of them.

First, in the association between life style habits, wisdom and health, HC had a positive correlation with life style habits and with wisdom, indicating that those with better life style habits and greater wisdom were more likely to preserve health well. Life style habits include diet,

weight management, smoking, caffeine and alcohol intake, safety awareness, sleep, stress management, character management, anxiety, depression management, satisfaction and relationships with family or friends.⁹ When these aspects of life style habits are well managed, health and quality of life can be improved. Middle-aged adults who exercise also had a higher quality of life.¹³ This is similar to the study that showed that the elderly who are wise can achieve successful aging⁷ and that wisdom is an important preceding factor for successful aging¹⁴. In addition, successful aging has the same meaning as lack of disease or disorder, maintenance of physical and cognitive function, and proactive participation in life¹⁵ and is a similar concept to HC. According to the principles of preservation by Levine, human beings must achieve an integration of structural, personal, social energies and can preserve health while maintaining uniformity and integration.¹⁶ As such, it is recommended that an iteration of this study be conducted by adopting the concept of life style habits and wisdom for HC of middle-aged men.

Wisdom includes the positive elements of self-preservation, completion, judgment, interpersonal skills and understanding of life, and allows for an integrated and comprehensive approach to life's challenges and issues. Such elements require life experience as an important element and take time to develop⁶, which means it is likely to increase as one ages. The scales for wisdom developed to best fit Korean culture consist of items on empathy, self-reflection and overcoming life's challenges. While these tools were developed for the elderly, but it was confirmed that the items are key concepts associated with health in middle-aged men, too.¹⁷ In Eastern philosophy, meditation and observation of wise people or teachers are ways to improve one's own wisdom.¹⁸ As such, it is appropriate to use wisdom as a variable to measure whether middle-aged men maintain their life with wisdom and manage their mental and social health. Wisdom had a mediating effect in the association between the health status and HC of the elderly¹⁹ as well as in the association between health improvement behaviors and HC of middle-aged adults.²⁰ As wisdom has an important mediating effect on the association between health status, health improvement behaviors, daily life style habits and HC in men and women in their middle ages and in their advanced years, a program related to a wise life that takes into account aspects of Korean culture must be developed to

encourage them to lead a wise life.

CONCLUSION

In this study, HC of middle-aged men had a positive correlation with life style habits and with wisdom. In addition, wisdom was found to have a complete mediating effect in the association between life style habits and HC in middle-aged men. Therefore, in order to encourage middle-aged men to take more interest in health and develop a healthy habit in daily life, local communities and healthcare experts such as nurses must develop and apply a program for healthy life style habits. This researcher hopes that continued studies on middle-aged men will be conducted using wisdom and HC as concepts.

ABSTRACT

Background: As a bacteria specialized in inhabiting the gastric mucosa, *H. pylori* is notorious as the chief cause of variable intestinal and extra-intestinal conditions. Yet, the link between *H. pylori* infection with IBS is still debatable. This has provoked us to execute a case-control study searching into the association between *H. pylori* status and IBS.

Objective: This study is designed to explore the association of *H. pylori* and the development of IBS, along with revealing if there is any association between this infection and the development IBS.

Methods: A descriptive case-control study of 135 individuals was conducted. We select (60) patients from inpatient and outpatient clinic (38 females, 22 males) and were diagnosed as IBS with respect to Rome 4 criteria. Another 75 (42 females, 33 males) seem to be healthy individuals without significant past medical history were assigned as control group. The two groups were subjected to stool antigen for *H. pylori* and the results were compared between the two clusters.

Results: There was no statistically significant association between HP infection and IBS ($p= 0.7$). The analysis explored higher prevalence of IBS in younger age group ($p= 0.6$) with overall female preponderance ($p=0.02$) and more common in married than single patients ($p=0.4$, $p=0.8$; respectively). The most common presentation was diarrhea predominance subtype ($p= 0.56$).

Conclusion: There is no significant association between *H. pylori* infection and occurrence of IBS in the general population.

Keyword: *H.Pylori*, IBS, Gastric Mucosa.

INTRODUCTION

IBS is considered to be the most dominant health issues experienced in the family practice, with a global prevalence of (1% - 20%). It classically emerges in early adulthood, even though it could develop in adolescents and in individuals around the age of 45 years; those older than 50 years with symptoms of IBS must have a complete assessment regarding any underlying conditions⁽¹⁾. The

disease has significant impact on patients' quality of life^(2,3) and socioeconomic status⁽⁴⁾. Prior studies proposed that abnormal brain-gut interactions, change of intestinal flora, chronic mucosal inflammation, and psychological disorders can be implicated in the pathophysiology of IBS⁽⁵⁻⁸⁾. As a bacteria specialized colonizing on the gastric mucosa, *H. pylori* is well-known as the chief cause of chronic gastritis, peptic ulceration, gastric carcinoma, and gastric MALT lymphoma⁽⁹⁻¹¹⁾. Moreover, *H. pylori* may have a part in extra-gastric syndromes, perhaps by prompting systemic inflammatory responses^(12,13). However, the link between *H. pylori* infection with lower GI disorders chiefly IBS remains unsettled⁽¹⁴⁻¹⁶⁾.

MATERIALS AND METHOD

A descriptive case-control study was carried out in Al-Diwaniyah Teaching Hospital and outpatient clinic in Al-Diwaniyah city from January to June 2018. TO achieve this goal, we select (60) patients from inpatient and outpatient clinic (38 females, 22 males) and were diagnosed as IBS with respect to Rome 4 criteria and by complete history and physical examination and investigated with various set of tests. Another 75 (42 females, 33 males) seem to be healthy individuals without significant past medical history were assigned as control group.

Inclusion Criteria

All patients were selected according to Rome 4 criteria (published in 2016) which are the latest criteria for the diagnosis of IBS. These include: Recurring abdominal pain at least 1 day/week in the last 3 months, accompanied by two or more of the following criteria:

- Related to defecation
- Associated with a change in frequency of stool
- Associated with a change in form of stool.

Criteria achieved for the last 3 months with symptom onset at least 6 months before diagnosis (17).

Exclusion Criteria:

These involve any alarming symptoms, which make the diagnosis of IBS unlikely:

- Rectal bleeding
- Anemia
- Nocturnal symptoms
- Weight loss
- Recent antibiotic use
- Onset after 50 years of age
- Abnormal abdominal examination (organomegally, lump)
- Family history of colorectal cancer or ovarian cancer.
- Family history of inflammatory bowel disease, or celiac disease.

METHODOLOGY

For the purpose of the study, initially we select (67) individuals from inpatient and outpatient clinic who had suggestive symptoms. Both groups underwent full

history and physical examination and were investigated regarding the risk of organic diseases in form of complete blood count, ESR, blood glucose level, liver function test, general stool examination, celiac serology, thyroid function test, abdominal ultrasonography. Additional 3 patients were also omitted as they appeared to have some red flag symptoms like rectal bleeding, antibiotic related diarrhea, and abdominal mass by abdominal ultrasonography. Further 2 patients who had Typical Rome 4 criteria refuse to participate in the study. Consequently we assemble 60 patients with characteristic Rome 4 criteria for IBS and willing to continue in the study, 38 were females and 22 were males. In the light of the purpose of our study, both groups were investigated with *H. pylori* stool antigen test.

Statistical analysis: Information was collected and included in a data-based system and analyzed by statistical package of social sciences (SPSS, Inc., Chicago, IL, USA) version 20. Parametric data were expressed as mean \pm standard deviation (SD) such as age. It was evaluated statistically by means of student t-test while non-parametric data were expressed as proportions like male and female were analyzed using chi square.

RESULT

A case-control study enrolled 135 person; 60 patients with IBS as a case group and 75 healthy individuals as a control group (Figure 1). The mean age of cases is 33.5 ± 2.5 and the mean age of control group is 34.8 ± 3.1 , sixty five percent of patients in age group of 20-39 years and sixty percent of control is in same age group, while age group 40-59 is 26% in case group and 28% in control as in shown (Table 1):

Figure 1: Case-control distribution.

Table 2 shows gender distribution, 63% of cases were female and 37% male, while in control 44% were

female and 56% were male.

Table 1: Age distribution in both groups.

Age group	case	Control	p-value
< 20 year	4(6.6%)	6(8%)	0.91
20-39 year	39(65%)	45(60%)	0.6
40-59 year	16(26%)	21(28%)	0.3
≥ 60year	1(1.4%)	3(4%)	0.5
Total	60	75	

Table 2: Gender distribution in both groups.

Gender	case	Control	p-value
female	38(63%)	33(44%)	0.02
Male	22(37%)	42(56%)	
Total	60	75	

Out 60 cases, there were 35% positive H pylori and 65% negative, and in control there were 30.6% positive H. pylori, and 69.3% were negative for H. pylori, as in (Table 3).

Table 3: The prevalence of H. pylori in case group and control group.

H pylori	case	Control	p-value
Positive	21 (35%) Female(15)	23 (30.6%) Female (11)	0.7
Negative	39 (65%) Female (23)	52 (69.3%) Female (22)	
Total	60 Female (38)	75 Female (33)	

In case group, there were 36.65% had IBS-D, 25% had IBS-C, 21.6% had IBS-A, 16.8% had IBS-U. Regarding H. pylori positive patients, there were 38% of them had IBS-D, 23.8% had IBS-C, 19.1% were positive for both IBS-A and IBS-U as (Table 4) shows.

Table 4: Show predominant symptoms in cases.

Type of IBS	H.pylori positive	H.pylori negative	Total	p-value
Diarrhea predominant	8 (38%)	14(35.8%)	22(36.6%)	0.56
Constipation predominant	5 (23.8%)	10(25.6%)	15(25%)	0.4
Alternating predominant	4 (19.1%)	9(23%)	13(21.6%)	0.1
Unclassified predominant	4 (19.1%)	6(15.6%)	10(16.8%)	0.21
Total	21	39	60	

With reference to prevalence gender, age, and residency in IBS patients, as (Table 5) shows, there were 39.5% of female had IBS-D, 29% had IBS-C, 18.5% had IBS-A, and 13% had IBS-U. As for age-group of 20-39 years, there were 33.3% had IBS-D, 30.7% had IBS-C, 20.5% had IBS-A, and 15.5% had IBS-U. Whereas the residency, there were 34% of urban had IBS-D and 31.7% of them had IBS-C, 19.5% had IBS-A, and 14.8% had IBS-U.

Table 5: Predominant clinical varieties of IBS for female gender, age-group and urban residency.

Type of IBS	Gender (female)	Age (20-39)	Residency (urban)
Diarrhea predominant	(39.5%) 15	13(33.3%)	14(34%)
Constipation predominant	11 (29%)	12(30.7%)	13(31.7%)
Alternating predominant	7 (18.5%)	8(20.5%)	8(19.5%)
Unclassified predominant	5 (13%)	6(15.5%)	6(14.8%)
Total	38	39	41
p-value	0.9	0.8	0.3

DISCUSSION

In reference to (Table 1) that exhibits 135 individuals divided in 4 age groups comprising of (60 patients with IBS, with median age of 33.5 +/- 2.5) demonstrates that IBS is more prevalent in age group of 20-39 (with a percentage of 65%) than other age groups in the case cluster. This result corresponds to a study in Lebanon 2017 which described 67% of cases of the same age group⁽¹⁹⁾. Other study labeled 40% in same age group in China⁽²⁰⁾.

These studies can be explained along with what our results have shown that the reasonably high occurrence of IBS in young people may be owing to psychological and emotional influences, such as stress related to studies and exams, finding jobs, monetary status, or marriage.

Our result reveal IBS more occurred in female patients 63% than males 37% as in (Table 2), these numbers are comparable to those of a study by ford⁽²¹⁾ in USA which stated that 62% were female and 38% were male of study sample, also correspond to other studies worldwide^(22, 23). An alternative research by Farzaneh 2013⁽²³⁾ of the IBS patients, 62.1% were females, 37.9% were males. On the contrary, various studies accomplished in Asia did not expose gender variance prevalence, other resources has identified a predominance of females^(24,25). The basis for this debatable gender dissimilarity is indefinite. Pan et al⁽²⁶⁾ ascribed this gender variance to female hormones on account of the falling occurrence of IBS in women post-menopause. Chang & Heitkemper⁽²⁷⁾ designated that

gender-related differences in GIT transit time, visceral hyper-excitability, neurological pain processing, neuro-endocrine, autonomic nervous system, and anxiety responses can clarify the majority of IBS in women.

As by (Table 3), our result demonstrated 35% of cases were positive *H. pylori* and in control group there were 30.6% had positive *H. pylori*, these finding are not statistically significant (p value 0.7). a study by Antonio Barrios showed that among 38 patients enrolled, 50% were *H. pylori*-positive and 50% were negative⁽²⁸⁾ and detected that the total infection rate of *H. pylori* in IBS sufferers in the study has no significant association from that of the of control.

In relation to type of IBS, as per (Table 4) it has revealed 36.6% (IBS-D), 25% (IBS-C), 21.6% IBS-A, 16.8 (IBS-U).

In positive *H. pylori* cases, there were 38% (IBS-D), 23.8% (IBS-C), and IBS-A and IBS-U is 19.1% for each subdivision. These result consistent with result by Dorn SD⁽²⁹⁾ which reported 30% (IBS-D), 25% (IBS-C), 14.3% alternating from positive *H. pylori* cases.

When debate with further studies we established that in study by Farzaneh⁽²³⁾, IBS-C around 52% with interchanging symptoms of mixed subtype (IBS-M) and diarrhea (IBS-D) was the maximum prevalent type of IBS. Of all IBS cases which had a referral to gastroenterology clinic in Iran, Roshandel, *et al*, stated that IBS-A is the utmost prevalent (60%) and IBS-C and IBS-D to be 29.1% and 10.9%, respectively⁽³⁰⁾.

The higher prevalence of IBS-D in our research may be clarified by the fact that the majority of patients were referred from primary health centers to our gastrointestinal outpatient clinic. General practitioner may be more assured in managing of IBS-C, since IBS-D may request more complex investigation and procedures. Lin et al⁽³¹⁾ established an alternate diagnosis for 21% of patients referred from primary health care as IBS-D, whereas no different diagnosis was made for IBS-C⁽³²⁾.

As a final point, in our result we can realize that (IBS-D) with regards to female gender comprises of 39.5% cases, 33.3% of age-group 20-39 years, and 34% of urban residency (Table 5). These statistics parallel to outcome by ford 2014, which labeled those with IBS-D, were younger, more probable to be female^(21,33). On the other hand, a study by Feng Xiong⁽⁴³⁾ 2016,

established that patients between 41-50 years of age had the maximum occurrence of IBS-D with female predominance.

Groundwater Contamination of Some Soils Near the Kefal River

Kifaya Hasan Qassim

Department of Geography, Faculty of Basic Education, University of Babylon 51002, Ministry of Higher Education and Scientific Research, Babel, Iraq

ABSTRACT

Groundwater is the water that is located below the surface of the earth and forms all or some of the spaces in the rock formations which are originally rainwater or river water or water resulting from the melting of the ice as it seeps into the ground and form a layer of groundwater and be on two types of water close of the surface of the earth as in the study area and groundwater beyond the surface of the ground and the groundwater despite some of their layers from the ground level of the most important sources of freshwater liquid has received great attention from specialists in the field of environmental protection. The pollution of water damage and corruption of water quality on this leads to pollution and malfunction in its system, which reduces its ability to perform its natural role and makes it lose much of its economic value and cause many health and environmental damage when used. Water is contaminated by many human, plant, mineral, industrial or chemical waste, the study is an agricultural area with fertile soil suitable for agriculture and animal husbandry.

Keywords: *Environmental Protection, Groundwater, Kefal River, Elements*

INTRODUCTION

The groundwater accumulates under the outer crust of the earth. These water resources are considered the main sources of water resources ⁽¹⁾. Random use guide him. The wealth of groundwater in Iraq and in the study area where the water is close to the surface of the earth and the inhabitants of these areas are used for domestic purposes and watering the plantations during the water scarcity through the wells of artesian. Ground wells have long been the main sources of water away from pollution as a result of what they do the soil is a candidate for water, but this belief is changing now. In many cases, the wells are close to the surface of the earth, which increases the chance of biological or chemical pollution ⁽²⁾. This is what we observe in the study area because it is located between the Indian Shatt and the Kefl River and is exposed to flooding during the period of water increase. The groundwater is very close to the surface of the earth not exceeding a few centimeters. Wells with a depth of 40-50 feet are less likely to be contaminated because water passes through semi-porous porous layers that filter and purify water from most Impurities. Groundwater is also polluted by waste and waste from

factories, oil pipelines, mines, and radioactive materials, as well as pollutants from agriculture due to the use of industrial fertilizers, pesticides, and wild animals ⁽³⁾. This is what we saw in the study area during the field study because it is famous for breeding sheep, cows, buffalo, and goats. Groundwater is difficult to get rid of this pollution, or to conduct any treatment of existing water-bearing classes where groundwater pollution leads to the reduction of water use in various purposes in addition to damage to human life. That animals and plants by causing various diseases. ⁽⁴⁾

The causes of groundwater pollution in the area near the Kefl River and what is the quality of the water and its suitability for different uses in the study area. The various human activities represented by agricultural activity and civil activity are directly related to pollution of groundwater in the study area.

The need for this study emerged as a result of the water scarcity experienced in the study area and the lack of surface water represented by the Indian steppe and the Kefl River due to the low water level of Shatt Hindi which causes the lack of water to flow into streams and rivers. The chemical and physical elements of groundwater in

the study area. ⁽⁵⁾

The importance of research is that the groundwater is one of the most important sources of liquid fresh water, which highlights its importance and the great role it plays from the human need of water in the study area which is located near the Kefl river and so close to the surface of the earth so it can be used in watering crops Animals and other human uses especially during drought time the area was totally dependent on the water so it was used to drink by some people.

Geology of the study area

The area of the study is located in the district of Hilla in the province of Babylon within the scope of the sedimentary plain in the unstable pavement in relation to the division of Iraq, where this range is called the scope of Mesopotamia between the mountains of Zakros in the north-east and the Arab plateau in the south-west and covers the research area in general sediments Of the four-year-old Pleistocene. The deposits of this sediment are characterized by the easy flux of both the Euphrates River and its branches. These sediments are generally composed of thin layers of fine sand, silt, and mud, whereas wind sediments are found in the eastern parts of the plains (E). ⁽⁶⁾

Geomorphology Study Area

The study area is located in Babil Governorate within the Sedimentary Plain, which is characterized by its flat surface, its incline and low general slope. The slope is about 22 cm per kilometer. Some dunes are found in some areas such as south of Hilla. Winds are shapes according to their direction. Agriculture has increased the soil level by (mm) per year, Groundwater in general is close to the surface and its salinity ranges from (10000) to (50000) ppm for the entire governorate. The center of Hilla city is about (1000-3000) ppm.

Components of groundwater from salts

The concentration of dissolved salts in groundwater is a measure to determine their suitability for the general use of groundwater, such as domestic use, drinking, agriculture, industry, and power generation. Table (1) shows. The qualitative division of groundwater according to dissolved total salts.

Table 1. Shows the qualitative division of groundwater according to dissolved total salts.

Water quality	Total dissolved salts mg/ L
fresh water	0 - 1000
Salted Water	1000 - 10000
Saline Water	10000- 100000
High salinity water	More than 100,000

Groundwater sources: - Groundwater sources are divided into three sources

Air or water falling: - The main source of groundwater, including rainfall and water flowing on the surface of the earth and water resulting from the melting of snow, to access these waters to the ground during the layers of rock as in the study area.

Water geological or fungal: - The water arising or composed of rocks between fresh water or the sea and the cohesion of the edges of the rocks, they store water droplets between the spaces forming one of the sources of groundwater.

Collective water or water crystallization of magma: - The water associated with the events of the volcanic and volcanic events that occur during the formation of igneous rocks and known as the rising water or underground water, which contains a high percentage of dissolved minerals and high temperatures.

water crystallization of magma: - include the water associated with the volcanic events that occur during the formation of igneous rocks and include the remaining solutions of water crystallization of magma known as the name of water rising and characterized by a high proportion of soluble salts and have a high temperature and often mixed with water to decrease its temperature And the salt concentration is less.

Waste

Like the area near to the river Kefl and Shatt Hindi high population density generated by different types of waste as this area does not reach municipal cars for cleaning, so they throw their industrial waste or from household and other uses, whatever their forms, whether solid or semi-solid or liquid It is dumped in exposed areas and buried in a thin layer of soil and since the

groundwater is close to the surface of the earth when this area to sink water from the irrigation of crops or irrigation, wrong or excessive or the fall of rain or exposure to the waters of the falcon deposition some of the components of these wastes After being dissolved or dissolved into the aquifer. ⁽⁷⁾

Table.2 shows the results of the chemical tests of selected samples for the area near the Kefl River for the year 2017-2018

NO.	Type of examination	Environmental determinants	Bashni Location (2)	Ibn Tufail Location (3)	Awfi Location (4)	Alshimary Location (5)	Al-Fanhara location (6)
1	Electrical connection EC	–	2.6	2.8	2.9	2.3	2.7
2	PH	–	8.3	8.2	8.1	8.4	8.7
3	Mercury	0,002	NIL	0.0025	0.029	0.031	NIL
4	Nickel Ni	0.02	0.126	NIL	0.110	NIL	Nil
5	Lead PB	0.1	Nil	0.068	0.052	Nil	Nil
6	Copper Cu	1	Nil	0.90	Nil	Nil	0.290
7	Zinc Zn	0.5	Nil	0.171	0.69	Nil	Nil
8	Cadmium Cd	0.003	0.002	Nil	0.001	Nil	Nil
9	Sodium Na	–	10.8	10.9	10.7	10.2	10.2
10	Sulfates SO4	–	7.00	7.77	7.15	6.55	7.4

Results of chemical analysis conducted in the Directorate of the Environment of Babil province on 15/11/2017

1. Electrical connection EC

Table 2 shows that the groundwater salinity of the study area and the sites affected by agricultural and animal wastes, as these areas are known for the cultivation of fruits and vegetables, as well as date palms, especially sites (2.3.5). Groundwater in these sites is highly saline according to the International Classification of Irrigation Water. Due to faulty irrigation.

2. Alkaline and acidic PH

Water is acidic if the value of ph. 1-6 and if the base is ph. Between (14-18) or if the value of ph. (7) the water is ideal or neutral. It appears from Table (2) that ph. The groundwater in the study area is of a basic nature and for all the studied sites due to the low presence of carbon dioxide in this water, as its solubility in the water leads to the transformation of water from the acidic to the basal. ⁽⁸⁾

3. Mercury: - hg

The element of mercury is toxic and dangerous, and if it is present in drinking water at a higher rate than its normal presence, it will be very dangerous for its users for agricultural purposes or drinking (Table 2 shows that the water of the study area is not polluted by the element of mercury, (0.031) due to the exposure of this site to insecticides and fungus being agricultural area in addition to that mercury affects the nervous system and reproductive system causes tremor and imbalance and kidney failure and menstrual irregularity in women and abortion and cerebral palsy.

4. Nickel: - NI

Nickel is found in acidic and oxidizing environments. The recipe for this environment is reflected in its presence in the Earth's crust in the form of oxides, carbonates and silicate with iron. Nickel concentration in the earth's crust is equal to (01.0%). It is concentrated in basal rocks and is cobalt- Nickel is also found in Iraqi fertilizers (Table 2) shows that the study area and all sites are not contaminated with nickel.

5. Lead: - Pb

Lead is found in many rocks where it is found in the minerals of igneous rocks above the base such as olefin and is slightly in groundwater due to the lack of melting of lead compounds in groundwater. Lead is considered to be a toxic element of regeneration and its concentration causes cancer, brain damage, Lead types of the most dangerous types of lead produced in oil and its derivatives. The element of lead is a toxic element and its effect in water is easier than hard water. Table (2) shows that the minimum lead (nil) and the upper limit (0.068) showed that the water in the study area is not contaminated with the lead element and all the studied sites. ⁽⁹⁾

6. Copper: - Cu

Copper is a natural element in nature where it is found in the form of sulfide or oxides. Its concentration is increased by increasing the temperature and increasing the acidity of water (ph) and 1.0ppm is present in groundwater. p.m)) Water is toxic and causes degenerative diseases, diarrhea and fatal heart disease of humans. The concentration of copper in the study area according to the table (2) has a minimum of (nil) and a maximum of 0.390 at site (5). The study area is not contaminated with copper.

7. Zinc: - ZN

The concentration of zinc is low in groundwater due to its weak solubility in moderately acidic water and its concentration increases with water acidity and is ionized when ph. (9.7). Table (2) shows that the lowest percentage in the study area (nil) and the highest 0.171) at the site (2). This means that the study area is not contaminated with zinc. ⁽¹⁰⁾

8. Cadmium: - CD

The most important sources of cadmium are phosphate fertilizers, heavy dirty household water, and industrial waste. Cadmium is a toxic and polluting element of the environment and has little importance in life processes. Cadmium causes kidney failure, acute pulmonary embolism, chronic pneumonia, and pneumonia. Table (2) shows that the minimum cadmium in the study area (nil) and the upper limit (0.002) at Site 1 shows that the study area is not contaminated with cadmium and is found to be within the permissible limit

according to the 1996 Iraqi specifications of (0.003) The limit of rare elements in groundwater.

9. Sodium: - Na

Sodium belongs to alkaline minerals and is the only element found in large quantities in groundwater. Sodium salts are high in groundwater where concentrations in groundwater are from (10-100 mg / L). Table (2) shows that the study area is not Contaminated and for all sites.

10. Sulfate: - SO4

The sulfates in groundwater are composed of water gypsum and anhydrous gypsum (CASO4). The igneous and transformative rocks contain less than 100 mg / L of sulfates. In addition, they contain magnesium sulfate called salt or sodium sulfate, Bitter taste in the presence of sufficient quantities. As for people who are not used to drinking water containing a high proportion of sulfates cause them diarrhea.

CONCLUSION

Groundwater in the area between the Kaffl and Shatt al-Hindi is an important source on which water is scarce because it is an area with fertile agricultural soil known for growing fruits and vegetables of all kinds, as well as palm trees. This study deals with the study and analysis of the impact of agricultural and human waste on the groundwater pollution of the study area and its validity for various uses of life. This study was based on the collection and analysis of five models of selected groundwater areas of the area near the Kefal River. Each model has 10 chemical and physical elements for 2017-2018 and is found to be uncontaminated with groundwater in the study area.

Relationship of Patient Characteristics with Patient Satisfaction

Anggun Wulandari¹, Ester Mariana¹, Nyoman Anita Damayanti²

¹Student of Health Policy Administration Program Study, ²Lecturer of Health Policy Administration Program Study, Faculty of Public Health, Airlangga University, Indonesia

ABSTRACT

Patient satisfaction becomes one of the indicators used as the initial imaging in providing good service to patients. The data of patient satisfaction assessment of PLK Unair in the last three year, overall approaching the achievement of the target set. However, there is a decreased performance from 2015 to 2016. The health care provider needs to understand the patient's characteristics for decision-making regarding the services provided so that the patient can be satisfied. The objective of the study was to analyze the relationship between respondent characteristics (sex, age, education, and occupation) with patient satisfaction. The study was conducted at the Airlangga University Healthcare Center (PLK) in November 2017. The population of this study were all patients who visited PLK Unair. Sampling technique using accidental sampling for 100 respondents. The statistical test used by Chi-Square test. The results showed that the characteristics of the respondents are mostly women as many as 65%, young as many as 80%, high education as many as 96%, and unemployed as many as 72%. Of the 100 patients, less satisfied were 64%. The statistical test results between sex, age, education and occupation with patient satisfaction respectively were 0.055, 0,000, 0.260, and 0.006. The conclusion is no relationship between sex and education with patient satisfaction. There is a relationship between age and work status with patient satisfaction. The suggestion is to be expected by doing a periodic satisfaction assessment can be a benchmark of service success.

Keywords: *patient characteristics, patient satisfaction*

INTRODUCTION

Nowadays, the company is experiencing a great competition, it can also be felt in healthcare. Healthcare providers are required to prioritize patient satisfaction so that patients will be satisfied with the service. To obtain such satisfaction, the service provider must be in contact with the recipient of the service in informing, engaging and motivating the patient in achieving recovery.

The measure of the success of service delivery is determined by the level of satisfaction of the service recipient. Service receiver satisfaction is achieved when the recipient receives the service as required and expected. Service recipients also expect a quality service, because with a quality service then the recipient will feel satisfied.

Patient satisfaction is important for healthcare providers¹ and will affect the marketing of the Healthcare Center of Campus C, Universitas Airlangga. The

emergence of various forms of competition in providing services in the community both provided by government agencies and private, and many other agencies serving service in the community is a heavy burden for Healthcare Center Campus C Univeritas Airlangga to further improve the quality of services provided at the clinic.

Based on the data assessment of patient satisfaction PLK Unair in the last three year, overall approaching the achievement of the target set. However, there is a decrease in the achievement of satisfaction assessment from 2015 to 2016. Achievements in 2014 amounted to 99.08%, 2015 by 101.85%, and in 2016 97.90%².

Patient services are activities that undertaken to meet the needs, wants and expectations of patients. If the service received is in line with patient expectations it means the service has satisfied the patient. To understand how to satisfy the patient is to identify the needs and wants of the patient³. The needs, wants, and expectations

of the patient can be identified by looking at the characteristics of each patient. Healthcare providers need to understand the characteristics of patients for decision-making related to hospital services so that services are provided in accordance with the needs and wants of the community in general and patients in particular³.

The characteristics of the patient are the particular characteristics or special identity attached to the user of the health service or the hospital patient, can be used to equalize or distinguish the patient with another patient and assumed to generate the same or different reactions among patients. The reaction of a person who produces the same or different judgments is largely determined by the background or individual characteristics, such as age, sex, education, occupation, and income. The magnitude of the influence of patient characteristics on the aspect of the quality of health services in the hospital can lead to feelings of satisfaction or dissatisfaction⁴.

According to the study of Abdillah AD and Muhammad Ramdan (2016) mentioned that there is a relationship between patient characteristics (sex, age, education, occupation) with outpatient satisfaction in Puskesmas Sindangkerta West Bandung regency⁵. Based on the description above, the researcher wanted to know how the relationship between patient characteristics (sex, age, education, and occupation) with patient satisfaction at PLK Airlangga University Surabaya in November 2017.

MATERIAL AND METHOD

This research is an analytic observational research with cross sectional study design. Data collection was conducted in November 2017. The population in this study was all patients who visited PLK Unair. Sampling was done by non-probability sampling with accidental sampling. Samples were taken accidentally, if there have been found visitors who want to get the health services, then they will become samples. The sample in this study were 100 respondents. Respondents were interviewed with questionnaires.

The questionnaire contains questions about the characteristics of respondents consisting of age, sex, education, work status and income, and questions about patient satisfaction consisting of 21 items of questions that have been tested for their validity and reliability. In this research, patient satisfaction variable is categorized into 2, that is satisfied and not satisfied. Patient is satisfied if got score from patient satisfaction questionnaire >mean. The statistical test used by Chi-Square test.

RESULTS AND DISCUSSION

A) Results

Based on the results of interviews with the help of questionnaires instruments to 100 respondents, the result can be seen as follows:

Table 1. Relationship between Patient Characteristics and Patient Satisfaction of PLK Unair in November 2017

Patient Characteristics	Patient Satisfaction				Total		P-value
	Less Satisfied		Satisfied		n	%	
	n	%	n	%			
Gender							
Male	18	51,4	17	48,6	35	35,0	0,055
Female	46	70,8	19	29,2	65	65,0	
Age							
Young	58	72,5	22	27,5	80	80,0	0,000
Old	6	30	14	70,0	20	20,0	
Education							
Low	1	25	3	75,0	4	4,0	0,260
High	63	65,6	33	34,4	96	96,0	
Occupation							
Unemployed	52	72,2	20	27,8	72	72,0	0,006
Employed	12	42,9	16	57,1	28	28,0	

B. Discussion

Relationship of gender with patient satisfaction

Based on the table above, it is known that most patients with female as many as 65%. Patients with female but less satisfied as many as 70.8%. Based on statistical test by using chi square test, it was found that $p\text{-value} = 0,055 (> 0,05)$. This means that there is no relationship between gender and patient satisfaction at PLK Unair in November 2017.

According to Rahman (2006) and Mohammed (2011) states that men have a higher level of satisfaction than women⁶. This research is in line with research of Christasani PD & Satibi (2016) which states that there is no relation between sex to satisfaction shown by $p = 0,683 (p > 0,05)$ ⁷. Hidayati AD's research, Chriswardani Suryawati & Ayun Sariatmi (2014) also stated that there is no relationship between gender to satisfaction^{7,8}.

Relationship of age with patient satisfaction

Based on the table above, it is known that most patients are young patients as many as 72%. Patients who are young but dissatisfied as many as 72.5%. The young patients in this study were patients <35 years of age. Based on statistical test by using chi square test, it was found that $p\text{-value} = 0,000 (<0,05)$. This means that there is a relationship between age and patient satisfaction at PLK Unair in November 2017.

WHO study in nine developing countries has concluded that the largest population using health care facilities is the five-year-old age group and the 30-35 year age group. Previous research conducted by Abdillah AD & Muhamad Ramdan (2016) mentioned that age group more than 30 years 63,2% expressed satisfaction, whereas in age group less than 30 years only 21,8% who expressed satisfaction⁵.

From this it can be seen that the age group of less than 30 years tends to be dissatisfied compared to the age group more than 30 years. This is in accordance with the opinion of Lumenta (1989) that this productive age group tends to be more demanding and expect much towards the ability of basic health services and tend to criticize. According to Rahman (2006) states that satisfaction based on productive age has greater demands and expectations than old age⁶. This study is in line with the results of research conducted by Farianita R

(2016), which states that there is a relationship between age and patient satisfaction⁹.

Relationship of education with patient satisfaction

Based on the table, it is known that most patients with higher education as much as 95%. Highly educated but unsatisfied patients were 65.6%. Based on statistical test by using chi square test, it was found that $p\text{-value} = 0,260 (> 0,05)$. This means that there is no relationship between education and patient satisfaction at PLK Unair in November 2017.

According to Mar'at, the feeling of satisfaction on each individual is not the same, but the expression of satisfaction on a group of individuals can occur almost the same because of the influence of the environment and society of certain groups. Just as Azrul Azwar (1994), points out that as well as the quality of service the dimensions of patient satisfaction vary greatly. So patient satisfaction is not only influenced by one's education but on other aspect¹⁰.

Lumenta (1989) states that a person with a higher level of education tends to demand or criticize a lot of services he receives if he is not satisfied. Someone with a low level of education, he tends to receive more because he does not know what he needs, as long as heal it is enough for him.

Carr and Hill (1992) argue that highly educated societies tend to be dissatisfied because their knowledge demands better service¹¹. This study is in line with research conducted by Hidayati AN, Chriswardani Suryawati & Ayun Sariatmi (2014) who found that there is no relationship between education and patient satisfaction level^{7,8}.

Relationship of work status with patient satisfaction

Based on the table above, it is known that most patients are unemployed as many as 72%. Patients who are unemployed in this study were patients with status as students, students, housewives, retired and jobless. Patients who are unemployed but less satisfied as many as 72.2%. Based on statistical test by using chi square test, it was found that $p\text{-value} = 0,006 (<0,05)$. This means that there is a relationship between work and patient satisfaction at PLK Unair in November 2017.

This is not in accordance with the Rahman (2006)

opinion which states that people who work (employed) tend to have higher expectations than people who do not work (unemployed)⁶. This research is also not in line with the opinion of Lumenta (1989) which states that a person working is more likely to demand or criticize the service he received if it is not satisfied for him compared with the unemployed. However, this study is in line with research conducted by Abdillah AD & Muhamad Ramdan (2016) who stated that there is a relationship between occupation and patient satisfaction⁵.

CONCLUSIONS

The conclusions of this study are:

1. Characteristics of respondents in this study mostly are women as many as 65%, young as many as 80%, high education as many as 96%, and unemployed as many as 72%. Of the 100 patients, patients were dissatisfied as many as 64%, while 36% satisfied.
2. There is no relationship between gender and patient satisfaction in PLK Unair in November 2017 (p-value = 0,055).
3. There is a relationship between age and patient satisfaction at PLK Unair in November 2017 (p-value = 0,000).
4. There is no relationship between education and patient satisfaction at PLK Unair in November 2017 (p-value = 0.260).
5. There is a relationship between occupation and patient satisfaction at PLK Unair in November 2017 (p-value = 0.006).

The suggestions that can be given are:

1. The management of PLK Unair is expected to conduct periodic satisfaction appraisal in order to be a measure of service success.
2. Provide a means to facilitate customers in submitting a complaint through a suggestion box or SMS complaints.
3. Facilitate access to information services to customers by using social media is growing.

Ethical Approval: Related departments should be assured about the confidentiality of the results of questionnaires.

Conflict of Interest: The authors report no conflict of interest.

Evaluation on Preparation of Fire Hazards in Pt. X Muncar Banyuwangi (Study on Fish Canning Company in Muncar Banyuwangi)

Hesti Jatmikowati¹, Yustinus Denny Ardyanto Wahyudono¹, Tjipto Soewandi¹

¹Department of Occupational Health and Safety, Airlangga University, Surabaya, Indonesia

ABSTRACT

Fire is a disaster event that comes from an unwanted fire and can cause harm. Decree of the Minister of Manpower of the Republic of Indonesia Number. 186 / MEN / 1999 on Fire Prevention in the workplace, so that fire hazards can be prevented and avoided as early as possible. This study aims to evaluate the preparedness of fire prevention in PT. X Muncar Banyuwangi through observational with cross sectional approach. Population in this research is all employees of production at PT. X Muncar Banyuwangi as many as 90 people. Data collection is done by using questionnaire, observation and examination. Data processing is done by descriptive analysis and correlation by using spearman test. The result of research of correlation between age with employee knowledge have weak relation ($\rho_s = -0,340$), relationship between training with employee knowledge have medium relation ($\rho_s = 0,350$), relation between working period of respondent with level of knowledge in preparedness fire prevention at PT. X in the weak category ($\rho_s = -0.089$), and the relationship between socialization and application of fire prevention procedures and readiness to the knowledge of employees at PT. X in the weak category ($\rho_s = -0.127$), while the observation result of infrastructure inspection obtained APAR (73.3%), hydrant, fire alarm, detector, sprinkler (0%) because the tool is not installed in PT. X, place of assembly (100%), exit signs (50%), emergency stairs and emergency exit (0%). Implementation of fire prevention preparedness at PT. X can work well if all elements of the fire hazard management system are implemented thoroughly.

Keywords: *evaluation, fire, fire prevention preparedness, knowledge*

INTRODUCTION

The fire emergency response system is part of the fire management management process in the readiness of building management in anticipating a fire emergency within a building. One workplace that has a fire risk is a fish canning factory. Fire risk occurring in fish canning plant has a high rank, then evaluation is needed in an effort to improve the implementation of fire prevention preparedness at PT. X Muncar Village Banyuwangi. Building of PT. X Muncar Banyuwangi equipped with facilities and infrastructure include management office, production room, clinic room, and other supporting infrastructure such as laboratory space.

In the process of production of fish processed in the exhaust box of fish cooked by using steam heat generated by boilers with a high enough temperature, the use of equipment requires a large electric power in

case of surge or excess electric current so that the heat can cause a fire. According to the NFPA³ itself, the classification of fire hazards of fish canning industry is classified into class A fire hazard (fire with paper, cloth, plastic and wood), class B (fire caused by methane, ammonia and diesel) and class C (electric fire). With the risk of this PT. X Muncar Banyuwangi does not have emergency procedures understood by all employees and management, so it is possible if there is a fire hazard, there is no effective and efficient rescue procedure and can be an evaluation so that the need for management readiness in the implementation of fire emergency response in PT. X Muncar Banyuwangi. Fires are caused by various factors, but in general the factors that cause fire are human and technical factors⁸. In case of fire in Indonesia around 62.8% is caused by electricity or short circuit of electric current. Spatial planning and lack of fire prevention infrastructure also contribute to the

emergence of fires, particularly fires in industrial estates and settlements.

According to the Decree of the Minister of Manpower R.INo.KEP.186 / MEN / 1999 on Fire Response Unit at Work², the fish canning industry is classified as a high risk level of fire hazard and if there is a fire will have a considerable impact, important to do. For this purpose, Law No. 1 of 1970 concerning occupational safety has stipulated that every workplace should make efforts to create workplaces and survivors, including from fire hazards.

Observation result of fire hazard protection in PT. X Muncar Banyuwangi there is an active fire protection system in the building building in the production area is not good because there are some components that have not met the standard. In alarms, detectors, sprinklers, hydrants are still not available, the APAR component is only the label component of the officer's name that maintains the card or APAR label is not yet available, and there are some rusty and poorly grounded APARs. It is therefore necessary to evaluate the preparedness of fire prevention in order to increase awareness of fire disaster.

Results of subsequent interviews with the management of PT. X Muncar that based on the Decree

of the Minister of Manpower RI No. 186 / MEN / 1999 on Fire Management at Work², PT. X muncar Banyuwangi does not yet have a fire organizational structure so that in the implementation of emergency response the fire hazard has not been implemented properly, this is causing the effort in prevention and handling fire hazard is not running maximally.

The purpose of this study is to evaluate the implementation of fire prevention preparedness at PT. X Muncar Banyuwangi based on Minister of Manpower Decree No. RI. 186 / MEN / 1999 on Fire Management in the Workplace².

MATERIAL AND METHOD

This research uses quantitative method with cross sectional awakening design which aims to photograph and analyze the situation in a certain time period against the evaluation of fire preparedness prevention in PT. X Muncar Banyuwangi. The data were collected by questioner and question and answer. While the observation with cross sectional study approach and by way of examination by using check list list. Data processing is done by correlation analysis using spearman test. Population in this research is all employees of production at PT. X Muncar Banyuwangi as many as 90 people.

FINDING

Table 1. The relationship between age and employee knowledge in PT. X Muncar Banyuwangi

No.	Age	Level of Fire Preparedness Readiness						Total		ρ_s
		Low		Medium		High				
		n	%	n	%	n	%	N	%	
1.	<25 years old	8	61,5	4	30,8	1	7,7	13	100	0,084
2.	25-45 years old	13	27,7	30	63,8	4	8,5	47	100	
3.	>45 years old	2	6,7	11	36,7	17	56,7	30	100	

Table 1 shows that the age of employees <25 years old are 8 people with a percentage (61.5%) have low knowledge, 25-45 years old employees turn out 30 people with percentage (63.8%) have medium knowledge and age > 45 year turns out 17 people with a percentage

(56.7%) have a high knowledge. From the table it can be concluded that age with knowledge level has weak relationship because of the older age of employees the better the level of knowledge.

Table 2. Relationship between training with employee knowledge in PT. X Muncar Banyuwangi

No.	Training	Level of Fire Preparedness Knowledge						Total		p _s
		Low		Medium		High		n	%	
		n	%	n	%	n	%			
1.	Ever	1	8,3	7	58,3	4	33,3	12	100	0,350
2.	Never	38	48,7	37	47,4	3	3,8	78	100	

Table 2 show that respondents who claimed to have received fire prevention training with medium knowledge level as much as 7 respondents with percentage (58,3%) whereas respondents who stated never received fire prevention training with medium knowledge level 38 respondents with percentage (48,7) %). From the

table can be concluded that the relationship between fire prevention training with the level of knowledge of employees at PT. X Muncar banyuwangi has a moderate relationship because employees who have never conducted fire training have medium knowledge level.

Table 3. Relationship between the working period with the knowledge of employees in PT. X Muncar Banyuwangi

No.	Work Duration	Level of Fire Preparedness Readiness Knowledge						Total		p _s
		Low		Medium		High		N	%	
		N	%	n	%	n	%			
1.	1-5 years old	35	55,6	27	42,9	1	1,6	63	100	0,089
2.	6-10 years old	3	25	7	58,3	2	16,7	12	100	
3.	11-20 years old	2	25	3	37,5	3	37,5	8	100	
4.	>20 years old	1	14,3	1	14,3	5	71,4	7	100	

Table 3 shows that the employment period of 1-5 years and 6-10 years turned out 35 people have a percentage (55.6%) have low knowledge and 7 people with percentage (58.3%) have moderate level of knowledge, the working period of 11-20 years it turns out that 3 people have a percentage (37.5%) with medium and high knowledge have the same number and

service life > 20 years turns 5 people with percentage (71,4%) have high knowledge level. From the table can be concluded that the relationship between the working period of respondents with the level of knowledge in the preparedness of fire prevention in PT. X has a weak relationship because the longer one's working period the knowledge level is good.

Table 4. Relationship between socialization and implementation of fire prevention procedures and preparedness with knowledge of employees at PT. X Muncar Banyuwangi

No.	Socialization and Application of Fire Preparedness Readiness	Level of Fire Preparedness Readiness Knowledge						Total		p _s
		Low		Medium		High		n	%	
		n	%	N	%	n	%			
1.	Yes	4	13,3	20	66,7	6	20	30	100	0,462
2.	No	34	56,7	25	41,7	1	1,7	60	100	

Table 4 indicates that once done the sosialisasi and the application of procedures and readiness of fire prevention was 20 people have percentage (66,7%) with medium knowledge level and employee who claimed has never done sosialisasi and application of procedure and readiness of fire prevention turns out 34 people have percentage (56,7%) with low knowledge level. From the table can be concluded that the relationship between socialization and application of fire prevention procedures and readiness with knowledge of employees at PT. X Muncar Banyuwangi has a moderate relationship because employees who have received socialization have a moderate level of knowledge.

DISCUSSION

a. The relationship between age and employee knowledge in PT. X Muncar Banyuwangi

The results of this study indicate that age with knowledge level has a weak relationship because the older age of employees eat the better the level of knowledge. The existence of relationship between age with employee knowledge about fire prevention preparedness at PT. X Muncar Banyuwangi, because most of the employees who work in the fish canning production is the male sex numbered 82 people and most respondents have high knowledge with age > 45 years. This may be because older ages tend to have more interest or commitment to understanding fire threats than younger ones. Based on the Decree of the Minister of Manpower of the Republic of Indonesia Number KEP.186 / MEN / 1999 on Fire Response Unit in the Workplace² Article 8 paragraph 2, stipulates that to be appointed as fire fighting team must meet the requirements of physical health, minimum age 25 years and maximum 45 years, have a minimum of high school education and have attended basic fire fighting technique course II (Package D).

b. The relationship between training and employee knowledge at PT. X Muncar Banyuwangi

The results of this study indicate that the relationship between fire prevention training training of employees at PT. X Muncar Banyuwangi has a moderate relationship because employees who have never conducted fire training have medium knowledge level. The results of this study is explained that most respondents have not been given training and fire simulation that should the management of PT. X Muncar Banyuwangi provide

training to its employees about fire training that is given such as the use of APAR, fire extinguisher using APAR and evaluate every room in PT. X Muncar Banyuwangi. This means that if management has provided training to employees who work in PT. X whether implemented in the workplace or held by the city government of Banyuwangi, the hope is there is an increase of knowledge and skills to employees of PT. X in the handling of disasters and fires at PT. X Muncar Banyuwangi. Education and training for employees working in fish canning production is not selected on the basis of experience but is shaped and nurtured through training programs that include theoretical education, physical training, fire fighting practices⁷. Based on Per Men PU no. 20 / PRT / M / 2009 Concerning Technical Provisions for Urban Fire Management⁶ that fire education and training should be held at least once in 6 months.

C. The relationship between the working period and the knowledge of employees in PT. X Muncar Banyuwangi

The results of this study indicate that the relationship between the working period of respondents with the level of knowledge in the preparedness of fire prevention in PT. X has a weak relationship because the longer one's working period the knowledge level is good. Employees who have a working period of 1-5 years have a low knowledge of the possibility at the working period of 1-5 years is a lot of employees who graduated from elementary school so that knowledge of the preparedness of fire hazard management do not understand, bathed by the working period > 20 years most employees have high knowledge, most likely high school graduates where in the working group > 20 years of respondents this is a productive age group where they are more active and easy to access information through mass media or internet than those who have a working period 1-5 years who tend to have a sense of responsibility is less and tend to be less lazy and less curiosity and lazy to find the latest information about emergency response of fire hazard. In addition, employees with a working period of > 20 years are likely to have been trained in previous workplace fire hazards as well as those run by government agencies. Working period is one of the factors in labor characteristics that make up behavior⁴. The longer the work period will make the workforce more familiar with the workplace environment conditions and the fire hazards that exist in the workplace. Knowledge can increase because of

the experiences gained in life⁵, in which case experience is gained from the length of the person's labor.

d. The relationship between socialization and implementation of fire prevention procedures and preparedness with knowledge of employees at PT. X Muncar Banyuwangi. The results of this study indicate that the relationship between socialization and application of fire prevention procedures and readiness to the knowledge of employees at PT. X Muncar Banyuwangi has a moderate relationship because employees who never get socialization have low knowledge level. The result of the research is explained that most of respondents stated that there has never been socialization and application of fire preparedness prevention procedures of PT. X Muncar Banyuwangi. From the results of interviews with the management and employees stated there has been no socialization about the preparedness of fire prevention and document review also stated PT. X Muncar Banyuwangi does not have a fire preparedness procedure in all rooms so what if there is fire the employees will be less responsive to fire and the company will suffer big losses. Education and training for firefighters are not selected on the basis of experience but are shaped and nurtured through training programs that include theoretical education, physical training, firefighting practices with a view to improving the quality and capability of both the fire prevention field and in performing the tasks in accordance with their function fire management organizations, enhancing theoretical, conceptual, moral and technical skills of job implementation⁷. The higher a person's education the better his knowledge⁵. Top of Form

c. The relationship between the working period and the knowledge of employees in PT. X Muncar Banyuwangi

The results of this study indicate that the relationship between the working period of respondents with the level of knowledge in the preparedness of fire prevention in PT. X has a weak relationship because the longer one's working period the knowledge level is good. Employees who have a working period of 1-5 years have a low knowledge of the possibility at the working period of 1-5 years is a lot of employees who graduated from elementary school so that knowledge of the preparedness of fire hazard management do not understand, bathed by the working period > 20 years most employees have high knowledge, most likely high school graduates where in the working group > 20 years of respondents this

is a productive age group where they are more active and easy to access information through mass media or internet than those who have a working period 1-5 years who tend to have a sense of responsibility is less and tend to be less lazy and less curiosity and lazy to find the latest information about emergency response of fire hazard. In addition, employees with a working period of > 20 years are likely to have been trained in previous workplace fire hazards as well as those run by government agencies.. Knowledge can increase because of the experiences gained in life⁵, in which case experience is gained from the length of the person's labor.

d. The relationship between socialization and implementation of fire prevention procedures and preparedness with knowledge of employees at PT. X Muncar Banyuwangi

The results of this study indicate that the relationship between socialization and application of fire prevention procedures and readiness to the knowledge of employees at PT. X Muncar Banyuwangi has a moderate relationship because employees who never get socialization have low knowledge level. From the results of interviews with the management and employees stated there has been no socialization about the preparedness of fire prevention and document review also stated PT. X Muncar Banyuwangi does not have a fire preparedness procedure in all rooms so what if there is fire the employees will be less responsive to fire and the company will suffer big losses. Education and training for firefighters are not selected on the basis of experience but are shaped and nurtured through training programs that include theoretical education, physical training, firefighting practices with a view to improving the quality and capability of both the fire prevention field and in performing the tasks in accordance with their function fire management organizations, enhancing theoretical, conceptual, moral and technical skills of job implementation⁷.

CONCLUSION

1. Organization of fire prevention has not been established, fire prevention team has not been established, preparedness handling guidelines have not been prepared, and Human resources K3 not yet available so that not yet fulfill the requirement of Decree of Minister of Manpower RI No. 186 / MEN / 1999

2. Active and passive fire equipment infrastructure equipment

a. Active infrastructure facilities Active fire protection system in building building in production area of PT. X Muncar Banyuwangi not good because there are some components that have not met the standard. In alarm, detector, sprinkler, hydrant still not available at PT. X Muncar Banyuwangi. In the APAR component only the label component of the officer's name performing maintenance on the APAR card or label is not yet available, and there are some rusty and less well-maintained APARs,

b. Passive infrastructure facilities Passive fire protection system in PT. X Muncar Banyuwangi not yet suitable that is not available fire resistant door.

3. The relationship between age and knowledge of employees in the production unit at PT. X Muncar Banyuwangi has a weak relationship because the older the age of employees the better the level of knowledge.
4. The relationship between training and employee knowledge in the production unit at PT. X Muncar Banyuwangi has a moderate relationship because employees who have never conducted fire training have low knowledge level.
5. The relationship between the working period of respondents with the level of knowledge in the preparedness of fire prevention in PT. X has a weak relationship because the longer one's working life the better the level of knowledge.
6. Relationship between socialization and application of fire prevention procedures and readiness with employee knowledge in PT. X Muncar Banyuwangi has a moderate relationship because employees who never get socialization have low knowledge level.

Association between Exclusive Breastfeeding with Health Belief Model in Working Mothers

Mardiana¹, Ave Alyatalaththova Mahabay Aryotochter², Galuh Nita Prameswari¹,
Muhammad Azinar², Lukman Fauzi³, Efa Nugroho²

¹Department of Public Health Nutrition, Public Health Science Study Program, Universitas Negeri Semarang, Indonesia, ²Department of Health Promotion, Public Health Science Study Program, Universitas Negeri Semarang, Indonesia, ³Department of Epidemiology and Biostatistics, Public Health Science Study Program, Universitas Negeri Semarang, Indonesia

ABSTRACT

Exclusive breastfeeding is important thing to do from the mother to the baby since it could decrease infant mortality rate. Exclusive breastfeeding on work place has been arranged in Indonesian Government Regulation No. 33/ 2012. Though the company has provided dedicated room for lactation as supporting factor to the achievement of exclusive breastfeeding, yet it only reach 14.25%. This research has objective to find out factors related with exclusive breast feeding practice by Health Belief Model theory. The research is conducted with cross sectional design. Sample size is 78 working women having baby ages 6-12 months. The sample is obtained by simple random sampling technique. The analysis of data correlation is processed by chi square test ($\alpha=0,05$) and logistic regression. Research result showed that perception ($p=0,036$), parity ($p=0,018$), knowledge ($p=0,017$), socio culture ($p=0,016$), family support ($p=0,006$), direct superior support ($p=0,013$), and nanny role ($p=0,045$) in the relation of exclusive breastfeeding practice on working mother at Garment Company "X". Result of logistic regression indicate direct superior support is the most influenced variable. Low practice of exclusive breast feeding on working mother at Garment Company "X" is influenced by direct superior support factor. Also the factor of perception, parity, knowledge, socio culture, family support and nanny role.

Keywords : *working, mother, lactation, exclusive, breastfeeding*

INTRODUCTION

Based on Indonesia Demography and Health Survey (IDHS) in 2012 indicate infant mortality rate (IMR) is 32 per 1000 life birth. This is quite far from 2015 target which is 23 per 1000 birth life. One effort to decrease the IMR is by exclusive breast feeding. Exclusive breast feeding means giving breast milk to the baby for first six month of life without additional food or other liquid. The percentage of exclusive breast feeding in Indonesia in 2013 is 54.34%, in 2014 it is increased to 60%. And still, far from the target 80%.¹

The government has tried to increase exclusive breast feeding. One of the effort is through health regulation number 33 year 2012. In the regulation mentions that every work place is obligated to provide lactation room. The garment X company has provided it as regulated yet the number of working mother giving exclusive breast feeding is still low, which is only 14.25%.

Rahmawati, research result mentioned that job is one of the reason of exclusive breast feeding failure. The 8 hours work hours become the reason of low intensity of mother-baby meet. Indeed, there has been a 3 ministries joint regulations issued by Ministry of Women Empowerment and Children Protection (48/MEN.PP/XII/2008), Ministry of Workers and Transmigration (PER.27/MEN/XII/2008) and Ministry of Health (1177/MENKES/PB/XII/2008) mentioned breast feeding during work hour at work place.²

Corresponding author:

Mardiana

Departement of Public Health Nutrition, Public Health Science Study Program,

E-mail: mardiana.ikm@mail.unnes.ac.id

Anggraeni, mentioned that there is a difference of exclusive breast feeding based on work status.³ Research by Putri, mentioned that exclusive breast feeding on mother working in factory is less than housewife.⁴ Other research by Hidayanti, found out work place support like lactation room and health attendant suggestion influence exclusive breast feeding by working mother.⁵

The Health Belief Model (HBM) theory can be used to describe behaviour determined factor. It can be used in this research since the practice of exclusive breast feeding is a matter of privacy. The HBM theory says the behavior of one is influenced by the perception or individual belief it self.⁶ Therefore, this research's objective is to find out the factors influencing exclusive breast feeding by HBM theory approach.

MATERIAL AND METHOD

The research is conducted at Garment Company

Table 1. Factors related with Exclusive Breast Feeding Practice of Working Mother at Garment Company "X"

Remark :

* : *chi-square test*

** : *fisher exact test*

"X", located on Bawen, Central Java, Indonesia, in March to April 2016. This research is analitical with cross sectional study . The samples are working mother at Garment Company "X" having infant ages 6-12 months and 78 working mothers are selected by simple random sampling. The data analysis is conducted by two methods which are chi-square test or Fisher Exact Test $\alpha = 0,05$) and logistic regression.

FINDING

HBM theory is the theory of the alter of health behavior and psychological model used to predict health behavior by focusing on perception and individual belief on a disease. The HBM theory is based on an understanding that someone will take any action related with health based on the perception and belief. *Chi-square test* or *fisher exact test* results are as below:

From table 1 can be found that p value on perception variable = 0.036, parity = 0.018, knowledge = 0.017, socio culture = 0.016, nanny role = 0.045, family support = 0.006, direct superior support 0.013, peer support = 1.000 and education = 0.108. Variables with p value < 0.05 are variables having significant relation with exclusive breast feeding practice. On the opposite, variables having p > 0.05 do not related with exclusive breast feeding practice on working mother at Garment Company “X”.

Table 2. Logistic Regression of Exclusive Breast Feeding Practice Research Variables

Variable	Wald	df	p
Education(1)	c	1	.996
Socioculture(1)	.000	1	.996
Family Support(1)	.000	1	.998
Direct Superior Support(1)	4.187	1	.041
Nanny role(1)	.000	1	.999
Constant	.067	1	.796

From Logistic Regression Analysis can be seen that direct superior support variable is the most dominant among all variables. As on table 2, Wald value of the variable is 4.187 which is the highest compare to others. Aligned with the p value 0.041 which is the smallest value compare to others.

Perception is one of the variable that related with exclusive breast feeding practice on working mother at Garment Company “X”(p = 0,036 < 0,05). Mother having poor perception regarding lactation management mostly do not do exclusive breast feeding compare to mother having good perception. Questions asked consist of vulnerable perception, seriousness, advantage, obstacle, and terms and condition to do lactation management and exclusive breast feeding. From the result can be known that respondents perception regarding vulnerability and seriousness of health problem due to do not give exclusive breast feeding obtain lower score compare to other perception. This is caused by the impacts or disadvantages occurred from do not give exclusive breast feeding are indirectly visible. This result is supported by one by Fikawati, Miguel, and Pawenrusi, stated that there is significant relation between mother perception regarding exclusive breast feeding.^{7,8,9} It is also aligned with HBM Theory stated that one behavior is determined by perception owned.⁶

Parity has a significant relation with exclusive breast feeding practice on working mother at Garment

Company “X”(p = 0,018 < 0,05). Mother having child >1 is tend to give exclusive breast feeding than mother having 1 child. The experience of breast feeding on previous birth giving influencing someone to repeat it on the next birth giving.¹⁰ In HBM theory, parity is included in demography variable. Demography is one of the factor influencing someone perception to behave.⁶ Breast feeding experience also become a terms to repeat it on next birth giving, thus it will initiate a mother to give exclusive breast feeding to the baby though she is working by doing lactation management.

Beside the perception and parity, other variable having significant relation with exclusive breast feeding is knowledge (p = 0,017 < 0,05). Most of mothers are less aware the importance of breast milk as baby main nutrition source. Mother only know about exclusive breast feeding, yet does not know and understand correctly regarding lactation management and other things that should be concerned in order to keep giving exclusive breast milk particularly on working mother.¹¹

A behavior is closely related with the local culture. Research result indicates that socio culture has a significant relation with exclusive breast feeding practice on working mother at Garment Company “X”(p = 0,016 < 0,05). Mother having negative socio culture (still rely on belief and tradition regarding breast feeding) does not give exclusive breast milk. On the opposite, mother giving exclusive breast milk is no longer rely on

belief, tradition and myth that can fail exclusive breast feeding such as giving or spreading honey on the lips of new born baby so the baby can talk earlier, giving coffee so the baby do not stiff and feeding banana so the baby gains weight and health.

Other variable having significant relation with exclusive breast feeding is nanny role ($p = 0,045 < 0,05$). The nanny has an important role to replace the mother during work time. Yet many of the nannies are not provide sufficient support to give exclusive breast feeding and do lactation management. The data indicates that mothers having nanny with good role tend to give exclusive breast feeding compare to them having nanny with less role.

A support is one of the factor that can motivate someone to behave. It can be obtained the environment, whether it is family or work place. Family support is significantly related with exclusive breast feeding practice on working mother at Garment Company "X" ($p=0,006 < 0,05$). The respondent said that the most supporting family member in lactation management are husband and mother (the baby's grandmother). Support giving can ignite mother behavior in exclusive breast feeding. It is showed by the research result. Respondents with family support tend to do lactation management and exclusive breast feeding compare to them with less family support.

Beside family support, one from direct superior also related with exclusive breast feeding practice ($p = 0,013 < 0,05$). The data obtained indicate that many direct superior does not give sufficient support the mother to do exclusive breast feeding . This causing many mother do not give exclusive breast milk to the baby. Mother with support tend to do exclusive breast feeding for her baby compare to them with less support from direct superior.

The tolerance and special permission for breast feeding mother to do lactation management like breast milk squeezing within working hour surely will give positive impact on exclusive breast feeding by working mother. Beside, if a sufficient facility is provided on the work place, it will be assisted working mother to do exclusive breast feeding.¹¹ The support from direct superior is cathegorized in sign to act in HBM theory. The support gived can motivate a mother to practice exclusive breast feeding though she is working.⁶

Yet, for peer support statistically does not related with exclusive breast feeding practice ($p = 1,000 > 0,05$). This result is contradictive compare with result of research by Ida and Suyes, stated that one of the factors influencing exclusive breast feeding is peer support.^{12,13} Mother working outside her home will interact more with the people in the work environment. Thus the support from work peer will influence the mother decision to do exclusive breast feeding.¹¹ In HBM theory, peer support also become a sign to act influencing a mother to behave.

Based on the data obtained can be known that tough many work peer support, yet only few mother do exclusive breast feeding practice. This is due to the peer giving the support does not practice lactation management and experience failure in exclusive breast feeding practice. According to behavior theory stated by Bandura which is Social Learning Theory explaining that human behavior is a continuous both side interaction between cognitive, environment and behavior factors. So the behavior to do exclusive breast milk is not only influenced by cognitive factor, but also environment factor. Environment factor in this term is not just a support provided by work peer but much further is the example given by the work peer (modeling). With many case of unpracticing lactation management such as squeezed breast milk and failure to do exclusive breast feeding by friend that viewed as a model or example, are caused the respondents not to do squeezed breast milk and do not give exclusive breast feeding though they got support from their work peer.⁶

Other variable that does not related with exclusive breast feeding practice on working mother at Garment Company "X" is education ($p= 0,108 >0,05$). This result is aligned with Weber and Banu, stated that education does not related with exclusive breast feeding practice.^{14,15} Yet vary with the research by Sholeye, stated that mother education is related with exclusive breast feeding practice.¹⁶

HBM theory categorize education as demography variable that able to influence perception to behave on someone.⁶ But as statistical test result, obtain that there is no relation between education with breast feeding practice on working mother at Garment Company "X". This difference can be occured due to the respondent's education back ground is only reached senior high school. Beside that the information regarding breast milk does not obtained from the school, but from instantion and health attendant. So does on Theory of

Reasoned Action (TRA) which stated that one behavior is influenced by belief, attitude and will, ignoring the education background.

From all variables significantly related with exclusive breast feeding practice, the analysis result of logistic regression stated that variable of direct superior support as the most dominant variable. This is acceptable, since the respondent is the working mother. The work environment is one of the circumstance that able to influence a mother to behave. Work demand and high work load dictate the mother to complete her job. If it does not counterbalance with support from the superior to lactation management, then the mother will have large percentage to fail in exclusive breast feeding practice.

CONCLUSION

The research showed that low practice of exclusive breast feeding on working mother at Garment Company "X" Semarang, Central Java, Indonesia is influenced by some variables. Variables that related with exclusive breast feeding practice are perception, parity, knowledge, socio culture, family support, direct superior support and nanny role. While variables of education and peer support are not related with exclusive breast feeding practice on working mother at Garment Company "X". Result of logistic regression showed that direct superior support is the most dominant variable in this research.

Availability, Accessibility, and Acceptability of Health Services in Remote Indigenous Community of the Baduy Dalam Tribe

Asri Nur Maulidya¹, Dumilah Ayuningtyas¹

¹Health Administration and Policy, Faculty of Public Health, Universitas Indonesia

ABSTRACT

Background: Unequally in rights to health cause a disparity between indigenous communities and people in general, which should be avoidable. The *Baduy Dalam* tribe is one of the indigenous communities in Indonesia that refuses to follow modern developments. The *Baduy Dalam* tribe's strong obedience to their tradition bothersome health workers in delivering modern health services. Availability, accessibility, and acceptability of health services as a base of health service concept and rights to health need to be further analyzed in the *Baduy Dalam* tribe.

Method: This qualitative research uses a Basic Human Rights paradigm approach to obtain in-depth information regarding health services among the *Baduy* community. The method used was in-depth interviews, and informants were chosen using a purposive technique to achieve correct and adequate information for this research. Results were analyzed using a matrix and content analysis to identify the thematic information. To maintain validity, document review and literature review on the subject were conducted.

Results: Utilization of available healthcare facility majorly affected by community acceptance. Mobile health services can't be conducted without the community leader's permit and acceptance. There's an urgent need to do strategic approach to increase the community acceptance using sensitive cultural approach. Attention and effort from multi-sectoral governments are very low.

Conclusions: Healthcare services to the *Baduy Dalam* community is not performed well as there are various obstacles in the availability, accessibility, and acceptability of modern healthcare services in The *Baduy Dalam* community.

Keywords: Primary Healthcare services; indigenous communities; availability; accessibility; acceptability

INTRODUCTION

There are approximately 370 million indigenous communities spread across 90 countries around the world. The total population of indigenous communities makes up 5% of the world population.¹ In Indonesia there are 231,268 families in remote indigenous communities. A regulation from the Indonesian government defines remote indigenous communities as

a group of individuals attached as a unit, geographically, economically, and/or by social culture, and poor, remote, and/or fragile social economy.² On the other hand, the UN categorizes indigenous community such as a group of people with their own social structures such as pre-colonial communities, those who profess to being an indigenous community, have strong ties to an area or the surrounding environment, form a minority, have specific culture and language, and protects the culture of the ancestors.³

Dumilah Ayuningtyas

email: dumilah.ayuningtyas@gmail.com;

Currently, indigenous communities in developing and in developed countries are a marginal group with minimal access to basic healthcare and poor health

conditions compared to the general population.⁴ As well as traditional knowledge and sustainable practices that are invaluable resources for human development. However, indigenous people remain on the margins of society in high, middle and low-income countries, and they bear a disproportionate burden of poverty, disease, and mortality compared to the general population. These inequalities have persisted, and in some countries have even worsened, despite the overall improvements in health indicators in relation to the 15-year push to meet the Millennium Development Goals. As we enter the Sustainable Development Goals “(SDGs)” Indigenous communities are located far away from basic healthcare services, placing them at higher health risks to reach healthcare facilities in time of urgent need. Moreover, unreachable modern healthcare services put them in a condition where traditional medicine is their only alternative to cure their illnesses.⁵

Unequal health status between the indigenous communities and the general population is an unacceptable condition because it can be prevented by government’s policy. This condition is a matter of concern to healthcare service providers in all countries as they have responsible in providing equal services for all. Provision of equal healthcare services to indigenous communities to fulfill their rights to healthcare is part of providing their basic human rights.⁶ Availability, accessibility, and acceptability are three components that have strong connections and are the bases for providing rights to healthcare. In addition, they are often used in various healthcare research for susceptible communities such as the disabled communities, indigenous communities, and other minority groups as they focus on equal healthcare rights and reflect a balance between characteristics and expectation of healthcare providers and receivers.⁶⁻⁸

There is an indigenous community in Indonesia that refuses to live using technology and limits themselves from the changing modern society, it is the *Baduy* Tribe which divided into two – *Baduy Luar* (outer *Baduy*); and *Baduy Dalam* (inner *Baduy*). The difference is that *Baduy Luar* has been exposed to modern lifestyle, whereas the *Baduy Dalam* still follows a traditional lifestyle such as not using electricity, electronic devices, and vehicles. Till today, the *Baduy Dalam* travel by foot even though they need to travel far distances.⁹

The *Baduy Dalam* Community is known for their

determination to follow traditions. There are traditional laws, “*lojor teu meunang dipotong, pondok teu meunang disambung*” which translates to “long cannot be cut and short may not be joined”. This means that all things may not be added or removed. That law has become a consideration of healthcare personnel in delivering services to the community.^{11,12}

In several studies about availability of healthcare service in indigenous communities recommend to provide services that incorporate the community perspectives on modern medicine and adjusted to their condition which would then increase its acceptance by the community.^{5,13} Based on Ipa (2014), healthcare services for the *Baduy Dalam* community should not be provided using the same model for other general communities. Adjustments to certain characteristics and conditions of the *Baduy Dalam* community are needed so they may be used and accessed healthcare services. As a country with big cultural diversity, Indonesia government has a lot of things to be considered to make health services equitable. Further analysis is required to identify the condition of health service for *Baduy Dalam* community using health rights paradigm from the availability, accessibility, and acceptability aspects.

METHOD

This is a qualitative study aimed at obtaining in-depth information on the provision of healthcare services to the *Baduy Dalam* community. Information was obtained by in-depth interview using in-depth interview guide. Respondents chosen by purposive technique were “one” representative from Lebak District Health Department, Head of Cisimeut CPHC, a nurse from Cisimeut CPHC, a Midwife coordinator at Cisimeut CPHC and as a pioneer of modern healthcare services for *Baduy* Tribe (*Baduy Luar* dan *Baduy Dalam*), Kanekes Village Midwife. Two healthcare personnels (a nurse and a midwife coordinator) from Cirinten CPHC were chosen because of its location near the *Baduy Dalam*’s exit gate in Cijahe and also they have close relation and good information about *Baduy Dalam* Tribe. Another respondent chosen by snow ball techniques were Kanekes Village Officer, three Kanekes Village Health Cadres, two persons from two humanitarian non-government organization, and three persons from inside and out *Baduy Dalam* Community. The interviews were written in the form of a transcript then simplified into a matrix. Thematic content analysis was performed to

obtain in-depth information regarding the availability, accessibility, and acceptability of healthcare services by *Baduy Dalam* community. To maintain data validity, data and information obtained from informants were compared, and document review and literature review of associated topics were performed.

RESULTS

Availability

All approach to make health service available for the tribe, such as mobile health service, additional health workers, and a transit-birth house didn't go well because of community's acceptance and healthcare workers' skill in approaching the community.

Cisimeut CPHC doesn't have special approach or strategy to build good relationship with the community and they feel helpless in delivering health services to the community. The Health Department in Lebak District already give all authority to Cisimeut CPHC to deliver health service, but their attention to monitor and evaluate how health services delivered to *Baduy Dalam* community is very low. Without intensive attention, help, and supervision from The Health Department district, Cisimeut CPHC performance will be the same. Even healthcare service is available for the *Baduy Dalam* tribe, leader's permit and community's belief play a major role on acceptability of modern healthcare services.

Even the health service was available and adapted to indigenous' characteristic, birthing house which built by Constitution of Mexico wasn't utilized by their indigenous community. Constitution of Mexico was built traditional birthing house where traditional birth attendance can help indigenous mother under supervision of professional birth attendance. But, the house wasn't utilize by their indigenous community because of indigenous' trust and comfort issues so the indigenous community prefer to deliver their babies in their own house.¹⁴ Before provide a health service for indigenous, it's important to maintain a good relation and trust between health provider and indigenous community. Without indigenous community acceptance, available health service won't utilize well.

Accessibility

Communication as an important aspect in health access also have big influence in delivering healthcare

services. Interviewed healthcare personnel said that they have difficulty in communicating with the *Baduy Dalam* community. It's not caused by the language, but it is because the *Baduy Dalam* community have different perspective about health and have low understanding about their own compliant and health needs which always confused the healthcare personnel as stated below.

“Communicating with them is very... very hard... we have to bring someone who have close relation with them such health cadres from The *Baduy Luar* community, so they will feel ease to communicate with us” (KP)

“When they visited me, they just sat... stayed quiet and and didn't say anything. Just quiet. So at the moment, I knew that I have to be very proactive in communicating with them, ask them why and what they want... sometimes after I asked them, they hardly to communicate what they want because of their lack understanding about their own health condition...” (BD-3)

With poor health seeking behavior of The *Baduy Dalam* community, the healthcare personnel shouldn't have to wait passively until The *Baduy Dalam* community come and ask for help. To reach the *Baduy Dalam* area, walk by foot is the only way that healthcare personnel can do. the travel time into The *Baduy Dalam* area from Cisimeut CPHC is about 3-4 hours by walk. Even the distance between Cisimeut CPHC and the *Baduy Dalam* area is about 8 Km, the healthcare personnel must pass a small pathway through hills and valleys. Besides that, the *Baduy Dalam* community mostly work in their field located far from *Baduy Dalam* area. That condition makes the healthcare personnel difficult to meet them, especially when they have to conducted a sweeping activity to do an examination and treatment for neglected disease such Yaws which still exist in the *Baduy* tribe.

Some informants were said even the *Baduy Dalam*'s priority to treat their illness were using traditional medicine and spiritual ceremony, few people from the community needs help from healthcare personnel. They started to need help from healthcare personnel because traditional medicine they always use didn't heal their illness. Some informants were said that they are afraid to go to health clinic or CPHC because they don't have enough money to pay the bills. The village officer said majority of the *Baduy Dalam* community haven't

covered from national health insurance. The Village officer said it was a dilemma for them to registered all the Kanekes Village citizen categorized as a poor and in need of National Healthcare Insurance so they can access healthcare service freely because it will raise poverty degree and cause another trouble in the village. Also, there's no specific regulation to protect the indigenous community from *out-of-pocket* health expense. Lack of attention and poor coordination between governments blocking community's opportunity to improve their life quality and it could be assumed as right to health violation that happen systematically.

One of the indigenous in Indonesia, *Orang Rimba* Tribe, live nomadic inside South Sumatera Forest had accept modern health service. The head of District Health Departments was working with other sectors to deliver regular healthcare services. Cultural approach as their main strategy results in good relationships between the government, healthcare personnel, and The *Orang Rimba* tribe while increase the tribe's health degree. Without direct support, synergy, and involvement of multi-departments, healthcare service innovation for indigenous community will not have a good impact.¹⁶

Acceptability

Acceptability of healthcare services is a combination of value as reflected by someone's ability to accept the services based on perception, experience, and response towards the services and highly associated with the social culture of an individual.¹⁷ The *Baduy Dalam* community known with their strong obedience to their culture and their leader's decisions. Based on in-depth interview, respondent from non-government organization said if there's something emergency cases related to health, the community couldn't make decision by themselves, they have to ask the leader's solution. If the community leader decides something that not in line with medical treatment, the community will still follow the leader's decision even it can threaten their life.

From in-depth interview, birthing assistance by professional healthcare is forbidden for the community. The women have to give birth without any assistance and traditional healer should come after the baby was born to cut the placenta. The community believe that blood released during childbirth can cause a disease especially for kids and men. But in 2000, one of the *Baduy* tribe leaders requested a village midwife to assist his daughter.

Because of the distances, the baby was already born when she arrived. After that, there's no request from the *Baduy Dalam* community to the midwife village.

Other restrictions related to modern healthcare are using family planning, immunization, antenatal care and postnatal care. For the community, family planning regarded as an act of refusal god's blessed and contrary to the culture their belief.^{11,18} The healthcare personnel said that the community believe that immunization doesn't prevent a disease but instead bring a new disease for healthy body. The community have a restriction on the use tools made of metals. That's why they refuse medication through injection.

Lack of culturally sensitive approach from healthcare personnel, make healthcare services remain strange and taboo for the *Baduy Dalam* community. One of the informants said, if there's any regular mobile healthcare services conducted in the *Baduy Dalam* area, although the healthcare services are just basic examination such as weighting and height measurement, these things will be considered as a threat and can contaminate the purity of their culture. Lack of healthcare personnel understanding about the community's culture had increase the community's discomfort. Discrimination and bullying experience brought by healthcare personnel lack knowledge about indigenous culture could increase indigenous refusal of modern healthcare services and widens communication gap between healthcare personnel and indigenous community. In New Zealand, cultural safety approach was developed and trusted as an innovation to minimize communication gap between healthcare personnel with indigenous community.^{19,20}

CONCLUSIONS

Healthcare services for the *Baduy Dalam* community mostly affected by their acceptance on modern healthcare services. Even though the healthcare services are available, it will not be utilized well when the community has low acceptance. Healthcare service access such communication, distances, and protection from financial hardship is in complicated condition and need a lot of attention from multi-sectoral governments. Before providing available healthcare service that also accessible for the community, the governments must do strategic safety cultural approach to increase community's acceptability.

The Effectiveness of Applying Score System in Growth Chart to Predict Stunting and Improve Nutritional Knowledge of Pre-Schoolers' Mother in Indonesia.

Haripin Togap Sinaga¹, Abdul Hadi², Alfridsyah², Ichsan², Nelson Tanjung³

¹Nutrition School, Polytechnic of Health, Republic of Indonesia, Medan. Negara Street, No. 1 Lubuk Pakam City, Deli Serdang District, ²Nutrition School, Polytechnic of Health, Republic of Indonesia Aceh. Soekarno-Hatta Street, Lampeunerut, Aceh Besar District, ³Environmental Health School, Polytechnic of Health, Republic of Indonesia. Kapten Selamat Ketaren Street, Kaban Jahe City-Karo District

ABSTRACT

Background: A growth chart is widely used to monitor child growth, but not to predict stunting. Therefore, there is a high need to create a more simple growth chart. The study aimed to find out the effectiveness of the application score system in growth chart in predicting stunting and improving mothers knowledge.

Materials and Method: This study was a quasi experimental study. A total of 533 pre-schoolers aged 4-5 years old and 110 mothers were selected from forty kindergarten schools in Deli Serdang and Aceh Besar District. Twelve field workers were trained to conduct height measurements using the score growth chart and teaching mothers on nutrition. Data on height status was presented in six classifications. Chi-Square test was performed to test the difference of mother's knowledge before and after intervention.

Findings: Of the total 533 pre-schoolers, 22.5% were stunted and 33.1% children had been predicted to be stunted. After intervention, mothers in the intervention group were three and half times more likely to have better knowledge than mothers in the control group (85.2% vs 56.6%) and Relative Risk : 3.5 (1.5-6.5)

Conclusions: Application of the score system in growth chart was practicable in predicting stunting and improving maternal knowledge. It needs to consider applying the wall score growth chart in nutritional survey. Children under-five year old need to involve in further studies.

Keywords: Score system, Growth Chart, Stunting, Pre-schooler, Nutritional Knowledge

BACKGROUND

Stunting is defined low-length-or height-for-age below two of standard deviation of the World Health Organization standard .^[1] Globally, the prevalence of stunting prevalence is improving. It has resulted in being an identified as a major global health priority.^[2] In sub-Saharan countries have the higher prevalence than Southeast Asian countries, 40% and <30%.^[3] WHO reported that since 1996-2010 there was not meaningful decreasing of stunted children all over the developing countries.^[4] In Indonesia, since 2007 until 2013 the stunting prevalence has remained stagnant at 35.0% to 37.0%. It is because children with height for age between <-2 to -1 standard deviation were not targeted in the nutrition intervention program. Meanwhile, WHO

stated that stunting prevalence has to decrease < 20.0%.^[5,6]

A growth chart is widely used as a nutrition education tool for parents to monitor their child growth including to detect stunting. However, most mothers found it difficult to interpret the child growth on the chart. Roberfroid found that 40%-70% mothers in Asia, Africa and Latin America had low understanding in interpreting their child growth.^[7,8] In Indonesia, not more than 34.0% mothers understood the function growth chart.^[9] Therefore, there is a high need to create a more simple and communicative growth chart to be easily understood by parents.^[10] Recently, more than 200 kinds of modifying growth charts created in eighty countries^[11,12] to allow parents have a better understanding of

early growth patterns. Several studies had found that good understanding of growth chart was effectively decreasing stunting.^[13,14]

In this study, we used score growth chart as the main media to detect and predict stunting and in teaching mothers on child nutrition. Scores 5, 6, 7, 8, 9 and 10 were applied in interpreting the nutritional status of children. This modified growth chart had been tested and resulted high sensitivity (91.0%) and specificity (92.0%).^[15]

The ideas of applying numbers emerged from several public health studies that applied percents and scores in motivating clients to do positive activities.^[16-18] This study aimed to find out the effectiveness of score growth chart to predict stunting and improve mothers nutritional knowledge.

MATERIAL AND METHOD

Study Design

This study was a quasi experimental study conducted in twenty kindergarten schools in urban areas of two districts that purposefully selected from two provinces; ten schools in Deli Serdang of North Sumatera Province as intervention location and ten schools in Aceh Besar of Aceh Province as control study. The prevalence of stunting in Deli Serdang and Aceh Besar was comparable, 24.4% and 26.4%, respectively.^[19,20]

Participants

a. Preschoolers

A total of 533 pre-schoolers aged 4-5 years old were selected from forty kindergarten schools; 265 children in Deli Serdang and 268 students in Aceh Besar. Selection of schools based on the number of students, school performance, the ratio of teacher and student and school health program.

b. Mothers

The number of mothers were determined by sample size calculation. We calculated the sample size keeping in view, there would be a 30% improvement of nutritional knowledge after intervention and adding 10% for drop-out possibility, using this formula;^[21]

Materials

Score Wall Growth Chart

Score growth chart is a modified growth chart. It is made from a thick plastic material with the size 150 cm x 200 cm. The horizontal lines show the height in cm (0-130 cm) and vertical lines show the child's age in months. Score 5, 6, 7, 8, 9 and 10 are placed on the left side.

These scores imply six classifications of height status: 1) Score 5 (HAZ <-3SD) = Severely Stunting. 2) Score 6 (HAZ ≤-3 to -2SD) = Stunting, 3) Score 7 (HAZ ≤-2 to -1 SD) = Tend to be Stunting. 4) Score 8 = Normal (HAZ 0 to +1SD), 5) Score 9 (HAZ +1 to +2SD) = Tall and 6) Score 10 (HAZ +2 to +3SD) = Very Tall.

Taking height measurement

The measurements were taken individually and collectively. See fig.1 and 2. Prior to taking the measurement, child's age had to put into groups. Measurement was started by positioning the child in front of the wall chart, calculated the height and determine nutritional status. The mother was asked to observe and to record child height and status.

Data collection

There were four steps data collection implemented in this study. Step one was collecting data on the height measurement of 533 pre-schoolers in forty kindergarten schools. Three field workers were responsible to take the measurements. Data on child height, scores and nutritional status of each child were recorded by enumerators. Step two was collecting data on respondents' economic characteristics and nutritional knowledge. A pretested structured questionnaire was administered to obtain information on socioeconomic profile, child age, weight, length and sex, parents education and occupation. Step three was conducting a nutrition education class. Mothers in the intervention group were taught on child growth and healthy food. Mothers were presented with five topics; 1) Function of the growth chart 2) Function of scores 3) Normal height gain 4) Interpreting growth scores 5) nutrition status. While in mothers control group were encouraged to weigh their children regularly and providing healthy breakfast and step four was re-collecting data on mother's knowledge.

Data Analysis

Data on height status of 533 pre-schoolers was presented was presented in distribution frequency table. Based on the mean scores of twenty questions used to categorize the level of knowledge. It was divided into two categories; high knowledge and low knowledge. Statistical calculation used was T-test and Chi-Square test. The significance level was determined by the *p*-values.

RESULTS

Table 1. Socioeconomic characteristics of respondents, by location of study

Socio-economic characteristics	Deli Serdang, n=265		Aceh Besar, n=268		p-value
	n(%)	Mean±SD	n(%)	Mean±SD

Others	9(3.4)		14(5.2)		

Table 2. Scores and Height Status of Preschoolers, by Location of Study

Score and Height Status	Location of study				TOTAL N=533	
	Deli Serdang, n= 265		Aceh Besar, n=268			
	n	%	n	%	n	%
5 = Severely stunting	10	3.8	18	6.7	28	5.2
6 = Stunting	33	12.4	59	22.0	92	17.3
7= Tend to be stunting	77	29.0	90	33.6	167	31.3
8 = Normal	119	45.0	83	31.0	202	37.8
9 = Tall	20	7.5	14	5.2	34	6.7
10= Very Tall	6	2.3	4	1.5	10	1.9

Table 1 shows the four characteristic variables of pre-schoolers and six characteristic variables of parents. Sexual types, birth weight, birth length and current age of children in the two locations of the study were comparable ($p>0.00$). The mean of birth weight and length of children in two locations of the study was normal; 3.2 ± 0.38 vs 3.2 ± 0.45 and 48.2 ± 1.9 vs 48.0 ± 1.6 respectively. None of the characteristics of parents were significantly different ($p>0.00$), even though mothers age in Deli Serdang was relatively younger than in Aceh

(26.8 ± 4.44 vs 28.9 ± 4.59) and more high education parents in Aceh than Deli Serdang (80.9% vs 74.5%).

As presented in Table 2. Of 533 pre-schoolers, 22.5% were stunted. Almost one third (31.3%) of children tended to be stunted. In terms of location, number of stunting children in Aceh Besar was almost double than in Deli Serdang (28.7% vs 16.2%), while the number of tall children were more in Deli Serdang than in Aceh Besar (9.8% vs 6.7%).

Table 3. Level of Mother's Knowledge Before and After Intervention

Level of knowledge	Before				<i>p-value</i>	After				<i>p-value</i>	Relative risk
	Intervention group, n=54		Control group, n=53			Intervention group, n=50		Control group, n=50			
	n	%	n	%		n	%	n	%		
High knowledge	30	55.5	28	52.8	0.58	42	85.2	30	56.6	0.00	3.5(1.5-6.5)
Low knowledge	24	44.5	25	47.2		8	14.8	20	43.4		

Before intervention, the nutritional knowledge in both groups were comparable. However, after intervention there was significantly changing. Table 3 shows, before intervention the proportion of high knowledge between intervention and control group was comparable (55.5% vs 44.5%; $p = 0.58$). After intervention, the high knowledge improved by 29.7% in intervention group and 3.8% in control group. Mothers in the intervention group were three and half times more likely to have better knowledge (RR = 3.5 (1.5-6.5) and $p = .00$)

FINDINGS

The present study proved that using score growth chart detected 22.5% stunted children and predicted 31.3% “tend to be stunted” children with HAZ >-1 to -2SD.

Assuming that half of those “tend to be stunted” children (15.7%) will be really stunted, therefore in the next round survey the prevalence of stunting could be in the range of 22.5% to 38.0%. The underlying reasons were because in most of nutritional surveys, parents were never well-informed on their child’s nutritional status. Most parents overestimated to their child nutritional status. [22-24] and restricted to get food make the children to have a risk to be malnutrition.[25]. The consequences the prevalence of stunting to be stagnated. This condition had happened in Indonesia. Since 2010 till 2016 prevalence of stunting stagnated at 35.0-37.0%. [5,6] and the coverage of food supplementary, exclusive breastfeeding and growth chart belonging was very low, 36.8%, 29.5% and 34.0%, respectively.[26]

These findings in line with the situation in other developing countries. de Onis et.al, found than by the year 2005-2010 stunting among pre-school children in Africa regions had stagnated at 38.8-38.2% and slightly decrease from 37.6% to 37.1% .[4] In sub-Saharan and Southeast Asia countries, the prevalence of stunting stagnated at 30%-40%, in Eastern Ethiopia 45.8%. [3,27] Lutter CK., et al (2011) also reported that only 36% of children in developing countries had exclusive breastfeeding and around half (~50%) poor meal practices.[28]

This study found that wall score growth chart was efficient as nutrition education media. Scoring system made it easier for mothers to interpret child growth. Involving mothers in taking child height measurements

and to do plotting in the chart were potential parts in nutrition education session. This results in a line with several studies who used a modified growth chart to improve maternal knowledge.[12,16], and the application of scores in health activities.[17,18] However, the economic and education level of participants might have played important role in these achievements.

The implication of this finding was in the next anthropometry survey, it needs to presents specifically the prevalence of children with HAZ >-1 to -2SD status and targeting them into nutritional intervention.

The primary strength of this study was the ability to prove the causes of stagnated stunting prevalence. The main limitation of the study was the sample. This study focused only the pre-schooler age and low number of mothers. Further study needs to cover the under-five year children and to include fathers in nutrition education session.

Figure 1. Taking height measurement individually

Figure 2. Taking height measurement collectively

CONCLUSION

The tracking of an individual child height-for-age z-scores on growth curve is an important indicator for

assessing stunting. This study found that the HAZ-1 to -2SD status is a useful indicator for predicting stunting children. Application of the score system in growth chart was effectively detecting and predicting stunting and improving mothers' knowledge of child growth.

Acknowledgement: We are extremely grateful to the Ministry of Health for financial support. We also thanked to the Chairman of HIMPAUDI in Deli Serdang and Aceh Besar for providing assistances. Thanks to Ms. Mincu Manalu from Poltekkes Medan and Mr. Rolando, Zulfan and Deddy from Poltekkes Aceh for the technical support in the field work.

Conflicts of Interest: We declare that there are no conflicts of interest in this study

Ethical Clearance: The ethical clearance was taken from the Ethics Board, Polytechnic of Health Medan

The Relationship between Hypermobility Syndrome and Systemic Lupus Erythematosus

Mohammed H. Al-Osami¹, Sarah Mohammed², Waleed Ibraheem Ali³, Hayder Adnan Fawzi⁴

¹Assistant Professor, College of Medicine, University of Baghdad, Baghdad, Iraq, ²Baghdad Teaching Hospital, Ministry of Health, Baghdad, Iraq, ³Instructor Lecturers in Department of Medicine, College of Medicine, University of Baghdad, Baghdad, Iraq, ⁴Baghdad Teaching Hospital, Clinical Pharmacy Department, Ministry of Health, Baghdad, Iraq

ABSTRACT

Objectives: investigate joint laxity in patients with systemic lupus erythematosus (SLE).

Patients and Method: case-control study involved 53 patients with SLE; disease activity for SLE assessed with the SLE Disease Activity Index (SLEDAI). Case histories and personal information assessed: age, SLE disease duration, body mass index (BMI), all subjects screened for hypermobility syndrome according to criteria of Beighton for joint hypermobility (total score 4 or more).

Results: Twenty-eight (52.8%) of the patients SLE had hypermobility compared to 31 (47.7%) of the control group. There is a slight increase in the risk of hypermobility in SLE patients compared to control the OR (95%CI): 1.229 (0.594-2.540). Considering joints complain Elbow pain was significantly higher in SLE patients compared to control. However, the rest (back, knee, and shoulder) showed no statistical difference between SLE and control. In SLE patients lower BMI associated significantly with hypermobility. There was a weak inverse relationship between hypermobility and age. There was no significant association in systemic lupus erythematosus patients between hypermobility with Anti- dsDNA, ANA, C₃ and C₄, but longer duration of disease and higher disease activity (SLEDAI) associated weakly with hypermobility.

Conclusion: SLE patients had a similar probability of having hypermobility compared to control, hypermobility increase with increasing immunological markers and with lower age and BMI, disease activity and ESR weakly increase the risk of hypermobility in SLE patients. Elbow joint pain associated with hypermobility in SLE compared to control while no such relationship found with back, knee and shoulder pain.

Keywords: SLE, Hypermobility, disease activity index, joint pain, disease activity

INTRODUCTION

SLE is a prototypic autoimmune disease characterised by multisystem involvement and the production of an array of autoantibodies. Clinical features in individual patients are highly variable, ranging from skin and joint involvement to organ- and life-threatening disease. SLE

is typically associated with a waxing and waning clinical course, but some patients have continuous disease activity⁽¹⁾. Systemic lupus erythematosus primarily is a disease of young women, with a peak incidence between the ages of 15 and 40 and a female: male ratio of 6 – 10: 1. The age at onset, however, can range from infancy to advanced age; in both pediatric- and older-onset patients, the female: male ratio is approximately 2:1⁽²⁾. The reported prevalence of SLE in the general population is approximately 20 to 150 cases per 100,000 persons⁽³⁾. In Iraq, the prevalence of SLE was estimated to be one case per 1867 of the population, one per 1127 of the total female population and for women aged between 10 and

49 years it was one per 616⁽⁴⁾.

Benign joint hypermobility syndrome (BJHS) is a heritable disorder associated with laxity and pain in multiple joints⁽⁵⁾. It found in chromosomal and genetic disorders such as Down syndrome and metabolic disorders such as homocystinuria and hyperlysinemia⁽⁶⁾. Benign hypermobility syndrome may present with joint dislocation and subluxation, arthralgia, arthritis, tendonitis, tenosynovitis, damaged ligaments and ligamentous attachments and fractures. BJHS can also involve other organ systems resulting in other collagen-related disorders⁽⁷⁾. Benign Joint hypermobility syndrome (BJHS) is very common in musculoskeletal disease clinics, but the diagnosis often missed, and the actual prevalence of JHS is not known⁽⁸⁾. In general, women have greater joint laxity than men⁽⁹⁾. In Iraq, the prevalence of joint hypermobility among university students determined from a survey made in 1981 in 25.4% of males and 38.5% of females⁽¹⁰⁾.

METHOD

Study design: a case-control study conducted at the Rheumatology Unit Department of Medicine in Baghdad Teaching Hospital from September 2016 to May 2017.

Sample selection: a total of 106 subjects enrolled in the study, 53 of them diagnosed as SLE, met the revised American College of Rheumatology (ACR) classification criteria⁽¹¹⁾, and 53 were controls age between (18-50). The degrees of joint hypermobility in both groups recorded according to Beighton method for all participants in the two groups. Participants who recorded 4 or more scores were considered hypermobile⁽¹²⁾. Hypermobility measured without blinding; patients excluded if they suspected of having Marfan or Ehler-Danlos syndromes—namely, the presence of a marfanoid habitus, dermal extensibility, and cutaneous scarring. Patients with renal failure and on haemodialysis excluded.

Data collection: All patients reviewed for age, gender, occupation, educational status, body mass index (BMI), SLE disease duration, data related to main disease

manifestations and other related features to BJHS. Disease activity for SLE assessed with the SLE Disease Activity Index (SLEDAI)⁽¹³⁾. Sociodemographic data and medications recorded.

Laboratory measurement: 1) Blood investigations measured in the form of haemoglobin, white blood cells (total and differential count), platelets, blood urea, serum creatinine, serum GPT, serum GOT, antinuclear antibodies, anti-double stranded-DNA (anti-ds-DNA) antibodies, and complements components. 2) Urine examination is done for the measurement of protein, white blood cells, red blood cells and cellular casts.

Ethical approval and signed consent: Ethical approval was taken from the medical department in Baghdad teaching hospital and college of medicine. Informed written consent was taken from the individuals for admission in the study.

Statistical analysis: chi-square test or Fisher exact test (used instead of chi-square for a 2x2 table, if total sample <20 and if 2 or more with an expected frequency is less than 5) used to analyse the discrete variable between 2 groups. Two samples t-test used to analyse the differences in means between two groups (if both follow a normal distribution with no significant outlier). Binary logistic regression analysis used to calculate the odds ratio (OR) and their 95% confidence intervals, when the outcome can categorise into two binary levels. SPSS 20.0.0 software package used to make the statistical analysis, p-value considered when appropriate to be significant if less than 0.05

RESULTS

All the patients and control in this study were females with mean age of SLE patients 33.0 ± 10.1 years and 31.0 ± 9.9 years for control, 26.6 ± 5.3 kg/m² was the BMI for control and 26.7 ± 6.2 kg/m² for SLE patients, the rest of the data explained in table 1. There was no significant difference between a patient with SLE and control in age, sex (all patients and control were female), weight, height and BMI, as illustrated in table 1.

Table 1: Demographic and clinical characteristics of patients and controls

Variables	Controls	SLE	P value
Number	65	53	-
Age (years), mean \pm SD	33.0 \pm 10.1	31.0 \pm 9.9	0.277
Sex			-
Female	65 (100%)	53 (100%)	
Weight, mean \pm SD	67.9 \pm 14.9	67.4 \pm 15.7	0.862
Height, mean \pm SD	159.6 \pm 6.4	157.2 \pm 15.3	0.249

DISCUSSION

In the current study, 52.8% of the systemic lupus erythematosus patients had Beighton score ≥ 4 while 47.7% of the matched control had Beighton score ≥ 4 , and those joints classified as hypermobile. The current study aimed to the possible correlation between systemic

lupus erythematosus and hypermobility joint in a case-control study. The results of the current study was in agreement with previous studies in which there was no significant difference in the rate of hypermobility between systemic lupus erythematosus patients compared to matched control, initial study by Klemp et al. [1] reported 7% vs 6% hypermobility between

systemic lupus erythematosus and control respectively; and in their study [1] the frequency of hypermobility in both systemic lupus erythematosus and control was lower than our, also in another study [2] the frequency of hypermobility 23% vs 27% in SLE vs control which also was similar to our finding of no association between systemic lupus erythematosus and hypermobility. These difference in the rate of hypermobility among studies and compare to the current study caused by the different methodology in each study.

In systemic lupus erythematosus patients, there was no significant difference between patients with Beighton score ≥ 4 with those < 4 in age, and disease duration which is similar to the findings of Klemp et al. ⁽¹⁴⁾, indicating both these variables did not affect increasing or decreasing the frequency of hypermobility in SLE patients.

Back, knee and shoulder joint complain statistically not significant between systemic lupus erythematosus and control, while in Gumà et al. ⁽¹⁵⁾ more than 80% of systemic lupus erythematosus patients had musculoskeletal symptoms which they attributed this high rate of symptom to SLE disease activity and less came from hypermobility; while in the current study both groups had a low rate of such joint involvement in both control and SLE and more large sample size are needed, or our patients had low disease activity or in remission ⁽¹⁵⁾.

Systemic lupus erythematosus patients presented with the generalised tendinous condition, especially those present with atlantoaxial subluxation, Jaccoud's arthropathy, and tendinitis. In a study ⁽¹⁵⁾ the authors reported that half of their SLE patients had localised hand hypermobility, and they also reported the most frequent manifestations were distal interphalangeal joint laxity and wrist instability ⁽¹⁵⁾.

In the current study no significant association in systemic lupus erythematosus patients between hypermobility with dsDNA, ANA, C₃ and C₄ (using univariate binary logistic regression analysis to predict the association) which in agreement with Gumà et al. ⁽¹⁵⁾ of no association between hypermobility with immunological, clinical and analytical features of SLE.

In the current, there was a weak inverse relationship between hypermobility and age (odds ratio = 0.952, i.e. for each year the patient younger there is 4.8% increased

probability of having hypermobility) which is similar to the previous study of increased hypermobility in younger age ⁽¹⁶⁾ and decreased slowly with ageing. In the current study we could not assess the relationship between gender and hypermobility since all our patients are females which is a possible bias of neglecting males, however, the rationale for this that female had a higher prevalence in SLE patients and also female had a higher rate of hypermobility; so we exclude male from seeing the effect of hypermobility of female SLE patients they are born to higher possible risk for both conditions ⁽¹⁶⁾.

In the current study the effect of BMI was similar between SLE and control ($p = 0.972$), however within the SLE patients there was inverse correlation between BMI and hypermobility (OR=0.914, $p = 0.037$) indicating the lower the BMI the higher probability of having hypermobility (1 unite increase in BMI there is 8.6% increased probability of having hypermobility), no study in the literature study the effect of BMI on hypermobility in SLE patient founded, and this the first reported observation about this correlation.

There is a slight increase (i.e. non-significant) in the association between disease activity of SLE and hypermobility (odds ratio = 1.016) indicating the higher the disease activity, the higher the probability (by 1.6% for each unit increase in disease activity) of having hypermobility. In the current study only elbow joint was significantly higher in SLE patients compared to control, no current explanation why the only elbow was significantly higher in SLE compared to control while other joint did not, which could be caused by low sample size that affects the power of detection of this, further studies are required to elucidate this relationship.

CONCLUSION

Systemic lupus erythematosus patients had similar probability of having hypermobility compare to control, hypermobility increase with increasing immunological markers, hypermobility increase with decreasing age and BMI, disease activity and ESR weakly increase the risk of hypermobility in SLE patients, and Elbow joint complains associated with hypermobility in SLE compared to control while no such relationship found with back, knee and shoulder pain.

Mapping the Model of Ecological Vegetation as Potential Malaria Habitats in a Malaria-Endemic Region in Oesao Village, Kupang Regency, Indonesia

Ragu Harming Kristina¹, Sri Subekti², Yoes P. Dachlan³, Santi Martini⁴, Heru Santoso Wahito Nugroho⁵

¹Faculty of Public Health, Airlangga University / Health Polytechnic of Kupang, Indonesia, ²Faculty of Fisheries and Marine, Airlangga University, Indonesia, ³Faculty of Medicine, Airlangga University, Indonesia, ⁴Faculty of Public Health, Airlangga University, ⁵Health Polytechnic of Surabaya, Indonesia

ABSTRACT

Environmental risk factors, both physical and biological (e.g. ecology of vegetation/plants, forest), equally serve as the risk factors for *Anopheles* mosquitos breeding. This study was designed to determine a model of spatial mapping for the ecology of vegetation and the potential habitats for the *Anopheles* mosquitos. Descriptive epidemiological research was implemented to carry out the project, supported with a cross-sectional design. The research took place in Kupang regency, Oesao village, lasting for 2 months from October to November 2014. The ecology of the vegetation and all habitats of the mosquitos in Oesao village were regarded as the population of the research. They were purposively sampled. The vegetation mapping revealed that the land area for rice fields is 169 ha, coconut and banana tress 56.68 ha, maize 67.03 ha, vegetable plants 59.53 ha, forages 21.52 ha, and forests 16.24 ha. The results of the mapping also revealed that the mosquitos breeding sites entail paddy fields, swamps, irrigation channels, and damps. The ecology of all types of plants mapped serves as potential habitats for the *Anopheles* mosquitos breeding sites. Plant ecology is quite varied in the Oesao Village, as well as extensive areas of the plant that are closely linked to inadequate growth and development of mosquitos and specific species of *Anopheles*, *An. vagus* and *An. annularis*.

Keywords: Ecological vegetation mapping; Breeding sites; Malaria mosquitos

INTRODUCTION

Malaria, a mosquito-borne disease, has caused an enormous number of deaths worldwide, particularly in the developing countries⁽¹⁾. Children and pregnant women are the most vulnerable groups to malaria deaths. The eastern Indonesia province of Nusa Tenggara Timur (NTT) is one of the provinces with the third highest malaria case in Indonesia; there was an estimated of 16.37% of malaria cases confirmed with blood test⁽²⁾. Based on the Annual Report of the Provincial Health

Office of NTT, the annual parasite incidence (API) for Kupang regency has been high for the last three years, with API of 3.55 ‰ in 2009, 6.48 ‰ in 2010, and 6.72 ‰ in 2011⁽³⁾.

There are community health centers (*puskesmas*) in Kupang regency showing an increase of malaria cases, included as health centers with high case incidence (HCI), i.e. Oesao, Naikliu and Oekabiti. The health center in Oesao district is the one with the highest number of increasing malaria cases. Concerning the Annual Parasite Incidence (API) in Oesao, it reached 4.04 ‰ in 2009, and continuously increased to 7.67 ‰ in 2010 and 10.17 ‰ in 2011⁽⁴⁾.

In NTT province the physical and biological environment (plant/plant ecology, forest) serves as environmental risk factors for *Anopheles* mosquitos

heruswn@gmail.com

breeding. This is so, for the spread, cluster and varieties of plants greatly vary; it is further supported by temperature, light intensity, air temperature, humidity, wind speed and precipitation, all of which provide suitable breeding environments for *Anopheles* population. The bionomic life of mosquitos that suits both the environment and cultural factors present in the society and the community behaviors becomes reinforcing and enabling factors, supporting the *Anopheles* mosquitos breeding in NTT province. As a result, it still places the province at a high risk of malaria cases and this becomes the major problem in the pursuit of malaria eradication.

There has not been an effort made to carry out spatial mapping (geographically) to map the physical and ecological factors of plants and mosquito breeding sites; the employment of advanced technology for mapping local specific areas with appropriate and accurate equipments is still rare as well. Such technology is pivotal to obtain a description of the physical environment conditions, the ecological patterns (species and area of forests/plants), and the geographical locations of the mosquito breeding sites (river, lake, standing water, ditch).

This study aims to map the risk factors for malaria: mapping of plant ecology and potential breeding habitats of *Anopheles* mosquitos. Furthermore, images of the mapping are used as the basis in establishing malaria intervention and eradication model in malaria endemic areas in Kupang regency.

MATERIALS & METHOD

Research Design

Descriptive epidemiological research was implemented to carry out the project, administering surveys to obtain ecological and geographical information. Furthermore, a cross-sectional study was employed. This research was conducted in Kupang regency, Oesao district. The research lasted for 2 months running from October to November 2014. Population in this research is all *Anopheles* sp mosquito habitats and plant ecology in Oesao district, Kupang regency.

Data Collection

The mapping of plant ecology and malaria breeding sites is done by mapping the distribution and abundance of plants in the *Anopheles* sp mosquito habitats and measuring the mosquito breeding sites in the malaria

endemic areas using GIS and GPS equipments.

Research Instruments

GPS (Global positioning system) was operated to take coordinates and track the mosquito habitats in the research site and a software, was respectively employed to process the data.

Data Analysis

The data obtained were presented in the form of spatial map images, which were then spatially and descriptively analyzed. Spatial data analysis program was used to process the spatial data.

FINDINGS

The larval habitat map consists of 4 habitat types: rice fields, swamps, rivers, irrigation channels, and dams. Based on Figure 1, it can be seen that larval habitats for rice fields have larger areas than other larval habitats; the arable area is 169.00 Ha. Other larval habitats found are water dams, swamps, irrigation channels and rivers, all of which become the breeding sites of *Anopheles* mosquito larvae. From the above map, it appears that all potential habitats for the growth and the spreading of *Anopheles* mosquito larvae reside in this region, covering a quite large area.

As presented in Figure 2, the area for coconut and banana trees covers 56.68 hectare. They are kinds of high-tree plants. So far, there has not been any research finding describing the leaves of coconut and banana trees as favorite resting places for *Anopheles* mosquitos.

Based on Figure 3, the map of the distribution of the maize (not kinds of high-tree plant species) spread evenly throughout the village. The area of maize is 67.03 hectare. From all plant species, maize covers the largest area.

Vegetable plants widely found in Oesao village are mustard, water spinach, cabbage, and root tuber. The land area for the vegetable crops is 59.53 hectare. Most people work to grow fast growing or short-term vegetables that can be immediately harvested. The crops are for local consumption, and they are also sold (Figure 4).

Figure 5 shows the forest land area in Oesao village. The forest land area for large plant types is quite small, covering only 16.24 hectare. It is the smallest area

compared to other areas in the village.

Types of plants included in forage plants are red barons, grasses, and shrubs. In Figure 6 above, it is shown that the land area for the forage plants covers approximately 21.52 hectare.

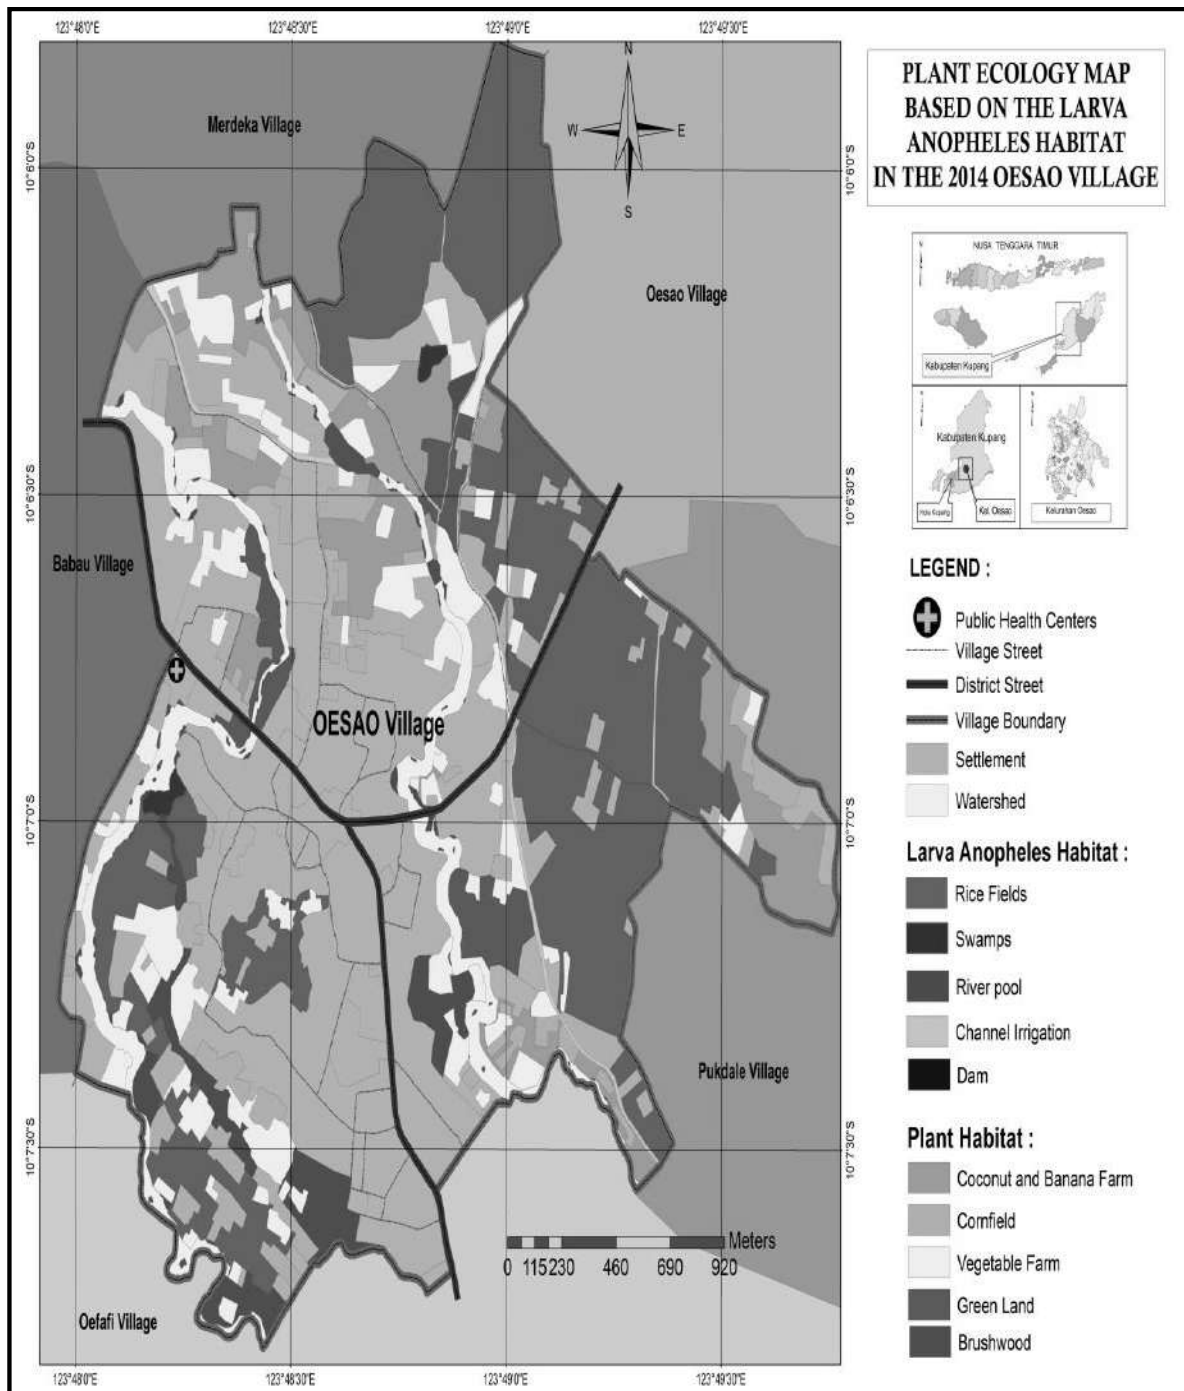

Figure 1. A Map of mosquito breeding sites (*Anopheles Sp* larval habitats) and ecology of vegetation in Oesao Village in 2014

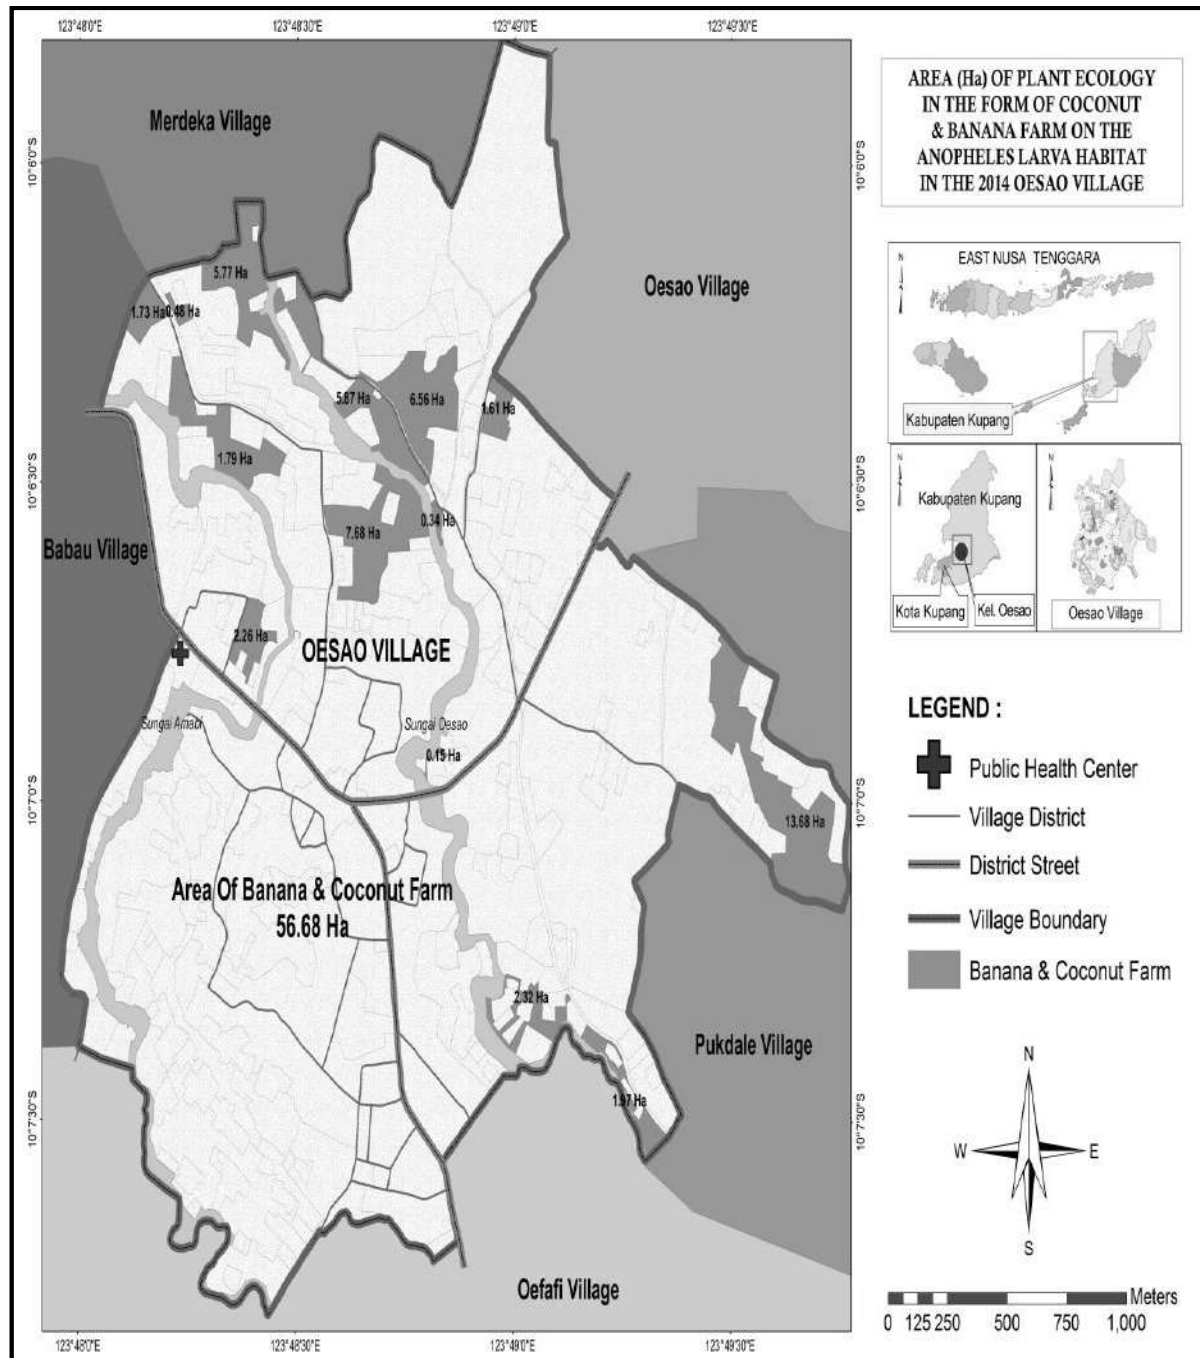

Figure 2. A map of ecology of coconut and banana trees and the land area in Oesao Village in 2014

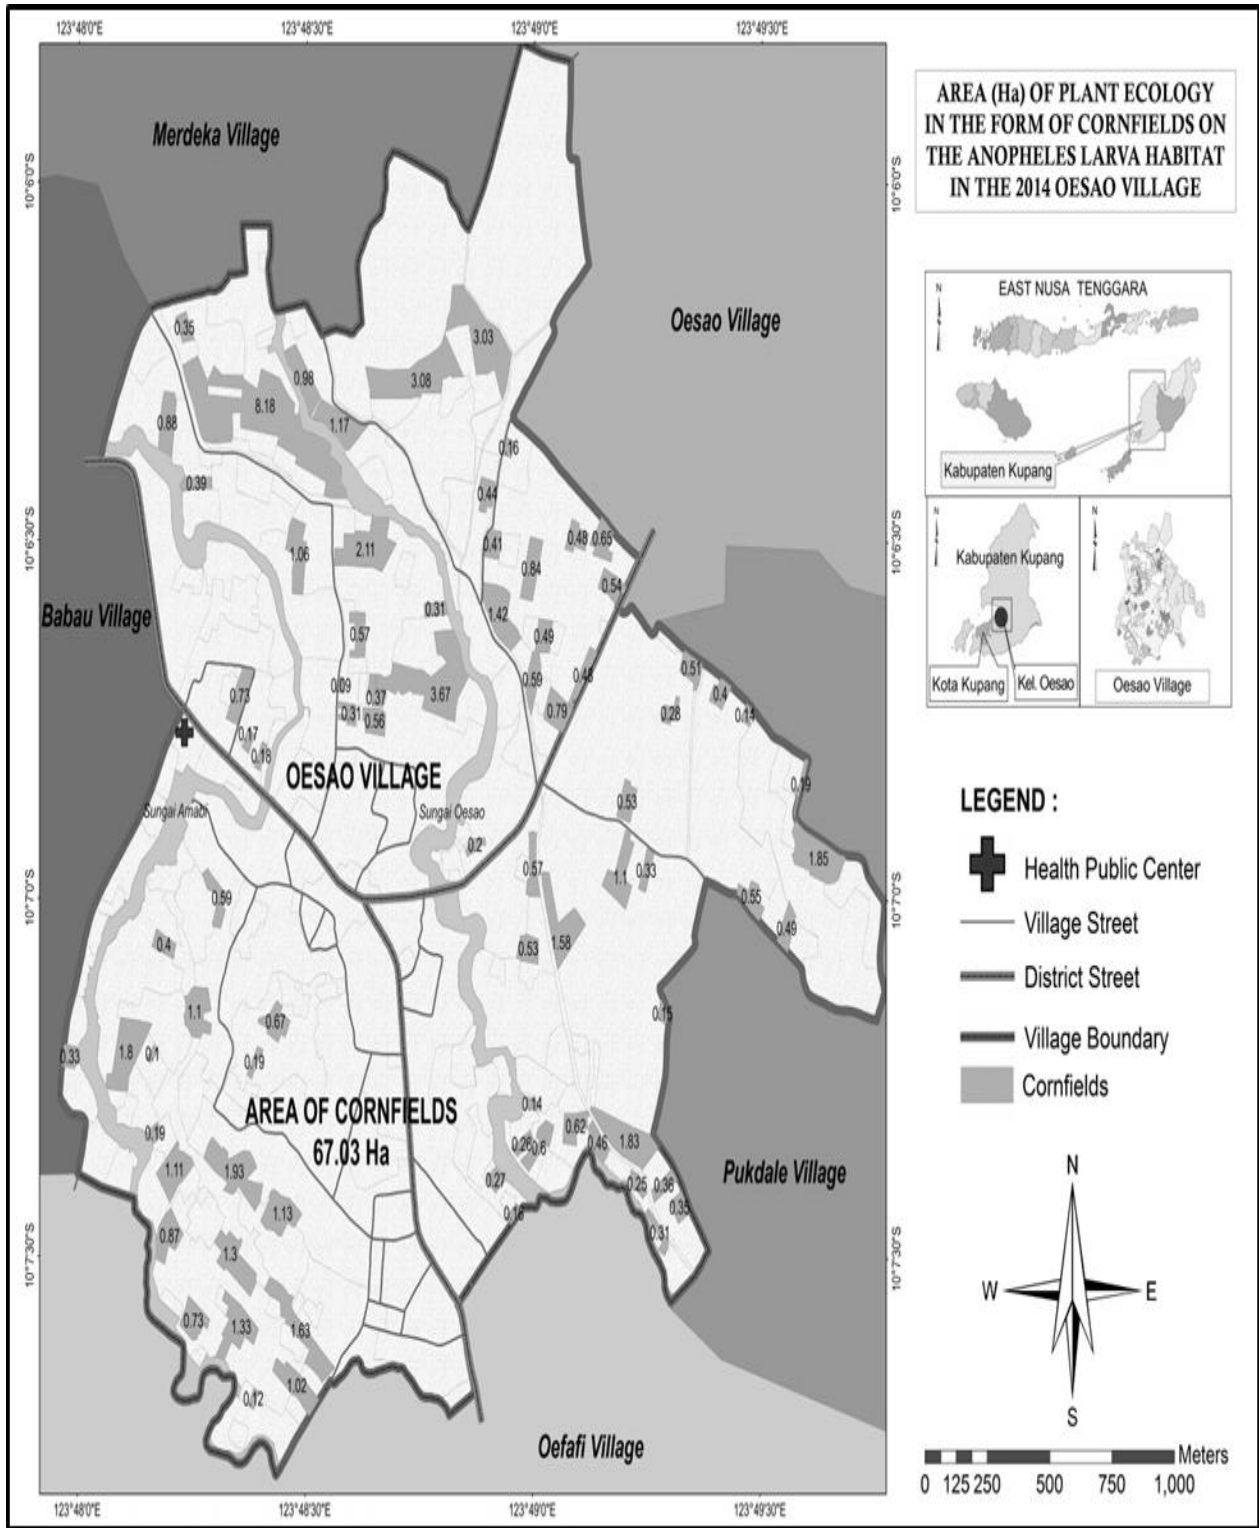

Figure 3. A map of ecology of maize and the land area in Oesao Village in 2014

Figure 4. A map of ecology of vegetable plants and the land area in Oesao Village in 2014

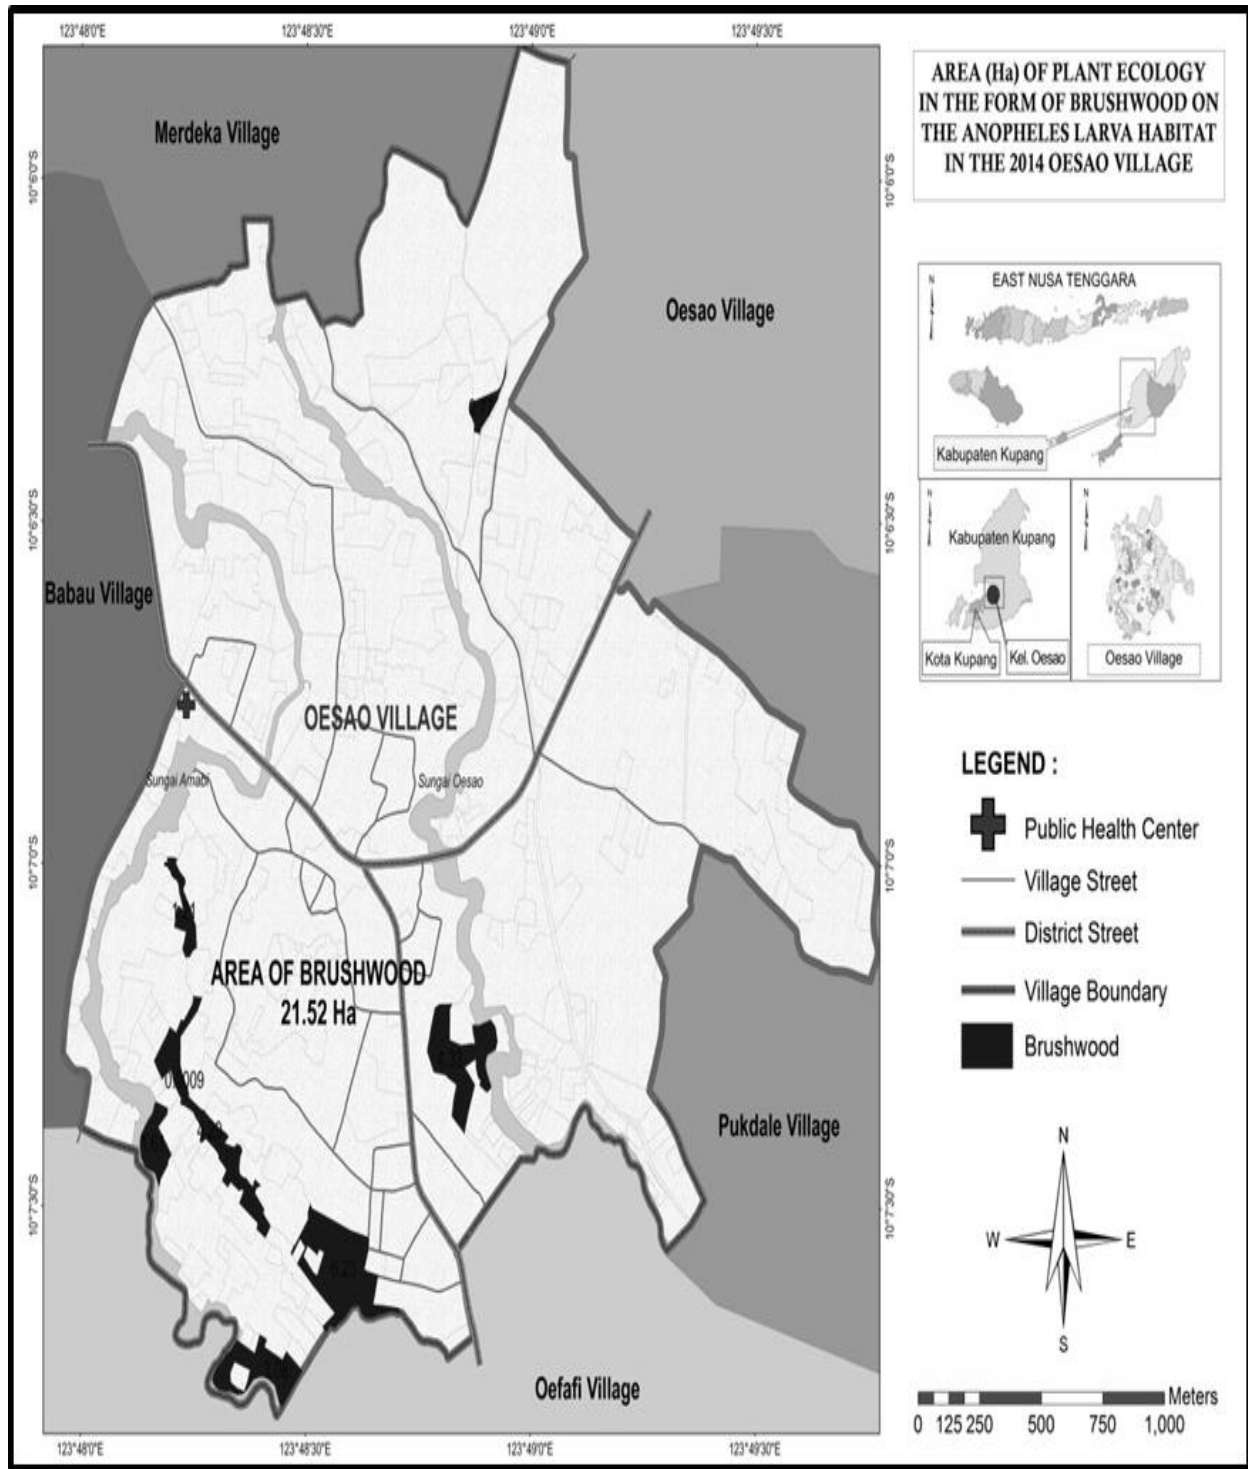

Figure 6. A map of forage plants and the land area in Oesao Village in 2014

From the illustration of the distribution of cases on the map (Figure 7), the spread is evenly distributed, and the types of plasmodium are falciparum and vivax.

Figure. 7 A map of the distribution of malaria cases and the ecology of vegetation in Oesao District, Kupang Regency

DISCUSSIONS

Ecological Vegetation Mapping

The ecology of vegetation is a community of plants according to their types and distributions that support the vectors breeding and growth of *Anopheles* mosquitos, particularly as resting sites and producers of oxygen

supply (O₂) contributing to the survival of mosquitos and other living organisms.

In general, there is a relationship between the plant habitat, types of plant, also the area of arable field on the growth and proliferation of *Anopheles* mosquitos⁽²⁾. For some types of plants in arable lands such as rice, kale, root tubers, grasses, blushes, and shrub, they become

very suitable habitats or resting sites for *Anopheles* sp mosquitos. Based on the research results, the researcher found an average of one to three larvae in a cup of water in the arable area. Geographically, rice paddy is the largest cultivation area in Oesao district. This is so, for the soil structure and rainfall intensity of Oesao district are suitable for the rice cultivation. Therefore, it reasons out why most Oesao people choose rice cultivation as the main source of their livelihood.

Theoretically, the ecology and area of rice paddy in Oesao district including irrigation canals and standing water along with grass as its protector make them suitable sites for *Anopheles* mosquitos breeding. In addition, another factor that supports proliferation of *Anopheles* mosquitos is the temperature of water in the Oesao's rice paddies. The result of measurement showed that the average of water temperature in the arable area is 29.37 °c. The water temperature was measured in the peak of dry season with very hot ambient temperature. The optimum temperature for *Anopheles* mosquitos' proliferation is 26°C up to 30°C⁽²⁾. Another reference says that the optimum temperature for the growth and proliferation of mosquitos is 20°C up to 30°C⁽⁵⁾. In addition, pH measurements in the rice paddies also demonstrated nominal values ranging from 6.6 to 6.98. However, according to the book published by Department of Health, 2017, "Ecology Malaria Vector", it is stated that the optimum pH for larvae's development is 6 - 8.

The researcher found another fact that in the ecology of Oesao District there are all types of plants ranging from groups of forages (including grass and shrub), vegetables (mustard, kale, eggplant, sweet potato, cassava), rice crops (rice paddy), high-tree plant species (coconut and banana trees), to forest areas (green fields). Some experts suggest that vector growth is inextricably linked with the number and type of plants. The land and plants area affect the growth and proliferation of *Anopheles* mosquitos. The wider and the more diverse the types of plants, the better for the mosquitos' proliferation than the dry and barren areas.

From the environmental aspect, pH and temperature provide positive contributions to the growth and breeding of mosquitos. Moisture level and adequate rainfall intensity per year also support such conditions to thrive. Concerning the book published by UNICEF in 2012, "Malaria, Immunization and Integrated KIA (Maternal

and Child Health)", geography and meteorology factors such as temperature, humidity, rain, and altitude are very beneficial to malaria transmission in Indonesia. These are the major factors that explain why malaria case in Oesao district is very high.

Mapping of the Mosquito Breeding Sites (Larvae Habitats)

The illustration of map on larval habitats comprises of 5 habitat types: rice paddies, swamps, rivers, irrigations, and dams. The mosquito breeding sites in rice paddies are the standing water and the water in irrigation canals that flow continuously on edge of the rice paddies. Based on Figure 1 above, the rice paddies become the largest area of the mosquito habitat compared to other larval habitats; the size of rice paddy is 165.03 Ha. The researcher classifies rice paddies into two roles: (1) as plant ecology and (2) as habitat of malaria mosquito breeding sites. In the discussion above, the rice paddy is closely related to the bionomic life of malaria mosquitos.

Previous studies found that the best resting places for adult mosquitos are areas in rice paddies like terraces, and edges. These places are suitable sites for adult mosquitos since they are not far from water puddles, water drains, irrigation canals of rice paddies, so that adult mosquitos can easily put their eggs in water anytime⁽⁴⁾. Beside rice paddies, the other larval habitats are water dams, swamps, irrigation canals, and rivers. Nevertheless, all types of habitats mentioned above are very suitable for the growth and proliferation of *Anopheles* mosquitos.

From the above map, it appears that all potential habitats for the growth and proliferation of *Anopheles* mosquito larvae reside in this region, with a large enough area.

Distribution of Malaria Cases

After combining the data of ecological vegetation with the previous data of the mapping, and mosquito breeding sites (larval habitat), the result revealed that the spreading of malaria patients in Oesao district was distributed evenly. Based on spatial mapping, it is clearly illustrated that the main factors that contribute to the growth and proliferation of larvae and malaria mosquitos are the number and types of plants, the area of arable land, pH and temperature of the malaria mosquitos' breeding sites, and also the types of the breeding sites.

To ensure the relationship or influence of these three factors, a more in-depth analytical research needs to be conducted in the future; 232 such as the analysis based on the demographic characteristics, the mobility of sufferers, etc.⁽⁶⁾.

CONCLUSION

Ecology of plants by type consisting of 5 types of plants are dominant, namely: crop rice (paddy), maize crops, vegetable crops, coconut and banana plants, plant shrubs and grass and forest plants. Plant ecology are quite varied in the Village Oesao, as well as extensive areas of the plant that is closely linked to inadequate growth and development of mosquitoes as well as species specific anophelles that kind of *An. vagus* and *An. annularis*.

Barriers in Treating Patients with Acute Coronary Syndrome in Indonesia Primary Health Care: A Phenomenological Study

Kumboyono Kumboyono¹, Dini Prastyo Wijayanti¹, Titin Andri Wihastuti¹,
Septi Dewi Rachmawati¹, Yulia Candra Lestari²

¹School of Nursing, Brawijaya University, ²School of Nursing, Kenedes Institute of Health Sciences,

ABSTRACT

Introduction: Acute Coronary Syndrome (ACS) is the leading cause of mortality in the world. Primary prevention strategy focuses on reducing the risk of disease spread. At the same time, curative strategy aims at reducing the risk of disability and mortality. Initial therapy should be considering early stabilization and immediate advanced care to reduce the risk of complication. Therefore, it is important to improve guidelines, the medical referral system, and family consent procedure to save patients with ACS.

Aim: This research aimed at exploring the barriers faced by nurses in treating patients with ACS in Primary Health Care (PHC).

Method: This research employed a qualitative research method using descriptive phenomenology. This study involving 16 subjects of nurses working in PHC with indepth interview . The data analysis procedure proposed by Clark and Brown 2013.

Result: Three main themes were pointed out by 16 participants; 1) Update Guidelines, 2) Inefficient referral process to other health centers, 3) Consent making process by the family.

Dicussion: Barriers in performing health care for patients with ACS in the emergency unit of PHC needs updating guideline to be enhanced by engaging the advancement of technology and communication using electronic medical record system, family education, and fulfillment of better medical facilities to make the process more efficient. At the same time, also improves the management service for patients with ACS and making it possible for PHC to provide reliable health care as the first health care provider for the society.

Keywords: *Barriers to care, Health Care Referral, Acute Coronary Syndrome, Emergency Nursing, Primary Health Care*

INTRODUCTION

Acute Coronary Syndrome (ACS) refers to a condition or complication of diseases which cause unstable condition caused by burst of blood vessels, causing sudden occlusion in the coronary artery.^[1] According to the data released by the WHO (2008), acute coronary syndrome is the world's top killer and causes death twice as much as cancer.^[2] Record shows

that around 7.200.000 people (12.2%) have died of ACS. The chance in rescuing patients with cardiac arrest declines around 7-10% every minute.^[3] Based on the data released by the European Society of Cardiology (ESC) on the guideline, initial stabilization procedure within the first 72 hours for patients who have low risk of complication.^[4]

Primary Health Care (PHC) attempts at providing responsive, comprehensive, effective and efficient that decreases the expenses of inpatient care and reduces the health gap in the society in order to let anyone have the access to reach excellent health service at affordable price. PHC in Indonesia is a first-level health service in peripheral areas development in health services. There

are fullfill of 20 million with rate 70% -90% in the population with health problems. This problem should be taken as a challenge for PHC to improve its service and facilities.^[5] A study conducted in New Zealand shows that generally nurses always try to apply nursing principles while they are performing their jobs.^[6] The role of PHC nurses in Indonesia performs health promotion, screening and treatment of general emergency diseases.

PHC service In treating emergency patients, referral procedure should be highly concerned, regarding to the fact that the distance to more advanced hospitals is quite far, and ineffective communication procedure as well as the lack of facilities might appear as the barriers during the process. At the same time, primary treatment that focuses on decreasing the risk and reduce of ACS. Whilst, curative strategy should also be given to decrease the risk of disability and death. Patients who felt the symptoms of cardiac diseases need deep investigation and immediate treatment, chest pain not always caused by ACS.^[7] Barriers in this process needed to be determined regarding to the fact that families of the patients might be lacking of knowledge to take immediate consent, nurses might also lack of experience and skills, as well as limited resources, accessibility issues and inefficient referral procedure.^[8] Some indicators are used to evaluate the quality of emergency treatment including nurses' emergency nursing experience, medical facilities and trainings given to deal with emergency patients.^[9] A study conducted in Sri Lanka also shows that poor communication.^[10] The result of this study is expected to give insights in solving the problems and improving the referral system across health care providers as well as advancing the facilities in PHC.

MATERIAL & METHOD

Research Design

A qualitative approach using a descriptive phenomenology design was employed in this study. The result of this study describes nurses' view about their nursing experiences related to certain concept or phenomena.

Setting

This reseach took place in Primary Health Care, Malang Regency, East Java, Indonesia.

Population and samples

For this study were selected by snowball sampling. Criteria of selection were that participant 16 nurse at PHC who owned 3-15 years nursing experience and minimal had 1 year experience treatment patients with ACS. 16 nurses possessed diploma degree in nursing and bachelor of nursing. All of the participants joined several professional trainings such as Basic Cardiac Life Support (BCLS).

Data Collection Instrument

In-depth interviews were done to collect data in which voice recorder was used to help the researchers in recording the complete data. The semi-structured in-depth interviews were conducted based on critical decision method using a set of open-ended questions, allowing the participants to give in-depth and broad explanation about their views.

Procedure

This research was conducted for 4 months from September to December 2017. Researchers acted as the key instrument in this study. After being given the explanation, the participants were asked to sign a consent for. Researchers scheduled the exact time and place for the interview.

Data Analysis

The data obtained from the interview were transcribed to be later analyzed using the thematic method proposed by Clark and Brown (2013).^[11] The thematic data analysis consisted of these steps: (1) transcribing; (2) identifying the data; (3) coding; (4) grouping the key words into sub-theme categories; (5) arranging the themes; (6) writing the report of data analysis which contained nurses' explanation about their experience that could not be analyzed using software.

Ethics

Ethical clearance procedure was administered and legalized by the board of ethics of the Medical Faculty, Brawijaya University number 216/EC/KEPK/06/2017.

Finding

The participants (nurses) selected for this research were 20–35 aged and had been working in the ED for 3-15 years. In the term of education background, it was obtained that participants almost were diploma in nursing graduates while the other 4 had Bachelor's degree

in Nursing. Participants have training certifications of BCLS. According to the results of the qualitative data analysis, there are three themes obtained based on the objective of the research.

Theme 1: Update Guidelines

The sub theme is update of ACS management SOP. The update is done by updating, replacing, adding, or subtracting. With the updated guidelines, nurses have a sense of calm in performing the action.

I have ever known the guideline, but yaa, you know, sometimes patients in EDs have different characteristics. Whether the ED is crowded (full of patients) cannot be ascertained, we will try to take care of him accordingly with the guideline... (P9)

In my opinion, the SOP should be upgraded in accordance with the scientific development and adjusted to the policy. The existing SOP may be replaced, added, or subtracted (P11, P16)

Theme 2: Inefficient referral process to other health centers

The sub theme are The communication network among health care providers, Barriers in transferring the patients to more advanced hospitals. the need for equipment availability, and Additional duties.

We desperately looked for referral hospital but it took quite a while. Patient's condition dropped. Unfortunately, 30 minutes was not enough to save the patient. (P6)

We always called the referred hospitals, usually we contacted the regional hospitals but sometimes it was not easy to reach them. So we had to bring the patients to RSSA (Saiful Anwar Hospital) which is quite distant. (P1, P3)

When the EKG record indicates IMA case, we directly refer the patient to a more advanced hospital. But the referral process can only be granted by ACS group. Thus, we always have to consult the case to cardiologists before it is granted. Usually, we contacted the cardiologists via telephone. Sometimes they did not grant the requests and we could not do anything. (P7)

...no oxygen saturation tester available. So, nurses collected their own money to buy it in order to save the patients with heart disease indication. (P5, P14)

We already propose for the equipment which has been months and years, but there is no response (P10, P15)

Actually, I tend to respond it as a part of the delegation or responsibility that we have to commit. But, it cannot be denied that such duties will increase our workload... (P13)

Theme 3: Consent making process by the family

The sub theme are Family rejected transferring patient and Family rejected medical treatment

Sometimes, conflicts occurred. Families insisted on staying here even if the patients agreed to be transferred to regional hospitals. Families wanted to stay in nearby hospitals. (P12, P2)

Families might not understand the condition of the patients. They stuck to their own assumption to transfer advanced hospital. They underestimated the patients' condition. (P4)

There were families who rejected the heart resuscitation procedure because they felt terrible to the patients. They might have watched the procedure on television and they assumed most of the procedure failed. (P8)

DISCUSSION

Transition in Epidemiology has changed the paradigm that believed non-contagious diseases could not be the major cause of mortality. Nurses in PHC hold the responsibility to give pre-hospital emergency health treatment which requires them to have adequate human resources and excellent coordination and communication among the personnels.^[10] Patients lives are the top priority of the SOP, allowing the nurses to change treatments in order to minimize any live-threatening risks.^[12]

The results of the interviews showed some barriers, first: guideline ineffective, the lack of medical tools or devices, delegation tasks or additional make nurse work overload, such as taking transporter actions and handling administrative. According Deaton (2016) that study found the nurses who have some barriers yet still showed a high level of responsibility for patients by maintaining their care quality despite those emerging barriers.^[13] Therefore, the nurse practice guidelines renewal is important to be done to improve the quality and service. SOP development is an effective tool

to improve the quality of service and documentation completion, so also avoid heavy workload.^[14]

Referral to other health care facilities requires a strategic, pragmatic, even, and coordinative system to provide a continuum health care from the first health facility to a more advanced health facility. This theme describes that crucial issue is related to the lack of knowledge, skills, resources and accessibility that also affect the efficiency of the referral process.^[8] There has to be a good integration in the communication system between PHC and regional hospitals to make the process faster. However, some nurses stated that sometimes negative responses due to disagreement from ACS consultant group in the regional hospitals. Studies show that as many as 67% of the population reported poor accessibility to reach advanced health services in rural areas compared to urban areas.^[14,15] Vast advancement of technology makes it possible to create innovations in medical treatment system. Excellent integration of advanced information, communication and technology allows betterment in information system which guarantees information continuity, quality service, medical treatment, and better access for people who live in outskirts areas. The innovations can be made in the form of electronic medical record system and telemedicine.^[16] Beside that lack of facilities like equipment at PHC, nurses often had to make their own donation which reflects their sincerity to their patients to buy some equipment needed because limited and it would take quite. Oxygen saturation tool is an important tool to measure the oxygen level in patients' blood and shows the risk of heart attack. This deficiency is associated with budget constraints which will have an impact on service quality.^[17]

According to the interview, they agree that family as decision making. Families are the closest relatives of patients. Any treatment given to the patients should be agreed by the family at first by signing the informed consent. This procedure also reflects the legal ethical even in emergency situation, such as informed consent like two-way communication between patient and one or more health practitioners which patients should be given the rights benefits and risks treatment.^[18] Any medical treatment should not be given when in a sensitive and difficult condition either or not to take life-saving treatment such as cardiopulmonary resuscitation (CPR) even if this treatment might save patients' lives.^[19] New Zealand has a complete set of patients' basic rights

which involves the participation of the patients, patients' family and medical practitioners in deciding the medical treatment. Meanwhile, in some Asian countries, there is a cultural-bond phenomena in which the family hold the strongest authority. Nursing ethics require the nurses to reach this balanced decision by solving the problems related to family consent.^[20]

CONCLUSION

In this study, nurses who participated in this study have explained the problems. Three major problems appear as the barriers during the treatment. These problems can be solved by implementing an advanced integration of technology in the communication system such as using electronic medical record system and guideline of nurse need updating, educating patients' family and the management of health care service, especially for patients with ACS.

Source of Funding : The funding sources of this research are from the researcher's own personal funds

Limitation: This research explains the Barriers found by nurses of PHC in peripheral areas of Indonesia. The result of this study cannot be simply generalized for other areas.

Implications for further research

Implication for future researchers to design guidelines for PHC services by implementing network-based referral system and using electronic medical record system to provide better emergency nursing in PHC services.

Conflict of Interest: No conflict of interest involved in this research.

ABSTRACT

Background: Guillain barre syndrome is monophasic acute polyradiculoneuropathy autoimmune in nature, it appears as rapid developing areflexia and motor weakness with or without sensory and autonomic disorder, it reaches nadir in less than 4 weeks. Papilledema is rare and usually asymptomatic finding in patient with GBS, the CSF protein is usually elevated in GBS with papilledema, and high protein level will cause a disorder in the appropriate absorption of CSF at the arachnoid villi.

Aim of the study: To determine the percent of papilledema in GBS, the causes of papilledema in GBS, the correlation of papilledema to different clinical presentations of GBS.

Patients and method: A cross sectional study was made on seventy patients who have GBS during 4 weeks hospitalization, males are thirty seven and females are thirty three, that admitted to neurological ward and Respiratory Care Unit in Baghdad Teaching Hospital between 1st January- 2017 to 1st January- 2018. All patients were newly diagnosed by consultant neurologist and selected according to criteria by Asbury and Cornblath 1990 and meet with Brighton Collaboration Diagnostic Criteria Level 1 and 2. Regarding patients who have papilledema diagnosed by consultant neurologist by fundoscopic examination and supported by consultant ophthalmologist by slit lamp examination .

Results: There is a correlation between GBS and papilledema, in this study 3 patients had papilledema, the percent of papilledema in GBS was (4.29%) and the cause appears to be high CSF protein.

Conclusions : Regarding the patients who had elevated CSF protein, there is significant association between the presence of papilledema and need for mechanical ventilation. There is more correlation between AIDP and papilledema as compared with (AMAN, AMSAN).

Keywords: *Gullian berre syndrome, papilledema, cerebrospinal fluid protein, Acute inflammatory*

demyelinating Polyneuropathy.

INTRODUCTION

Guillain Barré syndrome is an acute monophasic polyradiculoneuropathy autoimmune in nature. It manifests as rapidly evolving areflexic motor paralysis with or without sensory disturbance and autonomic

manifestation. The usual pattern is an ascending paralysis, it may be severe and fulminant^[1]. Two-thirds of patients can recall a preceding illness, most frequently upper respiratory in 58% or gastrointestinal infection in 22%, respiratory and gastrointestinal illness in 10%, surgery in 5%, or immunization 1 - 4 weeks before the onset of neurological symptoms in 3% ^[2]. its begins commonly with acroparesthesia, followed 7–10 days later by symmetric ascending type weakness, associated with severe radicular pain in up to two thirds of patient, proximal and distal weakness is usually the predominant feature, Hyporeflexia or areflexia may be delayed one week. Most reach weakness nadir by 2 weeks, but 80% by 3 weeks and 90% by 4 weeks, The disease ranges

Corresponding author :

Fallujah University/ College of Medicine

E-mail: mohkamil68@gmail.com

009647707216142.

from mild weakness to flaccid quadriplegia and up to one-third progress to respiratory failure, AIDP accounts for 80% of GBS cases, CSF protein is elevated in most patients^[3].

Protein elevated in 90% in the absence of white blood cell elevation (less than 20 per mm³), called albuminocytologic dissociation, CSF protein elevation may be delayed; a repeated lumbar puncture in 5 to 7 days may be supportive of the diagnosis, CSF pressure typically normal but may be raised and high protein cause papilloedema^[4].

Papilledema mean optic nerve head swelling caused by increased intracranial pressure with absent spontaneous venous pulsations, usually bilateral but may be asymmetric^[5]. It is primarily due to a rise of pressure in the optic nerve sheath, which produces axoplasmic flow stasis in the optic nerve fibers in the surface nerve fiber layer and prelaminar region of the optic nerve head, Axoplasmic flow stasis then results in swelling of the nerve fibers, and consequently of the optic disc, Swelling of the nerve fibers and of the optic disc secondarily compresses the fine, low-pressure venules in that region, resulting in venous stasis and fluid leakage; that leads to the accumulation of extracellular fluid^[6]. Papilledema caused by brain mass like tumor or pseudotumor include: Idiopathic intracranial hypertension, cerebral venous thrombosis, meningeal diseases include infections, gliomatosis cerebri, drugs include hypervitaminosis A, administration or withdrawal of corticosteroids, metabolic disturbances, hyper- and hypoadrenalism, myxedema, hypoparathyroidism, GBS, spinal tumor such as oligodendroglioma, systemic lupus erythematosus, severe systemic hypertension, and hypersecretion of CSF by a choroid plexus tumor^[7].

Papilledema and raised intracranial pressure have been reported in association with GBS, The cerebrospinal fluid protein is usually reported to be high. In most of these reports the papilledema appeared after established limb weakness and very rare the papilledema preceded the limb weakness, These elevated proteins will cause a defect in the proper absorption of CSF at the arachnoid villi, giving rise to increase intracranial pressure^[8].

The Pseudotumor cerebri also been rarely reported with (AIDP), where the CSF protein level was normal and papilledema develop^[8]. The papilledema in patients with Guillain Barré syndrome may be very rarely

secondary to cerebral edema and hypernatremia^[9].

Aim of the study: To determine the percentage and causes of papilledema in GBS, correlation of papilledema to different clinical presentations of GBS.

Patients and methods:

A cross sectional study was made on seventy patients have GBS during 4 weeks hospitalization, who were admitted to neurological ward and Respiratory Care Unit of Baghdad Teaching Hospital between 1st of January- 2017 to 1st January- 2018. The age of patients ranged from 18–75 years, males are thirty seven and females are thirty three. All patients gave their consent to participate in the study.

The inclusion criteria: All patients selected according to criteria by Asbury and Cornblath 1990, and meet with Brighton Collaboration Diagnostic Criteria Level 1 and 2^[10,11]. All patients were newly diagnosed by consultant neurologist and were investigated by Electromyography and Nerve Conduction Studies, CSF opening pressure and analysis was done after at least seven days from the onset of the disease. All patients who had papilledema were diagnosed by consultant neurologist by fundoscopic examination and classified according to Frise'n Papilledema Grading Scale, supported by consultant ophthalmologist by slit lamp examination and Optical Coherence Tomography (OCT) to excluded pseudopapilloedema and to approve finding.

The exclusion criteria: The patients with secondary causes of papilledema.^[7] The following investigations were done for every patient with papilledema to exclude secondary causes: 1-Brain and Spine Magnetic Resonance Imaging (MRI), Magnetic Resonance Venography (MRV) 2-CSF pressure and analysis. 3-Serum calcium and sodium. 4-Liver and renal function test. 5-Complete blood count, erythrocyte sedimentation rate and C reactive protein. 6-Antinuclear antibody, anti-double stranded DNA antibody, lupus anticoagulant, anticardiolipin antibody.

Statistical analysis: SPSS 20.0.0 software package applied to do the statistical analysis, p value considered when suitable to be significant if less than 0.05.

RESULTS

In this study, the age of patients range from (18-75) years with mean age of (36.1 ±16.2) years, 33 (47.1%)

are female while 37 (52.9%) of patient are male.

Forty four patients had antecedent infection (few weeks) preceding onset of the weakness, being most frequent respiratory tract infection (RTI) in 33 (47.1%), diarrhea in 7 (10.0%) of patients and 26 (37.1%) of patients had no previous infection.

The sensory symptoms was observed in 45 patients(64.3%),bulbar involvement in 24 patients (34.3%),involvement in 18 respiratory patients (25.7%),requirement for mechanical ventilation in 10 patients(14.3),facial weakness in 29 patients (41.4%),as shown in table 1

Three patients (4.29%) of GBS developed papilledema, while the remaining 67 (95.71%) did not had papilledema,as illustrated in table 2.

In the current study three cases had papilledema, two of them male and one female were presented below are their characteristics, which in summary; 2/3 had grade 2 papilledema presented within the 3rd week, with 1/3 presented in the 2nd week had grade 1 papilledema. All three cases were asymptomatic, as illustrated in table 3.

There was no significant difference in age, gender, limb weakness, sensory symptom, bulbar weakness, respiratory involvement, requirement for mechanical ventilation, bifacial weakness and cells in CSF among patients presented with or without papilledema. On the other hand, the CSF protein level and pressure was significantly elevated in GBS with papilledema compared to those without, with p value (0.004),(0.001) respectively, as illustrated in table 4.

In this study 47(67.1%)of patients had high CSF protein level ,there was no significant difference in age ,gender and various presentations (limb weakness ,sensory symptoms ,bulbar weakness, respiratory involvement and bifacial weakness)among patients presented with or without papilledema w, but on other hand there was significant association between requirement for mechanical ventilation and patient had papilledema with p value (0.016), as illustrated in table5.

In the current study four cases were AMAN and two cases were AMSAN, the CSF protein was lower than that in patients with (AMAN, AMSAN) compared to those with AIDP with p value (0.002), Odd Ratio (0.978) and 95% Confidence Interval (0.955–0.999), i.e. there is negative relationship between CSF protein level

and axonal variant (AMAN, AMSAN), as illustrated in table 6.

DISCUSSION

In this study there was association between Guillain Barré syndrome and papilledema, the percentage of papilledema in Guillain Barré syndrome was (4.29%). This agree with study done by Karkare in Bangalore (India) on sixty patients with Guillain Barré syndrome who found the percentage of papilledema was (3.3%)^[12]. And consisted with the Turkish study done by Güngör on thirty-two Guillain Barré syndrome patients which found the percent of papilledema was (3.1%)^[13]. And also similar to the percent of papilledema in Guillain Barré syndrome reported by Canadian Ophthalmological

Society 2015 which confirm the papilledema detected in (4%) of Guillain Barré syndrome cases^[14].

In this study three cases were reported with papilledema, regarding the causes of papilledema in GBS, this study found that the CSF protein level and pressure was significant elevated in Guillain Barré syndrome with papilledema compared to those without. In the current study not all patients had high CSF protein, only (67.1 %) of the patients had high CSF protein level during first 2 weeks of disease, this agree with study done by Massachusetts General Hospital (Boston) on 110 patients with GBS which found the CSF

protein elevations in (73 %) of patients^[15]. And agree with the Indian study done by Kalita between 2000 and 2012 on 328 Guillain Barré syndrome patients who found (68%) had CSF albuminocytological dissociation^[16]. The possible explanation of high CSF protein was increase in permeability of the blood – nerve – barrier due to inflammation of the proximal nerve roots, thus will lead to defect in absorption of CSF at arachnoid villi and increase ICP^[8].

Regarding other clinical feature of GBS in patients with papilledema, the follow up (after 3 months) also showed complete resolution of these finding, this agree with usual outcome of disease in general which was reported by Biomed Central Neurology in United Kingdom (BMC) 2013 in which (87%) of GBS experience full recovery^[17].

This study showed there is significant correlation between (CSF Protein level and CSF pressure) with time of CSF aspiration, the CSF protein level and pressure increase with time, this agree with Turkish study by Sahin carried out between 2011 and 2015 on 24 patients in which the CSF Protein level could be normal in first week and start to elevated after that in 2nd and 3rd week^[18]. And since the cause of papilledema is the high CSF protein, so give impression for increase possibility to find papilledema with time of disease progression.

CONCLUSIONS

There is correlation between GBS and papilledema, the percent of papilledema in GBS was 4.29%.

CSF protein level and pressure was significantly elevated in patients with papilledema comparing to those without. CSF protein level and pressure was elevated with time of disease progression.

No significant difference in the age, gender, limb weakness, sensory involvement, bulbar involvement, respiratory involvement, need for mechanical ventilation and facial palsy among patients presented with or without papilledema. But regarding the patients who had high CSF protein, there is significant association between papilledema and requirement for the mechanical ventilation.

There is more correlation between papilledema and AIDP as compared to (AMAN, AMSAN).

Effect of Sensory and Tactile Stimulation to Increase Glasgow Coma Scale (GCS) Score on Stroke Clients who Have Consciousness Disorders at Abdul Moeloek Hospital, Lampung

Purbianto¹, Dwi Agustanti¹

¹Health Polytechnic of Tanjungkarang, Indonesia

ABSTRACT

The stroke prevalence based on the diagnosis of health workers and the symptoms found in Lampung province was 5.4 ‰. This study aimed to determine the effect of sensory and tactile stimulation on increasing Glasgow Coma Scale (GCS) scores in stroke patients who experience decreased consciousness, using experimental quasy designs. The population in this study were stroke patients with decreased consciousness (GCS < 13), with a sample size of 32 respondents. Each respondent was measured for 5 days. The mean GCS score before intervention in the treatment group was 8.31 and the control group was 11.06. After the intervention, the mean GCS score in the intervention group was 8.94 and the control group was 11.12. While the p-value was 0.006, so it was interpreted that sensory stimulation and tactile stimulation can significantly increase the GCS score. It is recommended that nursing practitioners apply sensory stimulation and tactile stimulation in the management of stroke patients who experience impaired consciousness.

Keywords: *Sensory stimulation, Tactile stimulation, Stroke, GCS score*

INTRODUCTION

Stroke is a functional disorder of the brain due to obstruction of blood flow to the brain caused by blockage (ischemic stroke) or brain hemorrhage (hemorrhagic stroke) which can cause nerve paralysis even to death. According to Basjiruddin (2007), in the USA it is estimated that the incidence of strokes per year in the USA is > 700,000 which causes 160,000 (20%) deaths per year. Stroke is the third leading cause of death in industrialized countries and is a major cause of disability in adults. The incidence of stroke is increasing, because the number of people aged > 65 years has increased from 390 million at present to 800 million by 2025⁽¹⁾.

Based on the 2013 Riskesdas data, it is known that there are 12 stroke patients per 1000 population. The prevalence of stroke in Lampung Province based on the

diagnosis of health workers is 3.7 ‰ and based on the diagnosis of health workers and symptoms is 5.4 ‰⁽²⁾.

Stroke is the number one killer disease in Indonesia. People aged > 65 years are most at risk for stroke, but 25 % of strokes also occur in people aged < 65 years, including children. People who smoke, lack exercise, and have a poor diet are also prone to stoke. In addition, people with impaired blood circulation due to high blood pressure, high cholesterol, irregular heartbeat or atrial fibrillation, and diabetes, are also prone to stroke⁽²⁾.

The initial attack of ischemic stroke is generally in the form of impaired consciousness, unconsciousness, confusion, headache, difficulty concentrating, disorientation, while hemorrhagic strokes are usually often accompanied by acute headache and decreased consciousness that develops rapidly to coma⁽¹⁾.

Nursing or non-pharmacological therapies that can be given to patients with coma are to provide sensory stimulation in the form of visual stimulation, olfactory, tactile, gustatory, auditory and⁽³⁾. Sensory stimulation as soon as the symptoms of stroke are detected can prevent widespread damage to the brain area⁽⁴⁾.

Health Polytechnic of Tanjungkarang, Indonesia,

E-mail: heruswn@gmail.com

The effects of sensory stimulation, one of which is music therapy can reduce the stimulation of the sympathetic nervous system. The response that arises from the decline in activity is a decrease in adrenaline activity, reduce tension in neuromuscular activity, and increase the threshold of consciousness. Indicators that are commonly measured are decreased heart rate, respiratory rate, stomach acid, and blood pressure⁽⁵⁾.

Campbell (2002) states that hospitals in the world that apply music therapy such as Beth Abraham Hospital in the American Bronx, Charing Cross Hospital in London, music therapy are used during the surgical process. Saint Luke’s Hospital in Chesterfield uses music therapy in the field of physical rehabilitation, Saint Mary Hospital’s respiratory intensive care unit in Green Bay uses music therapy in order to create a healing atmosphere⁽⁶⁾.

Besides sensory stimulation, tactile stimulation also has important meaning. According to Scanhanberg, touch has power ten times greater than verbal or emotional contact, and touch affects almost everything a person does. There are no other senses that are more stimulating than touch. Researchers now know that certain types of tactile stimuli on the skin, will send a message to the brain, which in turn stimulates the formation of oxytocin and endorphins. Oxytocin strengthens the bond between mother and baby, while endorphin-peptide is related to opiates which creates a feeling of comfort⁽⁷⁾.

In Indonesia, music therapy and tactile stimulation have not been widely applied in Dr. H. Abdul Moeloek hospital also has not applied sensory stimulation and tactile stimulation as one of the alternative therapies in order to cure patients.

MATERIALS AND METHOD

The design of this research was quasi-experimental. The research was conducted on 2 to 31 October 2017 at

Dr. H. Abdul Moeloek Hospital, Lampung, Indonesia. The population of this study were impaired ischemic and hemorrhagic stroke patients (GCS < 13) who were treated in the intensive care unit (ICU) and the Bougainvillea Room of Dr. H. Abdul Moeloek Hospital, Lampung. The sample size of the intervention group and control group were 16, respectively, chosen by accidental sampling technique.

The research intervention instrument was a music player from the VSB - 810 Desktop Bluetooth Speaker using soft volumes without earphones. The data collection instrument about Glasgow Coma Scale (GCS) was an observation sheet. Data collection was carried out using the following procedures: 1) before being given sensory and tactile stimulation, GCS was first measured, 2) music was played to the patient, with a volume that was heard by normal people’s ears, for 30 minutes, 3) when the patient listened to music, tactile stimulation was carried out by sweeping tapping technique, that was, the patient’s family rubs all of the patient’s extremities for 20 minutes, followed by an approximation of pressing all the joints on the extremities for 10 minutes (the family must be trained first, 4) sensory stimulation was performed once a day, morning, afternoon and at night, for 5 days, 5) GCS evaluation was carried out, 6) calculation of the difference in GCS values between pre-intervention and post-intervention in the intervention group and control group. data about awareness level (GCS) is numerical data so it is presented in the form of mean, standard deviation, minimum score and maximum score⁽⁸⁾. The T test with a 95 % confidence interval was used to test the difference in GCS values between the two groups.

FINDINGS

The results of measuring the level of consciousness of patients based on GCS for the intervention group and control group are presented as follows.

Table 1. The level of consciousness of patients based on GCS for the intervention group and control group before the intervention

Group	Mean	SD	Min – Max	95% CI
Intervention group (n = 16)	8.31	2.245	5-13	7.12-9.51
Control group (n = 16)	11.06	2.048	7-13	9.97-12.15

Table 2. The level of consciousness of patients based on GCS for the intervention group and control group after the intervention

Group	Mean	SD	Min – Max	95% CI
Intervention group (n = 16)	8.94	2.048	5-13	7.85-10.03
Control group (n = 16)	11.12	2.125	7-14	9.99-12.26

Table 3. Comparison of changes in GCS mean scores between the intervention group and the control group

Group	Before	After	Changes in mean score	p-value
Intervention group (n = 16)	8.31	8.94	0.63	0.0006
Control group (n = 16)	11.06	11.12	0.60	

Based on the table above it can be interpreted that the intervention group has an increase in the average GCS score that is greater than the control group. The T Test results showed p-value 0.006 so it was concluded that there was a significant difference between the GCS mean score of the intervention group and the GCS mean score of the control group.

DISCUSSION

Based on the results of data analysis, there were significant differences in GCS mean scores between the intervention groups who received music therapy and tactile stimulation, with the control group. The results of this study are in line with the results of Asrin's research that music therapy is useful in increasing the status of consciousness of patients with severe head trauma. In addition, music therapy can also provide a positive stimulus to physical and psychosocial responses⁽⁹⁾.

Rosenfeld & Dun (1999) also reported the same thing that music therapy can help patients to restore awareness, communication, some physical abilities, and provide a pleasant experience⁽¹⁰⁾. Auntari (2001) concluded that auditory stimulation is a beneficial thing to encourage healing of head injury patients from coma and increase the level of patient awareness⁽¹¹⁾. The behavioral response of head injury patients with loss of consciousness who are given stimulation of familiar music sounds is greater than patients who are not given music sound stimulation. The above can occur due to the relaxation effect of soft music which is likely to have a positive effect on the brain because of the reticular activating system (RAS) which functions to control alertness or awareness and wake-sleep cycles. For patients with unconscious head

trauma, the only function is the RAS and hypothalamus and as a consequence of the healing process, the higher elements of the brain will begin to function⁽¹⁰⁾.

The effect of sensory stimulation including music therapy is to reduce the sympathetic nervous system stimulation. The response that arises from the decline in activity is decreased adrenaline activity, decreased tension in neuromuscular activity, and increased awareness threshold. Indicators commonly measured are decreased heart rate, respiratory rate, decreased gastric acid, and decreased blood pressure⁽⁵⁾.

When viewed from the mechanism of the relationship between the nervous system and the endocrine system, music stimulation or sound waves can stimulate the activation of dopamine which physiologically plays a role in increasing one's alertness. This is consistent with other studies at McGill University Montreal that "listening to music can trigger the release of dopamine in the body⁽¹²⁾.

In this study, in addition to sensory stimulation patients also received tactile stimulation. According to Scanhanberg, touch is ten times stronger than verbal or emotional contact, and touch also affects almost everything a person does. There are no other senses that are more stimulating than touch. Researchers now know that certain types of tactile stimuli on the skin, will send a message to the brain that stimulates the formation of oxytocin and endorphins. Oxytocin strengthens the bond between mother and baby, while endorphin-peptide which is related to opiates creates a feeling of comfort⁽⁷⁾.

Tactile stimulation is performed on the skin, muscles, joints with various techniques, namely tapping, swiping, approximation. Tactile stimulation in principle must cause muscle contraction, so that it will stimulate the golgi tendon and muscle spindle. Impulses derived from muscle spindles and tendon organs are sent by conduction fibers that are the most rich in myelin, namely fiber. Other proprioceptive impulses derived from fascial receptors, deeper joints and connective tissue, travel in less myelin fibers. Knocking, swiping, tapping and approximation will stimulate proprioceptors on the skin and joints, the muscle spindle will react by sending the impulse to the anterior motoneuron. Stimulating these neurons causing a brief increase in contraction.

Stimulation of muscle spindles and golgi tendons will be informed through afference to the central nervous system so that they will contribute facilitation and inhibition (gracianin). The tactile stimuli that are repeated will provide information to the “supraspinal mechanism” so that an integrated motion pattern occurs and becomes movements with functional patterns. Tactile stimulation through the peripheral motor nerves exercises “graps” and “release” hand functions and can facilitate muscle weakness in movement.

CONCLUSION

Based on the results of the study it can be concluded that the combination of music therapy and tactile stimulation proved effective to increase consciousness of stroke patients who experience impaired consciousness.

²Department of Biology, College of Science, Mustansiriyah University, Bagdad, Iraq

ABSTRACT

This study aims to evaluating the possible effect of anabolic androgen steroids (AAS) and diet supplements DS consuming by bodybuilders on their liver function and some biochemical parameters depending on consuming period. Blood samples were collected from 20 men didn't play any sport and 82 sport men who divided to four groups: 20 bodybuilder men consuming AAS, 20 consuming DS, 20 without consuming, and 22 football players. BMI of the subjects were also calculated. BMI and The frequency of overweight were significant higher in bodybuilder consuming AAS compared to other groups. Total and direct serum billirubin was significant higher in football player than bodybuilder consuming AAS and DS. The total bilirubin was also significant higher in football player than non sport men. While Alkaline Phosphate (ALKP) level was significant lower, Aspartate transaminase AST and Alanine transaminase (ALT) level were significant higher in serum of bodybuilder consuming AAS. Furthermore, their levels in bodybuilder consuming diet supplement were significant higher than non sport. No differences in ultra high-density lipoproteins (UHDL) and Cholesterol (Chol) levels were detected while Trig level was significant lower in serum of football player. Triglyceride (Trig) level was also significant lower in the serum of bodybuilder without consuming than consuming AAS. The differences of these parameters were studied in Bodybuilder consuming AAS and diet supplement groups in three consuming period: less 1 year, 1 to 2 years, and more than 2 years. No differences between the two groups after consuming period less than 1yr and 1-2yr while significant higher in bodybuilder consuming AAS after more than 2yr compared to consuming supplement were detected. As conclusion, both AAS and protein supplements have side effects on the liver function and other biochemical parameters and these effects increase with the consuming period especially the effects of AAS.

Keywords: *AST, ALT, AAS, ALKP, billirubin*

INTRODUCTION

The search for ways to increase the speed and quality of physical strength and activity has been a tendency for centuries⁽¹⁾. The use of hormones and protein supplements has become prevalent throughout the world. More disturbing is the fact that multiple studies have reported that a large number of people who consume these improvements did not seek medical advice before taking them⁽²⁾. Most athletes use more than

one product. The widespread use of anabolic steroids (AAS) has been reported by athletes, for purpose of enhance muscle functions and strength in sport.

The side effects of AAS abuse are well established such as its effect on the cardiovascular system⁽³⁻⁵⁾, hepatic function^(6, 7), and adrenal and renal function^(8,9). On the other hand, the usage of supplements is more accepted by bodybuilders because of not mentioned some harmful additives, which are included in dietary supplements, on the labels of their packages. Despite the fact that these supplements have many side effects, they are not subject to a serious examination of their effectiveness and public safety⁽¹⁰⁾. Many studies have reported that dietary supplements have many dangers effect such as, cardiovascular disease, blood diseases,

Jamela Jouda

Department of Biology, College of Science,
Mustansiriyah University, Bagdad, Iraq
jamela.jouda@uomustansiriyah.idu.iq

metabolism, and neurological problems⁽¹¹⁾ While there is little scientific data confirming the beneficial effects of dietary supplements in athletes⁽¹²⁾.

So this study was conducted for the purpose of evaluating the possible effects not only of steroids hormones but also of some commonly used supplements by bodybuilders on their some biochemical and liver function parameters depending on consuming, and then comparison was made with a control group.

MATERIAL AND METHOD

In this study, a total number of 82 sport men were selected from the different gyms in Thi-Qar/Iraq which divided to four groups: 20 bodybuilder men consuming AAS (G1), 20 bodybuilder men consuming diet supplements (G2), 20 bodybuilder men without any drug consuming (G3), and 22 foot ball players (G4); and 20 men didn't play any sport (G5) with apparently healthy status were included. The age group was in the range of 18- 40 years.

After one day from ASS and DS consuming, the consent was taken and 5 ml of venous blood was collected from antecubital vein with all proper aseptic precautions and by disposable syringe in a dry sterile test tube. The blood samples were centrifuged for 5 min. at 5000 rpm. The serum samples were used to estimate the biochemical and liver function parameters by Architect plus/Abbott c4000/ Germany using kits from Abbott.

The body weights of individuals were measured by body balance and the body heights of them were

measured by paper tape. BMI was calculated as weight in kilograms divided by height in meters squared⁽¹³⁾. The BMI of individuals was classified according WHO classification to underweight, Normal weight, overweight, and obese (<18.5, 18.5-24.9, 25.0-29.9, and >30 kg/m² respectively).

Results are expressed as mean ± standard error (M±SE) or ± standard deviation (M±SD) and as frequency of observations percentage (Cases %). Data were analyzed by one-way analysis of variance (ANOVA) followed by Fisher's test for multiple comparisons, using Statview version 5.0. Differences were considered significant when p<0.05.

RESULTS

The (M±SD) of age was significant lower in the football player (G4) (22.3±0.9) than other groups (27.4±1.4 in G1, 27.9±1.3 in G2, 29.7±1.8 in G3, and 26.1±1.4 in G5). The (M±SE) of BMI was significant higher in the bodybuilder consuming AAS (G1) (27±0.4) compared to other groups (24.9±0.4 in G2, 24.2±0.3 in G3, 23.4±0.2 in G4 and 22.8±0.3 in G5). The frequency of overweight was also significant higher in the bodybuilder consuming AAS (G1) (82%) and in DS (G2) (45%) compared to others (20% in G3, 10% in G4 and G5).

Total and direct serum bilirubin was significant higher in football player than bodybuilder consuming AAS and consuming DS. The total bilirubin was also significant higher in football player than non sport men (Figure-1)

Figure-1: Direct (A) and Total (B) bilirubin levels in serum of bodybuilder consuming AAS (G1), consuming DS (G2), without consuming and supplement (G3), football player (G4), and non sport (G5). \$ Significant difference vs G1, & significant difference vs G2, and § Significant difference vs G5

GOT or AST and GPT or ALT levels were significant higher in serum of bodybuilder consuming AAS compared to non sport, football player, and bodybuilder without consuming. Furthermore, AST level in bodybuilder consuming DS was significant higher than non sport. (Figure-2A&B)

ALKP level was significant lower in serum of bodybuilder consuming DS compared to non sport, football player, and bodybuilder without consuming (Figure-2C)

Figure-2: AST (A), ALT (B), and ALKP (C) levels in serum of bodybuilder consuming AAS (G1), consuming DS (G2), without consuming and supplement (G3), football player (G4), and non sport (G5). * Significant difference vs G5, # significant difference vs G4, and § Significant difference vs G3.

No differences in UHDL and Chol levels were detected while Trig level was significant lower in serum of football player compared to consuming AAS, and DS. Trig level was also significant lower in the serum of bodybuilder without consuming than consuming AAS. (Figure-3)

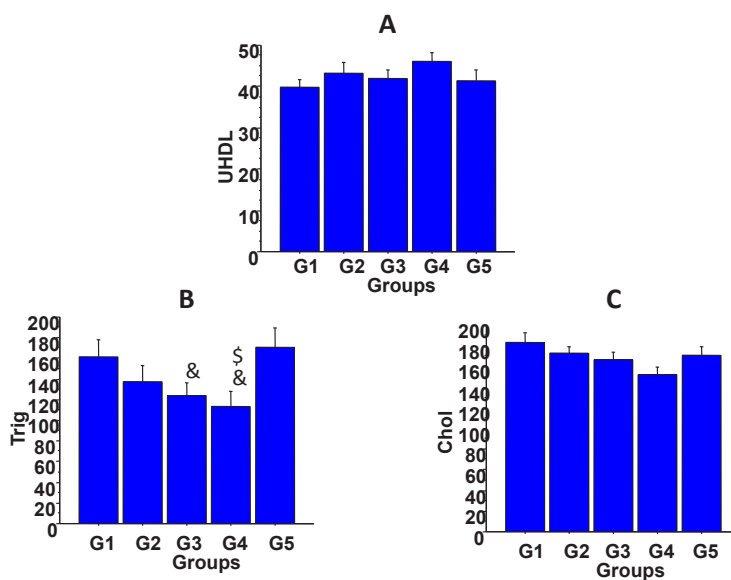

Figure-3: UHDL (A), Trig (B), and Chol (C) levels in serum of bodybuilder consuming AAS (G1), consuming DS (G2), without consuming and supplement (G3), football player (G4), and non sport (G5). § Significant difference vs G1, and & significant difference vs G2.

No differences in the Direct and total bilirubin levels between the two groups after consuming period less than 1yr and 1-2yr were detected while significant higher direct and total bilirubin levels in bodybuilder consuming AAS compared to DS after more than 2yr consuming period (Figure-4)

In bodybuilder consuming AAS, AST level was significant higher after consuming period 1-2yr while

ALT and ALKP levels were significant higher after more than 2yr compared to consuming DS (Figure-5).

No differences in the UHDL, trig, and chol levels between the two groups after consuming period less than 1yr and 1-2yr were detected while after more than 2yr they were significant higher in bodybuilder consuming AAS compared to consuming DS (Figure-6)

DISCUSSION

Many athletes used Anabolic because of its effect on protein synthesis and muscle growth⁽¹⁴⁻¹⁶⁾ which lead to increase muscle size and reduce body fat. AASs produce anabolic effects by binding to receptors of steroid. They activate the receptor of androgen which controlled the targeted gene transcription and lead to regulate the accumulation of DNA needed for growth of muscle. Since amino acids are effectively used for synthesis of proteins, The muscular strength and mass are increase when AAS bind with the androgen receptor of skeletal muscle^(14, 17). It also reduces the glyocorticoid-based metabolism by linking competitively to glucocorticoid receptors⁽¹⁸⁾. These evidences can explain the increase of BMI and the frequency of overweight in bodybuilder group which consumed AAS Bodybuilders. On the

other hand, the bodybuilder may complement their protein diet for convenience, lower cost (relative to meat and fish products), ease of preparation, to avoid the simultaneous consumption of carbohydrates and fats, and to support maximum muscle growth^(19, 20); but Anders et al reported there was no significant effect on BMI by consuming diet supplement⁽²¹⁾. Our results show that the BMI didn't affected by diet supplement but the frequency of overweight was higher also in the bodybuilder consuming diet supplement.

The hepatotoxicity occurrence of drug is a major problem in all stages of clinical development of drug and the main cause of post marketing warnings and withdrawals⁽²²⁾. The liver function tests asymptotically elevated during clinical trials resulting by drug-related and many other factors, such as strenuous exercise which may increase the levels of blood transaminase⁽²³⁾ but there was no information about the effect of body build on liver function tests^(24, 25). In this study, it has been shown that consuming of AAS and diet supplement resulted in profound increases in the liver function parameters, AST and ALT but not ALKP levels.

AAS has many toxic and hormonal effects which were documented, attention has recently been shifted to increased levels of cholesterol and LDL and decrease levels of HDL^(26, 27). Some studies have showed that repeated doses of AAS are correlated with an increase in cholesterol levels, while others have failed to show such correlation⁽²⁸⁾. Some studies have reported that the high exercise increase the liver lipoprotein lipase, which in turn leads to improved TG clearance and may reduce the plasma clearance of HDL components⁽²⁹⁾. The significant variation in the effect of ASS on cholesterol and triglyceride may be due to different study designs used, sampling time, AAS type, management path, and etc^(30, 31). our study has showed that the levels of cholesterol, UDHL, and triglyceride did not effected in the bodybuilder consuming AAS or diet supplement but triglyceride decreased in bodybuilder without consuming any drug and in football player.

In this study, all these parameters levels were higher after 2 years from AAS consuming compared to diet supplement. So we can concluded that both AAS and diet supplements have side effects on the liver function and other biochemical parameters and these effects increase with the consuming period especially the effects of AAS.

ABSTRACT

Introduction: Menopause is a natural thing that happens to every woman, Some people think that menopause is a pleasant thing and some think that menopause is sadness because of losing productive time, often women face menopause with anxiety and anxiety because menopause is identical to aging, mostly women enter the premenopausal period three to five years earlier than actual menopause. This study aims to determine the correlation concept of self with women's anxiety in the face of menopause.

Method: The study design used analytic observational with a partial cross-sectional approach, the independent variables in this study were self-concept and dependent anxiety, with a population of 70 respondents. The sample was 60 respondents using Probability Sampling simple random sampling technique using questionnaires. To obtain the significance level of the relationship, chi-square (χ^2) statistical test was performed with $\alpha = 0.05$.

Results: The results showed that most respondents had a positive self-concept, that most respondents have experienced mild anxiety, there is a relationship of self-concept with women's fear in the face of menopause in Sampang Village, Sampang District, Madura Regency.

Discussion: The results of this study are expected to add insight and knowledge for respondents especially regarding self-concept and anticipate the occurrence of anxiety in the face of menopause so that they are ready to face the age of menopause.

Keywords: *Anxiety, Self Concept, Menopause*

INTRODUCTION

Menopause is naturally happen to every woman, Some people think that menopause is a pleasant thing and sadness because of losing productive time. Women often face menopause with anxiety because of identical to aging(1) . The term menopause means the period of menstruation stops. This period is the normal stage of life where every woman will pass between the ages of 40 and 60, the average menopause starts at the age of 52. Most women enter the perimenopause period three to five years earlier and the real menopause (Life challenge.s.2007). The stages of development are one psychological stressor. For example, adolescence, adulthood, advanced menopause that naturally will be experienced by everyone. And if these stages of

development cannot be exceeded properly (unable to adapt) there will be anxiety (2).

The menopausal syndrome is experienced by many women in almost all of the world. Around 70-80% of European anita. 60% of women in America. 57% of women in Malaysia. 18% of women in China 10%, women in Japan and Indonesia(3). In Asia, according to the World Health Organization (WHO), in 2025 the number of elderly women will increase from 107 million to 373 million. In Indonesia, life expectancy from year to year has increased. In 1971 Indonesia's life expectancy was 46.5 years, and in 2005 it reached 68.2 years. Besides that, there was a shift in menopause age from 46 years in 1980 to 49 years in 2000. This increase was also experienced by Lampung Province. Namely

the number of life expectancy in 2002 was 66.1 years to 67.6 years in 2004 and Metro as the highest city, the life expectancy is 71.8 years with a population of pre-age women as many as 8,948 people. Metro Timur Subdistrict area is the number of pre-elderly women as many as 2017 people ⁽⁴⁾. The results of the preliminary study conducted at the Panglangkek District of Bajur Village, Waru Subdistrict, Pamekasan Regency, through interviews with ten postmenopausal women found that most (75%) of women before menopause experienced anxiety in the face of menopause and 25% did not experience anxiety.

Health problems begin to emerge due to the loss of the hormone estrogen which plays an active role in the work system of female organs. Changes that occur a lot at this time are physical changes, ranging from hair, eyes, skin to other physical organs. Target physical organs such as problems in the breast and vagina, as well as a burning sensation that radiates in the body (hot flushes). Some factors that influence a person's self-concept are the high expectations for work and ideal in a person. Although not an illness, this event has an impact on a woman's life, especially for women who are active, so that it can be felt as a disorder⁽⁵⁾. Psychological symptoms at menopause are Moodiness. Anxiety, change in mortality and feelings, emotional lability feel helpless, memory impairment. Reduced concentration. difficult to decide. Feel worthless⁽⁶⁾. These symptoms result in changes in self-concept. Stressors that can affect self-concept are a loss of body parts, surgery, pathology of disease, changes in body structure and function, growth and development, procedures and treatment⁽⁷⁾. It is estimated that the number of people who suffer from both acute and chronic anxiety reaches 5% of the population, with a comparison between women and men 2 to 1 ⁽⁸⁾. It is influenced by several factors including the level of education and economic status as well as information sources with a sufficient level of education that someone will be more mature in dealing with all the problems that occur. Information about health is needed for a woman before menopause. With enough information, a person will gain knowledge so they can understand their own needs.

The effort that must be done is to add insight or increase knowledge about the symptoms caused during pre-menopause to anticipate changes - changes that occur in a person. Anxiety often disturbs women aged 40-60 years. These feelings also arise due to a lack of

knowledge about menopausal signs and symptoms. Also, information and counseling about the changes in menopause they have not received, causing fear of being ostracized or no longer noticed by family members. It can be overcome by increasing knowledge through counseling and counseling by health workers (Posted, 2008).

The effort that must be done is to add insight into the causes caused during pre-menopause to anticipate changes that occur in a person. Anxiety often disturbs women aged 40-60 years. These feelings also occur. Also, information and counseling about the changes in menopause they have not received, causing fear of being shocked or no longer noticed by family members. It can be overcome by increasing knowledge through counseling and counseling by health workers (Posted, 2008).

METHODOLOGY

The research design used in this study is analytic observational, which examines the relationship between variables that aim to reveal the relationship between variables. With a study cross sectional approach, the type of research that emphasizes the time of measurement of independent and dependent variables is assessed simultaneously at one time, and there is no follow-up ⁽⁹⁾.

The population in this study were all women aged 40-60 years in Pangdangkek Hamlet, Bajur Village, Waru District, Pamekasan Regency.

In this study, the researcher used the Probability Sampling technique which is by using simple random sampling which is grouping data based on the area ⁽¹⁰⁾.

To collect data, the researcher will use a Closed-Ended Questionnaire which has been made by the researcher concerning the library consisting of 10 questions for self-concept including, physical changes, body shape, individual way of looking at themselves and psychological stability while 14 statements for anxiety. From the results of the presentation of the questionnaire described descriptively by using a frequency distribution table in the form of a table that is confirmed in the form of percentages and narratives.

To determine the relationship of self-concept with the level of anxiety of women in the face of menopause in the village Pangdangkek Bajur Waru District Pamekasan. Chi-square statistical test was used with

SPSS computerization technique with a significant level of 95% or $\alpha = 0.05$. This correlation coefficient test is a test to measure the degree of closeness of a relationship between levels or variables in a sequence of levels of other variables with data requirements on ordinal or semi-quantitative scale variables. The degree of significance $\alpha = 0.05$ means that if p is less than 0.05 H_0 is rejected and H_1 is accepted and if p is more than 0.05, H_0 is accepted, and H_1 is rejected

RESULTS

In this section, there will be presented the results of research showing the relationship of self-concept with the anxiety of pre-menopause women in Pangdangkek village, Bajur village, Waru sub-district, Pamekasa district.

General Data

Characteristics of respondents based on age. Table 1 Distribution of Frequency of Respondents by Age in Bajur village Based on Table 1 shows that most respondents aged 48-49 years were 42 people (70%)

Characteristics of respondents based on education. Table 2 Distribution of Frequency of Respondents by Education in Bajur Village Based on table 2 shows that most respondents have elementary school education as many as 33 people (55%)

Characteristics of respondents based on work. Table 3 Distribution of Frequency of Respondents by Work in Bajur Village. Based on table 3 shows that most respondents work as farmers as many as 31 people (51.7%)

Characteristics of respondents based on religion. Table 4 Distribution of Frequency of Respondents Based on Religion in Bajur Village. Based on that all Islamic respondents were 60 people (100%)

Characteristics of respondents based on the number of children. Table 5 Distribution of Frequency of Respondents Based on Number of Children in Bajur Village. Based on that almost half of the respondents had 2 and three children each with 23 people (38.3%)

Primary Data

Characteristics of respondents based on self-concept

Table 1 Distribution of Frequency of Respondents Based on Self Concept

Self-concept	Frequency (F)	Percentage (%)
Positive	32	53.3
Negative	28	46.7
Total	60	100

Based on Table 1 shows that most respondents have a positive self-concept as many as 32 people (53.3%)

Characteristics of respondents based on the level of anxiety in the face of menopause

Table 2: Distribution of Frequency of Respondents Based on Anxiety Levels of Premenopausal Women in Facing Menopause

Anxiety level	Frequency (F)	Percentage (%)
No anxiety	0	0
Mild anxiety	36	60
Medium anxiety	16	26.7
Severe anxiety	8	13.3
Very severe anxiety	0	0
Total	60	100

Based on Table 2 shows that most respondents experience mild anxiety as many as 36 people (60%)

The relationship between Self-Concept and Women's Anxiety in Facing Menopause

Table 3 Cross-tabulation of Self-concept and Anxiety of Pre-Menopausal Women in Facing Menopause

		Anxiety level			Total
		Medium anxiety	Severe anxiety	Very severe anxiety	
Self concept	Positive	30	2	0	32
		93.8%	6.3%	.0%	100.0%
	Negative	6	14	8	28
		21.4%	50.0%	28.6%	100.0%
Total		36	16	8	60
		60.0%	26.7%	13.3%	100.0%
P= 0.000					

Table 3 shows that most respondents (53.3%) as many as 32 respondents had a positive self-concept and experienced mild anxiety as many as 30 people (50%). To find out the relationship between self-concept and women's anxiety in the face of menopause, it was tested using the chi-square test with SPSS 15 for Windows program, it got the result that df 2 with 32.879 person correlation with a significant level of 0.000 < 0.05 means that H1 is accepted and Ho is rejected thus there is relationship of self-concept with women's anxiety in the face of menopause in Bajur Village

DISCUSSION

Self-Concept

From the results of the study found that most respondents have a positive self-concept as much as 32 respondents (53.3%) of the total respondents. Self-Concept is how one views size. Appearance and function of the body and its parts ⁽¹¹⁾. When someone is born to death. Then for 24 hours a day, the individual lives with his body. So that every change in the body will affect the lives of individuals ⁽¹²⁾. Changes in body appearance. Like amputation or changes in facial appearance is a stressor that influences self-concept ⁽¹³⁾. A realistic view of self. Receiving and liking parts of the body will provide a sense of security to avoid anxiety and increase self-esteem.

With a positive self-concept, one will be more able to accept all forms of change in themselves, so that they will be more confident in their condition. This causes a person to be more able to act positively in every action. In this study, most respondents have a positive self-concept. This is influenced by several factors including the age of a person.

That most respondents are aged 48-49 years. This age range is considered as an adult and has a lot of experience in living life. So they know more about their needs and what they have to do to meet the needs of their families. By the opinion of the more mature someone's age, they will have more experience and knowledge so that they can meet the needs of both the family and themselves.

The anxiety of Premenopausal Women in Facing Menopause

That most respondents experienced mild anxiety as many as 36 respondents (60%). According to ⁽¹⁴⁾, that anxiety is a feeling experienced by an individual, such as when he experiences fear. In this anxiety, feeling is vague, unrealistic or unclear object while the object fear is clear. Anxiety is a form of feeling of worry, anxiety and other unpleasant feelings. Usually, these feelings are accompanied by a feeling of lack of confidence, inability, feeling inferior, and unable to deal with a problem. Indecisiveness of individuals in facing a problem and coupled with concerns about things that are not clear are signs of anxiety in individuals. Anxiety

is a psychological reaction to the mental condition of a depressed individual. If people realize that things that can't work well in certain situations will end badly, they will worry. Pressing conditions or situations will cause anxiety⁽¹⁵⁾.

From the description above shows that anxiety is an individual psychological condition in the form of tension, anxiety, anxiety as a reaction to the existence of something that is threatening.

Relationship of Self Concept with Anxiety of Premenopausal Women in Facing Menopause

Based on the cross-tabulation of the relationship between self-concept and pre-menopausal women's anxiety in the face of menopause, the data obtained showed that the majority of respondents (53.3%) as many as 32 respondents had a positive self-concept and experienced mild anxiety as many as 30 people (50%).

Changes in body appearance. Such as amputation or changes in facial appearance is a stressor that clearly affects the self-image⁽¹⁶⁾. The impact of self-change on a person includes, Refusing to see and touching the changing parts, Not being able to accept changes in the structure and function of the body, Reducing social contact so that there is self-cultivation, feeling or negative view of the body, Preoccupation with body parts or lost body functions, Expressing despair, expressing fear of being rejected, depersonalization, refusing an explanation of body changes. Thus someone will be reluctant to meet other people. But if it is addressed with someone's maturity, it will ease the burden on him. So it doesn't worry too much about the situation.

If someone has a positive self-concept, then anxiety in the face of menopause will decrease. This is evidenced by the results of the above research that most respondents have a positive self-concept and experience mild anxiety.

CONCLUSION

Most respondents have a positive self-concept, some respondents have mild anxiety experiences. Women who have a positive self-concept will experience mild anxiety in the face of menopause.

SUGESTION

The results of this study are expected to add insight and knowledge for respondents especially regarding

self-concept and anticipate the occurrence of anxiety in the face of menopause.

Add information about your self with anxiety in the face of menopause

The results of this study can be used as additional references in improving knowledge about the self-concept of pre-menopausal women in the face of menopause. And it is hoped that it can be used as additional reference material in improving health services for the community.

The Effect of Use of Edutainment on Changes in Hemoglobin Levels in Adolescents (Case Study of SMPN 4 Banjarbaru)

Nia Kania¹, Siti Nurhayani², Lenie Marlinae³, Nida Ulfah³

¹Department of Pathology Anatomy, Ulin General Hospital, ²Student of Public Health Magister Program,

³Environmental Health Department, Medical Faculty Lambung Mangkurat University

ABSTRACT

Anemia is a body condition characterized by deficiency in size and number of erythrocytes or in insufficient hemoglobin levels for the function of O² and CO² exchange between blood tissues. The prevalence of anemia in adolescents in Indonesia is quite high, namely 21.7% with anemia sufferers aged 5-14 years by 26.4% and 18.4% of patients aged 15-24 years. Banjarbaru City is the highest area of anemia in adolescents in South Kalimantan Province at 58.75%. Efforts that can be made to improve the application of balanced nutrition in adolescents in preventing anemia have not been optimal either direct efforts such as giving tablets blood or not directly through counseling and socialization. another effort to provide information related to nutrition according to their needs, one of which is to provide nutritional education in the form of counseling edutainment. Edutainment is a form of counseling or education that is packaged in the form of fun entertainment. The purpose of the study is to analyze the effect of using edutainment on changes in hemoglobin levels in young women.

The study uses a Quasi Experiment design with a pre-test and post-test group design approach. The number of samples was 90 young women who were taken by purposive sampling technique. The data obtained were then analyzed using Paired T-Test and Wilcoxon statistical tests for paired different tests, and Anova and Kruskal Wallis tests for unpaired different tests, which was then followed by Post Hoc test for Anova test and Mann Whitney test for Kruskal Wallis test. The results of statistical analysis showed that overall the p value obtained was <0.005, this indicates the meaning that edutainment booklet and edutainment video had different effects before and after the intervention was given to changes in hemoglobin levels in adolescent girls.

Keywords: Edutainment, Changes in Hemoglobin Level, Anemia in adolescents

INTRODUCTION

Anemia is a body condition characterized by deficiency in size and number of erythrocytes or in insufficient hemoglobin levels for the function of O² and CO² exchange between blood tissues¹. Based on data from the Data and Information Center of the Republic of Indonesia Ministry of Health (2016) the average adequacy of energy consumption for adolescents aged

13-18 years is 72.3% with the proportion consuming <70% of the energy adequacy rate (AKE) of 52.5%. shows that adolescents still consume energy under minimum requirements². The lack of energy needed can lead to anemia. This is corroborated by the 2013 Basic Health Research data showing that the prevalence of anemia in Indonesia is 21.7% with anemia patients aged 5-14 years at 26.4% and 18.4% of patients aged 15-24 years³.

Correspondence :

Nida Ulfah

uulnida74@gmail.com

Nutrition program report data from the South Kalimantan Health Office in 2015 stated that the prevalence of anemia among female teenagers in South Kalimantan was still quite high, amounting to

29.13% before administration of blood-added tablets. After blood-tablet intervention, the results decreased to 13.64%. Of the 13 Regencies or Cities, Banjarbaru City of 58.75% was the highest problem of anemia among female teenagers before administration of blood-added tablets (TTD) followed by Banjar Regency of 48.92% and Tanah Bumbu Regency of 43.67%. This is corroborated by the results of the 2015 Banjarbaru Nutrition Program report on the highest data in SMP 4 Banjarbaru as many as 82.4% of girls who experience anemia.

Efforts that can be made to improve the application of balanced nutrition in adolescents in preventing anemia have not been optimal, both direct efforts such as giving blood tablets or not directly through counseling and socialization. This is corroborated by the Banjarbaru City Health Office report data that after being given a tablet intervention the blood was still anemic at the second examination, which was as much as 26.17% above the anemia prevalence of South Kalimantan Province which was 17.81%. So it needs other efforts to provide information related to nutrition according to their needs, one of which is by providing nutritional education in the form of counseling edutainment. Edutainment is a form of counseling or education that is packaged in the form of fun entertainment⁴.

MATERIAL AND METHOD

The method used in this study is quantitative research with Quasi Experiment design using the pretest and posttest group design approach. This research method is applied to see the effect of media booklets and visual media on changes in hemoglobin levels in young women. This research was conducted at Banjarbaru 4 Middle School with consideration based on secondary data of the Banjarbaru city health service. The population in this study were all female adolescents in grades VII and VIII at Banjarbaru 4 Junior High School, totaling 309 people. The size of the sample in this study was calculated using a formula according to Lemeshow (1997) with a large sample of 81 young women. The dependent variable in this study is the change in Hb level. The independent variables in this study are edutainment booklet, video edutainment, edutainment booklet and video. Data was analyzed by univariate and bivariate.

FINDING

The results of the measurement of anemia levels before and after being given edutainment booklet

Table 1 Distribution of Hemoglobin Levels in Adolescent Edutainment Booklets

No	Hemoglobin Levels	Pretest		Posttest	
		n	%	n	%
1	Anemia	10	33.3	4	13.3
2	Not anemia	20	66.7	26	86.7
	Total	30	100.0	30	100.0

Distribusi kadar hemoglobin sebelum intervensi *edutainment booklet* remaja yang mengalami anemia sebanyak 10 orang (33,3%) terjadi penurunan setelah diberikan intervensi menjadi sebanyak 4 orang (13,3%).

Tabel 2. Efektifitas Edutainment Booklet Terhadap Perubahan Kadar Hemoglobin

No	Media	Tes Normality (Sig.)	Mean Rank	P-Value
1	Edutainment Booklet	.000	45.32	.001

Based on 4.18 table, the results of the wicoxon test showed $p < 0.05$ which showed that there was a change in hemoglobin level between pretest and posttest in the edutainment booklet group.

The results of statistical analysis on adolescent girls obtained p value < 0.05 . So that means that there is a difference in the effectiveness of edutainment booklets on changes in hemoglobin levels. Based on table 4.25 shows that the increase in the average value of hemoglobin levels in the group given booklet edutainment intervention is higher at 45.32, thus means that the booklet is more effective in increasing hemoglobin levels than other media in young women.

The results of the wicoxon test obtained p value < 0.05 , which means that there was a change in hemoglobin level between pretest and posttest in the edutainment booklet group. Based on table 4.6 the distribution of hemoglobin levels before the edutainment intervention of adolescent

booklets that experienced anemia were 10 adolescents (33.3%) decreased after being given intervention for 12 weeks as many as 4 meetings to be 4 adolescents (13.3%). This shows that the edutainment booklet affects changes in hemoglobin levels, this is due to the occurrence of increased knowledge, attitudes and behavioral changes in the fulfillment of balanced nutrition. This data is supported also by the results of the edutainment booklet media questionnaire in the appendix that has been made which shows that 97.5% of teenagers consider edutainment booklets interesting, 100% of teenage girls understand the contents of edutainment booklet media, 100%, like edutainment booklets, 100% edutainment booklet media increase knowledge about anemia for adolescents, 100% of edutainment booklet media increases insight on prevention of anemia in adolescents, 100% of edutainment media booklet contains about how to drink blood tablets, 100% of teenagers after reading edutainment media booklet agree to prevent anemia and average results the average questionnaire showed 99.75%. In addition, booklets can also be taken home, so that subjects can read or study them.

The results of Listiana research (2016) showed that health education with booklet media had an effect on changes in hemoglobin levels in children in elementary schools with a significant value of 0.043. Nutrition education or counseling is an educative approach to produce individual or community behavior that is needed to improve food improvement and nutritional status⁵. This is also corroborated by the Adirsa study (2005) that the results of paired t-test hemoglobin levels in the treatment group before and after the intervention showed $p < 0.05$, which means there is a significant difference in hemoglobin levels⁶. According to Peymen (2016) The level of knowledge and behavior in food selection will ultimately affect the nutritional state concerned⁷.

CONCLUSION

1. Edutainment booklets affect hemoglobin levels in young women.
2. Edutainment booklets are effective for increasing hemoglobin levels in young women.

ABSTRACT

Folate alpha receptor (FR α) was a membrane receptor protein of glycosyl-phosphatidyl-inositol, which used as an antigen marker and also as a new molecular subtype in breast carcinoma with complex and heterogeneous genetic disorders. This study aimed to determine a relationship among FR alpha expression with Estrogen receptor (ER), Progesterone Receptor (PR), and HER-2 expression in breast carcinoma. This was observational study with a cross-sectional design, FR alpha expression was confirmed by immunohistochemistry methods, ER / PR alpha expression using Allred Score (1998), Human Epidermal Growth Factor Receptor -2 (HER-2) expression according to ASCO and Cap (2013), histopathological grading based on Nottingham Modification of The Bloom Richardson System. The total sample for this study was 75 samples of breast carcinoma patients. This study showed FR alpha expression was not significantly associated with alpha ER / PR expression ($p = 0.887$) and histopathological degree ($p = 0.190$), but FR alpha expression was significantly associated with HER-2 overexpression ($p = 0.037$) in breast carcinoma. Overexpression FR alpha was more dominant in breast carcinoma with a poor and aggressive prognosis.

Keywords: Breast Carcinoma, FR alpha, ER-alpha, PR alpha, HER-2 neu.

INTRODUCTION

Breast cancer was a complex and heterogeneous disease, had different histological and molecular features, behavior and varied therapy responses. Heterogeneous breast cancer morphology was related to specific molecular profiles, which could be investigated with gene expression.¹ Estrogen receptor (ER), Progesterone Receptor (PR) and Human Epidermal Growth Factor Receptor -2 (HER-2) reported as biomarkers related to clinical and biological behaviors in breast cancer.^{2,3} Folate Receptor Alpha (FR α) expression in breast cancer showed new and unique molecular subtypes and was useful for therapeutic interventions. It was 74% overexpression of FR α in breast cancer with negative ER/PR.⁴

FR α was a membrane protein of glycosylphosphatidylinositol (GPI-anchored), encoded by FOLR1 genes consisted of 257 amino acids.⁵⁻⁷ FR α

overexpression found in solid tumors, such as ovarian, breast and lung carcinomas.⁸ However, it was a low expression in healthy human tissue.⁹ Overexpression of FR α affected to the growth of cancer cells through direct or indirect mechanisms with the uptake of folic acid.⁴

Hansen et al., revealed a new transduction pathway initiated by folic acid and folinic acid bonded with FR α which resulted to cellular response through gp 130 co-receptors accompanied by JAK and STAT activations. Activation of STAT 3 oncogenes conducted by folic acid and folinic acid increased the complexity of the role of vitamin B9 in one-carbon metabolism. This pathway influenced several cellular processes through cell division, angiogenesis, metastasis and inhibited cancer cell apoptosis.¹⁰

This study aim were Examining the importance of FR alpha as a marker of targeting therapy in breast cancer.

MATERIALS DAN METHOD

Collection of Samples

This was observational research with a cross-sectional design. The study sample was a population of breast carcinoma patients, diagnosed based on histopathological examination and performed ER/PR/ Her-2 immunohistochemistry examination at the Makassar Pathology Diagnostic Laboratory, from January to December 2017.

Inclusion criteria: Block paraffin tissue of breast carcinoma carried out by ER α , PR α , Her-2 Immunohistochemistry examination which processed according to standard procedures.

Exclusion criteria: damaged paraffin blocks of breast tissue. Amount of samples which met inclusion and exclusion criteria were 75 paraffin blocks of breast carcinoma.

Pathological Review

Histopathological features of breast carcinoma were examined using hematoxylin-eosin staining. Scaled based on the Nottingham Modification of the Bloom Richardson System. Immunohistochemistry examination of ER / PR alpha evaluated based on Allerd 1998 score and Her-2 neu evaluated based on ASCO and Cap 2013.

Immunohistochemistry Evaluation of FR α expression

The Immunohistochemistry scores and evaluation results of FR alpha were assessed by two pathologists. Colored FR alpha expression was seen in the cell membrane and scaled based on the study of O'Shannessy D.J, et al. (2012) and set cut-off score of the cell colored percentage (> 5%) with the intensity of any color, then divided expression score into:

A. 3+ score, Cell Membrane has strongly colored at four times Obj magnification and confirmed with ten times Obj

B. Score 2+, Cell Membrane was moderate colored at ten times obj magnification of obj and established with obj 20 times

C. 1 + score, cell membrane was weakly colored at 20 times or 40 times obj magnification

D. 0 score, no cell membrane was stained with obj 20 times and 40 times

Data Analysis

Data analysis using Statistical Package for Social Science version 24. Analysis of relationship among expression FR α and clinicopathological criteria used chi-square test, with P<0.05.

RESULTS

Clinicopathological characteristics

In this study, there were 75 samples in the age range of 29-80 years old, the highest frequency in the age group (43 samples) was less than 50 years old(57.3%). Based on histopathological grading there were nine samples (12%) with low-grade breast carcinoma, 34 samples (45.3%) with moderate grade breast carcinoma and 32 samples (42.7%) with high-grade breast carcinoma. The study sample consisted of 25 samples (33.3%) with positive alpha ER / PR expression and 50 samples (66.7%) with negative alpha ER / PR expression. Regarding receptor marker and Her-2 status, It was divided into three groups, included Negative ER / PR / Her-2 group; Her / 2 Positive ER / PR Negative; Positive ER / PR Her-2 Negative / Positive, and each group consisted of 25 samples (33.3%). While positive Her-2 status was 29 samples (38.7%) and negative Her-2 status was 46 samples (61.3%) showed in Table 1.

Table 1. Percentages Characteristic of Respondents

Characteristics	Results	n	%
Age	< 50 yo	43	57.3
	≥ 50 yo	32	42.7
Histopathological Grading	Low Grade	9	12
	Moderate Grade	34	45.3
	High Grade	32	42.7

Cont... Table 1. Percentages Characteristic of Respondents

Marker	ER/PR/Her-2 Negatives	25	33.3
	ER/PR Negative Her-2 Positif	25	33.3
	ER/PR Positive Her-2 Negative/Positif	25	33.3
Her-2 Status	Positive	29	38.7
	Negative	46	61.3
Expression of ER/PR alpha	Positive	25	33.3
	Negative	50	66,7
Expression FR alpha	Positive	29	38.7
	Negative	46	61,3
score of Expression FR alpha	0	46	61.3
	1+	12	16
	2+	8	10,7
	3+	9	12

Immunohistochemistry expression of FR α in breast carcinoma

The results of this study showed 29 samples (38.7%) were expressed positively and 46 samples (61.3%) were expressed negatively in breast carcinoma. The intensity of FR alpha expression from the score range 0 to +3, the highest frequency was the group with FR alpha 0 expression score (61.3%), then the group with +1 score (16%), +3 score (12%), +2 score (10.7%) showed in figure 1. showed in figure 1.

Although statistically there was no significant relationship among FR α expression and patient age and

histological grading, however breast carcinoma with high histological grading which resulted to expression FR α was 43.8% shown in Table 2.

The relationship among FR α expression with ER/PR alpha expression, Her-2 neu, where FR alpha expression was significantly associated with Her-2 status (P = 0.037). However, ER / PR alpha expression there was no significant relationship with Her-2 status (P = 0.887). It could be seen that FR α was more expressed in breast carcinoma with negative alpha ER/PR of (40%) and ER- / PR- / Her-2 + group of (52%) was shown in Table 3.

Figure 1. Folate Receptor Alpha expression in breast carcinoma

Negative membranous and cytoplasmic Immunohistochemistry expression of FR α in breast carcinoma (obj 40x)

Positive 1, weak membranous and cytoplasmic Immunohistochemistry expression of FR α in breast carcinoma, (obj 40 x).

Positive 2, moderate membranous and cytoplasmic Immunohistochemistry expression of FR α in breast carcinoma, (obj 40 x).

Positive 3, strong membranous and cytoplasmic Immunohistochemistry expression of FR α in breast carcinoma, (obj 40 x).

Table 2. Clinicopathological characteristics of breast carcinoma based on Immunohistochemistry expression.

Clinicopathological Parameters	Expression of Folate Receptor Alpha				Total	P value
	Positive		Negative			
	Amount	Percentage	Amount	Percentage		
Age						0,95
< 50 yo	16	37,2 %	27	62,8 %	43	
\geq 50 yo	13	40,6 %	19	59,4 %	32	
Histological Grade						0,190
High Grade	14	43,8 %	18	56,3 %	32	
Moderate Grade	14	41,2 %	20	58,8 %	34	
Low Grade	1	11,1 %	8	88,9 %	9

Negative	13	28,3 %	33	71,7 %	46	
Expression ER/PR alpha						
Negative	20	40%	30	60%	50	0,887
Positive	9	36%	16	64%	25	

DISCUSSION

Breast carcinoma subtypes distribution differences based on age, race, staging, grading Bloom-Richardson, tumor size, and lymph node status.¹¹

FR alpha was a glycosyl-phosphatidylinositol (GPI) protein anchored in the cell membrane with high affinity for binding and transporting folate whereas folate acted as a one-carbon metabolism in essential components of cell metabolism, DNA synthesis, and reproduction, as well as rapid cancer cell division. Therefore, it was found high expression levels in malignant tumors from epithelium compared to healthy cells.¹²

In this study, breast carcinoma expressing FR alpha was only 38.7% of the total sample. There was a meaningful relationship among FR alpha expressions with Her-2 status with a value of $p < 0.05$. This showed that breast carcinoma with Her-2 status could affect the expression of FR alpha.

During the Her-2 phosphorylation process, in spite of inducing downstream intra-cell signaling, it also activated genes associated with cell growth.¹³ One of them was the FOLR gene 1. Previous research of Necela, et al., it was stated that breast tumors with Her-2 positive could express FR alpha.¹⁴

The role of Her-2 neu as a critical driver of cell growth was one of the transmembrane receptors of epidermal growth factor (EGF) receptor family, which was encoded by the erbB-2 gene. This gene amplification could result in 18-20% overexpression of Her-2 in phenotypic breast carcinomas that were more aggressive. Her-2 could activate three central signaling pathways, namely: Ras/Raf/MAPK, JAK/Stat, and PI3K/AKT/m-TOR. Those affected by cell growth and survival, proliferation, division, metabolism, apoptosis and migration ability. Therefore, tumors with Her-2 was classified as a tumor with a poor prognosis.¹⁵⁻¹⁷

Also, phosphorylation of serine and threonine from the erbB-2 gene could be stimulated by the PKC enzyme activated by phorbol ester.¹⁸ According to Elnakat et al., recycling FR required enzyme protein kinase C alpha (PKC α), which was activated by diacylglycerol and phorbol ester to bind RACK 1 receptor. Thus it increased FR alpha amount on the cell surface.¹⁹ This showed that indirectly PKC enzyme pathways could increase expression of FR alpha and Her-2 neu in breast

carcinoma.

Regarding important role of PKC enzymes in some cascade signal transductions, receptor desensitization also functioned, such as membrane structure modulation, transcription regulation, immune system mediation, regulation of cell growth and learning and memory processes.²⁰ Therefore, the understanding of the regulatory process of FR alpha recycling through the PKC pathway, it also functioned as effective drug delivery.

In other research results, it was found that there was no significant relationship among FR alpha expression with ER/PR expression in breast carcinoma. However, it showed that FR α was more expressed in breast carcinoma with negative alpha ER/PR at (40%) and ER-/PR-/ Her-2 + (52%). This stated that FR alpha expression affected by hormonal receptors (ER/PR) with steroid hormone especially estrogen.¹² It was known that regulation of FR alpha expression was very complicated depending on the subtype of breast carcinoma.¹⁴

Kelemen L.E et al., stated that regulation of gene expression and protein FOLR1 depended on the concentration of extracellular folate, the level of intracellular homocysteine, other transcription and translation rules, epigenetic regulation, hormonal regulation, and genetic mutation.⁹

Kelley et al. stated that promotor of FR alpha gene was repressed by 17- β estradiol/ER bonds in promotor of P4 area, then, it was depressed by antiestrogen tamoxifen. ER alpha corepressor in the form of SMRT played a role in increasing repression of FR alpha gene promoters with 17- β estradiol/ER. Therefore, breast carcinoma with ER was positive directly and actively repressed expression of FR alpha.¹²

It is known that corepressor was an essential regulator of ER α -mediated work, while transcription activation conducted by ER alpha was complex and multi steps. If this corepressor was lost, it affected breast cancer growth and resistance to endocrine therapy.²¹ This multiprotein complex had effects through several mechanisms depending on the type of corepressor and chromatin remodeling, histone deacetylation (HDACs) or basal transcription. In the transcription process of the FR alpha gene, the SMRT and NCoR corepressors played a role in repressing transcription factor via HDACs in Ligand Binding Domain (LBD) area.²²

On the contrary with the progesterone receptor (PR alpha) which indirectly increased regulation of the FOLR gene 1, androgen and glucocorticoid hormones could activate and improve control of the FOLR 1 gene.²³

Regarding biological regulatory processes of the FOLR 1 gene and other influential factors, the role of this gene in breast carcinogenesis was understood. Therefore, a new therapy for breast carcinoma with a low toxicity effect could be developed.

A variant of other previous research was probably related to the presence of polymorphism from the FOLR 1 gene, sample size differences and evaluation method differences of expression of FR alpha.

CONCLUSION

This research found that FR α expression was present in breast carcinoma with a poor and aggressive prognosis. Suggested to use FR α immunohistochemistry examination as additional prognostic factors in breast carcinoma.
