Prevalence of Oral Habits among 6-12 Yrs Old Children of Bhubaneswar, Odisha

Antarmayee Panigrahi¹, Uma Sankar Mishra²

¹Reader, PhD Scholar, Department of Pedodontics and Preventive Dentistry, Institute of Dental Sciences;

²Professor, Faculty of Management Sciences, Siksha O Anusandhan (Deemed to be University), Bhubaneswar, India

ABSTRACT

Knowledge and early diagnosis of deleterious oral habits allows dentists to intercept and reduce the long-term consequences.

Aim: The present study was done to assess the prevalence of oral habits in children aged 6-12 years in Bhubaneswar, Odisha

Materials and Method: A descriptive cross-sectional was done on total of 850 children. A thorough history along with filled questionnaire Performa was obtained. Clinical evaluation was done to correlate presence and absence of oral habit. Obtained data was statistically analyzed.

Results: Overall prevalence of oral habits was found to be 24.8%. Prevalence of oral habit was observed to be statistically significant regarding age and gender.

Conclusion: Persistence of oral habits beyond normal age needs to identify and intervened to avoid occurrence of disharmonious maxilla-mandibular relationship and development of dental malocclusion.

Keywords: oral habits, mixed dentition, prevalence

INTRODUCTION

Heterogeneous oral habits in children have been the cause of concern for parents, pediatricians, psychologists, speech therapists and pediatric dentists. Persistence of these habits beyond certain age leads to unbalanced force on occlusion development, normal growth and development of muscles as well as jaw bones thereby affecting overall child quality of life. These habits are complex and learned pattern of muscular contractions, which at beginning are conscious activity but gradually turn into unconscious doing. The extension of these disorders varies differently in every individual depending on actual jaw relationship and frequency.^{1,2}

Over past few years, traditional approach of evaluating oral health has shifted from mere absence or presence of oral disease to multidimensional concept including every aspect altering the equilibrium and affecting the quality of life.³

As described by Baer PN and Lester M the oral cavity is the primary as well as permanent location for location for expression of emotions and thus stimulation of mouth with tongue, finger, nail becomes source of relief in passion and anxiety in every age group acting as a palliative therapy.⁴

Thumb or digit sucking habits are non-nutritive sucking are the normal observation in infants and young children and usually can be explained on basis of need to satisfy the urge for contact and security. However, its persistence beyond age of 3 yrs results leads to long term consequences with imbalance of stomatognathic system. It often results to angle class II malocclusion, increased overjet, open bite, posterior crossbite and narrow maxillary arch.^{5,6}

Persistence or delayed transition from infantile swallowing patterns leads to tongue thrusting. Tongue

thrusting often is present with open bite and children with this habit often presents with long facial pattern and proclination of upper anterior teeth. Other associated features are high/narrow maxillary arch and class II div 1 malocclusion. It also leads to lisping and difficulty in speech.⁷

Chaves et al have described that the normal neutral posture of a child is also affected by mouth breathing habit where head is positioned forwardly to breathe. Also the physiological buccinators mechanism managing equilibrium between tongue and oral musculature is altered leading to mask-like appearance of face.⁸

Other oral habits like bruxism can occur due to stress, parasomnias, traumatic brain injury, neurological disabilities and morphological factors. It presents as habitual non-functional contact between occlusal tooth surface leading to attrition, headaches, temporomandibular joint dysfunction and muscle soreness.⁹

The oral habits either exist alone or in combination with other deleterious habits causing bone malformations depending on duration and frequency of habits. These detrimental habits if not diagnosed early leads to complex array of problems including poor dental health, speech disorders, altered facial features, poor self esteem, associated medical conditions and ultimately stigmatizing socially.⁶

Owing to its wide spread deterrent consequences it needs multidisciplinary approach to combat the consequences and provide integral care to child patients. Vast number of studies exists in scientific literature regarding prevalence of habits in young children so as to develop an efficient preventive measure to raise awareness, identify early and intervene the progress.^{10,11}

But to best of my knowledge no data exists assessing the prevalence of habits in our state. Thus, keeping this in mind the present cross-sectional survey was taken up.

MATERIALS AND METHOD

The present cross-sectional study was done in total of 850 school going children aged 6-12years, Bhubaneshwar, Odisha. Institutional ethical clearance was taken and after explaining the intent of survey written informed consent were obtained from the accompanying parents.

The inclusion criteria were children within age group of 6-12 years with mixed dentition. Children with congenital deformities, any systemic or medical conditions were excluded from the study. The sample was chosen by simple random sampling technique.

A close-ended questionnaire was given to parents to be filled on the same day to gather data about habits. Thorough clinical examination was done with mouth mirror and probe. Correlating the dental and extra-oral features the habits were assessed with specific tests. For mouth-breathing habit, water holding test was done. Data thus obtained was tabulated and statistically analysed (SPSS 15.0) to derive the prevalence of different oral habits. Chi –Square tests was done to compare the prevalence of habits in association with age group and gender. The probability level was set at $\alpha= 0.05$.

RESULTS

Out of 850 children aged 6-12 yrs, 400 were females and 450 were males. The mean age of the sample population was 8.78±2.32 yrs. Thumb sucking was significantly more common followed by bruxism and tongue thrusting. Thumb sucking. Also, these habits were found to follow to receding trend with higher prevalence among younger age group to lowering prevalence among older children. (p=0.000). However, mouth breathing, and nail biting were significantly more common in older age group. (p=0.000). Table 1 shows the prevalence of habits according to age.

Table 1: Frequency of Oral Habits According to Age

Age	N	Thumb sucking		Tongue thrusting		Bruxism		Mouth Breathing		Nail Biting	
6-8 yrs	250	45	18%	25	10%	31	12.4%	5	2%	0	0%
8-10 yrs	300	12	4%	17	7%	18	6%	24	8%	19	6.4%
10-12 yrs	300	03	1%	9	3%	3	1%	11	3.6%	13	4.4%
p-value		0.000		0.048		0.003		0.005		0.000	

The overall prevalence of deleterious oral habits was more in females (30.5%) as compared to males (21.5%). (Table 2)

Table 2: Frequency of Oral Habits According to Gender

Age	N	Thumb sucking		Tongue thrusting		Bruxism		Mouth Breathing		Nail Biting	
Male	450	32	7.1%	18	4 %	28	6.2%	25	5.5%	10	2.2%
Female	400	28	7%	33	8.25 %	24	6%	15	3.75%	22	5.5%
p-value		0.078		0.05		0.08		0.000		0.026	

DISCUSSION

This present study represents the first survey conducted in Bhubaneswar, Odisha to assess the prevalence of oral habits in 6-12 yrs old children. The main objective of assessment was done by means of closed ended questionnaire and absence or presence of habit was evaluated by clinical examination. The overall prevalence of oral habits in our sample population was found to be 24.8%. These observations were found to be consistent with reports by Basra AS and Kharbanda et al.^{12,13} However markedly higher prevalence have been reported by Garde et al (51%). On the other hand, Gauba A et al demonstrated as low as 3% prevalence of habits.^{14,15}

Present study revealed that thumb sucking was most prevalent with 7% frequency. Varied results are available in literature ranging 1.7% reported by Shetty et al to 50% reported by Kharbanda et al.^{13,16}

Mouth breathing is one of the established common etiological factor known to alter the normal growth of maxillo-mandibular and thus demands earliest diagnosis and prompt intervention. In the present study 4% of children showed mouth breathing habit. This was similar to results obtained by Garde et al (4.3%). The obtained frequency was lesser than as obtained by Vishnoi et al (10.6%) and Motta et al (17%).^{17,18}

Tongue thrusting was found be the second most prevalent habit among children in our population. However the observed frequency was lesser than earlier reported studies.^{13,16-18}

Bruxism was present in 6% of children which is in same range as found by Liu et al (6.5%) and Farsi et al (8.4%). The highest frequency was observed by Garde et al (17.3%). These differences can be attributed to variability in diagnosis and methods of collection of data. Also for deducing bruxism morphological variations of every region needs to be considered.^{14,19-20}

Nail biting habit was seen in mere 3.7% of study population which was way lower than as reported by Anila et al (20%) but in line with results by Sharma et al (3%). Wide variation in observation of nail biting can be attributed to stress levels, hormonal variations and diet pattern.^{21,22}

In the present study the overall prevalence of oral habits had females higher frequency (30.5%) as compared to males (25.1%). Similar distribution was also quoted by Kharbanda et al and Gildasya et al and this was explained on basis of societal and family setup along with hormonal changes.^{13,23}

In our study highest prevalence of oral habits irrespective of gender was highest in 6-8yrs (42.4%) followed by 8-10 yrs (30%) and lowest in 10-12 yrs (13%). The similar trend of decrease in frequency of habits among younger to older children was noted in studies by Shetty SR and Bhayya DP. This can be explained on the basis of craniofacial growth and developing musculature along with increase in level of intellect.^{24,25}

CONCLUSION

The present study was a cross-sectional study which depicts the frequency of oral habits in association with age and gender. However it fails to deduce the causal relationship and influencing environmental factors. Thus it becomes imperative to design and conduct analytical and more rational prospective study. With well known complications of oral habits on oral musculature and stomato-gnathic system it becomes most important to diagnose and intercept at the earliest to reduce the morbidity.

Conflict of Interest: None

Source of Funding: Self-funded

Ethical Clearance: The ethical clearance was obtained from Institutional Ethics committee, Institute of Medical science and SUM Hospital, Bhubaneswar, Odisha.

⁵Postgraduate Student, Department of Pedodontics and Preventive Dentistry, Institute of Dental Sciences,
Siksha O Anusandhan (Deemed to be University), Bhubaneswar, India

ABSTRACT

Factitious or self-injury can be defined as a behavioural disturbance that consisting of deliberate damage to body tissues and is usually repetitive. It is well known that various developmental disabilities, psychiatric disorders and syndromes may precipitate episodes of self-injurious behaviour. Whatever be the underlying etiology, the wide range of clinical presentation of self injurious lesions often mimicking those of other diseases, makes the correct diagnosis of such lesions taxing even for the most astute of dental practitioners. Most frequently affected regions of the body are the oral and perioral tissues, hands and neck. Lesions are most common in lower lip & tongue followed by gingival and buccal mucosa. Clinically such lesions appear as ulcers on the gingiva or recession, trauma to tongue and lower lip resulting in chronic non healing ulcers. Early dental intervention in conjunction with pharmacological and psychological therapy may be significantly instrumental in improving the quality of life for such patients. Treatment is better if individualized be it extraction of offending teeth or fabrication of custom intra-oral appliances.

Keywords: *Self-injurious, habits, masochistic*

INTRODUCTION

The terms self-injurious behaviour (SIB) or self-mutilation (SM) describes a form of behavioural disorder characterised by an intentional damage to a part of the body without a conscious purpose to commit suicide^{1,2}. Oral SIB is quite common and usually expressed by repetitive biting of oral mucosa and perioral tissues. Most common affected are the tissues are lower lip and tongue. Partial or complete amputation of fingers, toes, and tongue has been reported too.³It is usually associated with a plethora of psychiatric disorders, development deficiencies or syndromes.^{4, 5}. According to Olson and

Houlihan (2000) a combination of physical restraints, behavioural treatment and pharmaceutical therapy may be used to manage self injurious behaviour. Also timely dental intervention using intraoral appliances may be essential to prevent further complications in such cases.³

DEFINITION

Defining self-harm is a challenge, and a variety of definitions have been proposed. According to Hawton & James (2005) deliberate self harm could be defined as a behaviour with no suicidal intent but rather is precipitated for the intent to communicate distress, relieve tension or to escape a troubling situation.⁷ Although the risk of completed suicide among people who self-harm is 30 times higher than among those who do not.⁶ According to Duffy (2006) self-injury is a behaviour that involves deliberately injuring one's own body, without suicidal intent and with or without pain.⁸

A lesion can be attributed to non-suicidal self-inflicted injury, if it satisfies the following criteria: the alleged behaviour must be considered socially unacceptable which helps in differentiating it from

other social behaviors such as ceremonial piercings, intentional, repetitive, non-fatal, and producing mild or moderate damage⁹.

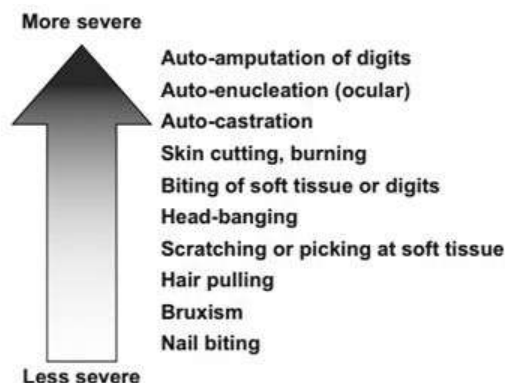

Fig. 1: Range of self injurious behaviour¹⁰

PREVALENCE

Although the exact prevalence of self-injurious behaviour in the general population hasn't been completely defined, it has been suggested that it may affect around 750 individuals per 100 000 populations¹¹.

Another study by John Briere (1998) have indicated considerably higher figures, of up to 4% in the general adult population⁹ while that figure rose to more than 17% in university students^{13,14} and up to 69% among young people considered to be of high risk (homeless and runaway youths, substance abusers, victims of sexual abuse).¹⁵ The reported prevalence among groups of psychiatric patients varies between 21% and 82%^{9,17}

RISK FACTORS AND ETIOLOGY

Self-injury is an critical health dilemma affecting individuals of any age, sex, or ethnic group, with an increasing incidence among adolescents and young adults.¹⁸ Although a plethora of causes have been suggested for precipitating self-injurious behaviour such as disorders causing discomfort, like sinusitis, toothache, or headache, it is particularly common in certain diseases, syndromes, and disorders.¹⁹ Also there exhaustive evidence in literature with reports on SIB in patients with normal intellect and psychiatric personality disorder.²⁰ Self injurious behaviour is often described as a "relief" from psychic pain or tension.^{21,22}

Also there have been several case reports of patients with cerebral palsy (CP) exhibiting SIB as a result of involuntary movement.^{23,24} and eye

poking serving a self-stimulatory function in those with visual impairment.¹⁶ It is also commonly seen among patients with Lesch-Nyhan syndrome, congenital insensitivity to pain with anhidrosis, Cornelia de Lange syndrome.⁴ Behaviourists have put down that individuals may exhibit SIB in various situations:^{26,27,28} as an attention-seeking mechanism, as a method of obtaining materials or activities that may otherwise be out of reach (positive reinforcement); as a means of to avoid stressful situations or undesirable tasks (negative reinforcement).

Lesch-Nyhan syndrome	Mental disorders (depression, obsessive compulsive disorder)
Mental retardation	Congenital insensitivity to pain with anhidrosis (CIPA)
Moebius syndrome	Infectious diseases (encephalitis)
Munchausen syndrome	Individuals with damage to the cerebral cortex, hypothalamus, reticular or pyramidal system, coma, etc.
Riga-Fede disease	Pharmacological or recreational drug reactions
XXY syndrome	
Gilles de la Tourette syndrome	
XXXXXY syndrome	
Cerebral palsy	

Fig. 2: Principal syndromes and conditions that favor the appearance of self-mutilation²

CLASSIFICATION

Oral self-injury may be classified as functional or organic. In organic self-mutilation, the person injures him/herself unknowingly, unintentionally and compulsively and this group includes disorders such as Lesch-Nyhan syndrome, psychiatric disorders and autism. Functional self-mutilation is performed knowingly and includes habits, with children often using this behaviour as a means of acquiring attention.²⁵

Functional self-injury may represent a method of manipulation or a true means to seek help.² Lloyd-Richardson et al.³⁰, in an anonymous survey performed in 2007 on 633 randomly selected adolescents (mean age, 15.3 years) in the United States, found that the most common forms of negative reinforcement reported by individuals with self-injury were to interruption unpleasant feelings or lethargy, to avoid school or work, or to avoid having to perform an unpleasant task; the principal positive reinforcements detected were to attract attention, to achieve control of a situation, and to pass the time when the individuals were alone.

Among other etiologic and pathogenic models proposed to explain organic self-injury, the dopaminergic, opioid, and serotonergic models are the most accepted. In studies performed in rats, it was found

that the frequency of self-injury increased after the administration of dopaminergic drugs and that dopamine antagonists helped to control this behaviour.^{2,29} It has also been proposed that addiction to self-injurious behaviour may be exhibited due to high level of endogenous opiate release in response to pain in affected individuals.² The association of self-mutilation with an apparent analgesia or insensitivity to pain and with certain dissociative states may be explained by this increase in endogenous opiate activity.³¹ Moreover, it has been reported that the administration of opiate antagonists such as naloxone or naltrexone can have favourable effects in patients presenting self-injurious behaviour.³²

ORAL FEATURES

Biting is the most common mode of self-inflicted injury, most frequently involving the oral and perioral regions.^{2,33} In a study by A. Amano et al (1998) to investigate the oral and dental manifestations in 18 patients suffering from hereditary sensory and autonomic neuropathy type IV (congenital insensitivity to pain with anhidrosis), it was reported that oral self-mutilations, such as auto extraction of teeth and severe biting injuries (with resultant scarring) of the finger tips and oral soft tissues (tongue, lip, and buccal mucosa), were most common. In infant patients the condition was typically characterized by decubital ulcers on the ventral surface of the tongue, resulting from trauma of the incisal edge of erupting mandibular primary incisors during sucking or nursing.³⁴

Compulsive self-injurious behaviour is the most distinctive symptom in Lesch-Nyhan syndrome. Hypertonicity and involuntary movements appear around the first year of age.³⁵ Common observations in such children include persistent biting of the lips, tongue, fingers, and shoulders and partial or total destruction of perioral tissues, especially of the lower lip.³⁶ Partial or complete amputation of fingers, toes and tongue have also been reported.³⁷ Cases of soft tissue lesions associated with self-inflicted tooth dislocation or even avulsion are known to exist as well. Oral self-injury is associated with lesions in other areas of the body in 20% of cases.¹²

MANAGEMENT OF SELF-INJURIOUS BEHAVIOR

A review of the medical, psychiatric, and dental literature reveals several common themes regarding

the treatment of SIB. Understanding the underlying mechanism of the patient's behaviour is key i.e., whether the SIB is serving any specific purpose. This may be instrumental in recognising the patient's cry for help as often such patients lack adequate communication skills.¹⁰

If the patient is determined to be in good physical health, a psychiatric evaluation may be prescribed to determine the existence of psychiatric conditions that may be corrected by pharmacotherapy.³⁸ A number of therapeutic modalities have been tried in patients with self-injurious behaviour. They may be classified into 3 groups: Behavioural treatment, pharmacological treatment and intraoral devices.

BEHAVIOURAL TREATMENT

This should be the preliminary therapeutic option to be considered by the health professional as it has shown an overall favourable response in many cases without the adverse effects of pharmacological treatment or the aggression and difficulties of intraoral devices.⁴² A bio-behavioural approach including functional analysis may lead to better outcomes than oral appliance therapy alone.²⁷ Potential intervention strategies include positive reinforcement by attention or tangible items, negative reinforcement by escape or avoidance of task demands and sensory reinforcement.¹⁰ To replace self-stimulating activities and allow for more functional ones sensory integration has been suggested as a treatment modality.⁴⁰ Extinction, systematic desensitization, and play therapy together have been reported to decrease SIB inpatients with.⁴¹ Aversive therapy such as shock have also been reported.³⁹

Klonsky evaluated 439 randomly selected individuals and found a prevalence of non-suicidal self-injury of 5.9%. A history of psychological therapy for emotional problems was detected in 39% of affected individuals.⁴³ In individuals with mental retardation, the method usually applied is positive reinforcement.⁴⁴ In most cases however, efficacy of behavioural therapy is often limited, and a conjunction with other therapeutic approaches such as pharmacological treatment or physical restraint is usually required.²⁸

PHARMACOLOGICAL TREATMENT

The serotonergic, dopaminergic, and opioid neurotransmitter systems have all been implicated in

the mechanism of SIB.¹⁰ Tricyclic antidepressants such as clomipramine and desipramine are commonly the drugs of choice. Leonard et al compared these 2 drugs and demonstrated that clomipramine (also used in the treatment of obsessive-compulsive disorder) was more effective in patients with onychophagia.⁴⁵

Agitations in SIB patients have been effectively treated using beta-blockers.⁴⁶ It is not unreasonable that opioid agonists such as naltrexone would be effective in treating patients with SIB. Interestingly however, failure of naltrexone therapy have also been reported in the literature.⁴⁷

ORAL DEVICES

Physical restraint is the only method that enables self-injury to be prevented directly and in an individualized manner. The possible options include helmets, face masks, gloves, special clothing such as straitjackets, and, in the case of lesions owing to biting, restrictive oral devices.²⁷ Intraoral devices basically work through 2 mechanisms: they hinder and discourage the patient from performing certain habits, helping to suppress the offending behavior, and they function as a direct barrier that prevents traumatization of oral tissues e.g., maintaining the lip at a distance from the dental arches.

Intraoral devices that prevent self-injury should ideally satisfy the following conditions- they should maintain the injured tissues at a distance from the dental arches, so that they do not suffer further injury; they must not provoke the formation new lesions; they should allow for full mandibular movement; they should not act as a hindrance for routine oral hygiene; they should be easy to manufacture and insert into the mouth, without causing discomfort to the patient; they should facilitate healing of the oral tissues; and they should be able to withstand masticatory and other oral forces without being displaced or breaking.²

Mouthguards have been the most widely used devices, although with variable results. They have been reported to be effective in some cases.⁴⁸ Another option is the use of acrylic splint positioned directly on the teeth either by cementation or held in place by extra-oral straps or by retention loops of orthodontic wires.² The 'lip bumper' is also frequently used. This consists of one long element and a small acrylic shield, fixed by inter-maxillary wires or elastic bands to tubes or bands

anchored to the first molar teeth. These devices act by displacing the lip downwards and forwards to prevent it being bitten, and they have been used successfully in a number of cases described in the literature.^{49,50} An oral screen may be used which has the advantage of not being fixed to the teeth, and it may therefore be indicated in infants and children in whom tooth eruption is not advanced.⁵¹

Intraoral devices however are not free of adverse effects, although they are not usually severe and are reversible. They may interfere with oral hygiene, favour the appearance of fungal infections, and can provoke new lesions.⁵²

In some patients, the severity of self-injury and the failure of other treatment modalities lead to a need to consider tooth extraction as a therapeutic alternative. Although this is a radical solution, it has been shown to produce an enormous reduction in damage to the soft tissues.²

CONCLUSION

SIB is a serious condition that often presents itself in the special needs population. Oral tissues are commonly involved and the form and function of the same are put in jeopardy. While behavioural and pharmacological treatment modalities are usually most often prescribed, their success rate at limiting self injurious behaviour is limited at best.

In such situations a comprehensive dental management by the dentist may be a much needed boon for the patient. The dentist should prioritize reduction of further harm to the oral and peri-oral tissues as the main objective while simultaneously ensuring the maintenance of adequate oral hygiene and minimizing appliance therapy driven ill effects.

ABSTRACT

The work of a dental expert who honestly prompts an individual or causes mental anxiety because of absence of proper or decent measure of working aptitudes can be classed as carelessness prompting to dental negligence. The main reason for dental malpractice is increased competition, advertising, higher costs for education and for opening a practice, lower incidence of tooth decay due to fluoridation and better oral hygiene, diminished dental education in methods & science, and the failure of organized dentistry to develop guidelines and polices for combating quackery. This article reviews the numerous causes leading to malpractice.

Keywords: Dental radiographs, malpractice, misdiagnosis, negligence, restoration.

INTRODUCTION

Dental malpractice is a form of medical malpractice focussing on injuries suffered during dental visits which range from obvious trauma to dental or oral tissues, negligence by the treating dentist or misconduct like abuse or molestation of sedated patients. Often dental patients have underlying systemic disease and are on multiple drugs; lack of proper history taking by the dentist or ignorance regarding the drug interactions or medical complications, even administration of correct dental treatment may still lead to medical emergencies and can be designated as dental malpractice. With advancements in oral and dental treatment modalities, many issues regarding wrong diagnosis, procedural delays in treatment, improper management and failure in follow ups have cropped up, comprising dental practice. In this article all issues regarding negligence, erroneous diagnosis and faulty treatment have been discussed,

avoiding erroneous practices and highlighting the principles of ethical and accepted standards of restorative dental treatment¹.

Diagnosis and Dental Radiographs: Dentists treat patients with an aim of restoring the patient's health. However adverse effects may occur in spite of all their efforts, some of which could have otherwise been prevented, hence amounting to malpractice. Any patient coming to the dental office needs to be diagnosed accurately first so as to formulate the correct treatment plan. Diagnosis is the identification of the disease through signs and symptoms by a careful history taking session and a meticulous clinical examination using scientific methods. Very often wrong diagnosis leads to wrong treatment, amounting to malpractice. Wrong diagnosis can occur due to the lack of expertise or inadequate experience of the dentist or the unavailability of appropriate diagnostic tools. Teeth affected by dental caries, fracture or regressive alterations like abrasion, attrition, erosion or abfraction generally require restorative treatment. Before performing any restorative treatment, the dentist has to evaluate the involved tooth, assess the amount of loss of tooth structure, depth of the lesion and then plan the restoration. Current evidence suggests that the use of a careful, methodical visual inspection of clean, dry teeth, supplemented where indicated by radiographic views, remains the standard of care in caries detection and diagnostics in spite of

the availability of numerous devices or technology-enabled detection systems. Intra-oral radiographs serve as excellent diagnostic tools when used judiciously.

A dental radiographic procedure involves exposure of a patient to potentially hazardous ionizing radiation and even if does not involve physical touching it is considered as physical abuse if it is unduly advised. Bitewings and periapicals are the common intra-oral radiographs that are required to assess the depth of the carious lesion. However, it must be noted that incipient carious lesions are missed on radiographs and at least 40% demineralization of the enamel and dentin occurs before it is evident on radiographs. Hence conventional radiographs may miss out incipient carious lesions which left untreated cause more demineralization and destroy tooth structure. With the advent of digital intraoral radiography, the ease of taking radiographs has increased eliminating conventional film processing with less radiation exposure. But inadvertent and injudicious of digital dental radiography is also of concern. Due to improper image receptor placement or faulty exposure technique, the resultant radiograph may be totally undiagnostic requiring repeats.

Figure 1: Secondary dental caries

In diagnostic radiology though the concept of ALARA is followed, still radiographs need to be repeated for diagnosis. Besides use of radiation protective gear like lead apron and construction of dental clinics as per the AERB guidelines wherever radiographic examinations are performed is mandatory, so as to reduce the harmful effects of radiation. Unnecessary exposure to X-ray radiation also amounts to malpractice^{2,3}. It is also essential to interpret the lesion correctly on a radiograph, knowledge of the radiographic anatomy and manifestation of diseases is a must, like differentiating dental caries from cervical burnout and secondary

dental caries from base below the restorations (Figure 1). Similarly, before planning a removable prosthesis like a cast partial denture or an implant supported overdenture pre-treatment radiographs are taken to assess the bone support of abutment teeth and the quality of the alveolar bone. For implant supported prostheses the quality of bone is to be evaluated using multi-planar imaging modality like CBCT so that assessment of the bone is possible in coronal, sagittal and axial planes. It is also imperative that the dentist be aware of the CBCT anatomy and able to use the digital software required to manipulate the images for measurements⁴. Whenever an implant needs to be placed in the mandibular alveolus its proximity to the inferior alveolar canal needs to be evaluated using CBCT as there is a chance of persistent paraesthesia following the procedure which can be avoided by accurately imaging the canal. Hence in such a circumstance, the pros and cons must be debated before advising for radiograph. Even for implant placement in maxillary edentulous ridge, decision has to be taken whether images of about 2-3mm superior to the sinus are enough or the entire sinus is needed, accordingly the imaging modality is to be advised⁵.

Before performing any treatment an informed consent is required from the patient a written informed consent is preferred over a verbal one. The dentist ought to inform the patient of the risks and benefits of the proposed treatment, the consequences of denying treatment and other available treatment options.

Malpractice in Conservative Dentistry: As stated earlier correct diagnosis is the key foundation to treating a patient. When it comes to our health, inaccuracy and wrong decisions are unacceptable. We place our full trust in our dentists. While it's clear that these mistakes are not deliberate and many misdiagnoses are caught quickly; overworked staff and inexperienced practitioners are leading to an increase in patient misdiagnosis and poor quality treatment. Malpractice in Diagnosis means that, dentist failed to spot a disease in their patient's mouth during the course of an oral exam. A dentist who is guilty of gross negligence, with no clinical reason for the performance, is incompetent and should have to suffer the consequences of the indefensible work⁶. If a dentist fails to correctly diagnose a condition it may lead to the wrong treatment being administered or no treatment at all. The condition may worsen, causing further oral damage. The inappropriate treatment may itself cause unnecessary injury and pain.

Negligence during patient history taking

- Dentists’ failures to take into account a patient’s relevant medical history.
- Ignoring test results, which do not fit in with the doctor’s preconceived idea of what is wrong with the patient, especially when those results are positive?
- Failure to obtain informed consent⁷.

Negligence during radiograph interpretation

- Dental radiographs not exposed properly may lead to misdiagnosis and untreated dental disease
- A diagnostic X- ray that shows all roots and surrounding anatomy is imperative. Potential complicating factors include hooked or curved roots and proximity to nerves and sinuses. Failure to obtain diagnostic radiograph or failure to interpret due to lack of knowledge can lead to wrong treatment plan.
- If the machine is not calibrated properly, the X-ray dosage could be excessive and result in an overdose. Also Failure to properly shield the body can result in a radiation overdose^{8,6}

Negligence during clinical examination

- Errors in clinical judgement
- Failure to follow up: Follow-up failures often result from the lack of a reliable tracking system to ensure that the patient kept the appointment with the specialist or underwent the diagnostic test that was ordered.
- Failure to screen patients ‘appropriately: infrequent examination of patients in a high-risk group

and failure to recommend routine screening examinations on a patient in a risk group.

- Evaluation Delays: involves repeated patient visits with continuing or progressive clinical findings, coupled with the practitioner’s failure to perform the indicated diagnostic tests on the patient or to refer the patient for proper testing; or failure to request a consult or referral when a definitive cause for clinical findings cannot be determined⁹.

Negligence in using diagnostic aids

- Diagnostic aids are essential to arrive at correct diagnosis. Advance diagnostic aids help in detecting early carious lesion and aid in rendering early treatment or preventive protocols. Failure to use such diagnostic aids leads to advancement of lesion and hence supports the issue of negligence by the dentist.
- Diagnostic aids also support the treatment plan can play vital role in saving the life of the tooth either through restorative dentistry or endodontics^{6,7}.

Negligence during anaesthetic solution administration

Figure 4: Intra oral malpractice in operative dentistry

- Malpractice in Restorative Dentistry- Intraoperative [Figure 4]

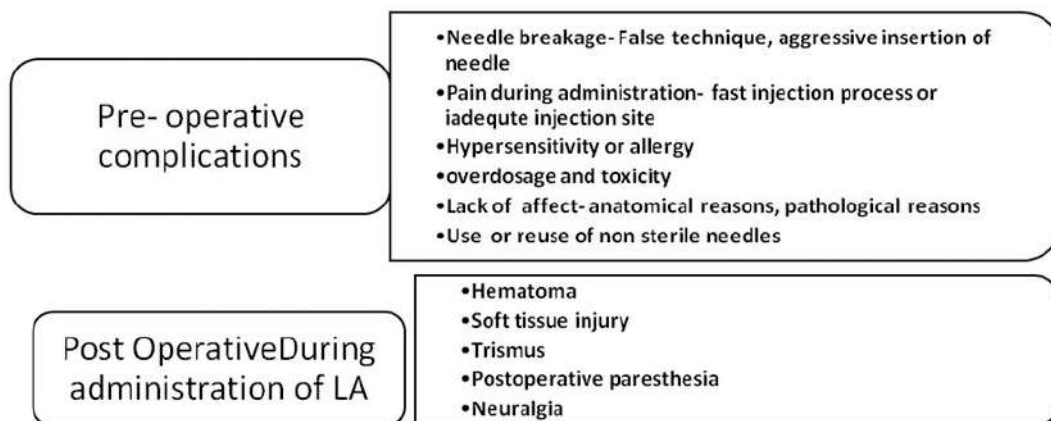

Figure 5: Dental equipment

- Perioperative dental damage is the most common of all medico legal complaints and improper administration of local anaesthesia is one of them, lack of anaesthesia or inadequate anaesthesia hampers the treatment procedure[Figure 5]

Malpractice in Restorative Dentistry due to Sterilization and Isolation Protocol

- Improper sterilization protocol in dental setup is one of the primary reasons for spreading infection in dental setup. It is also one of the leading causes of Professional malpractice or negligence.

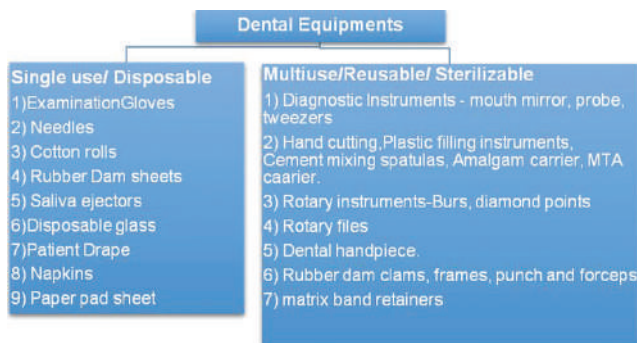

Figure 6: Classification of dental equipment

The dental equipment can be classified into: [Figure6]

- Improper or Lack of Isolation Protocol leads to
- Aspiration or injection of files, foreign bodies and restorative material to posterior pharynx or chest cavity
- Saliva which gets incorporated during restorative procedure hamper the quality of restoration and hereby leads to failure of restorations.
- Failure in restoration can occur due [Table 1]

Table 1: Causes of failure of restoration

Manufacturer’s Control	Operator Control
Faulty production	Improper diagnosis and treatment modality
Improper handling and storage	lack of knowledge about the material properties and usage
Impurities incorporated	Lack of skill and not fully understand the technique sensitivity issue of the material

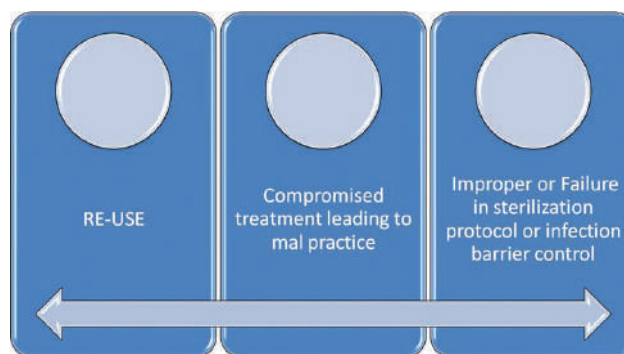

Figure 7: Failure due to infection control

Malpractice in manipulation and placing of restorative material in the cavity can lead to:

The main factors precipitating complaints and allegations of negligence can be summed up as follows:

- Pain
- Early failure and need for remedial treatment
- Perceived aesthetic deficits (e.g. unexpected display of metal)
- Overprescribing/over-treatment (e.g. patients feeling that they have been talked into treatment that they did not need, or which was of little benefit to them)
- Under-treatment/supervised neglect (before criticizing a previous dentist’s work and precipitating litigation, the new dentist needs to bear in mind that he or she may not have the full background behind the situation)
- Escalating or unexpected cost (patients have a right to know in advance how much their dental treatment is likely to cost with an explanation of potential situations which may necessitate costs to be revised)¹⁰.

Figure 2: Malpractice in conservative dentistry

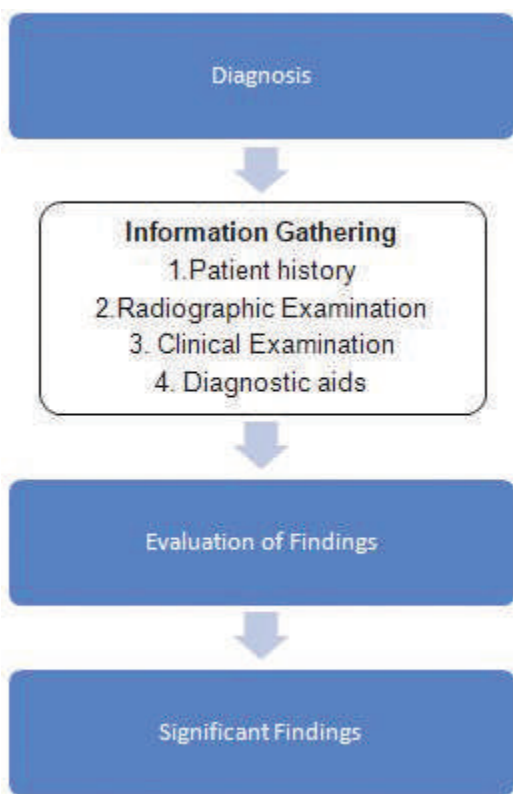

Figure 3. Importance of diagnosis

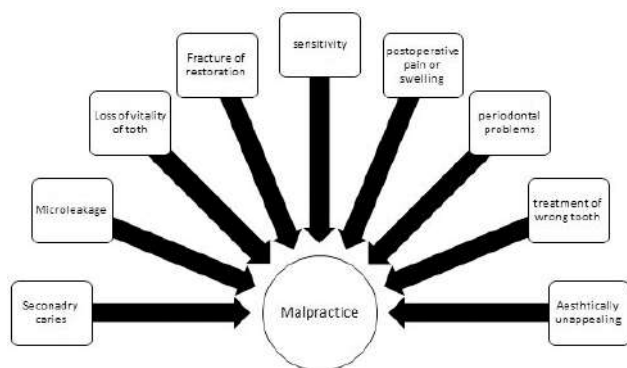

Figure 8. Restorative materials leading to malpractice

CONCLUSION

In conclusion it may be stressed that factors influencing “standard of care” include the diagnosis, advancing technologies and materials, and delivery methods for care. Thus adhering to ethical conduct means one must try to provide the most conservative procedure possible that is in the patient’s best interest. All dentists are ethically and even legally bound to follow some combination of all of the moral compasses. “Ethics and the needs of the patient should always be the priority of the clinician & do no harm should be the ethical and legal obligation of treating any patient.

ABSTRACT

The honeybee and its associated products have been used since time immemorial for its many therapeutic benefits. Those bee products being multifaceted materials are vital to the survival of the bee species and play a major role in the physiologic development and maturity of bees. Man has been harvesting this natural resource of infinite application. Use of this eco-friendly, bio compatible traditional medicine is termed as Apitherapy. So far, many scientific researchers had proved it to be beneficence in various human diseases due to its incredible nature in preventing infections, wound healing and in promoting health. As this natural remedy is showing promising results as a therapeutic agent in modern era this is a review article throwing some light upon this nature's sweet wonders clinical significance in pediatric dentistry.

Keywords: Honey, Propolis, caries

INTRODUCTION

Apitherapy (Apis is a Latin word that means bee) is the practice of using bee products such as honey, pollen, propolis, royal jelly, and bee venom for disease prevention or treatment proposes. As proposed by Dr. Stefan Stangacin "it is the art and science of treatment and holistic healing from the honey bee and her products for the benefit of mankind".¹⁻³

In 50 AD, Dioscorides described honey as being "good for all rotten and hollow ulcers."³ More recently, honey has been reported to have an inhibitory effect to around 60 species of bacteria including aerobes and anaerobes, gram-positives and gram-negative microorganisms.³ Honey is being used since ages

for its antimicrobial, antioxidant, sterility and anti-inflammatory characteristics.⁴

The word "Propolis" is believed to have been coined by Aristotle who identified how propolis was used to protect and defend the hive (Pro = before, Polis = city) based on the fact that honey bees use propolis to narrow the opening of their hives. Its chemical composition varies according to their source like different plant buds and bark exudates.⁵⁻⁷

Bees mix propolis with wax flakes and their saliva to reinforce their hive walls, humans use this product to boost immune system and because of its antibacterial, antiviral, anti-inflammatory, antioxidant and ant carcinogenic properties.⁸

Pollen grains are the reproductive spores of seed-bearing plants. Pollen collected by bees from flowers have benefits such as detection and immunization against allergies. Royal Jelly a combination of honey and pollen is a concentrated source of many nutrients including vitamin A, B, C, D, E and essential fatty acids.⁸⁻⁹

Apitoxin or honey bee venom, is a bitter colorless liquid which consists of a mixture of proteins that causes local inflammation and acts as a anticoagulant It can be administered in 2 ways, either directly by bee sting or by injection.^{3,10}

Honey: The first known prescription for honey dates back to somewhere between 2100-2000 BC, was written on a clay table found in Euphrates valley.⁹Hippocrates stated that honey cleans sores and ulcers, softens ulcers of the lips, heals carbuncles and running sores.^{3,8,9}

In 1989 issue of the journal Royal society Medicine an editorial expressed that time has come for the conventional medicine to lift the blinds off this “traditional remedy” and give its due recognition.⁸

Table 1 : Components of Honey^{3,8}

Composition	Percentage
Carbohydrates	79.7
Sugar	73
Water	22
Proteins	0.2
Ash	0.1
Ester extract	0.0

Table 2: Composition of Honey^{3,8}

Carbohydrates	Invertase, Glucose oxidase, Amylase, Invertase
Sugars	Glucose, Sucrose, Fructose and others
Free Aminoacids	Lysine , Histidine, Arginine, Aspartic acid, Threonine, Serine, Glutamic acid, Proline, Glycine, Alanine, Cysteine-, Valine, Methionine, Isoleucine, Leucine, Tyrosine
Minerals	K, Na, Ca, Mg, Fe
Vitamins	Riboflavin, Niacin, Pantothenic acid, Folic acid, B6, C
Antioxidants	Flavonoids, Catalase, Vitamin C, Selenium

Properties of Honey

Antimicrobial Property: The antibacterial property of honey was first recognized by Van Ketel (1892). The minimum inhibitory concentration was found to range from 1.8%to10. 8% (v/v).¹¹

The antimicrobial efficacy of honey is driven by 3 properties i.e its hygroscopic properties, acidic pH and due to hydrogen peroxide which is formed enzymatically.

Hygroscopic Property - it has been shown that wounds infected with *Staphylococcus aureus* are quickly rendered sterile by honey. This effect is based on high osmotic properties so it can extract water from bacterial cells and cause them to die.³ Hydrogen peroxide and Acidic pH - White et al. identified the major antibacterial substance in honey as hydrogen peroxide. And stated that glucose oxidase, catalyses the oxidation of some of the glucose present in honey to form gluconic acid, the resulting low pH between 3.2 and 4.5 which inhibits microbial growth and the by-product hydrogen peroxide kills vegetative cells and microbial spores.^{3,12,13}

Tissue Repair: Honey being acidic in nature decreases the pH of the wound bed and makes more oxygen available to the regenerating tissues.¹¹ Honey (at a concentration of 1%) stimulates monocytes in cell culture to release cytokines, tumour necrosis

factor (TNF)-alpha, interleukin (IL)-1 and IL-6, which activate the immune response to infection. Honey at concentrations of 0.1% proliferates the stimulation of B and T lymphocytes in peripheral blood and phagocytes are activated by honey at concentrations as low as 0.1%.^{3,11}

Nutrient Effect: As honey constitute a wide range of vitamins, minerals, amino acids and readily available sugars, so, it can harbor a direct nutrient effect on regenerating tissues.^{11,14}

Clinical Applications of Honey–

- **Radiation Mucocytis:** Radiation mucositis develops early during radiotherapy. The acute mucositis response to radiotherapy is a result of mitotic death of epithelial cells, since the cell cycle time of the basal keratinocytes is about four days.

Soad K. Al Jaouni et al.¹⁵ had conducted a study for 1 year on 40 patients admitted to oncology ward diagnosed with hematological and nonhaematological cancer and concluded that significant reduction in the number of episodes of oral mucositis, bacterial and fungal infections, and hospital stay among pediatric cancer patients undergoing chemo/radiotherapy who are taking honey in conjunction with their regular therapy. Because of its high viscosity, acidic PH, hydrogen

peroxide, high osmolarity, and rich nutritional properties, honey can inhibit bacterial and fungal growth and enhance healing and is thereby a justified approach in the management of oral mucositis.¹⁴⁻¹⁶

- **As Pulpotomy Medicament in Primary Teeth:** Krishna kumari et al have conducted a study on 100 primary molars of 50 children using honey as medicament in one group and Formocresol in other group. After 24 months follow up they found higher radiographic success in sample treated with honey than formocresol. Its healing properties can be due to the fact that it offers antibacterial activity, maintains a moist wound environment that promotes healing and has viscosity which helps provide a protective barrier to prevent infection.¹⁴
- **Anti-Halitosis:** Honey has been observed to give rapid removal of malodor from infected wounds. Candies made with honey maybe useful for prevention of halitosis as along with its anti-bacterial effect, bacteria would also use the glucose in honey in preference to amino acids, and thus

would produce lactic acid instead of bad-smelling amines and sulphur compounds.³⁻⁴

- **Periodontal Therapy:** Honey contains a substantial level of antioxidants they protect the periodontal tissues from the free radicals formed during inflammatory process¹⁸. Honey also has other beneficial effects like it stimulates the growth of granulation tissue and epithelial cells, which would aid in repair of the damage done by infecting bacteria and free radicals. According to a study conducted by Hidaka et al honey has been proved effective as an anticalculus agent.¹⁹
- **Anti-Cariogenic:** As compared to sucrose honey at a concentration of 10% gave 75–80% less acid production from the streptococci and 30% less from *L.caseii*. There was no dextran produced from 10% solutions of the honeys. When the honeys were added at a concentration of 10% to a medium containing 10% sucrose the production of dextran from sucrose was inhibited by 75–89%. the minimum inhibitory concentrations of honey for *Strep. mitis*, *Strep. sobrinus* and *Lactobacillus caseii* were 7%, 7.5–8.5% and 8–12% respectively.³

PROPOLIS

Table 3:Composition of Propolis

Propolis Types	Composition	Properties
Brazilian (Baccharis type)	Prenylated p- coumaric acids, flavonoids, lignans,	Antibacterial, Antitumor, Antioxidant activity
Cuban	Prenylated benzophenones	Antibacterial and anti tumor activity.
European (Popular type)	Flavanones, Flavones, phenolic acid , caffeic acid phenethyl ester (CAPE), Ferulic acids.	Antibacterial, Antiinflammatory, antitumor, antioxidant, allergenic activity.
Taiwaneese	Prenylated flavanones	Antioxidant and anti tumor activity.

Table 4: Antibacterial Activity⁸

Gram-Positive bacteria	Staph.aureus, streptococcus: Citecus epidermis faecalis mutans, pyogenes, viridans, sobrinus, Enterococcus spp., Mycobacterium sp.
Gram-negative bacteria	Paratyphi B, typhi-shigella: Dysenteriae, Helicobacter pylori, Klebsiella ozaenae, proteus vulgaris, Pseudomonas aeruginosa, salmonella, Proteus vulgaris.
Fungi	Aspergillus sp., Candida albicans, Cryptococcus sp, neoformans, Histoplasma capsulatum Trichosporon cutaneum etc.
Viruses	Adenovirus, Coronavirus, Herpes simplex, influenza A and B Virus, Rotavirus, Vesicular stomatitis virus, Coronavirus
Parasites	Chlomonas paramecium, Giardia lambia, Trypanosoma cruzi etc.

Anti-Inflammatory Effect: Hyaluronidase is an enzyme responsible for several inflammatory processes. Ethanolic extract of propolis inhibits hyaluronidase activity.⁷ Application of 5% ethanolic extracts of propolis in the dental cavity of dogs showed its anti-inflammatory reaction, as well as antibacterial activity.²¹

Antioxidant Effect: According to an Italian Study, Propolis extract (with CAPE) and its active components showed a dose-dependent free radical scavenging effect, a significant inhibition of xanthine oxidase activity, and an antilipoperoxidative capacity.²²

Healing Effect: Propolis promotes epithelial formation as well as vascular and fibroblastic neof ormation of the connective tissue. Thus it can be said that the topical application of propolis on surgical wounds may promote faster epithelium and connective tissue healing.²³

Antitumor Activity: CAPE, a phenolic antioxidant, is potent and specific inhibitor of activation of the nuclear transcription factor . CAPE also suppresses the induction of prostaglandin E 2 synthesis mediated by 12-O-tetradecanoylphorbol-13-acetate and calcium ionophores. Therefore, CAPE can be considered as a potential anti-angiogenic agent that can reduce neovascularization.²³

Clinical Significance in Dentistry :

- **Anticaries:** Based on literature reports showing that propolis resin is a product with antiinflammatory and bactericidal activity, According to a in vivo study by Duailibe for 7 days , it was concluded that the propolis extract used as mouthrinse possesses antimicrobial activity against *S. mutans* present in the oral cavity. The extract might be used as an alternative measure to prevent dental caries.²⁴
- **Anti-Plaque:** Koo H et al studied the effect of a mouthrinse containing selected propolis on 3-day dental plaque accumulation and polysaccharide formation . On the 4th day they found that the PI for the experimental group was significantly less than for the placebo group. The experimental mouthrinse reduced the insoluble polysaccharide (IP) concentration in dental plaque by 61.7%. Hence it is concluded that mouthrinse containing propolis was thus efficient in reducing supragingival plaque formation and IP formation under conditions of high plaque accumulation.²⁵
- **Pulp-Therapy:** On addition of propolis to calcium hydroxide in order to add all beneficial biological properties of propolis, particularly its antiinflammatory, antibacterial, antifungal and antiviral properties to those of calcium hydroxide and as being oily in nature it may promote low-speed dissociation and diffusion when used as a component in an endodontic paste for primary teeth.²⁶ According to a study conducted in Manipal dental collage on premolars for direct pulp capping also showed that propolis is equally efficacious as calcium hydroxide. It has been concluded in a study that propolis can be used along with calcium hydroxide as an intracanal medicament.²⁷
- Rezende et al. found propolis was to be effectual againstn *Enterococcus faecalis* as an intracanal medicaments.²⁸In another study Al-Qathmi and Al-Madi stated that Propolis was as effective as NaOCl when used as an irrigant on extracted human teeth¹¹ Propolis stimulates circulation, cell metabolism, various enzymes and collagen formation hence can contribute in hard tissue bridge formation when used as a pulp capping agent.²⁹
- **New Storage Media:** Many studies have proved that propolis is effective in maintaining periodontal cell viability. Al- Shaher et al examined the tolerance of fibroblasts of the PDL and dental pulp to propolis and calcium hydroxide and concluded that propolis can be used as a suitable transport media for avulsed tooth.⁸ This success can be due to the antioxidant, antibacterial and antiinflammatory properties.³⁰
- **Dentinal Hypersensitivity:** According to an in vivo study conducted by Mahmoud et al, propolis has a positive effect on controlling dentinal hypersensitivity.³¹ Almas et al had conducted a study using an electron microscopy and found that propolis occluded dentinal tubules. ^[32] According to a study conducted by Sales – peres propolis can partially obliterate the exposed human dentin as its effect are similar to those of sodium oxalate gel.³³
- **Oral Candidiasis:** Brazilian researchers in their study have concluded that all patients treated with the commercial ethanol propolis extract showed regression of candida lesion similar to those patients treated with nystatin .³⁴

- **Safety:** Patients allergic to bee and bee products are more likely to experience allergic reactions, such as hypersensitivity, asthma, anaphylaxis and oral ulceration. Disadvantage also includes the fact that it gets frequently contaminated by yeast, fungus, bacterial spores. For adults and children above 1 year it is safe to be taken orally but it can be unsafe for infants and young children as ingestion of raw honey contaminated with Clostridium Botulinum spores can cause Botulism poisoning.^{6,8,32}

ABSTRACT

Most common mode of disease transmission is inadequate hand hygiene as hands harbour numerous microbes. Hands are in constant contact of critical vectors for mediating microbes between people, pets, inanimate objects and our environments. Healthcare workers handle numerous animate objects which are colonized with bacteria and other microbes. Leading to increased chances of spread of infections. Antimicrobials may reduce the density of the skin resident flora, but they do not completely eliminate it. There is substantial evidence that the use of anti-microbial & proper understanding with daily correct following would lead to considerable reduction of infection. These infections are transmitted by hands when health-care workers or visitors are constantly in contact with the patient while providing assistance. Thus, using proper hand hygiene is critical in reducing the risk of infections in patients.

Keywords: *Disinfection, Hand Hygiene, nosocomial infection*

INTRODUCTION

Hand Hygiene refers to a process of physically removing dirt, blood, body fluids & microorganisms. It is important to the point that a few religions have additionally highlighted it. For instance, the Prophet of Islam made reference to it as an essential measure for general wellbeing and suggested it in various circumstances in day to day of life. The hands are in constant contact with the surroundings. Individuals utilize their hands for an assortment of exercises regular. It is greatly simple to interact with various microorganisms and to exchange them to different articles and perhaps individuals. Shockingly, fingernails harbor the most microscopic organisms found on the human hands.¹

It has been depicted as the foundation and beginning stage of all contamination. The hands of medicinal staff being the drivers and advertisers in treating diseased. Hand Hygiene has been recognized as the primary treating intervention framework that will drive down cross-transmission of pathogens.¹ It has been shown to decrease the recurrence of nosocomial contaminations even in intensive care patients. Proper hand cleanliness habits have been established to lessen the rates of gastrointestinal, respiratory tract, and skin diseases. Hand cleanliness practices of the ongoing time have incorporated the use of

liquor-based salves or rubs. In a dental setting hand hygiene should be mandatory before touching a patient, aseptic procedures, when exposed to body fluids or on coming in contact with a patient or its surroundings.²

Hand hygiene using a soap with water or waterless alcohol-based hand rubs all are methods which for be followed as basic mode of infection control. In dental practice hand hygiene is the most fundamental area of the disease control process and is without doubt the most basic need to diminish the threat of transmitting microorganisms from patient to the health care provider or vice a versa. It is low in spite of it being the least complex and most imperative parts of infection control^{2,3}.

HAND PATHOGENS NORMAL PROFILE

The skin of human hands is for all time exposed to resident microflora, present in the epidermis, sebaceous glands, and around nails in variable proportions. The occupant microflora comprises, most importantly, of coagulase-negative staphylococci, with the *Staphylococcus aureus* as the predominant strain. The non-pathogenic corynebacteria, and from parasites e.g. *Pityrosporum* (*Malassezia*) spp. are also most commonly found.⁴ It is likely for the resident microflora to cause a

disease. It could turn into a contamination of the operator at if the skin is broken.¹

Hands are the primary vector for contamination & transmission of diseases yet there has been no extensive or ongoing researches of the hand microbiome in disease transmission. When the hands are unwashed it contains the normal microflora or resident microscopic organisms and the transient microbes from the items that the hands are in constant contact. When hands are washed with cold water the residual dirt and a few microorganisms is expelled but principle pathogens are still present. Washing hands with cleanser and water decreases the quantity of transient microorganisms.⁶

Bacteria were the most prevalent microorganism (>80% relative abundance), then viruses, and fungi being least prevalent (<5% relative abundance) on hand. Studies stated approximately 8 to 24 families of bacteria were present on hands. Bacteria were present from almost four phyla in abundance which consisted of Firmicutes, Actinobacteria, Proteobacteria, and Bacteroidetes.⁷ Studies have found Staphylococcaceae, Corynebacteriaceae, Propionibacteriaceae and Streptococcaceae were found in a majority of which Propionibacteriaceae, if noticed were present in high relevance.^{6,8}

Indications for Hand hygiene: Washing hands with soap and water has been the primary method of hand cleansing. In 2002, however, the Centers for Disease Control and Prevention (CDC) published Guideline for Hand Hygiene in Health- Care Settings along with World health Organisation (WHO) which included several new evidence-based practices such as an alcohol-based hand sanitizer to replace traditional hand washing for all patient contacts except if hands are visibly soiled.⁹

- On presence of blood, body fluids and visible amount of dirt the health care providers should use either a non-antimicrobial or antimicrobial soap with water.
- If there is no visible dirt the health workers before coming in contact with patients could preferably use an alcohol hand rub or antimicrobial soap and water which should also be followed after removal of gloves. There are chances of tearing of gloves and thus fluid contamination.
- When there is potential exposure to spore forming organisms non-antimicrobial or antimicrobial soap

and water is recommended as the alcohol rubs is in effective against spore-forming organisms like as *Clostridium difficile*, *Bacillus anthracis* etc.¹⁰

- After using a washroom, before taking medications or having food & Concomitant or sequential use of alcohol rub with soap and water
- hand hygiene studies found that handwashing with soap and water was much more effective at removing bacteria when hands were dried with a paper towel then when hands were allowed to air dry. Other work supported this, showing increased bacterial transmission from improperly dried hand.¹¹

Who Needs to Perform Hand Hygiene?: In dental practice, microorganisms may be inhaled, implanted, ingested, injected, or splashed onto the skin or mucosa. They can spread by direct contact starting with one individual then onto the next, or through direct contact of instruments. When dental staff or others inhale small particles containing infectious agents.¹¹

A number of contaminating agents, like the bacteria or viruses can be transmitted through droplet infections from patients who are coughing, sneezing or talking. Transmission also occurs through close contact, through larger droplets that remain suspended in the environment. Annually healthcare personnel are held responsible for many healthcare-associated infections, of which primarily affected are the patients in in-patient settings and intensive care patients.¹²

Hand hygiene is also mediated to be the most crucial for decreasing the risk of transmission to patients and healthcare workers. As the principles of infection control hand hygiene is should be considered very important in the dental setting.

HAND WASHING METHODS

WHO has recommended hand hygiene in 6 basic steps with drying of hands being mandatory which should be done by sterilized gauze or towels. Reused of the towels are usually causes of contamination. Use of air dryer is time-consuming.

1. Washing of hands using warm water: It removes the dirt but will not be able to eliminate or reduce bacteria

2. Washing of hands with soap and water: This clears of the bacteria with reduction of resident bacteria.
3. Washing hands with water and an antimicrobial detergent: This method kills and eliminates the bacterial flora & to certain extent the viral population.
4. Hands washing with alcohol-based new disinfectants: This removes transient's bacterial flora, some viruses and spore of bacteria. This includes the newer antiseptic spray and gels.
5. Hands washing with traditional methods in operating room: This method involves using water and soap or an antimicrobial detergent such as 7.5% povidone-iodine and brushing. This hand washing method will take at least 1–3 min. In addition, being sure to scrub brushes should be used and concern with numerous skin lesions.
6. Newer method: In this method fast action cleaning solutions like deconexis applied. It doesn't require scrub brushes.

Hand Hygiene Technique: Wet hands completely with Luke warm water. Hot or cold water should be avoided, as hot water could lead to irritation of hands causing dermatitis. Hands should be rubbed together properly for a minimum of 15 seconds, covering all palms and fingers, then rinsed and completely dried. After hand wash care should be taken to turn off manual faucets by using a disposable towel to prevent recontamination of hands.¹³

- If utilizing a liquor-based hand rub, it ought to be connected to dry hands utilizing the sum indicated by the producer. Rub hands together, covering all surfaces and fingers, for something like 15 seconds until the point when hands are dry. (In the event that hands are dry following 10 seconds of liquor-based hand rub utilization, it is likely that too little of the item was utilized.)^{12,13}
- Surgical hand antisepsis is more important & should be routinely practiced. Jewellery likerings watches, bangles etc should be removed. Washed thoroughly under running water, fingernails are cleaned to evacuate debris. The microorganisms present are said to replicaterapidly under gloves.

ASSESSING THE THOROUGHNESS OF HAND HYGIENE

Monitoring hand hygiene should be made mandatory amongst the health care providers. It would be useful to identify gaps in our practices and to educate staff accordingly with a proper feedback of the information to those involved. The other aspects of hand hygiene which includes the finger nail length, artificial nails, wearing of rings, and proper use of gloves should be made mandatory.¹⁴ Improvement strategies could be developed for behaviour change towards Hand Hygiene should be advocated where in the staffs should be trained on the specific indications for hand hygiene. This could increase their awareness of the complexity of the indications of hand hygiene and make them more sensitive to non-adherence. The periodic performance measurement should be followed by comparative feedback on performance. The effective improvement should be monitored at both the provider and organizational levels. Even Visual or auditory reminders could be provided at multidisciplinary levels to analyse and improve hand hygiene processes.¹⁵

Indian Scenario: The quality of healthcare in India is governed by various factors as the facilities varies amongst the government or private-sector organisations. This could be primarily due to an economic and regional disparity across the country. Majority of medical and other health organisations are located in urban areas & it comprises 1/4th of the total population. There is unavailability of clean water for consumption. This is due to lack of support unavailability of trained personnel's, surveillance systems, sanitation, and understaffing in hospitals with overcrowding of patients. Although hand hygiene is an important custom for infection control it becomes difficult for all health care workers to practice proper hand hygiene.¹⁶

Thus practice of compulsory training on precautions, safe hospital practices on infection control should be practised amongst all health care workers. Such an exercise may be made mandatory across all medical and nursing colleges of India.

General considerations and conclusion: In India lack of hand washing facilities are major restraint for advocating hand hygiene. The alcohol-based hand sanitisers could be a solution to overcome these obstacles. They are handy and could be distributed individually to staff which they

can carry in the pockets and readily placed near patients. Health education has the potential to significantly alter the behaviour of students and their outlook towards hand hygiene.

Dental and medical professionals are exposed to a myriad range of disease conditions caused by bugs which has become resistant to current anti-microbial therapy. The blame is on healthcare workers to refresh the basics of infection control & to rate, reflect and implement effective measures to control and overcome the challenges we face in ineffective infection control measures. Dental faculties should be entrusted with teaching and training future dentists to practice infection control. Currently there are voids in awareness, training, compliance among healthcare workers in general and teaching faculty in particular.

Mother's Knowledge & Attitude Regarding Oral Health of Pre-Adolescent Children's and Associated Risk Factors on Dental Caries Experience and Oral Hygiene Status

Naveen N¹, Abhinav Patel², Yunus G. Y.³, Ram Tiwari⁴, Swati Patnaik⁵, V. Balasubramanyam⁶

¹Professor & Head, ²Post Graduate Student, ³Reader, ⁴Senior Lecturer, ⁶Post Graduate Student, Department of Public Health Dentistry, Rungta College of Dental Sciences & Research, Kohka-kurud, Bhilai, Chhattisgarh; ⁵Department of Public Health Dentistry, Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Aim & Objectives: To determine mother's knowledge & attitude towards their child's oral health, dental caries experience & oral hygiene status of pre-adolescent children's.

Material and Method: In this descriptive cross-sectional study 400 pre-adolescents children & their mothers were randomly selected from 8 private & government school. A 21 item, self-administered questionnaire was used to assess the mother's knowledge and attitude towards child's oral health. DMFT/def index was used to record dental caries experience & oral health status was recorded by using OHI-S index. Descriptive statistics, t-test & chi-square test were applied to analyse the data.

Results: The Mean percentage of Mother's knowledge & attitude towards child's oral health of private & government school was 44.2% & 44.6%, 27% & 34.49% respectively. The mean±SD of oral hygiene status was 1.824±0.85 & 1.712±0.81, DMFT & def was 2.42±1.59 & 2.39±1.38, 0.61±1.40 & 0.50±1.46 among private & government school children respectively (p>0.05). Illiterate to literate mothers had 0.860 odds of having poor oral hygiene and 1.506 odds of having caries experience among their pre-adolescent children.

Conclusion: This study reflects that mother's knowledge & attitude towards their child's oral health is significantly associated with dental caries experience & oral hygiene status. The study signifies that as the mother's knowledge and attitude increases the caries experience decreases. Therefore, mother's education towards child's oral health is necessary.

Keywords: Attitude, Child, Knowledge, Mothers, Oral health

INTRODUCTION

It is well said that, children are the reflection of the parents, i.e. they follow the same behaviour as that of their parents. Children get accustomed with the behaviour of their parents especially their mother during the childhood and the preadolescent period of the life.

The same follows when oral health is considered.¹ It becomes important for the mothers to have a sound knowledge and attitude regarding the maintenance of oral health of their children.² It is in the early childhood period when the child starts to distinguish between the right and wrong practices in life, thus once concreted would be perceived throughout life of the individual.³ Mother helps the child to learn proper dietary habits, oral hygiene skills & healthy practices, which is proven by researches that mother's dental knowledge & attitude had an important role on their children's oral health & oral health related behavior.⁴

Other than the role of mother as oral health behaviour developer & modifier, they also are the primary caregivers to their pre-adolescent children,

source of physical comfort & safety for the child.⁵ Some misconception do exist in this modern society among parents that the primary dentition are off less importance when compared to permanent dentition, so they misconceptualize that only proper oral health care is needed to be maintained with permanent dentition & they neglect the primary dentition, which results in grievances to the child.⁶

A negative impact on the day to day activities like performance skill in school and social life of the child occurs Due to the neglect and poor maintenance of oral health of the child .⁷ The most commonly encountered dental disease among pre-adolescent children include dental caries & malocclusion though which are preventable but still created havoc in most developed and developing countries. In India, the scenario becomes worse as they are preoccupied with the treatments that include emergency & curative oral health services rather than preventive oral health care.⁸ Oral health of pre-adolescent children is directly associated with the knowledge & attitude of their mothers and the foremost work of mother is to evaluate the oral health of their childrens, which is still questionable.¹

Due to the lack of knowledge about dental disease & importance of dentition an effective employment of disease control measure is not possible, which is added on with the fact that there are very few documented researches on mother's awareness of dental issues Hence the aim of the present study was to assess mother's knowledge & attitude towards child's oral health & a clinical assessment of pre-adolescent children's oral hygiene status & dental caries experience.

MATERIAL AND METHOD

This present descriptive school based cross-sectional study was conducted among pre-adolescent children of age 9-12 years, at 4 private & 4 government schools in Bhilai, Chhattisgarh. Using the Cochran formula, prevalence was taken from the previous study to be 92% & setting the confidence interval at 95%, margin of error at 5%, & design effect of 1.5, sample size was estimated to be 400.⁴ The total school in Bhilai city was obtained from the block education officer. The study was conducted for a period of 1 month from July 2017 to August 2017.

Incorporating the stratified random sampling technique the Bhilai city was divided into 4 zones (north,

south, east and west zones), from each zone 1 government and 1 private schools was randomly selected, and from each selected school 50 students between the age of 9-12 years were randomly selected.

Pilot study: The questionnaire was prepared in both Hindi and English language for ensuring comprehension by all mother's of the pre-adolescent children and pretested in a group of 10 mother's and modifications were made accordingly. Moreover, the validation was carried out by a panel of 10 experts in the subjects. Cronbach's alpha was calculated ($\alpha = 0.86$) and test-retest analysis showed a good reliability and consistency of 0.7 of the questionnaire. Those mothers who were involved in the pilot study were excluded from the final study. The knowledge questions were assigned score of one for the correct answer and zero for the wrong answer. The partially filled or incomplete questionnaires were excluded. Similarly for attitude score one was assigned for the correct answer and zero for incorrect answer. The option of don't know was assigned zero score.

Questionnaire:

A self-designed pre tested and close ended proforma comprised of two sections with a total of 21 items regarding mother's knowledge and attitude towards their pre-adolescent children's oral health was used.

Section-I: comprised of 10 questions to evaluate knowledge of mother's regarding their pre-adolescent children's oral health.

Section II: comprised of 11 questions to evaluate attitude of mother's regarding their pre-adolescent children's oral health.

After getting the completely filled questionnaire and signed consent from mothers, the oral hygiene status was recorded using Oral Hygiene Index-Simplified (OHI-S index 1964)⁹ & dental caries experience for permanent dentition was recorded using DMFT Index¹⁰ and for deciduous dentition def index was used.¹¹

STATISTICAL ANALYSIS

Descriptive statistics were derived; t-test was used to compare the mean of DMFT, def & OHI-S among private & government school children. Chi-square test was applied to check association between mother's knowledge & attitude with oral hygiene status & dental

carries experience of their pre-adolescent children. Simple linear regression model with odds ratio was incorporated for the statistical analysis of mother’s education and oral hygiene status, dental caries experience of their pre-adolescent children. The level of significance was set up at $p < 0.05$. The entire test were applied to analyze the data using (SPSS version 16.0 (IBM Corporation, SPSS Inc., Chicago, IL, USA).

RESULTS

A total of 400 subjects agreed to participate in the current study in which 181 (45%) were males and 219 (55%) were females with the highest prevalence in age among males 12 years (36.46%) & (33.33%) females were at the group of 11 years. In the present study kuppuswamy’s socioeconomic scale 2017 was used to assess the mother’s education & socioeconomic status, in which it was found that 114 (28.5%) mothers had a minimum of high school education & monthly family income ranging from 10357-15535 among 118 (29.5 %) mothers.⁶ (TABLE 1 & 2)

Table 1: Distribution of study subjects according to mother’s education

Sl. No.	Mother’s Education	Total n (%)
1.	Illiterate	57 (14.2%)
2.	Primary School	88 (22.0%)
3.	Middle School	99 (24.8%)
4.	High School	114 (28.5%)
5.	Higher Secondary	36 (9.0%)
6.	Graduate	6 (1.5%)
	TOTAL	400 (100%)

Table 2: Distribution of study subjects according to monthly family income

S. No.	Income (monthly)	n (%)
1.	< 2091	18 (4.5%)
2.	2092-6213	93 (23.2%)
3.	6214-10356	116 (29.0%)
4.	10357-15535	118 (29.5%)
5.	15536-20714	48 (12.0%)
6.	20715-41429	7 (1.8%)

Results from independent sample t-test on DMFT, def & OHI-S was compared on private & government

school children. It was found that mean DMFT, def & OHI-S was higher (values) among private school children but was not statistically significant ($p > 0.005$). (TABLE-3).

Table 3: Mean Comparison of DMFT, def & OHI-S among Private and Government school children

	DMFT (Mean ± SD)	Def (Mean ± SD)	OHI-S (Mean ± SD)
Private school	2.42 ± 1.59	0.61 ± 1.40	1.82 ± 0.85
Government school	2.39 ± 1.38	0.50 ± 1.46	1.71 ± 0.81
t-value	1.38	0.74	1.34
p-value	0.84 (NS)	0.45 (NS)	0.18 (NS)

Statistical test: independent t-test; ($p \leq 0.05$ -Significant, CI=95%)

Association between mother’s knowledge & attitude with caries experience & oral hygiene status was very highly significantly associated ($p < 0.001$) between study participants. This table implies that as knowledge and attitude of the mother’s regarding child’s oral health increases the oral hygiene status improves and dental caries experience decrease. (Table-4)

Table 4: Association of knowledge and attitude with caries experience and oral hygiene status:

	DMFT		Def		OHI-S	
	X ² -value	P-value	X ² -value	P-value	X ² -value	P-value
Knowledge	1.31	0.001*	1.50	0.001*	7.62	0.001*
Attitude	2.17	0.001*	3.77	0.001*	2.14	0.001*

Statistical test: X² = chi-square test; ($p < 0.001$)* = highly significant, CI=95%)

Simple linear regression model was applied and odds ratio was derived for literate and illiterate mothers for dental caries experience and oral hygiene status among the study subjects. The corresponding Odds ratio for each component is represented in table 5. It was evident from the table that the illiterate mother’s children had a odds of 1.5 of developing dental caries when compared to literate mothers children and this difference was found to be statistically significant. ($p < 0.001$) at 95% CI).

Similar findings were seen with the oral hygiene status among the pre-adolescent, this showed that the literate mothers had maintained a better oral hygiene

status for their preadolescent children when compared to the illiterate mothers.

DISCUSSION & CONCLUSION

This study was designed to determine mother's knowledge & attitude towards their pre-adolescent children's oral health. Children in their pre-adolescent years involve primary socialization & acquire childhood routine habits & oral hygiene practices. Parent's support towards maintaining their child's oral health is important for influencing the dental health of pre-adolescent children. It is essential that the mother have knowledge on oral hygiene practice that would play a key role in the development of oral hygiene habit among their pre-adolescent children. Not only the literacy level of mothers but also the social status of the family plays an important role in assessing the oral health status of pre-adolescent children in the society. It is assumed that a well-educated mother with good socioeconomic status will have knowledge and access to all the resources, which would be reflected in the pre-adolescent children's oral health.

Among 400 mothers who completed the questionnaire in the present study it was found that

64.0% mothers had knowledge that their children's teeth should be brushed twice daily. However it was found that, study conducted by Khanal K et al found that out of 76% mothers, only 10% of them brushed their child's teeth twice daily.¹² In our study 55.8% mothers had knowledge that tooth paste is the material of choice for cleaning their child's teeth. However study conducted by Mubeen N. & Nisar N found that majority of the mothers had inadequate knowledge in relation to duration of brushing and material to be used for brushing their child's teeth.¹³ In the current study 41.2% mothers had knowledge about what is dental decay and 74.0% mothers had knowledge that which food stuffs causes dental decay. Whereas a study conducted by Ashkanani F & Al-sane M also found that majority of the mothers had knowledge that consuming sugary food leads to dental decay.¹⁴

Among all the study participants assessing the attitude regarding evidence that good oral health related to good general health 68.8% mothers had a positive attitude whereas 13.2% mothers had a negative attitude

for the same. Study Alshehri A & Nasim V S found that approximately 85% of parents believe that dental health will affect child's general appearance.³

Mothers with the higher education level have better knowledge and attitude regarding oral hygiene and importance of deciduous tooth. This is similar to a study conducted by Szatko et al which reports that the mother with the lower level of education also have low level of oral health knowledge.¹⁵ In the current research, when it was asked whether deciduous dentition was as important as permanent dentition, 59.0% mothers had a positive attitude whereas 29.5% mothers did not believe that deciduous dentition was as important as permanent successor. However study conducted by Jain R et al found that majority of the mothers were in opinion that baby's teeth do not require good care as they will fall off.¹⁶

Majority of the mothers in the present study had a positive attitude that children should have regular dental visit. This result was in accordance with the study conducted by Moulana et al & Chand et al who also found that regular dental visit for their children is necessary, Thus it is suggested that the sooner the child visit a dentist the less is the dental problem.^{1,6}

This study concludes that the mothers play a very important role in promoting good oral habits & preventing dental diseases, thus positively influencing their children. This is the main reason for mothers to be well educated about good oral health. The result of present study reveals that the mother's knowledge & attitude regarding child's oral health were found to have a significant impact on oral hygiene status & dental caries experience of their pre-adolescent children. Mothers of high educational level have comparatively more knowledge and attitude about children's oral health than the mothers of low educational level. The present study also emphasizes the need to initiate more oral health awareness educational programs for mothers and their children at the school setups as well as to disseminate oral health awareness in the Indian population.¹⁷

This study has some limitations. Oral hygiene knowledge & attitude are influenced by a number of factors like occupation, dietary habits etc., which were not taken into consideration in the present study. This study carried out in only 8 schools, a large sample would be beneficial to reflect more appropriate results of the knowledge & attitude of mothers regarding their child's oral health in other part of the country.

This study strongly recommended that appropriate oral health strategies targeting mothers should be designed to improve the knowledge & attitude towards their pre-adolescent children's oral health. So during the planning of awareness programs for pre-adolescent children, mother's potential to promote good oral health should be advocated by oral health professionals.

Ultrasonography in Maxillofacial Lesions

**Basanta Kumar Choudhury¹, Santosh Kumar Subudhi², Radha Prasanna Dalai³, Shibasis Biswas⁴,
Saswati Priyadarshini⁵, Rupsa Das⁵, Suvranita Jena⁵**

¹Assistant Professor, Department of Oral Medicine and Radiology; ²Professor, Department of Oral and Maxillofacial Surgery; ³Post Graduate Trainee, Department of Public Health Dentistry; ⁴Post Graduate Trainee, Department of Oral and Maxillofacial Surgery; ⁵Post Graduate Trainee, Department of Oral Medicine and Radiology; Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Various kinds of diseases may be found in the oral and maxillofacial regions and various modalities may be applied for their diagnosis, including intra-oral radiography, panoramic radiography, ultrasonography, computed tomography, magnetic resonance imaging, and nuclear medicine methods such as positron emission tomography. Of these modalities, ultrasound imaging is easy to use for the detection of noninvasive and soft tissue-related diseases. Ultrasonography uses a probe with one or more acoustic Transducers to send pulses of sound into a material. Whenever a sound wave encounters a material with a different density a part of the sound wave is reflected back to the probe and is detected as an echo. The time it takes for the echo to travel back to the probe is measured and used to calculate the depth of the tissue interface causing the echo. Ultrasound is an inexpensive, non-invasive and readily available imaging technique, that can be used as a primary investigative imaging technique So as to avoid radiation hazards caused by X-ray radiation or to provide imaging in a cost-effective way ultrasonography is an alternative imaging modality. Hence proper application and utilization of this technique can be of great use in dentistry though it still has not made its place in routine imaging modalities of maxillofacial region. Its limited role in bony and intra-bony diseases and operator sensitivity makes it a less used and less appreciated imaging modality.

Keyword: *Ultrasonography, Maxillofacial Radiology*

INTRODUCTION

Sound is a form of energy which travels in the form of waves through a medium and it is audible to human ears. Ultrasound is acoustic energy which is also in the form of waves having a frequency greater than that of human hearing range. The maximum frequency that the human ear can perceive is roughly twenty thousand cycles per second (20,000Hz). Now it has

become an integral part of medicine to view internal organs. Some animals such as dolphins, bats and dogs have a higher frequency of hearing and hence can hear Ultrasound.¹ Various kinds of diseases may be found in the oral and maxillofacial regions and various modalities may be applied for their diagnosis, including intra-oral radiography, panoramic radiography, ultrasonography, computed tomography, magnetic resonance imaging, and nuclear medicine methods such as positron emission tomography. Of these modalities, ultrasound imaging is easy to use for the detection of noninvasive and soft tissue-related diseases.¹⁻⁴

In the oral and maxillofacial regions, Ultrasonography can be applied to various aspects such as to check salivary gland diseases, lymph node disease, subcutaneous lesions and tongue related lesions.² However, most dentists do not know the utilities of Ultrasonography for the diagnosis of various kinds of

oral diseases and it is very disadvantageous for patients with any of the diseases mentioned above. In the present article, therefore, we explain the significance of the clinical applications of Ultrasonography -guided fine-needle aspiration (FNA), ultrasound identification and measurement of tongue cancer thickness, and ultrasound-based diagnosis of metastasis to cervical lymph nodes³

Regulation of Ultrasonography: Diagnostic ultrasound is regulated in the USA by the FDA and world wide by National regulation agencies. The primary regulatory metrics are MI (Mechanical Index) a metric associated with cavitation bio effect and TI (Thermal Index) a metric associated with tissue heating bio effect. These are strictly followed for safety.⁵

Creation of Image: The creation of an image from sound is done in three steps:

Producing a sound wave: In medical ultrasonography, a sound wave is typically produced by creating short, strong pulses of sound from a phased array of piezo electric transducers. The electric wiring and transducers are encased in a probe. The electric pulses vibrate the ceramic to create a series of sound pulses from each.³¹ The frequency of the sound waves can be between 2 and 13 MHz. The goal is to produce a single focused arc shaped sound wave from the sum of all individual pulses emitted by the transducer. To make sure the sound is transmitted efficiently into the body, the transducer face has a rubber coating. In addition, a water-based gel is placed between the probe and the patient's skin.⁶

Receiving the echoes: The return of the sound wave to the transducer results in the same process that it took to send the sound wave, just in reverse. The return sound wave vibrates the transducers elements and turns the vibrations into electrical pulses that are sent from the probe to the ultrasound scanner where they are processed and transformed into digital image.⁷

Forming of the Image: The ultrasound scanner must determine three things from each received echo, The direction of the echo, How strong the echo was, How long it took the echo to be received from when the sound was transmitted. Once the ultrasound scanner determines these three things, it can locate which pixel in the image to light up and to what intensity.⁷

Sound in the Body: Ultrasonography uses a probe with one or more acoustic Transducers to send pulses of sound into a material. Whenever a sound wave

encounters a material with a different density a part of the sound wave is reflected to the probe and is detected as an echo. The time it takes for the echo to travel back to the probe is measured and used to calculate the depth of the tissue interface causing the echo.²⁹ The greater the difference between the acoustic impedances, the larger the echo is. Seeing deep into the body with ultrasound is difficult. Some acoustic energy is lost every time an echo is formed, but most of it is lost in the form of acoustic absorption common model of this loss is $0.3\text{dB}\backslash\text{cm of depth}\backslash\text{MHz}$.⁸⁻¹⁰

To generate a 2D image, the ultrasound beam is swept. A transducer may be swept mechanically by rotating or swinging or a 1D phased array transducer may be used to sweep the beam electronically.¹¹ The received data is processed and used to construct the image. The image is then the 2D representation of the slice into the body.⁷

Ultrasound Terminologies: Echo- reflection of sound

1. Types of echoes

- Hypo echoic-less reflection of sound waves
- Iso echoic-medium level reflections of sound waves
- Hyper echoic-total reflection of sound waves

2. Internal echoes

- Homogeneous-evenly distributed echos
- Non-homogeneous-unevenly distributed echos

3. Boundaries

- Clear-well distinguished
- Unclear-moderately distinguished
- Obtuse-not demarcated from the surrounding structures

4. Shapes

- Oval
- Roughly oval
- Polygonal
- Irregular

Acoustic Enhancement:

- **Posterior Shadowing:** Complete propagation loss of sound wave due to strong reflector

- **Posterior Enhancement:** Increase in the propagation of sound waves.
- **Lateral Shadowing:** Partial propagation loss of sound waves along the lateral borders.

Advantages

- It creates excellent images of the muscle and soft tissues as well is mostly useful to delineate the interfaces between solid and fluid filled spaces.
- It creates a linear array of images so that the operator can dynamically select the required section and offer an apt and rapid diagnosis
- It can be used to study the structure of the organs.
- Has no side effects and has better compliance from the patient
- Readily available and easy to use.
- Portable hand-held scanners are also available which can be used as a bed side operators' tool.
- Cost effective as compared to other radiographical units.

Disadvantages

- Scattered image in obese patients as the adipose tissues and the greater depth needed to travel weaken the image strength.
- Ultrasound devices have trouble in penetrating bone
- It produces poor quality images if there is presence of a dead space in between the transducer and the structure to be viewed.
- Deep seated structures are difficult to view
- Experienced operators are required to gain high quality images.
- There is no scout image as there is with CT and MRI. Once an image is acquired there is no exact way to tell which part of the body was imaged.
- There are several disadvantages of ultrasonography which are encountered while performing the examination of Head and Neck.

Instrumentation for Head and Neck Ultrasonography:

In the diagnosing of head and neck diseases, device with A and B modes are used; A-mode is employed in

the diagnosis of the diseases of paranasal sinus and of maxillary frontal and anterior ethmoidal cells. The curve typical for a particular pathological entity allows the free content in sinuses, edema or polypoidally degenerated mucosa and tumor to be determined.¹²

B-mode is also used in the diagnosis of sinus diseases as well as the diseases of other parts of head and neck, including the following organs located in the area of drainage of salivary glands, being tumors of neck, thyroid gland and tumors of the larynx, oropharynx and pharynx.¹³ Linear, complex and sector probes are used for ultrasonographic examination. The probes must be of high frequency ranging between 7-10 MHz. A combination of various probes should be used during examination (eg) the neck structures and thyroid gland should be observed by linear probes, where as in the case of structures of smaller surface convex, micro convex or sector probes should be used concerning patient position on examination, sinus diseases are diagnosed in sitting position recent advancement in probes in that complex electron produce of the same frequencies with radius convexion of 40-80 degrees are now frequently used.⁹ Diseases of salivary gland and oropharynx are above examined in sitting position, whereas other structures of the head and neck are as a rule examined in supine position or occasionally a combination of various positions may be required.¹¹ The skin of the region to the observed should be anointed with gel. In case of lesion in the region observed, a sterile slip-on cover and sterile gel should be used.¹⁴⁻¹⁷

Indications for ultrasound in the Head & Neck Region

- Evaluation of swellings of the neck, particularly those involving the thyroid, cervical lymph nodes or the major salivary glands—ultrasound is now regarded as the investigation of choice for detecting solid and cystic soft tissue masses
- Detection of salivary gland and duct calculi
- Determination of the relationship of vascular structures and vascularity of masses with the addition of colour flow Doppler imaging
- Assessment of TMJ disorders
- Assessment of the Intraosseous lesions of the jaw
- Assessment of cervical lymph node metastasis.

- Ultrasound-guided fine-needle aspiration (FNA) biopsy.
- Assessment of Maxillofacial space infections
- Assessment of Soft tissue lesions such as carcinoma of tongue

MUSCLES

Measurements and cross sectional dimensions can be made through ultrasonography in the muscles of head and neck to assess asymmetry, muscle dimensions, thickness, etc.¹⁸ For temporalis muscle the scanner should be placed against patients head in vertical to horizontal direction overlying the anterior temporalis.¹⁹ For the anterior masseter muscle the transducer is placed against the patients face in horizontal direction just above the superior border of the mandible. For the deep masseter muscle, the transducer is placed against the patients face in a horizontal direction just above superior border of the mandible.¹⁹ Inflammation of the masseter muscle will show complete or partial absence of hyperechoic bands and decreased internal echogenicity.²⁰⁻²³

PARANASAL SINUSES

The superficially located sinuses such as frontal and maxillary sinuses can be easily accessible by ultrasound, but sphenoidal and ethmoidal sinuses are inaccessible.²⁴ In ultrasonography a total reflection of the ultrasound waves result while examining the air containing paranasal sinuses due to marked difference in acoustic impedance between soft tissue and bone material on one hand and between bone and air in the area of the anterior wall of the inspecting sinus on the other hand.²⁵ Only an anterior wall echo of the abnormal paranasal sinus can be depicted by sonography.²⁶ When a thin layer of air is located between the anterior walls of the sinus cavity, the anticipated pathological lesion of the sinus cavity cannot be detected sonographically. In effusion filling the sinus the ultrasound beam is not totally reflected but is transduced to the posterior wall where it undergoes reflection.¹⁴ This reflection of the sound appears on the monitor as a posterior wall echo. Depending on the depth of the investigating sinus below the surface, this posterior wall echo can be expected to show at a certain distance from the echo produced by the anterior wall.⁵ The patient is seated in an upright position. First a transverse image is obtained and then a vertical

image is obtained, and the images are comparatively and bilaterally assessed. While imaging the maxillary sinus, the transducer is placed at the level of the infra orbital nerve. For the frontal sinus, the ultrasound probe is placed between the medial portion of the eyebrow and glabella, near the lowest point of the frontal sinus cavity. The anterior ethmoidal sinus can be imaged from the medial corner of the eye.²⁷

Only the anterior wall of normal air containing maxillary sinus can be visualized. Total reflection at the bone air interface of the paranasal sinus prevents further distal echo signals from being generated.³² The imaged soft tissue layer in the anterior bone wall of the maxillary sinus has a thickness of about 0.8 to 1cm and the corresponding thickness of the soft tissue layer of the frontal sinus is approximately 0.5cm.²⁸ If a pathological lesion is present posterior wall echo can appear 3.5cm to 4.5cm further distally in maxillary sinus and about 1.5cm to 2.5cm in frontal sinus examination. Depth and extension of the ethmoid cell system cannot be visualized because of the distinct inter individual variations.²⁹ There will be propagation of ultrasound waves up to the posterior wall if there is secretion or swelling of the mucosa. The content of the sinus cavity appears homogeneously hypoechogenic to sonolucent with isolated internal echoes. If the pathology is in the anterior wall and the remaining part of the sinus cavity contains air and normal posterior wall, it cannot be sonographically visualized. In solid tumors the inhomogeneous echo pattern distinguishes this finding from the typical echo pattern produced by an effusion in which case no further sonographic changes occur as the signal travels from the anterior to the posterior wall.¹⁹ Due to the physical principles of ultrasound imaging, the paranasal sinuses are accessible to the sonographic examinations only to a certain degree. It is not possible to plan surgical intervention solely based on ultrasound findings. Ultrasound of the paranasal sinus can be used in the investigating the maxillary sinus and frontal sinus after the surgery has been carried out.³⁰

SALIVARY GLAND ENLARGEMENTS

Ultrasonography has become one of the important imaging technique and pathological changes of salivary gland can be studied with ultrasonography.⁹ It is easy to use, less expensive less time-consuming non-ionizing and suitable for peripheral location of the salivary gland enlargement.¹⁵

In this process the electrical impulses are converted into waves and these waves produce high frequency sound and sonic waves. These waves are transmitted into the tissue. As sonic waves pass through the pathological tissue, they produce different type of echoes. These echoes vary in different diseases and echogenicity is recorded for variations.¹⁷

These echoes are broadly described as hypo echoic, iso echoic and hyper echoic. The sonographic features include not only the echoes of sonic waves but also help to identify echoes, acoustic enhancement, presence of calcification vascularity etc. Many diseases of salivary gland appear as enlargement both in major and minor salivary glands.³¹ Salivary gland diseases mainly appear in the form of enlargement. In sialadenosis a non-inflammatory bilateral enlargement of salivary gland though clinically can be confusing whether the bilateral enlargement of salivary gland is sialadenosis or Sjogren's syndrome. It is found by Louis mantel-et al etc, that multiple hypo echoic areas bilaterally with sonolucency vary in size. Thus, sialadenosis though it is a bilateral enlargement can be diagnosed from ultrasound and differentiated from Sjogren's syndrome.³²

In sialolithiasis- when it occurs in the salivary gland it will produce pain and inflammation. In radiograph the salivary stone is in the process of calcification it will appear as radiolucent misguiding the radiographer. In such occasion's ultrasonography is very much beneficial, in ultrasonography stone can be detected in the enlarged duct. If we standardize the ultrasonographic calcified masses can be detected early.⁶ Ultrasonography can also be used to diagnose benign neoplasms. The ultrasonographic observation for a polymorphic adenoma is hypo echoic mass, non-homogenous internal echoes ovulated, spherical in shape. These features are general for a polymorphic adenoma but variants like calcification and vascularity can also be noted. The extension of the tumor and its extension can be accurately seen using ultrasonography.³³

There is not much difference in ultrasonographic observations between benign and malignant tumors. But the malignant tumors have non-homogeneous internal echoes. The non-lobulation is the characteristic of malignant tumours. The non-homogenous or hetrogenus internal echoes in the parotid swelling are the characteristic ultrasonographic finding in malignancy. However, ultrasonographic observation can help to

diagnose the parotid swelling as malignant but it cannot give the characteristic type of the malignant tumors, but observations suggest that it is very difficult to diagnose benign and malignant tumours as there are overlapping of sonographic findings.³⁴

Parotid swellings in HIV patients show multiple hypoechoic areas bilaterally with a variety of sonographic patterns are seen. Mostly, well circumscribed large sonolucent areas surrounded by well-defined borders with in these hypoechoic areas and debris are seen. In the second variety small oval hypoechoic areas with echogenic centre is seen. In the third variety define small hypoechoic region interspersed with normal echogenic areas. However large circumscribed sonolucent areas are a dominant feature in most of the glands.²²

COLOR CODED DOPPLER SONOGRAPHY

It is a combination of sonography pulsed Doppler system and the color-coded representation of perfused areas. The speed and direction at which the erythrocytes approach and move away from the transducer provides the information necessary for the functional duplex sonography which is coded with blue and red colors.²⁵ The assessment of the color distribution gives information about the vascularization of tumour masses. Color coded duplex sonography is mainly used for assessment of anomalies concerned with blood and vascularity of a lesion. It is especially indicated for angiomatous tumours, lymphangiomas, hemangiomas and other vascularized tumours. Color Doppler sonography is useful in analyzing changes in blood flow of submandibular salivary gland caused by gustatory stimulation. Doppler sonography can clearly depict the facial artery and its branches in the anterior face, and this method useful in the follow up examination of hemangiomas in this area.³⁵⁻³⁸

CONCLUSION

Ultrasound is an inexpensive, non-invasive and readily available imaging technique, that can be used as a primary investigative imaging technique So as to avoid radiation hazards caused by X-ray radiation or to provide imaging in a cost-effective way ultrasonography is an alternative imaging modality. Hence proper application and utilization of this technique can be of great use in dentistry though it still has not made its place in routine

imaging modalities of maxillofacial region. Its limited role in bony and intra-bony diseases and operator sensitivity makes it a less used and less appreciated imaging modality.

Conflict of Interest: None

ABSTRACT

Tobacco related diseases are increasing, especially in the developing countries which are experiencing the highest increase in the rate of tobacco use. Tobacco use is one of the main risk factors for several chronic diseases, including cancer, lung diseases, and cardiovascular diseases. Dentist can help patient to quit smoking for better oral and general health. Various health agencies and professionals must work together to help patient to stop the habit of tobacco usage which may later emerge as the single most known cause of mortality and morbidity in the world. People will get aware of the ill effects of tobacco by the help of dentist. The next generation of dentists should be trained well enough in assessing and treating the patient with tobacco use. The present article reviewed the current scenario about the tobacco related diseases and the risk factors associated with oral health and general health and the measures taken to control tobacco by the various health programmes around the globe.

Keywords: Tobacco; Health risks; Public health; Tobacco control

INTRODUCTION

Use of tobacco and its hindering effect on human body has now become one of the greatest public health challenges in the world. Every year over 4.9 million deaths are caused by tobacco. By 2030, unless there are dramatic reductions in tobacco use, that number will rise to 10 million deaths annually. There is overwhelming evidence showing that tobacco use causes many diseases, including stroke; heart attack; chronic bronchitis; chronic cough; asthma; cold; and cancer of the lungs, throat, mouth, stomach, kidney and bladder. Half of all regular smokers die of a condition caused by smoking. Tobacco use is one of the main risk factors for several chronic diseases, including cancer, lung diseases, and cardiovascular diseases¹. Tobacco kills approximately 5

million people annually worldwide, accounting for over 20 percent of all deaths for adult men and 5 percent of adult women².

Many studies have shown that in the poorest households, less money for food, education and healthcare are because of spending 10% of total household expenditure on tobacco products. 10 – 14% of children from tobacco growing families stop attending schools and miss classes because of working in tobacco fields. 60 – 70% women from tobacco farm are often exposed to hazardous chemicals.

The institute for Global Tobacco control's mission is to prevent death and disease from tobacco products by generation of evidence supporting towards tobacco control intervention.(Global tobacco control.org.in) The US National Cancer Institute (NCI) launched an Initiative for the Study of Innovative Systems in the year 2002 to better understand strategies for integrating science and practice which includes broad consultation with tobacco control experts to map out the current extent of tobacco control activity and to identify tobacco control priorities. Developing an integrated model of tobacco control leads to a better alignment of tobacco control activities at the

national levels which is proposed by the leading experts in systems and network theory. Enhancing global tobacco control research through information sharing and collaboration among researchers was developed by the Global Tobacco Research Network (GTRN) which also connects organizations to conduct, synthesize, manage, and disseminate tobacco control research³.

Tobacco related diseases are increasing, especially in the developing countries with increase in the rate of tobacco usage. By the third decade of this century, tobacco usage will be the leading cause of death causing more deaths than HIV, malaria, tuberculosis, maternal mortality, automobile crashes, homicides and suicides combined. Tobacco usage is also the leading preventable cause of death in the world today which can clearly be the most cost-effective measure. Tobacco control protects the rights and health of non-smokers, especially babies, children, youth and pregnant women. Most significant effects of smoking on the oral cavity are: oral cancers and pre-cancers, increased severity and extent of periodontal diseases, as well as poor wound healing. Oral health professionals should take part in tobacco control initiatives and cessation programmes.

FDI shares and fully supports the goal of the WHO Oral Health Programme, which is “to ensure that oral health teams and oral health organizations are directly, appropriately and routinely involved in influencing patients and the public to avoid and discontinue the use of all forms of tobacco⁴.”

The Framework Convention on Tobacco Control: The main vehicle to accelerate tobacco control is the WHO’s Framework Convention on Tobacco Control (FCTC) which is the first global treaty on public health. The FCTC has introduced evidence-based strategies as its formulation was driven by evidence from two major reviews of global tobacco control. FCTC has been limited largely by a statement of intent; the specific actions needed to implement the provisions in each country require ongoing technical support. In particular, the pressing priority is to counter the active influence of the tobacco industry, which seeks to secure complex tax regimes.⁴

After MPOWER was introduced a decade ago as a tool to help implement the World Health Organization’s Framework Convention on Tobacco Control (WHO FCTC) there has been remarkable progress made in global tobacco control. The important MPOWER measures are: Monitor tobacco use and prevention policies, Protect people from tobacco use, Offer help to quit tobacco use, Warn about the dangers of tobacco, Enforce bans on tobacco advertising, promotion and sponsorship, raise taxes on tobacco.¹

One in nine deaths in South Africa is related to tobacco use. Relevant to the dental profession, within the FCTC’s guiding principle of the need to protect all persons from the initiation, maintenance or increase of tobacco use are articles 12 and 14. These challenge parties to take action to train health workers and secure treatment for tobacco dependence. Tobacco control, whether in private practice or in public service, must be viewed as primary prevention within the ethical context. For implementing tobacco prevention and tobacco cessation, science-based guidelines are present. Dentists who implement an effective cessation programme in their practices can expect to achieve quit rates of 10-15% each year. However, this primary prevention effort can be no better than the knowledge, skills and values of the practitioners. Trained professionals should assume stewardship by providing support for the training of dental professionals in tobacco counseling for the adequate reimbursement of practitioners providing such services⁵.

WHO Oral Health Programme initiating Tobacco Control: Tobacco-related oral diseases and its adverse conditions through several strategies are aimed to control by the WHO Oral Health Programmes. Within WHO, the Programme forms part of the WHO tobacco-free initiatives, with fully integrated oral health-related programmes. By the help of international and national oral health organizations WHO encourages the adoption and use of tobacco-cessation. WHO Collaborating Centres and NGOs who are the primary partners, are in official relations with WHO, i.e. the International Association for Dental Research (IADR) and the FDI World Dental Federation⁵.

<p>State-of-the-science and new knowledge</p> <ul style="list-style-type: none"> ● Analysis of existing knowledge about oral health – general health and relationships to tobacco use ● Update of the WHO Global Oral Health Data Bank, including periodontal disease data (CPI) ● Integration of oral health data bank into other WHO databanks on general health and tobacco use ● Update of the WHO Oral Health Surveys Basic Methods, including guidelines for recording risk factors/tobacco use and tobacco-induced oral diseases and conditions <p>Assistance to countries in risk behaviour analysis and risk surveillance</p> <ul style="list-style-type: none"> ● Development of indicators and tools for assessment of tobacco use and their impact on oral health, as part of national health programmes ● Tests of instruments in selected countries <p>Translation of knowledge into action programmes in countries/communities</p> <ul style="list-style-type: none"> ● Analysis of policy and analysis for policy in relation to tobacco use and oral health ● Effective use of schools in tobacco prevention among children and adolescents, based on Health Promoting Schools principles ● Guidelines on tobacco prevention and oral health for pregnant women and young mothers at MCH level ● Effective involvement of oral health professionals in tobacco cessation programmes – analysis of barriers and constraints <p>Evaluation, monitoring and surveillance</p> <ul style="list-style-type: none"> ● Operational research in tobacco behaviour modification ● Development of community/country specific goals for tobacco prevention, incorporating oral health ● Development of models for evaluation of community-based oral health promotion programmes, including tobacco control ● Outcome and process evaluation of community demonstration projects for sharing experiences ● Development of tools for surveillance and monitoring tobacco control programmes
--

The tobacco control priority areas are outlined in Table 1. Firstly, state-of-the-science analysis and development of modern, integrated information systems will provide an important new platform for public health initiatives in tobacco control. Secondly, Programme provides assistance in risk behavior analysis and surveillance in order to help include oral health aspects in tobacco prevention programmes. Thirdly, it supports the translation of knowledge into action programmes, e.g. tobacco prevention activities in schools or by involving oral health professionals in national or community-based tobacco control. Fourthly, the WHO Oral Health Programme has intensified the work towards development of surveillance, monitoring and evaluation systems⁶.

The World Health Organization (WHO) has strengthened the work for effective control of tobacco use. In May 2003, at the World health Assembly, the Member agreed on a groundbreaking public health treaty to control tobacco supply and consumption which covers tobacco taxation, smoking prevention and treatment, illicit trade, advertising, sponsorship and promotion, and product regulation. Oral health professionals and dental associations worldwide should consider this platform for their future work for tobacco prevention since in several countries they play an important role in communication with patients and communities. This programme gives priority to tobacco control in many ways through the development of national and community programmes

which incorporates oral health and tobacco issues, tobacco prevention through schools, tobacco risk assessment in countries, and design of modern surveillance systems on risk factors and oral health.

Since the beginning of the twenty-first century prevalence of tobacco smoking has decreased steadily (Table 1). It was estimated by WHO that 20.2% of the world’s population aged ≥ 15 years were current smokers in 2015, indicating 6.7% smoking rate has decreased globally since 2000 and by 4.1% since the WHO FCTC came into force in 2005. The estimates thus show the prevalence among females decreased annually

at a rate of -0.38% to -0.22% in the period 2000–2015. If current tobacco control initiatives targeting women are maintained till 2025, the rates are projected to fall by a further -0.20% on average in the period 2015–2020 and by -0.14% in the period 2020–2025. Males have achieved annual reduced rates of -0.68% to -0.50% between 2000 and 2015. As the annual reduction required to attain the male target is -0.73%, males are not likely to reach the 2025 target of 25.6%. Smoking prevalence at the age 45-64 is maximum⁵(WHO global report on trends in prevalence of tobacco smoking 2000–2025, second edition. Geneva: World Health Organization; 2018, Table 2).

Table 2: The change in prevalence of smoking among >15/15 years of age and different gender from 2000-2050

	Year	Both sexes		Males		Females	
		Prevalence (%)	Average change over past 5 years (%/year)	Prevalence (%)	Average change over past 5 years (%/year)	Prevalence (%)	Average change over past 5 years (%/year)
Fitted	2000	26.9		43.0		10.9	
	2005	24.3	-0.52	39.6	-0.68	9.0	-0.38
	2010	22.1	-0.44	36.6	-0.60	7.5	-0.30
	2015	20.2	-0.38	34.1	-0.50	6.4	-0.22
Projected	2020	18.7	-0.30	31.9	-0.44	5.4	-0.20
	2025	17.3	-0.28	30.0	-0.38	4.7	-0.14
Target*	2025	15.5	-0.44	25.6	-0.73	5.3	-0.15
Gap		-1.8		-4.4		0.6	

* The average annual change required to achieve the 2025 target, with 2010 as the baseline, was calculated for the 15-year period 2010–2025.

SOURCE: WHO global report on trends in prevalence of tobacco smoking 2000-2025, second edition

There have been decrease in prevalence all income groups. In high-income countries the prevalence decreased from 33.6% in 2000 to 24.6% in 2015, representing an absolute reduction of 9% during that time (or an average absolute reduction of 0.6% per annum). The trend for both sexes clearly illustrates the strong correlation between income level and prevalence. In 2000, the prevalence in high-income countries was 4% higher than that in upper middle-income countries, 10.5% higher than that in lower middle-income and 17.5% higher than that in low income countries. By 2015, the gaps decreased to 1.2% in relation to upper middle-income countries, 7.2% to lower middle-income countries and 13.0% to low-income countries (Fig 1).⁵

Figure 1: Prevalence of Smoking on the basis of income value, among HICs, MICs and LICs

SOURCE: WHO global report on trends in prevalence of tobacco smoking 2000-2025, second edition

Public Health Intervention: In 2003, the World Bank described six cost-effective measures for reducing population tobacco use/tobacco control measures—namely, price increases or increased taxation, comprehensive bans on smoking in public and workplaces, bans on advertising and promotion of tobacco products, better consumer information (including mass media campaigns), warning labels on tobacco products, and help for smokers wanting to quit.⁶

Tobacco Taxation increase Policy: Increase in taxation or price of tobacco is one of the successful public health interventions Tobacco control interventions, Tobacco control policies excises account for half of cigarette prices, a doubling (100% increase) of the cigarette tax will lead to a in revenues.⁷ Aggressive taxation is the key strategy for LMICs to reduce smoking at a rate faster. Over 100 studies demonstrate a strong negative relationship between cigarette pricing and consumption. Increased taxes are particularly effective in preventing young smokers from moving beyond experimentation into regular, addicted smoking. 2.11 was the estimated price elasticity of youth smoking.; a 10% increase in tobacco prices would result in a 21.1 percent reduction in consumption. Affordability is a concept that captures the interaction between consumers' income levels and tobacco prices. Typically, affordability is defined as per capita GDP relative to the wholesale price index for bidis or cigarettes.^{2,7}

Smoke-Free Environment: The CRD review identified 14 studies evaluating smoking bans in public or workplaces, since evaluations assessing exposure before and after legislation have failed to demonstrate a differential impact which is unclear.⁸

Bans on Advertising and Tobacco Products: The proposed legislation may prove less effective at controlling tobacco advertisement since it has ignored some avenues of advertising and promotion. Two developing countries, Brazil and Thailand, have recently passed legislation that may be effective in this area. Although Brazil has a big economic stake in tobacco, producing nearly as much unmanufactured tobacco as India and being the world's lead exporter of tobacco leaf, Brazil enacted measures in 2000 that outlaw all television, newspaper and magazine advertising of tobacco products, and event sponsorship by cigarette companies. Similarly, Thailand introduced comprehensive tobacco control legislation in 1992 that included strict advertising laws.⁸

The United Kingdom and the United States each took about 35 years, and Canada about 25 years, to halve per adult cigarette consumption (10 - 5 per adult per day). France took only 15 years to halve consumption. France's uptake of smoking was chiefly after World War II, and its prevalence rose until the mid-1980s. From 1990 to 2005, cigarette consumption fell from about six cigarettes per adult per day to three. Due to a sharp increase in excise tobacco taxation there is sharp decline in consumption in 1990 under President Jacques Chirac. Among men, the corresponding lung cancer rates at ages 35-44, which are a good measure of recent smoking in the population, fell sharply from 1997 onward. During this period, revenues in real terms raised from about 6 to 12 billion Euros. Tax levels—and the decline in per capita cigarette consumption—remained stagnant from 2004 onward but rose again from 2009 to 2010.⁷

Population-based media campaigns were generally found to have lower impact among low-SES smokers, while campaigns targeting low-SES smokers showed no clear impact on smoking behavior. Greater campaign responsiveness from Dutch study reveals more among educated smokers, while an evaluation of the UK's 'No Smoking Day' campaign also have similar responses by SES (Figure 2).⁶

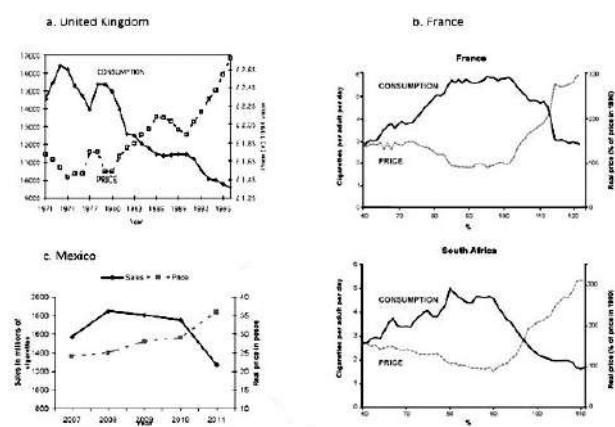

Figure 2: Tobacco consumption in UK, FRANCE, MEXICO, SOUTH AFRICA and their increase in cost price

Help Smokers Who Want to Quit: Exposure to worksite smoking bans and media antismoking messages were associated with higher odds of cessation is being recently analyzed by ex-smoking in the GATS data from 14 LMICs. Warning labels and cigarette and bidi prices were associated with higher odds of quit attempts, with success varying by country. Warning labels were

associated with a greater likelihood of recent quitting in the regions of Arab Republic of Egypt and Vietnam.⁹

Another way of counseling includes physician support or telephone- or internet-based counseling and cessation support. Other than educating and counseling medical treatment is also helpful. Pharmacological treatments, including nicotine replacement therapies, bupropion, and varenicline, further improve the likelihood of quitting, with success rates two to three times higher than when pharmaceutical treatments are not employed.⁸ The third largest grower of tobacco in the world, amassed 1.7 million disability-adjusted life years (DALYs). The WHO Framework Convention on Tobacco Control (WHO FCTC) is recognized as the pre-eminent global tobacco control instrument, containing legally binding obligations for its Parties. To implement effective strategies for selected demand reduction related articles of the WHO FCTC, WHO introduced a package of measures under the acronym of MPOWER.¹⁰

Tobacco and Oral Health: There are several moral, ethical and practical reasons for dental professionals to strengthen their contribution in tobacco cessation programmes, for example

- They are concerned about the adverse effects in the oropharyngeal region;
- They often have access to children, youths and their caregivers, thus providing opportunities to influence these individuals on the dangers of tobacco;
- They often have more time with patients than many other clinicians, providing opportunities to integrate education and intervention methods into practice;
- They often treat women of childbearing age, and are thus able to inform them about the potential harm to their babies from tobacco use;
- They are effective in quitting tobacco and it is known that a multi-disciplinary approach increases cessation rates; and
- By showing the actual effects of tobacco on the mouth smoking patients can quit their habit.

Brief counselling by health professionals on the dangers of smoking and importance of quitting is one of the most cost-effective methods of decrease smoking. Smoking cessation improves the health and wellbeing of

patients. Health professionals shall also lead by example. They should act as role-models for their patients, by ceasing to smoke, and by ensuring their workplaces and public facilities are smoke and tobacco-free¹¹.

ORAL HEALTH RISKS

The detrimental effects of tobacco on oral health are well documented; some of these involve a high degree of risk. According to studies it is shown that India is known as the capital of oral cancer. 7% of all cancer mortality in males and 4% in females are due to tobacco-associated oral cancers¹²⁻¹⁴. If the disease is detected soon, the survival rate in 5 years comes to around 85%. Nearly, all tobacco users develop periodontal diseases which have a diminishing effect on health and quality of life¹⁵. Maternal tobacco use during the pregnancy also has a negative impact on the fetus oral health. It is associated with intrauterine growth retardation that is harmful to the fetus and child's oral and dental development. Oral developmental anomalies include cleft palate, dental asymmetry, and morphologic variants such as reduced tooth crown size¹⁶. There is also some indication of an interaction between tobacco use and systemic disease, which creates further negative impact on oral health. For example, persons with diabetes are twice as likely to have periodontal attachment loss compared with nondiabetics. However, diabetics who smoke are 30 times more likely to have periodontal attachment loss than persons without these risk factors¹⁷. The biological mechanism whereby smoking impacts on periodontal disease requires further study and clarification. There is, however, some indication that it may include changes in the vasculature, the immune and inflammatory systems, tissue oxygenation, and the healing process¹⁸.

Tobacco quitting is a process which not only requires personal efforts but also requires good coordination from all the sectors to achieve greater success rates. The intervention which aimed at tailoring messages to the individual's stage of change can help the existing user move forward on the road to permanent abstinence¹⁸. Thus, adopting such tailored messages into the field of dentistry can be one of the most effective therapies for behavioural intervention.

CONCLUSION

Increases in tobacco taxes result in higher tobacco costs which also encourages the tobacco users to stop

using and consumption among the active users causing great impact to the younger generation and poorer people. Higher taxes effectively reduce death, disease and economic costs because of tobacco use. The positive health impact is evengreater when some of the revenues generated by tobacco taxincreases are used to support tobacco control, health promotionand/or other health-related activities and programmes.Dentist can help patient to quit smoking for better oral and general health. Various health agencies and professionals must work together to help patient to stop the habit of tobacco usage which may later emerge as the single most known cause of mortality and morbidity in the world. People will get aware of the ill effects of tobacco by the help of dentist. The next generation of dentists should be trained well enough in assessing and treating the patient with tobacco use. The experience of taxation is the best practice to reduce tobacco consumption and to gain control Globally on the rising situation and burden of diseases caused due to consumption or use of tobacco products.

ABSTRACT

The science of implantology is highly dynamic. Ever since its introduction into the field of dentistry by Dr. Branemark, it has undergone numerous modifications and improvements. With each improvement and advancement made, implantology has proved to be a boon in disguise to the society and hence its acceptance by the general population has widely increased despite it being a relatively expensive treatment modality. This article gives a brief review of the current trends in the field of implantology.

Keywords: *Implantology; Dentistry; Recent trends; Modifications*

INTRODUCTION

The history of implant dentistry spans not only decades, but millennia. The ancient cultures of the world—in Egypt, Honduras, China, and Turkey, among others—substituted missing dentition with shells, stones, ivory, and other human or animal teeth.^{1,2} The establishment of metal replacements for teeth is a relatively recent development. In the 1800s, surgeons used gold, silver, lead, and platinum molded into various forms with varying degrees of success.

By the early to mid-20th century, more familiar implant morphologies developed. Dahl in 1940 created the subperiosteal implant, a structure that rested on, not in, the jaw.² These implants frequently were met with complications including infection and bone resorption. Leonard Linkow developed the blade fixture for areas of deficient bone.³

Attached directly to the flat blade, an abutment protruded from the tissue. With time, the blade design fell out of favor as its complication rate precluded its use. In its place came the root form implant, which is the current standard shape. Thanks to the significant research by Brånemark, it was realized that osseointegration occurred between bone and titanium.⁴

Endosseous implants made from titanium have now become the standard. Implant Surface Changes Surface area augmentation often drives alterations in implant design. Over the past 15 years, practitioners have gradually switched from press-fit, cylindrical fixtures to threaded ones. A threaded implant leads to more immediate stability and hence greater success of osseointegration.

A threaded form additionally facilitates self-tapping, which eases placement. Surface alterations could also be made microscopically. Surface roughness of the implant can be created through grit blasting, plasma spraying, etching, or coating. This raises the percentage of bone-to-implant contact and also accelerates wound healing.⁵⁻⁷

During the last two decades, a shift from a smooth to roughened design has transpired. Surgical Technique, Timing, & Loading the original Brånemark protocol

published in 1977 influenced implant surgical technique and timing for years.⁴ It required that implants be submerged under the soft tissue for at least 4 months and discouraged load during the healing period.

As more research accumulated, so did the evidence for unsubmerged implantation (ie, placement of a transmucosal healing abutment).⁸ Barring the need for grafting, one-stage fixture placement is not only acceptable clinically but also easily accepted by patients, as it prevents the need for an uncovering surgery. This decreases the surgical experiences for the patient and minimizes chair time. Another time-saving surgical change is immediate temporization and immediate loading of dental implants within 48 hours of surgical implant placement. Case selection can be a thorny issue for these cases. Typically, immediate loading is non-occlusal, that is, non-functional temporization. The interim restoration placed should not occlude with the existing dentition.

These cases usually involve single teeth and short-span fixed bridges. While not voluminous, the initial data seems quite promising with the exception of single posterior teeth.⁹ Immediate occlusal loading of dental implants shows significant promise when full-arch treatment is considered.

Studies on full-arch immediate loading show success rates equal to conventional dental implant treatment.⁹ Contraindications for an immediate occlusal and nonocclusal load protocol consist of regions that experience undue mechanical stress, require grafting at the time of surgery or exhibit low bone density.¹⁰ Prosthetic-driven Surgical Placement The most critical advancement for implant dentistry concerned a philosophical reversal. All too often, restorative dentists were left frustrated by non-favorably placed implants.

“Well, that is where the bone was,” was a frequent refrain. Surgeons based implant positioning on the location or availability of the bone, for osseous grafting techniques were in their infancy. Today, this is not the case. The high predictability of current augmentation methods (ie, block grafting, guided bone regeneration (GBR), sinus elevation) allows for implantation based on prosthetic desires instead of biologic limitations.¹¹⁻¹⁵ Thus the treatment goal targets the ideal reconstruction of the dentition.

For the vast majority of cases, no compromises founded on anatomy need be made. Significant amounts of horizontal and vertical bony dimension is able to be achieved with GBR. GBR has been shown to equal

intraoral onlay grafting with respect to the amount of bone regenerated.¹⁶ Additionally, investigations do not demonstrate resorption of or lower implant survival in regenerated bone over time, when comparing GBR to onlay grafting.^{11,13} Block grafts are not by and large superior to GBR; the evidence simply fails to support that statement.

Current Implant Trends: As modern implantology is prosthetic driven, recent innovations affect the design, ease, esthetics and, in particular, the rapidity of fixture restoration. Professionally and publicly, there appears to be a trend to speeding the process of implant treatment. Faster treatment has both risks and benefits. An examination of the process follows. Immediate Implantation with Immediate Temporization Immediate loading of an edentulous mandible is not a new concept. However, full-arch or full-mouth edentulation followed by immediate implantation and temporization is, both to the literature and the clinic.^{17,18}

Because of its cursory appeal, a number of implant distributors offer their own versions of the immediate surgery-and-load protocol and advertise full-mouth reconstruction executed in one appointment to the public. It must be noted that hours of judicious multidisciplinary diagnosis, planning, discussion, and laboratory work prior to the surgical appointment are needed, regardless of the corporate protocol used. In the end, case selection becomes the limiting factor.

The patient requires a favorable occlusal scheme, sufficient bone to ensure primary stability, good health and a lack of parafunctional habits, among other traits. There is a trend in the direction of this treatment. While early results are promising, this protocol is currently not the standard of care. Abutments Abutment fabrication has and continues to undergo significant metamorphosis. Many abutment options exist: standard machined titanium, standard machined gold, standard ceramic, custom made gold abutments (eg, UCLA) and computer-aided design/computer-aided manufacturing (CAD/CAM) titanium abutments. From a practical stance, implant success criteria include not only stability and function but also esthetic harmony. Depending on the tissue thickness, implant location, and bone level, a standard titanium abutment may appear gray through the mucosa.

One solution involves use of abutments constructed from gold or ceramic. In certain cases the soft tissue will appear healthier and more esthetic.¹⁹⁻²² Improved

appearance in the presence of a thin mucosa is the goal. If the implant angulation falls short of ideal, a prefabricated straight or angled abutment may not compensate for offaxis orientation. Custom-made abutments, whether processed by the clinician or industrially, ease the restorative procedure and perfect results. Technology exists that reduces clinical work but still generates an abutment tailored to the individual.

Some manufacturers offer CAD/CAM implant prosthetics.^{23,24} In this process, the company typically requires only a fixture level index or a healing abutment or implant-level impression. The surgeon or restorative dentist sends that and the appropriate casts to a company laboratory, which fabricates a custom abutment.

Platform Switching: The interface between the abutment and implant, or the microgap, is subject to micromovement and bacterial seeding, and if it lies at or below the crest of the bone, prompts osseous resorption for those reasons.²⁵ An alternate design for the two-stage implant is platform switching, which is achieved by aligning a relatively wide implant platform to a comparatively narrow abutment and medializes the microgap, thus removing the interface from direct contact with the bone. With possible movement and infection compartmentalized more or less to only the soft tissue, less crestal resorption results. Clinical studies that employ this implant–abutment configuration observe reduced vertical bone loss, even after function.²⁶ Although a concept that garnered investigation only recently, platform switching data accumulates and shows potential.

Thread Modification: To enhance the fixture surface area, one may increase thread pitch, alter thread morphology, or augment surface roughness. At present, manufacturers fabricate implants that vary in at least one of the above characteristics. For example, integration of fluoride onto the implant surface boosts mineralization and attracts bone-forming cells.²⁷

Rather than exhibiting threads of similar size spaced evenly along the body, some implants possess microthreads at their coronal segments (body or collar) to amplify surface area—and, in turn, potential BIC—at the crestal bone. Correspondingly, other designs increase the area covered by a roughed surface, including even the collar. Another construct exhibits a scalloped body that abuts the curve of the interdental bone and in doing so, keeps it from resorbing.

All of these implant morphologies have little scientific evidence to substantiate claims of greater BIC, stability, or longterm survival but in some instances, previous versions of implants without these attributes are no longer available.

CONCLUSION

The usefulness of the implant trends discussed above is yet to be determined. With time, some of these innovations may become conventions; others will end up historical sidenotes. As always, we rely on biologic principles as well as longerterm clinical investigation to guide our judgment. Is a new design logical? Is it practical? Does it resolve or merely mask surgical or restorative problems? Most importantly, does it surpass significantly what is available? Clinicians, as individuals and as a collective, must be able to discriminate between a fad and a breakthrough, to separate the wheat from the chaff.

Prosthetic Rehabilitation of Patient with Multifocal Central Giant Cell Granuloma

Gunjan Srivastava¹, Sitansu Sekhar Das¹, Subrat Kumar Padhiary², Kajal Kiran Sahoo³

¹Professor, Department of Prosthodontics, ²Professor, Department of Oral and Maxillofacial Surgery,

³Tutor, Department of Prosthodontics, Institute of dental sciences, Siksha O Anusandhan (deemed to be University)

ABSTRACT

The primary objectives of successful prosthetic rehabilitation are to provide function, esthetics and comfort to the patient. Clinical decision-making is critical in deciding the most suitable treatment option for a particular patient. Patient usually want replacement of missing teeth with fixed prosthesis but sometimes a removable partial denture (RPD) can be a viable alternative if it can be made to support and stabilize the remaining teeth as well as replace the missing anterior teeth and associated gingival contours. This case report describes the prosthetic rehabilitation of a patient with central giant cell granuloma for whom surgical resection was done. Prosthetic rehabilitation was done with cast partial dentures in both maxilla and mandible. Removable partial dentures were selected as treatment option for two reasons first financial constraint of the patient and secondly in this case flange of removable denture will aid in lip support.

Keywords: Giant Cell Granuloma, Mandibular Reconstruction, Bone Transplantation, Root Resorption

INTRODUCTION

Central giant cell granuloma (CGCG) is a benign intraosseous lesion first described by Jaffe in 1953. This is a relatively uncommon pathologic process accounting for <7% of all benign lesions of the jaws^{1,2}. It most commonly affects the Maxilla followed by the Mandible. Although benign, it can locally be destructive. The clinical behaviour of CGCG ranges from a slow-growing asymptomatic swelling to an aggressive lesion that presents pain, local bone destruction, root resorption and tooth displacement. The radiologic features of the CGCG have not been clearly defined, and conflicting descriptions appear in the literature³. Radiographically, CGCG present as radiolucent defects, which may be unilocular or multilocular with well-defined or ill-defined margins and varying degrees of expansion of the

cortical plates. Surgery is the most accepted method of treating the condition. Excision followed by placement of free bone grafts have been used frequently for mandibular reconstruction followed by treatment with implant retained fixed prosthesis⁴. In this case prosthetic rehabilitation was done with cast partial dentures in both maxilla and mandible. Removable partial dentures were selected as treatment option for two reasons first financial constraint of the patient and secondly in this case flange of removable denture will aid in lip support.

Case report: A 35-year-old male patient reported to the outpatient department of Institute of dental sciences, Bhubaneswar with the chief complaint of pain and swelling in left side maxillary and mandibular teeth region since last six months.

On extra oral examination swelling was evident in left mandibular and maxillary region. Intraoral examination revealed bony hard swelling from right side parasymphysis to left side body of the mandible. The swelling was lobulated on palpation with mild tenderness. Similar kind of swelling was also seen on left side maxilla extending from anteriors to second molar region. There was no discolouration or deviation of the regional teeth.

Corresponding Author:

Dr. Gunjan Srivastava

Institute of dental sciences
Siksha O Anusandhan (deemed to be University)
Email: gunjansrivastava@soa.ac.in

Analysis of panoramic radiograph revealed multilocular radiolucency in mandibular anterior teeth region extending from right side canine to left side premolar region. Similar multilocular lesions were also evident in left maxilla involving the sinus, extending from midline to second molar region. Clinical and radiological findings suggested the lesion to be multifocal in nature with connective tissue origin. To confirm the diagnosis an incisional biopsy was advised.

The histopathological examination shows multiple giant cells in a background of highly cellular minimally inflamed connective tissue stroma. Each giant cell is composed of approximately 6-8 nuclei. Vascularity of stroma is intense.

Based on clinical findings, imaging results and histopathologic features a diagnosis of central giant cell granuloma was confirmed.

Surgical management was performed by department of oral and maxillofacial surgery. Surgical procedure involved excision and peripheral osteotomy with the removal of multiple teeth in maxilla extending from left lateral incisor to left second molar. In the mandibular arch from left first premolar to right side canine.

Patient was referred to department of prosthodontics for rehabilitation. With the loss of several teeth patient was having difficulty in mastication, impairment of speech and unpleasing appearance of face.

After surgery it was a case of Kennedy's Class III modification 2. However, the primary issue for this patient was the large anterior edentulous space, which approximated a Class IV situation and decreased lip support².

Treatment possibilities in this case could be fixed restorations or implant supported fixed restorations or removable partial denture. Due to financial constraint of the patient removable partial denture was planned. Also, the flange of the denture will aid in lip support⁵.

Fig. 1: Maxillary impression

Fig. 2: Mandibular impression

Diagnostic impressions were made with irreversible hydrocolloid impression material and poured in type III dental stone to obtain diagnostic casts.

Diagnostic cast was studied and surveying was done on Ney surveyor. The designing of cast partial denture for maxillary arch was done. Proper designing is essential to prevent any deleterious effect on the supporting structures. Forces that produce torque on abutment teeth should be controlled and reduced in the design of direct retainers⁶.

According to remaining teeth it was a Kennedy Class III Modification 2 situation in maxillary arch which is a wholly tooth supported partial denture.

Major connector chosen was anteroposterior or double palatal bar. It consists of thin bar of metal running both anteriorly and posteriorly on palate. The greatest asset of this major connector is excellent rigidity. The anteroposterior palatal bar minimizes soft tissue coverage, yet provides exceptional resistance to deformation, but because of its narrow bars the support provided is very less. So it must rely mainly on support from the remaining teeth. This major connector was chosen because remaining teeth had good periodontal support^{7,8}.

In mandibular arch also, it is Kennedy Class III Modification 2 situation. The major connector chosen was lingual bar. The basic form of the lingual bar is that of a half pear shaped with broadest portion at the inferior border of the bar. The advantage of lingual bar is its simplicity in design and construction. As it has minimal contact with the oral tissues. It does not contact the teeth, so decalcification of tooth surfaces because of food or plaque collecting around major connector does not occur.

The maxillary RPD design had occlusal rests on distal of right second premolar, mesial of right second molar and left third molar and cingulum rest on right

canine. Tooth preparation was done on 15, 17 and 28 in maxillary arch.

Tooth preparation was done 35, 36 and 38, 44, 45, 48 in mandibular arch.

Mandibular RPD design had occlusal rests on mesial of right first premolar and third molar and distal of right second premolar and on the left side mesial of second premolar and third molar and distal of first molar^{8,9}.

Fig. 3: Finished maxillary and mandibular prosthesis

Fig. 4: Intraoral view without prosthesis

Fig. 5: Intraoral view with Prosthesis

Maxillary and mandibular final impression were taken with addition silicon impression material (Aquasil, Dentsply) putty and light body consistency were used. Impression was poured in type 4 dental stone. (kalrock, kalabhai). The wax pattern was fabricated according to design planned. The metallic framework was tried in the patient's mouth to assess its fit. The jaw relation was recorded followed by articulation and teeth arrangement. Try-in was done followed by acrylicization with heat-polymerized acrylic resin. Finished and polished cast partial dentures were delivered to the patient. {Fig 3,4,5}

DISCUSSION

An RPD is also an excellent treatment modality in class III situations with large tooth-supported denture bases, where it is difficult to provide sufficient retention and stability for a fixed partial denture (FPD)^{8,10}. When the edentulous space is too large for a fixed prosthesis or when alveolar bone loss has been sustained that requires a resin flange to replace the missing bone to support the middle third of the face. In making the framework design, the dentist must consider the patient's comfort, esthetics, biomechanics of the prosthesis, and the prognosis of the abutments. In addition, the concept and design of the denture could have an impact on the incidence of mechanical failures of the framework. Finally, proper evaluation of the actual dental and periodontal situation, periodontal treatment, maintenance of good oral hygiene, and regular postinsertion controls are also of major importance in minimizing the sequel associated with wearing removable partial dentures (RPDs), such as caries, progression of periodontal disease, and residual ridge resorption¹⁰.

Schwartz et al. reported that RPD is an advised treatment option for the rehabilitation of Kennedy class IV situations where there are a) long span edentulous space that requires tooth- and tissue-supported designs, b) markedly resorbed ridge, where it is necessary to support the middle and the lower third of the face by denture flange, c) exposure of the gingival tissues during lip function, d) cleft palate and other maxillofacial defects, and e) young patients with large pulp horns for whom preparing the teeth is contraindicated for fixed prosthesis¹¹.

CONCLUSION

Prosthetic rehabilitation mainly aims for functional and esthetic well being of the patient. The phonetics of the patient was also improved due to the flange of the denture.

ABSTRACT

Full mouth fixed rehabilitation is one of the greatest challenge in prosthodontics. Apprehensions involved in the reconstruction of debilitated dentitions are heightened by widely divergent views concerning the appropriate procedure for a successful treatment. When it comes to comprehensive, full-mouth rehabilitation cases, dentists don't plan to fail, but they may fail to plan. Dedicating time for developing a treatment plan that includes the proper sequence of diagnosis and evaluation, as well as how to utilize them to get the best possible final desired outcomes for the case can make proceeding with clinical protocol more predictable. This clinical report describes the prosthodontics rehabilitation of a patient with severely worn dentition resulting in an end – to – end relationship. Maxillary and mandibular fixed restorations were constructed with canine – protective occlusion.

Keywords: full mouth rehabilitation, metal fused to ceramic crowns, occlusal analysis, severe attrition

INTRODUCTION

Full mouth Rehabilitation has received considerable clinical interest from modern dental practices as a means of rehabilitation -restoration of functional and structural integrity of dental arches by the use of crowns, partial dentures and implants. Rehabilitation has proved a fascination to mankind since the dawn of history because unlike other parts of the body the teeth in a gross sense are incapable of repair.

When it comes to comprehensive, full-mouth rehabilitation¹ cases, dentists do not plan to fail, but they may fail to plan. The dentist must dedicate time to develop a treatment plan that includes the proper sequence of diagnosis and evaluation. Imperative to the process is recognizing the importance of anterior guidance, incisal edge position, diagnostic models, and suitable treatment modalities that will satisfy patient expectations. Envisioning and determining the final restorations prior to undertaking any preparation design is also essential.

Indication: Full mouth rehabilitation is indicated for the following 1) Mutilated dentition. 2) Severely worn dentition. 3) Developmental anomalies 4) Discoloured dentition and 5) multiple faulty FPD.

Treatment Protocol: Many schools of thought exist for the treatment procedure for full mouth rehabilitation and they are based on individual author's discretion on occlusion and treatment procedure. But this can be broadly divided into two 1} one stage procedure, 2} Hobo twin stage procedure in which the posterior is rehabilitated first and then only the anterior are given. Each one has its own merits and demerits. But the protocol common for both these procedures can be divided into seven phases which are as follows²

Stabilisation: In this phase the pain and discomfort for which the patient has reported is first relieved. The causative aetiology is identified and eliminated or controlled. And measures are taken to protect the remaining tissues.

Reassessment I: The patient condition is assessed after stabilisation. Patient is educated on the further course of treatment and his interest in the same is assessed.

Preliminary restorative phase: The vertical dimension of occlusion is assessed Diagnostic wax up is done, the goal of the diagnostic wax-up is to recreate the patient's new bite and smile in wax so that this can then

Corresponding Author:

Dr. Abhilash Mohapatra, (MDS)
Reader in Dept of Prosthodontic
Institute of Dental Sciences,
Siksha O Anusandhan, Deemed to be University

be transferred to the temporary restorations. Creating excellent temporary restorations is a key step in the full mouth rehabilitation because they allow the patient to evaluate the smile, bite and jaw position and determine if any changes need to be made before the final restorations are made. Reversible interventional modalities like occlusal splint, overlay RPD, fixed provisional or direct composite restoration are also given. And these are observed for a period of 6 to 12 weeks.

Reassessment II: The patient is then assessed for response to the preliminary therapy. The temporomandibular joint and the muscles of mastication are assessed for pain or instability. If the vertical dimension is altered then patient's adaptation to this is assessed.

Definitive restorative phase: The teeth are prepared conventionally or conservatively according to the situation and the impression taken of the prepared tooth. The provisional are given till the permanent are ready.

Maintenance: Patient should be recalled every 6 months to be assessed for soft tissue, root caries and periodontal status for abutment teeth. Occlusal wear facet in canine are examined because wear in this area in a canine guided occlusion leads to excursive interfering contact of posterior teeth.

Fig. I: Pre operative photograph

CASE HISTORY

Clinical report: A male patient, aged 48-year, presented with a chief complain of severely worn teeth {fig I} and inability to chew food, at the Department of Prosthodontics, Institute of Dental Sciences, SOA deemed to be university, Bhubaneswar

Clinical findings:

- **Extraoral:** The patient had facial symmetry, and TMJ, and the muscles of mastication were asymptomatic.
- **Intraoral:** The following teeth missing 14, 16, 17, 27, 34, 36, 37, 46. Generalized attrition, abrasion, and erosion were noted. Composite restorations were present in 11, 12, 21, 22. Amalgam restoration were present in maxillary 18, 26, 28, and all mandibular teeth. Teeth 35 to 43 and 15 had undergone root canal treatment.
- **Occlusal finding:** The patient presented with a bilateral class I molar and canine relationship. The patient demonstrated a slide from centric relation to maximum intercuspation. The patient's lateral excursion showed a canine guided occlusion. Lower incisal edges glide along the palatal surface of maxillary anterior during protrusion. Due to attrition the vertical dimension was diminished {Category I – Turner & Missirian³ classification}. There was a high smile line with moderate display of gingiva. Maxillary and mandibular midline was 1.5 mm right to the midfacial vertical line.

Fig. II: OPG

- **Radio-graphical finding:** The patient radiographs showed a trabecular bone to be finely woven pattern. The crown root ratio of lower anterior were unfavorable. {fig ii}

Treatment procedure:

1. The patient received oral prophylaxis, periodontal therapy, and odontoplasty was done on mandibular and maxillary teeth with uneven and sharp cusp.
2. A permissive occlusal splint⁴ is constructed on mandibular teeth in heat cure acrylic, and it was inserted and adjusted to provide a mutually protected occlusion with increase in vertical dimension⁵ of 3mm.

Fig. III: Occlusal analysis by Broadrick occlusal plane analyser

3. Pankey-Mann Schuyler⁶ analysis gives the acceptable occlusal plane. Mandibular posterior occlusal plane was analysed using the Broadrick occlusal plane analyzer {**fig iii**}. On analysis it was found all mandibular teeth followed the curve of spee. Maxillary right premolar was supra-erupted due to absence of opposing teeth, which required occlusal correction.
4. Customized anterior guide table is fabricated with centric, protrusive & lateral record to preserve the natural anterior guidance.

Fig. IV: Mock Waxup

5. Mock preparation was done on articulated maxillary and mandibular cast and diagnostic wax patterns are developed in it. {**fig iv**}

Fig. V: Prepared teeth

6. Tooth preparations for full coverage metal ceramic crowns were completed for the entire dentition {**fig v**}. A final full – arch impression was made using polyvinyl siloxane {Aquasil, Dentsply Detrey, Germany} impression material with double-mix, double impression technique, the cast were poured in die stone { Kalrock ; Kalabhai Pvt. Ltd Mumbai. India}.
7. This assembly was mounted on a Whipmix articulator using a face bow {quick mount facebow} and centric inter-occlusal record made in Aluwax at previously determined vertical dimension.
8. Provisional restorations were made from the diagnostic wax-up template with autopolymerising acrylic resin, and esthetic and occlusion were evaluated. Provisional crowns were cemented with zinc oxide non-eugenol {Rely X, 3M ESPE, Germany} provisional cement.
9. Articulator was programmed with centric and two laterotrusive records. First posterior waxup is done to achieve a standard effective cusp angle of 25°. Then anterior wax up is done to achieve incisal guidance, which produce a standard amount of disocclusion⁶.

Fig. VI: Metal try-in

10. Definite restorations with porcelain fused to metal crowns exhibiting a vital and a natural appearance with proper contour, shade and optimal incisal translucency were designed⁷ and luted with glass ionomer type I {GC Corp, Tokyo} cement. **{fig vi}**. And oral hygiene instructions, emphasizing brushing habits and use of dental floss were given.

Fig. VII: Ceramic build up

Fig. VIII: Post operative

DISCUSSION

Every patient has unique treatment requirements. Proper diagnosis and treatment plan are an important aspect for full mouth rehabilitation. Planning is done with occlusal analysis, diagnostic waxup and correct programming of semi adjustable articulator. The treatment goal was to restore to worn out surfaces to enhance mastication and to improve the aesthetic appearance. The final prosthesis with mutually protective occlusion was aesthetically pleasing with good marginal fit.

Lip Curve Changes in Patients with Premolar Extraction and Non-Extraction Treatment

Smruti Bhusan Nanda¹, Tusar Kanti Nayak²

¹Professor & HOD, ²Professor, Dept. of Orthodontics, Institute of Dental Sciences, Siksha 'O' Anusandhan, Bhubaneswar, Odisha, India

ABSTRACT

Background & Objectives: Most previous literature has given little consideration to the depth and regularity of the lip curves and their importance in the overall perception of the lateral facial profile. The present studies was undertaken to asses and compare the changes in lip curvature of upper and lower lips after the orthodontic treatment with or without bicuspid extraction in adult patients.

Method: A total of 26 subjects were included in this trial, which were divided into two main groups- extraction of upper 4 and lower 5 and non-extraction group. In order to access the soft tissue effects of treatment, the depths of upper and lower lip curves were measured on all pre and post treatment cephalograms, in relation to skeletally defined PM line as the principal reference line.

Results: The mean reduction in the depth of upper lip curvature in the 4/5 extraction group was 1.94 ± 1.84 mm. In non-extraction group it was 0.33 ± 1.77 mm

The mean reduction of lower lip curve depth in the 4/5 extraction group was observed to be 1.66 ± 3.66 mm. In the non-extraction group a mean increase of lower lip curve depth by 0.59 ± 2.97 mm was observed.

Interpretation & Conclusion: The study concluded that lip curve depth changes in a particular direction are not entirely dependant on extraction or non extraction of bicuspid rather it is a resultant of a range of individual variable factors. Changes in the lower lip curve depth in response to orthodontic treatment, is comparatively more predictable than those in the upper lip. However, it should be interpreted with caution, given the small sample size.

Keywords: Premolar Extraction; non-extraction; lip curve changes; lateral cephalograms.

INTRODUCTION

Successful evaluation of facial balance and harmony includes a study of the facial profile. Evaluation of the human facial profile has always been an essential part of orthodontic diagnosis and treatment planning¹. The relationships between the size and proportion of the nose, lips and chin have often been discussed as critical factors in the achievement of balanced facial profiles.²⁻⁴ However; less consideration has been given to the actual

depth of curvature of the lips and the importance of these curves to the overall perception of the lateral facial profile.⁵⁻⁷

The orthodontist is often confronted with the need to predict soft-tissue profile changes that may result from orthodontic treatment. Many problems aroused because the contributions of many of the factors influencing the soft-tissue profile were not fully understood. The development of the soft tissue profile is a result of complex changes within the hard and soft tissue structures of the face.

Most previous literature regarding soft tissue behavior during orthodontic treatment has focused on retraction of the vermilion border and changes in the nasolabial angle^{2,8-15}. This was interesting because facial harmony was often described as determined by the morphologic relationships and proportions of the nose,

Siksha 'O' Anusandhan (Deemed to be University)
Bhubaneswar-751030, Odisha, India

lips, and chin^{2,4}. Discussion was further complicated by the fact that the balance between these structures can be altered by both growth and orthodontic treatment. Little consideration has been given to the depth and regularity of the lip curves and their importance in the overall perception of the lateral facial profile. Holdaway's^{5,16} soft tissue analysis would appear to be unique in its inclusion of an assessment of upper lip sulcus depth. Holdaway also noted that ideal upper lip sulcus depths may actually vary with different underlying vertical facial patterns. Incisal movements could vary greatly in cases treated either with or without extractions. Although incisor retraction was seen in the majority of patients treated with premolar extractions, it was certainly possible for minimal movement, or even incisal protrusion, to occur^{19, 21-25}. Similarly, non-extraction treatment could also result in either retrusion or protrusion of the incisors. Shearn and Woods,²² noted that the primary determinant of the amount of incisor retraction occurring during treatment was the residual space present after initial alignment.

The morphology of the soft tissues themselves is a major factor in determining the overall facial profile. The presence of varying inherent internal soft tissue architecture, however, has complicated attempts at predicting soft tissue responses to treatment⁸. Consequently, ratios of lip to incisor retraction have gained only limited acceptance because it has been recognized that the interactions that might determine soft tissue changes are complex^{2, 9, 11-14}.

A predictable change in facial esthetics can be achieved only if the predetermined treatment objectives are adequately realized and the amount and direction of expected facial growth can be estimated.³ The predictability of such changes appears limited.

The present study a prospective clinical trial, was designed to evaluate the effects of treatments, with and without premolar extraction, on the lateral facial profiles of patients, with particular reference to the curvature of upper and lower lips.

The research question addressed: Is there a predictable change in upper and lower lip curve, associated with extraction or non-extraction orthodontic treatment?

OBJECTIVES OF THE STUDY

- To assess and compare the changes in lip curvature of upper and lower lips after the orthodontic treatment with or without bicuspid extraction in adult patients.

- To establish if there is a difference in lower and upper lip curve response to bicuspid extraction and non-extraction orthodontic treatment in the given sample.

METHODOLOGY

The present, prospective clinical trial was designed to evaluate the effects of treatments, with and without premolar extraction, on the lateral facial profiles of patients, with particular reference to the curvature of upper and lower lips, on selected subjects who reported to Department of Orthodontics, College of Dental Sciences, Davangere, seeking orthodontic treatment.

Sample Size: A total of 26 subjects were included in this trial. Prior to the commencement of the trial, all the participants were informed and verbal consent was obtained. Ethical clearance was obtained from the Ethical Committee of the college for this study. All the 26 cases were treated by postgraduate students, using consistent contemporary biomechanical principles and this study was done over a period of seventeen months i.e. December 2005 to June 2007.

Sample Selection: The sample eligible for this study was selected on the basis of following criteria.

Inclusion Criteria:

- Adult subjects with Class-I and Class-II molar relationships requiring orthodontic treatment.
- A minimum crowding of 4mm and overjet of 4mm.
- High quality pre and post treatment lateral cephalograms exhibiting good soft tissue definition with lips relaxed, teeth in occlusion are taken using the same calibrated cephalostat for all subjects.

Exclusion Criteria:

- Subjects with Class-I crowding and Class-III molar relationships.

Assignment: All the 26 patients were treated with Preadjusted Edgewise Appliance by postgraduate students, using consistent contemporary biomechanical principles and guidance.

The sample was divided into 2 main groups

Non-extraction Group: 20 patients treated with non-extraction line of treatment.

Extraction Group: 6 patients treated with extraction line of treatment.

Upper 1st premolars & Lower 2nd pre-molars extraction done.

The mean pre treatment age of the extraction group was 19 yrs 9 months and that of non-extraction group was 18yrs 9months.

Cephalometric Analysis: All pre and post treatment cephalograms were traced by one examiner. In order to provide a consistent reference plane for evaluating horizontal changes in landmarks, both sphenoethmoidale (Se) and the inferior pterygomaxillary point (Ptm) on the pterygomaxillary (PM) line were transferred from the pretreatment tracing to posttreatment tracing, by superimposing on the cranial base landmarks of the pretreatment radiographs, according to the method described by Bjork.⁴⁶ Landmarks chosen for the study were based on the definitions of Nanda et al ²⁸. Cephalometric measurements used in this study are listed in Table 1. Linear measurements were multiplied by a factor of 0.92 to take into account the 9 percent cephalometric factor.

In order to access the soft tissue effects of treatment, the depths of upper and lower lip curves were measured on all pre and post treatment cephalograms, in relation to skeletally defined PM line of Enlow, Kuroda and Lewis⁴⁷.

STATISTICAL ANALYSIS

All the data were analyzed with MINITAB version 13.1 & SPSS softwares.

Results are presented as mean ± SD. Correlation and regression analysis was performed to measure the relationship between various pre-treatment parameters and to predict the post-treatment changes in lip-curve. One-way ANOVA was used for multiple group comparison & Man-Whitney test for group wise comparison.

For all the tests a P-value of 0.05 or less was considered for statistical significance.

Formulae Used for Analysis:

$$\text{Mean, } x = \frac{\sum x_i}{N} \quad i = 1, 2, \dots, n$$

$$\text{Standard deviation, SD} = \sqrt{\frac{\sum (x_i - x)^2}{n - 1}}$$

One-way ANOVA,

$$F = \frac{\text{Between group variance}}{\text{Within group variance}}$$

Pearson’s correlation Coefficient

$$r = \frac{\text{Covariance } (x, y)}{\text{Var } (x) \text{ Var } (y)} = \frac{1/n \sum xy - \bar{x}\bar{y}}{S_x \cdot S_y}$$

Regression Coefficient,

$$b = r \frac{S_y}{S_x} \quad S_x, S_y = \text{SDs}$$

Regression Equation

$$Y = a + b_1x_1 + b_2x_2$$

Mann-Whitney Test-(Alternative to unpaired t-test):

Ranks are assigned to combined values of two groups & then separated to corresponding groups. Sum of the ranks are found for two groups (i.e. R₁ & R₂)

$$\text{Find } U_1 = n_1n_2 + \frac{n_1(n_1 + 1)}{2} - R_1$$

$$\text{And } U_2 = n_2n_1 + \frac{n_2(n_2 + 1)}{2} - R_2$$

Least of the U₁ & U₂ is compared with table values for significance.

Fig. 1: Soft Tissue Measurements Taken in this Study

RESULTS

In the present study, the pre and post treatment lateral cephalograms of 26 patients (06 extractions & 20 non-extractions) were evaluated for the assessment of upper and lower lip curve changes associated with the extraction and non-extraction orthodontic treatment.

Changes in Depth of the Upper Lip Curvature Relative to PM Reference Line

The mean depth of upper lip curve was reduced with treatment in extraction groups as well as in the non-extraction sample. The mean changes in the depth of upper lip curvature in the 4/5 extraction group was 1.94 ± 1.84 mm and in non-extraction group was 0.33 ± 1.77 mm.

Within non-extraction and extraction groups there was a wide range of individual variation such that both increasing and decreasing upper lip curve depths were noted.

At a 5 percent level of significance, analysis of the variance demonstrated that the difference between the mean changes of upper lip curve in the non-extraction and extraction groups were statistically significant.

The changes in the upper lip curve depth in extraction, non-extraction in Table 1.

Changes in the Depth of Lower Lip Curvature Relative to PM Reference Line

The mean depth of lower lip curve was reduced in extraction group but not in the non-extraction group. The mean reduction of lower lip curve depth in the 4/5 extraction group it was 1.66 ± 3.66 mm. In the non-extraction group a mean increase of lower lip curve depth by 0.59 ± 2.97 mm is observed.

At a 5 percent level of the significance, analysis of variance demonstrated that the differences between the mean changes of lower lip curve depth in non-extraction, extraction group were not statistically significant.

Within all non-extraction and extraction groups there was a wide range of individual variation, and both increasing and decreasing lower lip curve depths were noted.

The changes in the lower lip curve depth are summarized in Table 2

Table 1: Post Treatment Upper Lip Curve Changes in Extraction and Non-Extraction Groups

Group		Upper Lip Curve				
		Pre	Post	Lip Curve Change		
				Mean+/-Sd	Min	Max
Ext 4/5		5.56+/-1.41	3.62+/-1.56	1.94+/-1.84	-0.1	5.7

Prediction of post treatment lip curve changes based on predictive pre treatment variables.

SE = Predicted Variation

R² = Explained Variance

DISCUSSION

Current concepts in diagnosis and treatment planning focus on the balance and harmony of the various facial features. Sincere attempts have been made to include an element of soft tissue profile assessment into it.

Previous published literature has given less consideration to the actual depth of curvature of the lips and importance of these curves to the overall perception of the lateral facial profile. Few articles^{43, 44, 45} have addressed this issue in Caucasian samples. But there has been no study reported in Indian population till date. The present study aimed to compare the responses of upper and lower lip curve to orthodontic extraction and non-extraction treatment in selected subjects who reported to Department of Orthodontics, College of Dental Sciences, Davangere, seeking orthodontic treatment.

As noted by Zierhut et al.,¹ lip tension will vary between individuals and also between time periods for any one individual. The inability to control this variable in the measurement of static lip positions and responses remains a shortcoming of all soft tissue cephalometric studies.¹⁵ In response to this potential

problem, every effort was made in this study to eliminate those radiographs with obvious lip strain and include those subjects whose lips appeared to be relaxed, with an even thickness of soft tissue.

The skeletally defined PM line of Enlow, Kuroda and Lewis⁴⁷ was used as a principal reference line. Other anterior reference lines like Ricketts E-plane, Holdaway's H-line or Burstones esthetic plane (Sn-Pg') are not used as they all used landmarks on nose and chin. As this study aimed to quantify the lip curve changes and compare the same between extraction and non-extraction group, the static skeletal reference line, PM line, was used.

The results of this study have indicated that greater the pre treatment lip curve depth, the greater the reduction in lip curvature with treatment is likely to be. This is seen in 4/5extraction group and non-extraction groups. This was not unexpected since a reduction in curve depth is generally a treatment goal in these cases. This was consistent with the results found in previous studies^{44, 45}.

The difference of pretreatment upper curve depth in 4/5 extraction group and non-extraction group were statistically significant. This was consistent with the suggestion of Brandt and Safristein⁴⁹ that extraction of second rather than first premolar might be undertaken to minimize retraction of incisal segment, in patients presenting with good pretreatment lip profiles and only mild to moderate crowding. This also explained the 4/5 extraction in the corresponding group.

The different post treatment changes in depth of the upper lip curve for the extraction and non-extraction groups were found to be statistically significant ($p=0.04$). This was expected when one considers the different pretreatment characteristics of the subjects within those groups. The 4/5 extraction group exhibited significantly greater mean pre-treatment upper incisor proclination and upper lip curve depth. This result was similar to previous studies^{44, 45}.

In this study the absence of significant differences in post treatment lower lip curve changes in the extraction and non-extraction groups might suggest that pretreatment skeletal or dental factors should take precedence over pre-treatment lip curve depth when deciding for the need of extraction in orthodontic treatment. This was certainly consistent with the suggestion by Bowman and Johnston³⁴ that factors such as crowding, midline correction, molar relation might be more important in extraction decision, given the surprisingly minor previously reported effect of premolar extractions on the lateral facial profile. This result was similar to the previous studies^{44, 45}.

Based on the strength of correlation coefficients for skeletal, dental and soft tissue variables with changes in lip curve, it appeared that soft tissue variables as a group may have a greater potential influence over changes in lip curvature, than dental or skeletal parameters. This would be consistent with previously published findings^{50, 51} supporting the concept that the soft tissues themselves are the ultimate compensators in the facial profile. In this way, the overlying soft tissues can actually mask significant underlying skeletal discrepancies. Hence in this study the correlation between pre-treatment soft tissue parameters and post treatment upper and lower lip curve changes are taken into account (Table- 3 & 4).

A high degree of positive correlation was found between pre-treatment upper lip curve and post treatment upper lip curve change in 4/5 extraction group. That

means deeper pre-treatment upper lip curve is associated with more post treatment upper lip curve change which agrees with studies done before^{44,45}. The explanation of this has already been discussed here.

A high negative correlation between soft tissue thickness at point B' and post treatment change in lower lip curve was found in 4/5 extraction group. Thicker the post treatment soft tissue at point B', lesser was the post treatment lip curve changes seen. This can be explained, that in most mandibular second premolar extraction cases the anterior retraction was minimal and the residual growth of lower lip could have played its role in increasing the lower lip curve.

A high statistically significant positive correlation between pre-treatment lower lip curve depth and post treatment lower lip curve change was found in 4/5 extraction group. Which is similar to studies done previously^{15, 44, 45}.

A high positive correlation between upper lip soft tissue thickness at point A and post treatment upper lip curve change in 4/5 extraction group was found. A high positive correlation between lower lip soft tissue thickness at point B and post treatment lower lip curve change in female non-extraction group was found and was similar to results of previous study⁴⁴.

Stepwise regression was used to identify not only those pretreatment variables with the most likely influence on lip changes but also to attempt to describe the extent of variability in lip response that might be explained by those variables. This analysis was conducted with the aim of perhaps providing the clinician with a tool to estimate the type and direction of lip response using only pretreatment factors. Higher percentage predictions were considered more clinically relevant than the less percentage predictions given the increasing deviation in the range of prediction. However, it should be interpreted with caution, given the small sample size.

When analyzing the results of stepwise regression, it became obvious once again that soft tissue factors such as the pretreatment lip curve depth are likely to influence lip curve changes to a greater extent than dental variables. It has been previously pointed out that the characteristics of the lip tissue themselves will greatly influence any response of the lips to orthodontic tooth movement⁴³. The fact that lower facial variables displayed a greater

potential for prediction than did those of the midfacial region, would support the findings of Woods⁴⁴ and Talass et al¹⁵ who noted that changes in the lower lip in response to orthodontic tooth movement, seem to be more predictable than those in the upper lip. Talass et al¹⁵ further suggested that, the reduced predictability of any upper lip response may be due to the more complex functional anatomy of the upper lip.

While various predicting ratios for lip to incisor retraction have previously been reported in the literature^{11,13}, no useful correlations between changes in upper lip curve depth and changes in underlying dental variables were found previously^{44,45}. Hence in current study the dental variables are not taken in to account. This is consistent with the findings of Wisth,¹² Roos,¹³ and Hershey,¹⁴ who all concluded that a wide range of individual variation makes reliable prediction of the amount of upper lip retraction in individual cases almost impossible.

CONCLUSION

The results of this study lead to the following conclusions–

1. The post treatment reductions in lip curvature were directly proportional to the pre-treatment upper and lower lip curve depth.
2. Post treatment change in the upper lip curve between extraction and non-extraction group was statistically significant, but was not clinically significant.
3. The lower lip curve depth change was significantly correlated to the pre-treatment lower lip curve. The upper lip curve did not have such correlation.
4. Analysis of stepwise regression showed, that changes in the lower lip curve depth in response to orthodontic tooth movement, was comparatively more predictable than those in the upper lip. However, it should be interpreted with caution, given the small sample size.
5. Lip curve depth changes in a particular direction are not entirely dependant on extraction or non extraction of bicuspids, were rather a resultant of a range of individual variable factors.

ABSTRACT

The vertical dimension problem is complex and multifactorial, the operator should recognize a vertical discrepancy (also known as Long-Face Syndrome) abnormality, and must be able to recognize its numerous components and understand their interrelationships, Many scientific investigators and orthodontic clinicians have contributed to the body of knowledge to which we have access. This article reviews some of the relevant literature and also some diagnostic and treatment planning suggestions to the clinical specialist who struggles with the vertical dimension enigma depending on various types of malocclusion.

Keywords: Vertical dimension, multi-factorial, malocclusion, long-face syndrome.

INTRODUCTION

Vertical dimension by the simplest definition is the vertical relationship between the maxilla and mandible. Vertical dimension can also be described as lower facial height using the distance between the anterior nasal spine (ANS) and gnathion.

The “Long face syndrome” includes multiple anomalies like open bite, hyperdivergent face, maxillary alveolar hyperplasia, maxillary vertical excess, anterior vertical excess of the lower face level, high angle facial type. Its separation into component parts is therefore necessary; for a better understanding and with a view to systematizing the therapeutic approach, it seems useful to suggest a classification of the facial height anomalies¹.

In order to define these height anomalies the authors Louis C. Merville and P.A. Diner have suggested the term ‘hypsoprosopia’. The main different aetiologies at three different levels are – A maxillary level between the dental apices and the nasal floor, - An inter-maxillary level between the anterior teeth and – A mandibular level between the dental apices and the lower border of the mandible, in the chin region.

“Hypsomaxilla” to indicate a height increase of the maxillary level. “Hypsogenia” to define the height increase of the chin, increased of the inter-maxillary or oral levels. The latter may result from three skeletal deformations, a vertical posterior maxillary dento alveolar excess through lowering of the upper premolar molar unit (VPMDE); a vertical anterior mandibular dento-alveolar deficiency, through lowering of the lower incisor unit (VAmDD); an excess give opening of the gonial angle of amblygonia (from “amblos” open, and “gonios” angle)¹.

Development of vertical problem: Vertical malocclusion can be divided into those, that are, dentoalveolar in origin and those that are, predominantly skeletal due to the growth patterns of the jaws. Skeletal

deep bite is characterized by concave facial profile with a reduction of anterior face height while, skeletal open bite is a convex facial profile with a pronounced retrognathic mandible. The malocclusions are primarily the result of the growth pattern of face and functional factors, greatly contributing to the final malocclusion².

Mandibular Growth and Vertical malocclusion:

Studies of facial growth using the metallic implant technique by Bjork and Skiller have demonstrated that the direction of growth of the lower jaw varies greatly in the normal population. The most common direction of condylar growth is vertical, with some anterior component, a more extreme upward, forward growth pattern of the condyle is not uncommon.

Patients with upward and forward growth of the mandibular condyle often have reduced anterior face height, usually develop a malocclusion characterized by a deep bite. The direction of mandibular growth, as expressed at the chin, is mostly vertical. Growth in this direction results in more horizontal displacement of the mandible and effectively improves the position of the chin. In more extreme cases of upward, forward growth of the condyle, a Class II, division 2 malocclusion in combination with skeletal deep bite is common³.

The erupting dentition in this type of mandibular growth characteristically undergoes a considerable amount of mesial migration of both the maxillary and mandibular teeth with some degree of proclination of the mandibular incisors. Where the amount of mesial migration of the lower posterior teeth does not equal the advancement of the incisors by proclination, secondary crowding of the front teeth frequently develops.

Patients with the so called "long face syndrome" and a pronounced increase in lower face height, in contrast have a more posteriorly directed growth pattern of the mandibular condyle. The direction of mandibular growth, as expressed at the chin, is mostly vertical. The malocclusion observed in this type of patient is an anterior open bite often in combination with a Class I or II malocclusion. These patients have little or no improvement in horizontal mandibular position over time⁴.

Growth Rotations and Vertical Malocclusions: The changes related to facial growth in the two extreme growth patterns are due to differences in condylar growth direction, but are also the result of differences in anterior

face height (AFH) and posterior face height (PFH) development. These differences in height development lead to rotational growth or positional changes of the mandible that greatly influence the position of the chin. The factors that determine the increase in AFH are the eruption of the maxillary and mandibular posterior teeth and the amount of sutural lowering of the maxilla. PFH, is determined by the lowering of the temporomandibular fossae and condylar growth. When vertical condylar growth exceeds dentoalveolar growth, i.e. eruption of the teeth in the jaws, forward rotation of the mandible occurs. In contrast, if dentoalveolar growth is greater than vertical condylar growth, the resulting change in mandibular position is backward or posterior rotation of the mandible. Patients with an anterior condylar growth pattern usually have a greater amount of vertical growth than patients with posteriorly directed growth⁵.

Bjork demonstrated that under ideal circumstances the fulcruming point for anterior or forward mandibular growth rotation is located at the incisors. If, proper incisal contact is lacking, either as a result of lip dysfunction or a finger sucking habit or if a severe sagittal skeletal jaw discrepancy exists, the patient will develop a skeletal deep bite as a result of growth pattern. The fulcruming point in these instances is located further back along the occlusal plane.

The mandibular translates during growth without rotation. This posterior growth rotation may result in an anterior open bite, depending on the extent of vertical dentoalveolar compensation. When treated orthodontically these patients are at increased risk for further mechanically induced posterior rotation by acceleration of their molar eruption and require careful control⁶.

A common scenario affecting the skeletal problem is mandibular growth and growth rotation, which unfavorably impacts dentoalveolar development in both the maxilla and mandible. Bjork and Bjork and Skieller have performed numerous studies that have shown that the most common direction of condylar growth is vertical, with some anterior component. Patients with a pronounced short lower anterior facial height generally exhibit upward and forward condylar growth. These individuals generally have a deep vertical overbite with a deep mentolabial sulcus and a strong over closed appearance. In contrast, patients with long face syndrome have a more posteriorly directed growth pattern of the mandibular condyle. These backward growth rotators have increased anterior facial

height, a more posterior position of the chin, and in extreme cases, an anterior open bite may develop. Serial images of the patient taken to monitor the direction of condylar growth would be very useful or the diagnosis of vertical growth. At the present time, serial imaging poses certain concerns, most significantly radiation exposure. Advances in imaging technology may, in the future, permit the clinician to use these methods for diagnostic purposes with greater safety⁷.

An understanding of the maxillomandibular growth rotation of the patient would be most helpful in the diagnosis of vertical variations. Bjork has contributed information that offers some guidelines for the clinician to assist in the determination of the growth rotation of the mandible so that the concomitant vertical changes are more easily understood. Bjork's method of prediction of condylar growth rotation from a cephalogram offers the clinician some guidelines. Bjork identified seven specific structural features that might develop as a result of remodeling during a particular type of growth rotation. Bjork's suggestions for predicting condylar rotation have, however, not been widely used by the speciality because (1) some of the indicators cannot be easily seen on the average cephalogram, (2) the use of the indicators is very time consuming for the clinician, and (3) there has been no scientific validation of the suggested indicators because of difficulties encountered in study design. Some in the speciality also question whether several of the suggestions are valid indicators of a particular type of growth rotation. However, when used for their intended purpose, as guidelines only, the indicators have some useful clinical applications in the diagnosis of the patient with vertical dysplasia³.

The forward rotator, exhibits several of Bjork's indicators including observations that (1) the condylar head curves forward, (2) the mandibular canal is curved, (3) the symphysis has a backward cant, (4) the interincisal angle is obtuse and (5) lower anterior facial height is short.

The backward rotator exhibits (1) a straight inclination of the condyle, (2) a relatively straight mandibular canal, (3) the symphysis slopes forward and, (4) lower anterior facial height is long.

Anterior and Posterior Facial Height³: Vertical dimension skeletal abnormalities are not solely caused by condylar growth direction. They are also caused

by differences in anterior facial height and posterior facial height development. These differences in height development can lead to rotational growth or to changes in mandibular position that greatly influence the position of the chin. Etiologies influencing unfavorable differences in development of anterior and posterior facial height are multifactorial. These factors can, for simplicity, be subdivided into those caused by (1) dentoalveolar development and (2) environmental factors.

Dentoalveolar Development: Issacson et al studied dentoalveolar development in three groups of subjects – those with short anterior facial height, those with average anterior facial height, and those with excessive anterior facial height. The amount of maxillary posterior alveolar development was found to decrease as the MP-SN angle decreased. In patients with long anterior facial height (high MP-SN angles), the mean distance from the occlusal plane to the inferior edge of the palate was 22.50 mm. this distance decreased to 19.6 mm for the average group and 17.1 mm for the group with short anterior facial height (low MP-SN angles). This difference of 5.1 mm of dentoalveolar development between the high angle and low angle groups is of significance⁹.

Environmental Role–Swallowing and Tongue Posture: The role of tongue posture, swallowing and breathing are still subjects of debate, argument, and studying orthodontics. Their respective impact on the vertical dimension are in need of continued study and research.

Mouth Breathing: The relationship between mouth breathing, altered posture, and the development of malocclusion is not as clear cut as the theoretical outcome of shifting to oral respiration might appear at first glance. Recent experimental studies have only partially clarified the situation. Current experimental data for the relationship between malocclusion and mouth breathing are derived from studies of the nasal oral ratio in normal versus long face children. The data from the study show that both normal and long face children are likely to be predominantly nasal breathers under laboratory conditions. A minority of the long face children had less than 40% nasal breathing, whereas none of the normal children had such low nasal percentages. When adult long face patients are examined, the findings are similar; the number with evidence of nasal obstruction is increased in comparison to a normal population, but the majority are not mouth breathers in the sense of predominantly oral respiration.

Airway problems, such as large adenoids, tonsils, or blocked airways caused by septum deviations, large conchae, or allergies are frequently observed in high angle patients and may affect mandibular posture, allowing more freedom for posterior eruption. This hypothesis is supported by Linder-Aronson who showed closing of the mandibular plane angle and reduction in the anterior face height after removal of adenoids and tonsillectomy¹⁰. DiPaolo devised a classification of the basic facial types encountered.

Type 1: This face is characterized by a downward and forward type of growth. The quadrilateral generally exhibits fairly equal bony arch lengths and an average vertical height equal to the maxillary arch length, demonstrating a lower facial harmony with the upper face. All malocclusions in this group are dentoalveolar in origin, that is, there is an imbalance in size of teeth to arch, forward position of upper teeth to lower teeth, or forward position of the teeth to upper face.

Type 2: The dominant direction of growth in this type of face is horizontal accompanied by the vertical growth resulting in a reduction of lower face height. A deep bite associated with this pattern is always due to undesirable growth. The characteristic quadrilateral configuration exhibits a deficient average vertical height in relation to maxillary arch length.

The subdivisions of this group would be the deficient vertical height associated with any of three possibilities:

- A. Upper and lower bony arches are comparable in size.
- B. Upper bony arch is larger than lower bony arch.
- C. Lower bony arch is larger than upper bony arch.

All subdivisions may be accompanied by malocclusions of dentoalveolar origin.

Type 3 the dominant direction of growth for this last type of face is vertical accompanied by little horizontal growth, resulting in an increased lower face height. Posterior alveolar compensation may result in an acceptable anterior overbite. A open bite associated with this pattern is always due to an undesirable growth pattern. The quadrilateral configuration in this facial type would exhibit an excessive average vertical height in relation to maxillary arch length. The subdivisions of this group would be the excessive vertical height associated with any of three possibilities.

- A. Upper and lower bony arches are comparable in size.
- B. Upper bony arch is larger than lower bony arch
- C. Lower bony arch is larger than upper bony arch

All subdivisions may be accompanied by malocclusions of dentoalveolar origin.

Class II malocclusion with vertical discrepancies- 5 types

Type 1

- Disproportionately increased AFH than PFH.
- Palate may be tipped downward.
- Ant. cranial base tipped upwards.
- Mand and functional lines are steeper
- High angle case or long face syndrome

Type 2

- Horizontal MP, functional op & palatal plane.
- Gonial angle is small
- Ant. Cranial base is.
- Square face appearance with more vertical incisor position and skeletal deepbite.

Type 3

- Palatal plane tipped upwards anteriorly
- Decreased ant upper face height
- Open bite
- Steep MP angle
- Severe skeletal open bite

Type 4

- Rare type
- Palatal & functional planes tipped downwards.
- Mandibular plane normal
- Gonial angle is relatively obtuse
- Maxillary incisors tipped labial
- Mandibular Incisors tipped lingually
- High lip line

Type 5

- Palatal plane tipped downward
- Normal mandibular and functional occlusal plane angle
- Gonial angle is smaller than normal
- Skeletal deep bite
- Maxillary incisors are almost vertical
- Mandibular incisors are severely labially placed.

CONCLUSION

Diagnosis of the vertical dimension is a complex problem. Yet, it can be as simple as studying a face and applying common sense diagnostic tools to ascertain the reason that the lower face is too long or too short. The vertical dimension has been a subject of study and debate since orthodontics became a speciality. Researchers in the field of vertical dimension diagnosis have provided the speciality many useful guide lines and concepts that can be used by every orthodontic clinician as they diagnose a malocclusion that is complicated by a vertical dimension discrepancy. Orthodontists should continue to use the work of these researches and clinicians for a foundation as more studies are undertaken that will yield more knowledge so that diagnosis of the vertical dimension become less art and more science.

ABSTRACT

The use of miniscrew and miniplate to obtain absolute anchorage has become very popular in clinical orthodontic approaches. The mode of anchorage provided by the implant systems is unique in that their use is temporary and transient. These characteristics have made them indispensable as a treatment option. The aim of this review is to discuss the development, classification, properties, clinical applications, site and placement procedures, and removal along with clinical benefits and drawbacks to obtain a temporary and yet absolute skeletal anchorage for Orthodontic applications.

Keyword: Anchorage, Implant, Onplant

INTRODUCTION

Conservation of anchorage in totality has been a perennial problem to the traditional orthodontist. Conventional means of supporting anchorage have been using either intra-oral sites or relying on extraoral means. Both of these have their limitations. The extra-oral forces cannot be used on a 24x7 basis to resist the continuous tooth moving forces and are also taxing on the patient's compliance. On the other hand, strict reliance on intra-oral areas - usually dental units does not offer any significant advantages, except the fact that the patient's co-operation is less critical. Due to these constraints therefore, at times, either the treatment options start getting limited or the end result compromised. The advent of osseointegrated implants, due to the pioneering studies of Prof. Branemark has changed this scenario. The implants made of titanium have been widely used by several orthodontists as they offer Absolute Anchorage.¹

CLASSIFICATION OF IMPLANT²

Implants can be broadly classified under the following headings:

Subperiosteal: In this design, the implant body lies over the bony ridge. This type has had the longest history of clinical trials but a decreased long-term success rate; probably due to the fact that the chances of getting it dislodged are high. Also, the complexity of their designs requires a precise casting procedure. The subperiosteal design currently in use for orthodontic purposes is the 'Onplant'.

Transosseous: In this particular variety, the implant body penetrates the mandible completely. These have enjoyed good success rate in the past. However they are not widely used because of the possible damage to the intrabony soft tissue structures like the nerves and vessels. Even in the field of Orthodontics, transosseous implants have not been used

Endosseous: These are partially submerged and anchored within bone. These have been the most popular and the widely used ones. Various designs and composition are available for usage in specific conditions. The endosseous implants are also the most commonly employed types for orthodontic purposes.

ORTHODONTIC ANCHORAGE WITH OSSEOINTERGRATION

Implant-Bone Interface

The relationship between endosseous implants and bone consists of one of two mechanisms: osseointegration, when the bone is in intimate contact with the implant, or fibrous integration, in which soft tissues, such as fibers and/or cells, are interposed between the two surfaces.

The proponents of the fibro-osseous system of implant retention opinion that the presence of a dense collagenous tissue between implant and bone will act as an osteogenic Membrane. There is no wide support, however, for this concept. The osseointegration concept proposed by Branemark et al and called functional ankylosis by Schroeder.³

It states that there is an absence of connective tissue or any nonbone tissue in the interface between the implant and the bone. A more accurate term, microinterlock, is used in orthopedic implantology where tissue and implant are juxtaposed, providing a bioinert fixation with surface porosity grooves, or beads⁴.

Osseointegration refers to the direct contact of bone and implant at the light microscope level.^{5, 6} Osseointegration never occurs on 100% of the implant surface. Successful cases will have between 30% and 95% of the implant.

Bone Tissue: Three distinct types of bone (woven, lamellar, and composite) are involved in postoperative healing and maturation of the osseous tissue supporting an implant. Woven bone has high cellularity, a rapid formation rate (30 m/day or more), relatively low mineral density, high random fiber orientation and poor strength. It serves an important stabilization role in postoperative healing of endosseous implants. During the initial healing process woven bone fills all spaces at the bone-implant interface. Although capable of stabilizing an unloaded implant, woven bone lacks the strength to resist masticatory function.⁷

Lamellar bone is the principal load-bearing tissue of the adult skeleton. It is the predominant component of a mature bone-implant interface. Lamellar bone is formed relatively slowly (less than 1.0 mm/day), has a highly organized matrix, and is densely mineralized.

Composite bone is a combination of paravascular lamellar bone deposited on a woven bone matrix. Formation of composite bone is an important step in achieving stabilization of an implant during the rigid integration process

If there is good postoperative stability of the implant in cortical bone, the healing response involves six physiological stages:

1. Callus formation (0.5 month)-initial,
2. Callus maturation (0.5 to 1.5 months)
3. Regional acceleratory phenomenon (RAP) (1.5 to 12 months) remodeling of the nonvital interface and supporting bone
4. Osseous integration of the interface (1.5 to 12 months) completion of the RAP, increased direct contact of living bone at the interface
5. Maturation of supporting bone (4 to 12 months) completion of the RAP, secondary mineralization of new bone and increased direct contact of living bone at the interface
6. Long-term maintenance of osseointegration

APPLICATION OF IMPLANT IN ORTHODONTICS

Endosseous Implant:

a. Implants for intrusion of teeth: Creekmore in 1983 published a case report of usage of a vitallium implant for anchorage, while intruding the upper anterior teeth. The vitallium screw was inserted just below the anterior nasal spine. After an unloading period of 10 days, an elastic thread was tied from head of the screw to the arch wire. Within one year, 6mm intrusion was demonstrated along with 25 lingual torque⁸.

b. Implants for space closure: Extensive research relating to usage of retromolar implants for orthodontic anchorage has been done by Eugene Roberts. The first clinical trial was on an adult wherein an atrophic extraction site had to be closed. A special implant was developed of size 3.8 mm⁹

width and 6.9 mm length, which was placed in the retromolar area. A 0.021" X .025" SS wire was used for

used for anchorage from the screw around the premolar bracket . In the initial phases, this wire also aided in leveling. The extraction spaces were closed using forces from buccal as well as the lingual sides (activating the lingual arch. The premolar was prevented from moving distally with the help of 0.021 X .025” wire acting as an anchorage. The modification in this technique as suggested by him in 1994 includes the usage of a .019” X.025” TMAwire.

Disadvantage of Endosseous Implant

The important limitations are:

- a. Bulkiness of the implant and therefore the nonsuitability of placement in the inter-dental areas.
- b. It involves a two stage procedure and therefore a long waiting time before loading the implant
- c. Anatomical limitations - such as erupting teeth, nerve canal etc. also add to their minimal usage
- d. Cost of the implants - These are the root form implants used for tooth replacement and therefore, very expensive.

These factors made it imperative that newer implants, adapted specifically for Orthodontic usage be developed and from 1995 onwards, over 10 such systems have been introduced.

Subperiosteal Implant: The Onplant

This is a classic example of a subperiosteal implant in Orthodontics. Developed by Block and Hoffman in 1995, this system consists of a circular disc 8-10 mm in diameter with a provision for abutments in the center of the superficial surface . These abutments would enable the Orthodontist to carry out tooth movement against the Onplant. The undersurface of this Titanium disc is textured and coated with Hydroxyapatite (HA). The HA, being bioactive helps in stabilisation of the implant by improving integration with bone. The average thickness (height) of the implant is 3 mm¹¹.

Disadvantages of Onplants:

- a. A long waiting period prior to orthodontic force application
- b. Excessive surgical intervention - Two surgeries are necessary after onplant placement; one to uncover

the onplant cover screw and the other to remove the onplant itself following Orthodontic treatment.

c. Cost factor

Osseous Implant: Osseous implants are those that are placed in dense bone such as the zygoma, the body and ramus area or the mid-palatal areas. The implant systems under this category are the

- Skeletal Anchorage system,
- The Grazimplant supported system
- The Zygoma anchorage system.

Skeletal Anchorage System: The skeletal anchorage system was developed by Umemori and Sugawara. It essentially consists of titanium miniplates, which are stabilised in the maxilla or the mandible using screws. The earlier of these miniplates were the conventional surgical mini plates, which are used by Oral Surgeons for rigid fixation. The recent versions of these miniplates have been modified for attaching orthodontic elastomeric or coil springs. Different designs of miniplates are available and this fact offers some versatility in placing the implants in different sites. The ‘L’ shaped miniplates have been the most commonly used ones, while the ‘T’ shaped ones have been proposed for usage while intruding anterior teeth . The screws used for fixing the miniplate are usually 2-2.5mm in diameter. ¹²

ADVANTAGE OF SAS

The SAS enables tooth movement to be controlled 3-dimensionally, so that treatment goals can be accomplished, even when the amount of tooth movement required is more than the mesiodistal width of the premolars.

SAS, it is not always necessary to extract the mandibular first or second premolars, even in patients with moderate to severe crowding.

The molar relationship in patients with symmetric or asymmetric Class III molar relationships can be corrected without having to extract mandibular premolars

It does not interfere with tooth movement.

ZYGOMA ANCHORAGE SYSTEM

Hugo De Clerck and Geerinckx of Belgium introduced this system in 2002. The upper part of the

Zygoma Anchor is a titanium miniplate with three holes, slightly curved to fit against the inferior edge of the zygomaticomaxillary buttress. A round bar, 1.5mm in diameter, connects the miniplate and the fixation unit. A cylinder at the end of the bar has a vertical slot, where an auxiliary wire with a maximum size of 0.032" x 0.032" can be fixed with a locking screw.

The plate is attached above the molar roots by three self-tapping titanium miniscrews, each with a diameter of 2.3mm and a length of 5mm or 7mm. The miniscrews do not need to be sandblasted, etched, or coated. Square holes in the center of the screw heads accommodate a screw-driver for initial placement, while pentagonal outer holes are used to remove the screws at the end of treatment¹³.

CLINICAL APPLICATION

Orthodontic forces can be applied to the anchor immediately after implantation. To connect the Zygoma Anchor with the anterior teeth, a rigid power arm was designed to fit in the large vertical slot of a canine bracket. The hook at the end of the power arm is situated at the level of the canine's center of resistance. A nickel titanium closed-coil spring with a force of 50-100g is attached between the power arm on the canine and the Zygoma Anchor, so that the direction of force is parallel to the main archwire.

Advantage

- Miniscrews are small enough to be placed between the roots of the teeth in the alveolar bone.
- By connecting two or more miniscrews, the orthodontic reaction forces can be neutralized.
- The surgical procedure is uncomplicated because the screws are placed directly through the gingiva, without a mucoperiosteal flap, and can be loaded immediately after insertion.
- Miniscrews can be used in the anterior or posterior region and attached with elastics or coil springs to the fixed appliance for direct anchorage.
- Anchorage can be adapted to changing treatment needs in different parts of the dental arches.
- The ZAS uses three miniscrews, increasing total anchorage over other types of implants.

- The point of application of the orthodontic forces is brought down to the level of the furcation of the upper first molar roots.
- The vertical slot with the locking screw makes it possible to attach an auxiliary wire, which can move the point of force application some distance from the anchor.

Disadvantage

- The main disadvantage of these screws is their proximity to the roots, which may be damaged during placement of the screws or when the adjacent teeth are displaced.

GRAZ IMPLANT SUPPORTED PENDULUM

Graz implant supported system introduced by Karcher and Byloff, this anchorage system consists of a modified titanium miniplate, with provision for four miniscrews, and two oval shaped cylinders. This was used mainly as a support for the Nance button of a pendulum appliance in the palate. This system can be loaded within 2 weeks to distalize and anchor maxillary first and second molars¹⁴.

Appliance Design: It consists of a simple surgical plate (15 X 10 mm). Two cylinders (10 mm long and 3.5 mm in diameter) are soldered at right angles to the center of the plate. The plate is fixed to the palatal bone via four 5-mm-long titanium miniscrews. The 2 cylinders perforate the palatal mucosa to enter the oral cavity. The entire anchorage device is constructed of 100% titanium. No auxiliary wires are bonded to the premolars, making the GISP removable. In the palatal portion of the resin body are 2 cylindrical slots that correspond to the 2 cylinders. The system is based on a telescopic principle: the 2 slots of the removable pendulum (RP) are placed over the 2 fixed cylinders of the implant.

Advantages of Osseous implants:

- The osseous implants, specially the mini plate designs offer the Orthodontist a fair chance of success in effecting complex tooth movements such as molar intrusion.
- True intrusion of upper and lower molars in moderate anterior open bite cases converts a borderline orthognathic case into an orthodontic one.
- This emerging new area of implant application has been termed as '**Orthognathic Orthodontics**

Limitations of Osseous implants:

Disadvantage

- a. They need a fairly complex surgery and therefore have to be placed by a surgeon.
- b. The chances of infection are greater than the screw implants.
- c. Their removal is as difficult as the placement.

CONCLUSION

With skeletal anchorage, orthodontic tooth movements can be accomplished that is beyond the realm of usual orthodontic practice. Skeletal anchorage considerably extends the range of biomechanical therapy for decreasing the need for extra oral anchorage and orthodontic surgery.³⁰

The newer anchorage systems provide skeletal anchorage without requiring patient co-operation or compromising esthetics. With anchorage consideration no longer an issue, orthodontic mechanotherapy can be greatly simplified. These skeletal fixtures would make treatment outcome more predictable satisfying both patient and the orthodontist. The concept of absolute anchorage can now be effectively explored and employed.

Dentistry with Ergonomics

Antarmayee Panigrahi

Reader, PhD Scholar, Department of Pedodontics and Preventive Dentistry, Institute of Dental Sciences, Siksha O Anusandhan (Deemed to be University), Bhubaneswar, India

ABSTRACT

Dental professionals of all the specialties are often amongst the groups suffering from musculoskeletal disorders because of prolonged working hours with awkward positioning . Adding to it are the vibratory equipments and miniature instruments. The disorders ranges from simple sprain to carpel tunnel syndrome. Thus the only way is to prevent by incorporating principles of ergonomics to avoid illness and injuries thereby resulting in prolonged efficient work outcome.

Keywords: ergonomics, MSDs, dentists

INTRODUCTION

Developing and managing good musculoskeletal health in dentistry is a challenge.

Dentists often cannot avoid prolonged static postures. Even in optimal seated postures more than one-half of the muscles are contracted. This may results in microchanges (back, neck, or shoulder pain) and macrochanges musculoskeletal disorders). Thus to maintain optimal health during the course of career it require special exercise and ergonomic interventions.¹

Ergonomics: “Ergo” means work, “Nomos” means natural laws or systems. Ergonomics is the study of relationship between people and their working environment. OSHA refers ergonomics as the relationship of the human/environmental interface that does not produce injury.^{2,3}

Our profession exposes us to various risk factors like Sustained/awkward postures, Repetitive tasks, Forceful

hand exertions ,Vibrating operational devices ,Time pressure from a fixed schedule, Coping with patient anxieties and precision required with work. All these indirectly leading to fatigue, discomfort, illness/injury, absenteeism, errors, lower productivity and customer dissatisfaction.^{4,5}

Musculoskeletal Disorders (MSDs) as described by WHO are Disorder of the muscles, tendons, peripheral nerves and vascular system not directly resulting from an acute or instantaneous event. Also known as Repetitive strain injury (Australia), Cervico-brachial disorder (Japan) and Cumulative Trauma Disorders (North America). It shows higher prevalence among female dentist. The presenting signs are deformity, decreased grip strength, loss of muscle function and this decreased range of motion. Most often they complain of pain, numbness, tingling of forearm and fingers, burning and cramping and in long run also leads to stiffness.⁶⁻⁸

Types of MSDs⁹⁻¹²

- Neck And Shoulder Disorders
 1. Tension Neck Syndrome
 2. Myofascial Pain Disorder
 3. Cervical Spondylolysis
 4. Rotator Cuff Tendinitis/Tears
- Hand and Wrist Disorders
 1. Tendinitis/Tenosynovitis
 2. DeQuervain’s Disease
 3. Trigger Finger

4. Carpal Tunnel Syndrome
5. Guyon's Syndrome
6. Hand-Arm Vibration Syndrome
7. Raynaud's Phenomenon

- Back Disorders

1. Herniated Spinal Disc
2. Lower Back Pain
3. Sciatica

Objectives of Ergonomics

- Permits a clear view of tooth being worked on
- Allows easy access of instruments
- Increases efficiency
- Prevents operator fatigue

Applying Ergonomics in Dentistry is needed for benefit of patient as well as dentist with objective of permitting clear view of operating field, allowing easy access for instrumentation thereby increasing efficiency and preventing operator fatigue and further long term complication. The principles of ergonomics can be described in every nook and corner of dental clinic and incorporating certain modifications in working style, which is explained as follows.^{13, 14}

Work Station Set Up

Provide sufficient space: Permanently place those equipments which is used in every clinical procedure within comfortable reach (within 20 inches of the front of the body) Sufficient space provide a clear line of sight to the oral cavity and all required equipment. It also maintain a neutral, balanced position.¹⁴

Accommodate Individual Preferences: Individuals vary in size, shape, training, and experience thus ensure equipment and work areas allow flexibility; examples may include:

- Allows right- or left-handed use,
- Allowing different working postures¹⁴

Operator Stool: The operator stool is the most vital but often neglected piece of dental technology. Ideally it should adjust to support your body in a neutral back, neck, and shoulder posture. The proper selection and adjustment of operator stools play a key role in the management and prevention of work-related pain in dentistry.¹⁵⁻¹⁶

BASIC FEATURES

- 1. Hydraulic controls:** For easy and smooth adjustments.
- 2. Tilting Seat Pan:** Research suggest that the most optimal seated posture for operator is hips higher than the knees, the slight downward inclination (10-15 degrees) helps facilitate lumbar curve.
- 3. Seat Contour:** The front edge of the seat should be padded and have a "waterfall" edge. This feature is especially important to reduce pressure on the posterior thigh's blood vessels when sitting with your thighs sloping downward. This allows an operator to maintain a forward and upward posture while operating and transfers some of the body's support to the feet. We refer to this as "leg balanced sitting"
- 4. Seat Depth:** Dental seat pans range from 14 to 18 inches
- 5. Backrest**
 - a. Should have good lumbar support
 - b. Should be convex and approx. 8 inches in height.
 - c. Lumbar support helps to preserve the lumbar curve, reducing muscle activity, disc pressure, as well as back and leg pain.
 - d. This is an especially important feature with nontilting seat pans, which tend to flatten the low-back curve.
- 6. Armrest:** Studies support the use of armrests in the prevention of neck, back, and shoulder pain. It Should be highly adjustable to provide support to the operator in a neutral working posture.
- 7. Cylinder Height:** It is recommended that a "short" operator have a stool with height adjustment from 16 to 21 inches, and taller operators from 21 to 26 inches

Operator Position¹⁶

- Feet should be flat on floor
- Back well supported
- Patient at operator's elbow level
- Elbows should remain close to body
- Operator/patient distance 14-18"

Dental Chair: Close Proximity is the Key^{17,18}

Headrests :Small and Thin Headrests

- (a) These allow for more legroom and easier/enhanced accessibility to the patient.
- (b) Double-articulating headrests allow for both rotation and tilt of the patient's head.(Aid in viewing the upper arch)
- (c) Magnetic headrests, on a flat and thin headrest, also allow side bending of the patient's head to further increase proximity

Backrest: Narrow Upper Backrest: A narrow upper backrest allows for easy movement around the head of the patient from 9 to 11 o'clock.

Adjustability

- (a) Should be able to accommodate different patient sizes and needs.
- (b) Tall patients will need a longer extension on the headrest, and geriatric patients with kyphotic head posture will need support of the head in a forward position.
- (c) Patient positioning aids can be very helpful when treating pedo patients

Height Adjustment

- (a) The chair should adjust low enough to allow the dentist to operate in a neutral seated posture, especially when the patient is in a semisupine position.
- (b) High enough for the dentist to have the option to comfortably stand for extractions, or impression taking without excessive forward bending.

Chair Length

- (a) Frequently overlooked consideration
- (b) Strive for a minimum of 24 inches between the top of the patient chair headrest (when fully reclined) and the counter, so you can easily move into the 12 o'clock position.
- (c) A chair with a "traverse" feature will allow the chair to glide horizontally back and forth to easily adjust this distance.

Working Positions:

Upper Arch

- (a) Fully supine position
- (b) Occlusal plane should be tilted backward up to 25° in relation to the vertical plane

- (c) Position the occlusal surface at elbow level or slightly higher while operating

Lower Arch

- (a) Semi-supine position(20° elevated from the horizontal supine position).
- (b) Occlusal plane of the lower jaw is close to horizontal
- (c) Forearms are parallel to the floor or sloping 10° upward

Lighting: The goal of overhead lighting is to produce even, shadow-free, color-corrected illumination that is concentrated on the operating field. The intensity ratio between task lighting (the dental operating light) and ambient room lighting should be no greater than 3:1. The light source should be in the patient's mid-sagittal plane. Directly above and slightly behind the patient's oral cavity. Fiber-optics lights mounted on handpieces adds concentrated lighting to the operating field thus minimising eyestrain.¹³

Instruments¹⁹: Various features of dental instruments may have an affect on ergonomic issues. These include:

- a. size and shape
- b. diameter
- c. surface configuration
- d. weight
- e. maintenance of the cutting edge

Four Handed Dentistry: Dental assistants create a more efficient environment for the operator by eliminating unnecessary motion; decreasing twisting and turning movement; decreasing long reaches and unbalanced posture thus increasing productivity and efficiency. Position of assistant thus impact and thus have certain recommendations as well like height of assistant in seated position should be higher than operator with feet on foot rest and thighs parallel to floor. They should remain close to patients and the instrument tray should be within their arm's reach.²⁰

Delivery Systems²¹

Rear Delivery System

- a. Poorest method of delivery.
- b. Limit access from 11 to 12 o'clock positions.
- c. Requires more trunk twisting.

- d. Equipment out of view of the patient which will decrease anxiety.

Side Delivery Systems

- a. Work especially well in 2 and 4 handed operatories.
- b. Require less trunk-twisting than rear delivery
- c. Tendency to “lock” into one working position resulting in fatigue and pain

Over-the-Patient Delivery System

- a. Allows moving freely from the 8 to 12 o’clock positions around the patient’s head.
- b. However, this system is highly visible and in close proximity to the patient thus making it undesirable for most pedodontic offices.

Transthorax Delivery Systems

- a. The transthorax unit design is positioned at the patient’s left side and designed to fully utilize the expanded duties of an assistant to maximize productivity.
- b. Designed for the practice of true 4-handed dentistry

Over-the-Head Delivery Systems

- a. Recently become recognized as a unique solution to dental delivery.
- b. Allow the operator the to practice from the 7 to 10 o’clock positions

Magnification²²: Forward head posture is common with unmagnified vision, which can lead to a pattern of painful muscle imbalances

Types of magnification

Procedure scope (1-23X): The newest magnification aid and allows the operator to sit upright while viewing images on an LCD screen.

Operating surgical microscopes (2-20X): A microscope fitted with an ergonomic adapter enables a near-neutral head posture.

Loupes (2-5X): Also referred to as telescopes, are the most popular type of magnification used in dentistry today.

Types

- a. Flip up loupe
- b. Through-the-lens (TTL)

Personal Protective Equipments^{14, 23}

1. Gloves:

- a. Ambidextrous (i.e., non-hand specific): exert more force than fitted gloves across palmar region of hand and may cause or exacerbate symptoms of carpal tunnel syndrome.
- b. Hand-specific (i.e., right vs left) is recommended as they Fit better and place less force on hand

2. Glasses:

- a. Lightweight, clean, well-fitted
- b. Magnifying lenses and head lamps are encouraged

3. Clothing: Should be loosely fit, lightweight and pliable

Scheduling of Appointments: Though overlooked most of times but it is of utmost importance to provide sufficient time to recovery of muscular fatigue, should have sufficient mental frame while treating difficult patients with unreachable accessibility. The appointments should be adjusted such that it alternates long difficult tedious patients and procedure with simpler shorter easier patients. It will not only enhance operator’s efficiency but also ensures quality treatment to patients.^{14,17}

CONCLUSION

As health professionals, we often focus our efforts on providing care for our patients, without taking proper care of ourselves. To deliver the best it is very important to begin to take care of yourself.

- a. Perform exercises/stretches
- b. Be aware of stress levels
- c. Get enough rest and relaxation times
- d. Be aware of pain signals
- e. Changing positions while working.

Applying ergonomics to the practice of dentistry not only could provide safety benefits but also improve performance objectives through greater productivity.

ABSTRACT

Everybody wants their smile to be beautiful. In Today's world appropriate application of principles of smile designing leads to drastic improvement of smile and aesthetic of the patient. It may be through conventional approach or more advanced application of Digital Smile Designing (DSD). DSD is a promising treatment approach toward s giving a beautiful smile to the patient.

Keywords: Dentistry, Smile, Esthetics

INTRODUCTION

First impression lasts long - They all say, and we follow. In our day today, life we all make assumptions right or wrong based upon our first impression. Great marketing is about great images and first impression. If the eyes are not grabbed the mind and heart are not either. Thus, we make the first judgement about a new person in the way he or she smiles and how confident they are. Smile says a lot about a person, about how confident they are, how satisfied they are, how wonderful and kind they are etc. But every individual is not so lucky to have such beautiful smile. A beautiful smile can be seriously compromised either by nature oneself or his or her dentist. But invariably we are all desirous of a beautiful smile.^{1,2}

In today's world we are lucky to transform worn out, broken, gummy and aging smile into most beautiful natural smile. Both art and science go hand in hand to create the most attractive, strong and confident smile. When good cosmetic artistry is combined with modern dental materials an expert training, we are assured of a durable vibrant healthy smile which imparts immense

confidence and winning thrill in ourselves. The ancient Greeks understood the concept of beauty and derived a parameter for it. They had given the most famous "Golden Proportion" that is used by famous artists and designers for long. Today we blend these design principles to create the pleasing smile. Attractive smiles are attractive as they follow the basic rules of nature. Natural beautiful smile is apparent to the subconscious eye and that's why they are universally attracted, noticed and rewarded.³

Making the smile perfect can be anything like making the teeth whiter and brighter, fixing the broken crooked teeth by aesthetic filling, shaping up the soft gum tissue to reduce its appearance in smile, replacing ugly dark filling by tooth coloured fillings, shaping up of teeth to look smaller, tilted etc – anything that can take years of our face and quickly and easily give that perfect smile. This perfect smile will seriously give the benefit of health, mind and spirit that come from a youthful attractive smile. We will understand why some smiles are so attractive and others don't by knowing some basic rules.¹⁻³

OBJECTIVE OF SMILE DESIGNING

The objective of aesthetic smile makeover is to develop a balance between teeth and soft tissue which would impart a bright and beautiful but believable appearance to the patient as well as impart a stable masticatory system where the teeth, alveolar bone, masticatory muscles and TMJ all function in harmony.

Smile as a component of aesthetics

Figure 1: Dental facial aesthetics

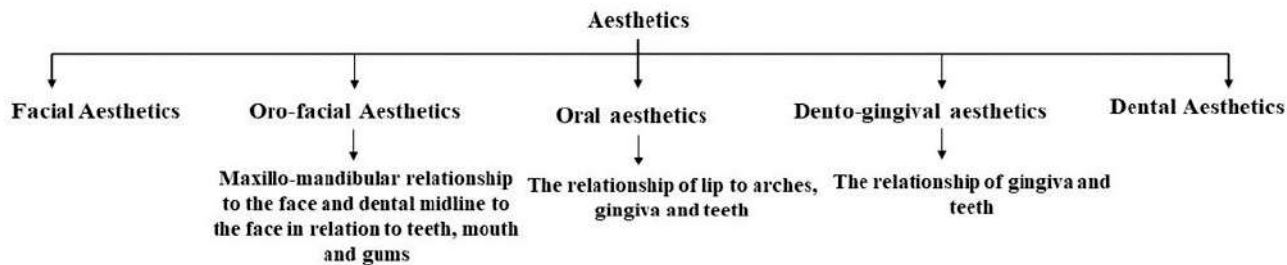

Figure 2: Types of Aesthetics

A. Facial aesthetics^{4,5}: Facial analysis includes the form and proportion of face. It has 2 components (Figure 1 and 2)

- a. Horizontal Component
- b. Vertical Component

Horizontal Component:

1. The width of the face should be the width of 5 eyes
2. The distance between the eyebrow and chin should be equal to the width of the face

Vertical Component:

1. The facial height is divided into three equal parts from forehead to eyebrow line, from eyebrow line to base of nose and base of nose to base of chin.
2. The full face is divided into two equal parts eyes being the midline
3. The lower part of the face from base of nose to chin is divided into two parts, the upper lip forms one-third and lower lip with chin is two-third of it.

Again, basic shape of the face when viewed from the frontal aspect can be of four types

1. Square
2. Tapering

3. square tapering

4. Ovoid

The lateral profile of an individual can be of three types

1. Straight
2. Convex
3. Concave

B. Orofacial aesthetics: The dental midline and facial midline are determined in this aesthetics, both of which should be collinear in a beautiful smile. Ideally facial midline is perpendicular to the horizontal imaginary lines like Interpupillary line, Commissural line and Opharic line (eyebrow line). Ideally all the horizontal lines should be parallel to each other. Now SMILE Creation is basically based on three pillars, Oral aesthetics, Dento-gingival aesthetics and Dental aesthetics.^{4,5}

C. Oral aesthetics: This analysis includes the placement of maxillary incisal edges and its proper display during static and dynamic lip movements. The parameter used to establish the maxillary incisal edge position are:

- i. **Degree of tooth display:** There should be 3.5-4mm of maxillary central display when the lips are at rest. In an ideal and fuller smile 2mm of the gingival tissue and proximity (not more

than 2mm) of the incisal line to the lower lip is seen. However, this display decreases with progressing age as the window of mouth begins to sag downwards showing more of the lower anteriors.

i. Phonetics: It is most important to determine tooth length. It is assessed by phonetics of M,E,F,V and S sounds.

ii. Patient input: Patient desires must be met as best as possible provided they do not interfere in the above parameters.

Correct incisal position is crucial as it is related to labial contours, lip support, anterior guidance, lingual contours and tooth display.

Lip line: It corresponds with the inferior border of the upper lip as it relates to the teeth and gingival tissues during smiling. Arbitrarily they are of three types:

- i. Average lip line-exposes maxillary teeth and only interdental papilla
- ii. Low lip line-exposes no gingival tissues while smiling
- iii. High lip line-exposes the maxillary teeth in full display and gingival tissues above gingival margin.

Smile Line: It is the imaginary line drawn along the incisal edges of maxillary anterior teeth. In an aesthetic smile the smile line follows the curvature of the lower lip. In reverse smile line, the centrals appear shorter than the cuspids along the incisal plane.

Smile arc: It is the relationship between a hypothetical curve drawn along the edges of maxillary anterior teeth and inner contour of the lower lip in the posed smile or social smile. They are of three types:

- i. Consonant smile arc,
- ii. Straight smile arc
- iii. Reverse smile arc

To provide an aesthetic smile we should prevent a straight or reverse smile arc. We should rather try to obtain some degree of curvature that parallels the lower lip curvature.^{4,5}

Smile symmetry: It is the relative positioning of the corners of the mouth in the vertical

plane during smiling. Symmetric smile is more attractive and so we should aim to give a balance form of teeth, gingival scaffold and lip framework to be near to the symmetry.^{4,5}

Buccal Corridor: It is the negative space visible during smiling between the corners of mouth and the buccal surfaces of maxillary posterior teeth. It is influenced by

- i. width of smile and maxillary arch
- ii. tone of facial muscles
- iii. the positioning of labial surfaces of upper premolars
- iv. the prominence of canines particularly at the distal facial line angle
- v. any discrepancy between the dimension of premolars and six anterior teeth.

This negative space should be kept minimum in a beautiful smile by restoring the premolars. The buccal corridor should not be eliminated as its complete absence gives the patients smile an artificial appearance.^{4,6}

D. Dento-gingival aesthetics: To have a beautiful smile there should be

- Gum line symmetry should be there on both right and left side. That means the height of scalloping should be symmetrical on both sides.
- The level of gingival zenith should be lower in the lateral incisor than that of adjacent central incisor and canine.
- Gummy smile is avoided where there is too much of the gum tissue seen during smiling. Ideal smile exposes 1-3mm of gingival tissue above the front teeth.
- Gingival zenith should be centred over each lateral and should be two-third away across the face of tooth in central incisor and canine.
- Attractive smile always has a good gingival health with regular dental cleanings. Healthy gums are light pink in colour and stippled in texture like orange peel.^{4,6}

E. Dental aesthetics: The final step of smile analysis is the dental aesthetics both intra tooth and intertooth. It includes

Tooth shape: It should be based on a facial appearance of the patient. Patient with longer face should ideally be matched with rectangular teeth whereas patient with square face will probably match teeth with 80% width to length ratio.^{4,6}

Dental midline: It refers to the vertical contact interface between two maxillaries central incisors. In a beautiful smile it should be perpendicular to the incisal plane and parallel to the midline of the face. The maximum allowed discrepancy of a tilted midline can be 2mm and sometimes greater than 2mm discrepancy is aesthetically acceptable so long as the dental midline is perpendicular to the interpupillary line. A midline that does not bisect the papilla is more noticeable than the one that does not bisect the philtrum. Maxillary and Mandibular midlines do not coincide in 75% cases, but this mismatch does not affect aesthetics as mandibular teeth are not usually visible while smiling.^{4,6}

Incisal length: In general, the maxillary incisors are 10-11mm in length, lateral incisors are 1-2.5mm shorter than central and canines are 0.5-1mm shorter than the central incisors. This incisal edge position is very vital in proper smile designing where only 3.5-4mm display of the tooth surface is there in relaxed mouth open position.^{4,6}

Tooth dimension: It is very essential criteria in creating an aesthetically pleasing smile. The width/height ratio in maxillary central incisor should be 75-80%. The relation of dimension of the maxillary central incisors with that of maxillary laterals and canines can be established by various guidelines like

- **Golden proportion:** As given by ancient Greeks, it is also called “rule of thirds”. Each tooth away from the midline should be two-third as width of previous tooth. So ideally central incisor should be 1.6 times as wide as lateral incisor and canine 0.6 times wide as lateral incisor e.g. If central incisor is 10mm wide, then lateral incisor would be 6.5mm and canine would be 4.4mm wide. Strict adherence to this golden proportion limits creativity and thus leading to cosmetic failure.
- **Recurring aesthetic dental proportion (As proposed by ward):** This is also called RED proportion. The successive width proportion when viewed from the

facial aspect, it should remain constant as we move posteriorly from midline. This offers great flexibility to match with facial proportion.

- **M proportion (As proposed by method):** This method compares the tooth width with the facial width using a software. The whole analysis is done by computer and thus have more mathematical touch rather than artistic.
- **Chu’s aesthetic gauges:** It is an instrument to make this analysis easier by following RED proportion and refuting Golden proportion. The gauge has colour coding which predefines desired tooth proportions.

Axial inclination: Each upper tooth seen in the smile has a slight inclination towards the midline of the mouth. These axial inclinations can be properly evaluated in the photograph of the patient’s anterior teeth.¹

Incisal embrasures: Failure to provide adequate depth and variation to the incisal embrasure will make the teeth appear too uniform and contact areas too long which gives box like appearance of the dentition. This is best seen as a triangle shaped wedge (which gradually increases from central to central incisor to lateral incisor to canine) on biting edge of the front teeth.¹

Interdental contact area and contact points (ICA and ICP): It is the broad zone at which two adjacent teeth touch. It follows the 50:40:30 rule in between central incisor to lateral incisor with canine. As a rule, ICP moves apically as one moves posteriorly from the midline.¹

Latest improvement in the field of smile designing: Digital Smile Designing (DSD) is the latest development in the emerging popular field of aesthetic dentistry. It is a software-based system which is a precise and efficient method for aesthetic rehabilitation which allows the clinicians, the lab technician as well as patient himself/herself to visualise and estimate discrepancy of orofacial and dento-gingival tissues. DSD employs digital editing software along with digital photography to provide digital simulations. It simplifies and demonstrates various steps involved in treatment planning. It also confirms patient’s expectations and thus provide greater treatment acceptance. DSD gives various treatment possibilities and their projected outcomes. It also compares patient’s existing smile to previous similarly treated cases.^{2,7,8}

DSD Procedure²: Equipment required for DSD are:

- (i) DSLR camera and a properly illuminated studio
- (ii) stabilising equipment for stabilising patient's head
- (iii) DSD software in the computer

Steps of DSD²

A. Four primary videos to be taken:

- A facio-frontal video should be recorded including with or without retractor smiling [keeping 1 metre and slightly zooming is recommended to avoid distortion]. Mouth should be opened in this video for better visualisation of aesthetic tissues.
- A facial profile video should be taken with lips at rest and in a wide E smile. Here the reference should be the upper lip of the patient.
- An occlusal video should be taken which allows visualisation of the incisal edges of the upper six anterior teeth. It is taken when the patient retracts his/her upper lip with both thumbs.
- A 12, O'clock video should be recorded from above the head with retracted upper lip by the patient's thumb as before. It shows relationship between facial midline, interpupillary line, commissural line etc.

Additional four complementary videos are taken:

- These are basically video of front to front interview with the patient by basic questions e.g. chief complaint, patient's desires about his/her smile.

These videos give way for facial, phonetic, functional and structural analysis. In these videos, patient is asked to perform various functional activities like protrusion and lateral movements. Thus facial analysis through these videos will guide the smile design process in both 2D and 3D.^{2,7,8}

B. These photographs and videos were downloaded and inserted in to slide presentation. Two lines must be placed on the centre of the slide forming a cross-the interpupillary line and facial midline.^{2,7,8}

C. Then these photographs are cropped to show only the intraoral view and three reference lines are marked- A straight line from canine to canine tip, a straight line touching the incisal edges of the upper central incisors and another straight line passing through the central interdental papilla which is referred to as dental midline.^{2,7,8}

D. With these lines being orientation landmarks, the previous photograph and to achieve smile is overlapped to allow a comparative analysis of teeth and face. Rectangles are placed over the incisors to mimic the required length and width of the incisors in proportion with the golden proportion grid (1.6:1) superimposed below maxillary anterior teeth. Digital ruler is calibrated on photograph by measuring width of central incisors in study model.^{2,7,8}

E. Desired morphology of tooth is then filled with a shade for which patient has agreed.

F. This is communicated with the laboratory where mock up in resin is done which is tried in patients' mouth. After functional evaluation effect of phonetics is also observed. Then tooth preparation for veneers or crowns are done. Impression is then taken after placement of retraction cord.^{2,7,8}

G. Permanent veneers or crowns when comes from the laboratory is then fitted after the restorations tried in to determine correct luting shade with try-in paste.^{2,7,8}

CONCLUSION

Be it with or without DSD it is very important to spend more time in the diagnosis and treatment planning to improve the treatment predictability and execution efficacy to obtain a beautiful smile. To improve treatment predictability, we can give complementary treatments like orthodontic movements, clinical crown increases by periodontal surgery etc. Combining the traditional and new techniques like mock up and DSD will give highly satisfying smiles to the patients.

ABSTRACT

The success of orthodontic treatment depends on the diagnosis of the the correct etiology of the malocclusion. Malocclusions occur due to an adverse interplay between genetic and environmental factors. Growth pattern and dentofacial morphology is genetically determined but it can be influenced to some extent by the environment. Advances in genetic sciences allowed the orthodontists to better understand the effects of genetics on the etiology of dentofacial characteristics and pathologies which in turn supported the effects of the genes in the development of dentofacial complex. Twin study is one of the most effective methods available for investigating genetically determined variables of malocclusion. Genetic influence on malocclusion is probably autosomal dominant with incomplete penetrance and variable expressivity. Therefore orthodontists should consider the genetic basis of a skeletal anomaly during the diagnosis and treatment planning. This review article focuses on the basic genetics and the effect of genetic factors on various malocclusions.

Keywords: Malocclusion, Maxilla, Mandible, Orthodontics, Pedigree.

INTRODUCTION

Genetics is the biological science which deals with the mechanisms of heredity and causes of variation in living beings¹. The term "Genetics" was coined by **Batason** in 1906. It is derived from a Greek word "Gene" meaning to become gene is the basic unit of hereditary.

Every process of growth, from multiplication, to cell death is ultimately controlled by the genes. Genes control reproduction and day by day function of all cells.

It is well known that the majority of malocclusions are produced by a combination of environmental and genetic factors.

Though growth is strongly influenced by genetic factors, it also can be significantly affected by the environment in the form of nutritional status, degree of physical activity, health or illness².

Many components of the head & neck region are involved in normal development of the occlusion. The most important are³ the size of the maxilla, the size of the mandible, the factors, which determine the relationship between the two skeletal bases such as cranial base and environment, arch form, size and morphology of teeth present, and soft tissue morphology.

Malocclusion may be defined as a significant deviation from what is defined as normal or ideal occlusion – **Andrews 1972**^{4,5}.

There is dental anthropological evidence that population groups that are genetically homogenous tend

to have normal occlusion. In pure racial stocks, such as a Melanesians of the Philippine islands, malocclusion is almost non-existent. However, in heterogeneous population the incidence of jaw discrepancies and occlusal disharmonies is significantly greater^{6,7}. According to **Stockard**⁸ individual features of the craniofacial complex could be inherited independently of other portions of the skull, and that jaw size and the tooth size could be inherited independently, and as genetically dominant traits.

Fernex et al⁹ found boys to show more similarities to their parents than girls. Facial skeletal structures were more frequently transmitted from mothers to sons than from mothers to daughters. **Littons et al**⁴ recorded that siblings usually show similar types of malocclusion and examination of older siblings can provide a clue to the need or interception and early treatment of malocclusion.

FAMILY AND TWIN STUDIES ON DENTOFACIAL PHENOTYPES^{15,16,17}

The twin method, when appropriately applied, provides geneticists with one of the most informative technique available for analysis of complex genetic traits. Alternative method for investigating the role of heredity in determining craniofacial and dental morphology is by familial studies. Heritability in such studies is normally expressed in terms of parent/offspring correlation coefficients or correlation coefficients with sibling pairs, of which twins are a special kind.^{10,11}

The study of craniofacial relationship in twins has provided much useful information concerning the role of heredity in malocclusion. The procedure is based on the underlying principle that observed differences within a pair of monozygotic twins, whose genotype is identical, are due to environment and those differences within a pair of dizygotic twins, who share 50% of their total gene complement, are due to both genotype and environment.^{12,13}

A comparison of the observed within-pair differences for twins in the two categories should be provide a measure of the degree to which monozygotic twins are more alike than dizygotic twins. The larger this differences between the two twin categories, the greater the genetic difference effect on variability of the trait. This model implies the zygosity is accurately determined and that environment effects are equal in the two twin

categories. The bulk of the evidence for the heritability of various types of malocclusion arises from family and twin studies.^{14,15,16}

CLASS II DIVISION 1 MALOCCLUSION

Many studies have been carried out to determine the heritability of certain craniofacial parameters in Class II division I malocclusion¹⁷. These investigations have shown that, in the class II patient, the mandible is significantly more retruded than in Class I patients, with the body of the mandible smaller and overall mandibular length reduced. These studies also showed a higher correlation between the patient and his unrelated siblings, thus supporting the concept of polygenic inheritance for Class II division 1 malocclusions.

Environmental factors can also contribute to the etiology of Class II division 1 malocclusion. Soft tissues can exert an influence on the position or inclination of upper and lower incisors and the need to achieve lip tongue contact for an anterior oral seal during swallowing can encourage the lower lip to retrocline the lower incisors and the protruding tongue to procline the uppers, influencing the severity of the overjet. Likewise, digit sucking habits can produce a Class II division 1 incisal relationship, even if the underlying skeletal base relationship is Class I. Lip incompetence also encourages upper incisor proclination by virtue of the imbalance in labial and lingual pressures on the teeth¹⁸.

CLASS II DIVISION 2 MALOCCLUSION

This is a distinct clinical entity and is more consistent of definable morphometric features occurring simultaneously, that are a 'syndrome' than the other malocclusion types¹⁹.

It comprises the unique combination of deep overbite, retroclined incisors, class II skeletal discrepancy and high lip line with strap-like activity of the lower lip, and active mentalis muscle, etc. A further feature of the class II div 2 malocclusion is a tendency to a forwardly rotating mandibular development, which contributes to the deep bite, chin prominence, and reduced lower face height.

Familial occurrence of class II div 2 has been documented is several published reports including twin and triple studies by **Kloeppel** and **Markovic**.²⁰

Markovic¹⁷ carried out a clinical and cephalometric study of 114 class II div 2 malocclusion, 48 twin pairs and 6 sets of triplets. Intra and inter - pair comparisons were made to determine concordance/discordance rates for monozygotic and dizygotic twin. Of the monozygotic twin pairs, 100% demonstrated concordance for the class II division 2 malocclusion where as almost 90% of the dizygotic twin pairs were discordant.

These studies point to incontestable genetic influence, probably autosomal dominant with incomplete penetrance and variable expressivity. It could also possibly be explained by a polygenic model with a simultaneous expression of a number of genetically determined morphological traits, rather than being the effect of a single controlling gene for the entire occlusal malformation. The controversy regarding the etiology of the class II division 2 malocclusion arises from a failure to appreciate the synergistic effects of genetics and environment on facial morphology.

Markovic¹⁷ stressed the predominant role of genetic factors in the etiology of Class II division 2 malocclusions. These views are of course not incompatible if the lower lip morphology, behavior, and position relative to the upper incisors is considered to be genetically determined or influenced. Aspects of skeletal and muscle morphology are genetically determined and there is some recent experimental evidence from a twin study by **Lauweryns et al**¹⁸ indicating strong genetic factors in certain aspects of masticatory muscle behavior.

CLASS III MALOCCLUSION

Probably the most famous example of a genetic trait in humans passing through several generations is the pedigree of the **Hapsburg jaw**. This was the famous mandibular prognathism demonstrated by several generations of the Hungarians/Austrian dual monarchy.^{21,22}

Strohmayer²³ showed in his detailed pedigree analysis of the Haspsburg family line that the mandibular prognathism was transmitted as an autosomal dominant trait. This could be regarded as an exception and in itself, does not provide sufficient information to predict the mode of inheritance of mandibular prognathism. **Schulze and Weise**²⁴ similarly showed mandibular prognathism in both monozygotic and dizygotic twins. They reported that concordance in monozygotic twins

was six times higher than among dizygotic twins. Both of the above studies reported a polygenic hypothesis as the primary cause for mandibular prognathism.

According to **Ellis and Mcnamara**²⁴ a class III malocclusion resulting from a skeletal imbalance between the maxillary and mandibular bases may result from deficiency in maxillary growth, excessive mandibular growth, or a combination of both. Various studies have also highlighted the influence of a distinct cranial base morphology with a more acute cranial base angle and shortened posterior cranial base resulting in a more anterior position the glenoid fossa, thus contributing to the mandibular prognathism.

Various models have been suggested, such as autosomal dominant with incomplete penetrance by **Stiles and Luk**²⁵, simple recessive by **Downs**²⁶, variable both in expressivity and penetrance with differences in different racial populations by **Kraus et al**²⁷.

Litton et al²⁷ carried out an analysis of the literature to that date and also analyzed a group of probands, siblings and parents with Class III malocclusion, and analyzed the results in an effort to determine a possible mode of transmission. Both autosomal dominant and autosomal recessive transmission were ruled out and there was no association with gender (male or female).

The polygenic multifactorial threshold model put forward by **Edward et al**²⁷ however, did fit the data and accordingly proposed a polygenic model with a threshold for expression to explain familial distribution, and the prevalence both within general population and in siblings of affected persons.

When the soft tissue is considered there is a tendency for lip and tongue pressure to compensate for a skeletal Class III discrepancy by retroclining lower incisors and proclining upper incisors.²⁸ Polygenic inheritance implies that there is scope for environmental modification and many familial and twin studies bear this out.²⁹

Watnick⁴ concluded that the analysis of unit areas with the craniofacial complex represents local growth sites and revealed different modes of control within the same bone. Certain areas, such as the lingual symphysis, lateral surface of the ramus and frontal curvature of the mandible are predominantly under genetic control. Other areas, such as the antegonial notch, are predominantly affected by environmental factors.

Hughes and Moore³⁰ suggested that the mandible and maxilla are under separate influence of genetics control, and that certain portions of individual bones, such as the ramus, body, and symphysis of the mandible are under different genetic and environmental influences.

CONCLUSION

Multiple factors and processes contribute to the development of malocclusion. Heredity & environment, singly and in co-operation provide many variations. Some of these are desirable. Others including dentofacial disturbances are undesirable and need correction. The aim of the orthodontist is to correct these undesirable changes. The influence of genetic factors on treatment outcome must be studied and understood in quantitative terms. Conclusions from retrospective studies must be evaluated by prospective testing to truly evaluate their value in practice. Genome-wide association studies are necessary to evaluate the further evidence base for the practice of orthodontics. Only then we will begin to truly understand how nature (genetic factors) and nurture (environment factors, including treatment) together affect our treatment of our patients.

Describing Role of Bacteria in Carcinogenesis with Special Emphasis on *Fusobacterium* species in Oral Cancer: An Overview

Devi Prasad Mandal¹, Shakti Rath², Swagatika Panda³, Neeta Mohanty⁴

ABSTRACT

Oral squamous cell carcinoma (OSCC) is one of the major global health problems with high prevalence and morbidity rates. This continues to be a major health concern, even after several decades of research and advancement in medical science. Studies conducted in last decade has established the fact that bacteria can be one of the etiologic agents of cancer. One such bacterium, *Fusobacterium nucleatum* has been identified as a potential carcinogenic organism. The methodologies ranging from traditional culture techniques to 16S rRNA metagenomics has established a significant difference in microbial counts between cancerous and healthy tissues. This article provides an overview on the association between bacteria and oral carcinogenesis with a special reference to *Fusobacterium* infection.

Keywords: Oral squamous cell carcinoma; Bacteria; *Fusobacterium nucleatum*; etiologic agents

INTRODUCTION

Oral squamous cell carcinoma (OSCC), is the 17th most common malignant neoplasm in the world and it is ranked 8th in India.¹ Despite the advancement in medical research prognosis of OSCC still remains an uphill task.^{2,3} Use of various forms of tobacco (both smoke and smokeless), alcohol, human papilloma virus (HPV) infections, nutrient deficiency, solar radiation and genetic predisposition have already been established as risk factors of OSCC.^{4,5} However, a significant proportion of OSCC (around 15%) is not explained by these risk factors, suggesting existence of other as yet unidentified risk factors worth exploring.⁵

After establishing *Helicobacter pylori* as the etiologic agent of in gastric cancer, many studies are being carried

out to find out the involvement of other bacteria in other forms of cancer.⁶ Similarly, the possible involvement of bacteria in oral cancer has taken centre-stage in scientific community. Several studies are being carried out using various methods starting from cultivation of bacteria to identification of 16S rRNA gene sequencing to establish the fact. However, the results have been insignificant across them. But *Fusobacterium nucleatum*, is an oral bacterium, indigenous to the human oral cavity, that plays a role in periodontal disease can and cause a chronic infectious/inflammatory condition that leads to soft tissue damage and carcinogenesis when there is a dysregulated immune response to host cells.⁷ *Fusobacterium* promotes cell proliferation, and in human epithelial cells, infection by *Fusobacterium* results in upregulation of 1, 2 kinases, those responsible in cell proliferation and cell survival signalling, as well as DNA repair.⁸

Bacteriology of Oral Cancer: Studies have confirmed data on interaction between the bacterial pathogenesis and the host cell environment regulatory systems. It has been shown that chronic bacterial infections produce toxins that have potency to disturb the normal cell cycle which leads to uncontrolled cell proliferation.⁹⁻¹¹ Chronic bacterial infections activate the mitogen activated kinase (MAPK) pathways and cyclin D1 which induce cell

proliferation and DNA replication resulting in increased incidence of cell transformation and genetic mutation promoting tumour development.^{12,13} Intracellular accumulation of the pathogens suppresses apoptosis through stimulating Bcl-2 expression or inactivating retinoblastoma protein pRb.^{14, 15} These findings confirm that intracellular pathogen can survive rather the attempts of the host immune system to destroy the infected cells by apoptosis. Many pathogenic bacteria have the potency to alter the host cell signalling pathways, which increase the survival of pathogen. Thus, pre-cancerous lesion formed in such infections which can regress with antibiotic treatment.¹⁶ Pre-existing microflora of the oral cavity also facilitate carcinogenesis by converting ethanol into its carcinogenic derivative and increase acetaldehyde levels which is also capable of inducing DNA damage. This is also evident from the increased levels of microbial acetaldehyde production in tobacco and alcohol users.^{17, 18}

Bacterial cells catalyse the formation of N-nitroso compounds from nitrite and amines, amides or other suitable compounds and *Escherichia coli* is the known example.¹⁹ This nitrosamine formed by bacteria, appears to be the cause for carcinoma, not only of the oesophagus but also of other mucosal areas such as the oral cavity.²⁰ Bacteria involve in podoplanin-dependent pathway passively stimulates the progression of OSCC. Podoplanin is a transmembrane glycoprotein expressed in neoplastic tissues. Many bacteria causing periodontal diseases have butyric acid (BA) as an extracellular metabolite. BA/sodium butyrate (NaB) increases podoplanin expression in certain OSCC cell lines, suggesting that the progression of periodontal disease may promote the progression of OSCC.²¹

***Fusobacterium* in Oral Cancer:** *Fusobacterium* activated inflammatory cytokines such as TNF- α , IL-1 β , and IL-6. These events become cyclic, leading to periodontal attachment and tissue damage.⁷ The role of the lipopolysaccharide (LPS) of *Fusobacterium* is not like the classical *E.coli* LPS, rather it contains a small quantity of 2-keto-3-deoxyoctonate and heptose.²² *Fusobacterium* additionally activates p38, resulting in the secretion of MMP-9 and MMP-13 (collagenase 3). *Fusobacterium* infection triggers several anti-apoptotic pathways. Fischman et al. demonstrated that *Fusobacterium* induced NF- κ B signalling in tongue epithelial samples of mouse.²³ Exposure of OSCC cells

to *Fusobacterium* shows the initiation of additional bioactive molecules, enzymes, and cytokines implicated in OSCC proliferation, survival and aggressiveness (such as TNF α , cyclin D1, heparanase, and MMP9), like MMP-9, MMP-13 plays a very important role in tumour invasion and metastasis.²⁴ Recently, a precise correlation between *Fusobacterium* and tumour progression was studied whereby the fusobacterial adhesion antibody (FadA) binds to E-cadherin on colon carcinoma cells and activates β -catenin signalling pathway. This pathway enhances the transcriptional activity of WNT pathway, pro-inflammatory cytokines, oncogenes, and stimulation of CRC cell proliferation.²⁵

Studies describing association of *Fusobacterium* species and OSCC:

Nagy et al 1998 described the isolation and microbiological identification of *Fusobacterium* species from 21 tumour samples (OSCC) by taking surface swabs. Similarly, Hooper et al 2006 and 2007, described the occurrence of *Fusobacterium* species in 51 and 20 fresh OSCC tumour samples, respectively, by doing microbiological identification and confirming the same by 16s rRNA sequencing. Again, in another study done in 2014 by Schmidt et al, the association of *Fusobacterium* and OSCC was confirmed by next generation sequencing of 16s rRNA isolated from 94 samples taken from pre-cancer stage patients. Likewise, Al Hebshi et al 2017, Zhao et al 2017 and Yang et al 2018 confirmed occurrence and association of *Fusobacterium* species in OSSC tumour samples in separate studies. Yang et al 2018 conducted this study by taking 197 samples, which is the largest sample size by far.²⁶⁻³²

CONCLUSION

There is an increased interest in the potential role of bacteria in oral cancer as evident from the increasing number of publications addressing the topic. However, published studies disagree on which specific bacteria to associate with OSCC. This is probably due to the significant methodological variation between studies with respect to sampling (e.g. deep tissue biopsy vs. surface swab), selection of control tissues and microbial profiling technology. 16S rRNA metagenomics with NGS has great potential in exploring the oral microbiome shifts associated with oral cancer, but currently lacks adequate standardisation, particularly in terms of DNA extraction, selection of primers and hypervariable region

for amplification, and bioinformatics. In addition, 16S rRNA microbial profiling does not inform about microbial gene expression and microbial function. Therefore, future work should, in addition to methodological standardisation, analysis into casecontrol studies to fully explain the role of the oral microbiome in oral cancer and generate information of translational value, for example, identify diagnostic and prognostic markers.

The oral carcinogenic properties of *Fusobacterium* are well documented *in vitro* as well as in experimental animals; many of the mechanisms underlying these have been elucidated. Virulence factors such as FadA of *Fusobacterium* may also serve as novel targets for therapeutic intervention of oral cancer. However, it is important to note that a strong epidemiological evidence for the association of *F. nucleatum* with oral cancer is still lacking.

ABSTRACT

Anchorage control during active orthodontic treatment is essential for uncompromised results. Conventional method of supporting anchorage have been using either tooth borne anchorage or extra oral anchorage. Extra oral anchorage can be used to supplement tooth borne anchorage and to deliver forces in directions not possible with intra oral forces but requires excellent patient co-operation. Intra-oral skeletal anchor units that are predictably stable, non-invasive, biocompatible and comfortable could make appliance design simplified and more efficient. With the introduction of Mini implants and microimplants they can be placed in areas earlier impossible. They are less expensive, allowing early force application and with reduced treatment time. The presently available implant systems are bound to change and evolve into more patient friendly and operator convenient designs. Long-term clinical trials are awaited to establish clinical guidelines in using implants for both orthodontic and orthopedic anchorage.

The objective of this article is to review the types of min-implants depending on the loading time, placement and insertion of min-implants, complications associated with and to formulate a definite clinical protocol for loading of orthodontic mini implants. It also deals with the future scope of min-implants usage during active orthodontic treatment.

Keywords: Anchorage, Extra-oral anchorage, Intra-oral anchorage. Mini-implants, loading time, design of mini-implant, complications.

INTRODUCTION

Attainment and control of anchorage is fundamental and critical to Orthodontics and Dento-Facial Orthopedics. Anchorage control throughout orthodontic treatment is essential for uncompromised results. Conventional means of supporting anchorage have been using either tooth borne anchorage or extra oral anchorage.

One of the greatest limitations in modern orthodontic treatment is Tooth borne anchorage. This is mainly due to the tooth movement in response to orthodontic tooth movement¹.

Extra oral anchorage can be used to supplement tooth borne anchorage and to deliver forces in directions not possible with intra oral forces but requires excellent patient co-operation.

Skeletal anchorage would offer capabilities heretofore unavailable. They expand the range of biomechanical possibilities with screws, pins or some readily removable implants anchored to the jaws, so that forces might be applied to produce tooth movement in any direction without detrimental reciprocal forces on the anchor teeth. Orthodontic forces might be applied directly to the jaws through skeletal anchorage².

Intra-oral skeletal anchor units that are predictably stable, relatively noninterfering, biocompatible and comfortable could make appliance design simplified and more efficient.

Progress in the use of implants and in the development of specialized newer systems has made skeletal anchorage a more reliable and standardized one. As orthodontists begin to appreciate the efficiency of implant supported appliances, the mechanotherapeutic procedures may undergo profound transformation.

Mini implant screw design²: These are made of commercially available pure titanium, is designed to be used transmucosally for osseous orthodontic anchorage. The screw comes in three diameters (1.5mm, 2.0mm, and 2.7) and five lengths (7mm, 10mm, 12mm, 14mm, and 17mm). It has four components.

Types of mini implants: Types of mini implants, Bone screws(6-15 mm long, 3-5 mm in diameter), Mini implants(6 mm long, 1.2 mm in diameter), Micro implants (1.2–1.8mm in diameter)

Comparison of stability between cylindrical and conical type mini-implants: The conical group requires high removal torque, which means good initial stability, it also showed high insertion torque which could affect adjacent tissue healing. The conical shape may need modification of the thread structure and insertion technique to reduce the excessive insertion torque while maintaining the high resistance to removal. Tapered orthodontic miniscrews induce bone – screw cohesion following immediate loading

T-type screws can be used for orthodontic anchorage immediately after placement³: In case of immediate-loading, the bone – screw contact ratio with t-type screws was significantly greater ($82.3 \pm 15.0\%$) than with the s-type screws ($33.3 \pm 11.8\%$).

Titanium vs SS: More fibroblastic activity with less inflammatory cells reactions is observed in patients with titanium implants than in patients with stainless steel implants. Less metal impregnation in the soft tissue covering the titanium was found than in the tissue covering the stainless steel implants. Oxides grow when implant is contact with bodily fluids on both stainless steel and titanium devices. Osteo integration is better with titanium. Surfaces of stainless steel implants are much smoother, where average roughness ra = 6.5 nm

has been measured, while on coated titanium average roughness ra was 68.6 nm, since titanium surfaces are coated with hard coatings. Young's modulus of bone and titanium is equal to bone. Increased young's modulus – undue stress on bone – implant failure.

Immediate vs delayed loading:

Immediate implant placement loading⁴ : Osseointegration of orthodontic micro-screws after immediate and early loading. The 100% survival rate indicates that micro-screws implanted in maxilla can support both immediate and early orthodontic loading. The three groups had significantly different degrees of osseointegration, and the 4w group showed the highest degree of osseointegration. Therefore, a 4-week healing time should be considered before orthodontic loading to improve stationary anchorage.

Implant placement: Temporary anchorage device insertion variables: effects on retention. Placement of tads at 45 - 60° to the cortical plate is the most retentive insertion angle. Insertion at an oblique angle from the line of force reduces retention of tads. Increasing penetration depth of tads results in greater retention. Increased abutment head distance from cortical plate leads to decreased retention. Impact of insertion depth and predrilling diameter on primary stability of orthodontic mini-implants. Higher insertion depths result in higher insertion torques and thus primary stability. Larger predrilling diameters result in lower insertion torques. Insertion angle impact on primary stability of orthodontic mini-implants. Implant diameter has a great impact on insertion torque and hence primary stability of orthodontic mini-implants. To achieve a higher insertion torque, an insertion angle ranging from 60 to 70° is advisable. If the available space between two adjacent roots is small, a more oblique direction of insertion is more favorable to minimize the risk of root contact. Very high insertion torques may lead to higher failure rates caused by excessive bone compression;

Recommended placement torque when tightening an orthodontic mini-implant⁴: The interface characteristic between implant and bone can be expressed in relation to the implant placement torque (ipt) when tightening the mini-implant into the bone. When the cortical bone is stiffer or the screw diameter is larger, the ipt will be larger and the stability of the mini-implant will be enhanced. Conversely, when the ipt is too small, the miniimplants

will be unstable because of their mobility. The mean ρ ranges from 7.2 to 13.5 ncm according to the location of the implants. There was a significant difference between maxillary (8.3 ncm) and mandibular (10 ncm) implants.

Removal torque of osseointegrated mini-implants: an in vivo evaluation⁵: The removal torque value (rtv) is the torsion force required to remove an implant. For osseointegrated implants designed for orthodontic anchorage, the torque used must allow easy implant removal, with no risk of breakage of instruments or damage to adjacent anatomical structure. The rtv of the palatal implants ranged from 53.0 to 82.3 n/cm (mean value: 67.2 ± 9.4 n/cm) and, for the retromolar implants, from 36.5 to 90.9 n/cm (mean value: 68.6 ± 15.6 n/cm). Rtv \propto bone density

Achieving primary stability: Identify the quality and quantity of available bone for each implant site. Use an implant with optimal macro- and microgeometry. Undersize osteotomies and prepare them precisely for placement of tapered implants. Match the drilling sequence to the bone type. Perform the surgical procedure accurately;

Implant driving methods⁶

Self-tapping method: in this method the microimplant is driven into the tunnel of bone formed by drilling, making it tap during implant driving. This method is used when we use small diameter microimplants.

Self-drilling method: here the microimplant is driven directly into bone without drilling. This method can be used when microimplant of larger diameter (more than 1.5 mm) are to be used.

Safe zone for implant placement:

“Safe zones”: a guide for miniscrew positioning in the maxillary and mandibular arch: In the maxilla, the greatest amount of mesiodistal bone was on the palatal side between the second premolar and the first molar. The least amount of bone was in the tuberosity. The greatest thickness of bone in the buccopalatal dimension was between the first and second molars, whereas the least was found in the tuberosity. In the mandible, the greatest amount of mesiodistal dimension was between first and second premolar. The least amount of bone was between the first premolar and the canine. In the buccolingual dimension, the greatest thickness was

between first and second molars. The least amount of bone was between first premolar and the canine. The insertion of screws in the maxillary molar region above 8–11 mm from the bone crest has to be avoided with any type of screw because of the presence of the sinus. Another area that is generally not suitable for screw implantation is the tuberosity, where the amount of bone is very limited by the presence of wisdom teeth. If the screw is inserted perpendicular to the dental axis, it might reach the narrowest interradicular space earlier than when inserted at an oblique angle. It should be embedded for no more than 6–8 mm of bone depth, ie, the 50% of the buccolingual average measure between first and second molars. A miniscrew insertion at 30–40° to the dental axis allows the insertion of a longer screw in the available bone depth. Because of the reduced tip diameter, a conic screw insertion has a lower risk of damaging roots.

Various implant systems⁷

Mini implant: Ryuzo Kanomi introduced the Mini-implant in 1997. The mini implant is only 1.2 mm in diameter and 6 mm long making it much more useful in orthodontic applications. Mini implants are small enough to be used between the roots, placed in palate for molar distalization, molar intrusion and other tooth movements. Better oral hygiene. Can be easily removed after treatment.

Clinical Application: Conventional dental implants are 3.5–5.5 mm in diameter and 11–21 mm long. The mini-implant is only 1.2 mm in diameter and 6 mm long, making it much more useful in orthodontic applications. It is used for horizontal traction if placed on the alveolar ridge. The screw is inserted between the mesial and distal roots of a molar for molar intrusion it is placed in the palate, to provide anchorage for molar distalization. It can be used distraction osteogenesis, with the implant placed intraorally instead of extraorally.

Advantage of mini implant: It is small enough to place in any area of alveolar bone, even apical bone. The surgical procedure should be easy enough for an orthodontist or general dentist to perform and minor enough for rapid healing. The implant should be easily removable after orthodontic traction.

Screw selection⁶: The 1.5 mm- diameter bone screw is intended for tooth bearing areas, particularly the interseptal bone between teeth. The extra thickness

provides better mechanical retention with its deeper thread pitches. This screw should be placed in the interseptal bone. The 2.0mm and 2.7mm diameter screws are designed for use in non-tooth bearing areas such as the zygomatic buttress, the midsagittal region of the hard palate and mandibular buccal shelf region. These screws can bear forces as high as 500-600gms. The 14mm and 17mm screw lengths are primarily designed for insertion in the zygomatic buttress. The 7mm, 10mm, and 12mm lengths can be selected based on the bone height at the implant site.

Micromplant: Conventional endosseous implants have been used to provide anchorage control in orthodontic treatment procedures. 1.2-1.8mm in diameter. The titanium micro implant has been designed specifically for orthodontic use. These micro implants are smaller in diameter of 1.2mm-1.8mm allows its insertion into many areas of the maxilla and mandible previous unavoidable (e.g.) Between the roots of adjacent teeth. It is inexpensive, loaded immediately and provides anchorage throughout treatment

General rule in choosing proper size of microimplant⁷

According to the length of microimplant: The recommended sizes are more than 6mm in maxilla, and 5mm in mandible. The cortical surfaces of the maxilla are thinner and less compact than those of the mandible and accordingly will require longer microimplants. A general rule of thumb should be, to use the longest possible microimplant, without affecting the health of adjacent tissues.

According to the diameter of microimplant: Microimplants are available in 1.2 to 1.3mm diameter (no.12- 18 series). No. 12 series (1.2mm diameter) and no. 13 series (1.3mm in diameter) can all withstand up to 450g of orthodontic force when patient has good quality of cortical bone. In the mandible, the buccal surfaces and retromolar areas offer adequate thickness and high quality cortex for the acceptance of microimplants. Usually, those of 4-5mm in length with 1.2 – 1.3mm in diameter provide adequate retention.

Site for microimplant placement⁷

In the Maxilla: The micro implant can be used in both the maxilla and the mandible. Several areas of the maxilla can be used for insertion. One location is the inferior surface of the anterior nasal spine, where

the micro implant can be used for proclination of the incisors. The location can also be that of the implant and the onplant in the midpalatal suture, taking advantage of the density and height of the cresta nasalis, where the bone structure is dense enough for retention of the implant. The anteroposterior position can vary slightly according to the individual anatomy. The orientation may likewise vary from almost vertical to an oblique anterior direction. It is, however, important to avoid the incisal canal, and when situated anteriorly, the miniscrew should be inserted a slight distance from the midline or more posteriorly. In this position the micro implant may render direct anchorage for retraction and intrusion of flared and overerupted incisors. Anchorage in this location has also been used for symmetric mesial movement of lateral teeth when the anterior teeth could serve as anchorage. Indirectly this location can also be used for consolidating miniscrew anchorage with the teeth that are serving as anchorage but delivering too little resistance. Another location is in the Infrazygomatic crest. Level and direction may vary depending on the individual anatomy. From this position the zygom wire and the implant can deliver anchorage for retraction and intrusion of anterior teeth.

In addition, the screws can be placed so that they serve as anchorage for intrusion of molars that have over erupted secondarily to extraction of the occluding teeth. The force delivered with a micro implant anchorage will result in intrusion and buccal tipping, although the latter can be avoided with use of a lingual appliance with a one point⁸.

In Mandible: Three different locations are suggested for use in the mandible. Roberts et al routinely placed micro implant in the retromolar position and established a satisfactory anchorage for mesial movement of molars, thereby avoiding retraction of the anterior teeth in the case of space closure following extraction of first molar. Roberts et al also used this position to neutralize the eruptive force generated in uprighting mesially tipped molars⁹. A second location is within edentulous areas of the alveolar process. The purpose here would be to move single teeth without interfering with the remaining dentition. The micro implant can be inserted laterally in the molar and premolar region and can as anchorage for vertical and/or transverse movement of lateral teeth, molars, and premolars.

In the anterior region of the mandible the screws can be inserted into the symphysis to be used as

anchorage for intrusion and protraction mandibular incisors. A miniscrew in this location can be useful as indirect anchorage by consolidating with a dental anchorage, as indicated by Kanomi¹⁰.

CONCLUSION

Implants for the purpose of conserving anchorage are welcome additions to the armamentarium of a clinical Orthodontist. They help the Orthodontist to overcome the challenge of unwanted reciprocal tooth movement. The presently available implant systems are bound to change and evolve into more patient friendly and operator convenient designs. Long-term clinical trials are awaited to establish clinical guidelines in using implants for both orthodontic and orthopedic anchorage.

ABSTRACT

The Temporomandibular joint is the joint between the Temporal bone and the Mandible. It is a Ginglymodiarthroidal joint. It is related with some of the controversial and complex disorders. Under an identical situation, one person's TMJ may appear to worsen while another's doesn't. When the degenerative changes start in the TMJ, the pathology often leads to functional and morphological deformities. The usual pathology is non-inflammatory and characterized by abrasion of articular cartilage with thickening. This is followed by secondary inflammatory changes. The degenerative changes occur because of dysfunctional remodelling due to a decreased host adaptive capacity of the articulating surfaces or functional overloading of the joint. Thus, understanding the pathophysiology of the TMJ disorders is important for understanding the etiology, diagnosis, and treatment of TMJ. This paper reviews the factors associated with functional overloading of the joint and the clinical, radiographic and Biochemical findings important in the diagnosis of the Temporomandibular joint disorders.

Keywords: Temporomandibular joint, Temporal bone, Mandible, TMJ, articular cartilage, Temporomandibular Joint disorders.

INTRODUCTION

A Joint is a place of union of two or more bones. The Temporomandibular joint is the joint between the Temporal bone and the Mandible. It is a Ginglymodiarthroidal joint. It is related with some of the controversial and complex disorders. The prevalence of signs and symptoms of temporomandibular disorders (TMD) has been the focus of interest of many

epidemiological surveys. Signs and symptoms of TMD are common in the population, with a higher prevalence in women than in men. During the last decades, several investigations have focused on morphological and functional malocclusions as well as signs and symptoms of TMD. In other studies, efforts have been made to evaluate the possible etiological importance of occlusal factors for the development of TMD. These studies indicate, in general, that occlusal factors are of minor etiological importance for pain and functional disorders in the masticatory system. But the role of occlusion in the etiology of TMD is still controversial.¹

ANATOMY OF TEMPOROMANDIBULAR JOINT²

A. Bony Components

Condylar Head: It has a 'Rugby ball' or 'Date-stone' shape. The medial pole is generally more

prominent than the lateral. Two distinct medial & lateral surfaces slope divergently from the condylar crest. Total medio-lateral length of the condyle is 15-20mm. Antero-posterior width is between 8-10 mm. The articulating surface of the condyle is quiet convex antero-posteriorly and only slightly convex mediolaterally.

Glenoid Fossa: It is the temporal component of the TMJ.

It is a concave area on the inferior part of the Squamous part of the temporal bone. Functional part of the glenoid fossa is covered by articular tissue, called the articular fossa. Articular fossa is bordered ⁴ anteriorly by the posterior slope of the articular eminence, Medially & superiorly by the wall of the temporal bone, Posteriorly by the post glenoid fossa or tubercle.

Articular Eminence: Anterior to the glenoid fossa is a convex bony prominence at the base of the zygomatic process of the temporal bone called the articular eminence. The eminence, assisted by the disc, guides condylar movement during jaw opening and closing. It has two slopes anterior and posterior, which are covered by fibro cartilage and has thick dense bone.³

B. Soft-Tissue Components

Joint Capsule/Articular Capsule/Capsular Ligament: It is the fibrous, non-elastic sheet of connective tissue that encloses the entire TMJ. The lateral aspect of the ligament is thickened to form a fan-shaped ligament known as the temporomandibular ligament. The capsule resist any medial lateral and inferior forces that tend to separate or dislocate the articular surfaces. Provide passive stability and seals joint space. The capsular ligament is well innervated and provides proprioceptive

Synovial Membrane: The membrane lines the entire capsule, with folds or villi protruding into the joint cavity except the articular surfaces of the joint or the disc, except for its bilaminar posterior region

Functions of the synovial fluid: Provides nutrient requirements for the non vascular tissues. Serves as lubricant during function by two mechanisms.

Boundary Lubrication: Primary mechanism; synovial fluid forced from one region to another by movement of the joint itself.

Weeping Lubrication: The articular surfaces itself absorb some amount of synovial fluid which due to the pressure during function is forced in and out of the articular tissues and provided the medium for metabolic exchange. This occurs only during compression but not all other movements.⁴

Articular Disc: The articular disc is a biconcave structure is composed of dense fibrous connective tissue devoid of any blood vessels or nerve fibers. Divides the joint space into upper and lower compartment. Anteroposteriorly the disc is divided into 4 parts: The Anterior band, The Intermediate band, The Posterior band, The Bilaminar zone.

Shape: Articular disc has the shape of a laterally wide ovoid. In frontal section the disc is wedge shaped thicker medially and thinner laterally

Ligaments

True ligaments: Collateral ligaments /Discal ligaments, Capsular ligament Temporomandibular ligament/Lateral ligament

Accessory ligaments: Sphenomandibular ligament, Stylomandibular ligament

Collateral ligaments/Discal ligaments: They function to restrict movement of the disc away from the condyle. They are responsible for hinging movements between condyle and articular disc. The discal ligaments have a vascular supply and are innervated ⁵

Capsular ligament: The capsular ligament encompasses the joint retaining the synovial fluid. It is fibroelastic, very well vascularised and well innervated and provides proprioceptive feedback regarding the position and movement of the joint.⁶

Temporomandibular ligament/Lateral ligament: The lateral aspect of the capsular ligament is reinforced by strong tight fibres that make up the lateral ligament or the TMJ ligament. It has two parts- Outer oblique portion -prevents excessive drooping of the condyle and limits the mouth opening. Inner horizontal portion. It limits posterior movement of the condyle and disc also prevents lateral pterigoid from over stretching.

Sphenomandibular ligament: Arises from the spine of the sphenoid bone and extends downwards to a small bony prominence on the medial surface of the ramus

of the mandible called the lingula. It does not have any limiting effects on the mandibular movement.⁷

Stylomandibular ligament: It Limits the excessive protrusive movements of the mandible.

Movements & Muscles Involved: The skeletal muscles provide the energy required for moving the mandible and allowing the function of the masticatory system

1. Jaw-closing: Masseter, Medial pterygoid, Anterior part of temporalis, Superior head of lateral pterygoid
2. Jaw-opening: Inferior head of lateral pterygoid, Anterior belly of digastrics, Mylohyoid and the infrahyoid muscles.
3. Protrusion: Inferior head of lateral pterygoid, Elevators
4. Retrusion: Posterior fibres of temporalis, Elevators
5. Lateral movement: Elevators, Posterior part of temporalis (retrusion on working side), Lateral pterygoid(protrusion on nonworking side)

DEVELOPMENTAL CHANGES IN TMJ^{8,9,10}

TMJ is formed from a secondary cartilage that arises ectopically rather than from the primary cartilage. It is transformed into bone except at its proximal ends where it forms an articulation with the temporal bone. In the condyle the growth cartilage is near the surface of the bone just beneath the fibrous articular layer. It quickly undergoes atrophic changes in the absence of function but regains endochondral capability when functional demands are reestablished.

Week 7: During week 7, mesenchymal condensation was observed in the temporomandibular joint region upon the future mandibular ramus. A mesenchymal condensation appeared cranio-laterally to the condylar anlage that formed the blastema of the zygomatic process of the squamous part of the temporal bone. Temporal and condylar blastemas were separated by lax mesenchymal tissue. During week 8 intramembranous ossification of the zygomatic process of the temporal bone begins. Intramembranous ossification of the ramus of the mandible reaches the base of the future condyle. Cranio-laterally to the future condyle there was a mesenchymal condensation that formed the anlage of the articular disc. There were no joint cavities during this stage¹¹.

Week 9: The intramembranous ossification of the squamous part of the temporal bone was continuous

and no cartilaginous regions were observed. At this week condylar chondrification began in the centre of the condylar blastema. Similarly, small spaces or clefts appeared between the anlage of the articular disc and the mandibular condyle that defined the initial formation of the inferior joint cavity.

Week 10: The organization of the inferior joint cavity was complete although crossed by a few tracts of connective tissue. There was still no sign of the superior joint cavity. The condylar cartilage had a conical shape and was surrounded by intramembranous ossification. The base of the condylar cartilage corresponded to the joint region and its vertex was placed next to the future mandibular foramen. In the posterior joint region, intramembranous ossification of the zygomatic process of the squamous part of the temporal bone was observed extending along the vertical part of the squamous region.

Week 11: The organization of the superior joint cavity began between the zygomatic process of the squamous part of the temporal bone and the articular disc. The articular surface of the squamous part of the temporal bone had a flat surface. The joint capsule was situated between the zygomatic process of the squamous part of the temporal bone and the condyle and was attached to the external part of the articular disc. In the external portion of the condylar cartilage, adjacent to the insertion of the articular disc, an invagination of mesenchymal cells was observed¹².

Weeks 12 to 17: During this period the organization of the temporomandibular joint system was complete and five events were noticed. During week 12, there were no significant changes in the joint surfaces. The joint cavities were clearly defined. By week 13 the joint surface of the squamous part of the temporal bone had acquired a concave morphology. After week 14 there was a clear reduction in the volume of Meckel's cartilage. During week 16 the narrow central portion of the articular disc appears avascular although small vessels can be observed on the peripheral portions. Vascular canals can be seen on the external part of the condylar cartilage. During week 17 there was a clear endochondral ossification of the anterior portion of the condyle is seen. In neonates cartilage layer constitutes a large part of the condyle & the outer most layer is richly vascularised. Condylar cartilage gradually decreases in thickness & by 5-6 years of age it constitutes only a thin zone on the top of the condyle. In neonates, the temporal component is

flat and lined by vascularized connective tissue, but, by the age of 3 years, the articular layer becomes avascular and contains few cells. A fibrocartilage layer is lacking in the fossa but is present on the articular eminence. At birth, the TMJ lies almost in line with the occlusal plane. Continued postnatal growth is largely dependent on the normal relationship of bone, muscles, and teeth. The condyle contributes to the continuing growth of the ramus in a posterosuperior direction until growth ceases and the joint is then positioned superior to the occlusal plane.

Condylar Fibrocartilage: The fibrocartilage of the growing mandibular condyle consists of several distinct zones, each with a characteristic organization and alignment of collagen fibrils. The fibrils in the articular zone are arranged in densely packed sheets running parallel to the articular surface.¹⁶ This layer passively adapts to the underlying tissue layers. The next layer, the fibrocartilaginous zone, contains dense, fibrous connective tissue in which the fibrils are organized in bundles with random orientation. The bundles in the calcified cartilaginous zone are also randomly oriented, although those just adjacent to the subchondral bone have a radial orientation.

Articular Disc: A concentration of mesenchymal cells between the developing temporal bone and mandibular condyle produces the articular disc, the capsule of the TMJ, and the lateral pterygoid muscle. The embryonic disc is vascularized until it becomes loaded by jaw movements in utero. At birth, the disc is flat on its superior surface because the articular eminence has not yet developed.¹⁸ By the time the primary teeth occlude, the temporal component develops its curvature, and the disc becomes biconcave. After approximately 20 years of jaw function, the compressed central part of the disc changes into fibrocartilage.

Temporal Component: The articular eminence of the TMJ, as a mechanical constraint, dictates the movement of the condyle-disc complex. It shows a symmetric growth pattern and grows rapidly, attaining almost half of its adult form by the age of 2 years. Bone deposition along the articular eminence leads to a steeper slope. This process occurs parallel to eruption of the primary incisors, the permanent first molars, and the permanent second molars. The eminence increases in height rapidly until the age of 7 years; growth almost ceases during the period of the mixed dentition, and the eminence acquires its final height by the age of 20 years.

Adaptive Remodeling: After growth has stopped, structural changes continue to occur in both the soft and the mineralized tissues of the joint. Such modeling changes reflect the functional demands on the joint structures. Modeling is characterized by slow morphologic changes under physiologic circumstances that permit adaptation of the shape of the joint components and, in this way, maintain joint function¹⁹.

Control of Growth & Adaptation: Overall shape of the mandible is genetically determined, But there are many variations in the size and shape of the components of the TMJ and their relationship to each other. These developmental variations likely reflect variations in function, both of the mandible itself and of its surrounding structures. This also applies to the period after growth has ceased and skeletal maturation has been achieved. The process of modeling continues so that adaptation in structure can meet changing functional demands.

Aging: The joint is believed to stop growing by 20 yrs but continues adaptation. Factors affecting the joint are: Aging and its accompanying decrease in muscle activity. Loss of teeth, changes in occlusion and attrition of teeth, which affects condylar morphology¹⁷

In edentulous mandible, following changes occur in different areas of joint

Condylar head decrease in convexity, decrease in condylar height. In extreme cases, drastic changes may produce disappearance of condyle.

Glenoid fossa and articular eminence- With age, flattening of the articular fossa and decrease in prominence of the articular eminence occurs. There is decrease in the vertical dimension of the glenoid fossa, lateral movement changes with resorption and flattening of the sigmoid curve²⁰.

CONCLUSION

The complex biologic, physiologic and psychologic factors involved in the craniomandibular articulation make the TMJ research and its interpretation more than a little difficult. TMDs comprise a substantial health problem and represent a major cause of non-dental pain in the orofacial region with so many controversies revolving around this topic, it is an area with scope for research. Extra care to be taken evaluating this area, to prevent any post treatment complications. More

studies regarding development and etiology of TMD are warranted. To be able to predict future development and demand for treatment of TMD would lead to improved diagnostic and treatment approaches.

Denture-Adhesives: A Brief Overview of the Indian Scenario

Debarchita Sarangi

Assistant Professor, Department of Prosthodontics and Crown & Bridge, Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Patient satisfaction and success of treatment depends on various factors such as technique of the dentist, not only in clinical laboratory aspects, but also on interaction with patient and patient response. The retention, stability and support of the prostheses fabricated are the main criteria determining its success. Unfortunately, every patient's condition is unique and may or may not ideal to attain these parameters. Thus, denture-adhesives have been used as an adjunct to treatment. Identification of patients requiring use of denture-adhesives is done by the dentist/prosthodontists. Dentists and patients are educated regarding its use. Though, negative attitude towards its use persists as it may mask the clinical and technical errors, use of denture adhesives have never seen their end. Various functions such as chewing ability, stability, comfort, etc are improved which lead to increased patient satisfaction. Instructions regarding proper use should be explained to the patient. This article is a review of types, uses, advantages, limitations and availability of various types of Denture adhesives in the Indian set-up.

Keywords: *Denture adhesives, Fixatives, Adherents, Retention, Stability*

INTRODUCTION

An adhesive is a material, non-metallic in nature, used to bind two separate items together, after application on one or both the binding surfaces. According to GPT (9), denture adhesive is a material used to adhere a denture to the oral mucosa¹. US-FDA defines denture adhesives as pastes, powders or adhesive pads that may be placed in/on dentures to help them stay in place.²

Denture adhesives can enhance aspects of performance of complete well-fitting dentures as well as provide increased comfort, confidence, and satisfaction with dentures. In situations where it is not possible to obtain the desirable retention, adhesives can be used to increase retention and stability of complete dentures.³ Denture adhesives, also referred to as adherents or fixatives, have long been recognized by denture wearers as a useful adjunct to denture retention, stability, and function. Although denture adhesives were first used in the late eighteenth century, they were not mentioned in the dental literature until 1935, when the American Dental Association, Council on Dental Materials, Instruments and Equipment, described them as nonmedical. The earliest patent issued for a denture adhesive dates back to 1913, with others following in the 1920s and 1930s.^{4,5}

“The use of denture adhesives, no-doubt improves certain functions, but there are reports of damage to supporting structure in prolonged uses. The dentist who prescribes denture-adhesives should be completely aware of its pros and cons so that the patient be instructed regarding its judicious use.

Composition of Denture-Adhesives And Their Function: Denture adhesives are composed of three types of components. They are Adhesives, anti-microbials and other additional agents^{4,5}

Table 1: Groups of Constituents

Group 1	Adhesives
Group 2	Anti-microbials
Group 3	Additives, Plasticizing and Wetting agents ⁴

Table 2: Types of Adhesive agent

Natural	Synthetic
Cellulose	Polymethyl vinyl ether–maleic anhydride (PVM-MA/Gangtrez)- long acting – PVM-MA with divalent salts of sodium, calcium & zinc.

Conted...

Hydroxy methyl cellulose	Combination of CMC & divalent salts of PVM-MA.
Sodium Carboxymethyl cellulose	Polyvinylpyrrolidone (povidone)
Karaya gum, 5. Tragacanth, 6. Acacia Pectin , 8.Gelatin	

Table 3: Other components

Type of Component	Constituent
Anti-microbials : Group 2 agents	hexachlorophene, sodium tetraborate, sodium borate, and ethanol.
Binding agent- Group 3 agents	Petrolatum, mineral oil, polyethylene
Anti-clumping agents : Group 3 agents	calcium stearate , silicone dioxide
Flavouring agents : Group 3 agents	menthol, oil of wintergreen, oil of peppermint
Preservatives : Group 3 agents	methyl paraben, poly paraben
Plasticizing agents , Coloring agents: Group 3 agents	

Mechanism of Action and Application: Denture adhesives work by increasing the interfacial forces in between the tissue surface of the denture and basal seat area .The viscosity of saliva is increased in between these two layers such that the air bubbles are eliminated .The particles of the adhesive increase the volume by 50-150 % due to their hydrophilic nature, thus justifying the whole mechanism of adhesion as force required to separate the two surfaces become difficult . Constituents like PVM-MA zinc provide even greater cohesive strength for longer durations as strong covalent bond develops due to the divalent zinc cation present in them.⁶

Available Forms: These are available in insoluble forms and soluble forms. The soluble ones come in the form of pastes, powders and creams. Wafers and pads are the insoluble forms. Anti-clumping agents and binding agents are found in creams and pastes, but not in powders.^{7,8,9}

Commercially Available Denture-Adhesives In India:

Powder: Fixon by ICPA health Products Ltd; Y-dent’s Denti-ro by MDM Corporation; Fittydent Powder by Dr. Reddy’s

Cream/Paste: Denofit by Global Dent Aids Pvt Ltd.; Fittydent Cream by Dr. Reddy’s ; Super Poligrip by Polident ; Denture fit by Pearl white

Wafer: Sea-bond Denture- adhesive wafers by Sea-bon

Strips: Secure Denture Adhesive Comfort Strips among all the above, Fixon by ICPA health Products Ltd, Denofit by Global Dent Aids Pvt Ltd , Denofit by Global Dent Aids Pvt Ltd.are the most commonly used in practice as they are affordable and economical.

Ideal Requirements: Denture adhesives should have the following properties:^{4,9,10}

1. Non-irritant
2. Non-toxic
3. Odorless and tasteless or should be neutral to taste
4. Bio-compatible
5. Should retain adhesiveness for 12-16 hours
6. Should not promote growth of oral microflora
7. Should provide adequate cohesion and adhesion for comfort of the patient, retention of denture and stability of denture in all functional activities such as chewing,speech, smiling and yawning.
8. Should be available in easily applicable forms like powder,cream,pastes, etc.
9. Should be conveniently usable by patient.

Advantages:

1. Provide retention , stability to denture in function
2. Patient becomes more confident while using the denture.
3. Sometimes, denture adhesives(insoluble) also function as relining material.
4. Provide cushioning effect
5. Prevent food materials from collecting beneath the denture surface
6. Distribute occlusal forces on the denture-bearing tissues, thus reducing pressure points.
7. Improved incisal ability.^{6,10,11}

Disadvantages: Dentures when placed on basal seat areas allow lateral movement. But, use of denture adhesives do not allow such movement. Thus, these

masks the real needs of the patient which may actually require the dentist's intervention.⁶

Indications:^{6,9,11}

1. Jaw relation: Denture adhesives can be used to stabilize the denture-bases during jaw-relation.
2. Wax Trial: The accuracy of the denture trial improves with use of denture-adhesives. This also reduces patient's apprehension for the denture fit during the insertion stage.
3. Patients with compromised basal support: Denture adhesives increases their denture adaptability.
4. Immediate dentures: Healing of the surgical site may lead to loose dentures. Therefore, denture-adhesive acts as an adjunct to soft-liner.
5. Reduction of tissue irritation: Denture adhesives reduce discomfort caused by tissue -irritation for patients with sensitive oral mucosa.
6. Patients with systemic diseases: Patients with dry-mouth, Parkinson's disease, Alzheimer's disease benefit with use of denture adhesive.
7. Prosthesis for Maxillo-facial defects: Denture adhesives act as a retaining aid for large defects.
8. Administration of drug therapy: It provides psychological security for people who socialize frequently and have public appearance.

Contra-Indications:

1. Allergy to any component of denture adhesives
2. Ill-fitting dentures
3. Improper hygiene maintenance of old-denture
4. Fractured dentures
5. Excessive bone-loss

Effects of Improper Usage: There are various problems that arise due to imprudent adhesive use.^{12,13,14} They are listed as follows:

1. Freeway space reduction
2. Resorption of residual ridge
3. Gag reflex
4. Mucosa erosion
5. Constipation due to prolonged use

6. Micro-organisms growth including Candida infections
7. Allergic reactions to mucosa.

Denture-adhesives have progressed from zinc-containing to zinc-free formulations, with time, to prevent detrimental effects of zinc on denture-wearers using denture-adhesives.^{12,14}

All the above are associated with prolonged usage, unacceptable hygiene maintenance protocol and irregular dental visits even when intervention is necessary.

Application Techniques: Application technique varies according to form of denture-adhesive being used. They are applied to the tissue surface of the denture. Cleaning the tissue surface of any kind of residue before application is mandatory. For powder form of denture-adhesive, the tissue surface should be wet. For cream or paste form, wet surface may or may not be required. Reading the manufacturer's instruction is a must before application.¹³

CONCLUSION

Denture adhesives can be advised as a supplement to a well-fitting denture. Since, the patient or the patient's attendant must use it at home, proper instruction regarding the usage of the prescribed denture-adhesive. Patient should also be made aware regarding the importance oral hygiene maintenance and regular dental visits. Though, denture performance and patient confidence is enhanced with the use of denture-adhesives, it should not be used to cater for gross denture inadequacies. Patient should also be cautioned regarding misuse and the importance of intervention by professional as per need.

Dentist Role in Child Abuse and Neglect

Sudeep Sreepad Iyer¹, Antarmayee Panigrahi²

¹Professor, ²Reader, PhD Scholar, Department of Pedodontics and Preventive Dentistry, Institute of Dental Sciences, Siksha O Anusandhan (Deemed to be University), Bhubaneswar, India

ABSTRACT

Child abuse is a globally prevalent phenomenon presenting as state of emotional, physical, educational, sexual and financial phenomenon towards child below eighteen years of age. However, in our country there is still very limited understanding of extent and needed approach towards identifying, reporting and treating such cases. As dentists we come across many usual presentation of this abuse but fail to understand and correlate. Thus with increasing awareness it also becomes imperative for dentists to realize to identify and report thereby assisting in the struggle against child abuse.

Keywords: *child abuse, neglect, dentists*

INTRODUCTION

Violence towards children has been noted between cultures and at different times within the same culture since early civilization. Infanticide has been documented in almost every culture, so that it can almost be considered a universal phenomenon. Ritualistic killing, maiming and severe punishing of children in an attempt to educate them, exploit them or rid them of evil spirits has been reported since early biblical times and ritualistic surgery or mutilation of children has been recorded as part of religious and ethnic traditions.¹

With the advent of urbanization and technological advancement in the 18th century, more economic value was placed upon the child by society and they were often used as a cheap source of labor. Harsh punishments for relatively minor mistakes were accepted²

In the 19th century, Western societies become more protective towards children and it gradually improved. However, the mortality rate remained high, and the isolated death of a child probably did not arouse suspicious.^{1,3}

In 1946, Caffey, described six infants suffering from chronic sub dural hematomas who were first seen with multiple treatments in their long bones. It was in this classic article that some of the common features of child abuse were first described.⁴

In 1962, Kempe et al published his paper “The Battered Child Syndrome” where the full impact of the physical maltreatment of children was brought to the attention of the medical community and subsequently the general public.⁵

The “Battered–child–Syndrome” with now called as “Non accidental injury” (NAI) had such and profound effect upon the professions and the public that within a few years the majority of states of USA had introduced laws which made it mandatory for physicians, dentists and other health related professionals to report suspected cases.⁶

Terminology:^{7,8} *Child Abuse* is defined as the non-accidental physical injury, minimal or fatal, inflicted upon children by persons caring for them (Selwyn et al 1985).

Battered Baby: Is a child who shows clinical or radiographic evidence of lesions that are frequently

multiple and involve mainly the head, soft tissue, the long bones, and the thoracic cage and that cannot be unequivocally explained (Selwyn 1985)

Battered-Child-Syndrome: The syndrome should be considered in any child exhibiting evidence of treatments of any long bone, sub dural hematomas, failure to thrive, soft tissue swelling or skin bruising. (Henry Kempe 1962).

Neglected Child: Is one who shows evidence of physical or mental health primarily due to failure on the part of the parent or care takers to provide adequately for the child's needs.

PREVALENCE

Children of all age are subjected to physical abuse, but the majority of cases occurs in younger children and often remains unnoticed in general. This is because they are more vulnerable and unable to seek help elsewhere. The number of boys subjected to violence slightly exceeds that of girls, and first born children are more often affected. Within a family; it is common for just one of the children to be abused and the others not.^{1,9}

Etiology:^{2,9} Varied etiology has been proposed leading to child abuse and neglect like:

1. Personality traits of the parents/abusing adults.
2. Child's characteristics and the environment conditions.
3. Poor socio-economic groups.
4. Often the mother of affected child maybe divorced or single.
5. Contributing factors- Alcohol, Drug Abuse, Poverty, Unemployment, Martial problem, Handicapped child, Unwanted pregnancy, Fail to attain the expectation of parents.

Types of Child Abuse¹⁰⁻¹²

1. Physical abuse – (31.8%) It is defined as injuries inflicted on a person less than 18 years of age by a caretaker.
2. Educational abuse (26.3%) - Exists when a parent or caretaker intentionally keeps the child at home or fails to enroll the child in school.
3. Emotional abuse which accounts for 23.3% Defined as the continual scapegoating and

rejection of a child by parents, caretakers, or teachers. Others forms include psychological terrorism, abnormal child rearing practices by a severely disturbed parent or caretaker or the close confinement of a child.

4. Sexual abuse (6.8%)- Child pornography, rape, molestation incest and child prostitution. Also include contacts or interactions between a child and an adult when the child is being used for sexual stimulation of the perpetrator or another person.
5. Failure to thrive (4.0%)- A child who is under weight and malnourished is Child fails to grow due to insufficient caloric intake and the parents are responsible for it.
- 6 Intentional drugging or poisoning : Administration of a harmful drug which is not indicated for normal use by a child.
7. Munchausen syndrome by proxy- Children who are victim of parentally fabricated or induced illness. Involves children who are too young (<6 years) to be aware of or able to tell others about this reception. Factitious signs and symptoms may includes bleeding from various sites, recurrent sepsis, from injecting contaminated fluids, chronic diarrhea from laxatives, fevers or skin rashes

Types of Child Neglect¹⁰⁻¹²

1. Emotional Neglect
2. Health care neglect including dental neglect: When a parent or caretaker ignores the treatment recommendations of a healthy professionals for the management of a treatable illness that a child has and that is becoming ware, HCN exits.
3. **Physical Neglect:** Defined as failure to care for a child according to accepted or appropriate standards. Example: Lack of personal hygiene. Inadequate clothing, diet or medical attention.
4. **Safety neglect:** Defined as gross lack of direct or indirect supervision of a child that result in an injury.
5. **Emotional neglect:** Include inadequate nurturance or affection is lack of "Mothering", knowingly "Permitted" mal adaptive behavior such as delinquency or substance abuse, or refusal

to allow needed remedial care for diagnosed emotional problems.

- 6. Dental Neglect:** Specific type of health care neglect. Dental neglect is “the failure by a parent or guardian to seek treatment for visually untreated caries, oral infection, and or oral pain, or failure of the parent or guardian to follow through treatment once informed that the above conditions exists”.

Abused Child-Identifying features are:¹³

1. Child is unduly afraid or passive (especially or his/her parents).
2. Child shows evidence of prolonged confinement.
3. There are evidence of repeated skin or other injuries
4. There has been inappropriate treatment of injuries by parents (Example in appropriate bandages or medications).
5. Child is undernourished and inappropriate intake food or drink
6. Child is wearing inappropriate dress for weather conditioning.
7. Child is aggressive, demanding or hyperactive.
8. Child is cranky or irritable or cries easily.
9. There is evidence of “Role reversal” (i.e., the child takes over the role of parent and tries to be protective or otherwise take care of the parents need).

The Abuser^{13, 14}

1. Poor self esteem, coping skills, and lifelines
2. Violent temper or outbursts, depressed and demanding
3. Unrealistic expectations of child’s behaviour
4. Inappropriate responses to the seriousness of the child’s condition (over reaching or under reaching, hostile).
5. Overly critical behaviour toward the child and never describing the child in +ve terms.
6. Reluctance to give the history of the accident or giving on unrealistic explanation.
7. Request for treatment long after the injury has occurred.

Diagnosis: The diagnosis is a difficult intellectual and emotional excursion and is most difficult tasks requiring time, experience and emotional energy. The aim of intervention is to diagnosis and cures the disordered parenting. In the 1970’s it was estimated that in USA 5% of abused children died and 35-30% sustained serious re-injury.^{13,15}

The Dentist and staff should be educated to get a visual impression and identify interaction of the child as they enters the reception room.

Seven Classic Indications to the Diagnosis^{16,17}

1. There is delay in seeking medical help
2. The account of the accident is not compatible with the injury observed.
3. The parents mood is abnormal, and tend to be more pre-occupied with their own problems, withdrawn or frightened.
4. The child may say something concerning the injury i.e. different to the parents story.

Common Sites to be Observed and Examined^{16,17}

1. Appear overly vigilant or display a ‘frozen watchfulness’ staring constantly. There are no spontaneous smiles and almost no eye contact.
2. The dentist should observe the child for lack of cleanliness, for small stature with respect to age, evidence of mal nutrition.
3. Over dressed children, should also be noted, long sleeves and high necked shirts or blouses during not summer may be worn to cover signs of physical abuse.
4. Face neck should be examined for peri-orbital ecchymosis, sclera hemorrhage, and ptosis, DNS, cigarette burn and hard slap marks.
5. A spoon or fork applied with enough force, for forceful feeding → treatment of anterior teeth, turn frenum.

Types of Oro-Facial Injuries^{18, 19, 20}

Bruising on the skin overlying bony prominences such as the forehead or cheekbone. Inflicted bruises occur at typical sites and/or fit recognizable patterns. Bruises on the ear are commonly due to being pinched or pulled by the ear and there will usually be a matching bruise on the posterior surface of the ear.

Bruises or cuts on the neck are almost always due to being choked or strangled by a human hand, cord. Accidents to this site are extremely rare and should be looked upon with suspicion. Bruising of the upper labial frenum of a young child can be produced by forcible bottle feeding and which may remain hidden unless the lip is carefully everted. Violent rubbing of the face; and may be accompanied by facial bruising /abrasions. A frenum tear is not uncommon in the young child who accidentally falls while learning to walk (generally between 8-18months) However, a frenum tear in a very young non-ambulatory patient (less than 1 year) or an older more stable child (2 years) should arouse one's suspicion as to the possibility of this injury being non-accidental.

Human Hand Marks: The human hand can leave various types of pressure bruises; grab markers or finger tip bruises, linear marks or finger edge bruises, linear marks or finger edge bruises, hand prints, slab marks and pinch marks. The most common types are grab marks or squeeze marks which leave oval shaped bruises that resemble finger prints. These linear bruises are due to the capillaries rupturing at the edge of the injury (between the striking fingers), as a result of being stretched and receiving a sudden influx of blood.

Abrasions and Lacerations: Penetrating injuries to the palate, vestibule and floor of the mouth can occur during forceful feeding of young infants; these are usually caused by the feeding utensil. Abrasions and lacerations on the face may be caused by a variety of objects, but are most commonly due to rings or finger nails on the inflicting hand and injuries are rarely confined to the orofacial structures.

Burns: Burns of the oral mucosa can be the result of forced ingestion of hot or caustic fluids in young children. Burns from hot solid objects applied to the face are usually without blister formation and the shape of the burn often resembles its agent. Cigarette burns give circular, punched out lesions of uniform size.

Bite Marks: Human bite marks are identified by their shape and size. The nature and location of the bite is likely to change with increasing age of the child. In infants, bite marks tend to be punitive and are often a response to soiling or crying. As a result, bite marks may appear any where; but they tend to be concentrated on the cheek, arm, shoulders, buttocks or genitalia. In childhood, bite marks tend to be less punitive and more a function of assault or defense. Sexually oriented bite marks occur more frequently in adolescent and adults.

The duration of bite mark is dependent on the force applied and the extent of tissue damage. Teeth marks that do not break the skin or visible up to 24 hours.

Dental Trauma: Trauma either to the primary or permanent dentition can be due to blunt trauma. A similar range of injuries to those found in accidental trauma is seen.

Eye Injuries: Most periorbital bruises involving one or both sides of the face. Ocular damage includes acute hyphema, dislocated lens, traumatic cataract and detached retina.

Bone Fractures: They may occur in almost any bone and may be single or multiple, clinically obvious, or occult and detectable only by radiography showing different stages of healing. Most fractures in physically abused children occur under the age of 3. In contrast, accidental fractures occur more commonly in children of school age.

Role of Dentist in the Management of Child Abuse^{13, 21}: The dental practitioner may be the first professional to suspect physical abuse as a result of injuries involving the orofacial structures. The aim of all professionals involved is to ensure the safety of child, help and counseling for the parents or care givers so that the abuse stops. A child with a severe injury is usually referred immediately to a hospital based consultant pediatrician. Where suspicious are aroused, the dentist should speak to the child's medical practitioner immediately and arrange for a medical examination within 24 hours. As far as possible, parents should accompany the child for the medical examination. If the parent is not available, the local child welfare department should be contacted.

Dental practitioners should ensure that their clinical records are completed immediately with illustrations of the size, position and type of injuries. Photographic documentation would be beneficial in this respect. These records may be referred to in any subsequent case conference or legal proceedings. Dental practitioners should not feel any guilt about referring children to a pediatrician or general medical practitioner. Because of the high frequency of intra oral and facial injuries, dental professionals comprise a very important part of the team necessary for identifying and importing child abuse and neglect.

CONCLUSION

The dental practitioners are in unique position to recognize the possibility of physical abuse and provide emergency dental treatment. Also role of dentist becomes crucial because it becomes mandatory to report and detailed documentation of the observed abuse and neglect. Thus need of hour suggest to take and correlate detailed history of all the dental, oral and perioral structures along with behavior assessment of the children, and accompanying parents or guardian. Also all the dentists and in specific pediatric dentist should be made well aware of emergency contact person or number to report any such doubtful cases.

Application of Virtual Reality in the Public Health

Amit Khatua¹, Snigdha Pattanaik²

¹Assistant Professor, School of Journalism and Communication, Jagaran Lake City University, Bhopal, Madhya Pradesh; ²Associate Professor, Dept. of Orthodontics, Institute of Dental Sciences, Siksha 'O' Anusandhan (Deemed to be University), Bhubaneswar, Odisha, India

ABSTRACT

Recent advancements in technology have made virtual reality an effective technique for the treatment of psychological disorders. VR consists of a three-dimensional, computer-generated environment viewed through a head-mounted display. This tool has opened new treatment possibilities of in the field of psychology. Creating various virtual environments for the treatment of different psychological disorders provides a patient friendly and cost effective treatment alternative. Virtual environments that have positive stimuli and are made in association with the medical personals provide a valuable tool for the treatment of public health related disorders.

Keywords: Anxiety Disorders, Information Technology, Stress Disorders, Virtual Reality.

INTRODUCTION

Virtual Reality is an application field in computer and information technology. It is defined as a sophisticated human-computer interface that creates an authentic simulation analogous to reality. The user interacts actively and in real time within an immersive computer-generated three-dimensional environment. The basic equipment consists either of a head-mounted display (HMD) or a computer automatic virtual environment (CAVE). In advanced VR systems, devices such as synchronized tracking systems, earphones, gesture-sensing gloves, scent machines, and haptic-feedback devices are employed in order to enhance the liveliness of Virtual Environments¹.

Especially tracking devices that enable to run user's real-world body movements consistently in the Virtual Environment (VE) and the incorporation of sound effects relating to the user's position in a VE, are of particular importance for the virtual experience. However, vital

to the success of VR systems is the credibility of the perceived (virtual) reality, called "sense of presence"².

Virtual reality (VR) is a new mode in the field of human-computer interaction where Individuals are actively involved in a computer-generated virtual environment (VE) in form of operating different devices and performing tasks. VR provides the opportunity to simulate different and difficult real-world environments and situations. As a result VR-based therapy serves as a substitute for psychotherapies requiring contact with real-world stimuli since exposure in vivo has become apparent to be an insurmountable obstacle for some individuals³. This therapy has been reported to be highly cost effective and successful mode of treatment when compared to the gold-standard therapy in vivo therapy.

The effectiveness of VR-based therapy has been recorded for various psychological conditions like variety of anxiety disorders, specific phobias and post-traumatic stress disorder.

The therapeutic approach of VR based therapy is based on exclusive Cognitive Behavioral Therapy (CBT). CBT-based exposure in vivo is the most frequently applied psychotherapeutic approach amongst all anxiety disorders. Characteristic is the systematic exposure to an external or internal feared stimuli that leads on to habituation and, eventually, to extinction

Bhubaneswar -751003, Odisha, India

of the pathological behavior. The underlying principle is rooted in the model of emotional processing of fear. Based on the assumption that fear settles down in memory structures that pave the way for fear behavior, and that change occurs by altering these structures⁴.

Systematic desensitization for the decrease of pathological fear can be done in various steps. At first, the fear network must be activated through exposure to the anxiety-provoking stimulus. In the next step, concurrently cognitive and affective new information needs to be integrated into the original memory structure, in order to achieve an emotional change and thereby reducing fear behavior. In particular, the fear eases through prolonged or repeated exposures, causing its full disappearance. Cognitive behavioural therapy assisted by VR devices can be used in treating anxiety disorders, as it can substitute real stimuli or situations⁵.

VR-based therapy only serves as an intermediate stage before subjecting the person to the real fear-evoking stimuli or in vivo therapy. VR-based therapy is similar to the in vivo therapies during the initial sessions which may range from psycho-educational sessions that may be composed of an introduction in relaxation training and of explaining the rationales behind the therapy, to trauma interview and training in breathing techniques, to anxiety management techniques, thought stop technique, and cognitive restructuring.

Virtual Reality-Based Therapy in different psychological disorders: The evidence for VR in psychotherapy has been documented widely in the field of anxiety disorders. In these type of situations though there is lack of real danger, yet the individuals feel a disproportionate fear followed by avoidance of a situation or a specific object.

Agoraphobia: Panic disorder is diagnosed if a panic attack, including symptoms such as sweating, palpitations, trembling, nausea, derealization and depersonalization, results in consistent concern about having additional attacks, worries about its consequences or behavioral changes. Persons suffering from panic disorder frequently develop agoraphobic avoidance behaviors.

Agoraphobia refers to anxiety about being in places or situations from which escape might be difficult or in which help may not be available in case of having an unexpected panic attack, such as being in a crowd, on a

bridge, train or the like. Therefore, agoraphobia often has to be included in the treatment of panic disorder as well⁶.

Exposure to anxiety evoking situations is considered to be highly prolific in treating agoraphobic avoidance behavior. However, the complexity of agoraphobia combined with panic disorder calls for focus on both agoraphobic avoidance behavior and panic, which can be addressed through VR-based therapy by creating VEs such as an airport building and a plane, a square and a street, or an elevator to achieve greater clinical significance⁷.

Arachnophobia: Arachnophobia is categorized within the group of zoophobias and is characterized by a persistent fear of spiders, an immediate anxiety response to exposure to a spider, and avoidance of spiders. The category of “bugs, mice, snakes or bats”, which includes spiders, accounts for about 40% of specific phobias. Approximately 3.5 to 6.1% of the general population suffers from arachnophobia, whereof the majority is constituted by women. Even though most arachnophobic persons recognize that their fear is unreasonable, daily life can be restrained.

Garcia-Palacios, Hoffman, Carlin, Furness III, and Botella were the first authors who compared the outcomes of a controlled study concerning spider phobia. VRbased therapy produced clinically and statistically improvements on all objective and subjective tests, whereas the data of the control group remained unchanged across all measures^{8,9}.

Aviophobia: Fear of Flying: Fear of flying, or aviophobia, is characterized by an intense fear of flying that often results in flight avoidance or experiencing substantial distress while flying. aviophobia affects 10-20% of the general population and 20% of airline passengers consume alcohol or sedatives to deal with their fear of flying. Most persons suffering from acrophobia fear a plane crash, while some fear being closed in and therefore often meet the DSM-IV criteria for claustrophobia. Further fears concern experiencing a panic attack and not being able to escape the situation or get medical attention, complying with the concept of panic disorder with agoraphobia, or a general fear of heights. Therefore, co-morbidity with other anxiety disorders occurs very frequently¹⁰.

The use of VR applications in the treatment of aviophobia could be advantageous to an exposure in-vivo

because financial and logistical expenses are essentially lower. Furthermore, the privacy and confidentiality of a VR exposure in contrast to a regular flight should be emphasized.

The first RCT in aviophobia traces back to Rothbaum et al. They compared the effectiveness of VR exposure and exposure in vivo against a control group. The participants' self-reports revealed virtually identical outcomes in the two forms of therapy, and superiority with respect to the control group¹¹.

Acrophobia: People suffering from fear of heights experience severe impairments, as they have to avoid a number of places such as elevators, planes, and bridges. Even offices and flats in high buildings may pose an insurmountable obstacle.

The VE which may replicate such environment like a multi-storey mall with escalators and balustrades, a fire escape, and a rooftop garden can be used in treatment of such people which is as effective as exposure in vivo¹².

Social Phobia: Social phobia is defined as an unreasonable or excessive fear of social situations and the interaction with other people that automatically brings on feelings of self-consciousness, judgment, evaluation or inferiority. Symptoms of social phobia include intense fear, blushing, sweating, a dry mouth, trembling, a racing heart and shortness of breath. There are two subtypes of social phobia: specific social phobia that is limited to a small number of fears inducing situations, and generalized social phobia, that involves almost all social situations. Situations that may evoke fear include speaking in public, establishing contacts, protecting one's interests and being under scrutiny. Usually, persons suffering from social phobia are worried that their fear is being noticed by others¹³.

The effectiveness of VR treatment of social phobia has been compared with cognitive-behavioral group therapy by Roy et al which showed similar clinically and statistically significant improvement in both the groups. Several studies also suggested similar results on the effectiveness of virtual environments in treating public speaking anxiety¹⁴.

Obsessive-compulsive disorder: Obsessive-compulsive disorder (OCD) is a debilitating mental disorder that is characterized by either obsessions, compulsions, or both. According to the DSM-IV, obsessions are defined

as recurrent and persistent thoughts, impulses, or images that may cause anxiety, including the obsession of contamination, need for symmetry or aggression. Compulsions refer to repetitive behaviors, such as hand washing, ordering, and checking, or mental acts such as praying, counting, or repeating words silently, that are performed to respond to an obsession or to rules in order to reduce distress. Lifetime prevalence rates are estimated about 2% worldwide.

Preliminary data concerning the use of VR in the treatment of OCD is available. A South Korean research group presented first results of VR exposure therapy of OCD which showed that VR is a potential device for the assessment and treatment of persons with symptoms of arranging compulsion¹⁵.

Post-Traumatic Stress Disorder: Posttraumatic stress disorder (PTSD) is a serious condition that persons experiencing a traumatic event may suffer from. According to the ICD-10, the traumatic event needs to be exceptionally threatening or catastrophic and would distress most people. Such disasters can be either manmade, as it is the case in war, torture, or sexual abuse, or they can be natural disasters, such as earthquakes, accidents, or life-threatening diseases. Criteria for PTSD include intrusions such as flashbacks and repeating dreams, avoidance of situations similar to the traumatic event, loss of memory about certain aspects of the event, and symptoms of hyperarousal. Experiencing psychological distress right up to PTSD is common among military members who are constantly confronted with threatening situations¹⁶.

These patients avoid anxiety-provoking stimuli, but they need to be faced with those in order to achieve treatment success. However, due to its nature it is evident that in multitude cases exposure in vivo therapy is hardly feasible, as a rape victim cannot be faced with the perpetrator or a combat veteran cannot be sent to a war zone for the sake of therapy.

A published RCT included current military members with a diagnosis of combat related PTSD showed clinically significant change for the better in VR-based therapy¹⁷.

CONCLUSION

VR has proven to be advantageous in psychotherapy in various manners when compared with in-vivo psychotherapy. Though the VR therapy may cause

nauseous feeling in some people after the initial use, it provides more predictable environment which makes the participants willing to undergo the therapy. It also reduces the cost and times spend on the in-vivo therapy. VR-based therapy can also be performed within a standard session at safe and familiar surroundings. VR therapy also allows the therapist to focus on monitoring the patient's behavior, which facilitates the therapist to intervene adequately, while keeping the experimental variables under constant control engenders good internal and ecological validity.

Several studies show a lower dropout rates in VR-based therapy compared to the in-vivo. VR technology also allows the imaginative environments to be create thereby reducing the difficulties to imagine the anxiety-provoking stimulus or situation.

Internet of Things Applications in Agriculture: A Survey

Revathy S¹, Sathya Priya S¹

¹Department of Computer Science and Engineering, Hindustan Institute of Technology and Science, Chennai, India

ABSTRACT

Agricultural activity in India is considered to be the largest, as it feeds larger population. The application of Internet of Things (IoT) in Agriculture field is acting as an aid to the traditional farmers and inspired youths who are interested in agriculture by assisting them in Organic farming by solving several problems of the producers. The need of the hour is sustainable cultivation and Organic food production with technology support. This study aims at discussing the merits and demerits of the organic and conventional farming methods respectively. It also elaborates the deployment of different technologies like IoT, Cloud Computing and Image processing in various field of Agriculture. It also summarizes the methodologies of IoT applications like monitoring soil fertility, biological pest control, Crop cultivation, animal husbandry and smart irrigation.

Keywords: Agriculture, Conventional farming, Cloud Computing, Image Processing, Internet of things (IoT), and Organic farming.

INTRODUCTION

Conventional farming includes the use of the chemical and synthetic fertilizers and pesticides to promote plant growth and soil fertility. Pesticides are used by the farmers to control growth of the weeds, insects and pests and prevent the crops from damaging. However the residue of the pesticides remain in food causing many health hazards to the human.

All the human beings from new born to oldsters^[1] are unknowingly taking in food with pesticide residues, which leads to birth defects like Attention Deficit Hyperactivity Disorder (ADHD), Nervous system disorder, Reproduction deficiency, chronic illness like diabetes, and degenerative disease like cancer.

The pesticide residue persistence refers to duration of the pesticide stay in the environment. Persistent^[2] pesticides are non decomposable and they quickly accumulate in the organisms. Example of persistent pesticide is Poly Chlorinated Biphenyl (PCB), an industrial chemical which is used as a additive in paint. Non persistent pesticides are able to break quickly in the environment. Example of Non-persistent pesticides is insect repellents, which are used in the homes.

Organic farming^[3] is a system of agricultural production which relies on organic waste, animal manure and biological pest control. It avoids the

use of pesticides, synthetic and chemical fertilizers. Organic farming ensures health security to all the living organisms and enhances the nutritional value of the food and soil health. The organic farming is yet to bear fruit among the producers, due to the lack of technology support^[4] and ignorance of methodologies like Internet of Things (IoT), Cloud computing and Image Processing in agriculture. This survey summarizes the technology application of IoT in the agriculture and also elaborates the methodologies used^[5].

This paper is organized as follows. Section 2 covers the basics of IoT architecture. Section 3 describes the application of IoT in various agriculture. Section 4 covers the summarization of methodologies used in applications and finally conclusion in Section 5.

BASICS OF IOT ARCHITECTURE

The IoT is defined as network of internet connected objects, which are able to collect and exchange data using Sensors, with internet as a backbone.

Fig. 2.1: IoT stack

The figure 2.1 describes the IoT stack, where the thing/device refers to the sensors or hardware devices used like Arduino/Raspberry Pi to integrate with software stack. The Edge is used to establish a secure and robust connection with cloud or edge devices to collect and manage the device data. The Data processing and platform is used to store and analyze the sensor data and to construct decision support system. The app level of the stack is used to build and run applications. The developed application can be hosted as Application Platform as a Service (APaaS).

APPLICATIONS OF IOT IN AGRICULTURE

a. IoT based Smart Soil Monitoring and Irrigation:

This system ^[6] uses embedded technology which is used to monitor the soil content and behavior using different sensors. The three types of the sensors used in this system are pH sensor, humidity sensor and temperature sensor.

The pH sensor is used to measure the hydrogen-ion concentration in the soil and indicates whether soil contains acidity or alkalinity. The humidity sensor responds to humidity changes and measures the humidity level. It is easier to integrate the humidity sensor with the application. The temperature sensor is used to record the temperature level. The device used is Raspberry pi 2, Model B. The system also contains web camera which capture the still images of the crops to identify the weeds and video streaming of the motion captured.

It also reduces the difficulty of the farmer by suggesting the suitable crop for the soil condition. It also automates the irrigation process based upon humidity sensor values.

b. Wireless Mobile Robot for Smart Agriculture:

In this system ^[7], Wireless Sensor Robot is used to implement the Smart agriculture. The Wireless robot is equipped with Raspberry Pi 2 Model B controller and many sensors. The Robot is controlled using remote by give commands to move around the crop field. It has cameras to capture the insects or weeds in the crop. Based upon the moisture, humidity and temperature sensor level values, the robot will switch on/off the motor for irrigation. It also monitors and suggests nutrients for the crops.

The various types of sensors used in the wireless mobile robot are CO₂ sensor, Moisture sensor,

Thermo Hygro sensor, pH sensor, Humidity sensor, Ultra Violet (UV) sensor and Passive Infra Red (PIR) sensor.

- CO₂ sensor- monitors the gaseous carbondioxide level.
- Moisture sensor - monitor the soil moisture level.
- Thermo hygro sensor - measure the outdoor temperature and humidity.
- pH sensors-to measure the pH value of the soil and supply nutrients
- Humidity Sensors-used to measure the humidity and convert it to the voltage value.
- The UV Sensors -to measure the UV light and give the value as voltage.
- The Passive Infra Red (PIR) sensors are used to detect the warm bodied organisms in motion like birds and animals. This sensor is used to protect the crop from the mammals and birds using bird scarer circuit which exhibits sound to scare them when they come near the crops without harming them.

The wireless mobile robot is capable of controlling the essential parameters for the plant growth and health. It also reduces the cost of the laborers and provides effective monitoring with the accurate data^[8].

c. Plant Health Monitoring using Image Processing and IoT:

This system ^[9] is used to monitor the plant health and prevent it from diseases. It uses the IoT sensing network to collect the humidity, moisture and temperature data using sensors and Arduino UNO is used as a device controller. It uses JPEG camera to capture plant images at regular intervals and data is fed to SD card for further analysis. The morphological analysis is done for the captured images using MATLAB and results are recorded as histograms. The variation parameter in the results is used to detect, whether the plant is affected or not.

This new approach enhances the possibility of combining the IoT and Image processing in the field of agriculture. The collected data is communicated to the farmers using CDMA/GSM at regular intervals. These processes immensely help farmers as they cannot be in their field always and assist them with accurate problem identification in plant health^[10].

d. Pesticide Residue Detection using IoT: This IoT enabled Pesticide Residue (PR) Detection system [12] is used to detect the pesticide residue in fruit and vegetables. It uses Acetyl cholinesterase (AChE) bio sensor and IoT for this process.

The traditional pesticide residue analytical technique uses Liquid Chromatography (LC), Gas Chromatography (GC) and the combination of the both. Though these methods are good in quantitative analysis, they consume more time and more expensive.

The PR detection system contains four components,

1. Hypogynous Computer-which has AChE bio sensor to detect pesticide residue in vegetable and get the concentration of pesticide residue.
2. Epigynous Computer receives the detected information from hypogynous computer and stored it in the data base.
3. Epigynous computer integrate detection is used to generate and print the QR code. The same code is pasted on the corresponding vegetables.
4. The customers while buying vegetables scan the QR code in their mobile. The Scanned QR code retrieves pesticide residue concentration range of the vegetable.

The delivered experimental output is acquired for eight kinds of vegetables and fruits and found it to be stable and accurate. This system of PR detection is fast and inexpensive.

e. Remote Monitoring System (RMS) Using IoT: This system [10] provides Remote Monitoring to monitor the weather pattern and crop using IoT .It sends collected data as a alert to the farmers as Short Messaging Service(SMS) and advices with necessary action.

The RMS contains three layers

1. Perceptron Layer.
2. Network Layer.
3. Application Layer.

1. Perceptron Layer: The Perceptron layer contains Ubi-Sense mote (M), a generic sensor board with Temperature and Relative Humidity, Light-Intensity, Barometric Pressure and Buzzer sensors. The Ubi-Sense mote (M) collects the values from sensor, detects Proximity Infra Red (IR) LED and generates an alarm through Buzzer. It transmits the measured physical value from the Ubi-Sense mote over the network.

A web camera is used in perceptron layer to capture the image of the crop and monitor its health and prevents it from the diseases.

2. Network Layer: The network layer is used for the reliable transmission of the collected data in wireless network. It contains Ubi-mote and ZigBee Wireless IP Network Gateway (WINGZ) devices to control and effectively monitor the wireless network and IP network.

3. Application layer: The collected sensor information including the crop's images are gathered in the database. Once the data is gathered, comprehensive analysis is done and decision support is constructed. For example based upon the soil moisture the water sprinkler will be switched off or on.

This RMS system helps the farmers who are planting the same crop for centuries, but unaware of techniques to maintain and monitor it, during changing weather and soil conditions. This system assist them by providing alerts based upon the soil moisture and humidity which reduces their time and increases their crop productivity.

f. Cloud and IoT based Architecture for Precision Agriculture: This Cloud and IoT based model [11] is used to provide precision agriculture, where precision emphasizes on accuracy and correctness. This model contains three layers.

1. Front-end layer
2. Gateway layer
3. Back-end layer

1. Front-end layer: The front layer contains physical hardware or sensing nodes. The four modules of the front end layer are Micro controller, Environmental sensor or actuator, Interfacing circuits and wireless communication module.

The Microcontroller is responsible for collecting the information from the sensor nodes and sends it to the other layer in the architecture. The various sensors used are

- Air Temperature Sensor
- Air humidity Sensor
- Soil Moisture Sensor
- Leaf wetness Sensor
- Wind speed/direction Sensor

These sensors are used to monitor the soil moisture, humidity, volume of the rain, wind speed and direction. The interfacing circuits are used to convert signal to voltage values and wireless communication module is used to communicate the information to the nearest gateway for immediate action.

2. **Gateway Layer:** The Gateway is used to collect the information and store in the Cloud Virtual Machines (VM) to avoid data corruption. The VM can be migrated according to the user requirements.
3. **Back-end Layer:** The back-end layer is used facilitate the end user to access the sensed data with the integrated Application Programming Interfaces(APIs). The user can view the soil

moisture, humidity, wind direction, speed of the wind and amount of rainfall. The same can be visualized in graph format.

This system provides frame work for cloud based IoT precision agriculture. It also suggests efficient way of integrating cloud and IoT in Agricultural applications. It monitors soil moisture and humidity level to spray the water and fertilizer at the appropriate time. It also monitors the rainfall and wind speed to safeguard crop from damage.

SUMMARIZATION OF METHODOLOGIES

This section summarizes the sensors and functions of the different methodologies discussed in Section 3. It provides complete framework of the application used in Smart agriculture.

Table 4.1: Summarization Table

Sl. No.	System	Sensors	Functions
1.	IoT based Smart Soil Monitoring and Irrigation	<ul style="list-style-type: none"> ● pH Sensor ● Humidity Sensor ● Temperature Sensor 	<ul style="list-style-type: none"> ● Smart irrigation ● Soil monitoring
2.	Wireless Mobile Robot for Smart Agriculture	<ul style="list-style-type: none"> ● CO2 Sensor ● Moisture Sensor ● Thermo Hygro Sensor ● UV Sensor ● PIR Sensor 	<ul style="list-style-type: none"> ● Smart irrigation ● Soil monitoring ● Crop health maintenance. ● Prevention of crops from birds and animals
3.	Plant Health Monitoring using Image Processing and IoT	<ul style="list-style-type: none"> ● Humidity Sensor ● Moisture Sensor ● Temperature Sensor 	<ul style="list-style-type: none"> ● Soil monitoring ● Crop health maintenance.
4.	Pesticide Residue Detection using IoT	<ul style="list-style-type: none"> ● AChE Bio sensor 	<ul style="list-style-type: none"> ● Pesticide residue range detection using Bar code link.
5.	Remote Monitoring System(RMS) Using IoT	<ul style="list-style-type: none"> ● Ubi-Sense mote (M),a generic sensor 	<ul style="list-style-type: none"> ● Soil monitoring ● Crop health maintenance. ● SMS alerts.
6.	Cloud and IoT based Architecture for Precision Agriculture	<ul style="list-style-type: none"> ● Air Temperature sensor ● Air humidity Sensor ● Soil Moisture Sensor ● Leaf wetness Sensor ● Wind speed/direction Sensor ● Rain Volume Sensor 	<ul style="list-style-type: none"> ● Watering the plant ● Spraying fertilizers ● Rainfall monitoring and wind speed monitoring to safeguard crops.

CONCLUSION

This study aims at summarizing different framework where technologies like IoT, Cloud computing, Image Processing and their combination are deployed for effective smart agriculture. This study also outlined the various IoT based architectures and explained their implementation details. It also act as an aid for the researchers to contribute their innovation with technologies to make the organic farming easier and effective.

ABSTRACT

In the domain of medical imaging, Computer Tomography (CT), Magnetic Resonance Imaging (MRI), Positron Emission Tomography (PET), Single Photon Emission Computed Tomography (SPECT) and rest of the other modes of medical images which will reflect human data from different views. We use medical images in radiography for diagnosis, clinical observations and in many other treatments. In this paper, we explored diverse medical imaging methods utilized for diagnosis of breast cancer, includes X-Ray mammography, MRI etc. we analyzed their adequacy, points of interest and weaknesses for distinguishing beginning time of breast cancer. Further we studied image fusion, a technique to expel the redundant information from the original medical images along with medical factors UIOQ, fusion factor, entropy etc. Be that as it may, from visual point of view, images that are fused gives better results than fuzzy systems. We further extended by investigating the medical tools to increase the speed and to enhance the study and analysis of medical images. The tools simulate the complete work, done by the human observations with numerous predefined components integrated in the software. However, protection software's or medical tools are challenging issue, since the tools provide content are routine in nature. We concluded our paper with few image encryption mechanisms along with their functionality.

Keywords: Breast cancer detection, Image fusion, medical imaging tools, metrics, and protection

INTRODUCTION

In the domain of medical imaging, Computer Tomography (CT), Magnetic Resonance Imaging (MRI), Positron Emission Tomography (PET), Single Photon Emission^[1] Computed Tomography (SPECT) and rest of the other modes of medical images which will reflect human data from different views. CT will vividly reflect anatomical pattern of bone tissues. It gives complete cross-sectional views of all tissue types. SPECT can detect the tissues lesion and also organs and give details regarding flow of blood and body temperature. PET scanning shows the flow of blood, metabolism of oxygen and glucose in brain tissue^[2]. In clinical diagnosis and the treatment, the issues of comparison and synthesis of images such as CT-PET, MRI-PET and CT-MRI were frequently detected. To give much useful details for clinical diagnosis^[3], it is necessary to integrate that data from multiple source images.

As per American cancer society^[4], the breast cancer is said to be the second leading reason for mortality of

woman in USA [1]. In the year 2013, about 232,000 women are going to be diagnosed with the breast cancer and above 39K women would die with this disease. Hence the integrated effectiveness to find breast cancer with the mammography, ultrasound, and MRI is greater than the one of those imaging approaches. Whenever the diagnosis of breast cancer is done, the ultrasound or MRI controlled biopsy confirms cancer. Various choices for treatment are there to diagnosis the breast cancer. Mastectomy is the most common treatment among them that removes cancer related tissues and prevents it from spreading. Even though the breast mastectomy is performed, still breast cancer may repeat and be a cause to death. In this paper, we described about a brief study on medical images techniques along with the research gaps. In section 2, we presented the literature work in the medical study. Section 3, is a formal discussion of various medical imaging techniques. Section 4 is about image fusion with some mathematical metrics for medical images for comparison. Section 5 depicts the security cryptosystem and conclusion is presented in Section 6.

Related works: According to Solomon et. al. [5], the process of using computer paradigms to apply image processing over digital images is known as digital image processing. As a domain of digital signal processing, a digital image processing having more merits than analog image processing. Narendra et al. [6] recommended a procedure for encrypting the gray images with the use of secret key of 128-bits. Here an image is send into some active blocks and then those blocks are approved by the diffusion and few of substitution methods. Jose Luis et. al [7] introduced an electronic health record that allows the organized health images to be combined in between the accepted health users so that to improve the medical images value. Jani Anbarasi et al. [8] suggested a scheme of sharing multi images on the basis of interpolation polynomial. Akila et.al. [9], the performance of this approach is evaluated using a measure of improvement and the peak signal to a noise ratio. Rinki Pakshwar et. al. [10] Proposed some procedures related to image encryption to improve the security levels by providing chaotic border for encrypting an image. Joseph Cooley and Sean Smith introduced a keyboard video mouse that captures instant text redaction for producing exact text which recovers the patient's requirements and increases the influence of an end-user on the system.

Mammography: A mammography, or mammogram, is a breast related X-ray. It is an instrument of screening which is for finding and diagnosing breast cancer. Mammograms are the important element in earlier diagnosis of the breast cancer. Here in this paper work, we depict the merits and demerits of an X-ray mammography, ultrasound and MRI.

X-ray Mammography: X-ray Mammography is extensively used in modality of medical imaging for speed detection of a breast cancer. This model utilizes X-ray radiation with the frequency range of 30pHz to 30 eHz (3×10^{16} Hz to 3×10^{19} Hz). It results an image which is a projection of complete breast (3D to 2D). This method can find about 78% of confined breast cancer and the sensitivity is as much as 98% in women of 50 years ago with the fatty breasts. One in the key limitations of an X-ray mammography is its least sensitivity in case of denser breasts. In young women the mammograms of the denser breasts is common and

are hard for interpretation. These denser breasts are likely to cause breast cancer and the mammography's sensitivity lies between 30%-48%. One more drawback with this approach is when a patient is exposed to X-ray ionizing radiation may induce the cancer related cells. Additionally, the screening procedure of mammography is not comfortable sometimes because the compression of the breast is done between flat surfaces in order to enhance the image quality. The below figure shows the mammographic signs of breast cancer.

Fig. 1: Mammographic signs of breast cancer

Ultrasound Imaging: In ultrasound imaging, the breasts are irradiated with the help of sound waves via examining an array of transducers. The sound waves that range between 2 to 20 Mhz is lesser than the X – ray frequency range and so it is safer. The systems of Ultrasound imaging produce single plane images. Because of enhancements in transducers and in ultrasound technology, the current systems of ultrasound imaging can find the breast cancers upto 3mm of size. Earlier studies advise a predictive value about 98% to identify invasive lobular carcinoma when the both mammography and ultrasound imaging are applied for screening. In the other recent study, about 88% of the invasive lobular carcinomas are detected by a X-ray mammography was also found through ultrasound imaging. The outcomes of the recent studies shows that increase in the breast density, the rate of detecting breast cancer also develops through using ultrasound screening. The following figure displays how the ultra-sounding is done on breast.

Fig. 2: Ultrasound breast imaging

MRI: Magnetic Resonance Imaging (MRI) is an important instrument for local staging before surgery of breast cancer. Small invasive cancers and ductal carcinoma in situ can be found by using a breast MRI because of remarkable advancements in the temporal and spatial resolution as well. MRI is done in view of an ultrasound imaging. The American cancer society has updated its breast cancer imaging guidelines and now advocates the breast MRI for specific groups of high-risk women. When compared to the other techniques in imaging, MRI is comparatively costly and needs an intravenous injection of gadolinium that causes the nephrogenic systemic fibrosis development within a few patients with the impaired renal function. Hence the patient with the renal disease background is unable to proceed with breast MRI. Since this approach uses huge magnets it can't be performed for finding breast cancer in the patients. MRI imaging approaches consumes more time and yield images with blur. The misinterpreted MRI images need that the patients must undergo the similar process many times. From total imaging approaches that are being studied till now, MRI has greatest sensitivity in finding confined with breast carcinoma and could give important information related to it.

Image Fusion: The word fusion refers to a model for extracting the data attained from various domains. The main aim of this Image Fusion (IF) is to combine the complementary multisensor, multitemporal and/or multiview data to single new image which has quality of information. The IF approaches that we are having discussion here are broadly categorized into two are 1. Pixel or spatial level image fusion. 2. Image fusion based on transforms. When compared to feature or decision-level fusion, pixel-level fusion can preserve more actual data.

Performance Evaluation Metrics: Our fusion principle's performance is evaluated on the basis of the following metrics.

A. Universal image quality indexing (UIQI):

The combination of the three factors are; loss of Correlation (C), luminance distortion (LD), and contrast distortion (CD).

$$Q = C * LD * CD.$$

It is also being expressed in detailed as below:

$$Q = \frac{\sigma_{xy}}{(\sigma_x \sigma_y)} \cdot \frac{2\bar{xy}}{(x^2 + y^2)} \cdot \frac{2\sigma_x \sigma_y}{(\sigma_x^2 + \sigma_y^2)} \quad \dots(1)$$

The initial component measures a degree of correlation between the images x and y and the dynamic range of them is [-1, 1]. The next component measures how close the mean luminance is between x and y with values [0, 1]. And the third measures how similar the contrast of images is with values [0, 1].

B. Entropy: Entropy is the quantity of data resides in an image. Here P is probability of pixel.

$$E = \sum_{i=1}^N p(x_i) \log_2 p(x_i) \quad \dots(2)$$

C. Fusion Factor (FF): Fusion factor of a fused image F and the input images are A, B is evaluated as: $IF=IAF+IBF$. IAF and IBF are the mutual data between the images A and F, B and F respectively and is evaluated as:

$$I_{MN} = \sum_{xy} P_{MN}(x, y) \log \frac{(P_{MN}(x, y))}{(P_M(x)P_N(y))} \quad \dots(3)$$

Greatest value of FF represents that a fused image comprises a relevant data from the both images.

D. Fusion symmetry (FS): Fusion Symmetry (FS) is the representation of a degree of symmetry in data content of both images. The least value of FS denotes better symmetry in a fused image.

$$FS = abs\left(\frac{I_A F}{I_A F + I_B F} - 0.5\right) \quad \dots(4)$$

Medical Image Processing Tools: Medical imaging is a technique, and is considered as a process of generating visual representations of internal body for the purpose of clinical analysis and also for the medical intervention. This approach tries to reveal the internal structures covered by skin and as well as bones for diagnosing and treat the disease. This technique also forms a database of

general anatomy and physiology for making it happen to find abnormalities. The main aim of this paper is to concentrate on survey of the medical image processing instruments. Table 1 contains, few of the widely used processing tools for a medical image. Some of the medical images processing tools are ANTS, Camino, DTI-TK, FSL, Elastix, GIMIAS, ITK, and MITK and so on.

Table 1: List of widely used Tools

Tool	Description
ANTS	Advances Normalization Tools is made by Brian B. Avants and presently managed by Hands J. Johnson. An ANT has the ability to retrieve the data from a complex Dataset, and it is more useful for managing, interpreting and visualizing multidimensional data [27].
DTI-TK	DTI-TK is a spatial normalization and atlas construction toolkit reduced to evaluate white matter morphometry by using DTI information. This software was developed by Gary Zhang. In 2011, a publication has been published in NeuroImage. It ranked DTI-TK as the top-performing tool in its class [28].
GIMIAS	Graphical interface for medical image Analysis and Simulation (GIMIAS) is a workflow-oriented environment for solving advanced biomedical image computing and individualized simulation problems, which is extensible through the development of problem-specific plug-ins [29].
NiftyRec	NiftyRec is a software project developed at UCL London, which enables code for tomographic reconstruction [30].
Elastix	Elastix is open source software, based on the well-known Insight Segmentation and Registration Toolkit (ITK). The modular design of Elastix allows the user to quickly configure, test, and compare different registration methods for a specific application [31].

Security of the medical image cryptosystem: Figure 3 shows, an efficient technique for encrypting a medical image in real-time so that to secure the transmission of that medical image in a public network. Therefore the security of a medical image cryptosystem is secure over all types of security attacks. The patient’s details such as name, birth date, address and rest of the other necessary details are required for medical diagnosis. The security of a medical image becomes a mandatory issue whenever the details of patient are transmitted over a public network.

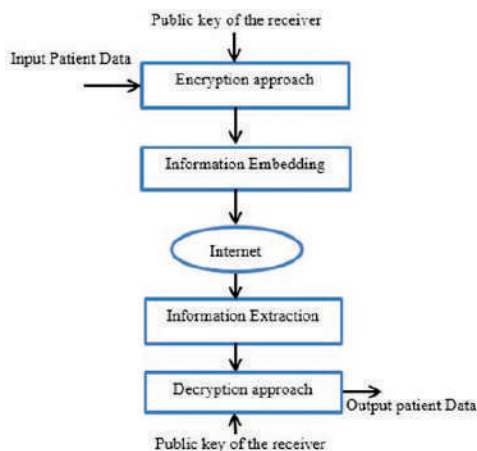

Fig. 3: Encryption and Decryption Technique

There exist different approaches like Encryption and Decryption, Information embedding and Information Extraction. The cryptography in the encryption and decryption is a mathematical procedure for performing encryption on information; therefore that data becomes cipher text which is not easily understandable and needs the usage of the key for transforming the data back to its previous form. Some of the instances of the encryption algorithms are Blowfish, AES RC4, RC5 and RC6. An encryption paradigm including with the key is utilized in data encryption and decryption as well. An information embedding is a scheme of hiding the data and its purpose is to perform encryption on images. Significantly it is used for embedding the extra text to some distortion, so that an original text and can be restored exactly even after the hidden text extraction. Data extraction is a process of extracting framed data instantly from semi-structured documents which are able to read by the machine. In many situations this task concerns the processing of human language messages similar to the processing of natural language. The table 2 provides the comparison of some research methods including with advantages and disadvantages of those methods. The primary objective of this comparison is to mention the security of the patient’s details during transmission.

Table 2: Some of the research methods along with their advantages and disadvantages

Method used	Advantages	Disadvantages
AIDM algorithm	No change in the size of a file.	Because of embedding image is invisible.
Situation based access control model.	It has the ability to state the patient's scenarios.	Maintains the mandatory process.
Pseudomization methodology	Secure against all types of attacks.	Consume more time.
(k, n) secret sharing scheme	Secure while sharing medical images.	Risk with hidden security.
Joint water marking encryption system.	Guarantees the priori and a posteriori security of medical images.	The process of encryption is slow.
Histogram shifting method.	Simple and the naked eye is unable to percept the difference.	Encoding is very sensitive.
Chaos-based medical image encryption scheme.	Improved efficiency.	Illegal access of medical details.
Interpolation technique	Less computational complexity.	Preserves the image quality.
Combination of cryptography and watermarking.	Data is highly secured.	Data values will lose.

CONCLUSION

In recent health issues, breast cancer is considered as one of the causes of women's death who has 40 and above years of age. We have to prevent it as early as possible for this we have two aspects are early identification and reduction of risks with that. Screening may find noninvasive cancers at early and enables to treat it before they become complex. When performing screening, mammography is playing a key role. The combination of the mammography, ultrasound and MRI will give us better outputs in finding the ductal carcinoma of in situ and invasive cancer. Nevertheless additional enhancements of such medical imaging approaches are required so that to recover the current limitations and to improve their breast cancer detection effectiveness. The prevailing tools of Medical Image Processing and suggest various MIP's to apply on analyzing process of a medical image. For providing better security levels the encryption techniques are studied and analyzed as well. Further, in our next work as continuation, we focus on the analysis of medical images of a specific category and will provide a good protection mechanism.

Impact of E-governance in Health Sector

M. Radhikaashree¹, Sowmya², Shruthiunnikrishnan², N. Kavipriya²

¹Associate Professor, Faculty of Management Studies, ²Assistant Professor Dr. MGR Educational and Research Institute, Chennai

ABSTRACT

“E-governance is the power provided to the government and citizens through information and communication technological solutions enabling interactivity via the internet and electronic mediums.” E-Governance is the application of IT for delivering government services, exchange of information, integration various stand-alone systems and services. The industry which is witnessing the major transformation and innovation is the Healthcare Industry. It is noted that the industry is growing at a steady pace and is expected to be US \$ 280 billion by 2020. The reasons for growth are found to be increase in earning capacity of the population and ever-growing elderly population. India has become a preferred medical destination by people from other countries gaining reputation globally by providing quality service at low cost. Private health care companies are providing better service than government. The hospitals are accredited and standard is maintained. In this article I would like to share my views on the role of e-governance in Health sector and benefits.

Keywords: Health care, e-governance current status, Benefits and Barriers.

INTRODUCTION

According to Verma (2013), “E-governance can be defined as an interaction between people and government through the use of technology^[1]. Generally it is referred to the use of ICT and other web- based technologies and communication for the improvement of service delivery from government to people.”

The Indian Healthcare Scenario: The key statistical indicators of health care sector is Infant mortality, longevity^[2], infectious disease rates and provision of health services which indicates that there is a major development work to be done in this sector. India’s healthcare allocation in budget has not kept pace with the economies and sectorial growth^[3]. The lack of proactive information leads to lack of adequate counseling. The collaboration with foreign medical institutes is leading to a better quality of healthcare being provided to economically weaker sections of society. India has become a preferred medical destination by people from other countries^[4]. Private healthcare hospitals play a major role in this regard as this sector is financially stronger and well managed^[5]. The impact of globalization and IT especially internet are said to have facilitated the formation of interlinking all the hospitals thereby keeping themselves updated in the latest technology in medical field^[6].

Healthcare And Medical Insurance Cards: The state governments of India allocate a huge part of its revenue for providing healthcare services to the public^[7], especially for the economically weaker sections of society. Globally, medical insurance and networked healthcare system has helped provide a safe and secure system beneficial to the general public^[8].

Computerization and networking of all the hospitals throughout India will make treatment procedures as well as billing and insurance a very convenient process^[9]. The use of insurance smart cards has brought about a revolution in the way government hospitals service to the citizen^[10]. Every patient treated across any medical care facility will have a card which will be checked for data by the hospital.

CHALLENGES

Although the Indian government has come up with various benefits to provide better access to public services, the desired outcomes are yet to be fully implemented. This is attributed to various customer facing and database maintaining which challenges the government. Front-end challenges relate to user-specific issues such as, high illiteracy levels, non-availability of user friendly interfaces, inadequate power supply in rural

areas, low broadband penetration and most importantly, lack of awareness of governance initiatives. On the other hand, back-end challenges relate to technical, process or human resource issues within the government. These issues include lack of systems integration within a department, lack of integration across government departments, limited knowledge of using computers at various levels of bureaucracy and deployment of technology without proper process re-engineering.

BARRIERS

The types of barriers are:

- Human Barriers
- Financial Barriers
- Legal and Regulatory Barriers
- Organizational Barriers
- Technical Barriers
- Professional Barriers

Human Barriers is the lack of awareness of the importance and benefits of using EMRs. The solution is improving the awareness of the importance and benefits of using EMRs by focusing on the topic through a multi-phase approach. Starting from the level of medical schools and colleges - the undergraduate level - and through different levels of post-graduate medical education

Financial Barriers is caused by high operation and maintenance costs of EMRs. The solution is designing the annual budgets of the hospitals to capacitate the high operation and maintenance costs of EMRs, which should be a part of the regular expenses of operations and not a burden on the hospital resources, by being unscheduled or unplanned

Legal and Regulatory Barriers is caused by lack of policies that govern EMRs on hospitals and lack of laws or legislation that govern EMRs on national level. Health information can be easily accessed. The solution is that the Ministry of health should start developing rules and regulations - on the national level - for the use of EMRs. In parallel with that, hospitals should start developing their own policies and procedures that control the use of data, information and EMRs internally, including signing privacy and confidentiality agreements and consents.

Organizational Barriers is caused by workflow needs redesign to match with EMRs. The solution is to redesign their medical and administrative workflow to match with EMRs specifications. This adaptation is important for the successful implementation

Technical Barriers is caused due to lack of guidelines for using EMR. The solution is to ensure that HIS and EMRs vendors and commercial providers are supplying hospitals with the proper system documentations, user manuals and guidelines for using and troubleshooting EMRs

Professional Barriers is caused due to lack of motivation to learn and train on using EMRs. The solution is improving motivation of healthcare professionals to learn and train on using EMRs by providing them with direct and indirect incentives, including overtime payments, bonuses and rewards for the hospital sections and departments successfully implementing EMRs. Departments that achieved well should also be recognized

CONCLUSION

There are various challenges for the implementation of e-governance in India. The challenges faced are low literacy, lack of awareness, low broadband penetration, lack of system integration etc. A visionary leader is required to implement the e-government and its related policies in India. To attain the vision the environment need to be cultivated so that the challenges are overcome India has number of award winning e-governance projects. Therefore we can say that e-Governance is the key to the "Good Governance" for the developing countries like India to minimize corruption, provides efficient and effective or quality services to their citizens.

The Impact on Emotional Intelligence among Lecturers Working in University

S. Joyce¹, R. Magesh²

¹Asst. Professor, Research Scholar, Department of Management Studies, Sathyabama Institute of Science and Technology, Chennai, India; ²Associate Professor, Department of Management Studies, Anna University, Chennai, India

ABSTRACT

The aim of this research paper was to investigate, the impact of emotional intelligence (EI) on Organizational Commitment and Job Satisfaction. This study considers emotional intelligence as the effect of these dimensions on job satisfaction and Organizational Commitment though there are many dimensions in previous research proven. In Chennai District Environment the Lecturers working in Arts College Facing a Challenge towards the Emotional Stress in their work place. A sample of 600 lecturers had been taken which comprised of 300 from Madras University Affiliation Colleges and 300 from Deemed University Affiliation like SRM, SATHYABAMA, and VELTECH. Further, both Affiliation Arts colleges were divided into three different strata: Professor (60), Associate Professor (100), Assistant Professor (100) and Lecturer (40) each in Chennai District. We used to examine the hypothesized relationships among study variables. The results of the study show significant positive relationship between emotional intelligence with Organizational Commitment and Job Satisfaction. The findings indicate that Lecturers in Art Colleges working under Madras University Affiliation are with high emotional recognition and Intelligence are more likely to have feeling euphoric levels of job satisfaction.

Keywords: *Emotional Intelligence, Organizational Commitment, Job Satisfaction*

INTRODUCTION

Ishak, Iskandar & Ramli, (2010) Teachers have a challenging^[1] work environment such as heavy workload, hectic working environments, insensitive administrators, and parents' expectation. These environments make the teachers more stress. Teachers make themselves more strong in their emotions and as well as to others feelings and emotions that's indicate their high organizational commitment and leads to better job performance^[2]. Salovey and mayer" the ability to monitor one's own and others' feelings, to discriminate among them, and to use this information to guide one's thinking and action .employees who have the ability to communicate with each other effectively can lead the organization toward success and effectiveness^[3]. Therefore, they should be aware of and understand emotions in the self while knowing that how to act with others, how they make decisions, how not to get angry, how to control one's own emotions with others^[4].

Emotional intelligence among Lecturers are high due to Organizational Commitment and job satisfaction are of particular importance to any Arts College Management considering as important factor for their Society Expectation nature based on direct communication to customers. As such, the goal of this study is to examine the impact of EI^[5] on job satisfaction of College Lecturers Working under Madras University and Deemed University Affiliation.

LITERATURE REVIEW

The term emotion indicates expressive communications and also explains inner stage feelings like sad,happy, love,hate,fear^[6] and joy etc. (Perlovsk, 2006) .Emotional intelligence has a valid relationship with job outcomes such as job satisfaction and organizational commitment (Wong and Law, 2002). Which are , employees where not appraise and regulate their emotions, as Abraham (1999) points out, have very less organizational commitment.

Nikolaou and Tsaousis^[7], (2002) showed a relationship of emotional intelligence and organizational commitment. Using emotions indicate a very strong link with organizational commitment irrespective of weak and average link between controlling and understanding of emotions.

Antoniou, Davidson, & Cooper^[8] (2003) relieved when stress is higher in working environment, in return job satisfaction reduces. As (Munro, Rodwell, & Harding, 1998) says there are various views or expectations or problems arise in the working situations which leads to dissatisfaction of work.

Farkas and Tetrick^[9], (1989) employees dissatisfied on the work relates to the organizational outcomes such as organizational commitment whereas studies show that punnett ,greenidge&ramsey ,2007and abraham . 1999, organizational commitment is more related to job satisfaction.

Lambert^[10] et al(2009) shows negative impact on employees such as absenteeism, lower job satisfaction and stress and also increased health problems. Mathieu and Zajac (1990) describes highly committed employees feels less stress in work place compared to less committed employes. Goleman (1998, p.317), has defined Emotional Intelligence as “the capacity for recognizing our own feelings and those of others, for motivating ourselves, and for managing emotions well in ourselves and in our relationships”. NahidNaderiAnari, (2012) suggest that the participants were selected by proportional stratified sampling and simple random selection. This study adopted a survey research design that utilized an ex post facto research type in which the researcher used questionnaires to collect data from the respondents. The results indicate that there is a positive significant relationship between emotional intelligence and job satisfaction, organizational commitment. It is also found there is no significant difference among high school English teachers of different genders and ages concerning their job satisfaction and organizational commitment. It provides support for gender differences, with females reporting higher emotional intelligence, but the results show no age differences among the participants.

OBJECTIVES

1. To measure the differences between emotional intelligence scale among Lecturers in Arts Colleges.

2. To estimate the difference between on organizational commitment scale among Lecturers in Arts Colleges.
3. To measure the difference between Lecturers in Arts Colleges on Job Satisfaction scale.
4. To determine the impact of emotional intelligence on organizational commitment among Lecturers in Arts Colleges.
5. To assess the impact of emotional intelligence on job Satisfaction among Lecturers in Arts Colleges.

Hypotheses

- H1: There is no significant difference between emotional intelligence of Lecturers.
- H2: There is no significant difference between organizational commitments of Lecturers.
- H3: There is no significant difference between Job Satisfaction of Lecturers.
- H4: There is no impact of emotional intelligence on organizational commitment among Lecturers.
- H5: There is no impact of emotional intelligence on Job Satisfaction among Lecturers.

CONCEPTUAL STUDY

Table 1: Independent and dependent Variables

Organizational Commitment: Organizational commitment was measured with Organizational Commitment Questionnaire (OCQ) developed by Allen and Mayer (1987) used the Three Component Model (TCM) of organizational commitment. They recognized affective, continuance, and normative commitment as unique components of organizational commitment. The instrument included 24 items investigating three dimensions: Affective, continuance, and normative commitment. A seven-point likert scale was used

with anchors ranging from 1 (strongly disagree) to 7 (strongly agree). Internal reliability coefficient was 0.78 for affective commitment, 0.77 for continuance commitment, and 0.65 for normative commitment.

Alikhani et al. (2015) Emotional Intelligence Impact in Organizational Commitment and Job Satisfaction to College Lecturers. It was concluded that individuals with high emotional intelligence had the ability to manage the pleasant mood, mental state and stress control. They also had high motivation and hope to achieve their aims at the failure

Hyun Jung Lee (2017), suggest that the training in emotional intelligence abilities may increase job satisfaction and decrease burnout of Teachers. Ashkanasy et al. (2003) showed emotional response related to stress affects employees’ performance. Gardner and Stough (2003) assessed the relationship between workplace, EI, job satisfaction and organizational commitment. Emotional self-regulation and emotional control were the strongest predictors.

Job Satisfaction: Maslow’s theory of hierarchy of needs could be presented as one of the theories related to job satisfaction. job satisfaction as “a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences”. Hackman & Oldham proposed the job characteristics model, which is widely used as a framework to study how particular job characteristics impact job outcomes, including job satisfaction. The five core job characteristics can be combined to form a motivating potential score (MPS) for a job, which can be used as an index of how likely a job is to affect an employee’s attitudes and behaviours. Not everyone is equally affected by the MPS of a job. People who are high in growth need strength (the desire for autonomy, challenge and development of new skills on the job) are particularly affected by job characteristics.

Two sets of factors are considered to influence job satisfaction: intrinsic factors (recognition, tasks and responsibility) and extrinsic factors (working conditions, company policies and salary). Internal job satisfaction is an internal desire to perform a task which deals with pleasure and is related to internal motivation. External factors are defined as those external benefits provided to the professional staff by the organization. These factors are unrelated to the task and include money, good scores and other rewards.

RESEARCH METHODOLOGY

The Sample: The respondents for the present study were selected from Arts Colleges located in South Chennai of Tamilnadu .The sample consists of 600 College Lecturers.

Sampling Method: The sample collected using stratified random sampling technique. A sample of 600 College lecturers had been taken which comprised of 300 from Madras University Affiliation Colleges and 300 from Deemed University Affiliation like SRM, SATHYABAMA, and VELTECH. Further, both Affiliation Arts colleges were divided into three different strata: Professor (60), Associate Professor (100), Assistant Professor (100) and Lecturer (40) each.

Tools used for data Collection: Emotional Intelligence and Job Satisfaction scales developed by the researchers have been used for the data collection. The Emotional Intelligence scale consists of 23 items and Job Satisfaction scale consists of 12 items. To attain the responses related to the Organizational Commitment, a scale developed by Meyer, Allen and Smith (1993) was used. The reliability of all three scales has been estimated with the help of Cronbach’s alpha.

Table 2: Reliability Analysis

Variables	No. of items	Cronbach’s alpha
Emotional intelligence	23	0.903
Job satisfaction	18	0.914
Organizational commitment	12	0.925

DATA ANALYSIS AND INTERPRETATION

H1: There is no significant difference between emotional intelligence of Lecturers.

H2: There is no significant difference between organizational commitments of Lecturers.

H3: There is no significant difference between Job Satisfaction of Lecturers.

Table 3: Comparison of Emotional Intelligence among Lecturers working in arts Colleges

Variables	T-Value	Mean		S. D.	
		MU(300)	DU(300)	MU(300)	DU(300)
Emotional intelligence	1.236	3.04	0.518	3.837	0.515
Job satisfaction	4.218**	3.097	0.636	3.897	0.658
Organizational commitment	2.064*	3.727	0.618	3.416	0.638

* Significant at 0.05 level.

** Significant at 0.01level.

The meanscore of emotional intelligence was found to be higher in Madras University than Deemed University. The mean score for organizational commitment was found to be higher for Madras University than that of the Deemed, and the difference was found to be significant at 0.01level. The mean score for job satisfaction was found to be higher for Madras University than that of Deemed University, and the difference was found to be significant at 0.05 level. Meyer and Allen (2007) Suggests organizational commitment into three dimensions: affective, continuance, and normative commitment. Fatemeh Sadat Ghoreishi(2014), the staff had average

level of job satisfaction and emotional intelligence and others were lower than average, it seems necessary for authorities to explore the reasons for job dissatisfaction to prevent job burnout, depression and developing a sense of helplessness in the staff. It is also recommended to hold educational workshops for the staff especially who are younger than 40 years to promote their emotional intelligence.

H4: There is no impact of emotional intelligence on organizational commitment and Job Satisfaction among Lecturers.

Table 4: Coefficient of Correlation between Emotional Intelligence with Organizational Commitment and Job Satisfaction among Lecturers working in art Colleges

		Emotional Intelligence	Organizational Commitment	Job Satisfaction
Emotional Intelligence	Pearson Correlation	1	0.560**	0.726**
	Sig. (2-tailed)	0.00	0.000	0.000
	N	600	600	600

**Correlation is significant at the 0.01 level (2-tailed).

** Correlation is significant at the 0.01 level (2-tailed).

The above table reveals significant and positive correlation between emotional intelligence and organizational commitment (r=0.560, p<0.01) job Satisfaction(r=0.726, p<0.01).

Regression: Emotional Intelligence towards Job Satisfaction and Organizational Commitment.

Table 5: Regression results for emotional Intelligence and Organizational Commitment

Independent variables	β	Sig
Job Satisfaction	0.539**	.000
Organizational Commitment	0.787	.000

Conted...

Dependent Variable : Emotional Intelligence, R2 = 0.500, F = 596.47

** Significant level 0.01, *significant Level 0.05

In regression analyse we investigated the influences of Job Satisfaction and Organizational Commitment influences on Emotional Intelligence. The regression model is significant as a whole (F=596.47: p< 0. 01). The findings shows that as we predicted that emotional intelligence has a significant impact on organizational commitment of Lecturers. So, higher the level of emotional intelligence of a Lecturers, higher will be her/his commitment towards the organization. The result is supported by the studies conducted by Adeyemo (2007),

Koshthegar (2008); Rathi (2009); Mohamadkhani. et.al. (2012); Nikkheslat et al. (2012); Alikhani et al. (2015), who found a positive and significant relationship between emotional intelligence and organizational commitment.

CONCLUSION

Based on analysis and research hypothesis of this study developed a model which investigated the effect of emotional intelligence on job satisfaction and on organizational commitment in Chennai, Tamilnadu. Mayar et.al. (2000) defined emotional intelligence as the ability to perceive, understand, regulate and monitor emotions in the self and others. In simple words, emotional intelligence has the same meaning as self-knowledge, self-awareness, and knowing others.). In Table.5, regression analyse we investigated the influences of Job Satisfaction and Organizational Commitment influences on Emotional Intelligence. The regression model is significant as a whole ($F=596.47$; $p < 0.01$). The findings show that as we predicted that emotional intelligence has a significant impact on organizational commitment of Lecturers. So, higher the level of emotional intelligence of Lecturers, higher will be her/his commitment towards the organization.

In table 4, it reveals significant and positive correlation between emotional intelligence and organizational commitment ($r=0.560$, $p < 0.01$), job Satisfaction ($r=0.726$, $p < 0.01$).

Ealias & George, (2012) it is assured that emotional intelligence related to individual emotional commitment, continued commitment and normative commitment.. Maslow believes that the lowest level needs are physiological needs and safety, and the highest level of needs is self actualization. It could be argued that a person with the ability of emotional intelligence gets to the stage of self actualization. Just as Maslow clearly states, if needs of the lower level are satisfied, higher level needs show off. Therefore, in the job environment, if needs such as payment, job security, respect toward co workers, manager, customers and organization's contract are not satisfied, the higher level of needs (i.e. self-actualization) and attention to oneself would not be satisfied. In an environment, where there are not enough economic growth and facilitation, the employees' lower level needs are not satisfied perfectly and fundamentally. Consequently, higher level needs do not show off and the individuals' needs are left at lower level needs. So, they can never be satisfied with high level of needs (Robbins, 2005)

Landscape and Psychological Well-being: Manori! The Magical Island, A Study on Anita Desai's *Where Shall We Go this Summer?*

S. Patchainayagi¹, V. Vijayalakshmi¹

¹Assistant Professor, Division of Social Sciences and Languages, VIT Chennai

ABSTRACT

Sita the middle-aged wife and mother of five children, the protagonist of *Where shall We Go This Summer?* is pregnant for the fifth time and desirous of an immaculate conception in the reverse, the child not to be born. Sita is so eccentric that she cannot put herself up with the mundane happenings of the modern city, Bombay. Raman, her husband, is a business man and could never understand her way of living. Thinking of the Immaculate Conception she moves to Manori, the magical island where she had her glorious past. Sita's father after independence settles down in Manori and becomes the beloved 'Babaji' of the village by practicing Gandhian principles. People believe that he has a magical power and regarded him with high respect. Like the villagers, Sita also believes that her father possesses magical powers. Now she wants to try with the powers, it might help her in stopping the child from being born. Sita's characterisation presents the individual preferences of a lady who suffocates and struggles frantically against mundane realities of life. Her commotion fills to the brim when she is pregnant for the fifth time and to everybody's astonishment and dismay she decides to go Manori the island. The paper tries to answer the question will the root give her a route?

Keywords: *Psychological well-being, Prenatal Neurosis, Landscape, Island studies,*

INTRODUCTION

"Islands are the Natural workshops of Evolution"

- Richard Dawkins

Anita Desai's novel "*where shall we go this summer?*" excels in portraying Sita and her pre-natal neurosis. The central theme of the novel is Sita's repugnance on her fifth pregnancy and her strong desire of an immaculate conception in the reverse. Sita presents the individual preferences of a lady who suffocates and struggles frantically against mundane realities of life. It is very bare that she is dissatisfied with her husband; she feels that he falls out of her world. Her commotion fills to the brim because of the fifth pregnancy and to everybody's astonishment and dismay she decides to go to Manori, the island where once she lived with her father.

Sita cannot understand or can never get used to any one, this as a problem could have been solved out easily by a supporting spouse. But Raman is unaware rather

unenthusiastic in making her life complacent. Raman is in business and he gets lots of guests visiting them. Sita dislikes this and says that they frighten her.

"They are *nothing*—nothing but appetite and sex. Only food, sex and money matter. Animals."

'I though you liked animals'

'My pet animals – or wild animals in the forest, yes. But these are neither – they are like pariahs you see in the streets, hanging about drains and dustbins, waiting to pounce and kill and eat.'

He shook his head baffled." (WSG 43)

Similarly she cannot go with her own children and the worst is that the children cannot understand her. Menaka the first daughter of the family^[1] is grown up and she frowns at her mother's behaviour. Menaka feels remorseful when her friends tease her that her mother is not normal. Sita is a loving mother and she is proud of her daughter's built. She is almost in tears to see karan's legs scratched. At the same time she could not tolerate^[2] with instances like, her sons playing a wrestling game,

Menaka's unknowing action of plucking the buds and to quote the worst case, Karan's destroying his Plastic structures which he himself created for playing^[3].

Sita looked all the more happy and had shown pride and pleasure in giving birth to the four children. But now, during the fifth time she expresses that she is all the more frightened not only now but she had the same feeling from the first delivery^[4]. The mental picture of the process of hospitalisation and the details of procreative procedures scares her. Sita and Raman have avoided direct confrontation so far, but now that at forty, graying^[5] and ageing makes her loses her self-control and explodes. Sita also waits for someone or something every minute, which can be compared to 'Waiting for Godot' by Samuel Becket, an absurdist play where the prime characters wait for nothing. Sita also waits perpetually but she herself does not know for what she is waiting^[6].

"I'am waiting, she agreed—although for what, she could not tell: for the two halves of this grey egg-world to fall apart and burst into festival fireworks, a woman's seaweed hair or bloodstained feathers?" (WSG 49)

It is Raman who ignites the idea of where shall we go this summer? He puts it out casually and gets the unexpected answer, Manori. She wants to recapture the magic of the island and at the same time she also wanted to keep out of her inconsiderate husband. She could not put it out that she wants to go alone but to her gratification^[7] she finds that the workers of her husband are threatening to go on a strike and he could not accompany her. She says that she is keen on going and withdraws into the magical island^[8].

Sita, as a mother, never understands the needs of her children, and she takes Menaka and Karan with her to the island in search of a bright magic depriving them of a cozy life. The worst part is, she left two more children at home and she thinks about them only when Raman comes to the island. Only at this juncture she asks him about the sons. She can understand very well that the old house of them is in no more a good condition to hold people like her children, from a gratifying apartment^[9], but, she tries to mend them according to the present situation.

Sita never cares for her society. But things take a turn when she marries Raman and her living locale changes to Bombay, a city of activity. She can never

adjust with anyone and is fearful of everyone that they might pounce on her any time^[10]. She never even thinks of looking good,

"Why can't you be just neat and tidy?" he asked despairingly in the beginning, but then learnt that these were the two qualities she had never known, and so she had continued to wear, instinctively, the garb of the male and then the female peacock. Now he said nothing – her dress was the least of his worries." (WSG 120)

Through the course of the novel Sita has no friends and if at all if she talks about or thinks about people other than her family it is about her co-sister or her brother. Nobody feels good about her; she is so distressed that she could not talk common to anyone around. She is almost at tears to common incidents like a small bruise on the boy's knee, Menaka's action of taking of the buds from the plant, crows killing an eagle and so on. She always sits alone and smokes vehemently which make others think that she is waiting for someone. When she comes to Manori, she feels happy that she has recaptured the bliss, but the way she plays in the river bed and treating her children make others pity on her.

Sita's father is a freedom fighter, after independence he settles down in Manori and turns out a hero of Manori. He works hard to fortify the villagers and helps them to be out with their mundane problems. He calls his new house *Jeevan Ashram*, 'the home of the soul'. He plans his time towards social work, prayers and practices Gandhian principles. Sita wants to spend time with him but he is always busy either with his *chelas* or his ever new patients or with his step-sister Rekha who turns out to be a popular divine singer. Sita's mother is a runaway and not dead (as told by Jivan and others) is a cause for her unhappy daughterhood. They believe that she has run away to *Benares* and the cause behind it is unaware of. His father is so busy that she cannot even talk about her mother to him. Sita senses that her father gives an extra parental care to Rekha, her step sister and he denies even the normal care to the other two children.

From the childhood she lives an unnoticed life, and she is happy to lead a life like that. The problem is she never expects or sees anything devious or suspicious during her child hood, except for her father's personal life and her mother's estrangement. She herself is happy to live like a cuckoo singing for its own pleasure unseen by others.

Now she herself is not happy about the island. It had its charm in the olden days, now the island has a soda-water shop, looking at the influence of the city, her face twisted with dejection and disappointment. The scenery of the village is no more pleasant. The men sit idle due to the monsoon, the children are playing with pigs amidst and the women draw out water from a pond which is green with the lots of germs, bacteria and diseases. It is evening where the bright light is gone and the house reveals complete darkness. The stares of Menaka and Karan kindle in her a feeling of despair. Slowly, Moses brings in candles and she goes into her house after twenty years to find only dust, cobwebs and the odours of bats. Even at her father's house Sita feels frustrated and alienated. And this feeling marks the starting point of her journey towards completion.

In Bombay she broods about her life in Manori and in a fit of rage and to her husband's astonishment she says that she would like to go to Manori. But after coming to Manori she realises that the island has lost its charm. At Manori she tries to live peacefully. She makes her children understand nature and wants them to lead an eco-friendly life. But the life becomes very eco-friendly as they could not get a nice meal. Due to the rain, fishermen could not make their livelihood and it is not a thriving time, and this has an effect on their household also. Soon the villagers start coming in to have a look at Babaji's daughter and grandchildren. They bring offerings as they once did to her father. Everyone comes in and praises him for all the good deeds he has done for them. She enjoys the respect and accepts their offerings. In turn, she gives them her cigarettes like her father who use to give them tobacco to chew.

“you are Babaji's daughter”, the old woman said in a Konkani dialect as raw and harsh as wet fishing lines. ‘I brought oil for Babaji once, and coconuts, and he blessed me with a son. So I have brought something for you today.’ (WSG 98)

Now she realises that the Immaculate Conception cannot happen as the ‘magic’ of her father has deserted the village. She is now aware that her idea of escape has grown blunt. As soon as she hears about Raman's arrival, she feels, in a way, relieved. Distanced from her home at Bombay, she finds time to retrospect on her life with Raman, though she is not very happy she identifies a security with him. She feels that the unborn child should be given proper care and attention.

As Sita is abducted by Ravana in Ramayana and is kept as a captive in ‘Srilanka’, Sita goes to Manori and keeps herself out of the reach of Raman her husband. For Sita Manori, the island is the mirror where she looks into her childhood days and compares her today's life with it.

“She saw the island as a piece of magic, a magic mirror – it was so bright, so brilliant to her eyes after the tensions and shadows of her childhood.” (WSG 59)

Distanced from her husband and her home give her time to reflect upon her past which furnishes comprehension of life. Her realisation that her father's miracles will not happen any more in the island makes her return to Bombay to have a safe delivery.

CONCLUSION

Sita is the ultimate negative product of parental rift, homelessness and estrangement. Sita feels out of the world and goes back to Manori to recapture her childhood bliss. Her involvement from the periphery to the centre takes place in the Island. Sita is in Bombay, hates and is furious about the routine trifles. She wants to lead a placid life back in Manori. The lurching truth behind makes her understand that the island has lost its charm and her comprehension of life begins. Her understanding comes to an end as she understands that she is no more just a woman but a mother.

Manori! The Magical Island shows her the realities of life. She wants to escape the frustrations of the city life, ‘zombie’ and she goes to Manori her native island. The island is ‘Utopian’; the result is not rejuvenation but realisation. Manori! The natural workshop has helped Sita to evolve into a normal human being, It makes her comprehend that socialisation cannot be evaded completely.

Conceptual Review of Work Life Balance

K. Krishna kumar¹, R. Premalatha²

¹Assistant Professor, ²Research Scholar, Department of Commerce, Periyar University, Salem

ABSTRACT

Work-life balance is about adjusting work patterns to achieve overall fulfilment. A good work-life balance enables the organisations to thrive and at the same time enables, the employees easily combine work with other aspirations and responsibilities. It is imperative to arrive at the conceptual understanding of the term, work life balance, its early beginning or evolution, transformations and advancement needs to be studied and analyzed. In this study 1 working definitions, characteristics, problems, benefits, dependents, barriers in achieving work life balance were highlighted.

Keywords: Working definitions benefits, problems, characteristics, barriers of work-life balance

INTRODUCTION

Achievement and enjoyment are the front and back of the coin of value in life. Therefore, any employee should balance their career life and personal life. Work-life balance is a concept that supports the efforts of employees to split their time and energy between work and the other important aspects of their lives. Simply we can define work-life balance as the healthy blend of an employee's professional^[1] and personal responsibilities. A positive Work-life balance involves achievement and enjoyment. Work-life balance may be meaningful daily achievement and enjoyment in each of the four quadrants of life- work, family, society and self. The best Work-life balance^[2] varies for an individual over time. Work is an instrumental element and is a means to support a way of life and to create optimal conditions for respect and personal challenges. Thus, the work-life balance is also about managing internal pressure from once own expectations and setting realistic goals, which do not inflict on family responsibilities^[3]. Originally, work was a matter of necessity and survival. Today, it is very rare for a person to stay with a single company in his or her entire working life. Because employees are often willing to leave a company for better opportunities, companies need to find ways not only to hire qualified people, but also to retain them. Hence, better quality of work life to attract and retain the employees becomes essential at this stage^[4]. The organization can provide good quality of work life to their employees when they follow the quality of work life programmes effectively. "The adaptation of quality of work life programmes may

differ to organization to organization depending upon the nature of the work and size of the organization. The management must be keen in selecting and implementing the most appropriate quality of work life programmes which suits their organization^[5]" (Dr. K. Krishna kumar et al.2012).

WORKING DEFINITIONS

Clark (2000) proposed as "Satisfaction and good functioning at work and at home with a minimum of role conflict".

Guest (2001) defined as "those who regularly work more than 48 hours a week will have an imbalance between work and the rest of their life^[6]".

Clutterbuck (2003) states that "Being aware of different demands on time and energy having the ability to make choices in the allocation of time and energy knowing what values to apply to choices making choices".

Vissar and Williams (2006) explained as "the equilibrium between responsibilities at work and responsibilities outside paid work^[7]".

Greenhaus and Allen (2006) proposed as "Work life balance is "the extent to which an individual's effectiveness and satisfaction in work and family roles are compatible with the individual's life priorities".

Swamy (2007) defined work life balance as "a practice that is concerned with providing scope for

employees to balance their work with the responsibilities and interests they have outside work. It enables them to reconcile the competing claims of work and home by meeting their own needs as well as those of their employers^[8]”.

Deery (2008) Defined the concept of WLB is a complex task, as it can be viewed from the meaning of “work”, “life” and “balance”.

Emslie and Hunt (2009) argued that “work–life balance defined as “satisfaction and good functioning at work and at home, with a minimum of role conflict”.

Delecta.P (2011) states that “Work life balance is defined as an individual ability to meet their work commitments as well as other non-work and family commitment^{[9] [10]}.”

Work Life Balance problems are as follows:

- I. Technological up-dating, for example mobile phones, computers and distinction between work life and personal life.
- II. Juggling of, one job to another.
- III. Age of workforce is increasingly diverse.
- IV. Unsatisfactory income.
- V. Work burden
- VI. Most of the parents go for job.
- VII. Hiring of skilled workers.

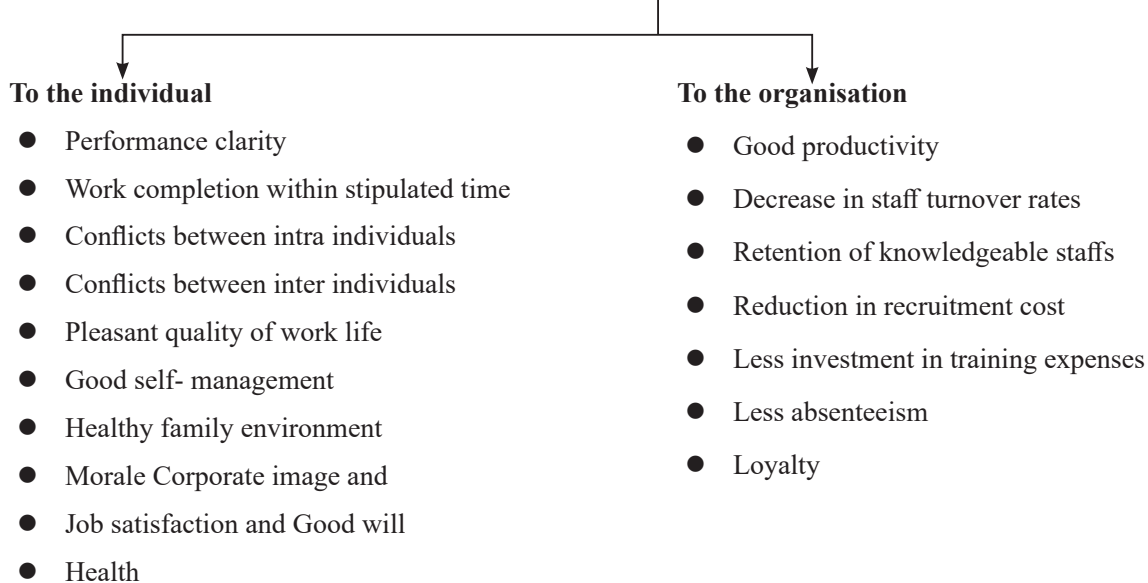

Apart from the above problems the BPO sector faces few more problems such as types of work, working hours, work style etc. their working hours is not based on their home country timings. So, they have to work in the irregular timings. It will give some health issues and don’t have enough time for spent with other work. And also they face health related issues like obesity, frequent head ache, diabetics, weight loss, muscle pain etc. (Dr. K. Krishna kumar et al 2018).

Characteristics of Work Life Balance: Organizational effectiveness becomes, to some extent, the question of management’s ability to motivate its employees. Motivation is one of the prominent factors. Every employer has to implement to get the things done through the others.

- I. Encourage employees
- II. Necessary for business benefits
- III. Accept life changes accordingly
- IV. Decrease sickness and absenteeism
- V. Enhance working relationship
- VI. Attract new employees
- VII. Help to retain staffs
- VIII. Improve morale
- IX. Increase production
- X. Low rate of stress.

Table 1

Benefits of Work Life Balance

Dependents of Work Life Balance:

- I. Flexi time
- II. Job sharing
- III. Compressed work weeks
- IV. telecommuting
- V. For better corporate social responsibility

Barriers in Achieving Work life Balance

- Lack of Superior support
- Consumption of time
- Lack of Support from colleague

Conceptual framework of work life Balance: Work-life balance is about people having a measure of control over when, where and how they work, it is achieved when an individual's right to a fulfilled life inside and outside paid work is accepted and respected as the norm, to the mutual benefit of the individual, business and society. Work-life balance has been described in many different ways, including being judged by one prominent commentator as a complete misnomer because work is, for most of us, actually a very important part of life.

A number of studies have addressed this issue from different perspectives. Greenhaus and Beutell (1985) and Greenhaus et al. (1989) examined the antecedents of conflict between family and work, Goodstein (1994) presented an institutional perspective on organizations' responses to work-family issues. In addition, Campbell and Kennard (1994) have studied the effects of family responsibilities on the work commitment and job performance of women. The work-family issue is even further expanded to address the relationship of business-marriage partners.

CONCLUSION

"Life is nothing but adjustment"- likewise the individual should allocate the time and effort on the basis of the work and life needs. Work life balance of an individual employee, viewed collectively for the total work force of an organisation results into a colossal impact on the qualitative and quantitative organisational performance. Employees who achieve improved work life balance with the assistance of the policies implemented by the employing organisation tend to

be more productive. The effectiveness of work life balance in managing stress and the various performance indicators also not much effect on productivity, more over a proper scheduling must be provided for the betterment of the organisation as well as individual. Then only both (individual and organisation) can survive in the work-life balance scenario.

Wellness of Employees and Engagement in Corporate Scenario

M. John Britto¹, R. Magesh²

¹Research Scholar, Faculty of Management Studies, Sathyabama Institute of Science and Technology, (Deemed to be University); ²Research Supervisor and Associate Professor, Anna University

ABSTRACT

Information technology has revolutionised the way global citizens go about their professional and personal lives. Employees serving in such service sectors need to battle stress as well as odd working hours. Concepts like flexi-time are more theoretical than practical and so is work-life balance. Employees continue to work tirelessly to reach various deadlines and in the process are compelled to align their body clocks to various international time zones. Performance in an era that has inflation and recession staring at companies is not an easy goal to achieve anymore. The implication for the human body are far-reaching. The human body is being battered not just at the physical level but at the mental and spiritual levels too. Companies are increasingly turning their attention to employee wellness programmes as they are now given to understand that wellness also counts in employees' progress. Wellness is fast being recognised as a necessary, helpful and urgent concept. Management are now given to understand that wellness initiatives would not only boost the morale of employees but would help them to maintain a mature approach in tackling challenges and enjoying the work they do. Cluster and random sampling was undertaken to survey 847 respondents serving in Information Technology service organisations at Chennai, Tamilnadu State in southern India. The current research delves into the perceptions about and impact of wellness on employee engagement

Keywords: Employee, Wellness, Engagement, Information Technology, Services.

BACKGROUND OF THE STUDY

The current scenario of Information Technology (IT) in the world's largest democracy is very encouraging^[1]. IT has a role to play in myriad fields (web 1) including health, education, hospitality, research and development, farming and agriculture, communication, weather forecasting, travel, marketing, and space administration. The upcoming emphasis is on artificial intelligence and virtual reality^[2].

NEED FOR THE RESEARCH

The modern day corporate office always bustles with activities, deadlines, negotiations, deals and trans-national projects. IT service provides function round the clock with hardly any breaks and have various shift timings^[3]. Employees in India are susceptible to genetic and other health-related problems. The sole aim seems to earn as much as possible with little or no consideration for health and wellness^[4].

Research on wellness and engagement has been widespread in the west and is only now gaining attention

in Asian countries. There is no integrated health system in India and the availability of doctors is meagre considering the growing populace. Engagement initiatives have mainly addressed issues like compensations, rewards^[5], and fringe benefits. Recent issues that grabbed headlines were quality of work life and work-life balance.

REVIEW OF LITERATURE

Employee Wellness: A reported on the conceptualising^[6] and implementation of a wellbeing plan at a large multi-site establishment, analysing the usefulness of wellbeing offers and its impact on employee wellbeing. The wellbeing plan was oriented towards a spurt on employee appointments^[7], better constituents and wellbeing among diverse groups. Results emphasised some of the difficulties that establishments should be conscious of when accepting employee wellbeing, accounting the for national culture, job grade and prevailing wellbeing levels. The results revealed how organisations^[8] can be assisted by wellbeing plans which integrate components intended to appeal to workers with diverse levels of wellbeing. Wellbeing plan which really caters to employee wants is a necessary step in ensuring that such programme are well received and augmented.

As explored^[9] the result of corporate wellbeing programmes on employees’ performance amongst commercial banks. The study revealed that financial, intellectual, environmental, social and physical wellness programs enhanced employee’s performance in the work organisation. Physical wellness programs are significant to personnel as they keep workers strong and a healthy employee is an advantage to the organisation. It was concluded the employee’s sense a feeling of confidence and enthusiasm when such an environment is facilitated.

A revealed that employees^[10] and their dependents take advantage from support offered by workplace wellness programmes that direct their physical health and emotional happiness. Chronic health forms such as substance violence are some of the distresses that strain the job surroundings and generate absenteeism, accidents and job inefficiency. Individual wellness is the endorsement of the bodily, social, emotional, occupational, religious, and intellectual wellness of employees. This can be facilitated by creating an organisational culture that is favourable to wellness and complete identification of psycho-social health risks. The wellness programs in the organisational fosters a culture and this favours individual employees. The competencies and balance between life and work is also supported.

Employee Engagement: On focussed on the level of employee engagement in telecommunication business. The telecom companies are functioning all the time to gratify their employees. Conversely, the organisation required to be clarified about the demands of the employees, particularly those employees who have been serving for a long time. The employees also should be accountable for the company’s performance. The workforce appeared to be quite fulfilled and pleased in the organisation. The organisations are endeavouring to make the work surroundings more appealing. The study demonstrated that inspiration of the workforce, contribution of employees in decision making, readiness of employees to be occupied in work, skills of workforce and commitment of employees are important for employee engagement in the telecom industry.

As expressed that employee engagement is the level of promise and participation an employee has in the direction of their organisation and its standards. Engagement is an optimistic approach of employee in creating value for the corporation. In engagement, people utilise and express themselves in three ways, namely, physically, cognitively, and psychologically during task performances. Employee engagement is the quantity of employee obligation and level of contribution in the organisational movement and value creation. It will be triumphant only when he is treated with admiration and honour, given support, and resources needed and is given sufficient liberty concerning work. People who work for wealth will become more creative through provision of some bonus and advantage in the form of inspiration. Some of the employee feels displeased due to their unforeseen profession.

METHOD

Information technology services’ employees at Chennai city, capital of Tamil Nadu state, in Southern India were surveyed with the help of a structured questionnaire. The estimated sample size was 826 respondents and the actual sample size was 847 respondents. Cluster sampling was employed. The IT and Tech Parks in Chennai was ascertained (web 4, web 5) and most of the companies were found to be located on Old Mahabalipuram Road / Rajiv Gandhi IT Expressway and Ambattur. Companies were approached in these clusters and permission sought. Respondents were chosen at random from such companies. Respondents participation was voluntary and oral confirmation regarding willingness to participate in survey was solicited before handing over research instrument.

ANALYSIS AND DISCUSSION

Effect of age on perception about wellness and engagement (Table 1) was analysed and it was found that there is no such effect on the variables as p value was not significant.

Table 1: Effect of Age

Effect of Age		Sum of Squares	df	Mean Square	F	p
Wellness	Between Age Groups	225.064	2	112.532	1.098	0.334
	Within Age Groups	86528.761	844	102.522		
	Total	86753.825	846			
Engagement	Between Age Groups	20.422	2	10.211	0.285	0.752
	Within Age Groups	30282.749	844	35.880		
	Total	30303.171	846			

Table 2 indicates a different implication. The effect of cadre on perception about engagement was observed while there was no such effect of cadre on perception about wellness.

Table 2: Effect of Cadre

Effect of Cadre		Sum of Squares	df	Mean Square	F	p
Wellness	Between Cadre Groups	198.266	2	99.133	0.967	0.381
	Within Cadre Groups	86555.559	844	102.554		
	Total	86753.825	846			
Engagement	Between Cadre Groups	392.121	2	196.061	5.532	0.004**

19 scale items relating to wellness (Myers and Sweeney,2014) and 9 scale items relating to were adapted. Consequent to Confirmatory Factor Analysis, the final number of rating scale items for each variable was: Wellness (10), and Engagement (9). Examples of 5-point rating scale items used were: ‘I can express both my good and bad feelings appropriately’ (Wellness), and ‘I am immersed in my work’ (Engagement). The path analysis of structural model is presented in Figure 1 and Table 3.

Table 3: Structural Model Path Analysis

Path			Unstandardised Coefficient	Standardised Coefficient	t	p
WEL1	<---	Employee Wellness	1.058	0.838	29.314	***
WEL2	<---	Employee Wellness	0.865	0.763	24.642	***
WEL4	<---	Employee Wellness	0.981	0.844	29.428	***

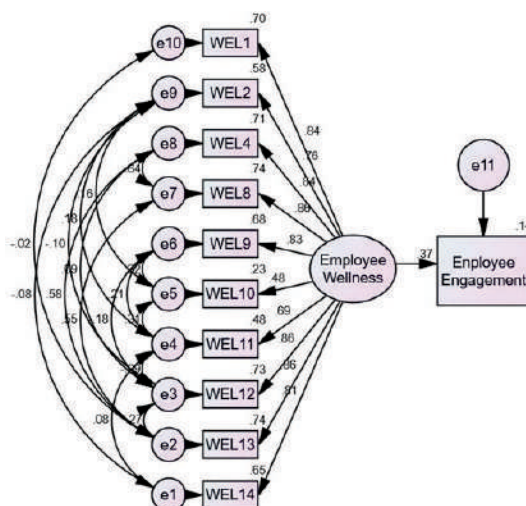

Figure 1: Structural Model Path Analysis with Standardised Coefficients

The analysis and discussion for the hypotheses is presented.

$H_{01.1}$: WEL1 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL1 being 1.058 represents the effect of WEL1 on employee wellness, holding other variables as constant. There will be 1-unit increase in employee wellness, for every 1.058-unit increase in WEL1. Hence, *WEL1 has a positive effect on Employee wellness.*

$H_{01.2}$: WEL2 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL2 being 0.865 represents the effect of WEL2 on employee wellness, holding other variables as constant. The p value is significant at 0.1% level and therefore the null hypothesis $H_{01.2}$ is rejected. There will be 1-unit increase in employee wellness, for every 0.865-unit increase in WEL2. Hence, *WEL2 has a positive effect on Employee wellness.*

$H_{01.3}$: WEL4 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL4 being 0.981 represents the effect of WEL4 on employee wellness, holding other variables as constant. Hence, *WEL4 has a positive effect on Employee wellness.*

$H_{01.4}$: WEL8 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL8 being 0.988 represents the effect of WEL8 on employee wellness, holding other variables as constant. There will be 1-unit increase in employee wellness, for every 0.988-unit increase in WEL8. Hence, *WEL8 has a positive effect on Employee wellness.*

$H_{01.5}$: WEL10 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL10 being 1.014 represents the effect of WEL10 on employee wellness, holding other variables as constant. The p value is significant at 0.1% level and therefore the null hypothesis $H_{01.5}$ is rejected. There will be 1-unit increase in employee wellness, for every 1.014-unit

increase in WEL10. Hence, *WEL10 has a positive effect on Employee wellness.*

$H_{01.6}$: WEL11 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL11 being 0.492 represents the effect of WEL11 on employee wellness, holding other variables as constant. The p value is significant at 0.1% level and therefore the null hypothesis $H_{01.6}$ is rejected. There will be 1-unit increase in employee wellness, for every 0.492-unit increase in WEL11. Hence, *WEL11 has a positive effect on Employee wellness.*

$H_{01.7}$: WEL12 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL12 being 0.815 represents the effect of WEL12 on employee wellness, holding other variables as constant. There will be 1-unit increase in employee wellness, for every 0.815-unit increase in WEL12. Hence, *WEL12 has a positive effect on Employee wellness.*

$H_{01.8}$: WEL13 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL13 being 1.052 represents the effect of WEL13 on employee wellness, holding other variables as constant. There will be 1-unit increase in employee wellness, for every 1.052-unit increase in WEL13. Hence, *WEL13 has a positive effect on Employee wellness.*

$H_{01.9}$: WEL14 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL14 being 0.991 represents the effect of WEL14 on employee wellness, holding other variables as constant. The p value is significant at 0.1% level and therefore the null hypothesis $H_{01.9}$ is rejected. There will be 1-unit increase in employee wellness, for every 0.991-unit increase in WEL14. Hence, *WEL14 has a positive effect on Employee wellness.*

$H_{01.10}$: WEL16 does not have a positive effect on Employee wellness.

It can be seen from Table 3 that the coefficient of WEL16 being 1.0 represents the effect of WEL16 on

employee wellness, holding other variables as constant. The p value is significant at 0.1% level and therefore the null hypothesis $H_{01.10}$ is rejected. There will be 1-unit increase in employee wellness, for every 1-unit increase in WEL16. Hence, *WEL16 has a positive effect on Employee wellness.*

H_{02} : Employee wellness does not have a positive effect on Employee engagement.

It can be seen from Table 3 that the coefficient of employee wellness being 2.932 represents the effect of employee wellness on employee engagement, holding other variables as constant. The p value is significant at 0.1% level and therefore the null hypothesis H_{02} is rejected. There will be 1-unit increase in employee engagement, for every 2.932-unit increase in employee wellness. Hence, *Employee wellness has a positive effect on Employee engagement.*

The structural model fit indices are summarised in Table 4. Good fit was found to exist for the structural model.

Table 4: Structural Model Fit Indices

Model Fit Indices	Structural Model Vales	Acceptable Values #
CMIN/df	2.229	<3
GFI	0.988	>0.9
AGFI	0.971	>0.9
NFI	0.993	>0.9
CFI	0.996	>0.9
RMSEA	0.037	<0.06

#Haier et al., 2009; Hooper et al., 2008; Steiger, 2007; Hu and Bentler, 1999.

CONCLUSION

All wellness factors were found to have a positive effect on employee wellness. Similarly, employee wellness was also found to have a positive effect on employee engagement. There will be 1-unit increase in employee engagement for every 2.932-unit increase in employee wellness.

Companies have not really understood the concept in its entirety. Attempts albeit partial have been made but a holistic and employee-centred wellness program is the need of the hour. Employees experience a gamut

of emotions every day at the workplace and while some situations are fairly well managed there are lot others where people have no clue as to how to tackle such issues. Employee wellness is just gaining attention in India but the fact remains that most of the

Companies have all along stressed only on financial factors as the predominant influencers of job satisfaction and morale. Possession of wealth and resources at the disposal of the employee does not completely account for wellness. Employees are unable to face stress at the work place, family issues, health issues, inter-personal conflicts, low self-esteem and self-confidence, and are mostly trained or skilled in a particular domain. They have not been taught to withstand the vagaries of life and unexpected challenges in the job. Hence, both engagement and wellness programs would immensely benefit the organisation to not just achieve productivity but also to foster a committed and productive workforce.

Organisations today are exploring and seeking more holistic wellness programs that can encompass all elements like Spiritual, Emotional, Social, Environmental, Career, Intellectual, and Physical needs. Flexible work environment (web 7) would foster work-life balance. Flexible work schedules can facilitate higher levels of job contentment, lower absence from work, and lower turnover. Teleworking has become more popular. Flexible schedules enable employees to get more sleep, time for tackling health concerns and an energised workday. Part-time offers could also be considered.

Mere physical health would not suffice. Total well-being is being avidly sought. Mindfulness is a growing trend. It calms the body and helps fight depression and anxiety. The quality and quantity of food intake also needs monitoring. Emotional intelligence needs to be nurtured and spiritual well-being needs to be emphasised.

Employee engagement practices that companies can undertake include those relating to company practices, performance, branding, leadership, Benefits and the work itself. The top engagement opportunities according to the global marketplace are Employee Value Proposition (EVP), senior leadership, enabling infrastructure, rewards and recognition, and career opportunities (Hewitt, 2017).

Prime Factor Random Shuffle Encryption & Decryption (Pfrse/D) Algorithm Based Bio-Medical Image Communications in The IoT for Smart Healthcare Applications

Raja Krishnamoorthy¹, A. S. Reddy^{2,3}, P. T. Kalaivaani³

¹Professor, ²Principal, CMR Engineering College, Department of ECE, kandlakoya Villaga, Hyderabad, Telangana, India; ³Associate Professor, Department of ECE, Vivekanandha College of Technology for Women, Tiruchengode, Namakkal, Tamilnadu, India

ABSTRACT

Objective: This paper is to minimize difficulties in medical image transmission over IOT due to the variation of Medical data across the patient population. To provide an effective and intuitive understanding of unique identification of users information; computational performance, reliability, and Flexibility of the system and efficient analysis of large datasets in real time.

Analysis: This paper is used to analyze the proposed PFRSE/D algorithm based image communication methods and compare the performance of secured PFRSE/D with conventional scheme.

Method: The Proposed PFRSE/D Algorithm based system offers two layers of protection, simultaneous encryption and watermarking, which address all issues related to security, privacy, and digital rights management. Then the results demonstrate that the new PFRSE/D technique outperforms JPEG in terms of compression quality and compressed file size while providing increased image quality. To design a novel PFRSE/D compression technique that facilitates real-time, high-quality, and low-size imaging. This is a novel use to address the numerous privacy and security issues associated with transmission of biomedical images over the IoT.

Findings: The finding showed that, results examination aftereffect of reversible information accuracy of 98.9 % various techniques and it takes 16ms using the proposed strategy has delivered a more significant number of information reversible precision than different approach.

Result: This proposed work emphasizes and conveys better precision in regards to acknowledgment from the images when contrasted and other conventional procedures. The results are integrated with PFRSE/D compression, thus forming an integral system, optimized for security and trust with minimal energy consumption which has superior performance of its suitability for next-generation IoT applications.

Keywords: Prime Factor Random Shuffle Encryption & Decryption (PFRSE/D), Biomedical Image

INTRODUCTION

Web of Things makes an organized correspondence state of the interconnected system and stages by attracting both virtual and physical world together. With the methodology of remote propelled human administrations based IoT systems, the transmission of remedial data transforms into an ordinary calendar. Along these lines, it is fundamental to build up a valuable model to ensure the security and trustworthiness of the

patient's accurate data transmitted and got from the IoT condition. However, the use of IoT technology in applications has spurred the maximize of real-time data, which makes the data storage and access more difficult and challenging. In this work, more efficient network communication is achieved for healthcare data.

This objective is to perform utilizing PFRSE/D methods and framework encryption calculations together to cover up advanced data in a picture, and

the critical investigation repossessed from the lot information activated with PRFSE/D. The inspiration driving the PRFSE/D isn't simply shielding data, it is the uncertainty of protected data. There are two essential parts of encryption and watermarking addition and immaterialness. In any case, these two properties are mixing up for each other because it is hard as far as possible while keeping the PRFSE/D nuance of a PRFSE/D framework.

LITERATURE SURVEY

The advancement of Information and Communications Technologies (ICT) is modifying our lives. They incredibly influence the economy [1], the course of action [2] and diverse locales of the overall population. This way, human administrations have generally been exceedingly connected with advancement. This relationship has ended up being more grounded throughout the latest two decades. One of the primary roles behind this is the extension of an extensive variety of devices that can be easily presented in most prosperity centers. In like manner, telemedicine, which was first indicated an extended period back, is at present reality and has been significantly made and this improvement has also extended to other human administrations divisions [3].

Accuracy solution, as it's called, is a term that will be every now and again heard in coming years [4]. It starts with genomics and experiences whatever remains of the omics stages, giving multi-scale information to

examination and elucidation [5] Engineering reproduction arrangements are making pharmaceutical participatory, customized, prescient and preventive for the people groups who have modesty of imparting the restorative detail to the next individual [6] The worldwide increment in populace has simultaneously raised the attention to keep up great wellbeing in a large portion of the people [7]. The issue of most clinicians wherever specialist's offices is that there are various patients for consistently. Like this, they need to sit tight for x-column enlightenment before suggesting the patients coordinate the specialists. This outcome will yield the treatment of patients from the clinicians [8] [9] [10].

Hypothetical examination for non-perfect execution of existing techniques is given and thought about the implementation of shading histogram leveling strategies dependent on the 3-D histogram in RGB shading space. The possible reason for the lighting up or over evening out the impact of the Trapani's calculation by introducing power are broke down the Menotti strategy demonstrates agreeable outcomes for most regular pictures. Notwithstanding, the execution of the Menotti calculation relies on the relationship of shading components.

MATERIALS AND METHOD

In this work, a novel smart healthcare system coding with built-in encryption of data and watermarking the encrypted medical image with a technique is called secure Prime Factor Random Shuffle Encryption & Decryption (PFRSE/D) Algorithmic presented in Figure.1

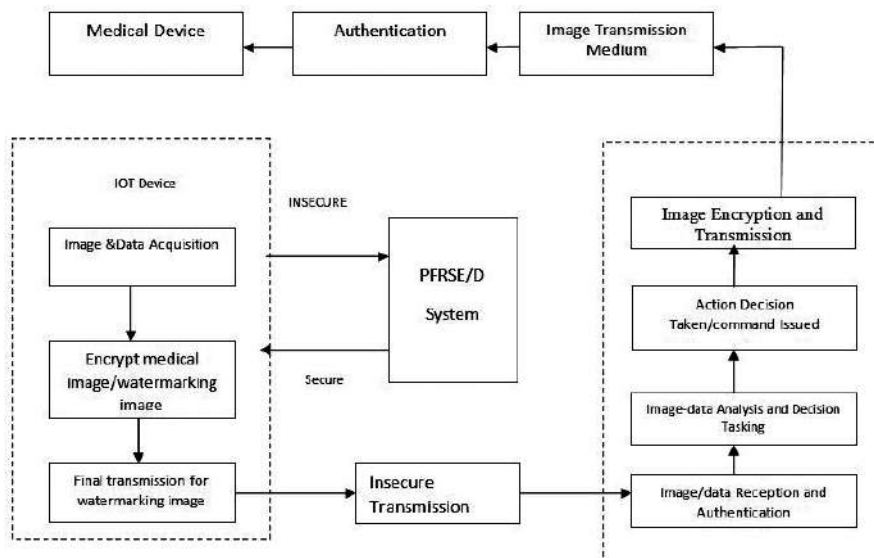

Figure 1: Block diagram for the proposed system

Compared to JPEG, PFRSE/D compression offers better pressure alongside the high feature images and extraordinarily appropriate for continuous data transmission limited situations. The PFRSE/D tends to numerous Digital Rights Management(DRM) issues including privileges of possession, savvy human services framework following of utilization, identification of altering, and confirmation of substance. These savvy human services framework security includes together with consistent execution make the PFRSE/D incorporated tremendously suited for brilliant applications, for example, the IoT based smart social insurance framework.

Preprocessing: The proposed filter preprocessing technique makes the histogram estimation of the image. Mainly watermarking the method considers Image Enhancement that provides an accurate color variation in the image processing. Mostly the histogram analysis of a standard model refers to the histogram of pixel intensity, and its values Pre-preparing Techniques Since the majority of the genuine information is noisy, conflicting and fragmented, so preprocessing winds up important. Image preprocessing is one of the Preliminary advances which are exceptionally required to guarantee the high exactness of the resulting steps The CT and MRI heart images usually comprise of a few curious; persistent special and model handling and gear based items. Understanding particular ancient rarities incorporate movement shaft solidifying, metal antique. Others combine halfway volume impact, ring and staircase relics. So it should have been evacuated by pre-preparing strategies before any examining. The improvement exercises likewise used to leave the ancient film rarities, marks and sifting the images. A few denoising approaches have been overviewed and investigated in this area.

2a) Input image 2b) Preprocessed image
Figure 2: Result of Preprocessing

The preprocessing result of the proposed system IoT based data encryption and decryption is shown in above figure 2.

Segmentation: Multi-model sub-space clustering segmentation with multiple sources of information is a way to separate groups of boundaries in the thermal images after preprocessing technique. It is the process of the watermarking the medical data with the high-quality conversion image. To analyze proposed PFRSE/D algorithm based image communication methods and compare the performance of secured PFRSE/D with conventional scheme. To outline a novel PFRSE/D pressure procedure that energizes consistent, continuous, high caliber, and low-measure imaging. This is a novel use to address the different assurance and security issues identified with the transmission of biomedical pictures over the IoT. To coordinate PFRSE/D pressure, hence shaping a fundamental framework, upgraded for security and trust with low vitality utilization which has the effective execution of its appropriateness for cutting-edge IoT applications.

a) Output Of Preprocessing b) Result of segmentation
Figure 3: Segmentation of Proposed system

The segmentation result of the proposed system IoT based data encryption and decryption is shown in above figure 3.

Features Extraction: Highlight Extraction this stage is a necessary stage that uses calculations and procedures to recognize and isolate distinctive needed bits or conditions of a given picture. Exactly when the data to an estimate is too considerable ever to be taken care of potentially, and it is suspected to be very monotonous, by then the data will be changed into a lessened depiction set of features. The essential characters of the element area zone, border, and unpredictability. These are estimated in a scalar. These highlights are characterized as pursues:

Energy: The energy extent of consistency between the pixels extend = [0, 1]. The consistency of the pixel has communicated

$$\text{Energy} = \sum_{i,j=1}^{N-1} (p_{i,j})^2 \dots(6)$$

Energy is an element that estimates the smoothness of the image. Less smooth the district is, the more consistently appropriated Pij and the lower will be the estimation of the precise second minute. Where Pij is the ijth passage of the standardized co-event framework, N is the number of thermal images

Contrast: Contrast is the measure of the distinction in luminance to make value discernable. Range = [0, 1].

$$\text{Contrast} = \sum_{i,j=1}^{N-1} p_{i,j}(i-j)^2 \dots(7)$$

Where N-1 indicates the measurement pixels in the image and Pij denotes the color value.

Standard Deviation: It is a generally used to calculate of changeability or decent variety used as a part of insights. As far as image preparing, it signifies how much variation or “scattering” exists from the normal (mean, or expected value).

$$\text{SD} = \sqrt{\dots(8)}$$

Where Σ means “sum of the function,” x is a value in the images, is the mean of the image and N is the numeral of data points in the picture.

Variance: The variance σ² is an image of variance, that is the squares of the standard deviations, in the values of the input or output images.

$$\sigma^2 = \frac{1}{N} \sum \bar{X}$$

Where the image is vector and is the mean given by 1/N

a) Segmentation Image b) feature extracted Image

Figure 4: Segmentation of Proposed system

The segmentation result of the proposed system IoT based data encryption and decryption is shown in above figure 4.

PRIME FACTOR RANDOM SHUFFLE ENCRYPTION ALGORITHM (PFRSE) ALGORITHM

The image encryption algorithm reads the input image and converts them into the matrix array. For each matrix, the method converts to ASCII and binary. The binaries value is then converted to byte and selects the secret key with the location in the pattern.

Now the method generates the random number to identify the pixel to be encoded. Using the PFRSE algorithm the process creates the mirror pixel set. Finally, the proposed technique substitutes the bytes and shift rows with mix the columns. Generated matrix is then added with the round key to produce the result.

Encryption Algorithm

Encryption Algorithm:

Input: Bio-medical image Pt.

Output: PFRSE encrypted Image Ct.

Start

Bio-medical image

Split image into matrix.

For each matrix value

Read the pixel value from the matrix file

Get ascii value and get binary equivalent

Transform to byte

Select the secret key and choose one location in the string

Generate a random number from the lookup table

Perform mathematical operation

Add the character of the random number to the sequence

Generate mirror string and

End

Stop

PFRSE BASED IMAGE DECRYPTION ALGORITHM

Encryption Algorithm

```

Decoding Algorithm:
Input: Cipher image
Output: Original image
Start
  Read cipher
  For each nipple
    Inverse Substitute keys
    Inverse shift rows
    Inverse Mix Columns
    Check the key and
    Perform mathematical operation
  End
  Bio-medical model.
Stop.
  Decode code sequence and perform the inverse operation
  Transform every byte of the string
  Read Ascii value of the binary string and identify the character.
  End
  Bio-medical image.
Stop.
    
```

The image data decryption algorithm reads the cipher image and converts into nipples. Then for each nipple, the method inverse the substituted keys and reverse the rows and columns. Then the process checks the key and performs the mathematical operation. Then the technique decodes the sequence. The decoded information is then transformed to the byte of string and converts to ASCII to produce the character.

RESULT AND DISCUSSION

The code has been written in MPLAB and tested. In this process have fixed a particular image value for each system and if there is any change in the reading it displays the input image, data hiding, data recovery, update on the internet and sends a message to the server.

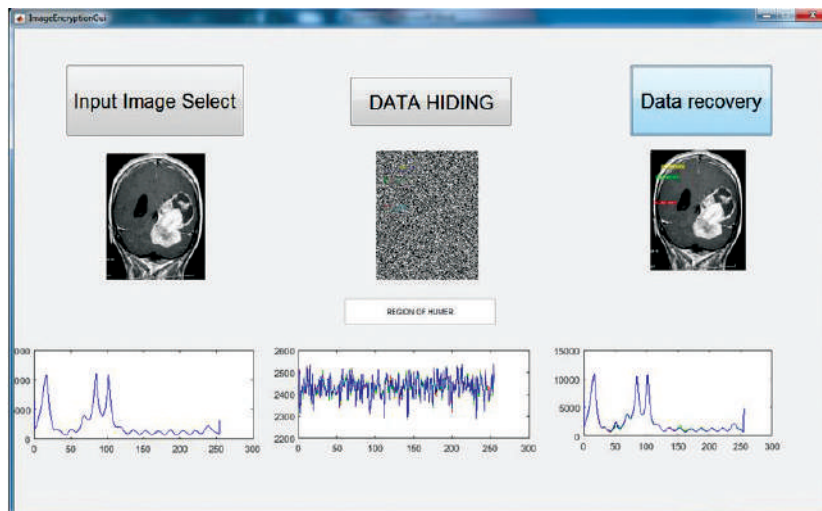

Figure 5: simulation result of the proposed system

In this step, we get the final result of getting the input image to specify the correct person the step we called data recovery. Form the technique using Finally Biomedical image through IOT and software we used in MATLAB.

Figure 6: histogram of an Input image

The above Figure 6 shows the histogram motion for the image of the section by utilizing the irregular square choice technique. The x-axis of the histogram speaks to the scope of force (pixel) values while; y-axis speaks to the check (frequency) of these powers esteems that happens in animage.

Figure 7: histogram of the encoded image

The above Figure 7 represents the histogram signal for an encrypted image by utilizing irregular square choice technique when contrasted with information image the scrambled image has little clamor. This is on account of while encoding the canister esteems, and the critical shading data is exceptionally very much held and just undesirable receptacle esteem is truncated and considered for sparing storage space.

Figure 8: histogram of the decoded image

For image encryption, the info image and encoded image has distinctive histogram diagram appeared in number 7 and figured 8. While unscrambling the information from an encoded image, a similar histogram diagram esteem has gotten in number 8. When contrasted with other customary strategies in the proposed arbitrary square choice framework there will be no information misfortune and blunder.

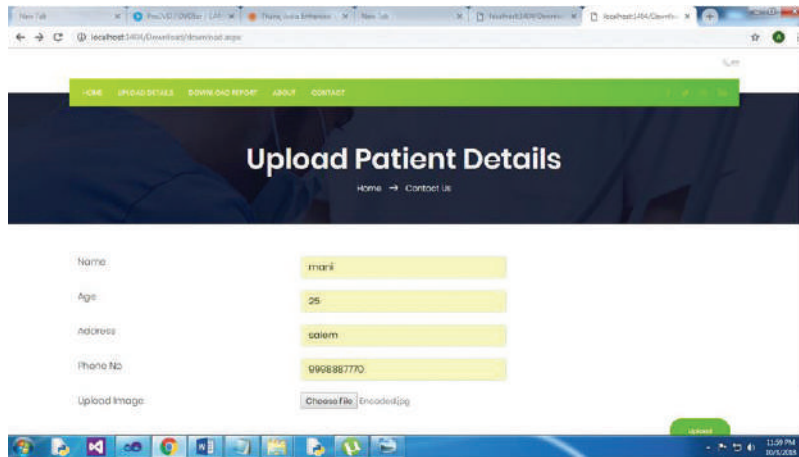

Figure 9: Simulation result of IOT

In this method, we fill current patient details, Name, age, phone image, upload image and upload the details.

Figure 10: Comparison of data hiding efficiency

Figure 10, demonstrates the examination of information hiding proficiency delivered by various strategies and it indicates plainly that the proposed RBS strategy has given more successful than different techniques.

Figure 11: Comparison of reversible data accuracy

Figure 11, demonstrates the examination aftereffect of reversible information exactness of various techniques and it indicates unmistakably that the proposed RBS strategy has delivered a more significant number of information reversible precision than different approach.

Figure 12: Comparison of Time complexity

Figure 12, exhibits the examination of time unpredictability created by various strategies and it demonstrates unmistakably that the proposed RBS strategy has delivered less time many-sided quality than different techniques. In this module, we look at the execution of the current, and the proposed framework demonstrates inserting rate and recovery exactness of the picture and messages. PSNR is most effectively settled through the mean squared error (MSE).

Figure 14: Performance Comparison

The above figure 14 demonstrates the graphical portrayal for assessment measurements like MSE, relationship factor and PSNR acquired for our proposed and existing techniques. From the diagram, our proposed RBS strategy conveys better precision in regards to acknowledgment from the pictures when contrasted and other customary procedures.

CONCLUSION

After extensive regions, the model of animage handling application was planned and executed. Work, wellbeing observing framework configuration depends

on scientist thought that meets to the patients require. According to the thought of regular, this system still being used from their assembling yet it is exceptionally cumbersome to deal with exclusively, and size and cost are likewise more contrasted with the development framework, and furthermore, it takes more than 1 minute for getting the correct outcome. During the first stage of the development, the biomedical User Interface was created. It required careful consideration of the purpose of the program, to sum up, the outcome of this thesis is a simple program that presents possibilities of Mat lab and the biomedical tool.

A Comprehensive Framework for Network Connectivity: A Study on IOT Networks

M Saravanan Muthaiyah¹; Thein Oak Kyaw Zaw¹

¹Multimedia University, Jalan Multimedia 63100 Cyberjaya, Selangor, Malaysia

ABSTRACT

Objective: This paper focusses on identifying a comprehensive network connectivity criteria set for IoT, with the advancement of Internet of Things (IoT) in many areas. Since, researchers are looking into network connectivity that will be best incorporated with IoT¹.

Analysis: First round of information gathering was done by examining research and technical papers as well as white papers and technical forums. Subsequent to that, two levels of interactive systematic Delphi rounds were applied to develop a holistic criteria set.

Method: Round one of Delphi was used to get as many indicators as possible for the criteria set from the experts. Round two of Delphi, was to ensure that the experts were in agreement with the combined criteria set from Delphi round one.

Findings: It is strong in finding information of unknown by means of consensus from the experts.

Result: Results obtained showed that experts were in agreement of a criteria set for IoT which can be referred to as a comprehensive network connectivity criteria set. Developers and manufacturers alike can use this as a guide in deciding the appropriate type of connectivity that is needed for their IoT hardware.

Keywords: Network Connectivity, Criteria Set and IoT

INTRODUCTION

A plethora of network connectivity options are available for IoT devices today, such as Wi-Fi, Bluetooth, Zigbee and WiMAX². New network connectivity options are also introduced from time to time. Upgrades are quite apparent in cellular network connectivity due to the exponential growth in innovation. Seamlessness is an important feature for IoT connectivity. Importance of seamlessness in network connectivity can be observed by looking at Alipay in China³. Alipay is a fintech company that allows payments to be made online through mobile phones and integrated payment machines in stores (Alipay, 2017). It has been so successful that substantial amount of the payments in China are done online through Alipay. As the number of network connectivity increases, seamless connectivity of devices becomes crucial. Tillman (2013) estimated that 50 billion devices will be connected to the Internet by the year 2020⁴. Mathematically, it means that the number of connected devices has far exceeded the number of people on this planet and that is not a small figure.

As the number of connected devices grow, the demand for IoT grows as well. Bjorlin (2017) reported that the IoT industry has grown to 2,888 companies and employs approximately 342,000 people⁵. This amount shows that there are many companies engaging into IoT and robust network connectivity is required to handle it (Menon, 2014). Khodadadi, Dastjerdi & Buyya (2016) estimated that in year 2018, there will be more than 30 million IoT devices worldwide with market size to reach astonishing \$1.71bn dollars by year 2020 (The Market Mogul, 2017). Figure 1 shows what The Market Mogul (2017) has stated.

Figure 1: Market Size of Global Internet of Things (IoT) from 2009 until 2019

The gigantic number of IoT devices will keep on expanding and it will require different network connectivity that will work for the devices⁶. Thus, choosing a network connectivity that will work seamlessly with the current or future technology for IoT devices is crucial. Also the chosen network attributes must be holistic for each network connectivity. This includes attributes such as range, latency, reliability, security, frequency protocols, battery life, bandwidth and modulation. Such a criteria set has to be endorsed by experts in order to make it complete. In other words, a comprehensive network connectivity criteria set for IoT can be achieved with careful planning with inputs from experts. The objective of this research is to identify comprehensive network connectivity criteria set for seamless IoT connectivity which is the gap that this study will contribute towards.

LITERATURE REVIEW

Literature shows that a comprehensive criteria set is not yet available. This scenario can be observed by going through DesignSpark (2014) where it gives out only 4 criteria list for each of the network connectivity for IoT. They are standard, frequency, range and data rates with a total of 11 network connectivity discussed. The same can be observed for IBM (2017) as well where it was mentioned that criteria set that should be considered when going for IoT are range, bandwidth, power usage, intermittent connectivity, interoperability and security. DesignSpark (2014) and IBM (2017) shows that they are only considering basic attributes of the network connectivity and does not have a comprehensive criteria set. Serrien (2014) provided more detailed criteria set for network connectivity such as power consumption, radiated power but it is still inadequate to accomplish a comprehensive set⁷. This is because it lacks many aspects such as implementation and costing which makes it unreasonable to become comprehensive.

LinkLabs (2016) on other hand gives quite a comprehensive list for network connectivity for IoT but it is lacking in the criteria set provided. It discussed main network connectivity attributes that are potential for use in IoT. Although LinkLabs (2016) had provided many features for network connectivity, but it is using a fraction of the needed set criteria. Perhaps one of the more comprehensive network connectivity criteria set list is from Karimi and Atkinson (2013) where the author has

provided a total of seven attributes. The author included network types and topology as the attributes which are important attributes that has yet to be provided from previous authors. As for Telenor Connexion (2014), only five attributes were used to deploy IoT solutions into businesses. They are flexibility, scalability, security, reliability and manageability. Flexibility was not discussed in details making it vague attribute. With only few items listed, the set is too small to be accepted as comprehensive⁸. The most recent study can be found by looking at Kondratenko, Kondratenko, and Sidenko (2018) who proposed eight attributes for selecting IoT network connectivity. They are reliability and dependability, safety and security of data transfer, maximum signal range, throughput, data rate, network topologies application, minimum latency and wireless power transfer⁹. The list offers a broader scope when comparing with the previous sources. Even so, some of the items need modification in the terms of use and a much better comprehensive criteria set can still be achieved.

In choosing a suitable IoT platform, IoTIFY (2017) proposed some acceptable attributes. They are scalability, bandwidth, protocol, and security. Some items from the source were not accepted as it talks about cloud criteria selection and platform infrastructure rather than the network connectivity criteria set itself¹⁰.

Blue App (2016) on the other hand, provides only range, data rate, power and security as the criteria for best network connectivity for IoT. Both IoTIFY (2017) and Blue App (2016) does not provide many attributes for a achieve comprehensive criteria set. Lethaby (2017) gave range, throughput, power consumption, network topology, desktop/mobile device compatibility, cost, ease of integration and security as key attributes. The criteria set is good in a sense that it covers from integration part to the characteristics of the network connectivity. Even so, Lethaby (2017) still cannot be accepted as comprehensive as many of the characteristics such as architecture to scale were left uncovered.

Attributes from Al-Sarawi, Anbar, Alieyan, and Alzubaidi (2017) is by far the most comprehensive. It contains twelve attributes with references for each of the criteria. While it is considered quite adequate for its network connectivity criteria set, it is also not complete. This is because attributes such as architecture to scale and maximum message size of the network connectivity are left untouched. Conclusion that can be made from these

studies is that a comprehensive network connectivity criteria set for IoT is still very much desired and is the key research gap that this study is addressing.

METHODOLOGY

Methods used in this study are divided into three main stages. The first stage was getting the information for a comprehensive network connectivity criteria set from research papers, journals, white papers and technical forums. This involved going through all the resources that were related to network connectivity criteria set list for IoT. In the second stage, two rounds of systematic Delphi method were used with one-month interval. During Delphi round one, experts were asked regarding on comprehensive network connectivity criteria set for IoT that they think and believe must be included. The information gained from the Delphi round one were analyzed and acceptable criteria that were not included from the initial research was included.

In Delphi round two, results from Delphi round one were shown to the experts. In this round, experts were asked whether the list is comprehensive enough and whether the criteria set needs modification. This was to ensure that a comprehensive network connectivity criteria set list for IoT is achieved. Results from Delphi round two were analyzed and evaluated and a comprehensive criteria set for IoT was obtained. General workflow of the whole process is shown in Figure 2 below.

Figure 2: General workflow of methodology

Delphi methodology was chosen because it is a strong and solid way of research in finding information of unknown by means of consensus from the experts. Feedback from rounds of Delphi also will widen knowledge and stimulate new ideas which highly motivates the people involved (Phil, 1971). These feedback process allows the experts to reassess their initial judgement and to modify it if needed making it having less chance for discourse. Besides being educational to the researchers, it is also educational to the experts (Stokes, 1997).

RESULT AND DISCUSSION

From research, 20 network connectivity criteria set for IoT had been identified that will make the criteria set to be complete. Table 1 shows the results from the research. With regards to Delphi methodology, 10 experts were interviewed and the demographic profile of the experts were shown in Table 2. Although there is a variation in the number experts to be included, Reid (1988) notes panel size ranging from 10 to 1685.

Selection of experts also were quite high in standards where one the criteria to be selected require minimum experience of 5 years in network connectivity or IoT profession. The knowledge nomination worksheet of the experts were shown in Table 3. The pool of experts are also quite diverse in a sense that the study benefitted not just from developments’ point of view but managerial point of view as well. This advantage may give the criteria set an added advantage by taking views from multiple areas. An improvement that can be undertake in future is to add more experts to the pool or redo the study again with different experts in order to observe if the criteria set has any changes.

Table 1: Comprehensive Network Connectivity Criteria Set for IoT from research

No.	Criteria Set
1.	Range
2.	Operating Frequency
3.	Data Rate
4.	Number of Users
5.	Topology
6.	Securities
7.	Encryption
8.	Energy/Power Requirement
9.	Current IoT Application
10.	Reliability
11.	Latency
12.	Costs
13.	MTU (Maximum Transmission Unit)
14.	Network Type
15.	Protocol
16.	Operating mode(s)
17.	Channel bandwidth
18.	Modulation Types
19.	Scalability
20.	Signal Penetration into Building

Table 2: Demographic Profile of Experts

Profile		Frequency	Percentage (%)
Gender	Male	9	90
	Female	1	10
Experience	Only in IoT	4	40
	Only in network connectivity	1	10
	IoT and network connectivity	5	50
Position	Manager/Director	2	20
	IoT developer/architect/engineer	4	40
	Network developer/architect/engineer	4	40
Location	Malaysia	10	100

Table 3: Knowledge Nomination Worksheet

Disciplines or Fields	Skills requirement (minimum 2)	Must have requirement
Academic	1. Deep knowledge/experience in network connectivity 2. Deep knowledge/experience in IoT	1. Have been an academicians for at least 5 years
Practitioner	1. Deep knowledge/experience in network connectivity 2. Deep knowledge/experience in IoT	1. Working or owns a company that is related

From Delphi round one, a total of 74 answers were gathered from 10 experts including rejected and selected ones. Figure 3 shows the rates for accepted and rejected opinions’ of experts from Delphi round one. From Figure 3, it shows that 73% of the experts’ opinions are rejected for Delphi second round. This however, is a good indicator that the research has been done properly in getting the comprehensive network connectivity criteria set list.

Acceptance versus rejection of experts’ opinions from Delphi round one

Figure 3: Acceptance versus rejection of experts’ opinions from Delphi round one

Criteria that were accepted are the one that fulfills the attributes of the network connectivity itself. Table 4 shows the accepted criteria set from Delphi round one that has been accepted with its frequency of occurrence from all of the experts. From Table 4, it shows that the highest frequency occurrence is the disaster recovery time.

Table 4: Selected experts’ opinions from Delphi round one

No.	Criteria Set	Frequency	Percentage (%)
1.	Disaster Recovery Time	4	20
2.	Interoperability (continuous ability to send and receive data among the interconnected networks)	1	5
3.	Network’s nature footprint	1	5
4.	Network Numbering and Addressing	1	5
5.	Roaming/Mobility ability	1	5
6.	Flexibility (ability to view, monitor and manage devices)	2	10
7.	Consistency (Response time)	1	5
8.	Failure Rates (Frequency of failures)	2	10
9.	Environmental factors	2	10
10.	Mean Time Between Failure (MTBF)	1	5
11.	Robustness (ability to withstand failures and perturbations)	1	5
12.	Ease of access	2	10
13.	Ease of implementations	1	5
	Total	20	100

While the second highest frequency are flexibility, failure rates, environmental factors and ease of access. A note should be taken that all of these items are included in the second round of Delphi. These 13 items were further discussed in Delphi round two on whether the items should be added or edited. Results for Delphi round two were shown in Table 5. Six attributes were accepted out of thirteen attributes listed from Delphi round one. Many of the attributes were not selected because experts are having disagreement between themselves on whether the attributes should be included or not. Therefore, with the results from Delphi round two, a comprehensive network connectivity criteria set for IoT was obtained and it is shown in Table 6.

Table 5: Accepted criteria set from Delphi round two

No.	Criteria Set	Disagreements Frequency
1.	Interoperability (continuous ability to send and receive data among the interconnected networks)	2
2.	Roaming/Mobility ability	0
3.	Environmental factors	1
4.	Mean Time Between Failure (MTBF)	0
5.	Ease of Access	1
6.	Ease of implementations	1

18.	Modulation Types
19.	Scalability
20.	Signal Penetration into Building
21.	Interoperability (continuous ability to send and receive data among the interconnected networks)
22.	Roaming/Mobility ability
23.	Environmental factors
24.	Mean Time Between Failure (MTBF)
25.	Ease of Access
26.	Ease of implementations

To ensure the holistically of network connectivity criteria set for IoT, Delphi methodology helps by backing up the prior research that has been done. From the outcome, it can be said that the result has been satisfactory and has achieved sufficient credibility. It shows that the set is comprehensive enough that there no attributes of the network connectivity that is important to IoT has been left out. Further improvement that can be proposed is by finding more experts to redo the Delphi rounds and see if the criteria set remains the same. Another improvement can be proposed is to add more experts to the pools of the experts available. As written by (Weaver, 1971), "Delphi operates on the principle that several heads are better than one...". Therefore, addition of more experts to the pool will certainly makes it better.

CONCLUSION

The availability of a comprehensive network connectivity criteria set for IoT will tremendously help organizations in implementing IoT. With very less resources available for the public to clutch, the criteria set will be an important resources to many. From the results shown, it can be concluded that a comprehensive network connectivity criteria set for IoT has been attained.

Although there might be some areas where the set can be disputed, it will not effect the comprehensiveness

of the criteria set. The criteria set stands strong and sturdy with sufficient satisfactory and credibility that it can be concluded as a comprehensive set.

An Appraisal of the China's Claims in the South China Sea Territorial Disputes

Muhamad Hassan Ahmad¹, Ashgar Ali Ali Mohamed¹, Mohammad Naqib Ishan Jan¹

¹Department of Civil Law, Ahmad Ibrahim Kulliyah of Laws, International Islamic University Malaysia, Kuala Lumpur, Malaysia

ABSTRACT

ABSTRACT

Objective: This paper predominantly aims at evaluating the territorial claims made by China in the South China Sea as to whether or not these claims are in accordance with the contemporary international law. This study is primarily doctrinal and qualitative in nature.

Analysis: China claims almost 90 percent of the South China Sea by arguing that both maritime and land territories in the region were regarded as integral parts of the Chinese nation since centuries ago. In the same vein, other disputing parties also made numerous claims to their respective contiguous parts of the South China Sea. Despite the fact that these nations have been trying to resolve the disputes, tensions among the rival countries have steadily increased.

Method: The authors propose that China has to acquire the sovereignty over land territories in the South China Sea in conformity with the modes of acquisition of state territory under contemporary international law. Then, it can claim maritime boundaries on the basis of the land territory in accordance with the relevant provisions under the United Nations Convention on the Law of the Sea 1982 (UNCLOS 1982).

Findings: The paper greatly contributes to evaluate Chinese territorial claims in resolving the South China Sea territorial disputes.

Result: It is thus proposed that the adjudicative settlement either before the International Court of Justice (ICJ), the *International Tribunal for the Law of the Sea* (ITLOS) or an ad hoc international territorial arbitration would be desirable between or among the parties to deliberate further on the disputes with the view to maintain the international peace and security.

Keywords: State territory, territorial dispute, boundary dispute, South China Sea, international dispute resolution

INTRODUCTION

In the contemporary world, the South China Sea appears to be one of the most controversial areas that triggered several maritime boundary and territorial disputes among various nations in the Southeast Asia. Subject matters of these disputes comprise the Pratas Islands (*Dongsha Qundao*)¹, the Scarborough Shoal (*Huangyan Dao*), the Macclesfield Bank (*Zhongsha Qundao*), the Paracel Islands (*Xisha Qundao*), and some other rocky outcrops, atolls, sandbanks, reefs and numerous submerged features in the South China Sea (US Department of State, 2014).

The disputed areas in the South China Sea are rich in natural resources and consist of world major sea lanes through which multi-trillion dollars worth of goods are transported annually (Fensom, 2016). Therefore, authors intend to evaluate the Chinese sovereign claims in the South China Sea as to whether or not these claims are in accordance with the contemporary international law in the following discourses.

HISTORICAL BACKGROUND OF THE CHINA'S CLAIMS IN THE SOUTH CHINA SEA

In general, the origin of the South China Sea territorial and maritime boundary disputes can be traced

back to 1894 in which the Sino-Japanese War broke out and China lost its territory in Taiwan as well as on the Liaodong peninsula as the Chinese military was defeated by the Japanese (Nish, 1995).

Again, in 1945, the three victorious nations in the World War II convened the Potsdam Conference which declared that: “The terms of the Cairo Declaration shall be carried out and Japanese Sovereignty shall be limited to the islands of Honshu, Hokkaido, Kyushu, Shikoku² and such minor islands as we determine” (Wan, 2005). After the Japanese unconditional surrender in the World War II on 02 September 1945, the Japanese signed the instrument of surrender at Tokyo Bay and accepted the provisions set forth in the declaration issued at Potsdam. In this way, the Cairo Declaration and the Potsdam³ Declaration became part of the conditions for the Japanese surrender (Lohmeyer, 2008).

Eleven-dash line: On 01 December 1947, China - under the rule of the Kuomintang Party - claimed sovereignty over maritime territories in the South China Sea within an Eleven-Dash Line on a map. These Dash Line claims are also referred to as the “Dotted Line,” “U-Shaped Line,” and “Cow’s Tongue” by various commentators⁴.

Fig. 1: Eleven-Dash Line Map

Source: (US Department of State, 2014)

In 1949, the Communist Party came to power in China and renamed country as the People’s Republic of China⁵. The new government ousted the Kuomintang Party from the mainland China. In December 1949, the Kuomintang Party fled to Taiwan and formed a government in exile.

The final peace agreement with Japan could not settle well until 1951 due to the fact that separate governments claiming for China, i.e., the People’s Republic of China (Mainland China) and the Republic of China⁶ (Taiwan) (National Diet Library, 2003).

On 08 September 1951, the Treaty of Peace with Japan (also known as the San Francisco Peace Treaty), signed between Japan and 48 Allied Powers (Lohmeyer, 2008), in which Japan agreed that it not only “renounces all right, title and claim to Formosa⁷ (Taiwan) and the Pescadores (Penghu)” (Article 2 (b) of the San Francisco Peace Treaty) but also “renounces all right, title and claim to the Spratly Islands and to the Paracel Islands” (Article 2 (f) of the San Francisco Peace Treaty). In addition, it further renounces all special rights and interests in China (Article 10 of the San Francisco Peace Treaty).

Nine-dash line: In 1953, the People’s Republic of China removed two of the dashes encompassing the Gulf of Tonkin and reduced it to be the Nine-Dash Line (Brown, 2009). Since then, China had asserted its claims over the disputed territories in the South China Sea on the basis of this Nine-Dash Line claim.

Fig. 2: Nine-Dash Line Map

Source: (United Nations, 2009)

On 04 September 1958, China issued a declaration with regard to its claims on the territorial sea in following words: “The Government of the People’s Republic of China declares: (1) [t]he breadth of the territorial sea of the People’s Republic of China shall be twelve nautical miles⁸. (2) China’s territorial sea along the mainland and its coastal islands takes as its baseline the line composed of the straight lines connecting base-points on the mainland coast and on the outermost of the coastal islands.

Nonetheless, a controversial provision can be found in Article 14 which provides that: “the provisions in this Law shall not affect the rights that the People’s Republic of China has been enjoying ever since the days of the past” (People’s Republic of China, 1998)⁹. It does not specify in which part of the sea China has been enjoying what types of privileges since which days of the past.

Ten-dash line: In June 2013, the SinoMaps¹⁰ Press – the sole Chinese state mapping authority under the State Bureau of Surveying and Mapping – published the latest national map that adds a Tenth-Dash Line to the east of Taiwan as a part of its official sovereignty claim to the disputed territories in the South China Sea (Graham, 2013).

Fig. 3: Ten-Dash Line Map

Source: (US Department of State, 2014)

It is not surprising to see that this Ten-Dash Line claim includes Taiwan again as a subject matter of

China’s claim - apart from maritime features that have mentioned above, i.e., the Pratas Islands, the Scarborough Shoal, the Macclesfield Bank, the Paracel Islands, the Spratly Islands, James Shoal and some other rocky outcrops, atolls, sandbanks, reefs and numerous submerged features in the South China Sea (US Department of State, 2014).

Objections from the neighbouring States: Other neighbouring disputant States (i.e., Brunei, Malaysia, the Philippines and Vietnam) have officially been protesting these Dash Line claims made by China in the South China Sea in various ways including diplomatic means, political means, adjudicative means and sometimes even by way of using force at different point of time. In January 1987, China established a physical presence on Fiery Cross Reef in the Spratly Islands and Vietnam occupied several reefs in response.

Article 5 (a) of Annex I to the Rules of Procedure of the Commission on the Limits of the Continental Shelf, the Chinese Government seriously requests the Commission not to consider the Joint Submission by Malaysia and the Socialist Republic of Viet Nam. The Chinese Government has informed Malaysia and the Socialist Republic of Viet Nam of the above position” (United Nations, 2009). The attached map referred to in this Note Verbale can be seen in the figure 2.

On 14 April 2011, the Chinese Permanent Mission to the UN submitted another Note Verbale to the Secretary-General of the UN by stating that: “China has indisputable sovereignty over the islands in the South China Sea and the adjacent waters, and enjoys sovereign rights and jurisdiction over the relevant waters as well as the seabed and subsoil thereof. China’s sovereignty and related rights and jurisdiction in the South China Sea are supported by abundant historical and legal evidence” (United Nations, 2011). China became more assertive in its claims over the South China Sea on the basis of the historic title through this Note Verbales in 2011.

As the Tribunal had already satisfied that it has jurisdiction to accept the submission made the Philippines, China’s non-participation does not bar the Tribunal from proceeding with the arbitration. Thus, China is bound to comply with the award of the Tribunal in accordance with Article 11, Annex VII of the UNCLOS 1982 which states that: “The award shall be final and without appeal, unless the parties to the dispute have agreed in advance to an appellate procedure.

In response to this arbitral award, China declared that it neither accepts nor recognises the award. To

make the matter worse, China went on to the extent of militarisation of the disputed areas in the South China Sea by deploying surface-to-air missiles on Woody Island, one of the Islands in the Paracel Island chain (Council on Foreign Relations, 2017).

THE APPRAISAL OF THE CHINA'S CLAIMS IN THE SOUTH CHINA SEA

Albeit China has three different Dash-Line claims, i.e., Eleven-Dash Line (1947), Nine-Dash Line (1953) and Ten-Dash Line (2013), it has never provided a proper chart that specifically described its maritime entitlements in the South China Sea as required by the UNCLOS 1982 (Articles 16, 47, 75, 76 (9) and 84 of the UNCLOS 1982).

As it can be seen from the above map, the dotted lines in each of the map are not consistent with one another. The questions arises here is that how a State can claim maritime entitlements on the basis of historic title whereas it does not even know how to draw its own maritime boundaries consistently as its claims vary significantly from time to time.

In addition, Article 15 provides that “the equidistant median line should be drawn from the nearest points on the baselines from which the breadth of the territorial seas of each of the two States is measured if the delimitation of the territorial sea between States with opposite or adjacent coasts could not be done with an agreement between the respective State Parties”.

Fig. 4: Dash Lines Map

Source: (US Department of State, 2014)

Until recently, before the emergence of the maritime zones established under the various UNCLOS regimes developed by the United Nations Conferences on the Law of the Sea in 1958 (UNCLOS I), 1960 (UNCLOS II) and 1973-1982 (UNCLOS III), States had been exercising its sovereignty over only narrow water line along their coastal regions and the rest of the sea areas had been regarded as the high seas. It was a widely accepted principle under customary international law that no State can exercise any form of jurisdiction over the high seas.

Land boundary claims: If China is making land boundary claims, China still has to comply with the contemporary international legal principles on the modes of acquisition of state territory. In the past, there was, of course, no unanimous agreement in the international community pertaining to the modes of acquisition of territory. In most part of the world, state territory was merely regarded as the private property of the monarch. Therefore, it is not surprising to see that Grotius and his follower even went on to the application of the concept of acquisition of private property to the acquisition of territory by states (Shaw, 2005).

Besides, a state cannot acquire the territory even by exercising self-defense to repel armed force used against it. This will still be regarded as illegal acquisition of territory due to the involvement of the use of force (Malanczuk, 1997; Hamid, 2011). In the middle of 20th Century, the principle of self-determination was introduced by the UN and, as a result, colonial powers needed to grant independence statehoods to most of the States that were under their subjugation. Accordingly, acquisition of territory by way of subjugation, conquest or annexation was outlawed ever since (Malanczuk, 1997).

Hence, at present, there are only three essential legal concepts in which a State can acquire territory, i.e., occupation, prescription and cession. Besides, accretion is also still a legal mode of acquisition of territory derived due to the geographical changes but not on the basis of any legal notion. Furthermore, there are a few more legal principles upon which the territorial acquisition by a State can be derived, namely, acquiescence, recognition, estoppel, continuity, contiguity, *uti possidesti* and self-determination (Hamid, 2011). The aforesaid contemporary modes and legal principles of acquisition of territory under international law have well been developed by various international arbitrations, tribunals,

the Permanent Court of International Justice (PCIJ) and the ICJ in adjudicating territorial and boundary disputes across the world (Shaw, 2005).

Under the contemporary international law, States are encouraged to resolve “their international disputes by peaceful means in such a manner that international peace and security are not endangered” (Article 2 (3), the UN Charter). Article 33 (1) of the UN Charter obliges the Member States to “seek a solution by negotiation, enquiry, mediation, conciliation, arbitration, judicial settlement, resort to regional agencies or arrangements, or other peaceful means of their own choice” in resolving the disputes like in the South China Sea which is likely to endanger the maintenance of international peace and security.

Still the best way to resolve the disputes between or among the parties would be through adjudicative means in which China has to claim each and every disputed area by providing evidences on how it has acquired such territory in the South China Sea. Therefore, it has to satisfy all the requirements of the relevant mode of acquisition of territory for each of these maritime features such as islands, banks, reefs, etc. Only after acquiring the land territory, it will be able to claim maritime boundaries in accordance with the relevant provisions under the UNCLOS 1982.

CONCLUSION

In a nutshell, it can be seen obviously for the above discussions that China’s sovereign claims over disputed areas in the South China Sea have always been regularly varied from time to time and these claims are mostly not in consistence with the contemporary international law. Hence, not a surprise to see persistent objections from neighbouring disputing States to China’s claims at all time. The authors are of the view that, China has to acquire the sovereignty over land territories in the South China Sea in conformity with the modes of acquisition of state territory under contemporary international law. Only then, it can claim maritime boundaries on the basis of the land territory in accordance with the relevant provisions under the UNCLOS 1982.

These maritime boundaries and territorial disputes are likely to continue until and unless these disputes are resolved in one way or another. The parties to the

disputes have already resorted to all available means but their efforts have not been able to bring any tangible result yet. Of course, any armed confrontation among the disputants is not desirable as it would entail grave repercussions to the international peace and security, *inter alia*. Under the auspices of the UN, members are required to resolve disputes among them in peaceful manners as prescribe in Article 2 (3) and Article 33 of the UN Charter. It is thus proposed that the adjudicative settlement either before the ICJ, the ITLOS or an *ad hoc* international territorial arbitration would be desirable between or among the parties to deliberate further on the disputes with the view to maintain the international peace and security.

Harnessing Business Continuity Management in Malaysian Universities

Husin N. A.¹, Abdullah M², Ali A. H.²

¹Selangor Business School, Menara PKNS, Petaling Jaya, Selangor;; ²Faculty of Business and Accountancy, Universiti, Selangor, Section 7, Shah Alam, Selangor

ABSTRACT

Objective: This paper is to investigate risk management (RM) practices and contingency approaches (CA) as latent factors which can contribute towards improved business continuity planning (BCP) and business continuity management (BCM), both, resulting in higher levels of university resilience.

Analysis: This paper is used to analyze the data with the application of a bootstrapping technique to decide the significance levels for loadings, and path coefficients.

Method: The structural equation model with SmartPLS was done on 220 respondents of top management of the university e.g. Vice-Chancellor, Senate Boards, Deans of Faculties, Head of Departments, as well as non-academic managers such as Bursar, Registrar, Human Resource Managers, IT Managers, Head of Technical Departments, and Heads of Centres of Excellence. The sampling technique used is cluster sampling in public and private universities around Malaysia.

Findings: The finding showed that 50.6% variation in BCM is explained by BCP ($\beta = 0.528$, $p < 0.01$), along with RM ($\beta = 0.079$, $p > 0.01$) and CA ($\beta = 0.164$, $p > 0.01$). The findings also confirmed that both CA and RM have significant relationships with BCP, by explaining 61.1% variance.

Result: This study emphasises on the needs of the university to include BCP and BCM in their agenda for its strategic management.

Keywords: risk management, contingency approach, business continuity planning, business continuity management, public, private, university

INTRODUCTION

Universities all around the world nowadays are facing a lot of challenges. Currently, Malaysian universities experience declining funding, tough competition from local and overseas universities, intensified Malaysia quality assurance (MQA)^[1] requirements, and change of 14th. election political party. Other educational issues can be traced back from elite to mass education, internationalization and globalization high-dependent on information technology, innovative approaches and university ranking^[2] Owing

to these unavoidable evolvments, inviting quite a number research zooming into university challenges and its precautions and solutions ^[3]. Universities are also investigated in different viewpoints for examples students ^[4], curriculum, assessment, lecturers as well as their leaders^[3] Ghasemy, Hussin, Megat Daud, Md Nor, Ghavifekr, & Kenayathulla.

Sirat found out that Malaysian university lack of talented leaders, due to no proper and systematic procedure to appoint the most capable academician to lead the university. He further contended that the present provision in the Universities and University Colleges Act 1971^[4], in regard to the appointment of a Vice-Chancellor, is not up-to-date and not in line with the aspiration in making universities as independent, trustworthy and autonomous entities. On the contrary of the situation in international scenario that best approach of appointing university leaders by having a strict

competitive^[5] and scrupulous search. Unfortunately, the common and current practice do not have meritocracy system in promoting the university leaders. The public does not show its trust on university leadership, this is evidenced that Prime Minister, Tun Dr. Mahathir Mohamad⁶ recently announced that National Professor Council which mainly are university Professors and leaders to be dissolved

LITERATURE REVIEW

In dealing with challenges and risks, normally most businesses would prepare for the worst and unexpected event by having business continuity planning (BCP)^[7] and business continuity management (BCM). BCM is a process that enables an organisation to proactively identify and plan to minimize the impact of risks that could affect its objectives, operations and infrastructure. BCM is concerned with improving the sustainability and resilience of a university.

In a similar front, Amran, Manaf, Che Haat Mohd Hassan, have probed into an exploratory study on risk management disclosures in Malaysian annual reproof 100 listed on the Main and second Board of Bursa Malaysia^[8] companies. Previous research associate with risk management in universities are not many especially in Malaysia^[9]. Bajgoric (2014) conducted a study that examined the relationship between business continuity planning and business continuity management. The finding of the study showed a good relationship between BCP and BCM^[10]. On this basis, we formulate the five hypotheses as follows:

H₁: Risk management (RM) has significantly influenced business continuity planning (BCP).

H₂: Risk management (RM) has significantly influenced business continuity management (BCM).

H₃: Contingency Approaches (CA) has significantly influenced business continuity planning (BCP).

H₄: Contingency approaches (CA) has significantly influenced business continuity management (BCM).

H₅: Business continuity planning (BCP) has significantly influenced business continuity management (BCM).

METHODOLOGY

This research design includes a cross-sectional, quantitative, descriptive and causal relationship examination among the variables that relate to BCM. A set of questionnaire was adopted and adapted from Greer. The population are top management in all public and private and university. The questionnaire was first then emailed to the main target population: Vice-Chancellor, Senate Boards, Deans of Faculties, Head of Departments, as well as non-academic managers such as Bursar, Registrar, Human Resource Managers, IT Managers, Head of Technical Departments, Heads of Centres of Excellence etc. They were chosen as these people are the key players in the universities and well-versed in the management. The emails were sent to 967 respondents for three consecutive times. Only nine emails came in, then the researchers administered the questionnaires themselves. A total of 211 out of 250 questionnaires were received (84.4% response rate).

FINDINGS

Demographic analysis: Table 1 presents the details of the type of institution in this research. From the total of 220, 112 respondents work in private institution which represents 50.8%. Meanwhile, 108 respondents (49.2%) work in public university. Next, the designation holds by the respondents. The total of 166 out of 220 respondents which equal to 75.4% are academicians, and 54 respondents (24.6%) work as the administrators. Then, the total number of employees in the institution of the respondents. The most significant percentage is 59.2% was reported for more than 500 employees, 27.7% which the number of employees is less than 300, followed by 300-500 with 13.1%. The awareness of their administration on the concept of BCM in the institution. The results showed that only 113 respondents who are 51.3% of the total respondents stated that the administration in their institution are aware of BCM. On the other hand, 59 of respondents them (26.7%) responded that their administrator is not knowledgeable about BCM, and 20 respondents (22%) are not sure about BCM. However, 19 respondents 8.9% responded that their institution's administrator is not informed about the ISO 22301 BCM standard. Some 86 respondents (39.3%) were not sure whether the administration is aware or not aware of the ISO 22301 BCM standard.

Table 4.1: Demography Profile

No.	Item	Freq	%
1.	Type of institution		
	Private	112	50.8
	Public	108	49.2
2.	Your designation		
	Academic	166	75.4
	Administration	54	24.6
3.	Total Number of Employees (academic & non-academic)		
	Less than 300	61	27.7
	300–500	29	13.1
	More than 500	130	59.2
4.	Does your institution have Quality Management System?		
	ISO 9000 QMS	151	68.6
	ISO 14000 Environment	6	2.6
	ISO 9001: 2008	2	1.0
	Others	61	27.7
5.	Is the administration in your institution aware of the concept of Business Continuity Management (BCM)?		
	Yes	113	51.3
	No	59	26.7
	Not sure	20	22
6.	Is the administration in your institution aware of the ISO 22301 BCM standard?		
	Yes	114	51.8
	No	19	8.9
	Not sure	86	39.3

Assessment of the Measurement Model: Firstly, the measurement model of all constructs was checked for reliability, convergent validity and discriminant validity, prior to testing the hypothesized of the model. Table 2 shows the scores obtained from the analysis of the measurement model. The average variance extracted (AVE) of all constructs exceeded 0.5 (Bagozzi & Yi, 1988) while the composite reliability scores (CR) were all higher than 0.7 (Hair et al., 2013). As such based on the results of factor loadings, AVE, and CR signified that all the reflective items were proven reliable for the measurement model of the study.

Table 4.2: Measurement Model

Construct	Items	Loading	AVE	CR
Risk Management	B1	0.890	0.721	0.911
	B2	0.878		
	B4	0.801		
	B5	0.823		
Contingency Approach	C2	0.823	0.560	0.863
	C4	0.705		
	C5	0.822		
	C6	0.658		
Business Continuity Planning	C7	0.718	0.583	0.893
	D1	0.720		
	D3	0.796		
	D4	0.818		
	D5	0.695		
Business Continuity Management	D6	0.753	0.674	0.950
	D7	0.793		
	E1	0.781		
	E2	0.869		
	E3	0.816		
	E4	0.856		
E5	0.765			
	E6	0.833		

For next subsequent test, we run the discriminant validity test. As recommended by Hair et al., (2017) and Henseler, Ringle, and Sarstedt (2015) the Heterotrait-Monotrait Ratio (HTMT) score are used to assess the discriminant validity between reflective constructs. Whereas, if the HTMT value is below 0.90, discriminant validity has been established between two reflective constructs. As shown in Table 3, all constructs meet this criterion and we conclude that the constructs have discriminant validity.

Table 4.3: Discriminant validity of the constructs

Variable	BCM	BCP	CA	RM
BCM	0.821			
BCP	0.698	0.764		
CA	0.607	0.755	0.748	
RM	0.483	0.591	0.560	0.849

Note: RM=risk management, CA=contingency approach, BCP=Business continuity planning, BCM=business continuity management

Hair et al suggests that the loadings of measured variables should be higher than the cross loadings by at least 0.1 to indicate sufficient discriminant validity. As shown in Table 4 the loadings of all constructs satisfy this criterion. As such we conclude that discriminant validity is achieved.

Table 4.4: Item Cross Loading

Item	RM	CA	BCP	BCM
RM1	0.890	0.485	0.541	0.399
RM2	0.878	0.506	0.589	0.472
RM4	0.801	0.493	0.423	0.428
RM5	0.823	0.408	0.425	0.321
CA2	0.525	0.823	0.633	0.454
CA4	0.379	0.705	0.513	0.397
CA5	0.498	0.822	0.590	0.485
CA6	0.352	0.658	0.521	0.433
CA7	0.328	0.718	0.557	0.495
BCP1	0.603	0.527	0.720	0.520
BCP3	0.386	0.650	0.796	0.625
BCP4	0.516	0.560	0.818	0.590
BCP5	0.438	0.569	0.695	0.409
BCP6	0.463	0.520	0.753	0.545
BCP7	0.301	0.632	0.793	0.486
BCM1	0.525	0.511	0.621	0.781
BCM2	0.366	0.555	0.565	0.869
BCM3	0.440	0.357	0.511	0.816
BCM4	0.326	0.445	0.556	0.856
BCM5	0.212	0.409	0.485	0.765

Note: RM=risk management, CA=contingency approach, BCP=Business continuity planning, BCM=business continuity management

Assessment of the Structural Model: To estimate the structural model, a bootstrapping procedure with 1000

resamples was run to generate the q-values. Figure 1 presents the structural model while Table 4 presents the results of the hypothesis testing. Risk management ($\beta = 0.079$, $p > 0.01$) and contingency approach ($\beta = 0.164$, $p > 0.01$) are not directly related business continuity management.

Figure: 1

In the test of hypotheses from the structural model, the dataset was run based on non-parametric bootstrapping procedure (Wetzels, Odekerken-Schröder, & Van Oppen, 2009) with 1,000 replications ($n=220$) to test the significance of regression coefficient. The significance of the paths coefficients was determined based on the t-values of a two-tailed test at 1.96 (significance level = 5%) and 2.58 (significance level =1%): whereas one tailed test was at 1.645 (significance level = 5%) and 2.326 (significance level =1%). The results are presented in Table 5 below:

Table 4.5: Hypotheses testing

Hypothesis	Relationship	Beta	Std Error	t-value	Decision
H ₁	RM -> BCP	0.244	0.056	4.362**	Supported
H ₂	RM -> BCM	0.079	0.072	1.092	Not supported
H ₃	CA -> BCP	0.618	0.041	14.967**	Supported
H ₄	CA -> BCM	0.164	0.093	1.758	Not supported
H ₅	BCP -> BCM	0.528	0.123	4.294**	Supported

Note: * $p < 0.05$ (two-tailed); ** $p < 0.05$ (one-tailed); *** $p < 0.01$ (two-tailed)

By referring to the above results, three out of five independent variables were found positively influence the dependent variables. The highest impact was exhibited by contingency approach -> business continuity planning ($\beta = 0.618$, $p < 0.01$), followed by risk management -> business continuity planning ($\beta = 0.244$, $p < 0.01$), and business continuity planning ->

business continuity management ($\beta = 0.528$, $p < 0.01$). We conclude that H1, H3 and H5 are supported and H2 and H4 are not supported.

Table 6 and 7 show that, there was a significant difference in score between the two groups of university by, BCP with $t(218) = -2.858$, $p < .05$, two-tailed with public university ($M = 4.7918$, $SD = 0.7932$) scoring

higher than private university (M = 4.452, SD = 0.8583). The magnitude of the differences in the means (mean difference = -0.3398, 95% CI: -0.5743 to -0.1053). BCM with $t(218) = -2.986$, $p < .05$, two-tailed with Public (M = 5.1897, SD = 0.8996) scoring higher than Private university (M = 4.8046, SD = 0.8915). The magnitude of the differences in the means (mean difference = -0.3852, 95% CI: -0.6396 to -0.1307).

Table 4.6: Group Statistics

	Private University			Public University		
	N	Mean	Std. Dv.	N	Mean	Std. Dv.
Score on BCP	119	4.452	0.8583	101	4.7918	0.7932
Score on BCM	119	4.8046	0.8915	101	5.1897	0.8996

Table 4.7: Independent sample t-test

	Levene's Test		t-test for Equality of Means						
	F	Sig.	t	df	Sig (2-tailed)	Mean Diff	Std Error Diff	95% Conf Interval of the Difference	
								Lower	Upper
BCP Equal variances assumed	.313	.576	-2.852	218	.005	-.33979	.11913	-.57478	-.10481
Equal variances not assumed			-2.858	217.864	.005	-.33979	.11889	-.57430	-.10529
BCM Equal variances assumed	.015	.903	-2.987	218	.003	-.38516	.12895	-.63951	-.13081
Equal variances not assumed			-2.986	217.289	.003	-.38516	.12898	-.63958	-.13074

DISCUSSIONS

This paper is to address the problem of business continuity management in various academic unit in Malaysia university. This paper is consistent with Husin et al., 2018; Bakar, et al., 2017; and Bajgoric, 2014 study. This research has found out that RM and CA have significantly influenced BCP in Malaysia university and BCP alone has greatly affect BCM in Malaysian universities. RM and CA are not directly related BCM. BCP is the precursor to BCM.

Presently none of the universities in the country; national public & private and foreign, have any kind of BCM policy or plans to enact and implement this evolving global continuity paradigm. Nearly, two thirds of all universities in Australia, England, New Zealand and North America have already put in place an active BCM regime and the rest are following suit, with formalized plans to institute one in the next three years.

From the empirical perspectives, both measurement and structural models of the analysis have proven to be

credible in predicting the relationships between RM and CA towards BCP as well as the relationship between BCP and BCM in Malaysian universities. This anticipated outcome is theoretically justified and validated by the institutional theory, especially situations are related to sustainable business practices. The adoption of BCM is highly expected to enhance the university quality. Thus, increase the public's confidence and trust in university.

CONCLUSION

Business continuity planning and business continuity management are vital in Malaysian university. We recommend that the top management to develop ISO 22301 BCM standard-centric environment to be used as a guide in all Malaysian universities as the demography profile showed only 51.2 percent are aware of its existence. Awareness on BCM and training programmes should also be more frequently held. The number of certified BCM professional is much needed to improve university resilience, complimenting the national education developmental agenda, set forth by the government in its

national education blueprint 2013-2025. This is in-line with the government's National Education Blueprint 2015 and its PSPTN Transformation Agenda.

Suggestions for future research: This research has carried out a study on two important factors: risk management and contingency approach that influence business continuity planning. Business continuity planning greatly affects business continuity management. Future research is suggested to expand the factors from the stakeholders' perspective, such as competitive edge and innovation. Besides that, further research could also expand the number of respondents with different demographic backgrounds and their interest and concern towards business continuity management in order to understand clearly pertaining to university sustainability and resilience.

Employment of Refugees: A Malaysian Perspective

Mohammad Naqib Ishan Jan¹, Ashgar Ali Ali Mohamed¹, Muhamad Hassan Ahmad¹

¹Department of Civil Law, Ahmad Ibrahim Kulliyah of Laws, International Islamic University Malaysia, Kuala Lumpur, Malaysia

ABSTRACT

Objective: This paper aims at identifying some challenges of the employment of refugees in enhancing the Malaysian economic growth.

Analysis: The employment of refugees can be challenging to engage for the stakeholders if there is no efficient and proper legal framework to govern the human resources practices for this aspect as there is no legislation dealing with the employment of refugees in Malaysia.

Method: In order to increase the productivity, the method used in existing refugees in the country can contribute as active work in the local workforce and thereby generate revenue for the government.

Findings: It also explores whether developing a legal framework in order to allow and enforce the employment of refugees in Malaysia would be feasible. This study is primarily doctrinal and qualitative in nature.

Result: The paper significantly contribute to some of the key focus areas in the Eleventh Malaysia Plan (2016-2020) such as improving labour productivity in the local economy, generating revenue for the government and promote human rights. Malaysia should create a legal framework for the employment of refugees to boost its fast booming economy.

Keywords: *Refugees, asylum seekers, foreign workers, migrant workers, employment*

INTRODUCTION

The world experiences the worst refugee crisis after the World War II, which results to 86% of refugees being displaced in developing countries. The number of people forced to seek refuge increased every year, due to unavoidable reasons like natural disasters, or even worst; human rights violations, conflicts, or persecution. Governments worldwide have started to be awakened by current events but unfortunately only a few are willing to accept and offer helping hands to the unfortunate refugees. The citizens, on the other hand, tend to show compassion quicker than their governments

Article 1 of the 1951 Convention defines refugees under the Status of Refugees section. Fundamentally, there are two major categories; ‘quota’ refugees, also known as ‘programme’ refugees, are people who are part of organised program and delivered to the UK. The second one is ‘spontaneous’ refugees, or also known as asylum seekers. In the UK, accepted refugees are given the same social and economic rights as the citizens. The only different is that they are given a UN passport instead

that allow them to go to any countries except the country they are originally from. Thus, a number of refugees tend to apply and naturalise to be British citizens ^[1]

There are 145 State are Parties to the 1951 Convention whereas 142 States are Parties to both 1951 Convention and the 1967 Protocol. Cambodia and the Philippines are the only ASEAN countries that are Parties to the 1967 Protocol ^[2]. This potentially results to the protective Malaysia’s policy on refugees, specifically regarding education (refugees are not allowed to attend Malaysian schools), employment (refugees are not allowed to work legally), healthcare (only recognised refugees have access to public health services), arrest, and detention. Nonetheless, during 2015-2016, the government had considered and made public announcement of the plan to provide temporary work permits for Rohingya refugees^[3]

Essentially, access to legal and safe employment is among fundamental human right which is applicable to everyone, asylum seekers and refugees included. Through this access, one have the potential to gain their basic survival needs which then may support their

family, community, and even the country they live in. In addition, the fulfilment of this right allows them to realise their social, cultural, economic, political, and civil rights, thus resulting them to feel valued and useful^[4]

Immigrants in Malaysia, which include 2.1 million registered immigrants and more than 1 million of undocumented immigrants by 2013, have continuously showed that they have enormous role in supporting economic development. Immigrant workers are recorded to be one of the key sources of labour-intensive and low-skilled occupations including agriculture, construction, and manufacturing. According to studies, Malaysia's GDP could be increased by 1.1% through 10% net increase in low-skilled immigrant workers, and this could result to more job creation and wages increment for Malaysians in general^[5]

In this paper, the authors also attempt to show that this reflux of refugees in Malaysia can be a blessing than a menace. Malaysia has already hosting a tremendous number of refugees. Thus, it is prudent to take this as an opportunity to fill the gap in the labour market. It would be very constructive for the society and, of course, the refugees as well.

FUNDAMENTAL PRINCIPLES OF INTERNATIONAL REFUGEE LAWS

International refugee law¹ is defined as “a set of rules and procedures that aims to protect, first, persons seeking asylum from persecution, and second those (whose status is already recognised as refugees)”. It is “designed only to provide a back-up source of protection to seriously at-risk persons. Its purpose is not to displace the primary rule that individuals should look to their state of nationality for protection, but simply to provide a safety net in the event where a state fails to meet its basic protective responsibilities”^[6]

The 1951 Convention is established based on the principle of non-refoulement as stated in Article 33. According to this Article², everyone has the right not to be deported to a country they may be sentenced to persecution, regardless they are State Parties of the 1951 Convention or not. Principle of non-refoulement is considered as a principle of customary international law, and in this Convention, it covers the fundamental rights of refugees as found in Articles 14 up to 30^[8] According to Article 33 of the 1951 Convention, “No Contracting

State shall expel or return (“refouler”) a refugee in any manner whatsoever to the frontiers of territories where his life or freedom would be threatened on account of his race, religion, nationality, membership of a particular social group or political opinion”.

Three major areas are emphasised by the Convention and Protocol combined:

- (1) “The basic refugee definition, along with terms for cessation of, and exclusion from, refugee status
- (2) The legal status of refugees in their country of asylum, their rights and obligations, including the right to be protected against forcible return, or *refoulement*, to a territory where their lives or freedom would be threatened
- (3) States' obligations, including cooperating with the UNHCR in the exercise of its functions and facilitating its duty of supervising the application of the Convention” .

According to Articles 2 to 34, majority of the Articles in the 1951 Convention must be implemented by all agreeing States towards anyone that falls under the refugee definition found in the Protocol. A huge number of States have agreed to both the Convention and the Protocol as both treaties are the cornerstone to the international refugee protection system⁸ (UNHCR, 2014).

REFUGEES AND THE RIGHT TO WORK

The right to work and access to labour market is extremely essential for refugees to allow them to secure dignity, restore their livelihood, be independent, and to contribute to their host country. The 1951 Convention in its Articles 17 to 19 expresses the opportunities of self-employment, wage-earning employment, and employment in liberal sectors^[7]

‘Lawfully staying’ refugees are generally given access to work in the host territory. Many authors describe ‘lawfully staying’ refugee as a person recognised as refugee by the national authorities. States usually emphasise the uncertainty of an asylum seeker, whether the person ultimately be a refugee and then a long-term resident, and that their access to work may affect the economic migration negatively

MALAYSIAN POSITION

According to Mallow, one hundred forty five countries have become parties to the 1951 Convention, yet Malaysia has neither ratified the 1951 Convention nor the 1967 Protocol¹⁰. Malaysia is urged to re-evaluate its assessment on this issue (Mallow, 2017). Despite the continuously growing number of foreign workers, authorities have not managed to fix the national immigration policy.

The principle of non-refoulement is described as: “No Contracting State shall expel or return (‘refouler’) a refugee in any manner whatsoever to the frontiers of territories where his life or freedom would be threatened on account of his race, religion, nationality, membership of a particular social group or political opinion”^[9]. This principle is widely recognised as principle of customary international law which means it is applicable to all nations irrespective of its membership to the 1951 Convention^[10]

Meanwhile, sections 6 and 51 of the Immigration Act 1959/63 are used against illegal migrants. Article 6 describes the boundaries of legal entry, where any person who failed to do so will be strictly punished. Article 51 expresses the offence as ‘unlawful entry or presence in the country’ or persons who overstay in the country. Migrant workers have no authority in determining their length or status of their stay as they rely heavily on their employers on that. Migrant workers have no refugee protection provisions to protect them and they are governed under the Malaysian immigration legislation instead.

REFUGEES AND ILLEGAL IMMIGRANTS: A NECESSARY DISTINCTION

The 1951 Convention and its 1967 Protocol are the beginning for any inquest into the definition of a refugee. It is specified by the 1951 Convention that a person is qualified to be a refugee if (1) the person has already been considered a refugee under prior treaty arrangements or (2) the person is outside the country of his nationality (or not having a nationality) and is unable or unwilling to avail himself of the protection of that country due to a well-founded fear of being persecuted for reasons of race, religion, nationality, membership in a particular social group or political opinion. The latter are frequently referred to as the “inclusion” clauses. If one fails to fall or be qualified under the former, it does not defeat the probability of qualifying under the latter.

PROBLEMS AND CHALLENGES FOR REFUGEES WITHOUT THE RIGHT OF EMPLOYMENT

No special protection or procedures are provided by the Malaysian immigration law for refugees and asylum seekers. Consequently, the ‘refugee’ status is non-existent in Malaysian law and, no special rights are granted to persons who have been recognised by the UNHCR. Therefore, as other undocumented migrants, refugees and asylum seekers are in the same way subject to the Immigration Act 1959/63 as if they have entered or remained in Malaysia unlawfully, exposing them to imprisonment, whipping, detainment and removal. However, at national level, a basic de facto status may be enjoyed by those refugees who have attained recognition from the UNHCR, despite lack of formal recognition and protection. This recognition gives refugee status in international law, and very little special exemption from Malaysian immigration law enforcement. (International Federation for Human Rights, 2008).

In Malaysia, refugees and asylum seekers are not given the right to legal employment. They are forced to work in jobs that are unfavourable by the local population batter terms as 3D jobs (i.e., dirty, dangerous and difficult). This also led to their exploitation by the employers, paying them very little or no salaries at all (Yunus, 2017). Lack of legal employment also leads to social exclusion. It is defined as the feeling of not belonging and exclusion from the mainstream’ and resulting in an entirely ‘urban problem’ (Phillimore, 2006).

UNDERSTANDING THE IMPORTANCE OF THE RIGHT TO WORK IN THE MALAYSIAN CONTEXT

The UDHR and many other international human rights instruments acknowledge that the right to work is given to all as a fundamental human rights principle. The right to be engaged in productive employment should be enjoyed by all. The right to work is greatly connected to economic freedom, to property and a minimum standard of living. It is evident that employment is instrumental to people’s social status, independence, recognition and offering them with an income. Therefore, it is submitted in this paper that employment of refugees is not only beneficial for the refugees themselves, but also it is instrumental to the society as well as Malaysian economy.

For the refugees: It is significant for refugees to be given the right to work. Their dignity and self-respect are enhanced as shown by many studies. It also provides them with satisfaction, hope, and re-establishment of their sense of self-worth. Integration is another benefit provided by employment, and offers a unique chance for “positive socialisation and for the development of resourcefulness”. Better financial self-sufficiency comes with income and independence and decreases economic deprivation, specifically in poor housing.

For the society: Access to legal employment for refugees can have a positive impact to the host society too, as the considerable proportions of refugees are of working ages between 18 to 59. Gaps in the labour market can be filled by the refugees’ expertise and knowledge. It is vital to be noted that if refugees ultimately return to their country of origin, same benefits will be applied.

If the right is not given to asylum seekers and refugees, there will be a high chance that they will either depend on state support and assistance or will be engaged in informal employment. Member States consider both outcomes undesirable. Employment is a vital component of integration that facilitates social contacts between the members of the host states and refugees, resulting in the recognition that integration is a two-way process.

For the economy: Over the past decades, Malaysia has been able to acquire outstanding achievements, including promotion of inclusive growth and eradication of extreme poverty. By 2020, Malaysia has the ambition to become a high-income nation that goes beyond simply attaining a per capita GDP threshold. As it is pointed out by the Eleventh Malaysia Plan, the aim is to accomplish a sustainable and inclusive growth path over time reflecting greater productivity. It can only materialise if it is ensured that all the resources are accessible to the future generation such as productive opportunities and education. It is necessary to also realise their ambitions and if Malaysian economy is competitive globally and resource-sustainable (Moreno, 2016).

First and foremost, the refugees’ right to work with a regulated scheme would address law and order, security and criminal activities in the labour market will be curbed as the legitimate concerns of the government. Working closely with the UNHCR with a government-administered registration system, would offer the government with an essential verifiable identity

documentation and important biometric data, as to who is in Malaysia. Third, allowing refugees to work legally in Malaysia also provide them with a dignified lifestyle and improve their protection mainly for vulnerable women and children.

CONCLUSION

Essentially, access to legal and safe employment is among fundamental human rights which applicable to everyone, including refugees and asylum seekers. Through this access, one have the potential to gain their basic survival needs which then may support their family, community, and even the country they live in. In addition, the fulfilment of this right allows them to realise their social, cultural, economic, political, and civil rights, thus resulting them to feel valued, and useful.

Even though Malaysia is not a signatory to the 1951 Convention, it has already hosted a considerable number of refugees and tremendously contributed to the refugees. Not being a party to the Convention has unfairly affected Malaysia’s reputation, a country that already has done so much for hosting and protecting refugees.

On the matter of refugee’s employment, it is recommended that Malaysia should make use of this refugee’s influx into its advantage by creating a win-win situation for both, i.e. for itself and refugees. As highlighted above, Malaysia should create a legal framework for the employment of refugees to boost its fast booming economy.

The Entrepreneurial Traits as Moderating Variable in the Relationship between Academic Performance and Entrepreneurial Orientation of University Students: A Study in Indonesia Higher Education Context

Harif Amali Rivai¹, Cempaka K Negara¹, Hendra Lukito¹

¹*Faculty of Economics and Business, Department of Management, Universitas Andalas, Indonesia*

ABSTRACT

Objective: This research aimed to exam the role of entrepreneurial traits as moderating variable on relationship between students' academic performance and entrepreneurial orientation. This research was conducted university students.

Analysis: The data were drawn from 250 students through survey using questionnaires. There were four universities participated in the survey. The results of survey were analyzed using hierarchical regression analysis to answer the proposed hypotheses.

Method: Regression Analysis is technique which is used to see the significance of independent variables toward dependent variable. So that, added one variable that indicating interaction.

Findings: The finding of the research found that students' academic performance significantly affected on entrepreneurial orientation of the students. Meanwhile, the students entrepreneurial traits significantly influenced on entrepreneurial orientation. Implications of the finding were also discussed in the paper.

Result: Testing of moderating effect demonstrated that entrepreneurial traits significantly moderated relationship between students' academic performance and entrepreneurial orientation.

Keywords: *Entrepreneurial orientation, entrepreneurial traits, academic performance*

INTRODUCTION

The issues of entrepreneurship in has been interesting discussion for scholars since last two decades¹. The role of entrepreneurship in a nations can be seen from its impact on creating new job opportunities which in turn might reduce unemployment rate. Entrepreneurship is source of innovation and creativity that pushes the one country's economy development and growth (UNCTAD, 2004). Entrepreneurship has been identified as the best solution to reduce unemployment and poverty among the youths, especially higher education graduated who can not find jobs² (Brownhilder 2014). It can be argued that university or higher education institutions could be a starting point to choose the next career afterward for graduated. This issue appears to be essential and important since the chances to find jobs is getting decrease, moreover the job opportunities is becoming more limited for job seeker due to slowly economic growth.

Gorman and Hanion³ (1997) highlights the need of research into what makes an entrepreneur and how the characteristic can be developed through educational systems. Therefore entrepreneurial orientation has been studied extensively with numerous research instruments for some examples, Autio et al. (2001), Engle et al (2010), Louw et al. (1997), Pruett et al. (2009), Reynolds et al. (1994), Segal et al. (2005), Shane (1992) and van Eeden⁴ et al. (2005).

Lumpkin⁵ and Dess (1996) further clarified the definitions issue of entrepreneurship in their 1996 seminal work by making distinction between entrepreneurship and entrepreneurial orientation. They suggested that entrepreneurial orientation⁶ (EO) represents entrepreneurial processes that address the question of how new ventures are undertaken, whereas the term entrepreneurship refers to the content of entrepreneurial decisions by addressing what is undertaken. Prior research findings⁷ related to psychological traits have

been empirical evidence, for example McClelland (1961) claimed that much of the discussion in entrepreneurship has been concentrated on the individual. (Carland Jr. and Carland 1997: 34) The individual traits plays important role in entrepreneurship, (Bulut, et al. 2010: 560) In addition, Dollinger⁸ (1995) argued that every individual's psychological, sociological and demographic characteristics have an effect on a person's abilities to be an entrepreneur. His research is aimed at providing additional insights and understanding to the relationship between psychological traits and entrepreneurial orientation. Investigation psychological traits as antecedent entrepreneurial intention is still continuing until now.

The dimensions of EO⁹ might be identified from various perspectives: autonomy, innovativeness, risk-taking, proactiveness, and competitive aggressiveness. These dimensions represent distinct constructs that may vary independently of each other in a given context. In prior research studies, achievement need, tolerance for ambiguity, risk taking and locus of control have been found to correlate with intention to be entrepreneur¹⁰ (Ahmed, 1985; Begley & Boyd, 1987; Bonnett & Furnham, 1991). Regarding the multidimensional concept of performance we have to point out that its link with EO may depend upon the indicators used to assess performance (Lumpkin and Dess, 1997). The students' GPA might be affected by various factors, such as personal factors, family background, and teaching-learning process. Role of entrepreneurial traits can not be avoided in fostering entrepreneurship in a nation. It has been long debate among academicians to prove whether the entrepreneurs are born or educated. Therefore, the recent research takes into account effect of entrepreneurial traits (i.e. self-confidence, innovativeness, risk taking) that is surmised to strengthen entrepreneurial orientation.

REVIEW OF THE LITERATURE

Entrepreneurial orientation: Entrepreneurial orientation (EO) refers to a strategy making process which guides firms developing constant innovations, adopt a proactive posture in the market and undertake risky investments

(Zahra, 1993; Covin and Slevin, 1989; Stam and Elfring, 2008). It captures various practices, activities and processes that help someone to behave entrepreneurially. According to Covin and Slevin(1989) EO is primarily described with the dimensions of innovativeness, proactiveness, and risk-taking, and Miller, (1983) said that EO consists of three core dimensions: innovativeness, pro-activeness, and risk-taking.

Innovativeness reveals a firm's proclivity supporting new ideas, experimentation and creativity which lead to modification and development of new products, services or technological processes (Lechner and Gudmundsson, 2014; Lumpkin and Dess, 1996; Vij and Bedi, 2012). Pro-activeness means a firm's desire to be in constant motion to be ahead of its competition. Risk-taking refers to the firm's ability to make decisions in light of complex, uncertain circumstances. Wiklund and Shepherd (2005) mentioned that risk taking behaviors can come in the form of investing in a new venture or technology where the probability of success is unknowable or very small.

Academic Performance of Students: In term of academic performance in college, grade point average (GPA) is commonly used as an indicator student performance and achievement to evaluate student persistence (McGrath & Braunstain, 1997; Tross, Happer, Osher, &Kneidinger,2000). GPA is calculated at the end of each term a student is enrolled, the GPA earned during the first semester tends to be better indicator of academic performance than other variable (Allen, 1999; McGrath & Braunstain, 1997). Pascarella and Terezeni (1991) argued that GPA is frequently cited as major indicator of academic performance. The value of using GPA as a measure of academic achievement has been highlighted as GPA has been found to be a significant predictor of persistence and serve as one indication of the degree to which students have responded to the institutional environment (Tinto,1993).

Regarding the multidimensional concept of performance we have to point out that its link with EO may depend upon the indicators used to assess performance (Lumpkin and Dess, 1997). The empirical literature reports a high diversity of performance indicators (Combs et al., 2005; Venkatraman and Ramanujam, 1986); a common distinction is between financial and non-financial measures. In this study, In this article, we use non-financial measures of Academic performance (Murphy and Callaway, 2004, Murphy et

al., 1996 and Gupta and Govindarajan, 1984). It's widely accepted in literature that Entrepreneurial Orientation is positively linked to firm performances (e.g. O'Shea, Allen, Chevalier and Roche, 2005). While, There are many factors that affect GPA that we do not control for, such as personal factors (abilities, learning strategies, and homework), family situation (parental involvement, siblings, and living situation) and school factors (peers, school size, and teaching methods other than EE).

H1: Students' academic performance positively and significantly affects on entrepreneurial orientation

Entrepreneurial Traits: Entrepreneurship is known to be highly influential on the development of economies (Audretsch and Keilbach, 2004). Halil and Hasan (2010) already mention in their research as individuals differ in entrepreneurial awareness, regions and countries as well have different entrepreneurial development levels. Mueller (2002) also claimed that creation of new ventures and entrepreneurial activity depends upon the availability of prospective entrepreneurs who possess personality traits combined with personal circumstances which are likely to lead them to forming a new venture. Self-confidence refers to a person's perceived ability to tackle situations successfully without leaning on others and to have a positive self evaluation. In the words of Basavanna (1975) self confidence refers to an individual's perceived ability to act effectively in a situation to overcome obstacles and to get thing go all right. Taking calculated risk is the latest approach in entrepreneurship. Risk taking can lead both success and failure. Thus, entrepreneurs should calculate risks of their actions before they take them, evaluate advantages and disadvantages of risk taking in all stages of entrepreneurship. Entrepreneurs tolerate risks more than other people. Tolerating risks is a major trait for entrepreneurs to succeed.

There are significant relationships between biographical characteristic (such as gender, race and age) and environmental factor (such as education and family environment) and certain entrepreneurial characteristics of undergraduate students. In case of gender significant relationships are evident for risk taking, the use of outside resource person, technical knowledge and money sense. According to Frese (2009), need for achievement, locus of control (self-efficacy), innovativeness, risk taking are important personality attributes whereas education, experience, mental ability and knowledge are important human capital attributes for entrepreneurial orientation (Frese, 2009: 459)

H2: Entrepreneurial traits positively and significantly affects on entrepreneurial orientation

H3: Impact of students' academic performance on entrepreneurial orientation is significantly moderated by entrepreneurial traits.

RESEARCH METHODOLOGY

Data were obtained from university students in West Sumatra Province Indonesia. There are four universities participated in the current study. A total of 300 questionnaires were distributed to the universities. Participants were involved in voluntarily basis and responses were treated with confidentiality. In total, 250 were returned, comprising a response rate 83%. All variables were measured using items which have been utilized in previous studies with 5 point Likert scale. The Entrepreneurial intentions questionnaire was adopted from Linan and Chen (2009). Entrepreneurial traits were measured by using questionnaires taken from Taatila & Down (2015). Academic performance was adopted from Adedipe (1985). All items consists of five point Likert-scales ranging from '1' meaning 'strongly disagree' to '5' meaning 'strongly agree'. All constructs demonstrated good reliability. The psychometric properties of scales are reported in Table 1.

Table 1: The Psychometric Properties of Scales

Variable	1	2	3	Cronbach Alpha	Mean	SD
Academic Performance (1)	-			.822	3.82	.45
Entrepreneurial traits (2)	.338**	-		.791	3.76	.58
Entrepreneurial Orientation (3)	.332**	.452*	-	.867	3.63	.63

REGRESSION ANALYSIS

Regression Analysis is technique is used to see the significance of independent variables toward dependent variable. This research is also aimed to see the impact

of moderating variable (Entrepreneurial Traits) toward relationship between Academic performance to Entrepreneurial Orientation, so that author added one variable that indicating the interaction.

Table 2: F-test for overall model

R	R-Square	F	Significant
0.397	0.158	6.002	0.01

Source: proceed from questionnaires by using SPSS 22 in 2018

Test aims to know the impact of independent variables (include moderating variable) in overall toward dependent variable. The result indicates that overall independent variables have impact on dependent variable.

Table 3: Regression Analysis

Variable ^a	Entrepreneurial Intention		
	Model 1	Model 2	Model 3
Step 1: Main Effect Academic Performance Academic Performance (AP)	.136**	.112*	.182**
Step 2: Main Effect of Entrepreneurial Traits Entrepreneurial Traits (ET)		.224**	.141*
Step 3: Interaction Academic Performanc x Entrepreneurial Traits (AP*ET)			.311**
Overall F	1.162	2.677**	6.002**
R ²	.021	.065	.158
F Change		4.281**	8.062**
R ² Change		.062	.094

Note: N = 250. Entries are standardized regression coefficients. ^a Variables are standardize.

* p ≤ .05. ** p ≤ .01

In order to test the interaction effects of academic performance and personality traits, regression analysis was conducted with three steps (Table 3). Then, the standardized independent variables were entered into the equation in three steps. Step 1, regression equations were computed by entering independent variable in the regression analysis, then step 2, it was followed by moderator variable. Finally, interaction effect of independent variable and moderator variable was computed in step 3 (see table 2). In the step 2, regression showed the incremental variance accounted for by interaction effect of academic performance and entrepreneurial traits was significant for entrepreneurial intention (Δ F=8.06, p ≤ .01). The results supported that academic performance significantly influenced on entrepreneurial orientation. Entrepreneurial traits are found significantly influence on entrepreneurial orientation. The finding also supports that entrepreneurial traits significantly moderate relationship between academic performance and entrepreneurial orientation.

DISCUSSION

The Influence of Academic Performance on Entrepreneurial Orientation: The result of this research found that there is significant effect of academic performance on entrepreneurial orientation. It means practically the entrepreneurship Academic Performance shows its impact of the students willingness and propensity to be entrepreneur.

According to Rauch et al., (2009) which suggests that the correlation between entrepreneurial orientation and performance is significant, although only moderately strong. Upon further investigation, it becomes clear very quickly that the relationship between entrepreneurial orientation and performance is not a straightforward, positive relationship. Entrepreneurial performance can be fostering by supporting good academic capacity included mastery knowledge related to entrepreneurship. Based on characteristic respondent, majority of the students with GPA range between 3-3.5. Those are high range of GPA would can be strengthen students’ entrepreneurial orientation.

The Influence of Entrepreneurial traits on Entrepreneurial Orientation: This result of the study found that the entrepreneurial traits effects positively effect on entrepreneurial orientation. It means, by having entrepreneurial traits/ personality of entrepreneurship will strengthen student willingness to be entrepreneur. The conditional factors are becoming the main points for this Du Toit and Motlatla (2000) mention in their research that although one should accept that there are probably specific personality traits, deep-seated urges and even genetic factors that predispose people to become entrepreneurs.

This research result supported the previous studies result. According to Frese (2009), need for achievement, locus of control (self-efficacy), innovativeness, risk taking are important personality attributes whereas education, experience, mental ability and knowledge are important human capital attributes for entrepreneurial orientation (Frese, 2009: 459)

Researchers focusing on the individual approach of the entrepreneurship mostly keep their focus on psychological, demographic and personal traits. This approach states that entrepreneurs have specific values, attitudes and needs. This would mean that psychology, personal characteristics and a person's experiences determine entrepreneurship. According to the individual approach, people with certain characteristics such as internal locus of control and need to be independent are more likely to become entrepreneurs in the future. (Bulut, et al. 2010: 560) In addition, Dollinger (1995) claimed that every individual's psychological, sociological and demographic characteristics have an effect on a person's abilities to be an entrepreneur. The psychological factors can be argued as source of entrepreneurship power (Dollinger 1995)

The Influence of Entrepreneurial Traits moderate relation between Academic Performance and Entrepreneurial Orientation in student Andalas University: This study's result found that the academic performance and entrepreneurial traits effects positively and significantly on entrepreneurial orientation. The study limits on risk taking and self confidence. This result found that the two things above combine with the higher GPA are really impacts on students entrepreneurial orientation. Higher GPA with the entrepreneurial traits is the perfect combination to effect the entrepreneurial orientation. Students who have higher GPA with the

entrepreneurial traits tend to be more confidence with their decision, that make them comfortable to take the high risk decision.

The result is supported by the views of Schwarz et al. (2009) who found that the intention to start a business was influenced by students' attitudes. According to Ferreira et al. (2012) that need for achievement, self-confidence affect entrepreneurial intention among students.

CONCLUSION

This research uses variable of academic performance, entrepreneurial traits as independent variables and entrepreneurial orientation as dependent variable. The research observation used questionnaires that distributed to 250 higher educational students in West Sumatra Province, Indonesia. Academic Performance significantly influence on student's Entrepreneurial Orientation. This result supports the hypothesis (H₁) constructed. This result explains the higher academic performance of students, the more students demonstrate entrepreneurial orientation. Entrepreneurial Traits have positive and significant influences toward student's Entrepreneurial Orientation. This result supports the hypothesis (H₂). The student with strong traits in self-confidence, innovativeness, and risk taking will be strengthen orientation to be entrepreneur after graduating from universities.

There are a few limitations being discovered during the process of conducting research. The limitations merely provide platforms for future studies, thus do not divert the significance of the findings. The samples were limited on higher educational institutions, meanwhile opportunity to entrepreneur can be happen for vocational institutions. The downside of the non-probability sampling method is that an unknown proportion of the entire population was not sampled. This entails that the sample may or may not represent the entire population accurately. Therefore, the results of the research cannot be used in generalizations pertaining to the entire population.

Health Related Quality of Life in Life Hemodialysis Patients : A Single Center Study

Umi Khoirun Nisak¹, Cholifah¹, Paramitha Amelia Kusumawardani¹, Aditiawardana²

¹Fakultas Ilmu Kesehatan, Universitas Muhammadiyah Sidoarjo, Jl. Raya Rame no 4 Pilang Wonoayu Sidoarjo, Jawa Timur, Indonesia; ²Departemen Ilmu Penyakit Dalam, RSUD Dr. Sutomo-Fakultas Kedokteran Universitas Airlangga, Jl. Airlangga no 4-6, Surabaya, Jawa Timur, Indonesia

ABSTRACT

Objective: This study were to identify the many factors (gender, age, education level, employment, accessibility, income, history of disease, dialysis duration, caregiver, nutrition) that might influence QoL scores on hemodialysis patients.

Analysis: The quality of life (QoL) has become a recognized outcome in studies of the treatment for patients with undergoing hemodialysis (HD).

Method: This study used a cross-sectional design and was conducted in Hemodialysis Unit of dr. Soetomo Hospital on September-October 2016. The subj of this study were 59 HD patients with HD therapy >3 months (twice a week) and used the SF-36 forms covering 8 domains of QoL, into physical composite summary (PCS), mental composite summary (MCS) and total score.

Findings: the mean age was 44.3(±11.3), 52.5% were male. Most of participants were graduate from senior high school (54.2%), have nondiabetes mellitus history(91.5%), has spouse as caregiver (61%). The mean albumin scores were 3.8(±0.26). The total score mean was 65±20.1, PCS was 58.8(±19.6), MCS was 71.5(±29.4). There were significant correlation between age with RE and GH domain (s= -0.283;r=0.291), education level with PF domain(s=0.327), HD duration with BP, VT, and SF domain (s=0.278, 0.272 and 0.309 consecutively), nutrition with GH and VT domain (s=0.420;r=0.582) and significant comparison between history of disease with PF domain (P<0.006).

Result: Factors affecting some QoL domain in HD patients were age, education level, history of disease, HD duration, and nutrition. Adequate management of these factors can increase patient outcomes.

INTRODUCTION

World Health Organization defined health as State complete physical, mental and social well-being and not merely the absence of disease or infirmity ^[1]. NKF/K/DOQI (2002) state that chronic kidney disease is a worldwide public health problem. In the United States, there is a rising incidence and prevalence of kidney failure, with poor outcome and high cost. Some of study shows the prevalence of earlier stages of chronic kidney disease are higher. Irreversible retrograde of renal function that lead to end-stage renal disease (ESRD). Hemodialysis (HD) is one of therapy needed for ESRD patients. Based on United States Renal Data system Annual Data Report 2015, Incidence case on ESRD was

reported by the end of 2013 in the US were 117,162, the incidence rate was 363 per million/year ^[2]. Prevalence of HD patients in Indonesia had increased 9396 cases in 2013 to 11689 cases in 2014, and the incident also increased 15128 cases in 2013 to 17193 cases in 2014 ^[3].

Successful renal replacement therapy leads to good quality of life (QoL). HRQOL can be used to evaluate the impact of illness, quality of healthcare, and analysis of cost effectiveness with HRQOL ^[4]. Patients perception can be described with HRQOL about their own function status and the impact of the medical condition on their daily lives ^[4]. Increased mortality and complication are associated with decreased HRQOL in HD patients. There are several factors related to QoL in

hemodialysis patients, such as body mass index, serum albumin, hemoglobin, dietary intake, HD duration, age, and ethnicity [5].

However, these studies did not evaluate the comprehensive factors affected with QoL. Thus, the aim of this study was to identify the many factors (gender, age, education level, employment, accessibility, income, history of the disease, dialysis duration, caregiver, and nutrition) that might affect the QoL scores among on hemodialysis patients using Short Form 36 (SF 36) surveys.

EXPERIMENTAL METHOD

This cross-sectional study was conducted in Hemodialysis Unit of dr. Soetomo Hospital on September- October 2016. We studied 59 of 152 HD patients who had Hemodialysis therapy >3 months (twice a week). This study using primary data with sample size calculated by 95% Confidence level and 0.10 of precision.

The sample was obtained by simple random sampling and interviewed to the eligible respondents (primary data) using SF 36 surveys, it's a generic core of Kidney Disease Quality of Life Short-Form (KDQOL-SF™) [6]. SF 36 consist of 36 items that cover 8 domains of QOL. These eight scales can be aggregated into two summary measures: the Physical Composite Summary (PCS) and Mental Composite Summary (MCS), a total score of QoL also assessed. PCS comprises the scale of physical function (PF), role limitations due to physical health problems (RP), bodily pain (BP), and general health perceptions (GH). MCS comprises the scale of social function (SF), role limitations due to emotional (RE), and general mental health perceptions (MH). Furthermore, gender, age, education level, employment, accessibility, income, history of disease, dialysis duration, caregiver and nutrition also assessed independent variable.

Nutrition assessed based on levels of albumin. Gender was categorized by female and male, age was ratio data type, education level was categorized with elementary, junior high school, senior high school and college, history of disease was categorized with diabetes mellitus (DM) and nondiabetes mellitus (nonDM) and other variable were ratio data type.

Respondents signed informed consent prior to data collection. Data were analyzed using comparison and correlation tests such as Pearson's, Spearman's, Independent t-test and Willcoxon Mann-Whitney test. Dependent variable with normal distribution was analyzed with Independent t-test for comparison and Pearson's test for correlation. The others of dependent variable were assessed with Spearman's test and Willcoxon Mann-Whitney test.

RESULTS AND DISCUSSION

A total of 59 HD patients with the mean age was 44.3 (±11.3), 52.5% were male. The mean duration of dialysis was 43.27±31.85 months. Most of the respondents, 54.2% were senior high school, 67.8 % were unemployed, a mean income was IDR 2.783.898 (± IDR 1.975.440), accessibility respondents to the hospital was 13.37 (±14.6) kilometers and the most frequent history disease 91.5 % was Non Diabetes Mellitus (Non DM), the caregiver 61% was spouse. The mean value of albumin were 3.8 (±0.26). Average of QoL are showed below (table 1).

Table 1:v Quality of Life (QoL) of Hemodialysis Respondents

SF 36	Score mean* ± SD
Total score of SF 36	65 ± 20.1
Physical Component Summary (PCS)	58.8 ± 19.6
Physical functioning (PF)	59.9 ± 27.6
Role limitations – physical (RP)	49.6 ± 38.7
Bodily pain (BP)	71.7 ± 28.7
General health perceptions (GH)	53.9 ± 15
Mental Component Summary (MCS)	71.5 ± 29.4
Vitality, energy or fatigue (VT)	72.4 ± 67.7
Social functioning (SF)	81.5 ± 27.7
Role limitations - emotional (RE)	78.9 ± 86.1
General mental health (MH)	53.1 ± 23.3
* The score range 0-100, with higher score indicating better QoL	

The mean scores of PCS were 58.8 and MCS were 71.5. Additionally, there was not significant comparison between gender and history of disease and not significant correlation between age, education level, employment, accessibility, income, dialysis duration, caregiver, and nutrition with total score, PCS and MCS (table 2).

Table 2: Factors related to total score of QoL, Physical Component Summary (PCS) and Mental Component Summary (MCS)

Variable	P value		
	Total Score	*PCS	MCS
Gender	0.439	0.768	0.785
Age	0.414	0.432	0.160

Nutrition	0.058	0.234	0.061
PCS: Physical Component Summary; MCS: Mental Component Summary			

Statistically, there were comparison and correlation between RE, SF, GH, PF, BP, and VT domains. Age was significantly correlated to RE ($s = -0.283$). In addition, age also was correlated to GH ($r=0.291$). Education level was a significantly correlated to PF ($s=0.327$). History of disease also significantly compared with PF ($p=0.006$) with mean rank for non DM was 31.86 and DM was 9.90. Duration of HD (in month) was significantly correlate between BP ($s=0.278$), VT ($s=0.272$), SF ($s=0.309$). Enhancement of HD duration could increase BP, VT and SF scores. Albumin level was a significantly correlate between GH ($r=0.420$) and also VT ($s=0.582$) (Table 3).

Table 3: Factors related 8 domain of QoL

Variable	P value							
	PF	RP	BP	GH	VT	SF	RE	MH
Comparison Test								
Gender	0.148	0.284	0.753	0.498	0.437	0.842	0.245	0.217
History of disease	0.006	0.336	0.463	0.396	0.412	0.306	0.132	0.085
Correlation test								
Age	0.794	0.078	0.685	0.025	0.390	0.912	0.030	0.121
Education level	0.01	0.303	0.463	0.170	0.662	0.686	0.91	0.169
Employment	0.721	0.995	0.578	0.239	0.581	0.683	0.958	0.188

Income	0.721	0.995	0.578	0.336	0.581	0.683	0.958	0.118
Dialysis duration	0.231	0.278	0.033	0.555	0.037	0.017	0.618	0.999
Caregiver	0.490	0.566	0.360	0.271	0.207	0.654	0.985	0.289
Nutrition	0.230	0.874	0.249	0.05	0.000	0.637	0.522	0.205
<i>PCS: Physical Component Summary; PF: Physical functioning; RP: Role limitations – physical; BP: Bodily pain; GH: General health perceptions; VT: Vitality, energy or fatigue; SF: Social functioning; RE: Role limitations – emotional; MH: General mental health</i>								

The QoL scores measured among the studied patients were converted into percent scores, with higher scores indicating better QoL [7]. The mean total score of QoL were 65.

In this study, age had a correlation with RE domain in negative coefficient correlation. That showed the older age in patient related to the lower RE score. Thus, weaker and negative coefficient correlation were revealed with age, more limited role due to an emotional problem. Limited role due to an emotional problem caused the

severity of illness. Research showed patient's age and increasing the severity of illness are score strongly correlate ($r = 0.93$, $P=0.0001$) [8]. Age also correlate with GH domain in positive coefficient correlation. It showed that increasing age can improve a spirit of life, satisfaction of life and have a good perception of their health too. Research showed that age correlates strongly with the satisfaction of life score (SMLS) [9].

PF domain of QoL had significant correlation with education level and had a positive correlation, that meant

respondents with higher education had better PF domain of QoL. Higgins, Lavin and Metcalfe (2008) state that education is an important social determinant of health, education can affect health in different stages of the life cycle. In older people physical functioning, education level have a greater impact on mental health (van Oort, van Lenthe and Mackenbach, 2004). Other studies also showed that education level had significantly affected in all HRQoL dimension ^[10].

The result of this study indicated that history of disease was associated with PF domain. Percentage of the history of disease for nonDM was 91.5%. Additionally, hypertension and other factor included in nonDM category. Hypertension was the most recognized cause of ESRD, followed by diabetes ^[8]. Hypertension and diabetes mellitus were risk factor of CKD. Thus, impairment in functioning and well-being may be due to conditions that cause chronic kidney disease (such as diabetes or hypertension) or complications of decreased GFR. In this study showed respondents with nonDM had better PF score than DM.

As duration of HD had a significantly correlation BP, VT, and SF. The longer duration of HD can increase the score of BP (reduced pain intensity), VT (more vitality and spirited), SF (good social lives). Other study showed duration of HD was associated with QoL especially bodily pain ^[11].

Albumin level (nutrition) was a significant correlation between GH and VT domain. That showed good nutrition give a good perception about general health and could make patient happier and spirited. Albumin level was one of nutrition measurement in Hemodialysis patients. Based on NKF-K/DOQI guideline, one of the most important markers of protein-energy malnutrition (PEM) in patients with chronic kidney disease was serum albumin concentration, even when only slightly less than 4.0 g/dL. Albumin level also independently associated with QoL ^[7].

CONCLUSION

We conclude from our study that factor affecting some QoL domain in HD patients were age, education level, history of disease, duration of HD, and nutrition. Adequate management of these factors can increase patient outcomes. One of primary goals of renal

replacement therapy was improving patient's QoL. Multi-center research is needed to evaluate HD patient's QoL and comprehensive factors that affected HD patient's QoL in Indonesia.

ACKNOWLEDGMENT

We acknowledged the HD patients for their support and help and co-operation in this research.

Career Transformation among Orang Asli: Are They Ready?

Khatijah Omar¹, Muhammad Abi Sofian Abdul Halim¹, Hazman Samsudin¹

¹Institute of Tropical Biodiversity & Sustainable Development, Universiti Malaysia Terengganu

ABSTRACT

Objective: This study, in general, addresses the willingness and readiness of the Orang Asli community in Kg Ulu Tual, Kuala Lipis, Pahang to cope with the career transformation due to the decreasing of the forest products which is also their source of income. Respondents for this study were Orang Asli (indigenous people) living in this village.

Analysis: To obtain the relevant information, questionnaires were distributed to 44 adults among the Orang Asli participants who voluntarily agreed to be involved in the study.

Method: The sampling method used was convenient sampling. All the data obtained in this study was usable for further analysis. For data analysis purposes, descriptive analysis was used to answer the research questions.

Findings: The study found that majority of the Orang Asli adults in the village are ready to venture into a new career and is ready to undergo the trainings that are to be provided.

Result: The results of this study can provide an understanding of the readiness of the Orang Asli community towards a more holistic career transformation and at the same time it benefits the relevant authorities in their efforts in planning for the training programs and making proper preparation to launch a career transformation program among Orang Asli community.

Keywords: *Orang Asli, forest products, deforestation, alternative career*

INTRODUCTION

The indigenous people are believed to be the earliest community that has resided in Malaysia's land (Kardooni et al., 2014). In Malaysia^[1], these indigenous people are better known as the Orang Asli community as they have been very inclined to their forests and their souls are very close to nature (Kardooni et al., 2014; Gomes, 2004). Their lives depend entirely on forest resources; for economic and social purposes as well as for spiritual and ritual purposes. In fact, they are very knowledgeable about jungles, lakes and rivers. They are also very expert in vegetation, from the value of the vegetation as food, medicine, decorations until the use of vegetation as a tool for survival in their daily livelihood. Likewise, they are more knowledgeable about the animals in the forest. They know where to hunt and where to avoid themselves from being hunted by predators.

Forests provide them with a source of livelihood because from forests they collect forest vegetation and also hunt animals to sustain their lives^[2] (Nur Fadilah, 2018; Kardooni et al., 2014). The majority of the forest

resources are for their own use and the rest are sold if there is any request from the outsiders. Other than collecting the forest products and hunting, some of them are also farmers and often the type of agriculture practiced is traditional agriculture^[3] (Mohd Tajuddin Abdullah et al., 2016; Kardooni et al., 2014).

The Background of Study: In Kg Ulu Tual, Kuala Lipis, Pahang, the majority of the Orang Asli community here are from the Semai tribe. There are more than 300 villagers with as many as 140 houses. There is still no electricity and clean water supply here.

They are quite lucky to have received some changes and developments. The houses provided by the government are well maintained with relatively clean surroundings. There is an educational building called Cenwaey Penaney Community^[4] Education Center (Tunas Pintar) which is quite comfortable and provides library facilities and teaching classes in addition to classes provided by schools. Praise is forwarded to Tok Batins in Kg Ulu Tual who have been the catalyst for the change. However, even though the change occurred,

their dependence on forests as a source of livelihood for their subsistence is still undeniable. Almost all of the villagers are still in and out the jungle for forest products especially for their own needs and families^[5]. A very small number of them have permanent jobs like being teachers at the education center in their village, being guides, farmers or fishermen (Tok Batin Harun, 2017). Thus, this study aims to investigate their willingness and readiness to venture into other kinds of jobs realizing the fact that the forests that they are depending too much for their source of income can no longer promise them with the yields as before.

LITERATURE

Orang Asli And Forest Resources: Historically, natural forest resources are a very important source in the life of the Orang Asli communities^[6] (Kardooni et al., 2014). The use of forest resources among the Orang Asli is closely related to the traditional knowledge inherited from their ancestors. Traditional knowledge is defined as knowledge or belief about the relationship between the source of life with their environment^[7] (Kai et al., 2014). Due to their traditional knowledge and their close relationship with nature, research involving the Orang Asli community has gained attention from independent researchers, academicians, students, researchers from government and non-governmental organizations as well as volunteers (Er Ah Choy et al., 2010). Researchers try to comprehend the secret of the Orang Asli community because of their uniqueness, especially their high dependence on forests and nature.

The environment, especially the forests, is also quite capable of giving the pattern and meaning to the Orang Asli community in their socio-cultural life. They really follow and abide the laws and traditional customs inherited from their ancestors, including their daily economic affairs^[8], religions, beliefs and rituals, arts and culture, social systems and their daily behaviors and practices (Mohd Tajuddin Abdullah et al., 2016). Most of their way of life is largely influenced by the wilderness and its inhabitants^[9]. Yet with the ever-increasing influence of modernization throughout the world and Malaysia is no exception, thus forests are increasingly being destroyed for development purposes. This certainly has a profound effect on the Orang Asli community. When the forest area is diminished, it reduces its natural resources. Certainly in the future

their careers as forest product seekers and hunters are no longer guaranteed.

In recent times, the situation has slowly changed with the decreasing number of forests and the Orang Asli can no longer be entirely dependent on forest resources as their economic source^[10] (Tok Batin Harun, 2017). The forest resources is no longer in abundance like before. If the Orang Asli community still relies solely on jungle resources, they will face with life crisis in the next 20-30 years. This is because of the widespread consumption of forest resources or products and the widespread activities of forest clearing and pollution for modernization and developments, which has reduced the number of plants that can be picked and animals that can be hunted.

Recognizing the fact that forest resources are getting diminished, the Orang Asli community can no longer be really dependent on forest resources as their economic sources. Thus, this article will then discuss the readiness of the Orang Asli community in facing the career transformation.

METHODOLOGY

Questionnaires were distributed to youths in telematches and knowledge transfer event organized by Universiti Malaysia Terengganu and Pejabat Daerah Hulu Terengganu held on 13-14 September 2017 at Kg Ulu Tual, Kuala Lipis. Since this study was about the willingness to change career among indigenous people (Orang Asli), the respondents were youths and adults aged 17 years and above. The sampling technique used was convenient sampling because questionnaires were distributed to any youths and adults who volunteered to become respondents to this study during that knowledge transfer activity on how to make banana chips at their village. The questionnaires were returned at the end of the event in the evening before the event ended.

FINDINGS AND DISCUSSION

The findings of this study are based on the information provided by the Orang Asli community in Kg Ulu Tual, Kuala Lipis, Pahang.

Respondents' Profile: Below is the profile of the Orang Asli respondents from Kg. Ulu Tual, Kuala Lipis, Pahang.

Table 1: Respondents’ profile

Demographic info		Frequency (n=44)	Percent (%)
Sex	Male	24	54.5
	Female	20	45.5
Age	17 years	4	9.1
	18 years	8	18.2
	20 years	4	9.1
	22 years	4	9.1
	23 years	4	9.1
	24 years	12	27.3
	34 years	4	9.1
	41 years	4	9.1
Tribe	Semai	44	100
Marital status	Single	16	36.4
	Married	28	63.6
Education Level	Primary school	44	100
Occupation	farmer/forest harvester/ fisherman/hunter	44	100
Residence	Own house	28	63.6
	Parents’ house	16	36.4
Number of households	3 persons	16	36.4
	4 persons	4	9.1
	8 persons	4	9.1
	10 persons	20	45.5
Monthly family income	Less than RM 1000	44	100

Most of the respondents involved in this study were men (54.5%) while women respondents were 45.5%. In terms of age, most respondents were 24 years old (27.3%), followed by 18-year-old respondents (18.2%). While the rest were 17 years old, 20 years, 22 years, 23 years, 34 years and 41 years old. The majority of respondents were married (63.6%) and those who were still single were 36.4%.

Uses of Forest Resources: Interestingly, in this study the respondents also revealed that the forest products they acquired are for their own use and not for trading. While only 16 percent of respondents stated that they use forest products for their own use as well as for sale. However, referring to Table 1, it shows that all respondents earn less than RM1,000.00, therefore, it is concluded that the sale of forest products is not that significant.

Table 2: The Usage of forest products

Question	Answer	Frequency	Percent
Are you making use of forest products available at your surrounding?	Yes	44	100
Are they for your own use or to be sold?	Own use	37	84
	Own use and to be sold	7	16

Awareness of the Decrease of Forest Products: Table 3 shows that the Orang Asli community of Kg Ulu Tual is aware of the decreasing of forest products in their area day by day. Information obtained from an interview with Tok Batin Harun also supports that the Orang Asli community is aware that forest products are getting reduced. They are also aware that among the reasons for the lack of forest products are illegal harvesting and illegal hunting not only by locals but also by collectors from the neighbouring countries like Thailand and Myanmar (Tok Batin Harun, 2017).

Table 3: The awareness on the decreasing of the forest products

Question	Answer	Frequency	Percent
Are you aware that the forest products are decreasing in amount?	Yes	44	100

Willingness to Engage in Forest Conservation Effort

Table 4: Willingness to involve in forest conservation efforts

Question	Answer	Frequency	Percent
Are you willing to protect our forest and natural environment around you	Yes	44	100

The findings of this research also found that one hundred percent of the respondents involved in this research are ready to give their unwavering commitment to defend their natural environment around their area. They have always taken most of their forest products for their own use and they have also played their part

in preserving the forest they live in (Nur Fadilah, 2018). The findings of this study as shown in Table 2 revealed that they use forest products for their own use. This has further reinstated the fact that the Orang Asli are not the greedy type and they are not the ones who are responsible for deforestation and destruction of the forest.

The findings are consistent with Ramle Abdullah's research twenty-five years ago. In his study in 1993, he found that the Orang Asli community collected forest products or resources for self-sufficiency and this study also shows that until now the Orang Asli community has only taken forest products mostly for their own use. This gives the impression that the Orang Asli community is very concerned about the conservation of forest resources from being over-harvested (Nur Fadilah, 2018).

As recognized by previous researchers as well as information disclosed in the recent articles, journals and books about Orang Asli and their lives, most of Orang Asli community is not a destructor of nature. It is not surprising when Tok Batin Harun (2017) stating. They really appreciate the nature and are willing to defend the forest around them.

Readiness to Venture into New Careers: As shown in Table 5, 100% of respondents in this study stated that they are willing to do farming, rearing animals and also engaging in other jobs when forest products are diminishing or extinct. This is not surprising because the life of the Orang Asli community here in Kg. Ulu Tual is quite modern with the forward thinking. Even some of them have been involved with rubber plantation and vegetable farms. Some of them also embrace in the work of bringing children to school (drivers), vegetable sellers and also involve with Kampung Ulu Tual community education center (Tok Batin Harun, 2017). When asked further about the potential jobs that they are willing to venture into, many of them chose to be a nature guide as their alternative career.

Table 5: Willingness to Venture into New Career

Question	Answer	Frequency	Percent
With the decreasing of the forest products, are you ready to be a modern farmer, rearing animals or involve in other kind of jobs?	Yes	44	100

Willingness to Join Training Program: In view of Orang Asli community that is highly related to natural forests, it is assumed that they will reluctant to involve in jobs other than the jobs that are related to forests. While the other 16% are not ready to go for training but are ready to engage in new careers.

Table 6: Willingness to Join Training Program

Question	Answer	Frequency	Percent
Are you ready to join any training program provided by government or non-government agencies?	Yes	37	84
	No	7	16

It is not easy for the Orang Asli community to venture into a new environment. Hence, the efforts of some government and non-governmental organizations to welcome and encourage Orang Asli to work in the villages, in the suburbs and in the city are something that should be viewed as positive efforts because the Orang Asli people who live in Malaysia are also Malaysian citizens who are entitled to enjoy the benefits of modernization but in their own way.

For the Orang Asli community to embrace and involve in something new, training and education as well as exposure are very important to ensure that the efforts made by government and non-government agencies will produce good outcome and results as anticipated. Based on this research, it is predicted that the Orang Asli community in Kg Ulu Tual will not face major or complicated problem when they venture into new careers as majority of the respondents have expressed their willingness to undergo any training programs that are going to be provided for them.

CONCLUSION

Forests and the Orang Asli community are two inseparable objects. Their way of life, nutrition, clothing, culture, beliefs and customs and manners are predominantly related to forests. They make the forest as the source of sustenance for them to continue their survival and may also partially make the forests as their economic source or income.

Butet, a volunteer in Indonesia who is actively involved in helping the Orang Asli community to improve the standard of living through education in Indonesia, stated that the Orang Asli community is

quite stubborn and not that easy to be influenced by modernization (Polly Christensen, 2014). They still want to continue protecting what they have and what they go through, especially their way of life. However, with the increasing deforestation for agricultural activities such as for oil palm and rubber plantations, the Orang Asli community needs to look forward and think of other alternative jobs for their sources of income. They can not be continually dependent on natural forest resources for their subsistence or for their main source of income. Seeing the reality of today's world, the Orang Asli community needs to be prepared to venture into a new career and no longer rely heavily on forest harvesting and hunting. For them to engage in a new career, they need training to help them to be familiar with the tasks and know what to expect from their new job.

The findings also revealed that the Orang Asli community is willing to participate in the training that are being proposed to them in order to help them succeed in their alternative careers. Despite the fact that they are still making the forest as a major source of income, they are willing to try and turn to other careers other than being collectors of forest products and hunters. This is something that can be proud of and would make the government's efforts to improve the status and quality of life of the Orang Asli community much easier and would be close to a reality.

ABSTRACT

Objective: This paper is used to demonstrate the preparation of the ZnO films on indium tin oxide (ITO) glass. This work also demonstrates a low cost, environment friendly and well abandoned material for photovoltaic device applications.

Analysis: We report the sol gel concentration effects on the morphological, structural and optical properties of ZnO thin film prepared on ITO substrates by sol gel spin coating method.

Method: The n-ZnO thin films have been successfully fabricated on the ITO glass by sol gel spin coating method with different sol-gel concentration of 1~10%.

Findings: The ZnO thin films were found by spin coating on ITO substrate using a sol-gel containing zinc acetate dehydrate, 2-propanol and ethanolamine. The coverage of ZnO films was maintained by controlling the spinning speed and coating time during the spin coating process.

Result: Combining results from AFM, XRD, and UV-Vis, we conclude that 5% of ZnO concentration gives the best result in terms of morphological, structural and optical properties. The formation of ZnO hexagonal wurtzite structure showed the average transmittance in the visible region of all films is almost 80%. The calculated band gap energy of ZnO thin films were between 3.60 eV to 3.85 eV. The thickness and average grain size of ZnO thin films were found to be around 8~15 nm and 90~150 nm respectively.

Keywords: Zinc oxide, sol-gel, spin coating

INTRODUCTION

Zinc oxide (ZnO) is an interesting material for solar cell application due to its wide theoretical band gap energy of 3.37 eV^[1]. ZnO, having a large exciton binding energy of 60 meV^[2] at room temperature have unique properties such as abundant, nontoxic, low cost and chemically stable at room temperature. ZnO is an n-type semiconductor which means electron as the majority carriers with an electron mobility of 2000 cm²/Vs at 80 K^[3]. The n-type ZnO acts as an electron transporter and window layer in the photovoltaic cell. ZnO is considered as an excellent candidate for electronic material due to its electrical and luminescent properties, strong absorption in the ultra-violet (UV) region and high transparency in the visible region^[4,5]. ZnO can be fabricated by several techniques such as radio frequency (RF) magnetron

sputtering^[6,7], electron-beam evaporation^[8], pulsed laser deposition (PLD)^[9] and chemical vapor deposition (CVD)^[10]. These methods have been used to fabricate ZnO thin films with a high quality of the crystalline structure. However, these methods are expensive and require a complicated operation such as high temperature or vacuum system. Therefore, another technique with a low cost is widely used to fabricate the ZnO layer such as electrochemical deposition and sol-gel spin coating.

K. Ikhyun *et al.* studied the effect of different sol concentrations on the properties of nanocrystalline ZnO thin films by sol-gel spin-coating. The result shows that the thickness of the ZnO thin films was depend on the sol concentration and increased from 50 to 600 nm with increasing sol concentration. Similar research has been conducted by M.Dutta *et*

al. The result shows that the band gap energy value increases from 3.27 eV to 3.3 eV when the sol-gel concentration increased from 0.03 M to 0.1 M. In addition, the structural and optical properties of ZnO thin films grown on glass substrates using the sol-gel spin-coating method have been found to be influenced by the precursor concentrations as reported.

Here, we demonstrate the preparation of the ZnO films on indium tin oxide (ITO) glass. The sol-gel were prepared at various concentration followed by a spin coating method for construction of the ZnO thin films and report the effects of the sol-gel concentration towards the properties of the ZnO thin films on pre-cleaned ITO glass. The optical, structural and morphology characterizations for ZnO thin films were carried out by UV-Vis spectroscopy, X-ray diffraction (XRD) and atomic force microscopy (AFM).

Experimental Section: Zinc acetate dehydrate, $Zn(C_4H_6O_4) \cdot 2H_2O$ was used as a precursor while 2-propanol, $CH_3CH(OH)CH_3$ and ethanolamine, $NH_2CH_2CH_2OH$ were used as a solvent and stabilizer respectively for the sol-gel preparation. All the material used for sol-gel preparation was purchased from EMD Milipore Corporation. Zinc acetate dehydrate (1.0975 g) was first dissolved in 50 ml of 2-propanol and then 0.3024 ml of ethanolamine were added. The molar ratio of ethanolamine to zinc acetate dehydrate was maintained at 1.0 and the concentration of zinc acetate dehydrate was 0.1 M (10 %). The solution was stirred at 70°C for 1 hour and the obtained clear solution was allowed to cool to room temperature. The sol-gel was diluted to three concentration which are 5 %, 3 % and 1% by adding 10 ml, 23.33 ml and 90 ml of 2-propanol respectively. Then, the sol-gel was aged for 24 hours to obtain a clear and homogeneous solution of ZnO. The ITO glass purchased from (Lianyungang Liaison Quartz Co. Ltd) with a dimension of 2 cm (length) x 1 cm (width) was used as a substrate and prior to the deposition, the ITO glass was immersed in acetone for 2 minutes and then rinsed with distilled water before polarized with +2 mA/cm² current in NaOH solution for 1 minute. Prior to deposition of zinc oxide, the pre-cleaned ITO glass was covered with a Kapton tape to separate the coated and uncoated area. The deposition area for zinc oxide was 1cm x 1 cm. The sol-gel solution was dropped onto the surface of ITO glass which was rotated at 2000 rpm for 15 sec using spin coater at room temperature. Then,

the single layer of the thin films was dried at 100°C for 20 min on a hot plate. Structural characterization was carried out by X-ray Diffractometer (XRD BRUKER D2 PHASER), operated at 30kV and 10mA using Cu K α radiation (wavelength of $K\alpha_1=1.5406\text{\AA}$) that linked with DIFFRAC. SUITE EVA Software. The optical UV-Vis absorbance, reflectance and transmittance spectra were recorded by using PERKIN ELMER LAMBDA 35 UV-Vis Spectroscopy in the wavelength range from 200 nm to 1000 nm. The surface morphology of thin films was studied using SII Atomic Force Microscope linked with SPA400 Soundproof Housing and SPI 3800N Probe Station using a scan size of 3 μ m to 5 μ m.

RESULTS AND DISCUSSION

Morphological properties of ZnO thin films on ITO glass at different sol-gel concentration

Fig 1: a) Schematic illustration of cell configuration of the ZnO thin films on ITO glass

Fig 1: (b) Actual image of the transparent ZnO thin films on ITO glass

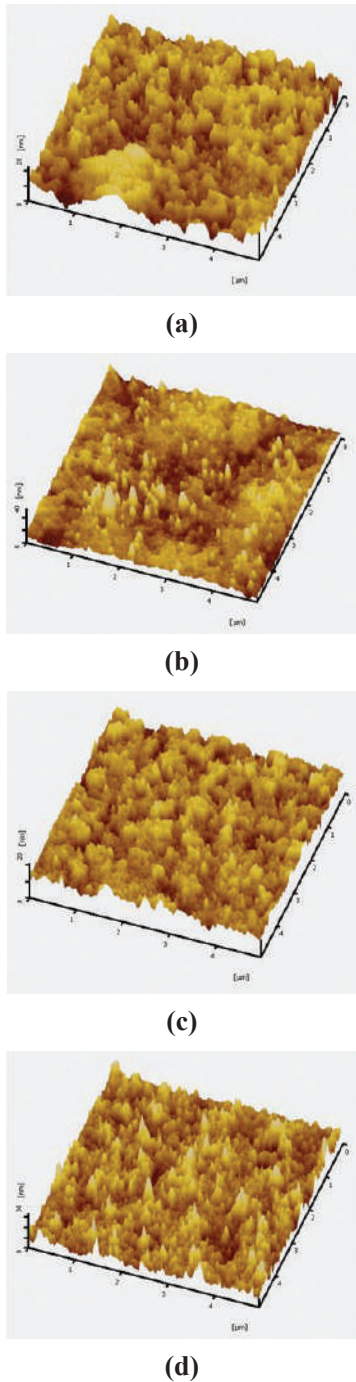

Fig 2: The AFM images of ZnO thin films on ITO glass at various sol-gel concentration in 3D view ; (a) 1%, (b) 3%, (c) 5% and (d) 10 %

Fig 1(a) shows the schematic illustration of the cell configuration of ZnO thin films on ITO glass. The physical appearance of ZnO thin films on ITO glass is shown in **Fig 1(b)**. ZnO thin films was found to be existed as a transparent thin film. The surface morphology of the ZnO thin films was further examined by AFM. **Fig 2** and **Fig 3** show the 3D view of surface morphology and the plan view of the AFM images of ZnO thin films on

ITO glass at various sol-gel concentrations. From **Fig 2(a-d)**, the ZnO thin films exhibited the mountain-chain-like structures irrespective of the sol gel concentration. The mountain-chain-like structures of the ZnO thin films prepared at different sol concentrations has speculated to be due to the effects of either the slow cooling after the post baking or the presence of ethanolamine . The average grain size found to be increased from 90 to 150 nm as the sol gel concentration changed from 3% to 5% as shown in **Fig 2(b,c)**. However, the grain size of ZnO became smaller when the sol gel concentration is increased to 10%. The grain size obtained at 5% sol-gel concentration exhibited the largest grain size with slightly coarse structure as shown in **Fig 3(c)**. It may be observed from the AFM micrographs that there is mixed structures of the films in which some particles are in nano size and some are in micro size due to different sol gel concentration.

Fig. 3 : The AFM images of ZnO thin films on ITO glass at various sol-gel concentration in plan view ; (a) 1%, (b) 3%, (c) 5% and (d) 10 %

Fig. 4 : The average grain size and surface roughness of the ZnO thin films on ITO glass against the sol-gel concentration

Table 1: The correlation between the sol-gel concentration with the average grain size, surface roughness and average thickness of the ZnO thin films

Sol-gel concentration (%)	Average grain size (nm)	Surface roughness (nm)	Average thickness (nm)
1%	110	2.89	8.51
3%	90	2.27	17.65
5%	150	2.80	14.57
10%	100	2.62	15.47

Fig 4 shows the relationship between average grain size and surface roughness of the ZnO thin films on ITO glass with various sol-gel concentrations. The ZnO grain size is directly proportional with the ZnO film thickness. The surface roughness of ZnO thin films increases as

the average grain size increase. The thickness of ZnO thin films obtained from this study was around 8 to 15 nm. The summary of the correlation between the sol-gel concentration with the average grain size, surface roughness and average thickness of the ZnO thin films are explained in Table 1.

Structural properties of ZnO thin films on ITO glass at different sol-gel concentration

X-ray diffraction (XRD) analysis was carried out to examine the orientation and crystal structure of the ZnO thin films. The fundamental of XRD was based on Debye-Scherrer equation :

$$D = K\lambda/(\beta \cos \theta_B) \quad \dots(1)$$

where D is the crystallite size, λ is the wavelength of X-radiation, β is the full width at half maximum (FWHM) of the highest intensity peak, θ_B is the diffraction angle in radian and K is the Scherer's constant of the order of unity for usual crystal.

Fig. 5: XRD spectra of the ZnO thin films on ITO glass at different sol-gel concentration (a) 10%, (b) 5%, (c) 3% and (d) 1 %

Table 2: XRD analysis data of the ZnO thin films on ITO glass at different sol-gel concentration

Sol-gel concentration (%)	Phase	Lattice constant (Å)	Diffraction angle, 2θ (°)	hkl	Interplanar spacing, d (Å)
10%	ZnO	Hexagonal a = 3.2498 c = 5.2066	34.42	002	2.603
			47.54	102	1.911
5%	ZnO	Hexagonal a = 3.2498 c = 5.2066	34.42	002	2.603
			47.54	102	1.911
3%	ZnO	Hexagonal a = 3.2498 c = 5.2066	31.77	100	2.814
1%	ZnO	Hexagonal a = 3.2498 c = 5.2066	31.77	100	2.814

Fig 5 and **Table 2** show the XRD patterns and XRD data analysis for the ZnO thin films on ITO glass at different sol-gel concentrations from 1% to 10%. The ZnO peaks were seen in the XRD patterns which proved the presence of the ZnO thin films. The ZnO thin films at 5% and 10% concentration revealed one main diffraction peak, which was indexed to (002) at diffraction peaks of 34.41°. Higher intensity of diffraction peak (002) with 5% compared to 10% sol-gel concentration. A minor peak of ZnO (102) is also detected in the XRD pattern at a diffraction angle of 47.54°. The ZnO orientation was corresponding to hexagonal wurtzite structure of ZnO pattern (PDF 00-036-1451) with a lattice constant of $a = 3.2498 \text{ \AA}$ and $c = 5.2066 \text{ \AA}$. The value of crystal lattice constant of a and c remains constant for all sol-gel concentration, indicates that no changes on the hexagonal wurtzite structure of ZnO crystals. At the lower concentration of 3% and 1%, the orientation of (002) and (102) were not detected. A new orientation of ZnO (100) was formed with a low intensity at the diffraction angle of 31.77°. The result shows that at concentration lower than 3%, only one orientation of ZnO is formed due to the low composition of ZnO.

Optical properties of ZnO thin films on ITO glass at different sol-gel concentration

Fig. 6: UV-Vis absorption spectra of the ZnO thin films on ITO glass at different sol-gel concentration

The optical absorbance and transmittance of ZnO thin films as a function of sol-gel concentration was studied. **Fig 6** and **Fig 7** show the UV-Vis absorption and transmittance spectra of ZnO thin films on ITO at different sol-gel concentration, respectively. The absorption edges show the transformation from

absorption to transmittance regions from lower wavelength to a higher wavelength starting at 380nm. A sharp absorption curve is observed in the ultraviolet region and the exciton absorption is at 380 nm indicate the presence of ZnO, shown in **Fig 6**. The ZnO thin films spin coated at a low concentration below 3% showed lower absorption while at higher concentration of 5% and 10%, higher absorption is observed. As can be seen from **Fig 7**, all ZnO thin films at different concentration were highly transparent in the visible range of 380–700 nm with a transmittance almost 80.

Fig. 7: UV-Vis transmittance spectra of the ZnO thin films on ITO glass at different sol-gel concentration

Fig. 8: Corresponding $(\alpha hv)^2$ versus $h\nu$ plot of ZnO films grown on ITO glass at different sol-gel concentration

The fundamental of UV-Vis absorption is related to the equation of Tauc's relation:

$$\alpha hv = A(hv - E_g)^n \quad \dots(2)$$

where α is the absorption coefficient, $h\nu$ is the photon energy, E_g the optical band-gap energy and A is a constant. n is equal to 2 for indirect band gap semiconductor and

1/2 for a direct band-gap semiconductor. The band gap energy was obtained by extrapolation method from the $(\alpha h\nu)^2$ versus $h\nu$ curve as shown in **Figure 3**. The band gap energies of ZnO thin films at 1%, 3%, 5% and 10% sol-gel concentration are 3.85 eV, 3.82 eV, 3.60 eV and 3.65 eV respectively. As the calculated band gap energy value of ZnO thin films is more than the theoretical value, this might be due to the thermal stress effects that produced in ZnO thin film.

CONCLUSION

The n-ZnO thin films have been successfully fabricated on the ITO glass by sol gel spin coating method with different sol-gel concentration. The ZnO thin films were prepared by spin coating on ITO substrate using a sol-gel containing zinc acetate dehydrate, 2-propanol and ethanolamine. The coverage of ZnO films was maintained by controlling the spinning speed and coating time during the spin coating process. The results obtained from AFM showed that 5% concentration of sol-gel gives the best grain structure with the highest intensity of ZnO (002) supported by XRD result. UV-Vis absorption spectra proved the existence of ZnO with a high absorption at absorption edge of 380nm and average transmittance was almost 80%. The value of band gap energy obtained from this study is from 3.60 eV to 3.85 eV. The thickness of the ZnO films was found to be around 8 to 15 nm while the average grain size was 90 to 150 nm. Combining results from AFM, XRD, and UV-Vis, we conclude that 5% of ZnO concentration gives the best result in terms of morphological, structural and optical properties. Although further improvement is needed, these results show the importance of the crystalline structure of the ZnO films to the improvement of the photovoltaic device performance. This would be useful to enhance the optical and electrical properties of films as the ZnO particles have high mobility.

Knowledge, Attitude and Practise of Prophet Muhammad (PBUH) Dietary and Medicine among Pharmacy Students in Malaysia

Roz Azinur Che Lamin¹, Qi Ying Lean¹, Nursyuhadah Othman¹, Sofwan Hasbullah²

¹Faculty of Pharmacy, ²Academic of Contemporary Islamic Study, Universiti Teknologi MARA, Malaysia

ABSTRACT

Objective: Prophet Muhammad (PBUH) dietary and medicine has been widely advertised and also commonly practised among Malaysians especially among the Muslim. The campaign on Prophet Muhammad (PBUH) dietary and medicine has aimed to increase awareness among the public, but the awareness among the pharmacy students remain unknown.

Analysis: This study was conducted at one university in north state of Malaysia. The protocol of study had been approved by the university Research Ethic Committee.

Method: In this paper, method is based on the questionnaire which consists of various levels of the students. This was a cross sectional study to assess the level of student's knowledge, attitude and practise toward Prophet Muhammad (PBUH) dietary and medicine.

Findings: A total of 138 pharmacy students from Faculty of Pharmacy were invited to participate in this study. The number of students that aware of Prophet Muhammad (PBUH) dietary and medicine practices (Mean Rank = 71.34, n=138) were significantly higher than those to unaware group of respondents.

Result: The majority (73.1%) of the respondents claimed that they practised the Prophet Muhammad (PBUH) dietary and medicine with various reasons. However, the existing knowledge from the informal education on Prophet Muhammad (PBUH) dietary and medicine is not sufficient to give high impact on student's attitude and practise.

Keywords: Knowledge, Prophet Muhammad (PBUH), practices, Malaysia and medicine

INTRODUCTION

Modernisation in Malaysia has been extended into many sectors including food industry, information technology and medicine. Nonetheless, the lifestyle and eating habits among Malaysians are influenced by local cultures (Fournier, Tibère, Laporte, Mognard & Poulain 2016)[1]. Malaysia as a multi-racial country has a lot of custom and tradition especial in dietary and

medicine. In Malaysia, the complexity of the social cultural and ethnicity may contribute to the diversity of dietary and medicine practices. Although different ethnics have their own custom and tradition, Prophet Muhammad (PBUH) dietary and medicine are widely practised among Malaysians especially Muslims[2]. In Islam, Prophet Muhammad (PBUH) was the last Messenger and prophet sent by Allah to guide humanity to the right way[3] (Al Quran). The Muslims will follow His words, actions, recommendation and prohibition. There are also guidelines on medical treatments, prescriptions of diseases, prevention, health promotion and spiritual aspects that were recommended by Prophet Muhammad[4] (PBUH) (Al-Rumkhania, Al-Razganb & Al-Farisbet 2016). Generally, the Prophet Muhammad (PBUH) dietary is known as Sunnah food or Sunnah diet[5] (Ishak et al. 2013).

Pharmacists are drug information providers and have important responsibility in developing Malaysian healthcare setting[6] (Elnaem et al. 2018). Pharmacy students are involved directly in health care system after graduation. In their curriculum, students are exposed with modern drugs and alternative medicines. Although pharmacy students will be well-equipped with the knowledge on good practice in maintaining health, the level of student’s knowledge, attitude and practise toward Prophet Muhammad[7] [8] (PBUH) dietary and medicine are unclear. There was a study on Sunnah diet’s perception among youth at International Islamic University Malaysia (IIUM) which covered multi-discipline such as engineering, medicine, dentistry and nursing (Ishak et al. 2013). Thus, this study aimed to assess the level of knowledge about Prophet Muhammad[9] (PBUH) dietary and medicine, specifically among pharmacy students. We also determined the student’s information seeking method and their practise on Prophet Muhammad (PBUH) dietary[10] and medicine.

METHODOLOGY

This study was conducted at Universiti Teknologi MARA Pulau Pinang, Bertam campus, Malaysia. A total of 138 of first year pharmacy students were invited to participate in this study. The protocol of study had been approved by the university Research Ethic Committee.

A set of questionnaire was constructed based on Che Lamin et a. (2017) and content validated. The questionnaire consisted three sections: i) demographic data, ii) student’s awareness and their practise and attitude toward Prophet Muhammad (PBUH) dietary and medicine, iii) knowledge of definition on Quran, Sunnah and Prophetic medicine and scientific facts of the Prophet Muhammad (PBUH) dietary and medicine.

RESULT AND DISCUSSION

There were 138 respondents in this study. There were 33 (23.9%) males and 105 (76.1%) female students. The first year students aged 18 years old.

In Malaysia, *Sekolah Menengah Kebangsaan Agama* (SMKA) is an Islamic background school while *Sekolah Menengah Kebangsaan* (SMK) is an ordinary types of secondary school. Figure 1 illustrates the association between the student’s education background

and their awareness on Prophet Muhammad (PBUH) dietary and medicine. Majority of students were aware of Prophet Muhammad (PBUH) dietary and medicine regardless their background of school. A Mann-Whitney U test indicated that the academic background of the participants that claimed they are aware of Prophet Muhammad (PBUH) dietary and medicine practices (Mean Rank = 71.34, n=138) were significantly higher than those of the unaware group of respondents (Mean Rank = 55.44, n=138), $U = 751, z = -1.627$, (corrected for ties), $p = 0.104$. There was no significantly different between academic background of the aware groups and unaware groups of the Prophet Muhammad (PBUH) dietary and medicine practices. The effect of this associated can be described as “week” with $r = 0.14$.

Fig. 1: Previous student’s education background and their awareness on Prophet Muhammad (PBUH) dietary and medicine

Figure 2 shows the relative popularity of each type of information sources of Prophet Muhammad (PBUH) on dietary and medicine. The respondents were allowed to give the answers more than one answers. There were three tops of information sources: parents (85.5%), school (85.5%) and religious forum or preach (85.8%). Book and mass media such as television and internet contributed as source of information around 60.1% and 54.4% respectively. Our finding was similar to a previous study (Che Lamin et al. 2017) where parents and school were the most popular source of information on the Prophet Muhammad Dietary and medicine. Different finding by Ishak et al. (2013), indicated that majority of the students in International Islamic University of Malaysia (IIUM) gained the information about Sunnah diet from the Holy Quran. This was because Islamic environment was enlivened at IIUM where the students always bring and recite the Quran.

Fig. 2: the choices of information sources type of Prophet Muhammad (PBUH) on dietary and medicine

We also identified five reluctant reasons of Prophet Muhammad (PBUH) dietary and medicine (Figure 3). Thirty-six (26.1%) of the respondents were not practising Prophet Muhammad (PBUH) dietary and medicine. The majority (61.1%) of the respondents indicated that Sunnah food was not their diet habit since childhood. Equal percentage (41.7%) respectively claimed that they do not know the Sunnah food and they were satisfying with their health level. A small portion of respondents (13.8%) mentioned that Sunnah food does not suit with their appetite and the food was hardly found in the market. Ishak et al. (2013) also justified the reasons for not choosing Sunnah diet including the fact that the Sunnah food is scarce, costly, and it is less tasty.

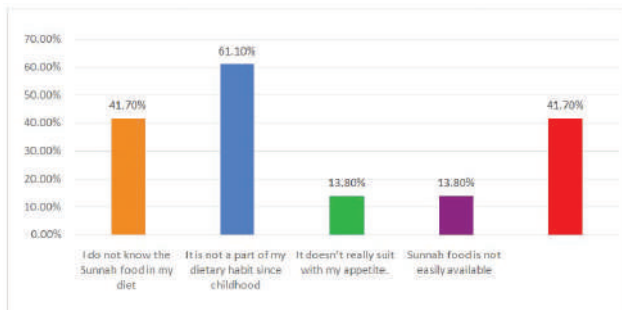

Figure 3: The total sample of reason of not practising the Prophet Muhammad in the respondent's diet and medicine practices

On the other hand, there were 102 students (73.9%) claimed that they were complying with Prophet Muhammad (PBUH) dietary and medicine. Figure 4 shows that 99% of students that practise the Prophet Muhammad (PBUH) dietary and medicine have a positive belief of Sunnah food, helping to improve their health level. This was found similar with a previous study, all students realized that Sunnah diet can enhance their health level (Ishak et al. 2013). Besides, 97% of them were advised to comply with Prophet

Muhammad (PBUH) dietary and medicine. While 92% of the respondents indicated that Sunnah food fitted their appetite and 87.3% of respondents mentioned that they could easily have the Sunnah food. Finally, the respondents that indicated the Sunnah food was their diet habits since childhood was 68.6%.

Fig. 4: The total sample of five reason of practising the Prophet Muhammad in the respondent's diet and medicine

Basically, Sunnah diet is synonym with Arabic diet rather than Malaysian. Figure 5 shows the frequency of practising the Prophet Muhammad (PBUH) dietary and medicine. Majority of the students (44.9%) only practise of the Prophet Muhammad (PBUH) in dietary and medicine practices when they felt they wanted to or based on the feasibility. The same trend also was observed by Che Lamin et al. (2017). Only 17.4% of the respondents had included the Prophet Muhammad (PBUH) as daily practice. About 18.1% of the respondents took two or three times of the Prophet Muhammad (PBUH) in their dietary and medicine practices. While 8% and 1.4% of the respondents practised of the Prophet Muhammad (PBUH) in their dietary and medicine practices once a week and once a month respectively. Ishak et al (2013) also stated that the students preferred to consumed Sunnah diet such as date during Ramadhan, the fasting month. Besides, our findings were agreeable with Ayatollahi (1992) where the consumption of food, diet patterns and the customs of parties are driven by the culture of a society.

Fig. 5: Frequency of practising the Prophet Muhammad (PBUH) dietary and medicine

Majority of the students were unable to identify the definition of the Prophetic Medicine according to Al-Quran and Sunnah (Figure 6). There are about 34.8% of the respondents who only got 1 correct answers out of 5 questions and 3.6% who got zero mark. Only 0.7% of respondents were successfully answered all the questions correctly.

Fig. 6: The score of student’s knowledge on basic definition of Prophetic Medicine according to Al-Quran and Sunnah

Besides that, the assessment of the scientific evidence perspective (table 1), shows that 60% of the students have weak knowledge and 40% have satisfactory level. None of the students were able to score good and excellent score.

Table 1: Knowledge score of scientific perspective of the Prophet Muhammad Dietary and medicine

Level score of scientific evidence perspective	Percentage of students
Weak (1 to 10 corrects answers)	60%
Satisfactory (11 to 20 corrects answers)	40%
Good (21 to 30 corrects answers)	0%
Excellent (31 to 41 corrects answers)	0%

A bivariate Pearson’s correlation coefficient (*r*) was calculated for the knowledge of respondents on definition of Prophetic Medicine in term of Islamic perspective and scientific evidence perspective. The bivariate correlation (table 2), between these two variables was positive but weak, $r(136) = 0.218, p < 0.05$. The student’s knowledge on the definition of Prophetic medicine in term of Islamic perspective was proportionate with their knowledge.

Table 2: Pearson’s correlation between

Variables	Scientific evidence perspective	Definition of Prophetic medicine
Definition of Prophetic Medicine	0.218*	1
Scientific evidence perspective	1	0.218*

N=138, * significant value $p < 0.05$.

Fig. 7: Respondent’s opinion on the benefit of Prophet Muhammad (PBUH) dietary and medicine

Student’s perception on the Prophet Muhammad (PBUH) dietary and medicine also had been determined. Up to 94.2% of the respondents were agreed that the Prophet Muhammad (PBUH) dietary and medicine could be beneficial to everyone. Only 0.7% of the respondents disagreed on that. Meanwhile, 5.1% of the respondents indicated that they were unsure about the suitability of the Prophet Muhammad (PBUH) dietary and medicine to everybody. According to Lange, Heilbron, & Kok

(2018), knowledge affects the perception and also is an essential for perceptual decision-making. In our findings, the respondent’s perception on the benefit of Prophet Muhammad (PBUH) dietary and medicine might be affected by their education background, belief and experience in life.

CONCLUSION

Student’s knowledge, attitude and practise towards the Prophet Muhammad (PBUH) dietary and medicine has been influence by many factors. Informal education such as parental guide and mass media has contributed to limited level of knowledge and attitude to practise the Prophet Muhammad (PBUH) dietary and medicine. Students may have a good perception on the Prophet Muhammad (PBUH) dietary and medicine but it is not reflecting their practise which may be due to lack of knowledge in this area. Further investigation is suggested for better understanding of this behavioural because there could be many other influencing factors.

ISO/IEC 27001 Implementation in SMEs: Investigation on Management of Information Assets

Saravanan Muthaiyah¹, Thein Oak Kyaw Zaw²

¹Faculty of Management, ²Faculty of Engineering, Multimedia University, 63100, Cyberjaya, Selangor, Malaysia

ABSTRACT

Objective: The main reason of this study was to generate knowledge and improve understanding amongst practitioners and academics. This paper examines the extent to which SMEs have implemented physical, policy as well as logical controls in place to curb security threats as a preventive control.

Analysis: Data was gathered through surveys and to achieve more reliable responses, questionnaires were distributed and collected personally by hand. ISMS provide a systematic approach to manage sensitive data in terms of maintaining its confidentiality, integrity and authentication.

Method: This study is based on both quantitative and qualitative tests method or measurement which determines IEC/ISO27001 practices amongst SMEs. ISO/IEC27000 family of standards provides clear guidelines to medium and large organizations on how to keep their information assets secure.

Findings: A total of 100 surveys were sent administered by hand across six enterprises which were equally represented by four sectors i.e. Business Process Outsourcing (BPO), telecommunications, software and hardware vendors. Respondents were data handlers that had at least five years of working experience. All 100 responses were collected by hand, giving this study a response rate of 100%.

Result: Results reveal that 98% of the respondents agreed that ISMS has a significant relationship with recommended industry best practices. Majority of firm ISMS initiatives are on voluntary basis.

Keywords: ISO/IEC27001, Information assets, Confidentiality, Integrity, Authentication, Information Security Management Systems (ISMS)

INTRODUCTION

In most organizations security is often an afterthought. In some rare cases, organizations adopt best practices and implement certain processes that clearly comply with best practices to improve their customer goodwill^[1]. ISO/IEC27001 that emphasizes requirements for Information Security Management Systems (ISMS) is one such example. It may for some others seen as a passive work

procedure that negatively impact performance of workers with little or no empathy that the information asset is a significant commodity^[2] (H. Kong, S. Jung, I. Lee, and Seung-Jun Yeon, 2015). The reason for compromise of information asset security is largely due to this lack of empathy by handlers of these information assets. Table 1 shows the cost type; proven scenarios associated with data vulnerabilities and cost relationships^[3]. Table 2 highlights nature of information assets.^[4]

Table 1: Information asset cost

Cost Type	Proven Scenarios	Cost Relationships
Financial loss	Service interruption	Direct and indirect
Resumption cost	Prevent and mitigate breach	Direct
Productivity cost	Diversion of staff, redundant work to amend entries, correction entries	Direct
Reputational cost	Customer confidence due to negative media publicity	Direct and indirect
Privacy breach cost	Remediate data breach of data	Direct
Legal cost	Negligence or breach of contract	Direct
Relationship cost	Loss of trust by local and foreign business partners	Direct and indirect

Table 2: Nature of information assets

Primary assets	Secondary assets
Information in transit	Hardware Software Network Personnel
Information at rest	Site Organization structure

According to Jeremiah Grossman, the founder of White Hat, recognizes that industries are able to categorize security vulnerabilities when they encounter, however when it comes to the process of remediation and fixes^[5], there solutioning are not being addressed in timely manner. This goes back to the reason of traditional solutions have been widely ineffective. It is simply because the focus was more towards the tools and consultancies. Besides, most of these methods lacks in complexity of data and they are expensive^[6]. Subsequently, companies need better approach to not only able to trigger the security vulnerabilities but also ensuring the security level is high and mitigation plans are in place from any risk.

In return, numerous employees regularly make a conscious choice to violate security policies for the reason they want to further their work or increase their own productivity^[7] (J. Predd, S.L. Pfleeger, J. Hunker and C. Bulford). In a similar study, researchers found that fear of penalty stimulate employees to obey security policies in an organization. On the contrary, Miller and Doyle (1987) stated that corporations that attain greater work presentation are those who adopt Information Security that ties their organization’s goals^[8]. Information Security can have diverse purposes in an organization, thus management should ensure that the organization utilizes the securities effectiveness to suit and organization objectives^{[9][10]}.

Information Assets (IAs): Information assets (IAs) are identified by various definitions. From the survey of definitions listed in Table 3 a summary of key attributes that reflect information assets are as follows:

Table 3: Standard definitions for information assets

No.	Source of definition	Web Link/URL	Summary		Key Points
1.	WhatIs	https://whatistechtarget.com/definition/information-assets	A body of knowledge that is organized and managed as a single entity.	i.	Value increases with direct relationship to the number of information assets handlers
				ii.	Value tends to depreciate over time

- IAs must represent a value to the firm
- IAs value increases linear to the number of information assets handlers
- IAs value can depreciate over time
- IAs cost money, skills, time, resources to be acquired and to be reacquired
- Once permanently lost IAs will incur legal, reputational or financial repercussions
- IAs should have data classification on its importance
- IAs should be maintained in a consistent and cooperative manner
- IAs are a source of reference for multiple business functions

What Is stated that information asset is a body of knowledge that is organized and managed as single entity. It should have financial value in which the value increases as a direct relationship with the number of people who are able to make use of it. In other words, the value should increase as the number of information assets handlers increase. Not just that, there will be financial value associated it just like the physical assets of an organization. It may be less quantifiable but the importance can outweigh the physical assets.

It can be a simple monthly update to a complex development project ROI dashboard that is being updated weekly. It differs from one entity to another on defining their information asset. Each organization may have different information that they feel is a vaults towards them. Queensland Government Chief Information Office gave definition of information asset to be an identifiable collection of data stored in any manner and recognized as having value for the purpose of enabling an agency to perform its business functions thereby satisfying a recognized agency requirement. The information asset will become the source of reference for multiple business functions with value.

Conted...

2.	Simplifiable	https://simplifiable.com/new/information-asset	A body of information that has financial value to an organization.		Improves revenue or reduce future costs by having it
3.	The National Archives	http://www.nationalarchives.gov.uk/documents/information-assets-management/information-assets-factsheet.pdf	A body of information defined and managed as a single unit so it can be understood, shared, protected and exploited efficiently. Information assets have recognizable and manageable value, risk, content and lifecycles.	i.	It gives value to the organization
				ii.	Costs money to reacquire it
				iii.	Legal, reputational or financial repercussions if couldn't produce it on request
				iv.	There should be a risk associated with it
				v.	Group of information should have a specific content
				vi.	It has manageable lifecycle
				vii.	Disposal should have rules
4.	Cambridge Dictionary	https://dictionary.cambridge.org/dictionary/english/information-asset	A piece of information, such an employee record, a customer list, or a financial report, that is valuable to a company or organization		It has a value to the organization
5.	University of Tasmania	http://www.utas.edu.au/it/records/information-asset-register	A body of information defined and managed as a single unit so it can be understood, shared, protected and exploited effectively. Information assets have recognizable and manageable value, risk, content and lifecycles.	i.	It has value, risk, content and lifecycle associated with it
				ii.	It is a strategic assets of an organization
				iii.	Handlers of information must be liable person
6.	Yourwindow	http://www.yourwindow.to/information-security/gl_informationasset.htm	An Information Asset is a definable piece of information, stored in any manner, which is recognized as 'valuable' to the organization.	i.	It has value to the organization
				ii.	It is not easily replaceable without cost, skill, time, resources or a combination
				iii.	They form a part of organization's identity
				iv.	It should have data classification on its importance
7.	Information Asset Development	http://www.information-assetdevelopment.com/what.html	An Information Asset is organized Information that is valuable and easily accessible to those who need it. Information Assets comprise a wide range of corporate product, service and process information.	i.	Must be maintained in consistent and cooperative manner
				ii.	Value increases according to the information it aggregates
				iii.	Value increases according to the number of handlers

Conted...

8.	Queensland Government Chief Information Office	https://www.qgcio.qld.gov.au/publications/qgcio-glossary/information-asset-definition	An identifiable collection of data stored in any manner and recognized as having value for the purpose of enabling an agency to perform its business functions thereby satisfying a recognized agency requirement.	i.	Source of reference for multiple business functions
				ii.	It has value to the organization

Study Objectives and Research Questions: Information security is crucial for maintaining data integrity. With poorly administered security systems data availability, integrity and confidentiality becomes a problem. main objective of this paper is to understand how much SMEs exercise focus on controls of information assets and keep their data secure without breach or compromise with reference to ISMS and IEC/ISO27001. Specific research questions that this paper aims to address are as follows:

- To what extent were data handlers of information assets aware of IEC/ISO27001?
- To what extent have SMEs implemented IEC/ISO27001 as best practice?
- What are problems that are related to IEC/ISO27001 implementation?
- Does the implementation of ISMS lead to greater IEC/ISO27001 compliance?
- Has IEC/ISO27001 been introduced and if so to what extent?

METHODOLOGY

This was is an exploratory study with main reason of this study was to generate knowledge and improve

understanding amongst practitioners and academics. This study is based on both quantitative and qualitative tests or measurement which determines IEC/ISO27001 practices amongst SMEs. Data was gathered through surveys and to achieve more reliable responses, questionnaires were distributed and collected personally by hand.

DISCUSSIONS AND FINDINGS

A total of 100 surveys were sent administered by hand across six enterprises which were equally represented by four sectors i.e. Business Process Outsourcing (BPO), telecommunications, software and hardware vendors. Respondents were data handlers that had at least five years of working experience. All 100 responses were collected by hand, giving this study a response rate of 100%.

IEC/ISO 27001 Awareness: Table 4 below shows the years the awareness among information asset handlers. 61 % of data handlers were not aware IEC/ISO 270001 compared to only 39% who were aware. This clearly indicates that there awareness as a whole was low and it was not impacted by the years of work experience.

Table 4: IEC/ISO27001 awareness

Level of awareness	Working Experience	Frequency	Cumulative Percent
Aware	5-6 years	12	39
	5-7 years	16	
	> 8 years	11	
Not Aware	5-6 years	18	61
	5-7 years	24	
	> 8 years	19	
	Total	100	

Antecedents of IEC/ISO27001: Respondents were asked to rank factors that leading towards the implementation of IEC/ISO27001. Specific reasons that were listed included: 1) keeping information assets secure, 2) improving customer/client trust, 3) minimizing information audit failure, 4) compliance control standards, 5) process sustainability and 6) others.

Table 5: Antecedents of IEC/ISO27001 implementation

Performance Evaluation	Contributing Factors	Rank	Aggregate	Percent
		<i>r</i>	<i>n</i>	%
Most important	Keeping information assets secure	6	180	30
2 nd important	Improve customer/client trust	5	100	20
3 rd important	Minimizing information audit failure	4	80	20
4 th important	Compliance control standards	3	54	18
5 th important	Process sustainability	2	20	10
Least important	Others	1	2	2
			436	100

The most important factor was assigned 6 points, followed by 2nd most important value with 5 points and so on. Table 5 shows the overall ranking of the reasons that contributed to the antecedents of IEC/ISO27001 implementation.

Problems related to ISMS Implementation: Table 6 below, shows overall ranking of the further issues faced for the deployment of ISMS. The most important factor was assigned 4 points, followed by 3 points for the 2nd most important factor and so on. Below were the results for overall ranking.

Table 6: Problems for ISMS implementation

Performance Evaluation	Problems	Rank	Aggregate	Percent
		<i>r</i>	<i>n</i>	%
Most important	Productivity cost/loss	4	180	45
2 nd important	Realignment of processes	3	66	22
3 rd important	Industry recognition	2	36	18
4 th important	Management support for best practices	1	15	15
			297	100

Hypothesis Testing: Table 7 summarizes key hypotheses that were formulated to facilitate this study.

Table 7: Hypothesis

Hypothesis 1	IEC/ISO27001 is significant for information asset controls
Hypothesis 2	Regulatory requirement has a significant relationship towards IEC/ISO27001 implementation
Hypothesis 3	IEC/ISO27001 significantly reduces personnel productivity among data handlers
Hypothesis 4	Implementation of ISMS has a significant relationship with recommended industry best practices

In this hypothesis, the objective is to find out whether the implementation of IEC/ISO27001 will improve information asset controls significantly. The questions that were developed to support the hypothesis are:

Hypothesis 1 - Implementation of IEC/ISO27001 is significant for improved information asset controls

- Do you think information asset controls are necessary?

Table 8: Response to necessity of information asset controls

		Frequency	Percent
Valid	Yes	67	67%
	No	33	33%

- Do you think information asset controls will yield benefits to the firm?

Table 9: Response to information asset controls yielding benefits

		Frequency	Percent
Valid	Yes	88	88%
	No	12	12%

- ISMS and IEC/ISO27001 should be standard practice.

Table 10: Response to ISMS and IEC/ISO27001 as standard practice

		Frequency	Percent
Valid	Yes	85	85%
	No	15	15%

67% of the respondents agree that information asset controls are necessary. 85% of the respondents agree ISMS and IEC/ISO27001 should be and only 15% disagree. In this context, the hypothesis that IEC/ISO27001 is significant for improved information asset controls can be accepted.

Hypothesis 2–Regulatory requirement has a significant relationship towards IEC/ISO27001 implementation

Out of 100 respondents, 89% agree that regulatory requirement has a significant relationship towards IEC/

ISO27001 implementation. Therefore, this hypothesis can be accepted as well.

Table 11: Regulatory requirement has a significant relationship towards IEC/ISO27001

		Frequency	Percent
Valid	Yes	89	89%
	No	11	11%

Hypothesis 3 – IEC/ISO27001 significantly reduces personnel productivity among data handlers

Hypothesis 3 can be stated in the null and alternate as follows:

H_{10} : IEC/ISO27001 does not reduce productivity significantly. Statistically expressed: H_{10} is $\mu_b = \mu_a$, where μ_b is productivity before the implementation and μ_a , is productivity after implementation.

H_{1A} : IEC/ISO27001 reduces productivity significantly. Statistically expressed: H_{1A} is $\mu_b > \mu_a$ or $\mu_b < \mu_a$

A *t*-test was done to compare differences in the means for two groups. A *t*-test will indicate if the implementation of IEC/ISO27001 has a positive effect on minimizing productivity. The result of the *t*-test done is shown in Table 12. The difference in the means of 3.87 and 2.08 with standard deviation of 1.582 and 0.743 for before and after implementation is significant. The null hypothesis is rejected as the *t* value falls outside of the region. Therefore, the alternate hypothesis is supported i.e. $\mu_b > \mu_a$.

Table 12: Response to reducing personnel productivity of data handlers

		Mean	N	Std Deviation	Std. Error Mean
Pair 1	Before implementation of IEC/ISO27001, productivity has significantly reduced	3.87	100	1.582	.095
	After implementation of IEC/ISO27001, productivity has significantly reduced	2.08	100	.743	0.05

Hypothesis 4–Implementation of ISMS has a significant relationship with recommended industry best practices

Table 13: ISMS and relationship with recommended industry best practices

		Frequency	Percent
Valid	Yes	98	98%
	No	2	2%

Results reveal that 98% of the respondents agreed that ISMS has a significant relationship with recommended industry best practices. As such this hypothesis was accepted.

CONCLUSION

Information assets and implementation of ISMS and IEC/ISO27001 is still in its infant stage among most SMEs. Based on the data collected we realize that most firm are still lacking behind in terms of implementing ISMS and IEC/ISO27001. Majority of firm ISMS initiatives are on voluntary basis. Regulatory enforcement is needed to be the catalyst that will mandate promotion and exhaustive use of IEC/ISO27001 in managing better controls of information assets. Future research should explore what factors can induce the implementation of ISMS and IEC/ISO27001 as best practice and improve productivity threshold at the same time. Although Sarbanes Oxley and HIPAA standards have been widely implemented only large firms have the manpower and processes in place to execute them well.

Occupational Stress: An Analysis of the Causes

Ashgar Ali Ali Mohamed¹, Farheen Baig Sardar Baig², Muhamad Hassan Bin Ahmad³, Arun Kasi⁴

¹Professor, ²Associate Professor, ³Assistant Professor, International Islamic University Malaysia;

⁴Advocate and Solicitor (Malaya)

ABSTRACT

Objective: This paper seeks to deliberate on the causes of occupational stress with reference to unmanageable workload, job insecurity, sexual harassment, workplace discrimination and employer's unlawful conduct.

Analysis: Excessive or unmanageable demands, insufficient support from co-workers and unsatisfactory working conditions may affect staff-motivation and productiveness. The main thing is to analyse that, the long-term stress or traumatic events at work may have affect the workers physically and psychologically.

Method: Job uncertainty due to impending retrenchment, restructuring or management changes and hostile work environment could also give rise to occupational stress. Occupational stress often results in high dissatisfaction among the employees in terms of job mobility, burnout and poor work performance and less effective interpersonal relations at work.

Findings: In the event of breach of this duty by the employer, apart from alleging constructive dismissal, the employee may be able to recover compensation for non-pecuniary loss such as mental distress or the effect of the dismissal on employee's reputation or the chances of finding other employment.

Result: The employer may also expose himself to a civil claim for negligence or a failure to provide a safe place of work. These causes of actions relate in deed to occupational or workplace stress, discussed in this article.

Keywords: *Stress, Occupational, Causes*

INTRODUCTION OF OCCUPATIONAL STRESS

The occupational stress in the present globalised world has fraught a tremendous concern to the employees and other stakeholders of organisations. This is a sombre dilemma in many organisations around the world and its impact can be substantial. Occupational stress can be defined as the gap between work-demands and individual-ability to fulfil those demands. The underlying cause of stress include lack of resources and equipment, heavy work schedule such as working late or overtime, under-staffing, increased workload and responsibility^[1]. Occupational stress often results in high dissatisfaction among the employees in terms of job mobility, burnout, and poor work performance.

Occupational Stress: The Causes: There are many working conditions or stressors that a worker may encounter at the workplace on a daily basis which will have an effect on his or her physical and/or emotional well-being. Excessive workload or work demand, stressful deadlines, long working hours, insufficient number of staff, lack of support from co-workers and supervisors, annoying co-workers, angry customers and hazardous working conditions are, among others, some of the circumstances that may contribute to occupational stress. It can also be triggered by job uncertainty such as impending retrenchment, restructuring or management changes and hostile work environment. It is an accepted fact that prolonged job-related stress can drastically affect the physical health of a worker^[2].

Further, there is a significant relationship between stress and job performance. Stress is the common denominator for depleting work performance and productivity^[4]. Persistent tardiness, absenteeism or leaving the office earlier than the scheduled working hours will seriously affect the employer's productivity, profits and reputation^[3].

Corresponding Author:

Ashgar Ali Ali Mohamed

Professor, International Islamic University Malaysia

Email: ashgar@iiu.edu.my

An employee who absents himself from the workplace on a scheduled workday will inevitably disrupt the employer's work schedules, aside from affecting the employer's customer commitments, among others. To minimise the work disruption due to the slack caused by an absent employee, a regular worker would in normal circumstances assume the added workload. For example, in *Damien Thanam Divean v CSC (M) Sdn Bhd*, the claimant, a Customer Support Analyst who was expected to attend to customer phone calls, was frequently late to work and this affected the company's ability to answer calls in a prompt and timely manner which in turn affected the company's business and reputation^[5].

Unmanageable workloads: Pressure at the workplace is unavoidable due to the demands of the contemporary work environment. Setting goals which put pressure on staff to achieve their best can lead to positive results. However, setting unrealistic expectation, giving unmanageable workload, setting deadlines, setting super-ambitious goals without adequate staff, equipment and resources to carry out the work undoubtedly can have a negative impact on the worker's self-esteem, motivation, and productivity^[7]. The key performance indicators (KPI) imposed on an employee to gauge performance which is unrealistic or unreasonable will give rise to unnecessary stress level amongst the workers in the workplace. An employee who failed to meet the KPI would be deemed to have performed poorly and that may form a basis for disciplinary action^[6].

It is noteworthy that an employer may, depending on terms of the contract, not bound to retain an employee whose performance is unsatisfactory. It is equally important to note that an employer cannot dismiss such a worker without first informing him where he is slacking and giving adequate time to remedy it. As Sir John Donaldson aptly stated in *S James v Waltham Holy Cross UDC*: '[a]n employer should be very slow to dismiss [an employee] upon the ground that the employee is incapable of performing the work which he is employed to do^[8].

The requirement to pre-warn and afford adequate time for improvement however does not apply to a skilled and professional employee where a certain standard is implied and hence expected of him in the running of the everyday business. When he or she has demonstrated his or her incompetence or inability and thus performing short of the skill or professional capability expected of

him or her, the employer is not bound to retain him or her and thus, may be justified in terminating his or her services without prior warning, depending on the factual matrix of the case^[9].

Job insecurity: A vast majority of workers build their lives around their jobs. They might have made a substantial contribution, achieved a high rank in the organisation, have enjoyed various benefits from being a long time employee in service and might have planned their future in the expectation that they would continue in employment. Loss of employment due to genuine redundancy in the organisation can be a distressing experience that inflicts severe economic hardship on the affected worker, which can shatter his or her life as it has both financial repercussion and psychological effects. The aggrieved worker will be deprived of his or her major source of income and may possibly suffer long term unemployment. The effect would be more apparent on workers who had been in a long time service involving only specific skills, which may be of little use to other potential employers^[10].

Besides the economic loss, any dismissal from employment is likely to affect the reputation and standing of a person. The higher the status and responsibility an employee enjoyed, the greater the effect of his dismissal. To make things worse, if the dismissal has been effected in a high-handed manner, it may have real prospect of humiliation and embarrassment. There may be feelings of life dissatisfaction, lack of self-esteem, lack of personal control and general psychological depression, and other stress related illness such as hypertension, cardiac disorders, and gastric ulcers, among others, which increase with continued unemployment.

Sexual Harassment: Employment occupies a central role in a working person's life by providing for the basic necessities of life besides a sense of identity and self-worth. Repeated unwelcome sexual comments, looks or physical contact, among others are examples of sexual conducts which are imposed on, and is unsolicited or unreciprocated by the recipient. Pulling victim's bra straps and touching her buttocks, touching victim while making sexual remarks, slapping victim's buttocks. Sexual harassment affects the victim physiologically where the aggrieved worker may experience emotional trauma, anxiety, nervousness, depression and feelings of low self-esteem which may lead to absenteeism, malingering and other negative consequences. Further, it also affects

the employee's morale and job performance, such as experiencing difficulty in concentrating on her job.

In *Mohd Ridzwan Bin Abdul Razak v Asmah Binti Hj Mohd Nor*, the appellant was alleged to have uttered vulgar and sexually explicit rude remarks at the respondent. The High Court accepted the psychiatrist's findings that the respondent suffered from major depression caused by the sexual harassment. Suriyadi Halim Omar FCJ, delivering the judgment of the Federal Court, stated:

Sexual harassment is a very serious misconduct and in whatever form it takes, cannot be tolerated by anyone. In whatever form it comes, it lowers the dignity and respect of the person who is harassed, let alone affecting his or her mental and emotional well-being. Perpetrators who go unpunished, will continue intimidating, humiliating and traumatising the victims thus resulting, at least, in an unhealthy working environment.

Workplace Discrimination: Discrimination means a comparative unfair treatment of a person on grounds such as race, gender, disability, age and religious belief. Discrimination based on the above reasons can lead to a lowered self-esteem, lack of self-confidence, mental distress, anxiety and depression and when translated to the workplace, it can result in lower productivity and a rapid drop in morale and job satisfaction. The International Labour Organisation (ILO) considers discrimination as 'a differential and less favourable treatment of certain individuals' because of any characteristics such as sex, race and religion, 'regardless of their ability to fulfill the requirements of the job'. The United Nations Universal Declaration of Human Rights 1948 provides that all human beings are born free and equal in dignity and rights. Gender discrimination takes place when women, for example, are treated less favourably or suffer detrimental treatment at the workplace as a result of unreasonable differential treatment between men and women.

In Malaysia, although there is no specific legislation regulating workplace discrimination, the gender discrimination claims can be construed and rationalised pursuant to section 20(1) of the Industrial Relations Act 1967. Dismissal tainted with unfair motives, having the element of discrimination, victimisation, capricious or *mala fide* actions that are incorporated under unfair labour practices would come within the scope of the said section.

Employer's wrongful conduct: The employer and employee relationship must be one of complete confidence and trust. The employer may not, without reasonable and proper cause, conduct himself or herself in a manner calculated or likely to destroy or seriously damage the relationship of confidence and trust. It imposes a duty on the employer to treat the workers fairly and reasonably during employment and where dismissal is inevitable, it should be carried out in a justifiable manner. It is further implied from the above implied term that the employee would be treated in such a manner as to enable him or her to retain his or her dignity and status.

The wrongful conduct of the employer can take place in a number of forms and may arise when the employer harasses or humiliates the employee particularly in front of junior staff, victimising or targeting particular members of staff, falsely accusing an employee of misconduct such as theft or of being incapable of carrying out his or her job, a fundamental demotion involving reduced responsibilities and/or positioning within the corporate hierarchy where his newly assigned position involves a substantial reduction in salary, bonus, benefits, status, responsibilities, authority or a combination of any of them, making a significant change in the employee's job location at short notice and forced resignation, etc.

Accusing an employee of theft without adequate supporting evidence or unjustifiably undermining the supervisor's authority in the presence of other employees. Any form of victimisation of the employee, whether arbitrary, perverse or baseless actions by the management that are unnecessarily harsh or is not just or fair, or other *mala fide* action on the part of the management, may warrant court interference.

Sometimes an employer may, in order to get rid of an employee, resort to making the life of the employee miserable, short of any major breach of contract. By reason of the employer's conduct, the employee may opt to resign, thus relieving the employer from compensating the employee for unfair dismissal or with a retrenchment payment. In *Wood v WM Car Services Ltd* Browne-Wilkinson J reprimanded such practice. His Lordship stated that:

Any employer who wishes to get rid of an employee or alter the terms of his employment without becoming liable either to pay compensation for unfair dismissal or

a redundancy payment have had to resort to methods of 'squeezing out' an employee stopping short of any major breach of the contract, such an employer attempting to make the employee's life so uncomfortable that he resigns or accepts the revised terms. Such an employer, having behaved in a totally unreasonable manner, then claims that he has not repudiated the contract and therefore that the employee has no statutory right to claim either a redundancy payment or compensation for unfair dismissal.

CONCLUSION

Employer must ensure that the workers are treated fairly and that work assignments are reasonable and commensurate with the position and the capability of the worker to discharge.

Dismissal tainted with unfair motives, having the element of discrimination, victimisation, capricious or *mala fide* actions that are incorporated under unfair labour practices would come within the scope of the unfair dismissal under the Industrial Relations Act 1967. It is worth noting that an employer has a duty to ensure that the environment at the workplace is safe and conducive free from threats, intimidation and violence. In the event of breach of this duty by the employer, apart from alleging constructive dismissal, the employee may be able to recover compensation for non-pecuniary loss such as mental distress or the effect of the dismissal on employee's reputation or the chances of finding other employment. The employer may also expose himself to a civil claim for negligence or a failure to provide a safe place of work. These causes of actions relate in deed to occupational or workplace stress, discussed in this article.

Redefining Training Motivation: Determining the Booster Effect of Training Motivation on Training Effectiveness Using The Malaysian Sample

Siti Fardaniah Abdul Aziz

Universiti Kebangsaan Malaysia, Faculty of Social Science and Humanities, 43600 Bangi, Selangor, Malaysia

ABSTRACT

Objective: The objective of this article is to discuss the redefinition of training motivation into essential training motivation (ETM) and its effect on learning and job performance.

Analysis: Data were collected from 281 academic staff in a large public university in Malaysia. Training motivation is highlighted as a booster to stimulate training effectiveness in organization however, the determination of training motivation was vague because it was referred as various terms.

Method: This research used a quantitative approach and self-report survey; it also used prediction study because it is the most suitable design to achieve the research objective.

Findings: Findings show that training motivation can be redefined as ETM and can predict learning performance to a large effect and job performance to a medium effect. Hence, to differentiate between the valuable and the useless training, the level of ETM can be determined.

Result: Human resource development researchers and practitioners are suggested to predict training effectiveness by determining the level of ETM.

Keywords: *human resource development, employee training, training effectiveness, training motivation, Malaysia*

INTRODUCTION

Formal training is organized for developing and managing quality human resources. Ironically, D. L. Kirkpatrick and J. D. Kirkpatrick argue that training is useless if it cannot be proven that there is no improvement in trainees' learning; meanwhile, Holton argue that job performance is the most important criteria of training effectiveness because this is the main objective of sending employees for formal training. Interestingly, training motivation can be useful to predict training effectiveness because it is highlighted as the most important precursor for effective training. Hence, training motivation should be able to predict both learning and job performance.

Nevertheless, there is a need to redefining training motivation since there are many types of training motivation as discussed by previous researchers. Fortunately, Bauer et al. have determined that only the motivation to learn and motivation to transfer are the most influential types of training motivation; however,

they argue that empirical study that combines both types of training motivation as a measure of training motivation within a single study has never been done previously. Therefore, the objective of this research is to redefining training motivation into essential training motivation (ETM) by combining the motivation to learn and motivation to transfer, as well as to test its prediction effect on training effectiveness measures including learning and job performance. Specifically, this research will focuses on academic staff in a large public university in Malaysia. Significantly, findings of this research can be used to predict training effectiveness in organizations especially in public sector to develop and manage quality human resources.

LITERATURE REVIEW

Commonly, learning and job performance are essential measurements of training effectiveness; these measurements have been given considerable attention by previous researchers. A large number of training

effectiveness models have highlighted the importance of measuring learning performance including those suggested by Kraiger, Ford and Salas^[1], Holton, and D. L. Kirkpatrick and J. D. Kirkpatrick . Holton and D. L. Kirkpatrick and J. D. Kirkpatrick argue that it is impossible to prove that training can affect job performance if it is not proven that trainees have learned in training^[2]. Meanwhile, using psychology discipline, Kraiger et al. argue that learning is the most important measurement to assess training effectiveness^[3] because it can distinguish between training program that can or cannot affect changes in trainees specifically through cognitive, skill, and affective development. Hence, Siti Fardaniah^[4] has developed an instrument to measure learning performance using the components suggested by Kraiger^[5] et al.

Further, most of training effectiveness model has included job performance as another important measurement for training^[6] effectiveness including those models by Baldwin and Ford , Holton , and D. L. Kirkpatrick^[7] and J. D. Kirkpatrick . This is because they argue that the main purpose of organizing training is to improve job performance; hence, the increase in job performance should be measured to prove the effectiveness of training. Siti Fardaniah^[8] has also developed instrument to measure the effect of training on job performance.

On the other hand, contemporary models of training effectiveness including those suggested by Colquitt^[9], LePine and Noe, Holton , and Siti Fardaniah have

suggested that training motivation as the most influential factor that stimulate training effectiveness. However, previous researchers including Alvarez et al., Rowold, and Gegenfurtner, Festner, Gallenberger, Lehtinen and Gruber argue that there are various types of training motivation including pre-training motivation, post-training motivation, motivation to learn, motivation to transfer, motivation to participate in training, autonomous training motivation, controlled training motivation, etc.

Fortunately^[10], Bauer et al. used three theories of motivation including the self-determination theory, expectancy theory, and the expectancy-value model to determine the most influential types of training motivation; findings indicated that there are only two types of training motivation that has large effect on various measurement of training effectiveness including the motivation to learn and motivation to transfer. Meanwhile, Siti Fardaniah has developed instrument to measure motivation to learn and transfer; she also used an integrative literature review to determine the effect of these types of training motivation on learning and job performance (see Table 1).

Based on the literature review, it is hypothesized that essential training motivation (ETM) is comprise of motivation to learn and transfer; and ETM can predict learning and job performance to a large effect size. This is demonstrated in Figure 1. Additionally, ETM is defined as the willingness of the learner to put effort into his/her job performance by learning from training and use the skills and knowledge obtained in training.

Table 1: Effects of the different dimensions of ETM on learning and job performance

Dimension of ETM	Effects of different dimensions of ETM on learning and job performance	
	Learning performance	Job performance
Motivation to learn	$r = .63$ and $\beta = .67$ (Tracey et al., 2001) $\beta = .44$ (Bell & Ford, 2007) $r = .758$, $\beta = .561$ (Tziner et al., 2007) $R^2 = .43$ (Chen & Chih, 2012)	$r = .608$, $\beta = .376$ (Tziner et al., 2007)
Motivation to transfer	-	$\beta = .712$ (Pilati & Borges-Andrade, 2008) $\beta = .49$ (Liebermann & Hoffmann, 2008) $r = .55$ and $\beta = .48$ (Axtell et al., 1997)

Notes: All figures are significant at least at 0.05 level of significant, ETM = essential training motivation
 Source: Adapted from Siti Fardaniah (2013, p. 95-97)

Figure 1: Hypothesized research framework for the prediction effect of ETM

METHODOLOGY

This research used a quantitative approach and self-report survey; it also used prediction study because it is the most suitable design to achieve the research objective. Data for this research were based on secondary data collected in the year of 2011 using survey from a population of academic staff in a large public university in Malaysia that participated in one of 17 general training program organized by the university’s Academic Development Center (ADC). In sum, only 281 academic staffs were willing and chosen to participate in this study using a stratified simple random sampling method; as suggested by Buxbaum , more than 50% participants in each training were included. The total of sample is sufficient to determine mediation effect as analyzed by G-Power software.

Instruments used in this research were developed by Siti Fardaniah. Data for motivation to learn and transfer were collected during training; meanwhile, data for learning and job performance were collected after the completion of training. This is to reduce common method bias as suggested by P. M. Podsakoff, MacKenzie, Lee, and N. P. Podsakoff (2003). Sample

question for motivation to learn was “I am trying to learn as much as I can from this training program”, motivation to transfer was “I will try to think about how to apply the skills that I have learned in this training”, learning performance was “I have the capability to perform the skills taught in this training”, and job performance was “My job performance has improved as a result of applying the skills emphasized in this training”. Data were then analyzed using SPSS and SEM-AMOS.

FINDINGS AND DISCUSSION

Findings indicated that ETM can be redefined as the motivation to learn and transfer in training; it also had a large effect on learning performance and medium effect on job performance. Ironically, findings indicated that learning performance did not significantly affect job performance although it has a significant relationship.

Figure 2 shows the structural model for the hypothesized research framework. Meanwhile, Table 2 shows the sufficient and significant value of AVE, construct reliability, correlation, and squared correlation between each variable. The structural model had passed construct validity test including the discriminant, nomological, and convergent validity as suggested by Hair, Black, Babin and Anderson . The structural model also has acceptable model fit; $\chi^2(60) = 109.67$ with $p = .000$, $\chi^2/df = 1.823$, $GFI = .942$, $CFI = .978$, $TLI = .971$, and $RMSEA = .054$ with $PCLOSE = .311$. This has shown that training motivation can be redefined as ETM that comprise of motivation to learn and transfer. Meanwhile, all the ETM, learning performance and job performance has significant correlation.

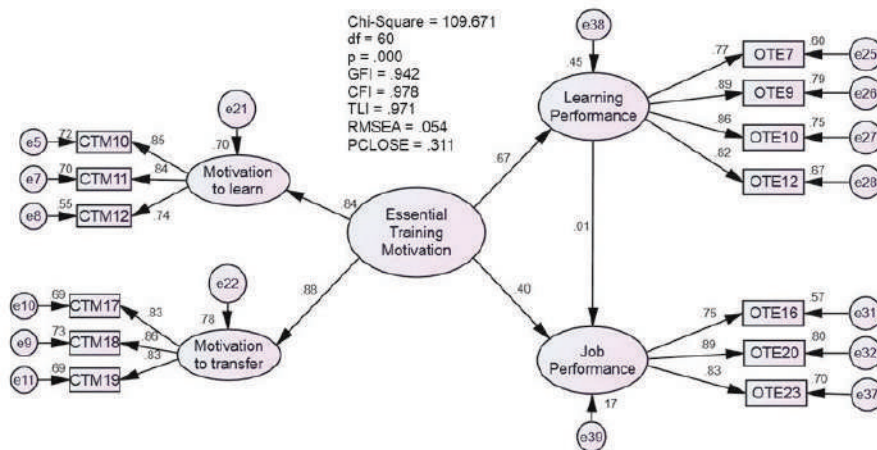

Figure 2: Structural model for the hypothesized research framework

Notes: All regression weights, covariance and variances are significant at .0001 level of significant

Table 2: Average variance extracted (AVE), construct reliability (CR), correlation, and squared correlation among variables

AVE	CR		ETM	LP	JP
.740	.851	ETM	-	.67	.41
.703	.902	LP	.4489	-	.28
.690	.864	JP	.1681	.0784	.1369

Notes: Values above the diagonal are correlation as produced by SEM. Values below the diagonal are squared correlation. All correlations are significant at .0001 level of significant

ETM = essential training motivation, LP = learning performance, JP = job performance

Most of the research findings are consistent with previous researches. Firstly, findings indicated that training motivation can be redefined as ETM that comprise of motivation to learn ($\beta = .84$) and motivation to transfer ($\beta = .88$). This is consistent with findings by Bauer et al. that found motivation to learn and motivation to transfer are the most influential types of training motivation. Hence, hypothesis 1 is fully supported.

Secondly, findings indicated that ETM had a large effect ($\beta = .67$) and can explain 45% variance in learning performance. This is consistent with previous research, such as by Tracey, Hinkin, Tannenbaum and Mathieu, Bell and Ford, and Tziner, Fisher, Senior and Weisberg that found a large effect of training motivation on learning performance; meanwhile, Chen and Chih found that training motivation can explain 43% variance in learning performance.

Nonetheless, findings indicated that ETM had a medium effect ($\beta = .40$) and can explain 17% variance in job performance. This is inconsistent with previous research; in which, Previous researchers including Axtell, Maitlis and Yearta, Pilati and Borges-Andrade, and Liebermann and Hoffmann found that training motivation had a large effect on job performance. Hence, hypothesis 2 is partially supported. The inconsistent findings might be explained by the fact that both learning and job performance should be considered as different dimension of training effectiveness. In addition, findings also indicated that learning performance did not significantly affect job performance ($\beta = .01, p = .895$), this has revealed new findings.

For example, Pilati and Borges-Andrade did not include learning performance but only tested the effect of training motivation on job performance. Meanwhile, Liebermann and Hoffmann included learning and job performance and found that training motivation affect both measurement of training effectiveness with different strength effects. Additionally, Axtell et al. also include both learning (referred as skill acquired) and job performance measures; however, they found that training motivation had significant correlation with learning performance but only affect job performance. This demonstrated that both learning and job performance are not different levels but different dimension of training effectiveness; this is consistent with suggestion by Bersin and Siti Fardaniah. Hence, it is demonstrated that training might have large effect on learning performance but medium effect on job performance.

CONCLUSION

The purpose of this article was to redefine the various types of training motivation into ETM (essential training motivation) and hypothesized it to have large effect on training effectiveness. Findings indicated that ETM can comprise of motivation to learn and motivation to transfer and had a large effect on learning performance and medium effect on job performance. Hence, it can be seen that training motivation had a booster effect on training effectiveness. Therefore, human resource development researchers and practitioners are suggested to predict training effectiveness by determining the level of ETM. In addition, Cannon-Bowers, Salas, Tannenbaum and Mathieu, and Siti Fardaniah had investigated factors that can stimulate ETM and training effectiveness; hence, these factors can be used to stimulate ETM to improve training effectiveness.

Additionally, consistent with debates by Bersin and Siti Fardaniah, learning performance and job performance should not be considered as different levels of training effectiveness but different dimensions of training effectiveness. Hence, to determine training effectiveness, both measurements should be included. Consistently, Aguinis and Kraiger suggest that training effectiveness should be evaluated by determining the impact of training on individual, followed by team, organization, and society performance. Hence, Siti Fardaniah, Abu Daud and Zaki had developed an instrument to measure it by considering the learning, job,

and attitudinal performance as appropriate dimensions; this can be used to determine training effectiveness on individual level.

Critical Discourse Analysis of Political Economics of Media Coverage on Sabdaraja on the Succession in Yogyakarta Empire by Kedaulatan Rakyat Daily Newspaper, Yogyakarta, Editions of May 2015

Sutopo¹, Diah Rukmini¹

¹Post-graduate Program of Science of Communication, the Faculty of Social and Political Sciences, Sebelat Maret University of Surakarta

ABSTRACT

Objective: This research aimed to reveal how the local newspaper constructed the controversy of *Sabdaraja* on the succession and to expose the economic-political interest of the printed media in exposing internal polemic of Yogyakarta Empire.

Analysis: This research is a critical discourse analysis on the controversy of *Sabdaraja* in Sultan empire in Yogyakarta exposed by local newspaper namely: Kedaulatan Rakyat daily newspaper. The data were collected by using media text analysis technique combined with in-depth interviews.

Method: It used critical paradigm with Norman Fairclough's research method of critical discourse analysis. The selection of this type of qualitative research in the preparation was due to some reasons: it focussed on the words (not on the numbers), the authors were in this study as the main instruments.

Findings: By using discourse, it was found that the *Sabdaraja* were related to power dominance. It was also seen that there was an additional discourse which was actually the result of alignment of the dominant interests. Economic factors were more prominent and overcame other pressing factors such as politics and culture.

Result: Results of the research showed that *Kedaulatan Rakyat* daily newspaper did not stand firmly. It tended to lean to one of the camps, namely:the sultan's, by accommodating the opposite discourse. *Kedaulatan Rakyat* identified itself to be the supporting group of *Sabdaraja*. The way the media exposed the succession polemic showed the vulnerability of media independence.

Keywords: *political economy of media, discourse analysis, Sabdaraja*

INTRODUCTION

Basically, media system is related to the prevailing social political system in the country where they operate. Political and economic (or market) control has always been a significant factor affecting media operations. While the interests of both politics and market are prioritized very much^[1]. The mass media have roles not only as the power-controlling force but also as an economically, politically and even culturally influential force. Their expanding commercial expansion has placed media institutions as a calculated political force.

"... By receiving the title GKR^[2] Pembayun is ordered by the Sultan to sit on *Watu Gilang*. In other words GKR Pembayun was chosen to be a candidate

to substitute the Sultan and at the same time became princess crown^[3]."(Source: *Kedaulatan Rakyat*, March 16, 2015," Receiving Title, GKR Mangkubumi Saton*Watu Gilang*")

In this study, researchers will only use two analyses on the theory of political economy of the media that are commodification and structure. Researchers deliberately raised the theories on the assumption that the formation of media discourses on the polemic of *Sabdaraja*^[4] ^[5] become the dominant class struggle in order to create hegemony in the editorial space.

Problem Formulation: From the above explanation, problems in this study can be formulated as follows:

1. At the text level, how is the practice in discoursing the reality of polemic on *Sabdaraja* on the succession^[6] of the throne in Yogyakarta empire by *Kedaulatan Rakyat* daily newspaper to raise commodification of the content?
2. At the producer level, how do the editors create a space of negotiation in the process of producing texts on the polemic on *Sabdaraja* on the succession of the throne in Yogyakarta empire^[7] to raise commodification of media workers?
3. At the consumer level, how can *Kedaulatan Rakyat*^[8] be wanted and become the guidance of the local people of Yogyakarta regarding the discourse on *Sabdaraja* on the succession of the throne in Yogyakarta empire to raise commodification of the audience?

AIMS OF THE STUDY

1. To investigate the existence of political economy practice of media in commodification of content seen in discoursing the polemic on *Sabdaraja* reconstructed^[9] by *Kedaulatan Rakyat*.
2. To investigate the practice of media political economy that is the commodification of media workers when the editors and journalists of *Kedaulatan Rakyat* create a space of negotiation in the production process of text news on the polemic of *Sabdaraja* in Yogyakarta empire.
3. To investigate the existence of media political economy practice that is the commodification of media workers toward consumers of *Kedaulatan Rakyat* readers who use this newspaper as a guiding information on the polemic of *Sabdaraja*.

Benefits of the Study

- a. Providing an understanding of discourse analysis as one of the research forms used to examine the process of discourse creation.
- b. Providing an understanding of the discourse management process as a construction of media reality in its effectiveness to strengthen the theory of media reality construction.
- c. Providing an understanding of the discourse related to the polemic of *Sabdaraja* Kraton Yogyakarta and an ability to describe the social reality that happened.

- d. Understanding the editor's perspective of *Kedaulatan Rakyat* daily newspaper in making a discourse as one form of information media that influences aspects of news quality and reality changes that occur.

LITERARY REVIEW

The main focus in this study is to analyze the construction of media reality on the content of each news text on the polemic of *Sabdaraja*. In this study, researchers describe the theory of messages contained in the study of communication science.

Littlejohn points out the notion of theory as "Any attempt to explain or represent a phenomenon is a theory. As discussed in the next chapter, a theory is someone's conceptualization of an observed set of events." (Littlejohn, 1982: 2)

Political Economy of Media: In the process of understanding the relationship between logic and ideology, mass media and the political economy of the media fall into the category of political economy perspective. In media studies, the economic perspective of media politics is part of a critical perspective other than cultural studies (Mohammadi, 1990: 15).

This is reinforced by the Human Rights Act no. 39/1999, Article 23 Paragraph 2 which states:

"Everyone is free to have, issue, and disseminate the opinion of one's conscience orally or written through the printed media and electronic media by paying attention to religious values, ethics, order, public interest, and the integrity of the nation."

This is then also reinforced by the Press Law No. 40/1999 which states "freedom of the press is a citizen's right."

The critical political economy analysis consists of three criteria: first, capitalist society becomes the dominating class group. Secondly, the media is seen as part of the ideology in which the classes within society engage in battle but it is in the context of the media itself. The efforts to understand the relational process between ideology, mass media and the political economy of the media are included in the category of political economy perspective.

The three frameworks of Mosco (2010) in the political economy of the media are commodification,

spatialization, and structure. However, in this study, researchers only describe and the commodification and structure.

Commodification: Commodification is the process of transforming use values into exchange values. It is about the process of transforming goods and services along with their useful value to be a commodity with market value. The transformation process ranges from usage to exchange rate. In the mass media it always involves the media crew, readers, markets, and the state with each own interest.

RESEARCH METHOD

This research was conducted by using the critical paradigm. Guba and Lincoln (2005) define social science as a process that critically seeks to uncover the real structure behind the illusion and false needs expressed in the material world, with the aim of helping to form a social consciousness in order to improve and change the conditions of human life.

The methodological aspects are dialogical and dialectical. It means that ethical values and moral choices are an integral part of the research. Researchers view themselves as transformative intellectual.

Research with critical discourse analysis method was considered more qualified if it paid more attention to the historical, social, cultural, economic, and political context of the texts studied, in this case it is "*Sabdaraja Kraton Yogyakarta dalam Ekonomi Politik Media*" (Study of Critical Discourse Analysis on *Sabdaraja* of Yogyakarta empire in *Kedaulatan Rakyat*, Edition May - July 2015).

RESULTS OF THE STUDY

Kedaulatan Rakyat divided the reader segmentation into 3 categories of age, education, and occupation. The readers of 10-14 years, 15-19, 30-39, 40- 49, and 50 years of age and over were 4.95%, 13.96%, 34.45%, 23.20%, 14.19%, and 9.46% respectively.

Identity is viewed in how the identity of journalists, audiences, and news participants is displayed and depicted in the text. Fairclough explains how journalists place and identify themselves toward the problems or social groups involved.

The producers of the text on the news of Special Region of Yogyakarta were the journalist and its media

institution that is *Kedaulatan Rakyat*. Here, media audiences were readers of *Kedaulatan Rakyat*. While the public participants were the parties mentioned in the news on the succession of the king of the Palace of Sultan HB X, GKR Pembayun, *hisrayi dalem* and *sedherek dalem*.

"King Sri Sultan Hamengkubuwono (HB X) re-issued *Sabdaraja onwage* (5/5) at Siti Hinggil of Yogyakarta Palace"

In Javanese philosophy there is cosmological balance, namely: harmonization between the work of human thought and the command of God. *Sabdaraja* should not cause a polemic or a political battleground of parties that has a particular interest. Tradition should not be the reason to reject *Sabdaraja* leading to succession. Tradition and *Sabdaraja* should not be contrasted but they should be balanced.

CONCLUSION

The results of the text analysis by researchers show that the Sultan was seen to be a single actor who has legitimacy (power). His decision to change the name of his eldest daughter's title into GKR Mangkubumi making her to be the Throne Princess is called *Dhawuhraja*. It was allegedly as a political action of the Sultan on promoting the future queen.

Besides presenting a pro discourse to the *Dhawuhraja*, *Kedaulatan Rakyat* also raised a contra discourse. It could be considered as a counter argument to what the Sultan had been concerned about the succession in his empire. It was done by displaying the discourse to criticize *Dhawuhraja* against tradition and by discoursing that anyone who is Throne Prince and holds the title of Mangkubumi will not necessarily ascend the throne.

The results of analysis on a number of texts on the news page show that, the news on *Sabdaraja* in *Kedaulatan Rakyat* indeed was used as a tool to achieve goals on the economic interests of *Kedaulatan Rakyat*.

The text analysis in this study was related to commodification of content which is proved by the use of national pages as a privilege for the sponsors who seem to support *Sabdaraja*.

- **Practices of Discourse Analysis on Producer:** In spite of that, the local media seek to be an independent media like its jargon “voice of conscience of the people” and carries the principles of the Pancasila Press. The editors still try to take advantage of local wisdom. For example, in some news texts, *Kedaulatan Rakyat* likes using Javanese language. In producing news texts, they also consider the content of news as part of socio-cultural factors. It is proven to be used by editor in news as an effort to influence local people in constructing reality.
- **Practices of Discourses Analysis on Consumers:** In this research, the respondents were divided into 3 groups, namely: the proponents of *Sabdaraja*, the opponents of them, and people who claim themselves to be neutral in the case. Some of the respondents gave almost similar opinions, which is, by using *Kedaulatan Rakyat* as the source of information they follow the polemic on *Sabdaraja*. But there were respondents who read it because they intended to do it.

The results of the research show that the commodification of the audience seen in consumer analysis on *Sabdaraja* news was used to influence or affect the reader. It had the agenda of directing the readers to support the future queen.

Indirectly the news read by consumers of *Kedaulatan Rakyat* was used as a tool to lead audiences to dig information on *Sabdaraja* from *Kedaulatan Rakyat*. Furthermore, *Kedaulatan Rakyat* tried to make its media as a superior and factual media in reporting the case. People were guided to choose *Kedaulatan Rakyat* as the source of information so as to greatly rise media circulation.

- **Sociocultural Analysis:** In addressing these conditions, the readers of *Kedaulatan Rakyat* reacted against the Sultan’s venerable interest, *Sabdaraja*. Prototype of the discourse of *Sabdaraja* on the succession showed the alignment of the Sultan.

In addition to this, the opinions of the culturalists whose statement seemed to support and justify the Sultan’s move, frequently appeared in *Kedaulatan Rakyat* and were repeated in other editions.

IMPLICATION

In accordance with the title “*Sabdaraja dalam Ekonomi Politik Media (Analisis Wacana Kritis Pemberitaan Sabdaraja Terkait Sukses Penerus Tahta Raja Kraton Pada SKH Kedaulatan Rakyat Edisi Mei-Juli 2015)*”, this research has implications for the political economy theory in the media.

Theoretical Review (Economy and Politics): The political economy of the media is an approach that focuses on its media ideology on the economic power that directs the research’s attention to empirical analysis of the ownership structure and mechanism of the forces of the media market. According to this review, media institutions should be assessed as part of an economic system that is also closely linked to the political system.

In addition to media ownership factors, the choice of resource persons was due to the closeness of between *Kedaulatan Rakyat* and the Palace. *Kedaulatan Rakyat* tried to influence its readers in understanding the content of its news in accordance with the Sultan’s desire because it supported the idea of the succession by a queen.

PRACTICES

The results of the analysis show that news text on *Kedaulatan Rakyat* was inconsistent and had more sensation elements than the polemic issues discussed by various circles in Yogyakarta. Based on this research, it is seen that imbalance the message contained in the news text was imbalanced. It only focused on and formulated the message in accordance with goals to be achieved, namely: inviting the people of Yogyakarta to support the idea of the succession by a queen. The strong ideology led to a tendency to support one of the camps.

Thus, the results show that the political economy of the media greatly affected the content of the news based on the construction done in the editorial desk before the news was printed. The opposition could find a way to reach reconciliation by means of dialogue between the two camps.

CONCLUSIONS

1. **For Media and Practitioners (of *Kedaulatan Rakyat*):** The biggest advantage of media is to be the bridge for policy makers, ideology

owners, and information owners. However, the media has a tough challenge to correctly interpret policy, ideology, and information. Of course, it is legitimate for the media to make their news attractive so as to get many readers and to make profit.

It should also be underlined that the media must be aware of the ability to mobilize audiences so as not to provide information and let everything up to the audience, especially information that has been arranged by the editor to be the media agenda. It will also have more implications if it has carefully been planned. Apart from the closeness and history factors, *Kedaulatan Rakyat* should be a pioneer media in voicing what is right and what is wrong as well as to be the media that can be followed by other media to dare to open the truth of an issue.

Examining the Innovative Minds of Takaful Consumers: The Case of Malaysia

Rusni Hassan¹, Salina Kassim¹, Hafiz Majdi², Syed Ahmed Salman³

¹*Institute of Islamic Banking and Finance (IiBF)*, ²*Kulliyyah of Economics and Management Sciences, International Islamic University Malaysia (IIUM)*; ³*Senior Lecturer at Faculty of Business and Accountancy, Lincoln University College, Malaysia*

ABSTRACT

Objective: This study aims to examine the factors that will affect Malaysian consumers to participate in Takaful.

Analysis: Out of the 600 questionnaires that were sent to consumers in greater Malaysia i.e. Kuala Lumpur and Selangor, we received 503 questionnaires. The sample is randomly selected from the known population. The total of 35 questions are constructed to know the determinants to choose new products by the respondents.

Method: New product adoption theory is used in developing the questionnaire. In this, questions are organised into seven groups, namely, (a) cost vs. benefit, (b) accessibility, availability and service quality, (c) product features, (d) reputation of the company, (e) attributes of agent, (f) marketing and promotion and (g) social and religious factors. The data collected from respondents were subjected to exploratory factor analysis based on Principal Component Analysis (PCA) through varimax rotation. This was performed in order to reduce the data to a manageable size.

Findings: The findings show that, three predictors out seven predictors significantly contributed to the model and these are social and religious factors, product features, and marketing and promotion.

Result: It can be said that, marketing, social and religion and product features are the most important and dominant factors that can influence Malaysian consumers to adopt and participate in Takaful products. Takaful operators should enhance their marketing strategy and simplify the product features to capture the untouched market.

Keywords: *Takaful, Affecting Factors, Consumers and Malaysia*

INTRODUCTION

Takaful is a social and ethical insurance based on the principles of *Ta'āwun* (cooperation)^[1] and *Tabarru* (donation) where the risk is shared collectively by members of a policy. The concept of Takaful is providing financial assistance to the participants on a basis of mutual assistance, brotherhood and solidarity if the participants face misfortune. Takaful^[2] operation begins with the formation of contract where a person chooses to become a participant and to mutually help each other, specifically when any of the participants faces a defined loss. The participants^[3] have to set aside certain portion of money to a common fund as a contribution. Instead of heavily depending on commercial factors per se, Takaful celebrates mutual co-operation^[4] socially and legally between the participants.

Phase I (from 1984 to 1992): The Takaful Act 1984 or TA 1984 was legislated and became the main reference for regulatory law of Takaful. Among others, TA 1984 was essential provided for (i) the Takaful business and the registration of the Takaful operators; (ii) the roles^[5] of Shari'ah Committees; and (iii) the Shari'ah compliance nature^[6] of the various business operations under the Takaful operators.

Phase II (from 1993 to 2000): during this phase, the regulators allowed the introduction of competition by allowing the establishment of another Takaful operator. Such competition is vital to flourish in Malaysian industry^[7].

Phase III (from 2001 to 2010): The Financial Sector Masterplan or FSMP was introduced in 2001.

Specifically referring to the Takaful industry^[8], FSMP's objective is to enhance the capacity of Takaful operators by strengthening the legal^[9], Shari'ah and regulatory framework for the entire Takaful industry.

LITERATURE REVIEW

The primary focus of this literature review is a detail analysis of Takaful in Malaysia and other countries. The data is taken from credible researchers and the research findings are recent and quite relevant to the subject at hand. The research is based on two different aspects of Takaful industry; one aspect is the demand side of Malaysian Takaful market and the other assesses the knowledge, awareness, ethicality of agents, accounting, and underwriting^[10], etc. of Takaful industry.

Kasim et al. (2016), states that Takaful is based on Islamic ethics and hence, it excludes the practice of interest, uncertainty and gambling from Takaful. These elements are prohibited not only from the teachings of Islam, but also from other religions such as Christianity, Judaism Hinduism, Sikhism, and Buddhism. They added that Takaful is fit for everyone irrespective of faith, and it is a product based on cooperative nature with mutual help and harmony.

RESEARCH METHODOLOGY

New product adoption theory is used in developing the questionnaire. Both primary and secondary data have been used. Primary data are collected by survey questionnaires from consumers in Malaysia. Secondary data that was used in this research includes articles, books and internet resources.

FINDINGS

The Perception of Consumers on Takaful: Innovation plays a significant role for the success of the operators because Takaful is offering attractive benefits compared to conventional insurance. Among the consumers 67.22% said that Takaful is an innovative product and 26.61% said that somewhat Takaful is innovative whereas only 6.16% said that it is not innovative.

Looking forward to the future, the Takaful industry needs to maintain their relevancy and strive to move

towards sustainability. While learning from the experiences of conventional insurances, innovations need to be considered by the stakeholders of the Takaful industry. Not only looking into the advancement of current technology, innovations in Takaful industry can be versatile and flexible.

Mean values of Respondents' Innovative Mind: Table 2 shows the percent of the respondents' innovative mind. To explore the innovative mind of the respondents, a five-point Likert-scale is used ranging from 1=strongly disagreed to 5= strongly agreed, and ten questions are asked. The questions are constructed to examine the innovative attitude of the respondents, and all the mean values are more than 3.4.

Mean Values of Factors in Choosing New Products

Cost vs Benefit: Table 3 shows the mean values of the determinants to choose new products. The total of 35 questions are constructed to know the determinants to choose new products by the respondents. These questions are organized into seven groups, namely, (a) cost vs. benefit, (b) accessibility, availability and service quality, (c) product features, (d) reputation of the company, (e) attribute of agent, (f) marketing and promotion.

Accessibility, Availability and Service quality: Table 4 shows the mean values of the determinants to choose new products. The five questions are constructed for accessibility, availability and service quality. Moreover, the best mean value in the accessibility, availability and service quality is 4.2 for three statements "I like to get easy access to the service e.g.: availability of branches.

Product features: Table 5 shows the mean values of the determinants to choose new products. The five questions are constructed for product features. "I want clear illustrations on the benefits of the products" and lowest is 4 for two statements "I choose the product that is well known in the market and I choose the product if I get the same benefits as my existing plan". All the mean values better than good.

Reputation of the company: Table 6 shows the mean values of the determinants to choose new products. The five questions are constructed for the reputation of the company. Moreover, the best mean value in the reputation of the company is 4.1 for three statements "I choose the product based on its brand, I choose the product if it is ethical and I choose the product if the company is active in the corporate social responsibility".

Attributes of agents: Table 7 shows the mean values of the determinants to choose new products. The five questions are constructed for the attributes of agents. Moreover, the best mean value in the attributes of agents. is 4.2 for all the statements. Therefore, it can be concluded that all the mean values are very good.

Marketing and Promotion: Table 8 shows the mean values of the determinants to choose new products. The five questions are constructed for marketing and promotion. Moreover, the best mean value in the marketing and promotion. is 4.0 for “I choose the product if the brochures provide clear, attractive and reliable information” and lowest is 3.6 for three statements “I choose the product if the advertisement is everywhere (e.g.: e-advertising, television and radio, I choose the product if the product is promoted through agent and I choose the product if the product is offered through the company’s branch”.

Social and Religious Factors: Table 9 shows the mean values of the determinants to choose new products. The five questions are constructed for social and religious factors. Moreover, the best mean value in the social and religious factors is 4.0 for “I choose the product because it is ethical and fair” and lowest is 3.1 for “My employer chooses the product for me”.

FACTOR ANALYSIS

The data collected from respondents were subjected to exploratory factor analysis based on Principal Component Analysis.

To determine the cut-off point, the researcher follows Kaiser’s (1960) recommendation that factors with eigenvalue of one or more should be retained in order to avoid negative reliability.

Reliability Result: Following the construct validity test as presented above, the eight factors produced during the principal components analysis were further tested for reliability using Cronbach’s alpha (α). All factors (innovation, agent, marketing, cost, product, reputation, social, and accessibility) have demonstrated high internal consistency with α greater than 0.7 in most cases.

Table 10: Reliability Statistics

S. No.	Variable	Cronbach’s Alpha
1.	Innovation	.811

Conted...

2.	Agent	.916
3.	Marketing	.830
4.	Cost	.795
5.	Product	.880
6.	Reputation	.820
7.	Social	.751
8.	Accessibility	.698

Pearson Correlation: Another analysis here is correlation analysis to show the relationship between the variables used in this study. As shown in the below table, the relationship between the variables ranged from 0.289 to 0.870, suggesting that there are moderate to strong relationships between the variables used for this study.

Note: correlation of ± 0.1 is weak, ± 0.3 is moderate, and ± 0.5 is strong

DISCUSSION ON FINDINGS

Three predictors out of seven predictors have contributed positively and significantly to the innovative mind and these are social and religious factors, product features, and marketing and promotion.

Since the external factors were constructed according to the new product diffusion theory, the findings of this research are in line with its theoretical expectations, as well as with the findings of prior researchers of Takaful and insurance.

According to Abideen & Saleem (2011) and Salleh et al. (2013), marketing can influence the participant’s behavior towards the product. Arifin et al. (2014), investigate whether product services influence on the customers to engage with Takaful.

CONCLUSION

The study has been conducted based on 503 respondents which consist of 224 males (44.5%) and 279 females (55.5%). To explore the innovative mind of the respondents ten questions are asked. The questions are constructed to examine the innovative attitude of the respondents, and all the mean values are more than 3.40. The total of 35 questions are constructed to know the determinants to choose new products by the

respondents. In addition to this, factor analysis has been done. Moreover, the Kaiser-Meyer-Olkin (KMO) which measures sample adequacy is excellent (0.932), and none of the Anti-image correlation is less than 0.500, suggesting that multi-collinearity assumption has been satisfied. In terms of reliability, following the construct validity test as presented, the eight factors produced during the principal components analysis were further tested for reliability using Cronbach's alpha (α).

It can be said that, marketing, social and religion and product features are the most important and dominant factors that can influence Malaysian consumers to adopt and participate in Takaful products. Takaful operators should enhance their marketing strategy and simplify the product features to capture the untouched market. In addition to this, religion is the most important factor that changes the mind of the consumer. Takaful operators should create the awareness among Malaysian consumers regarding Takaful products to penetrate the market.

Feasibility of Introducing Takaful (Islamic Insurance) in India from the perspective of Islamic Finance Experts

Syed Ahmed Salman¹, Rusni Hassan², Adnan Yusoff³

¹Faculty of Business and Accountancy, Lincoln University College, Malaysia; ²Institute of Islamic Banking and Finance (IiBF), International Islamic University Malaysia (IIUM); ³University Tenaga Nasional, Centre for Islamic Studies and Civilization, Kajang, Malaysia

ABSTRACT

Objective: India as the second largest Muslim populated country has no practice with Takaful. This triggers the researchers to identify why Takaful has not been introduced in India. The main objective of this study is to scrutinize the perception and acceptability of Islamic finance experts to introducing Takaful in India.

Analysis: The total 18 interviews have been conducted and all of them are male. Out of 18 interviewees, 12 are conducted through face to face interviews, and the remaining interview sessions were done either by phone calls or emails.

Method: A combination of convenient sampling and purposive sampling method is used for selecting the Islamic finance experts as the respondents. Interview technique is the solely method used to collect the findings for this research.

Findings: Four questions were asked to know the opinions of Islamic finance experts on the viability of Takaful in India. They are related to (Q1) possibility of introducing Takaful soon, (Q2) benefits of offering Takaful, (Q3) challenges to offer Takaful and (Q4) essential steps to be taken to start offering Takaful.

Result: Regarding viability of Takaful, most of them share the positive view on this matter. In terms of operation, hybrid Wakalah-Mudarabah is the best suitable model for both general and family Takaful products.

Keywords: Feasibility, Takaful, Insurance, Islamic Finance Experts & India

INTRODUCTION

Human beings possess limited knowledge and cannot forecast or predict the future with hundred percent^[1] certainty. In addition, they have limited capacity to avoid unfortunate events. By nature, they are born with limited ability and capacity to control any future incident, which means they are perpetually exposed to risks. Within the context of insurance, risk is a danger or unfavourable exposure to misfortune. Health deterioration, accidents, natural disaster, and economic loss are examples of risk.

^[2]Group Symposium, Resolution 42 of Al-Rajhi Bank-Saudi Arabia, Resolution of National Fatwa Committee of Malaysia 1972, Resolution of Dewan Syariah Nasional Indonesia 2001 and Resolution of Fiqh Council^{[9][10]} of Muslim World League 1978. From the assorted boards and investigations from the religious scholars on the conventional insurance, the alternative

way of this which is acceptable and lawful under Shari'ah is Takaful. The practice of the conventional insurance contract contains major elements of interest, uncertainty and gambling which invalidates the conventional insurance contract.

This paper is organized in five sections. Section two is devoted for literature review. Section three discusses about research methodology and section four deliberates the findings and last section concludes the paper.

LITERATURE REVIEW

This part deliberates^[3] the utmost pertinent findings of previous researchers in the area of Takaful (Islamic insurance). Ali et. al (2014), discuss the issue of applying *Tabarru* concept^[4] in Takaful and the issue of underwriting surplus of *Tabarru* fund. They have raised the Shari'ah issues because the concept of *Tabarru* is not

based on the pure donation^[5]. In Takaful, the participants make the *Tabarru* with the expectation that their financial loss will be compensated if they meet any misfortune^[6] according to the terms and conditions of the Takaful contract. Also, the amount of *Tabarru* is specified based on the underwriting^[7] process, whereby, the participants who are facing higher risk are supposed to make a higher amount of *Tabarru* contribution. Thus, voluntary contribution nature of *Tabarru* has been changed to compulsory nature of the contribution. Consequently^[8], it makes the contract bilateral.

RESEARCH METHODOLOGY

The objective of this research is to explore the perceptions of Islamic finance experts towards the viability of introducing

Profile of Islamic Finance Experts: The total number of interviewees is 18 and all of them are male. In terms

of age range, four are between 25 to 30 years, three are between 31 to 35 years, one is from 36 to 40 years, three 41 to 45 years, two 51 to 60 years and the rest (four) are between 61 to 65 years. In the case of material status, one is single, one is divorced and the rest are married. Interviewees consist of 12 master degree holders, five PhD holders and one Mufti. Among the master degree holders, one of them has three master’s degree and one is also Mufti.

FINDINGS

Four questions were asked to know the opinions of Islamic finance experts on the viability of Takaful in India. They are related to (Q1) possibility of introducing Takaful soon, (Q2) benefits of offering Takaful, (Q3) challenges to offer Takaful and (Q4) essential steps to be taken to start offering Takaful.

Table 1: Feasibility of Takaful in India

Possibility of introducing Takaful in near future	Islamic Finance Experts																	
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
Feasible	√	√	√		√	√	√	√	√	√	√	√	√	√	√	√		√
Not Feasible soon				√													√	
Huge size of Muslims	√					√			√	√		√			√			
Name “Takaful” is a barrier				√													√	

Feasibility of Takaful in India: When the interviewees are asked whether Takaful can be offered in near future, the majority (16 interviewees) believe that it can be done. Among the interviewees who think that Takaful can be introduced within the foreseeable future mention some of the reasons why it is possible. Six interviewees believe that huge size of Muslim population in India invites for introducing Takaful. It might be due to the fact that India has the second highest Muslim population in the world. However, there is no Takaful in India and so Muslims are helpless except to participate in insurance which is prohibited in Islam.

Table 2: Benefits of Offering Takaful

Benefits of offering Takaful	Islamic Finance Experts																	
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
Benefit to the community	√		√	√		√			√	√					√	√	√	√
Economic development		√	√				√		√			√	√	√	√		√	

Benefits of Offering Takaful: The major benefits of offering Takaful are benefit to the community and contribution towards the economic development. The first one is it will be beneficial to the Indian community as a whole (10 Interviewees). IFE 3 mentions:

Essential steps to be taken: The interviewees mentioned six essential steps to start Takaful. They are creating awareness through education (16 interviewees), regulation (16 interviewees), enforcement of Shari’ah governance (7 interviewees), preparation by the operators (IFE 1, IFE 4 & IFE 11), support from other Islamic financial market players (IFE 16) and learning experience from other countries (IFE 18).

Among the interviewees who mention that education is the essential steps, IFE 15 explain as follows:

“There should be some seminars, talks or workshops opened to the public to create the awareness and important of education in their lives. In addition, there should be more budget allocated for education to help the students who are in need. The youth are the leaders of the future and hence, education must the first thing to be emphasised on”. (IFE 15)

In the current situation, due to poverty, the youth start working without going to school. Parents cannot afford to send their children to school and there is lack of having the basic necessity such as food, clothing and shelter. Poor people’s kids are brought up without proper education.

The second essential step is lobbying the regulatory body (16 interviewees) because it might be due to the fact that in India, Insurance Regulatory and Development Authority of India (IRDAI) is a supervisory body for insurance. Without the support and approval from this regulatory body, Takaful cannot be offered in India. It is because Takaful has additional restrictions such as approval of the product from Shari’ah board and investment choice and it has unique nature since the contracts in insurance and Takaful are not the same.

The third essential step is related to Shari’ah governance. Seven interviewees believe good Shari’ah

governance will be essential since it can mould the operators to operate in line with Shari’ah.

“Shari’ah governance should be established in Takaful and it should be the foremost step. The ultimate aim of having Takaful is to eliminate Shari’ah non-compliant practices and to minimise the unethical issues as much as possible. Once the practice is in line with Shari’ah, automatically unethical issues will not exist anymore”. (IFE 9)

The role of Shari’ah governance in Takaful is essential because it is not only responsible for the product approval but also for ensuring the whole process of Takaful practices is in line with Shari’ah. They can monitor the approval of the contents of advertisement in the pamphlet to ensure that the potential policy holders are not misled and there is no misunderstanding towards the Takaful operators.

The fourth essential point is that the operators need to prepare themselves before offering the Takaful products (IFE 1, IFE 4 & IFE 11).

Finally, it is important for India to learn experience from other countries which offered Takaful products (IFE 18). According to IFE 18, non-Muslim countries like Thailand does not have the centralised Shari’ah board and hence the individual operators need to take initiative to have their own Shari’ah committee members to get the approval of the products and to ensure that the operating activities are in line with Shari’ah.

It can be summarised that Takaful is viable based on the opinions of Islamic finance experts. After discussing the interview results for the viability of Takaful, the next section explains specially on their opinions for choice of Takaful model and products to suit within the Indian context.

Operational Aspect of Takaful

Table 5: Operational aspect of Takaful

Choices of Takaful Models.	Islamic Finance Experts																		
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	
(a) General Takaful																			
Pure Wakalah Model					√						√								
Pure Mudarabah	√					√					√					√			

Conted...

Hybrid Wakalah-Mudarabah Model	√	√	√	√		√		√	√	√	√	√	√	√	√	√	√	√
Wakalah Waqf Model	√		√		√	√	√			√	√		√	√	√	√	√	√
Family Takaful																		
Cooperative (Taa'wuni) Model	√		√		√	√				√								
Pure Wakalah Model											√							
Modified Wakalah Model		√	√								√		√	√				
Pure Mudarabah						√					√	√					√	
Modified Mudarabah Model	√		√			√					√		√	√				
Hybrid Wakalah-Mudarabah Model		√	√	√		√		√	√	√	√	√	√	√	√	√	√	√
Waqf Model			√		√	√					√			√	√	√	√	√
No command on model since the industrial player can decide.							√											√

General Takaful: Currently, there are four Takaful models used almost all over the world. The Islamic finance experts are further asked which model is the best suit for general Takaful in the Indian context. In the case of general Takaful products, the best suitable model is hybrid wakalah-mudarabah model (voted by 15 interviewees), followed by wakalah waqf model (13 interviewees), pure mudarabah model (4 interviewees) and pure wakalah Model (2 interviewees).

(voted by 13 interviewees), waqf model (8 interviewees), modified mudarabah model (6 interviewees), modified wakalah model (5 interviewees), cooperative model (5 interviewees), pure mudarabah model (4 interviewees), pure wakalah model (1 interviewees) and two interviewees are silent on this issue.

Family Takaful: Similar question is asked for the family Takaful products, hybrid wakalah-mudarabah model

With regard to *Waqf* model, India is a rich country with *Waqf* assets and hence, these assets are fully utilised, it will be beneficial to the poor Muslims.

Table 6: Suggested products to be offered first

Suggested products to be offered first	Islamic Finance Experts																	
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
General Takaful products	√	√	√	√	√	√		√	√		√	√		√	√		√	
Family Takaful products			√	√					√	√	√	√	√	√	√	√	√	√
No command							√											

Suggested products to be offered first: In the case of the products, eight interviewees think that both general and family products should be offered at the same time. However, five interviewees think that general Takaful products should be offered first, before family Takaful. Four interviewees think that family Takaful should be offered first. One interviewee (IFE 7) does not disclose his opinion.

profitable. So, to diversify the risk, it is better to offer both products.

CONCLUSION

In addition, since it is the new products for India, it is difficult to estimate exactly which product will be

The paper has provided the interview results from the Islamic finance experts. Their views are important because once Takaful is offered, the operators must get the approval to offer the products and they have adequate experienced in Islamic finance. Regarding viability of Takaful, most of them share the positive view on this

matter. The interviewees mentioned six essential steps to start Takaful. They are creating awareness through education, legal support, enforcement of Shari'ah governance, preparation by the operators, backing from other Islamic financial market players and learning experience from other countries. In terms of operation, Hybrid Wakalah-Mudarabah Model is mostly preferred by the interviewees over the other Takaful models. However, in the case of products, both general and family Takaful products are suggested to be offered overall.

Planning Process Development of Cultivation Fishery based Minapolitan in Malang District

Trisnawati

Faculty of Administrative Science, Brawijaya University

ABSTRACT

Objective: This paper aims to describe and analyze the process of development planning of minapolitan area based cultivation fishery in Malang.

Analysis: Analysis show the mechanisms and stages as part of a regional development plan has been implemented in stages through the village planning forums, district planning forums, coordination meeting, which is an innovation of Marine and Fishery Agency in Malang, agencies forum and regency planning forum.

Method: Planning paradigm that used through the top down, bottom-up and participatory approach. This study uses a qualitative approach. The data obtained were tested for validity with triangulation techniques, and then analyzed with an interactive analysis model.

Findings: In this paper, the involvement of stakeholders in the process of planning the development of Minapolitan Area Based on Aquaculture in Malang Regency have been carried out according to existing regulations, where based on the findings of the researcher. The discussion will be limited to the involvement of Malang Regent, Malang Regency DPRD and Non-Governmental Organizations (NGOs) to be more focused and focused.

Result: Involvement of stakeholders (Regent, Parliament and NGOs) still minimal and not optimal yet, resulting a stagnation in the development of minapolitan area based cultivation fishery in Malang Regency.

Keywords: *planning, cultivation fishery based minapolitan, mechanisms, stakeholders.*

INTRODUCTION

The paradigm embodied in decentralization and regional autonomy, led to fundamental changes in governance relations, where there was an increase in authority and autonomy handed over to regional governments, one of which was in the field of maritime affairs and fisheries. This policy change will certainly be followed by changes in economic development, which originally focused on regional development. Minapolitan^[1] Concept Based on Aquaculture from the Ministry of Maritime Affairs and Fisheries of the Republic of Indonesia, emerged as a concept of fisheries development based on regional economic management with the driving force of fisheries cultivation, which is expected to be the main strategy, as a manifestation of governance towards the paradigm of good governance. This concept aims to accelerate the development of regions with fisheries as the main drivers in improving the welfare of the Indonesian people^[2].

Since 2010, Malang Regency^[3] has been designated as a minapolitan area by the KKP which was followed by the Malang Regent Decree concerning the establishment of a development location for aquaculture-based minapolitan areas. Empirically, until now there has been no significant progress in the development of the region. Even though the time span is 3 years, not a short time for an implementation of regional development priorities, there should already be an embryo to become a minapolitan area, according to Sumarsono (2011, p. 54), which is a fishing city that grows and develops due to the running of the business system fisheries that are able to serve, encourage, attract and control regional economic development activities^[4].

Development of Minapolitan Area Based on Aquaculture in Malang Regency^[5] is a multi-sector development program involving multi-stakeholders, and is a harmonious blend of top-down planning, bottom-up

planning and participatory approaches. Initially carried out based on the top-down planning paradigm, this was indicated by the determination of the location of aquaculture-based minapolitan with the Malang Regent Decree, but as its development became a regional development priority program, it became a bottom-up planning and participatory involving the community.

This paper aims to discuss and analyze 2 (two) main things related to the Minapolitan Area Development Planning Process Based on Aquaculture in Malang Regency, namely the mechanism and stages of the planning process and the involvement of stakeholders (Bupati, DPRD and NGOs)^[6].

LITERATURE REVIEW

The Planning Process for the Development of Minapolitan^[7] Areas Based on Aquaculture in Malang Regency can be understood through a mechanism and stages in the planning process, as well as the involvement of relevant stakeholders. Planning plays a very important role in our development and life, it can be explained by the opinion of Abe (2005, p. 31) which states that planning is nothing but a systematic arrangement of steps (actions), which will be done in the future, based on careful consideration of potential and external factors, and interested parties in order to achieve a specific goal. This is in accordance with the opinions of Conyers^[8] and Hills (1984) cited by Kuncoro (2012, p. 50) that planning is a continuous process that includes decisions or choices of various alternative use of resources to achieve certain goals in the future coming.

There are various types of planning according to Widodo (2006, pp. 42-45), namely: (1) based on the time period, planning^[9] is divided into three, namely long, medium and short term planning; (2) based on the flow of information, there is a centralized planning that is controlled by the center and decentralized^[10] planning, the implementation process of the plan from below; (3) based on its nature, namely planning with command and planning with stimuli; (4) based on the dimensions of the approach, development planning consists of macro planning, sectoral planning, regional planning and micro planning. Meanwhile, according to Faludi (1973, p. 3), there are two types of planning, namely procedural planning and substantive planning. Substantive planning makes it easy for planners to understand all things related to what is planned, while procedural planning makes it

easier for planners to understand the position and ways to complete the task.

According to Riyadi and Bratakusumah (2004, p. 7), regional development planning is a development planning process that is intended to make changes towards a better development direction for a community, government, and environment in a particular area / region, by utilizing or utilizing various available resources, and must have a comprehensive, complete orientation, but still adhere to the principle of priority. Whereas in PP No. 8 of 2008 concerning Stages, Procedures for Preparation, Control and Evaluation of the Implementation of Regional Development Plans, the definition of regional development planning is a process of preparing the stages of activities involving various stakeholders in it, in order to utilize and allocate existing resources in order to improve welfare social in an area / regional environment within a certain period. In general Riyadi and Bratakusumah (2004, pp. 15-38) suggested factors that can influence the success rate of a regional development planning program, among others are environmental factors, human resource planning factors, system factors used, scientific and technological development factors and funding factors. The stages in the regional development planning process, including one of them in the development of aquaculture-based minapolitan areas, must be based on Law No. 25 of 2004 concerning the National Development Planning System. SPPN is carried out in stages through the implementation of development planning meetings (musrenbang), which are carried out starting from the village / kelurahan, kecamatan, kabupaten, provincial and central / national levels. In the explanation section of the Act, it is stated that in SPPN includes five approaches in the entire planning sequence, namely (1) Politics; (2) technocratic; (3) Participatory; (4) Top-Down; and (5) Bottom-Up (Kuncoro, 2012, p. 53)

This is clarified by the opinion of Nurcholis, et al (2009, p. 23) that a forum used to carry out participatory planning is known as the musrenbang technical term (development planning deliberation). Musrenbang starts from the lowest level of government unit, namely the village / kelurahan level, then hierarchically, upwards, namely the kecamatan level, district / city, provincial level and finally the central level. Musrenbang implementation is one of the efforts to attract community participation in development planning, explained by

Sumaryadi (2010, p. 54), that community participation in development planning essentially includes participation in the selection of alternative objectives to be achieved in activities that can be intangible, suggestions, responses and determination of choices, all delivered at the meeting.

According to Grimble, et al (1995) in Abdulkarim, et al (2007, p. 10), stakeholder or stakeholder analysis is the identification of the stakeholders of a project, an assessment of their interests and ways that influence the risk and truth of the project, and is used to evaluate the development of stakeholder capacity.

RESEARCH METHODS

This study uses a qualitative approach, data obtained from informants covering the DPRD, Bappeda, DKP Malang Regency, Sekcam Bendungan, Village Heads and Sumurup Village Secretary, Sumurup Village community and NGOs, coupled with observation and documentation. The data obtained were tested for validity with triangulation techniques, then analyzed with an interactive analysis model developed by Miles and Huberman (2009, pp. 16-20), which consisted of data reduction, data presentation, and drawing conclusions and verification.

DISCUSSION

Mechanisms and Stages in the Development Planning Process for Minapolitan Areas Based on Aquaculture in Malang Regency: The mechanisms and stages in the Minapolitan Area Development Planning Process Based on Aquaculture in Malang Regency are the regional development planning mechanism and carried out through a stage of activities or forums, known as development planning meetings (musrenbang).

Based on the above flow, all activities in the Minapolitan Area Development Planning Process Based on Aquaculture in Malang Regency have been carried out through the mechanism and stages of the planning process, which starts from the village level by organizing village musrenbang and this is where the process of community aspiration is carried out, then it will be used as material proposal at the subdistrict level musrenbang. The planning mechanism goes through the musrenbangdes stage in accordance with the participatory planning approach, where the

implementation involves all stakeholders (stakeholders) or related with development. According to Abe (2005, p. 88), participatory planning is planning which involves the interests of the people and in the process involves the people. So it can be understood that community involvement can only be carried out, if the community has the willingness to participate from the beginning of the process until the formulation of results.

The next stage of regional development planning is the subdistrict musrenbang, where the implementation is almost the same as the musrenbangdes. The activities in the kecamatan musrenbang are to accommodate proposals from villages, then classify and categorize according to the functions and Regional Work Unit (SKPD). There is a new breakthrough carried out by the DKP of Malang Regency in this planning stage and mechanism, namely by conducting coordination meetings involving relevant stakeholders to discuss various kinds of proposals regarding the aquaculture-based minapolitan program. This activity was carried out prior to the implementation of the SKPD Forum and invited stakeholders such as DPRD Dapil Bendungan, government elements from Bendungan and Sumurup Villages, NGOs, chairmen of Gapokdakan or Pokdakan and Sumurup Village community leaders, resulting in several agreements that will be brought and escorted together at the Forum SKPD and Musrenbang Malang Regency. In a planning process, in fact this is not usually done, there are rarely SKPDs that want to coordinate the planning of sustainability and assume that the results of the kecamatan-level musrenbang are sufficient. The DKP of Malang Regency continued coordination because based on the previous year's experience and seeing the proposed programs and activities in 2013 from the results of the Musrenbang in Bendungan Subdistrict, not much has been related to the development of aquaculture-based minapolitan areas, both physical and non-physical. This shows that the DKP of Malang Regency has a good commitment as a leading sector in the development process of the Minapolitan area based on aquaculture.

Based on the description above, it is known that the Minapolitan Area Development Planning Process Based on Aquaculture in Malang Regency has been carried out through the mechanism and stages of regional development planning namely musrenbang which is carried out by involving community participation, but at the budgeting stage it is still often defeated by various political interests,

both by SKPD and DPRD. Participatory planning in the musrenbang forum can indeed attract the aspirations of the community in supporting the development planning process of the Minapolitan area based on aquaculture in Malang Regency, but have not been able to optimally accommodate the aspirations of the community into regional development policies in the APBD.

Stakeholder Involvement (Bupati, DPRD and NGOs):

In this paper, the involvement of stakeholders in the process of planning the development of Minapolitan Area Based on Aquaculture in Malang Regency, the discussion will be limited to the involvement of Malang Regent, Malang Regency DPRD and Non-Governmental Organizations (NGOs) to be more focused and focused. The development planning process cannot be separated from stakeholder involvement, as well as in the development planning process of the Minapolitan area based on aquaculture in Malang Regency which includes all parties, both individually, community, and organizations that are involved directly or indirectly and benefit from or otherwise the process of developing the aquaculture-based minapolitan. This is according to previous research conducted by Muchlisin, et al (2012 p. 69), explaining that in the Minapolitan concept the coordination and synergy of various stakeholders involved is the key to the success of the Minapolitan program.

According to Abdulkarim, et al. (2007, p. 6), that stakeholder decisions are influenced by their respective involvement and interests, which is a function of their power, legitimacy and interests, which will be a feature of primary stakeholders, secondary stakeholders. and not a stakeholder (non-stakeholder).

Based on the opinion of Boonstra (2006, p. 43), there are 3 attributes possessed by stakeholders, namely strength, legitimacy, and interests and produce 8 types of stakeholders, namely Dormant, Discretionary, Demanding, Dominant, Dangerous, Dependent, Definitive, and Non-stakeholder . Based on this stakeholder typology can be categorized into several types of stakeholders, which are related in the development planning process of minapolitan areas based on aquaculture in Malang Regency, namely:

1. Definitive stakeholders, namely Malang Regent and Malang Regency DPRD. This type of definitive stakeholder is the key to the success of the development process of the Minapolitan area

based on aquaculture in Malang Regency because it has the power, legitimacy, and interests.

2. Dependent Stakeholders, namely Bappeda, DKP Malang Regency, along with several related SKPDs, and NGOs. Where Bappeda, DKP Malang Regency NGOs and SKPD are directly related to the Minapolitan Development Planning Process Based on Aquaculture including stakeholder typologies that have legitimacy and urgency, but do not have power.

The involvement of the Malang Regent, is high in terms of its interests and legitimacy, but is very low in the use of force to overcome and mobilize all its power to create success in the development of Minapolitan Area Based on Aquaculture in Malang Regency. The DPRD is high in matters of interest, but is still minimal in the use of its strength and legitimacy. As for NGOs, they do not have power, but have interests and legitimacy and assume that this is not something that is important to pay attention to. The main control of stakeholder involvement in determining the success of the Minapolitan Area Development Planning Process Based on Aquaculture in Malang Regency actually exists in the Malang Regent who can use all of his strengths, interests and legitimacy, but until now the involvement and is still minimal and not optimal, while the DPRD and NGOs are only supportive. This has become an estuary for the existing problems so that the Development of Minapolitan Area Based on Aquaculture in Malang Regency is still stagnant and not yet running in accordance with the existing plans.

CONCLUSION

Mechanisms and stages in the Minapolitan Area Development Planning Process Based on Aquaculture in Malang Regency have been carried out according to existing regulations, where based on the findings of the researcher there is a new breakthrough made by the Malang Regency DKP as a form of moral responsibility, namely holding a coordination meeting after the musrenbang level sub-district, to gather all stakeholders related to proposals regarding minapolitan activities and programs based on the Minapolitan Master Plan and Renstra Based on Aquaculture in Malang Regency. The involvement of Malang Regent, Malang Regency DPRD and NGOs is still minimal and not optimal in using the strengths, interests, and legitimacy they have to overcome existing problems and mobilize other supporting stakeholders.

All matters relating to regional development planning should involve community participation, so that there is responsibility from the community in its implementation. Malang Regent as the key role holder in development in Malang Regency, with the support of Malang Regency DPRD and NGOs, must take the initiative to be willing and able to work together together actively involved in the Development Process of Minapolitan-Based Aquaculture Development Planning so as to realize success in development with the ultimate goal of improving the welfare of the people in Malang Regency.

Motivation Factors of Internet-Supported Learning Environment (ISLE) among Malaysian University Students

N. Z. Ismail¹, M. R. Ismail²

¹Communication Department, Faculty of Communication, Visual Art and Computing, University Selangor, Malaysia; ²English Unit, Centre for Languages and General Studies, Sultan Idris Education University, Malaysia

ABSTRACT

Objective: Internet-supported learning environment (ISLE) is necessary for students in higher institutions in order to be able to learn efficiently in a class. The study investigated the importance of applying ISLE among Malaysian university.

Analysis: There were 120 questionnaires were managed to complete and return the questionnaires. All the data that were obtained from the respondents had been analyzed by using the Statistical Package for Social Science (SPSS) version 17.0. This is one of the most compatible software that can be used to key in and analyze the data gathered.

Method: In this, motivation level in learning techniques was used. This method uses four ISLE motivation factors which included technology, effort, persistence and task choice.

Findings: The finding showed that all the four ISLE motivation factors have a significant value on student motivation level in accepting technology in their learning. ISLE helps students to learn the courses more efficiently.

Result: ISLE has benefited students in their learning especially in increasing their motivation level. Compared to classroom learning environments, ISLE are relatively less structured, student focused, and process oriented.

Keywords: Motivation factors, Internet, Learning, statistical, Students, Internet-supported learning environment (ISLE), Learning motivation, 21st century education, Technology, E-learning

INTRODUCTION

In the era of technology, people access the internet to find and share information, communicate^[1], and exchange ideas with other internet users. Internet seems to provide a potential effective approach in the learning environment. Even though it is possible to teach without the internet access but in this era of modernization where the technology developed rapidly, it is hard to deny the importance of technology in our learning environment. The use of technology in our learning has changed the landscape of education field in 21st century. It forms the new student approaches to learning, teaching approach to teach and how educators interact with^[2]students

(Hargadon, 2009). Despite of the advancement of internet and computer in learning, the use of traditional learning is still valid (Lokie, 2011).

The existence of Internet-Supported Learning Environment (ISLE) in the education system has become the major shift in the education system. During the present century, Computer Based Learning^[3] (CBL) and Instructional Technology have made a substantial contribution to the education especially in Higher Education and both are part of ISLE (Barger & Byrd, 2011; Bekele, 2010; Kuo, Hwang, Chen, & Chen, 2012). ISLE promises to become even more pervasive in the next phase. In fact, the ISLE^[4] is a process where students have the access to a global software

and non-local, and this connection produces several important advantages. Researchers have also highlighted that positive benefits automatically happen in a collaborative learning environment when an instructional technology is used in learning process^[5]. (Hwang, Chu, Lin, & Tsai, 2011; Lazakidou & Retalis, 2010; Schellens & Valcke, 2006). Particularly, it can raise students' interest and motivation to learn all the subjects offered through e-learning (Keller, 2008).

The finding of the study implicates the importance of applying ISLE among Malaysian^[6] university students to understand the acceptance of technology whether it is in line with the major shift in the education system in 21st century. Bekele (2010) gave the clear explanation on the overall motivational impacts of ISLE^[7] in Higher Education. ISLE was presumed to support students' motivation in many courses. In some cases, ISLE is more effective than the traditional method. To address^[8] this concern, the present study intends to identify how motivation factors of ISLE been measured on the students' motivation level in learning.

LITERATURE REVIEW

Sources of Motivation in Using Internet Supported Learning Environment (ISLE): The utilization of technology especially the computer and internet access have a tremendous effect on the whole aspects of people's lives. In this era of globalization, internet existence is regarded as a gift to the world of education and making the educator task easier. The whole world seems to be an electronic village where everyone can communicate with each other. Focusing on the motivation aspect, the use of technology to support the learning environment plays important roles as the students' motivation is a major issue faced by educators in the field^[9]. According to Pintrich & Schunk (2002), motivation is one of the crucial factors for a productive learning and it also affects the acquisition and demonstration^[10] of higher-order thinking skill. Therefore, it is very important for the educators to examine the overall motivational factors influences of Internet Supported Learning Environment (ISLE) in Higher Education. This would bring a better understanding of how and to what extent ISLE impacted the phenomena.

According to Bekele (2010) and Menchaca (2008), motivation and achievement were positively related in

ISLE. ISLE students also have a mandatory requirement to perform well as students in traditional classrooms. In addition, motivation enables students to facilitate the achievement and demonstration of thinking skills (Stes, 2011). Malaysian society lives in the era of globalization and they rely heavily on the use of science and technology in all aspects of life and the use of creative elements are very important in everyday living. The impact of globalization and development of information technology demands some changes in the education system.

The previous researches on ISLE in Higher Education have considered technology, persistence, and effort and task choice as the motivation factors. As stated by Bekele (2010), these four factors give a positive impact in motivating them to learn the subject taught in Higher Education. First motivation factor is the technology which includes the aspect of technology attributes and user (student) skills, experiences, or views. This factor is one of the main factors that affects the student's motivation level. The usage of the internet technology such as Google, World Wide Web, e-mail and other technologies will help to link the information resources for effective communication and visualize problems and solutions at their finger tip. Other than that, by using an online database of project-based instructional unit modeling will also supports learning within the context of classroom and diverse needs of learners including the use of adaptive and assertive technologies. Furthermore, the use of technology will maximize students' learning in analyzing and evaluating the issues as well as consistently helps to facilitates interdisciplinary learning and address global issues. Bekele (2010) stated that students who perceived technology as easy and friendly would use them consistently and their motivation in learning would increase.

According to Bekele (2010), persistence is also one of the most significant factors that will affect the motivation of student in ISLE. By using a technology in learning, student tends to attend the class to do the online exercise rather than skipping them and they will be attracting to the notes that are attached with animation and video. Apart from that, they tend to spend time to study when their teachers use an instructional technology in their learning and teaching. Indirectly, it will increase students' motivation level. It is supported by Kim (2012), that learning process is easily continued when students feel motivated. This showed how the use of the ISLE can affect their persistence and motivate them to learn.

The third motivation factor is effort. Bekele (2010), in his study also describes student’s effort in ISLE as one of major motivation factor. Students are motivated by their own effort when they consistently use an internet to find their assignment references and they are willing to spend more time to finish their online assignment. Beside that, students also willing to participate in the class when the teacher use the online games as part of revision. It shows that when there is a goal, we will be motivated and put a great effort towards it.

The last factor of motivation in ISLE is task choice. The student will choose the task that will motivate them towards their goal. Technology will help them completed their task easier as the technology allows them to read the tutorials anywhere and ease of using it to complete their task will affect their behavior intention (Yi & Hwang, 2003; Ying, 2008). Apart from that, they have many options to choose from the online exercises and get faster feedback from the online exercises. By using the technology tools they also will have the opportunity to create their notes and exercises very fast and easy. Bekele (2010), believed that with the appropriate task choice, the student will be motivated in using technology in their learning environment.

METHODOLOGY

Figure 1: Factors of ISLE motivation (Bekele, 2010)

(a) Conceptual framework: A conceptual framework referred to an analytical instrument with numerous variations and contexts. A conceptual framework is used to design and create the conceptual differences to form ideas. The conceptual framework for this case study is shown in *figure 1*.

(b) Participant: The population of this case study was second year undergraduate students from one of the universities in Malaysia. There were 120 questionnaires were managed to complete and return the questionnaires. The sample was 40 undergraduate students who experienced e-learning system in their learning with the duration of fourteen (14) weeks and they were having face-to-face and online learning interaction.

(c) Instrument: The questionnaire was adapted from Innovation Components Configuration Map by Javeri & Persichitte (2007). The amended questionnaire comprises of three sections. The first section was about the demographic of the respondents. The second section was about the motivation factors in using ISLE. Second section was then divided into 4 categories; technology factor, task choices, effort and persistence. Each category has 5 items and it comprises of 4-degree Likert Scale (1 = strongly disagree, 2 = disagree, 3 = agree, 4 = strongly agree). The third section was students’ motivation level. This section has 20 questions and responded on 4-degree Likert Scale (1 = strongly disagree, 2 = disagree, 3 = agree, 4 = strongly agree). All the data that were obtained from the respondents had been analyzed by using the Statistical Package for Social Science (SPSS) version 17.0. This is one of the most compatible software that can be used to key in and analyze the data gathered. The descriptive statistics had been used to determine the mean and standard deviation of each statement of motivation factors in using ISLE in section two and Pearson correlation had been used to find the relationship between ISLE motivation factors and students’ motivation level in section three.

RESULTS AND DISCUSSION

The present study aimed to examine the motivation factors of ISLE among Malaysian university students in terms of technology (T), effort (E), persistence (P) and task choice (TC). Motivation factors of ISLE were analyzed in terms of mean, standard deviation, minimum and maximum and its correlation. The results are summarized in Table 1.0 and Table 1.1 as follows.

(a) The Overall ISLE Motivation Factors; Technology Factor (T), Effort Factor (E), Persistence Factor (P), Task Choice Factor (TC)**Table 1: The Overall ISLE Motivation Factors; Technology Factor (T), Effort Factor (E), Persistence Factor (P), Task Choice Factor (TC)**

ISLE Motivation Factors	N	Min	Max	Mean	Std. Deviation
T	40	2	4	3.28	.470
E	40	2	4	3.21	.354
P	40	2	4	3.14	.433
TC	40	3	4	3.54	.298

Table 1 showed that all the students agreed that all the four motivation factors of ISLE affected their learning process. The highest mean of the motivation factors was TC (M = 3.54, SD = .298). It means task choice was the highest motivation factor in ISLE. It was followed by T (M=3.28, SD = .470) and E (M = 3.21, SD = .354). The lowest mean was P (M = 3.14, SD = .433). In this study, the ISLE motivation factors had been proven to give an impact on the level of students' motivation level whenever they learn the courses in the university. It was showed in the finding result that most of the students were agreed with all the motivation factors which include of technology, task choice, persistence and effort factors. It can be seen through the mean and standard deviation of the overall motivation factors as shown in table 1.0.

*(b) The relationship between motivation factors and the students' motivation level***Table 2: Relationship between Overall ISLE Motivation Factors (OMF) and the Students' Motivation Level (ML) in ISLE**

		ML	OMF
ML	Pearson Correlation	1	
	Sig. (2-tailed)		
	N	40	
OMF	Pearson Correlation	.364*	1
	Sig. (2-tailed)	.021	
	N	40	40

*. Correlation is significant at the 0.05 level (2-tailed).

Table 2 showed that there's a significant value between overall motivation factors and the students' performance ($r=.364$, $p < .021$). It implied that motivation factors of ISLE gave an impact on the students' motivation level when they learned in ISLE.

As presumed, ISLE supported student motivation to learn in various courses.

In some cases, ISLE was more effective as traditional learning. Students may learn fast because the accessibility of the internet helps the students a lot in answering the questions and at the same time they can get feedback faster when they do any online exercises. Indirectly, it will also make the students motivated to answer the questions. Although ISLE is not totally guaranteed the students to complete the tasks, but it is proven that student's perception and motivation towards learning in ISLE changes after they experience the task using technology tools including the computer and the internet. It has been highlighted in the Technology Acceptance Model (TAM) and Attention, Relevance, Confidence, and Satisfaction Model (ARCS) (Liu, Liao, and Pratt, 2009; Keller, 2008; Keller, 2010; Jason, Kevin, Leslie, & Kimberly, 2008). It was discussed in TAM that student's perception will determine their willingness to complete the task in ISLE (Liu, Liao, and Pratt, 2009). Since the computer and the internet help them to learn fast and it is also friendly user, it makes students' motivation to increase which can be seen through their persistence and effort to learn the subject or completing the online tasks. When students have a positive attitude towards the system, they tend to apply the system regularly and intensively and may have a positive plan towards using the system (Shih, Shing, & Chien, 2011).

CONCLUSION

This present study recommended that motivation factors must also emphasize on the supports. These denote technology leadership and support provided by

faculty or tutors, administrators, and peers. Technology leadership provides logistics crucial for success. Presumably, support factors directly affect and are affected by success and technology and course factors. Within the supports factor the result will be more effective in finding the motivation level in ISLE. It can be concluded that ISLE has benefited students in their learning especially in increasing their motivation level. Compared to classroom learning environments, ISLE are relatively less structured, student focused, and process oriented. Consequently, adequate level of student motivation is a key to success. In addition, students may enroll for more online courses if they get satisfied with their first encounter with ISLE. That is partly why previous studies considered motivation among the success measures in ISLE in Higher Education.

Performance Analysis of Machine Learning Based Classifiers for the Diagnosis of Lung Cancer & Comparison

Arun B. Mathews¹, M. K. Jeyakumar²

¹Research Scholar, Department of Computer Science; ²Professor, Department of Computer Applications, Noorul Islam Centre for Higher Education, Tamil Nadu, India

ABSTRACT

Objective: In this paper, diagnosing in premature stages a detection system has been designed which contains the following digital image processing techniques.

Analysis: Lung cancer is the most injurious form of cancer which affects the human. Lung cancer has quickly increased in western part of the country among the world. Various feature combinations are given as the input to the KNN and ANN classifiers.

Method: First, dermoscopy image of lung is taken, and it is subjected to the pre-processing step for noise removal and post-processing step for image enhancement. Then the processed image undergoes image segmentation using Otsu method & Morphological processing. Second, features are extracted using feature extraction technique –GLCM, and FOS.

Findings: KNN classifier is used to classify the data set into two classes. ANN classifier is used to classify the data set based on the number of layers. Performance is analyzed based on the accuracy of the learning classifier output.

Result: The proposed system defines an effective way to detect the lung lesion more accurately and faster by segmenting the lesions images.

Keywords: Lung Cancer, Otsu, Morphological, Feature extraction, KNN, and ANN.

INTRODUCTION

The early detection of lung cancer can be helpful to save the human life. Fortunately, lung cancers are rare in children. Somasundaram and Kalavathi [2011] proposed a skull stripping algorithm using Chan-Vese ACM^[1]. The method is fully automatic and middle slice was used for computation. The method is very effective for extracting the lung region in T1 and T2 weighted images^[2]. This method makes use of the binary form of the lung MR image to process. This binary image is used to develop active contour. Segonne et al. [2004] used hybrid edge based method^[3] using watershed algorithm to develop initial mask of lung. A deformable structure is developed based on global features of the image. The algorithm is referred to as Hybrid Watershed Algorithm (HWA)^[4]. The accuracy is analyzed using atlas based methods. Rex et al. [2004] developed an accurate meta algorithm for stripping skull region. Four different algorithms are executed and a combined result

is generated. Each algorithm works best for different anatomic locations^[5]. A Boolean logic is used to combine the result of different algorithms. Computational complexity and computation time increases due to the use of many numbers of algorithms. Balan et al. [2012] developed a smart histogram^[6] based method for efficiently skull stripping T1-weighted lung image. Initially background is removed from the image. Double thresholding^[7] is used to separate various regions in lung image. Rough binary classification is used to select the regions. Mathematical morphology was incorporated to remove regions by obtaining a lung mask and this method was not dependent on parameter^[8] tuning. Tasi et al. [1995] used accumulated histogram from all slices of lung image volume separate cerebrum from skull and soft tissues^[9]. This implicitly removes background noise using background threshold.

Thresholding is a simple method used for the segmentation of lung image. The threshold value is

determined by analyzing the histogram of the image^[10] Pham et al [2000]. Lee et al [1998] developed an adaptive model of thresholding based on pixel wise connection of path. The threshold value changes dynamically and disconnected regions are obtained. Markov Random Field (MRF) is an effective statistical model for lung image segmentation Held et al [1997]. Zhang et al [2001] developed conditional probability distributions to encode spatial information. Wu and Chung [2007] developed a compound MRF model. This work combined label information and boundary level information to elevate accuracy of segmentation. Conditional Random Fields (CRF) uses probabilistic distribution framework to model original pixel values and pixel labels Sutton and McCallum [2012]. The accuracy of CRF depends on the statistical distribution of pixels.

Least Square Transformation (LST) is applied to conventional Probabilistic Neural Network (PNN) by Georgiadis et al. [2015] for the classification of meningioma, glioma and metastasis.

The main aim of the proposed method is to detect & classify the lung tissue, it is a cancer lung or not by using, ANN & KNN classifier. Improve the accuracy of lung classification. Then performances are analysis based on the output of classifiers.

PROPOSED METHOD

In the proposed lung cancer detection and classification system, Data base images are taken as input images. Fig.1 illustrates the block illustration of lung cancer detection and classification.

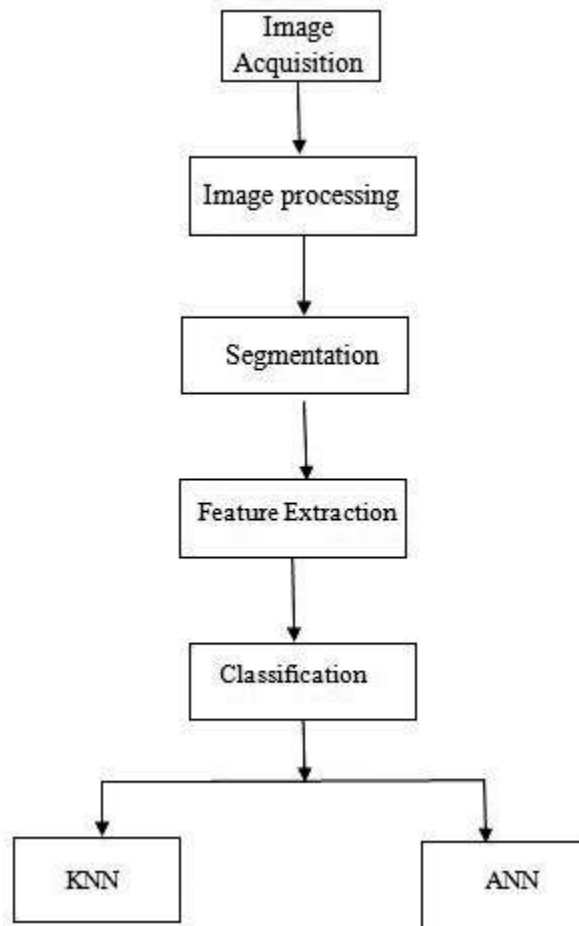

Figure 1: Proposed Architecture

The design of a system for lung cancer detection and classification based on Image Processing techniques include the following stages:

Image processing: The acquired database images is always in digital format which is subjected to various Digital Image Processing Techniques. Usually, the image

is composed of noises. These noises reduce the accuracy of classifiers output. To avoid that, images are subjected to pre-processing techniques. Image Processing consists of following procedures:

- First, the image is resized to 180x180 pixels.
- Second, Gamma correction can repeatedly enhance the image contrast.
- Then color (RGB) image is converted to gray scale image using mat lab command.

Median filter: For smoothing image from noise median filtering is used. Median filtering is used for denoising. In the median filter, the operation will be performed on non-linear function In order to improve the result of future process & to preserve the edges of input image this type of filtering is done.

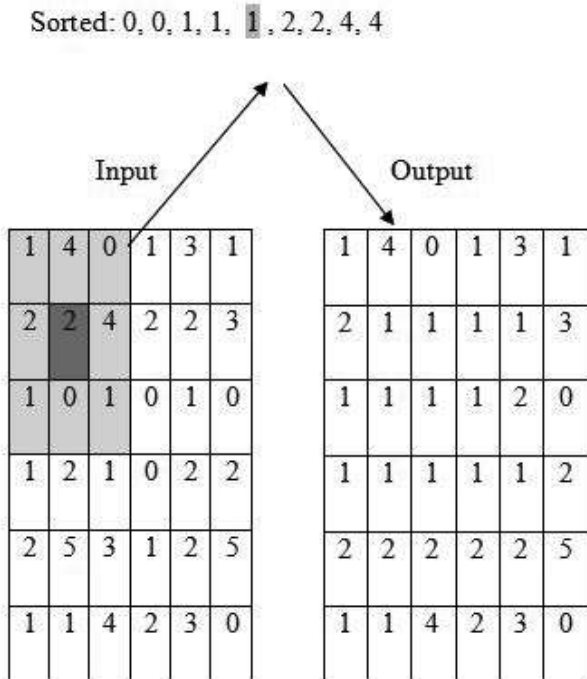

Figure 2: Median filter process

Fig.2 shows that the median filtering process. In that 3x3 window is placed over an image and replace each pixel by sorted median values. The right side cell contains the median filtered values. For example the input values are 1, 4, 0, 2, 2, 4, 1, 0, 1 then this value are sorted as 0, 0, 1, 1, 1, 2, 2, 4, 4. Finally sorted median value of this is 1. Such that each input values are replaced by a median value which is available in output.

Segmentation: Segmentation plays a major role in the detection of lung cancer through digital image

processing, which maximizes the accuracy of further steps. Before segmenting a cancer affected area, we must consider the size, lesion shapes, color, and textures of the input image. It refers to the partitioning an image into two or more put out of joint regions that are unique on some property. There are two important things which deal with this paper. They are given below,

- Otsu’s method
- Morphological processing

Otsu’s method: In order to separate an object (region of interest) from background, an optimal thresholding is used which is called Otsu’s method. This method partitions the image into two classes based on differentiating analysis. In this paper, gray scale image is taken for segmentation which leads to an effective separation of the image into two classes. The output of segmented image contains two intensity values (0, 1). Normally, background pixel value is 0 but sometimes background area pixel value is 1 because some properties of objects are similar to the background. To avoid that problem, morphological process is done. The main aim of segmentation stage is to extract the lesion area from the healthy lung images. For example in a given gray scale image, represented in L gray levels {0,1,2,...L}, this method divide the gray scale image pixel values into two classes $S_0 = \{0, 1, 2, \dots, t\}$ & $S_1 = \{t+1, t+2, \dots, L-1\}$. Consider the number of pixels in the gray level image is , where n is the total number pixels in an image. The probability of occurrence of gray scale image formula is given by [1]:

$$p_i = n_i/n \quad \dots(1)$$

Morphological processing

Erosion: The basic operation of erosion on a binary image is to erode away the boundaries of foreground pixels. This will shrink the area of foreground pixels and larger the holes within that area. This type of operator needs two types of data as input. First is the image which is going to be eroded. The second is a set of coordinate points known as a structuring element. SE used here is disk, and the radius of disk is 4. Structuring element determines the fixed effect of the erosion of the input image. To calculate the erosion of a binary image by this structuring element, we must consider each foreground pixels in the input image. Structuring element covers up the input image pixels so that the coordinates of input pixels coincides at the center of the structuring element.

Erosion can also be used to remove small unwanted bright spots in images. Finally, get fully segmented images of lung cancer.

Feature extraction: To diagnose lung lesion automatically, we will follow feature extraction process. There are two feature extraction processes to be considered. They are FOS and GLCM.

GLCM Features: Feature extraction is done by using Gray Level Co-occurrence Matrix. The gray level co-occurrence matrices represent spatial distribution and gray levels dependency within a local area. There are many texture features available, but here only four features are used. They are Energy, Contrast, Correlation, and Homogeneity.

Energy: It is the sum of squared GLCM elements. This statistic is also called as Uniformity or Angular second moment. It measures pixel pair duplication, which is called as textural uniformity. It detects disorders in textures. Energy reaches a maximum value equal to one. Energy has a normalized range. The GLCM of a less homogeneous image will have a large number of small entries. A feature which measures the overall probability of having distinctive gray scale patterns in the image, defined as

$$\text{Energy} = \sum_{i=0}^{N_p-1} \sum_{j=0}^{N_p-1} p^2(i, j) \quad \dots(2)$$

Contrast: It measures the local variations in the gray-level co-occurrence matrix of the image. This statistic measures the spatial occurrence of an image and is difference moment of GLCM. It measures the quantity of local deviation present in the image. It is defined as

$$\text{Contrast} = \sum_{i=0}^{N_p-1} \sum_{j=0}^{N_p-1} (i - j)^2 p(i, j) \quad \dots(3)$$

Correlation: It measures the joint probability occurrence of the specified pixel pairs in the GLCM matrix. Correlation that takes out how correlated a reference pixel to its neighbor over an image, defined as

$$\text{Correlation} = \sum_{i=0}^{N_p-1} \sum_{j=0}^{N_p-1} \frac{(i - \mu)(j - \mu)p(i, j)}{\sigma_i \sigma_j} \quad \dots(4)$$

Homogeneity: It is the measure of closeness of GLCM distribution elements to the GLCM diagonal elements. This method is also called as Inverse Difference Moment. It measures image homogeneity as it presumes

larger values for minor gray value differences in couple elements. It has the maximum value when all elements in the image are same. It is defined as

$$\text{Homogeneity} = \sum_{i=0}^{N_p-1} \sum_{j=0}^{N_p-1} \frac{p(i, j)}{1 + |i - j|} \quad \dots(5)$$

Histogram-based (statistical) features: Mean, standard deviation, skewness, kurtosis, and entropy are called as a color feature. Entropy gives the quantity of information of the image that is desired for image compression. These features are extracted using Color Moment (CM) descriptor. Statistical features equations are given as

$$\text{Mean: } \mu_i = \frac{1}{N} \sum_{j=1}^N f_{ij} \quad \dots(6)$$

$$\text{SD: } \sigma_i = \left(\frac{1}{N} \sum_{j=1}^N (f_{ij} - \mu_i)^2 \right)^{\frac{1}{2}} \quad \dots(7)$$

$$\text{Skewness: } \gamma_i = \left(\frac{1}{N} \sum_{j=1}^N (f_{ij} - \mu_i)^3 \right)^{\frac{1}{3}} \quad \dots(8)$$

$$\text{Kurtosis: } \delta_i = \left(\frac{1}{N} \sum_{j=1}^N (f_{ij} - \mu_i)^4 \right)^{\frac{1}{4}} \quad \dots(9)$$

$$\text{Entropy: } \epsilon_i = - \sum_{j=1}^N (f_{ij} * \log f_{ij}) \quad \dots(10)$$

Where N is the total number of pixels in the image and f_{ij} is the intensity value of the i^{th} color element of the j^{th} image pixel. $\mu_i, \sigma_i, \gamma_i, \delta_i, \epsilon_i$ denotes the mean, standard deviation, and skewness, Kurtosis, entropy of each channel of an image.

Classification methods

KNN Classifier: An instance-based learning method called the K-Nearest Neighbor or K-NN algorithm has been used in many applications in areas such as statistical pattern recognition, image processing. In this paper, two classes KNN classifier is used for classifying lung images into cancerous or non-cancerous. In order to perform the classification process, take 60 lung images which contain 30 cancerous and 30 non-cancerous images. KNN classifier output is displayed in a confusion matrix of 3x3. Various combinations of features are combined and given to the classifier. From the classifier result, we find the accuracy of the image.

ANN Classifier: A classifier classifies the given datasets into cancerous and non-cancerous. Here a computer based classifier implemented in MATLAB software is used for classification purpose. Figure 3 shows that,

there are 13 features, the classifier network consists of 13 inputs. Number of hidden neurons taken is 4 and one output neuron. Then the feature selection method is used to minimize the number of input features. Finally the

input feature taken for this classifier is 9. The activation function used is tan sigmoid function. The output of the network is 0 or 1. Zero indicates a non-cancerous or benign condition and one indicates Cancerous condition.

Figure 3: Artificial Neural Network

EXPERIMENTAL RESULTS AND DISCUSSIONS

In fig. 4 same operations will be followed. The input image is resized as 180x180 images, and then gamma correction is done with the gamma value of 2. The color image is converted to gray scale image, and top-hat transform is applied to extract the hair particles. Noise removed image is given to the unsharp masking

to sharpening the image. Noise removed image is subjected to the Otsu method to segment the image into two classes, and then erosion operator is used to removing the white pixel in foreground areas. Finally, the object is separate from the foreground. The Fractal & Hausdorff dimensions plot are drawn based on the box count & number of blocks in the input image. The decision is taken based on the features extracted from the segmented image.

Figure 4: Experimental result of lung tumor image (a)MRI image of tumor affected lung (b)Gamma correction image (c)Gray scale image (d)Median filter image (e)Contrast Adjusted image (f) Segmented tumor

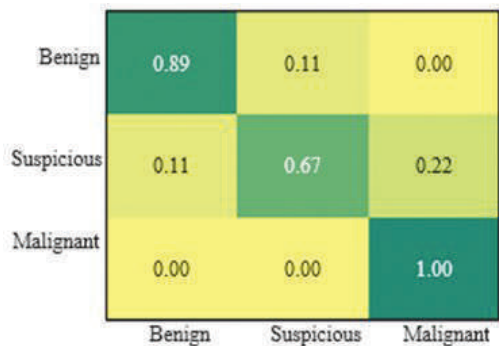

Figure 5: confusion matrix of KNN classifier based on GLCM & FOS feature combination

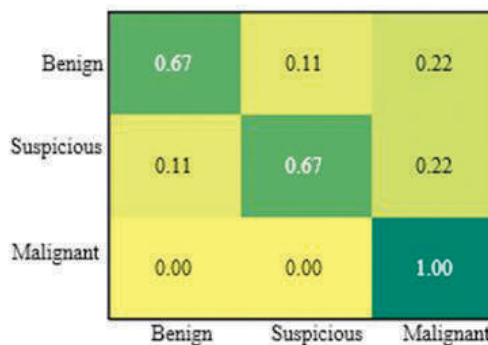

Fig.5 shows that the KNN classifier output from Matlab software. Classify the lung image is cancer and non-cancer based on their features, for that 30 cancer and 30 non-cancer images are taken. From this matrix 30 (100%) cancer images are correctly identified by the GLCM + FOS feature combination.

GLCM

FOS

GLCM+FOS

Figure 6: confusion matrix of ANN classifier based on GLCM & FOS feature combination

COMPARISONS

There are two classifiers which can be used to classify the lung image dataset. KNN & ANN classifier is used to classify the dataset into two classes. Table.1 shows that the comparisons of classifier accuracy and error. From this table we can finalize that the ANN classifier gives the best result.

Table 1: Comparisons of classifier accuracy and error values

Classifier	KNN	ANN
Accuracy (%)	93.7	95.3
Error (%)	6.3	4.7

CONCLUSION

Performance analysis of learning based classifier is proposed for the diagnosis of lung cancer. It proves that this is the best method for diagnosis of lung cancer. The image of lung cancer is taken, and it is subjected to various pre-processing techniques for noise and image enhancement. The cancerous region is separated from the healthy lung by the method of Otsu segmentation. The features of the segmented region are extracted and based on the features images are classified as Cancerous or Non-cancerous using KNN classifier and Benign, Suspicious, Malignant using ANN classifier. The proposed system defines an effective way to detect the lung lesion more accurately and faster by segmenting the lesions images. Moreover, it has got good accuracy and higher levels of quality images. All the above processes are done in Matlab software. From the experimental result, the KNN classifier, ANN classifier accuracy will be 93.7% & 95.3% based on the features.

A Study on Customer Satisfaction of Banking Services with Reference to State Bank of India in Chengalpattu Branch

V Murugan

Assistant Professor of Commerce, R. V. Government Arts College, Chengalpattu, Kancheepuram (D.t.)

ABSTRACT

Objective: The Indian economy is emerging as one of the strongest economy of the world with the GDP growth of more than 8% ever year. The strongest banking which can have a significant role in supporting economic development through efficient financial services. Actually meaning of bank is not specifies clearly in any regulation or act.

Analysis: In India, different people have different type of meaning for bank. Objectives of the study, To study the level of customer satisfaction on bank service with preference to state bank of India, Chengalpattu.

Method: Methodology of the study, The primary data were collected with the help of the structured questionnaires. Secondary data are collected from the various magazines, websites and service branches. For getting primary data, a questionnaire is constructed and distributed to the respondents.

Findings: Findings of the study, The majority 60.7% respondents are male segments, followed by 39.3% are belongs to female category and the majority 60.7% of the respondents are individual's category, followed by 25.0% of the respondents are company category. Suggestions of the study, the banks are suggested that though overall banking services is useful it will improve only if customers satisfaction concept is concerned more. Thus banks must concentrate further on customer satisfaction and improve bank service. Bank decreases additional charges while using internet banking, mobile banking and core banking.

Result: Conclude this study, the nationalization of major commercial banks led to 'Mass banking' which in turn increase the number of customers. The increased in number of customers automatically led to deterioration in quality of customer services.

Keywords: Customer, satisfaction, chi-square test

INTRODUCTION

The strongest banking which can have a significant role in supporting economic development through efficient financial services. Banking sector plays a vital role in growth and development of Indian economy. After liberalization the banking industry in India undergone major changes. The process of liberalization and globalization has strongly influenced the Indian banking sector. A stable and efficient banking sector is an essential precondition to increase the economic level of a country.

Banking Sector performs three primary functions in economy, the operation of the payment system, the mobilization of savings and the allocation of saving to investment products. The Government has taken various steps in this sector in a basic priority and this service sector has been changed according to the need of present days.

Origin of Bank: It is generally said that the word "Bank" has been originated from Italy^[1]. In the middle of 12th century there was a great financial crisis in Italy due to war. To meet the war expenses, the government of that period forced subscribed loan on citizens^[2] of the country at the interest of 5% per annum. Such loans were known as 'Compare', 'minto' etc. The most common name was "Monte". In Germany the word 'Monte' was named as 'Bank'^[3] or 'Banke'.

Meaning of Bank: Actually meaning of bank is not specifies clearly^[4] in any regulation or act. In India, different people have different type of meaning for bank. Normal salary earner, it means that it is a saving institution, for current account holder or businessman bank as a financial institutions and many other, bank is not for profit making, it creates saving^[5] activity to salary earner.

Definitions of Bank: Indian Banking Regulation act 1949 section 5 (1) (b) of the banking Regulation Act 1949 Banking^[6] is defined as “ Accepting for the purpose of the landing of investment of deposits of money from public repayable on demand or other wise and withdraw able by cheques, draft, order or otherwise^[7].”

History of Bank: Ancient Rome perfected^[8] the administrative aspect of banking and saw greater regulation of financial institutions and financial practice^[9]s. Charging interest on loans and paying interest on deposits became more highly developed and competitive. The development of Roman banks was limited, however, by the Roman^[10] preference for cash transactions. During the reign of the Roman emperor Gallienus (260-268 AD), there was a temporary breakdown of the Roman banking system after the banks rejected the flakes of copper produced by his mints. With the ascent of Christianity, banking became subject to additional restrictions, as the charging of interest was seen as immoral. After the fall of Rome, banking was abandoned in Western Europe and did not revive until the time of the causal.

Banking after Independence in India

Third Phase: 1991-2002 Economic Reforms: The Indian economic development takes place in the realistic world from 1991 “Liberalization, Privatization and Globalization” policy. As per “LPG” policy all restriction on the Indian economy was totally dissolved and the soundest phase for the Indian banking system adopt over here. This also changed the scenario of the macroeconomic world. The budget policy and suggestion provided by shri Dr Man Mohan Singh and the Governor of Reserve Bank of India. As per the guideline the segments for development is having various problem and so the importance of public sector cannot be ignored. The country is flooded with foreign banks and their ATM stations. Efforts are being put to give a satisfactory service to customers. Phone banking and net banking is introduced. The entire system became more convenient and swift.

Functions of Commercial Bank

Acceptance of Deposits: An important function of commercial banks is to attract deposit from the public. Those people who have cash account and want their

safety; they deposit that amount of banks. Commercial banks accept deposits every class and source and takers possibility to repay the deposit in the same currency whenever they are demanded by depositors.

Lending: Another function of commercial banks is to make loans and advance out of the deposit receive in various forms. Bank Apply the accumulated public deposits to productive uses by way of loans and advances, overdraft and cash credits against approved securities.

Investments: Now-a-days commercial banks are also involved in Investment. Generally investment means long term and medium term investments.

Corporate Governance: Banks not only accept and deploy large amount of uncollateralized public funds in fiduciary capacity, but they also leverage such funds through credit creation. Banks are also important for smooth functioning of the payment system. Profit motive cannot be the sole criterion for business decisions. The focus, therefore, should be on enhancing and fortifying operation of the principles of sound Corporate Governance.

NEED OF THE STUDY

The study was conducted to know the customer satisfaction regarding service provided by state bank of India for the customers. The study totally revolves around the opinions and feedback from the users. An opinion survey with the help of questionnaire was conducted to know the users view on the services provided by state bank of India, Chengalpattu.

Statement of the Problem: State bank of India in Chengalpattu is not providing services properly to their customers especially opening of new account, delay in getting withdrawal money, lending of housing loan Hence the researcher has taken the problem that the consumers are satisfied or dissatisfied with the services of the state bank of India in Chengalpattu. Customers of state bank of India face many problems in getting the services like ATM operation for depositing and withdrawing money. The process of educational to the students gets delayed for a long time. The prompt payer of loan is not given the concession which is available in the bank like waiver of 0.5% for regular re-payer of loan.

Objectives of the Study

- To study the level of customer satisfaction on bank service with preference to state bank of India, Chengalpattu.
- To estimate the performance of state bank of India based on the service provided.
- To suggest the strategies for the bank to improve the level of customer satisfaction
- To determine the customer-Bank interactions towards satisfaction.
- To know the variety of different services offered by the state bank of India.

RESEARCH METHODOLOGY

Since the primary objective of the study is to identify the consumer satisfaction, it was decided to use descriptive research design. The purpose of this research is description of the state of affairs, as it exists at present. The necessary data for analysis were collected mainly with the help of the primary sources. To know the basic idea and concepts regarding the consumer attitude and behavior, the secondary data were used.

The primary data were collected with the help of the structured questionnaires. Secondary data are collected from the various magazines, websites and service branches. For getting primary data, a questionnaire is constructed and distributed to the respondents.

The respondents are of different types of customer and the data were collected with several significances and analyzed with the help of various statistical tools like percentage analyzed, graphical representations.

Sample Selection: The researcher has selected the sample to the maximum no. of 56. Since the population is infinite, the samples are selected for the study as convenient to the research process. It has been decided on the basis of simple random and convenient sampling techniques and that too according to the availability of the users at state bank of India in Chengalpattu.

Sources of Data: Primary data were collected from the customers using SBI service to find the level of their satisfaction. It was collected with the aid of formal questionnaire, with personal

Limitations of the Study: The following are the limitations that are encountered by the researcher during the period of the research work and that too affected the research process in very many dimensions: There may be a bias in collecting the primary data from the customers, The study is limited 56 Respondents. The study is conducted only in Chengalpattu town and some of the respondents were not interested to mention the actual data.

ANALYSIS AND INTERPRETATION OF DATA

Table 1: Primary data

Particulars	Respondents	Percent
Individual	34	60.7
Firm	4	7.1
Company	14	25.0
Others	4	7.1
Total	56	100.0

Source: primary data

Interpretation: From the above table reveals that 60.7% of the respondent’s customer status was individuals, 7.1% of the respondents have a firm as customer status, 25.0% of the respondent’s customer status was company and 7.1% of the respondents have other customer status.

Table 2: Occupation wise sample respondents

Particulars	Respondents	Percent
Business	16	28.6
Govt. service	2	3.6
Private service	9	16.1
Farmer	18	32.1
Student	7	12.5
Others	4	7.1
Total	56	100.0

Source: primary data

Interpretation: The above table shows that out of the total customer satisfaction 56, 28.6% of they are doing business, 3.6% of them are govt. service, 16.1% of them are private service, 32.1% of them are farmer, 12.5% of them are student,7.1% of the respondents are doing some other occupation.

Annual income wise sample respondents**Table 3: Annual income-wise respondents**

Particulars	Respondents	Percent
Upto 100000	38	67.9
100001-300000	15	26.8
300001-500000	1	1.8
500001-1000000	2	3.6
Total	56	100.0

Source: primary data

Interpretation: From the above table, it was found that 67.9% of the respondents belongs to the income level of up to Rs 1,00, 000 , 26.8% of the respondents belongs to the income level between Rs 1,00,001 – 3,00,000, 1.8% of the respondents belongs to the income level income between Rs 3,00,001 – 5,00,000 and remaining 3.6% of the respondents belongs to the income level of Rs5,00,001- 10,00,000. It is crystal clear from the above data that an overwhelming majority (67.9%) of sample respondents annual income (in Rs) level below Rs 1,00,000.

Mobile banking, e-banking and other latest technologies providing in the bank sample respondents**Table 4: Bank sample respondents**

Particulars	Respondents	Percent
Very good	15	26.8
Good	27	48.2
Satisfactory	12	21.4
Poor	2	3.6
Total	56	100.0

Source: primary data

Interpretation: From the above table reveals that 26.8% of the respondents were very good level, 48.2% of the respondents good,21.4% of the respondents satisfactory and remaining 3.6% of the respondents poor on mobile banking, e-banking and latest technologies.

Hypothesis

Ho1: There is no significant relationship between age-group and satisfied with the operation of your account in this branch.

There is no significant relationship between age-group and satisfied with the operation of your account in this branch is given in table

Table 5: Satisfied with the operation of your account in this branch

Particulars	Satisfied with the operation of your account in this branch				Total	
	Very good	Good	Satisfactory	Poor		
Age-group	Below 25	12	11	6	0	29
	25-35	2	8	4	0	14
	36-45	0	3	2	2	7
	Above 46	0	4	2	0	6
Total		14	26	14	2	56

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	22.840 ^a	9	.007

Source: primary data

Since P value (0.007) is less than 0.05, the null hypothesis is rejected at 5 percent level of significance. Hence, concluded that there is significant relationship between age-group and satisfied with the operation of your account in this branch.

Hypothesis

Ho2: There is no significant relationship between occupations and satisfied with the operation of your account in this branch.

There is no significant relationship between occupations and satisfied with the operation of your account in this branch is given in table

Table 6: Satisfied with the operation of your account in this branch

Particulars		Satisfied with the operation of your account in this branch				Total
		Very good	Good	Satisfactory	Poor	
Occupation	Business	7	9	0	0	16
	Govt. service	0	0	2	0	2
	Private service	2	5	2	0	9
	Farmer	2	11	3	2	18
	Student	3	1	3	0	7
	Others	0	0	4	0	4
Total		14	26	14	2	56

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	34.875 ^a	15	.003

Since P value (0.003) is less than 0.05, the null hypothesis is rejected at 5 percent level of significance. Hence, concluded that there is significant relationship between occupations and satisfied with the operation of your account in this branch.

SUMMARY OF FINDINGS, SUGGESTIONS AND CONCLUSION

Summary of findings

1. The majority 60.7% respondents are male segments, followed by 39.3% are belongs to female category.
2. The majority 60.7% of the respondents are individual’s category, followed by 25.0% of the respondents are company category.
3. The majority 32.1% of the respondents are farmer, followed by 28.6% of the respondents are doing business.
4. The majority 67.9% of the respondents belongs to the income level of up to Rs 1,00,000, followed by 26.8% of the respondents belongs to the income level between Rs 1,00,001 to 3,00,000.

5. Ho3 the age-group and satisfied with the operation of your account in this branch is rejected.

SUGGESTIONS

The suggestions are offered by the researcher for improving customer’s satisfaction and providing service the research findings and also from the interactions the researcher had with the respondent’s customers. Banks must ensure to their customers that their service is competitive. Thus the banks are suggested that though overall banking services is useful it will improve only if customers satisfaction concept is concerned more. Thus banks must concentrate further on customer satisfaction and improve bank service. Bank decreases additional charges while using internet banking, mobile banking and core banking. The banks would increase the use of internet banking as these offer the benefits namely convenience to the customers and reduction of cost of operation to the banks. Internet banking can increase the comfort level for transacting. To attract their customers to use online banking, banks should reduce the charges levied for online transactions.

CONCLUSION

A sample of 56 was collected were convenience sampling was used to analyze the data with percentage analysis and chi-square test. The researcher’s aim throughout the study has been to examine how far the customers are satisfied with the banking services offered by state bank of India in Chengalpattu branch. Customers are the most important of overall banking services. The success and failure of any banking services depends upon how far they satisfy the expectations of their customers. Banks are an important social organization rendering various financial services to its customers. Realizing the importance of customer’s service in banks, recommendations are made by various committees to improve the services quality of banks. The nationalization of major commercial banks led to ‘Mass banking’ which in turn increase the number of customers. The increased in number of customers automatically led to deterioration in quality of customer services.

The Level and Dimensions of Resilience of Trainee Teachers at Teacher Education Institute of Malaysia

Kamarul Md Shah¹, Farah Mukhtar²

¹Lecturer, School of Social and Economic, University Malaysia Terengganu, Kuala Nerus, Terengganu, Malaysia; ²Lecturer, Teacher Education Institute of Malaysia, Seremban, Negeri Sembilan, Malaysia

ABSTRACT

Resilience is one of the important aspects that can improve a person's ability to handle stress and adapt to a situation. Resilience brings many advantages, especially for the students at the Teacher Education Institute (TEI) and the Higher Education Institutions (HEI) in particular to improve academic achievement and personal skills. However, there were not many studies done on resilience in Malaysia. This research is conducted to identify the resilience level and dimension among trainee teachers and their differences based on gender. The respondents consist of 172 semester eight students and this study uses purposive random sampling. This study used the Dispositional Resilience Scale Questionnaires to answer the research questions. The results showed that the overall mean score of resilience is at high level. Apart from that, the findings also showed that respondents have moderate level of dimension of control and challenge than the dimensions of commitment which is at moderate level. The findings also found that there were significant differences according to gender. This study has implications on the teacher training and also teaching and learning methods practiced in the TEI in order to develop the attitude of perseverance among future teachers towards the quality of novice teachers.

Keywords: Resilience, Stress, Trainee teachers, Novice teachers

INTRODUCTION

The concept of resilience was introduced and developed from the existential Theory of Personality¹. In the field of psychological research, resilience is often associated with the attitude of someone who is able to compete and survive in a stressful situation or in an unpleasant situation. In the dictionary, it defines resilience as able to face challenges. Therefore, it is difficult to define and provide the corresponding term of the 'hardiness' in the context of the study in Malaysia. Personality or resilience is divided into three dimensions namely (1) an individual's commitment towards his goal of his life and work or what he does in his life, (2)

having the ability to sense or control of the belief that he can control what happens in his lives, and also having a perception that change occurs as a positive challenge and as an opportunity for him to grow rather than taking it as a threat. Determination helps in building the perception, interpreting and building the skills required by an individual to resolve a pressured or complicated situation in order to be successful². This construct helps an individual to deal or confront with the tensed or complicated situation and also to protect them from the bad effects³. One of the positive psychology areas that are frequently studied by foreign researchers was found that determination can help an individual to see or assess a situation or event in his life as something that is less stressful if the individual has a high determination personality.

In summary, persistence is a personality that allows an individual who is under pressure to feel committed rather than isolated, to have the ability or greater power control than the powerless and the weak and to see change as a challenge rather than consider it a threat to remain in good health¹.

Conceptually, persistence is a difference between the individual's development from the start of his life and his stable over time though it may change under certain levels⁴.

Several existing studies only related to persistence as one of the characteristics that help trainee teachers, particularly during the ongoing evaluation process and during their teaching practices. Persistence factor is also related with the stress experienced by trainee teachers. The study was done and found that the factors that affect stress experienced by trainee teachers is that they have less experience as teachers, problems in choosing teaching methods and choosing appropriate teaching aids, problems of providing teaching induction, clerical work and other non-teaching duties⁵. Study showed that trainee teachers who have positive attitudes and who are interested in the teaching profession is highly motivated to achieve success in their careers. They also show better performances during their teaching practice than those who are not interested and have low motivation⁶.

In Malaysia, teachers nowadays face the greatest challenge in meeting the different learning needs of a diverse group of student. Thus teachers need to recognize and realize the individual learning mode of all their students and to motivate them so as to maximize the learning progress and the achievements of these students⁷. Action research is a way to improve teachers teaching. The key challenges were found to be lack of research culture in schools, which have led to a series of other challenges, and teacher's lack of confidence due to limited scaffolding received in acquiring research-based knowledge and skills⁸.

METHODOLOGY

This is a quantitative study using survey method where a set of questionnaire was used to collect the data. The data obtained were analyzed using the SPSS version 22.0 software. The mean score and t-test were used to test the hypotheses in the study. The sample of this study consisted of 172 semester eight trainee teachers from one of the Teachers' Education Institute (TEI) in Malaysia. Random sampling was used to obtain sufficient data for the purpose of data analysis and to answer the research questions. A set of questionnaire, Dispositional Resilience Scale (DRS)⁹⁻¹⁰ contains 15 items with four levels of measurement that is incorrect (0); Slightly

correct (1); True (2); and, very correct (3) has been used. The alpha coefficient of this instrument is .76 and .83⁹. The degree of resilience in the instrument is divided into three categories: (1) Low (mean score between 0 and 1.00); (2) Simple (mean score between 1.01 and 2.00); and (3) High (min score between 2.01 and 3.00). This category is designed and adapted according to the scale recommended by some statistical experts¹¹⁻¹⁵.

RESULTS AND DISCUSSION

The Resilience Level of Trainee Teachers: The mean of the research sample is 2.10 which were in high category (2.01-3.00). Generally, the level of resilience in the high category is quite satisfactory but the value was still considered low in this category compared to the highest value of 3.00. This high level of resilience indicated that these trainee teachers are able to achieve good and excellent results. There are many studies that have been conducted in the west about the resilience level and their relationship with the academic achievement of the students. The study done by researchers stated that there is a relationship between the resilience levels with academic achievement of the undergraduate students¹⁶. In this study, the researchers also found that the dimension of commitment, in terms of resilience, played the most important role in determining the academic achievement of students. The results of this study also suggested that students with high dimension of comment, resilience in particular, more likely to achieve better academic results.

According to researcher⁴, since late 1980s, researchers had identified one type of attitudes and skills that can improve the students' performance, morale and health which caused by stressful situations, which is known as the resilience. The findings of the previous studies also suggested that this enhanced attitude of resilience is able to control or help to reduce the stress level experienced by college students, especially through regular training of resilience¹⁷.

The Malaysia education system has changed aligned with the Malaysian Education Development Plan (PPPM) and this change also includes the teaching and learning method and the format of the examination¹⁸. This is because previously, the education in Malaysia is more on examination-oriented which has been identified as one of the contributors to stress among students¹⁹⁻²⁰.

The Degree of Consistency According to the Dimension of Persistency: The mean score of the three dimensions in this questionnaire is 2.10. This shows that the level of resilience amongst the trainee teachers of *Raja Melewar* Campus is at a high level. The score for each dimension of resilience in this questionnaire has been calculated using the SPSS software 22.0. However, based on the mean score shown in Table 1, the dimension of control is the highest mean score of 2.26 compared to the mean score for the dimension of challenge which is 2.07 and the mean score for the dimension of commitment is 1.97. This analysis shows that in terms of dimensions of resilience, dimensions of control are the highest dimensions among the respondents followed by the dimensions of the challenge and on the contrary the dimensions of commitment are at a moderate level. This high score of resilience can help trainee teachers in the teacher education institute to avoid the feelings of burn-out due to the extensive workload and examination in which the teacher education institute has been practicing continuous evaluation system. This is in line with the study found that resilience is negatively related with ‘burn-out’ for professionals, especially in the field of mental health and education²¹⁻²².

Apart from that, this high level of resilience also can help trainees to manage their time and to develop their own potential and also adapt to the challenges and also to build good relationships with lecturers and colleagues. This is supported by a study which stated that resilience helped in managing and improving performance, leadership, morals, and health²³⁻²⁴. Individuals with high level of persistence, use frequent adjustment strategies (e.g. active and problem-based strategies), and use less of non-adaptive strategies (e.g. avoidance)^{25,22}. Furthermore, those who have better and wider socialized skills in the society enabled them to face the challenges in their job requirement and they are reported to have a higher level of support than their supervisors and supervisors²⁶.

Table 1: Mean Score of the Dimension of Resilience among the Trainee Teachers

Dimension Level	Frequency	Mean
Commitment	172	1.97 (Intermediate)
Control	172	2.26 (High)
Challenge	172	2.07 (High)
Overall	172	2.10 (High)

Differences in the Level of Resilience Based on Gender: The t-test in Table 1 showed that there was a significant difference in the level of resilience among the respondents’ gender, $t(172) = 1.273, p = .004 (p < 0.05)$. This means that the male and female trainee teachers have different levels of resilience (Table 2). The findings of this study were supported by the research which stated that there was a significant effect of gender on the level of resilience in the dimensions of control and dimensions of challenges, but not in the dimensions of commitment²⁷. In addition, this study also found that there was also a significant effect on school’s climate and also resilience. The effect of gender and the school climate is also important in the formation of resilience except for the dimension of commitment. This suggests that there is a significant impact between the school’s gender and gender in which both rely on one another to explain the influence of dimensions of control and the dimensions of the challenge towards resilience among adolescents.

Resilience also affects the development of one’s career. The study found that the resilience emerged and became one of the most important traits that relate to the job tolerance, performance and pressures that he will be excelled in the very challenging job²⁸. Furthermore, in terms of social relationships, the other study found that there was a significant relationship between the bond of safe relations and the resilience with creativity²⁹. On the other hand, there is a significant negative relationship between the bonds of an insecure relationship with creativity. If this defect exists in social skills for a stable relationship, it will lead to long-term problems such as denial of friends, the achievement level at schools and other social problems.

In addition, in terms of health, the study found that there was an effect between the levels of stress and gender toward resilience especially in the dimensions of commitment and the dimensions of control over good health. Men who were less stress showed less physical and psychology symptoms which related to dimension of commitment and dimension of control, but this was not related to women. There is also a relationship between resilience, gender and stress on health among teenagers³⁰. Studies done on gender differences and resilience that affecting career development and individual health have shown that training on these attitudes of resilience has to be carried out so that those concerned will have high level of persistence for physical and mental well-being.

Table 2: The t-Test of Level of Resilience Based on Gender

Dependent Variable	Group	N	Mean	t	Sig.
Level of Resilience	Male	65	29.86	1.273	0.004*
	Female	107	32.49		

*significant < 0.05

CONCLUSION

Many studies in the west have proven that resilience can influence academic achievement and also stress levels. Resilience can also help to establish healthy personality and to ensure mental well-being. The study done at teacher education institute also found that the differences level of resilience among gender could affect their academic achievement and their ability to self-adjust with campus life. However, the students at teacher education institute also showed that they have high level of resilience and this is in line with their outstanding academic achievements. Teaching and learning methods practiced in the teacher training institute are likely to be the one of the contributing factors to the development of resilience among these trainee teachers. It is recommended that a program or training in the effort to develop and further instill resilience should be planned and implemented at the teacher education institutes level so that it can help trainee teachers in preparing themselves for the real atmosphere in schools as novice teachers and hence to achieve the objectives of the Malaysian Education Development Plan (PPPM) and Vision 2020.

Transformation the Role of Government in Solid Waste Management in Malaysia through Local Agenda 21 (LA21)

Siti Aisyah Saat¹, Rahaya Md Jamin¹, Roseliza Mat Alipiah¹, Nurul Izzwani Md Khairuddin¹

¹Lecturer, School of Social and Economic Development, Universiti Malaysia Terengganu, Terengganu, Malaysia

ABSTRACT

Sustainable development agenda for local authorities have become the national agenda. The local authorities must be prepared to meet the challenge, particularly in relation to growing urbanization within the context of sustainability of solid waste management. This paper describes the result from the survey among local authorities in Malaysia regarding of solid waste management. A survey was conducted to gauge the thoughts decision makers of local authorities in Malaysia with regard to the concept of sustainable development and Local Agenda 21. This paper examines the transformation of the role of the local government in solid waste management in Malaysia using ecological modernization theory. The survey among local authorities in Malaysia shows that solid waste management has a low priority within the local authorities causing mismanagement of existing resources and a lack of formal planning. Consequently, there is lack of expertise, inadequate equipment and untrained staff with minimal education in waste management. Despite these shortcomings the local authorities require technical and financial resources in order to improved solid waste management in Malaysia. In fact, inadequate support from decision-makers of local authorities raises the question whether smaller or less advanced local authorities will have the capacity and capability to assume new roles to meet the new challenges.

Keywords: Ecological modernization, Solid waste, Local authority, Sustainability, Malaysia

INTRODUCTION

The Solid Waste Management (SWM) in Malaysia problems are caused by various factors¹, which have an impact on the development of effective solid waste management system in Malaysia. Institutional constraints are among these problems. Even though several agencies such as the state Department of solid waste management and Municipal Councils are involved in waste management, they often have no clear functions in relation to waste management and there is no single agency designated to coordinate their projects and activities. The lack of coordination among the relevant agencies often results in duplication of efforts in waste management, wasting of resources, and unsustainability of overall waste management programs. The waste

management problem has a complex nature with a range of important dimensions such as multiplicity of the types of waste generated in the system, complex spatial pattern of waste arising, the necessity to transport waste long distances for processing, a variety of emissions from waste collection, transporting and treatment to the environment, and the almost unpredictable and localized character of impacts of these emissions on humans and ecosystems¹⁵. Malaysia faces with a problem dealing with waste management. The reason for the problems in waste management is that there is not only an increase in the rate of waste production, but also characteristics of the waste today are far different from what they were a few years ago. These demands need special attention for collection, treatment and disposal.

THEORETICAL FRAMEWORK

Ecological Modernization “has become the dominant discourse of sustainable development” amongst environmental policymakers², creating “a way of thinking about how to move beyond the conflict

Corresponding Author:

Siti Aisyah Saat

Lecturer, School of Social and Economic Development,
Universiti Malaysia Terengganu, Terengganu, Malaysia

Email: s.aisyah@umt.edu.my

relationship that it assumed to exist between the economy and environment”¹⁰. Therefore, ecological modernization refers to a series of institutional, operational, economic, governance, social and political shifts that are set in motion by environmental driver. These drives push new social arrangements, a new discourse, new scientific and technical developments, and a shift in responsibilities and interests between public and private sectors, between governments and their citizens, between civil society and other economic actors, and between the formal and informal sectors and arrangements within a wide range of disciplines¹¹.

METHODOLOGY

This research method is explanatory, research population is employee relating to finance reporting as much as 109 persons, data collecting technique through observation using questionnaire research instrument and literature study. Statistic test tool use multiple linier regression and hypothesis test by t-test. The survey was conducted to gain some information and perception regarding solid waste management among the local authorities in Malaysia. As many as 12 decision makers of local authorities in Malaysia were chosen as key respondents through interview sessions.

Of the respondents 11 were males and 1 female, a ratio which generally represents the unequal distribution of men and women at the level of decision making in local authorities. The interviews survey served to evaluate and examine policy of Solid Waste Management among the local authorities in Malaysia. Interview survey could provide the opportunities for a more detailed investigation amongst the municipal councils, while gathering data for general evaluation. There were 12 officers among the local authorities in Malaysia who were interviewed through the survey.

RESULTS AND DISCUSSION

Environmental Awareness among Local Authorities in Malaysia: According to the survey, as indicated in Table 1, most respondents were less knowledgeable about complex conceptual issues about sustainable development. 58.3% of respondents did not understand the concept of sustainable development, whereas a 66.6% of respondents had never heard of the concept of sustainability. This could be related to the inaccessibility to knowledge necessary to shape their opinions, resulting from inadequate infrastructure and resources for service delivery and planning and conflicts arising from development priorities.

Table 1: Knowledge of Sustainability of Solid Waste Management

Question	Proposition of Answers			Total
	Yes	No	Not Sure	
Do you understand the concept of sustainability?	41.6%	58.3%	0	100%
Have you ever heard the concept of sustainability?	25%	66.6%	8.3%	100%
Do you understand the concept of Local Agenda 21 (LA21)?	25%	75%	0	100%

Table 2: Behaviour for Environmental Awareness Reason among Decision Makers of Local Authorities

Question	Proposition of Answers			Total
	Yes	No	Not Sure	
Do you utilize used paper for printing and photocopying?	25%	66.6%	8.4%	100%
Do you aware of litters?	50%	41.6%	8.4%	100%
Do you use greening guidebook personally?	16.6%	75%	8.4%	100%
Do you buy or use green product?	41.6%	50%	8.4%	100%
Do you participate in recycling campaigns?	58.3%	33.3%	8.4%	100%

The findings in the table highlight the critical importance placed on National Agenda 21 campaigns with more than 50% of the respondents participating in environmental campaigns. Within the government sector,

raising awareness should focus on the local government, who is responsible for proper municipal solid waste management. In this respect, the national government shall inform the top administrators of local government the

national policies on sustainable solid waste management including waste recycling program which is one of the national agenda to implement 3Rs (Reduce, Reuse and Recycle) activities in their localities. The objective of ecological modernization theory is to increasing the efficiency of material use through waste minimization and recycling. These efficiency improvements need to occur at the both macro and micro-economic levels through structural economic change and changes in infrastructure and technology, and through the adoption for new technologies and techniques. Clean technologies that integrate environmental factors into the design and application of products and processes progressively replace technologies synonymous with end-of-pipe pollution control and tackle pollution problems at source. Therefore, the national government should guide the local government to implement recycling program and organize public, businesses, NGOs and other relevant stakeholders to promote 3Rs activities for sustainability solid waste management. Involvement from different actors such as NGOs, academics, consultants provides legitimacy, opens inflexible bureaucracies, brings in new ideas, and increases provider willingness to innovate¹³.

The Concept of Local Agenda 21 Plan and the Transformation of the Role of Local Governments:

Agenda 21 is a comprehensive plan adopted as the framework for achieving sustainable development in the 21st century at the Earth Summit in Rio de Janeiro in 1992. Chapter 28 of Agenda 21 proposes Local Agenda 21 (LA21). LA21 is a decentralized initiative that focuses on the role of local governments in the implementation of sustainability programs within a country. The implementation of Local Agenda 21 (LA21) seen as an opportunity to include people in planning for sustainability at local level. The study argues that the Local Agenda 21 address the institutional dimension of ecological modernization theory which is the important of the role government to deliver sustainable policy and development. This section examines the Local Agenda 21 and the role of local government to deliver sustainability of solid waste management in Malaysia. In the case of Malaysia, the government response to the implementation of Agenda 21 is reflected in the Seventh Malaysia Plan (1996-2000), which provides an in-depth treatment of the issues of concern identified

in the Agenda (7th Malaysian Plan 2000). Local Agenda 21 initiative specifically recognized the role of governments, as 'the level of governance closet to the people' and communities in delivering sustainable development policy¹⁶.

The survey shows that about 75% of the respondents do not understand the concept of Local Agenda 21, whereas only 25% understand the concept (Table 1). The survey also shows that most departments of local authorities were still in the early stage of planning for Local Agenda 21. All but one is at the level of 'not yet decided to produce an action plan'. The one that has given some attention to producing an action plan is Department of licensing, Urban and social services, but details have not been decided. However, the preparation of action plans by all departments is generally slow. It is suggested that the reason for this is the legitimacy of Local Agenda completion of planning activities of Local Agenda 21 pilot project at national level. This pilot project has been initiated but is yet to be completed. The result of the pilot project will serve as a guideline to all local authorities in the country.

From the findings it was concluded that most decision-makers in local authorities were less knowledgeable about complex issues of sustainable development and were expressing low concern with regard to behavior or value for environmental awareness, this highlights the essential point of the preparedness and their contribution in meeting the challenge of sustainable development. Local authority staff should be made available to be sent for retraining in aspects related to solid waste management and their specialized jobs to keep them abreast of the latest developments. Hence, this would be suggesting that general training activities among the decision makers in order to enhance the capacity building. (Table 3) As a result from the fact that most departments of local authorities are still at the level of not having decided to produce an action plan of Local Agenda 21 planning, the above suggestions for training would also encourage the formulation of local action of Agenda 21. Further they have to work in a long- term, open and integrated fashion, in order to enable the innovation capacity building for the economic sphere⁶.

Table 3: Capacity Building Activities for Local Authorities Decision Makers¹⁶

Format of Training	Objectives	Goals
National conference	<ul style="list-style-type: none"> ● To assess the country’s issue and situation ● To raise environmental political awareness 	<ul style="list-style-type: none"> ● To develop national legislation and policy for the ‘emergency’ adoption of Agenda 21’
Technical meeting/ workshops	<ul style="list-style-type: none"> ● To draft technical documents for political endorsement and follow up 	<ul style="list-style-type: none"> ● To develop plans and procedures for Local Agenda 21 management.
Inter-district/state workshops	<ul style="list-style-type: none"> ● To raise awareness ● To standardize locally relevant approaches ● To consolidate experience ● To clarify needs and draft projects for political endorsement 	<ul style="list-style-type: none"> ● To strengthen institutional and human resources for the management.
Technical meeting	<ul style="list-style-type: none"> ● To identify relevant message and appropriate audiences and media 	<ul style="list-style-type: none"> ● To develop programs for public education, awareness and community participation
Workshops	<ul style="list-style-type: none"> ● To draft plans of local action for political endorsement and follow up ● To plan for community mobilization 	<ul style="list-style-type: none"> ● To develop programs for public education, awareness and community participation
Technical meetings/ workshop at country and inter country levels	<ul style="list-style-type: none"> ● To identify available indicators ● To facilitate networking ● To identify sources and systems ● To make compatible parallel system 	<ul style="list-style-type: none"> ● To promote the collection, analysis and dissemination of information related to ‘global’ actions

Issues and Problem Dealing with Solid Waste Management in Malaysia⁸: The study found that the policy on the appropriate development of closed landfill sites, long-term monitoring of pollution generated from landfill sites and strict enforcement of pollution from active landfill sites owned by local councils are not clearly defined and adhered to. Despite the degradation of valuable land resources and creation of long-term environmental and human health problems, uncontrolled open dumping is still prevalent in most developing countries⁵ which indeed desperately need an immediate action due to the associated harmful impacts. Moreover, in South and Southeast Asia, more than 90% of all landfills are non-engineered disposal facilities.

Waste experts comment; The landfill required a proper set-up—a carefully selected location and soil which is of clay-like texture that has minimum permeability to prevent underground water contamination. On the other hand, the landfill should also be properly engineered in accordance with geological and hydro geological requirements”.

However, during this study it was observed that human resources and expertise in waste management was lacking in most of local authorities in Malaysia. There have not enough staff to implement sustainability method for solid waste management in their local area. Therefore, the number of expertise staff and training in waste management within the local authorities needs to be increased if waste management plans are to be implemented in the future. According to the survey, solid waste management requires large financial resources. In Malaysia, the expenditure for managing solid waste is around 40 to 50 percent for larger councils and more than 50 percent for smaller councils. Since solid waste management was not one of the priority tasks for most local councils until recently, its financial management was relatively inefficient.

From the survey found that the major issues and problems in managing solid waste management in Malaysia are due to inadequate resources and absence

of national level policy and guidelines for allocation of resources for SWM. Under ecological modernization theory, the state is seen in a variety of roles and capacities for example as the enabler for markets that help produce the technological advances via competition. In some cases, the state seen as an institution that is incapable of addressing critical local, national and global environmental problems. A more recent development in the ecological modernization literature has been the emergence of civil society as a key agent of change³. Thus, the national government should encourage more investment by industry and private company involve in solid waste management. In terms of engaging economic imperatives, the idea is to harness market forces and steer them in a direction that encourage eco-efficiency. This start with internalising the externalities of environmental damage (e.g. making the polluter pay for the damage done) but moves on the creating substantive incentives for both consumers and investors to support greener firms^{4,9,10,2}. In this new green market, a healthy environment is seen as essential for a healthy economy.

CONCLUSION

The survey among local authorities in Malaysia shows that solid waste management has a low priority within the local authorities causing mismanagement of existing resources and a lack of formal planning. Consequently, there is lack of expertise, inadequate equipment and untrained staff with minimal education in waste management. Despite these shortcomings, the local authorities require technical and financial resources in order to improved solid waste management in Malaysia. In fact, inadequate support from decision-makers of local authorities raises the question whether smaller or less advanced local authorities will have the capacity and capability to assume new roles to meet the new challenges. There also seems to be problems with translating excellent policies at the national level into actions on the ground. Thus, National policy of solid waste management in Malaysia is not successful to deliver sustainability agenda. In the context of Solid Waste Management, analyzing sustainability of solid waste is a complex task but an important agenda in order to achieve national policy goals. The ability of its proponents to achieve real and positive impacts on social and environmental conditions will also require the practice of democratic values, cooperation of

stakeholders and implementation of supportive national government framework for sustainable development.

Religious Integration among Counselling Practicum Students

Mazidah Mohd Dagang¹, Raja Zirwatul Aida Raja Ibrahim¹, Azlina Abu Bakar Mohamad²,
Siti Nazilah Mat Ali¹

¹Lecturer, Psychology and Counseling Department, School of Social and Economic Development, University Malaysia Terengganu, Malaysia; ²Lecturer, Faculty of Human Development, Universiti Pendidikan Sultan Idris, Malaysia

ABSTRACT

This paper attempts to explore the level of religious integration in counselling practicum among practicum students in public university. 173 practicum students from three public universities were involved in this study and questionnaires were sent by post to the selected sample. Descriptive analysis (percentage, mean and standard deviation) and inferential (t-test) was used to analyze the data. Research finding shows that the religious integration among counselling practicum students are moderate. Based on the findings of the study, the recommendations made are standard training and constant exposure on the integration of religious understanding in the practice of counselling should be established to improve the competency level of spirituality and religiosity among counselling practicum students.

Keywords: Religious integration, Counselling, Practicum

INTRODUCTION

The term ‘Religious Counselling’ in general refers to the counselling services using religious approach both in terms of philosophy, goals, processes, procedures and problem-solving approach². The *ACA Code of Ethics* also obligates counselors as:

“They must learn during their professional education to respect the importance of spirituality and religion in the lives of clients and how to incorporate that respect in their practice”.

It is pertinent to identify relevant issues and concerns that surround the fundamental propositions of value systems, spirituality, morality, and use of religion⁶. Religion should be included in the counselling process, because it act as a guidance for client to forsee their problems in life¹⁵. Secondly, religion plays major influence in determining client’s cultural identity²³.

Thirdly, religion is one of the component in multicultural setting¹⁸. And finally, religion can assist exploration and problem solving in the counselling process⁸. Religious and spiritual is also seen as a key component that affects clients in terms of physical, social, emotional and intellectual²². As asserts as follows:

Culture is where religion happens; religion is located within human culture. Religion has emerged within the cultural phase of evolution. What does religion do—what is it for?—in the cultural realm? It is a primary force for the organization of consciousness and therefore for the worldviews and values and decisions that drive culture. Religion is above all concerned with what the natural world can become—its possibilities. Religion’s adaptive success in strengthening individual psyches and mobilizing group spirit flows from its vision of what the world can become¹¹.

Therefore, religion should be included as one of the components evaluated in the counselling process as other aspects such as physical, social, emotional and intellectual.

In United States for example, in the field of counselling, religious and spiritual issues are often avoided⁸. Most of the counselling theories that were used today are more focused on the behaviour and cognitive

aspect without any indicator of religions or spiritual in it²¹. The transition of acceptance to the spirituality element has begun since the separation of Alfred Adler and Sigmund Freud¹⁷.

LITERATURE REVIEW

Recently, spirituality has received increased attention in the counselling field since 1990 when a conference on this issue was held in 1995 which resulted of ninth components of counsellor competencies on the integration of this type of counselling, and both spirituality and religion have been acknowledged as important aspects of multiculturalism¹⁵. The role of spiritual and religious beliefs is mentioned throughout the Standards of the Council for Accreditation of Counseling and Related Educational Programs (CACREP), and guidelines for working with spiritual issues within various cultural paradigms are emerging. In addition, the American Counseling Association's *Code of Ethics and Standards of Practice* now includes religion as a component of human diversity, and spiritual concerns are included as a V-code in the *Diagnostic and Statistical Manual of Mental Disorders*⁶.

The results of their study also showed counsellors inclined to engage in that aspect and they view it as a minor issue in people's lives²⁹. Most counsellors have their own views about religion, but they are not so keen to discuss this with the client¹². These factors are likely to occur due to lack of religious elements in their clinical training. A study conducted found that the majority of counselling or counselling psychology programs do not contain or contain few subjects related to religion¹³. The findings also stated that as a whole, the counselor is not very conversant with religious issues raised by the client. Only 45.3 percent of counselors who participated in this study stated that religious or spiritual element is essential or very important in counseling programs. Religious is not seen as something negative in counselling eventhough most of the curriculum only exposed limited knowledge on this issue.

Counsellors are also practically not prepared to utilize the spiritual and religious elements in their practice because they did not receive adequate formal training in spiritual and religious aspects. Based on a survey conducted by CACREP found that less than 25 percent of the programs offered have courses related to spiritual and religious aspects. The majority of programs

offered also do not have the relevant supervisory aspects³. Therefore, they proposed a complete course-related aspects of spiritual and religious counselling should be developed, enhanced and given emphasis so that counsellors have adequate exposure on this issues. This study attempts to explore the level of integration of religious understanding among counselling practicum students in public universities.

STATEMENT OF PROBLEMS

Religious and spiritual aspect has not been seen as one important aspect of cultural diversity. Review have been made to show that only four universities that offer courses related to religion and it also focused on Islam. Although there are subjects such as multicultural counselling and ethnic relations, but the question arises, are these subjects contain competent spiritual and religious aspects, and whether the knowledge and training acquired during the program of study is sufficient to enable them to integrate an understanding of religion in handling counseling session. A counsellor can be considered unethical if they practice counselling services outside the realm of competence as stated in the ACA Code of Ethics 2005 under the professional responsibility (c.2.a)¹. The Code of ethics from Malaysia Counselling Association¹⁴ also states that counsellors should provide counselling services in your area of expertise with did not cross-border expertise based on education, training and supervised experience. Therefore, studies related to the integration of Religious Understanding in counselling practice in Malaysia are very limited.

OBJECTIVES

The specific objectives are as follows:

1. To describe the level of integration of religious understanding among counselling practicum students
2. To identify whether there are differences based on gender in the integration of religious understanding.

METHODOLOGY

The researcher employed a survey method to conduct test and answer the questions and hypotheses

of the study. This method was selected because it has the ability to describe the issues and problems in a variety of perspectives that involve attitudes, opinions, beliefs, feelings, behaviors and perceptions¹⁰. This research involves a form of nominal, ordinal and interval data. Descriptive statistics such as mean, percentage, standard deviation and inferential statistics will be used to analyze and explain the questions and hypotheses of the study.

The subjects for this study consisted of 173 counselling practicum students from three public universities. The type of sampling chosen was purposive sampling. The instrument used in this study was a questionnaire consisting of two parts. Part A is the items intended for respondents' demographic information. In this section also included a closed question on the suitability of the course taken in terms of to know whether the respondents' opinion of the respondents felt that the course or program of study counselling once they follow the institutions of higher learning sufficient to enable them to integrate an understanding of religion in their counselling practice. Part B consists of questionnaire on The Integration of Religious Understanding in counseling practice. This questionnaire has 31 items with a five-point scale developed by the researchers based on previous literature review. From the reliability analysis using Cronbach Alpha model shows that the questionnaire has high reliability which is .97. Data obtained from the questionnaires were analyzed using descriptive analysis (means and percentages) and inferential analysis (t-test) to describe the findings. Overall, the data were analyzed using SPSS version 20.

RESULTS AND DISCUSSION

The highest proportion of 173 respondents is Malay and Muslim. The majority of respondents are 24 years old. Detailed as shown in Table 1.

Table 1: Demographic Distribution of Respondents

Demography	Category	Frequencies	Percentage
Age	23 years	18	10.4
	24 years	119	68.8
	25 years	25	14.5
	26 years	7	4.0
	27 years	2	1.2
	28 years	1	0.6
	29 years	1	0.6

Conted...

Gender	Male	36	20.8
	Female	137	79.2
Race	Malay	159	91.9
	Chinese	8	4.6
	Indian	3	1.7
	Indigenous	3	1.2
	Sabah and Sarawak	1	0.6
	Others		
Religions	Islam	159	91.9
	Hindu	3	1.7
	Buddha	7	4.0
	Christian	5	2.4

The mean for the integration of religious understanding is the average level is 3.45 with a standard deviation of 0.83. Items with the highest mean was for item 5, which discusses religious values (e.g.: patient, forgive yourself and others, responsible) deemed appropriate by the issue or problem brought by the client. These items mean score is 4.23 with a standard deviation of .84. Items that showed the second highest mean is item 22 which discuss those things happened for a reason with the mean value and standard deviation 4.17 and .92. Items that showed the third highest mean score was item 19 (suggested prayer or prayer as a means to achieve peace) with a mean standard deviation of 4.06 and 1.00. Next item with the lowest mean value (M = 2:27, SD = 1.14) was item 15 which talk about religion even if the client professes different religions. Items that showed the second lowest mean score (M = 2.72, SD = 1.17) was item 30 (the use of the text of religious scriptures as a reference in client problems). Items that have a third lower mean scores is item 1, (M = 2.77, SD = 1:42), which began counseling sessions with a prayer organized by the religion you belong to, if the client belong to that religion.

To answer the second research question, the results showed no significant differences in scores between men (M = 3:39, SD = 0.71) and women (M = 3:46, SD = 0.77); $t(173) = 0.60$, $p > .05$. Consequently, the null hypothesis is accepted for demographic factors.

Table 2: Results of t-Tests Based on Gender Differences

t-Test		M	SP	t	df	p
Gender	Male	3.39	.71	.53	171	.60
	Female	3.46	.76			

The findings indicated that the integration of religious understanding in counseling practicum students is moderate. This indicates practicum trainees include religious beliefs, religious and faith-based intervention in the process of counseling moderately. This shows that the majority of counsellors integrate implicit understanding that religious beliefs and religious values apply indirectly when conducting counselling sessions. There is distinguished differences between implicit and explicit integration to incorporate beliefs, values and interventions based on the teachings of the counseling process²³. Implicit integration occurs when a counsellor indirectly initiates discussion about faith and religious values in counselling.

The explicit integration is a more open approach to integrate an understanding of religion. It is where counsellor directly and systematically discussing religion and faith-based interventions applied as prayer, worship and read scripture in the counselling process. The approach implicitly and explicitly conceptualized as a continuum between the two ends²³. Some counsellors tend to integrate an understanding of religion implicit, partly explicit and partially integrate between implicit and explicit. One example of methods of integration between the two continuum occurs when a counsellor discuss issues brought by the client in a religious perspective, but not systematically applying interventions such religious worship or prayer as an alternative client efforts to address the problem.

The counsellors take the initiative to introduce a religious element in counselling sessions conducted by discussing the positive values of religion as intolerant, forgiving oneself and others and take responsibility in their actions. It is stated that even though there are numerous religions in the world, the moral principles and values are similar towards the betterment and spiritual well-being of its adherents²⁰.

Empirical evidence through research that has been conducted shows that spiritual values help clients the ability to address the problem, help healing the mental and physical well-being of the client as well as encouraging the client lives¹⁷.

In addition, the values held by counsellors influence every phase of the counselling process is carried out starting from the philosophy and theory of personality, strategy evaluation, the goal of the session, the selection

of techniques and interventions, and evaluation of counseling sessions⁴. Next, the client is also influenced by the values held by counsellors⁵. The proper approach employed by counsellor in order to insert religious values in the counselling process is minimal explicit approach²⁰.

It occurs when firstly; counsellor is conscious and clearly understood the values of religious belief. Secondly, they will not affect clients well being eventhough there are disagreement among them. Thirdly, counsellor informs client that their belief will affect their life in terms of physical, emotional and spiritual. Finally, the counsellor assists the client to access resources and religious values to help clients towards the development and reach their life goals. This method can be used to avoid the uneasiness the counselors felt that religion is an unethical approach in the counseling process²⁰.

CONCLUSION

This study is expected to be a catalyst for more research related to religious understanding that integration has provided counselling services to the community in Malaysia will be more efficient and effective when integrated spiritual and religious issues in the practice of multicultural counseling. This is no doubt due to religious and spiritual factors play an important role in the formation of a client living culture. And hopefully if both aspects are taken into account in helping clients address the problems and issues faced by the more holistic approach will provide a shift towards a more positive note in the client's life. Both of these domains should be given equal attention by counsellors to offer counseling services provided will give the desired results and will improve the quality of counselling services.

RECOMMENDATIONS

1. Based on the results of the study, the following recommendations are given to improve the integration of understanding religious and spiritual competence among registered counsellor in Malaysia: Exposure given to the counsellor either through courses or programs organized by responsible parties such as higher education institutions that offer counseling programs, Malaysian Counselling Association (PERKAMA International) and the Board of Counselors.

2. Further research should also be conducted to obtain more information about spiritual counsellor competencies and determine what other factors affecting the level of integration of religious understanding among counsellors.
3. Referral sources should be increased to enable the counselor to obtain information and knowledge related to the integration of religious understanding and competence in the practice of spiritual counselling.

Mediating Effect of Enterprise Risk Management on Quality Communication and Performance of Malaysian Public Higher Educational Institution: A Conceptual Framework

Ummu Ajirah Abdul Rauf¹, Nusaibah Mansor¹, Juhaini Jabar¹

¹Lecturer, Centre of Technopreneurship Development (CTeD), Faculty of Technology Management and Technopreneurship, Universiti Teknikal Malaysia Melaka (UTeM), Malaysia

ABSTRACT

Enterprise Risk Management (ERM) was introduced many years ago and currently implemented by many countries as well as organizations due to positive impact, especially in their performance. Besides, it is an approach that is useful to help organization in order to manage the risks for better outcome. In Malaysia, it was first implemented around ten years ago and the organizations are recommended to use it as a tool or basis to recover any potential risks. ERM is believed as an effective technique to manage the risk and is fast becoming the best practice standard. Therefore, the factors that influence ERM implementation in organization should be taken into consideration. Hence, the aim of this paper is to construct a conceptual framework that describes the relationship between quality communication and organizational performance. This relationship will mediate by ERM implementation. The area of this paper will be focus on Malaysian Public Higher Educational Institution (IPTA), which are 20 institutions that listed under Ministry of Higher Education (MOHE).

Keywords: *Enterprise risk management, Quality communication, Knowledge management, Performance, Educational institution, Malaysia*

INTRODUCTION

Higher education is recognized for pioneering and leading trends, exploring new knowledge, promoting new ideas, and transforming innovation that can be turned successfully and practically to business, industry and community. However, it is far behind business and industry in developing and implementing a practical and sustainable enterprise risk management (ERM). The National Association of College and University Business Officers (NACUBO) released a report on managing risk in higher education in 2003 that encouraged higher education leaders to implement an advance effective risk management programs³².

In 2007, three leading higher education associations which are The University Risk Management and Insurance Association (URMIA), the Association of Governing Boards of Universities and Colleges (AGB) and the National Association of College and University Business Officers (NACUBO), have strongly recommended for an institutions of higher education to go beyond the mere discussion of ERM and start implementing it on their campuses. This is because, risks also occur at higher education institutions and they should consider risks as part of their strategic planning process³. Furthermore, ERM can be beneficial for universities in addressing key areas of risk that being faced by universities and manage the risks that lead to achieving the universities' key performance indicators^{11,32}. Thus, it can minimize the consequences of unfavorable events and will motivate the decision-making process to ensure specified organizational performances are met³⁴.

In Netherland, higher education institutions still do not routinely have an integrated policy related to risk management¹¹. In Malaysia, the introduction of University

Good Governance Index (UGGI) in 2011 requiring public universities to implement an organized risk management for it to get the autonomy status. Currently, in 2018, the last six of 20 public universities in Malaysia have finally been granted the autonomy status by Education Ministry. Before this, 14 public universities already have obtained their respective autonomous status¹⁹. However, operating in new environment after being awarded the autonomous status; these universities will be competing intensely in higher education market, which resulting in greater exposure to multi-dimensional risks²⁰.

The multi-dimensional risks involves uncertainty about future government funding, increasing number of post-graduate students, and the pursuit for high ranks in world university ranking, intense competition in getting quality of international students, and global competition. This provides a great challenge for the universities to explore a framework of risk management and organizational performance that is workable within these universities. Despite the existence of a rich literature in the fields of risk management, there is little written about risk management practices in relation to the provision of higher education³².

However, risk management as a formal part of the decision-making processes within companies is traceable during late of 1940 and early 1950⁸. This traditional risk management was practiced in “silo” approach in which risks are often handled individually without acknowledging the interrelationship of each risk. Meanwhile, ERM is about optimizing the process with which risks are taken¹⁶.

Apart from that, in 1990, organizations have started suffering spectacular losses often from risks that they never should have taken in the first place. Many companies throughout the world faced big losses in 1990s. For instance, Orange County (November 1994) lost \$1.7 billion, Barings Bank (February 1995) lost \$1.5 billion, Daiwa Bank (September 1995) lost \$1.1 billion and Sumitomo Corp (June 1996) was lost \$1.8 billion^{12,35}.

Therefore, nowadays, organizations across the world are applying ERM concept to deal with risks rationally and effectively^{9,18,27-28}. ERM is the series of process of risk identification, assessment and prioritization to handle uncertainties that arise in organization development. As a result, the performance measurement of an organization

has gained significant interest amongst both academics and practitioners²⁸.

Thus, most organizations would make sure that the performance measurement is done systematically and thoroughly²³. This is because organizations strive to sustain and improve performance in order to attract investment from the investors and maintain good relationship with their stakeholders. Previous study concur and suggested that in order to increase market share and attract investors, it is crucial for the organization to perform well and have a good track record of business performance²¹. However, today’s business environment has made it more difficult as risk has become the major factor in every business plans and decisions. Therefore, many organizations and stakeholders are showing more interest in risk management¹³.

Besides, a general argument that organizations employing the ERM will improve organizational performance has received a rising support¹⁰. The underpinning theory that supports this research is knowledge management theory. Knowledge management theory supports this research based on the fact that the implementation of ERM will help an organization to improve the performance as well as maximize shareholder value^{17,22}. Since no study has been carried out to address the extent of ERM implementation in higher education, particularly in Malaysia’s public autonomous universities status, this research gap must be filled.

This paper aims to propose a framework that contributes to a better understanding of ERM implementation by investigating the extent of implementation of ERM among Malaysian Public Higher Educational Institution. Thus, this paper will focused on the quality communication that extracted from Knowledge Management theory. Based on this, the objectives of this paper are as follows:

- (a) To examine the extent of ERM implementation among Malaysian Public Higher Educational Institution.
- (b) To establish the relationship between quality communication and organizational performance.
- (c) To investigate the mediating effect of ERM implementation on quality communication and organizational performance.

LITERATURE VIEW

Enterprise Risk Management (ERM): ERM is most frequently defined with reference to the 2004 guidance document Enterprise Risk Management-Integrated Framework published by the Committee of Sponsoring Organizations of the Treadway Commission (COSO) although there have been various definitions of ERM^{5,8,15}. ERM is defined as⁶:

“A process, effected by an entity’s board of directors, management and other personnel, applied in strategy setting and across the enterprise, designed to identify potential events that may affect the entity, and manage risk to be within its risk appetite, to provide reasonable assurance regarding the achievement of entity objectives”.

An evaluation of the various ERM definitions indicates that they share three important characteristics, in that ERM should be¹:

- (a) **Integrated:** ERM must span all the lines of business.
- (b) **Comprehensive/inclusive:** ERM must comprise all types of risk.
- (c) **Strategic:** ERM must Concorde with the overall business strategy and objectives of the organization.

Enterprise Risk Management (ERM) is one of the approaches that goes far beyond the silo-based view of risk¹⁰. It is a holistic approach in identifying possible risks that a firm would encounter and selecting appropriate responses that matches enterprise’s risk appetite.

Quality Communication and Organizational Performance: Communication may be defined as the giving, receiving or exchange of information, opinions or ideas by writing, speech or visual means or any combination of the three so that the material communicated is completely understood by everyone concerned³¹. Meanwhile, quality or effective communication is a process by which sender of message, received feedback from receiver in intended²⁴.

It was found that the effective communication helps in improving operational efficiency thus improving firm performance. The study recommended that organizations should develop effective communication strategies since

it will facilitate passing of information both within and outside the organization thus improving performance⁴.

The previous study was able to ascertain that effective communication have major role to play in organizational performance. Recognizing the causes of firm performance is important especially in the perspective of the current global crises because it helps an organization to identify those factors that should be given priority attention in order to improve the firm performance².

Besides, it was found that there was a significant relationship between effective communication and firm performance. Thus, it means that effective and efficient communication results in better overall firm performance. Meanwhile, ineffective communication leads to loss of meaning or understanding which in turn leads to mistakes. Success of an organization is a reflection of the effectiveness of its communication¹³.

Hypothesis 1: There is a positive relationship between quality communication and organizational performance

Quality Communication and Enterprise Risk Management: Knowledge sharing and effective communication depends on the overlap and amalgamation of knowledge bases among people³⁰. The flow of information for risk knowledge in an ERM context needs communication capacity between the different groups in risk management³³.

Knowledge sharing has an important influence on ERM implementation, and this goes even further²⁷. A lack of risk knowledge sharing can create issues in the ERM processes and the controls may not be enough. The search for reasons outside an isolated area or unit is important in order to get better answers. Lack of knowledge access can create failures. Weak communication can provide insufficient knowledge of the operation, poor assessments of the lessons learned and poor understanding of the present and forecasts based on risk knowledge. This lack of knowledge can be created because of interruptions in the flow of information, which is a component of the risk management work that is complemented and used properly by the expert²⁵.

The effective communication among groups can contribute towards the ERM implementation³⁶. Furthermore, effective communication plays a critical role in enabling the flow of risk information in a firm

which will enhance the ERM implementation in firms. Thus, the consequences of limited communication among groups can be a barrier to overcome for the holistic view that ERM needs to have⁷.

Hypothesis 2: There is a mediating effect of Enterprise Risk Management implementation on quality communication and organizational performance.

A PROPOSED FRAMEWORK

This paper will examine the extent of ERM implementation among Malaysian Public Higher Educational Institution.

Based on the literatures there are eight factors that were identified under Knowledge Management theory that contribute towards the extent of ERM implementation in an organization. These eight factors include quality communication. Therefore, this paper examined the relationship between quality communication and organizational performance and also the mediating effect of Enterprise Risk Management on this relationship.

The proposed framework for the research is shown in Figure 1.

Figure 1: Conceptual Framework

CONCLUSION

In conclusion, this paper attempts to propose a framework by explaining the mediating effect of ERM implementation on knowledge management theory in Malaysian Public Higher Educational Institution. This paper suggested one of a factor under Knowledge Management theory that influences the extent of ERM implementation which is quality communication and this in turn affect the performance of the organizations. There are two hypotheses that have been developed under the proposed framework and need to be tested empirically. This paper is intended to contribute to the existing body of knowledge in the ERM area. This paper also will provide an insight to relevant government agencies to

formulate new policies or strategies on matters pertaining to Enterprise Risk Management in Malaysia. Since this is a conceptual paper, it is subjected to some limitations surrounding similar conceptual academic works.

ACKNOWLEDGEMENT

The researchers would like to thank Universiti Teknikal Malaysia Melaka for the UTeM Zamalah Scheme for sponsorship and Centre of Technopreneurship Development (CTeD) for assistance in conducting this research.

Medical Diagnosis Based on IOT using Arduino

U. Sadhana¹, P. Haritha¹, P. Preeti Prasada¹

¹Assistant Professor, Department of CSE, Geethanjali College of Engineering and Technology, Cheeryal, Keera

ABSTRACT

In this paper the Internet of Things using arduino has a great impact on healthcare sector. The doctor and patient communicate with each other. The doctor can access the patient's pulse rate and temperature values through the web page and the message is sent to the patient. The patient can know the condition of normal/abnormal. If patient condition was abnormal immediately precautions have to be taken^[1]. It mainly focuses on healthcare Sensors used in the IOT such as temperature and Pulse rate Sensor.

Keywords: Internet of Things, arduino, Pulse Rate, Temperature Sensor.

INTRODUCTION

Internet of Things (IOT) has a great impact on today's world to incorporate several technologies and communication solutions. Smart health monitoring system is based on improving quality of human life and wireless sensors are placed on the body of patients in order to monitor their health condition.

The sensor gives us data like body temperature and pulse rate of a person. The data can be retrieved when an authorized persons requests for the same^[2]. The data gets on a web page and the result is obtained in a graphical format. To the arduino sensors and Ethernet cable network were connected to function the retain mobility for monitoring the patient. Smart Health monitoring system performs various measurable factors of the patient in hospital using the Internet of Things. Smart health monitoring system is based on the Internet of Things, the patient data sends to the cloud server stores on the particular channel. The data on the channel shows in the graph format even the data can be gets on the mobile app and the doctor can be gets it monitoring purpose anywhere in the place, even can alert the doctors signal goes down to particular level of the corresponding patient.

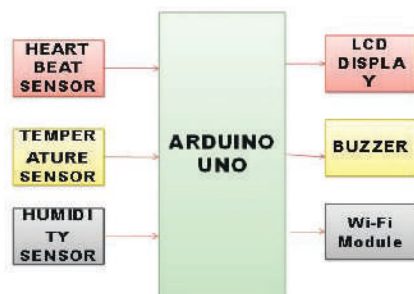

Fig. 1: Architecture of Smart Health monitoring System by using Arduino

PROSPECTIVE AND LITERATURE WORK

The following are the requirements for performing health monitoring system

Arduino: Arduino board gives digital and analog input/output pins can be interfaced and also to other circuits. To load the programs from computer to arduino board we use USB to function serial communication interface.

Breadboard: A Breadboard is used in learning of electronic devices used in connecting the components.

Pulse Rate Sensor: Pulse Rate Sensor sends the light signal on the finger then the blood circulation on the finger is not constant with respect to time sensor. It uses the infrared lights on the tissue, amplified signal displayed on the monitoring signal.

Temperature Sensor: It reads the temperature from the temperature sensor and plugging the output pin directly into an analog input.

Centigrade Temperature = $[(\text{analog voltage in mv} - 500)]/10$.

Thing Speak: Thing Speak channel used to update the data on the channel and even can be downloading on the mobile application to monitor the current status of the application.

IMPLEMENTATION AND IT'S RESULTS

In the present world, Health monitoring is the major problem due to lack of proper smart health monitoring

system. There are lots of IOT devices now a day to monitor the health of patient over internet^[4]. Health experts are taking advantage of these smart devices to help the patients. With tons of new healthcare technology start-ups, IOT is rapidly revolutionizing the health care industry.

In this paper, smart health monitoring system records the patient pulse rate and body temperature. It also sends an SMS alert whenever the patient condition was abnormal. The Sensor are recorded on Things Speak and google sheets so that patient health can be monitored from anywhere in the world via internet. A panic will also be attached so that patient can press it on emergency to send SMS to their relatives.

Fig. 2: Patient Health Monitoring System based on IOT using Arduino

LM35 represents a linear temperature sensor. Its output is proportional to the temperature in degree Celsius. The temperature ranges from -55° C to 150° C. The output voltage varies by 10mv in every rise or fall in temperature. It can be operated from 5V as well as 3.3 V power supply.

Fig. 3: LM35 Temperature Sensor

Pulse Rate sensor designed for plug-and-play sensor for Arduino. It includes an open source monitoring app that graphs your pulse in real time. The front of the sensor is covered with heart shape logo. On the front you see a small round hole where LED shines from the back^[5]. There is a small square just under the LED. The square is an ambient light sensor. The LED shines light into finger print and sensor reads the amount of light that bounces back. This is how it calculates the heart rate.

Fig. 4: Pulse rate Sensor

Code for Arduino to create a Temperature Sensor

int SensorPin=0 //the analog pin is connected to 3.3V or 5V power supply

void setup () // this function runs when you turn your arduino board and connected to the computer by using cable.

```
{
  Serial. begin (); //the result on the monitor
}
```

```
Void loop () // to run and run over again
```

```
{
  int reading=analogRead (SensorPin)
```

```
// Voltage reading from temperature sensor
```

```
float      temperature=[(voltage0.5)*100Serial.
print(temperature);
```

```
Serial.println (“temperature in centigrade”);
```

```
// prints the temperature in Centigrade.
```

```
delay (1000); // waiting for 1000 ms
```

```
}
```

Fig. 5: Graphs of sensor Output

CONCLUSION

In this paper the Internet of Things is slowly influencing on healthcare sector includes both the doctor and patient. The doctor can access the patient's pulse rate and body temperature values through the webpage and message is sent to the patient. It mainly focused on health sensors such as Temperature and pulse rate sensor.

In future we can add GPS in IOT patient health monitoring system using Arduino UNO. You will find out the location of the patient by using GPS. In this way the doctor can find out the location of the patient in case they have to take precautions.

Call for Papers / Article Submission

The editor invites scholarly articles that contribute to the development and understanding of all aspects of Public Health and all medical specialities. All manuscripts are double blind peer reviewed. If there is a requirement, medical statistician review statistical content. Invitation to submit paper: A general invitation is extended to authors to submit papers papers for publication in IJPHRD.

The following guidelines should be noted:

- The article must be submitted by e-mail only. Hard copy not needed. Send article as attachment in e-mail.
- The article should be accompanied by a declaration from all authors that it is an original work and has not been sent to any other journal for publication.
- As a policy matter, journal encourages articles regarding new concepts and new information.
- Article should have a Title
- Names of authors
- Your Affiliation (designations with college address)
- Abstract
- Key words
- Introduction or back ground
- Material and Methods
- Findings
- Conclusion
- Acknowledgements
- Interest of conflict
- References in Vancouver style.
- Please quote references in text by superscripting
- Word limit 2500-3000 words, MSWORD Format, single file

All articles should be sent to: editor.ijphrd@gmail.com

CALL FOR SUBSCRIPTIONS

About the Journal

Print-ISSN: 0976-0245 **Electronic - ISSN:** 0976-5506, **Frequency:** Monthly

Indian Journal of Public Health Research & Development is a double blind peer reviewed international Journal. The frequency is **Monthly**. It deals with all aspects of Public Health including Community Medicine, Public Health, Epidemiology, Occupational Health, Environmental Hazards, Clinical Research, Public Health Laws and covers all medical specialities concerned with research and development for the masses. The journal strongly encourages reports of research carried out within Indian continent and south east Asia.

The journal has been assigned international standards (ISSN) serial number and is indexed with Index Copernicus (Poland). It is also brought to notice that the journal is being covered by many international databases.
