ECONOMIC CONSEQUENCE OF SOCIAL AND ENVIRONMENTAL CONCERN IN ISLAMIC BANK – DO COVID-19 PANDEMIC MATTER?

--Manuscript Draft--

Full Title:	ECONOMIC CONSEQUENCE OF SOCIAL AND ENVIRONMENTAL CONCERN IN ISLAMIC BANK – DO COVID-19 PANDEMIC MATTER?
Manuscript Number:	COGENTBUSINESS-2023-1134
Article Type:	Research Article
Keywords:	corporate social responsibility expense; environmental concern; economic consequence; covid-19 pandemic
Manuscript Classifications:	50.6.2.11 Environmental Economics; 50.6.3 Finance; 50.6.4 Business, Management and Accounting
Abstract:	Islamic banks should care about social and environmental issues. However, the economic consequence of social and environmental concerns is still being debated. This study aims to prove the role of economic consequences of social and environmental concerns and market competition on financial performance. Moreover, this research aims to examine the role of the covid-19 pandemic in the relationship between social and environmental concerns and market competition on profitability. The research sample was 14 full-flagged IBs in Indonesia, with observations from 2009 to 2021. The results showed that social and environmental concerns and market competition did not affect financial performance. Therefore, the covid-19 pandemic plays a major role in the extent to which social and environmental concerns affect profitability

Dear Asrori Asrori,

Thank you for your submission.

Submission ID	237326196
Manuscript Title	ECONOMIC CONSEQUENCE OF SOCIAL AND ENVIRONMENTAL CONCERN IN ISLAMIC BANK – DO COVID-19 PANDEMIC MATTER?
Journal	Cogent Business & Management
Article Publishing Charge (APC)	USD \$1270.00 (plus VAT or other local taxes where applicable in your country)

**APC only payable if your article is accepted*

You can check the progress of your submission, and make any requested revisions, on the [Author Portal](#).

Thank you for submitting your work to our journal.
If you have any queries, please get in touch with **OABM-peerreview@journals.tandf.co.uk**.

For any queries relating to your APC, please get in touch with APC@tandf.co.uk

Kind Regards,
Cogent Business & Management Editorial Office

21 Mei 2023. Review artikel Economic Consequence of Social and Environmental Concern In Islamic Bank – Do Covid-19 Pandemic Matter? Manuscript Doi: 10.1080/23311975.2023.2225818.

37326196 (Cogent Business & Management) A revise decision has been made on your submission

External

Dear Asrori,

Your manuscript entitled "ECONOMIC CONSEQUENCE OF SOCIAL AND ENVIRONMENTAL CONCERN IN ISLAMIC BANK – DO COVID-19 PANDEMIC MATTER?", which you submitted to Cogent Business & Management, has now been reviewed.

The reviews, included at the bottom of the letter, indicate that your manuscript could be suitable for publication following revision. We hope that you will consider these suggestions, and revise your manuscript.

Please submit your revision by Jun 20, 2023, if you need additional time then please contact the Editorial Office.

To submit your revised manuscript please go to <https://rp.cogentoa.com/dashboard/> and log in. You will see an option to Revise alongside your submission record.

If you are unsure how to submit your revision, please contact us on OABM-peerreview@journals.tandf.co.uk

You also have the option of including the following with your revised submission:

* public interest statement - a description of your paper of NO MORE THAN 150 words suitable for a non-specialist reader, highlighting/explaining anything which will be of interest to the general public

* about the author - a short summary of NO MORE THAN 150 WORDS, detailing either your own or your group's key research activities, including a note on how the research reported in this paper relates to wider projects or issues.

* photo of the author(s), including details of who is in the photograph - please note that we can only publish one photo

If you require advice on language editing for your manuscript or assistance with arranging translation, please do consider using the Taylor & Francis Editing Services (www.tandfedittingservices.com).

Please ensure that you clearly highlight changes made to your manuscript, as well as submitting a thorough response to reviewers.

We look forward to receiving your revised article.

Best wishes,

Collins G. Ntim, PhD
Senior Editor`Cogent Business & Management

Reviewer 2: Recommendations/Results of Article Review

1. The grand theory must be described briefly in the abstract.
2. In the abstract section, it is also necessary to briefly describe the methods and techniques of data collection used.
3. Each keyword should be present or mentioned in the abstract description.
4. In the introduction section, it is necessary to emphasize the description of the research objectives. This section also needs to strengthen the theoretical and practical gap related to implementing Corporate Social Responsibility (CSR). For example, the implementation of CSR is still limited to a mere formality to abort obligations.
5. Request a statistician to evaluate the methodology of this study and confirm the quantitative data of the research findings.
6. In the conclusion section, it is necessary to strengthen suggestions or recommendations from the research results and emphasize the theoretical and practical implications of the research results.

Comments to the author
Reviewer 3: The COVID-19 pandemic has created an economic crisis ranging from weak industrial output to severe market competition across the globe
The pandemic has also affected environmental sustainability adversely and disrupted economic activities worldwide
The author must put the implication:
what are the implications of the study's findings for IBs in Indonesia?

Comments to the author

Reviewer 5: This article provides bold information. Indeed, there are a few flaws in the methodology, but this can be forgiven. However, this article should have been published to awaken readers in Indonesia about the novelty of the findings of this study.

Comments to the author

Reviewer 7: First, the finding that ICSR does not affect profitability is actually to be expected because almost all CSR research has found no effect on profitability. However, that Covid-19 moderated ICSR in influencing profitability would oversimplify the problem if only using dummy variables. So it is not clear exactly what is meant by Covid-19. Time? Incident? community response to Covid-19? or IB response to Covid-19. Therefore it is not clear what exactly in Covid-19 then moderated ICSR.

Furthermore, the results of this study are meaningless. So how can ICSR affect profitability? By entering a new moderating variable (in this case, Covid-19), IB should understand how to use the CSR program economically. So that after Covid-19, IBs have a better understanding of how ICSR should be carried out to have a better effect.

The second thing that should be noted is the use of regulations. The Indonesian government issued Law No. 40 of 2007, which is not accurate, should use newer regulations:

1. Government Regulation No. 47 of 2012 concerning the Social and Environmental Responsibility of Limited Companies
2. OJK Regulation No. 51/POJK.03/2017 concerning the Implementation of Sustainable Finance for Financial Services Institutions, Issuers, and Public Companies

On this basis, it is better to explain Qardh's position in the ICSR because, in the regulatory context, the beneficiary is not obligated to return the funds. In contrast, the Qardh contract requires the beneficiary to return without additional costs. So that the characteristics of Qardh should be explained so as not to cause misunderstandings for those who do not understand contracts in Islamic finance.

Editor's Comments:

Thank you for submitting your paper for consideration for publication in ACGBE section of Cogent Business and Management. I sent your paper to two reviewers' and they have suggested that your manuscript requires further revisions. I have read the paper myself, and I agree that you should be given the opportunity to revise and resubmit your paper for consideration. I will not repeat the reviewers concerns and suggestions here, but please you should endeavour to address them. In addition, please address the following issues that I would like you to effect before resubmitting:

1. Your current structure is messy and so please re-structure paper as follows: 1. Introduction, 2. Background, 3. Theoretical literature review, 4. Empirical literature review and hypotheses development, 5. Research design, 6. Empirical results and discussion, and 7. Summary and conclusion. Please you must re-structure your paper according this comment 1, which will involve substantial revisions to your work. To reduce wasting the time of reviewers, yours and mine, if this suggestion is not followed, then, the paper may be rejected without any further review, and so please kindly take this comment seriously.

2. Introduction: Please clarify your research questions, objectives, background motivation, theoretical and empirical motivation and the lines of contributions to the literature. You can do

this by sharply articulating your research questions/objectives, identify the potential theoretical, background and theoretical motivation or gaps, and explain how your study contributes to the literature. You can do this by highlighting the weaknesses of prior studies as well. Currently, your introduction is very dry. Additionally, you need state clearly the contributions of the paper. For example, “Consequently, the current paper seeks to make the following contributions to the existing literature. First,..., Second,..., Third, ..., Fourth,... and so on”. The introduction should be about 5 pages long.

3. Background – you need to explain why this is the appropriate context to conduct this study by exploiting regulatory, reform and policy issues and developments within the research context or setting. This should be about two to three pages long.

4. Theoretical framework - Please an overarching theoretical framework that will explain the underlying predictions and hypotheses of interest. In doing so, please explicitly outline how they help link the dependent and independent variables together by drawing on both seminal (old) and recently (newly) published studies. This should be about two to three pages long.

5. Literature review and hypotheses Development – please enhance your hypotheses by: (i) drawing on the theory; (ii) empirical literature; (iii) research setting/contextual insights; and (iv) then setting up your hypotheses. You will do this for each hypothesis. Currently, you have not developed your hypotheses in this way. You will need to so by drawing on both seminal (old) and recently (newly) published studies.

6. Research design – Please identify, classify and explain your variables – dependent, independent and control variables, as well as any others, such as moderating or mediating variables. Please also explain your sample selection clearly (insert a table tabulating the steps - how many was missing, many had data, how many selected and why) and also clarify in a normative way how the variables are operationalised. Similarly, explain your sample in a tabular form, outlining step by step the total population to the selection of the final sample. Label all your equations, figures and tables in a consecutive manner. Make the tables self-contained by clearly identifying dependent, independent and control variables in the tables.

7. Empirical findings – please link your findings more strongly to the: (i) theory, (ii) empirics, (iii) context; and (iv) highlight their economic, academic/research and policy implications. Closely link up and cite the papers that you have discussed in the background, theory and empirical literature review & and hypotheses development section to the findings you are presenting here.

8. Conclusion – Please outline a summary of findings, contributions, implications, limitations and avenues for future research. Especially, expand the discussions relating to implications, limitations and avenues for future research.

9. Robustness or additional analyses – please demonstrate how your findings are to alternative measures (e.g., different ways of measuring the key dependent and independent

variables), estimations (e.g., lagged structure, and instrumental variables estimation, amongst others) and general endogeneities. This is completely missing.

10. Typos – please there are considerable number of typos, spelling errors and grammatical mistakes throughout the paper that a careful reading will help you to eliminate them. Seek professional proof-reader's help if deemed appropriate. Improve presentation by clearly labelling equations, tables, sections and subsections.

11. In order to build on this line of research in the ACGBE of Cogent Business and Management, please identify at least 3 appropriate and relevant papers from ACGBE and cite to support your arguments. Also, these five papers are directly relevant in terms of the recommended structure and content, consider citing and drawing insights to support your analysis: (i) Al-Bassam et al. (2017) The effect of Islamic values on voluntary corporate governance disclosure: the case of Saudi listed firms. *Journal of Islamic Accounting and Business Research*, 8 (2), 182-202. (doi:10.1108/JIABR-09-2015-0046); (ii) Elamer et al. (2020) Islamic governance, national governance, and bank risk management and disclosure in MENA countries. *Business & Society*, 59 (5), 914-955. (doi:10.1177/0007650317746108); (iii) Elamer et al. (2019a) Sharia supervisory boards, governance structures and operational risk disclosures: evidence from Islamic banks in MENA countries. *Global Finance Journal*, [100488]. (doi:10.1016/j.gfj.2019.100488); (iv) Elamer, et al. (2019b) Impact of multi-layer governance on bank risk disclosure in emerging markets: the case of Middle East and North Africa. *Accounting Forum*, 42 (2), 244-281. (doi:10.1080/01559982.2019.1576577); and (v) Elghuweel et al. (2017) Corporate governance, Islamic governance and earnings management in Oman: a new empirical insights from a behavioural theoretical framework. *Journal of Accounting in Emerging Economies*, 7 (2), 190-224. (doi:10.1108/JAEE-09-2015-0064).

12. Please follow the ACGBE section of the Cogent Business and Management author guidelines. For example, re-write your abstract to follow ACGBE section of Cogent Business and Management guidelines. In the same, follow the beer guidelines regarding referencing, tables, equations, heading and subheadings and so on in type-setting your work.

13. Please kindly take these 12 comments seriously and endeavour to fully address them in addition to the reviewers' comments. Please prepare a point-by-point detailed response to the reviewers' comments as well as mine and highlight all changes in the colour yellow in the main manuscript.

I hope you will positively embrace these constructive suggestions as a way of taking this research forward, and I look forward to receiving a revised version of your paper.

Best regards
Collins Ntim, PhD, ACGBE Senior Editor

Faculty of Economics and Business, Universitas Negeri Semarang, Indonesia

¹⁾asroriunnes@mail.unnes.ac.id

Abstract

Islamic banks should care about social and environmental issues. However, the economic consequence of social and environmental concerns is still being debated. This study aims to prove the role of economic consequences of social and environmental concerns and market competition on financial performance. Moreover, this research aims to examine the role of the covid-19 pandemic in the relationship between social and environmental concerns and market competition on profitability. The research sample was 14 full-flagged IBs in Indonesia, with observations from 2009 to 2021. The results showed that social and environmental concerns and market competition did not affect financial performance. Therefore, the covid-19 pandemic plays a major role in the extent to which social and environmental concerns affect profitability.

Keywords: corporate social responsibility expense, environmental concern, economic consequence, covid-19 pandemic

1. Introduction

Islamic bank (IB) is a bank that operates using Islamic law (shariah), which is based on the Qur'an and Sunnah. Al-Qur'an has revealed 675 verses in 84 chapters throughout all 30 parts of the Qur'an, with environmental content relating to the core components of the natural world, including human beings, water, land, plants, animals, and other natural resources (Helfaya et al., 2016). In addition, (Mukhibad et al., 2019) added that in Islamic teaching, there are the concepts of *Hablum Minallah* and *Hablum Minannas* which posit that humans must have good vertical relations (humans with God) and good horizontal relations (humans with other humans and nature). Rizk (2014) appointed the concept of *khalifa*, or guardian of the planet Earth that every man and woman inherit the power and responsibility in relation to the planet and all its life forms. From this argument, a good Islamic should care for social and environmental concerns.

Commented [A1]: The COVID-19 pandemic has caused economic disruption at an unprecedented speed and scale
The pandemic has had a negative impact on stock returns of both conventional and Islamic banks due to COVID-19 and social distancing policies
The severity of the current pandemic has shaken economies and policymakers around the world
The present study proposes Islamic finance as a potential tool to help affected economies safely pass through the economic crisis resulting from the pandemic
Islamic finance can help during different stages of COVID-19
Impact investing, which is private investment prioritizing businesses with social and environmental concerns, is more urgent than ever due to the pandemic
The COVID-19 pandemic has played a role in the comparative analysis of conventional banking and Islamic banking profitability, and the result indicates that Islamic banking is more affected by the external condition (COVID-19) than conventional banking
How has the COVID-19 pandemic affected the profitability of Islamic banks?
What is the response of Islamic financial services to the COVID-19 pandemic?
How can Islamic finance help during the economic crisis resulting from the pandemic?

Commented [A2]: The economic consequences of social and environmental concerns are still being debated, but these studies suggest that there is potential for Islamic banks to positively impact society and the environment while also improving their financial performance.
what are some examples of sustainability practices in Islamic banks?
how do Islamic banks prioritize environmental impact in their operations?
what are the benefits of social reporting by Islamic banks?

Commented [A3]: In Islamic teaching, there are two concepts that posit that humans must have good vertical relations (humans with God) and good horizontal relations (humans with other humans and nature). These concepts are known as *Hablum Minallah* and *Hablum Minannas*. Additionally, Rizk (2014) appointed the concept of *khalifa*, or guardian of the planet Earth, which suggests that every man and woman inherit the power and responsibility in relation to the planet and all its life forms. From these arguments, it can be concluded that a good Muslim should care for social and environmental concerns. The achievement of the goal *hablum minallah* (relationship with God), *hablum minannas* (relationship with humans), and *hablum minal 'alam* (relationship with nature) should be considered in Islamic education
how can the concept of *khalifa* be applied to environmental conservation efforts?

Meanwhile, a review of the general literature emphasizes that corporations do not only focus on profit. The company's operations have a negative impact on the environment and, in the long run, will further affect business continuity. From the perspective of legitimacy, companies must conduct business according to firm gain legitimacy by conforming to societal norms and values, such as ethical standards, legal requirements, and environmental responsibilities. They also gain legitimacy by engaging in social and environmental initiatives that benefit the community and the environment. This is the reason that corporate social responsibility (CSR) is a major concern of all three researchers, the business people, and the government.

Regulators from various countries set regulations to increase corporate awareness of CSR. The Indonesian government issued Law No. 40 of 2007, which mandated that companies allocate 2% of their net profit to social and environmental activities. In IBs in Indonesia, the regulator has adopted a policy that IBs care about CSR. Our identification, the fatwa of the National Shariah Council of the Indonesian Ulama Council (DSN-MUI) number 17 /DSN-MUI/IX/2000 and 123/DSN-MUI/XI/2018 explain that loan penalty income and non-halal income obtained by Islamic entities must be issued as bank operating income and recognized as social funds. Then The standard-setting body in Indonesia (the Indonesian financial accounting standards board/Dewan Standar Akuntansi Keuangan) stipulates that shariah commercial entities issue reports on the statement of sources and distribution of zakah fund and statement of sources and uses of *qardul hasan* fund. These two financial reports describe the receipt and distribution of social funds, including zakah (Islamic tax), loan penalty income, non-halal income, etc.

Previous literature on CSR performance evaluation can be summed up in two approaches: disclosure of CSR activities and CSR expense. However, previous studies on social performance in IB put more emphasis on disclosure performance and were limited to social fund distribution performance (see Ahmed & El-belihy, 2017; Amran et al., 2017; Bukair & Abdul-Rahman, 2013; Farook et al., 2011; Farook & Roman, 2007; Harun et al., 2020; Hassan & Harahap, 2010; Jusoh & Ibrahim, 2018). CSR performance studies on IBs in Indonesia also focus on disclosure-based CSR performance (see Handayati et al., 2017; Mukhibad et al., 2022; Nugraheni & Khasanah, 2019; Probohudono et al., 2021; Qoyum et al., 2017). Researchers use a variety of factors, including corporate governance (Mukhibad et al., 2022; Bukair & Abdul-Rahman, 2013; Harun et al., 2020; Farook et al., 2011) and financial factors (Menassa & Dagher, 2019) to explain CSR disclosure performance. Other researchers proved the economic consequences of CSR disclosure on IBs (Alshurafat et al., 2022; Platonova et al., 2016).

Mukhibad & Setiawan (2020) and Mukhibad et al. (2017) measure CSR performance based on the expenditure of IB zakat funds. Mukhibad et al. (2017) use the corporate governance index, financing deposit ratio (FDR), and size factors as factors to explain financial performance (return on assets-ROA) and social performance. They found that the corporate governance index, FDR, and size had an influence on social and financial performance. Furthermore, Mukhibad & Setiawan (2020) complements previous research by using financial factors (leverage, capital adequacy ratio, non-performing loans, profitability) and corporate governance (shariah supervisory board-SSB, independence board of directors-BOD) to explain the distribution of social funds. They report that independent BOD and profitability had a positive influence on the distribution of social funds.

The heterogeneity of previous research models in explaining the social performance of IB is because there are indications that the IB has not focused on social performance as one of the performance targets. Recent studies indicate that IBs are not completely fulfilling their social role in accordance with

Commented [A4]: What are some examples of social and environmental activities that companies in Indonesia can allocate their net profit to? Are there any penalties for companies in Indonesia that do?

Islamic teaching (Farook et al., 2011). The study from Maali et al. (2006) suggests that IBs' CSR reporting falls short of the benchmark for entities whose operations are founded on Islamic principles. IBs use forms of financial instruments, both in mobilizing funds for their operations and in providing finance for their clients, that comply with the principles and rules of shariah. So, IBs required to pay the Islamic religious tax *zakah* provide more social disclosures than banks not subject to *zakah* (Maali et al., 2006).

CSR studies on non-religion-based entities also show that they have low social and environmental concerns, and there is still an ongoing debate about its economic consequences (Zhou et al., 2021). Studies of the economic consequence of social and environmental concerns on non-religion-based entities have been proven by many researchers and show that social and environmental concerns increase the corporate's financial performance (Alshurafat et al., 2022; Wang & Qian, 2011), reducing the cost of debt (El Ghouli et al., 2011; Chen et al., 2022), reducing asset price volatility (Chen et al., 2022), and reducing the firm risk (Zhou et al., 2021; Shih et al., 2021; Do, 2022). Positive economic consequences of social and environmental concerns help corporate gain sociopolitical legitimacy, obtain positive stakeholder responses (Alshurafat et al., 2022; Wang & Qian, 2011), and increase investor confidence (Chen et al., 2022).

Our studies contribute to expanding the existing literature in several important ways. **First**, this research proves the economic consequences of social and environmental concerns for IBs. IBs use Islamic law as the basis for bank operations emphasizing that IBs must have deep social and environmental concerns as a form of carrying out tasks from God (Farook et al., 2011). Islamic teaching teaches Muslims to take responsibility as God's representatives for the welfare of humans (*hablumminanas*) and nature (*hablumminal Alam*). Thus, the social and environmental concerns in Islam as a form of Worship.

Second, previous research that proves the economic consequences of social and environmental concerns focuses on companies in developed countries as research objects (Magnanelli & Izzo, 2017; Xue et al., 2023; Chen et al., 2022; Suganda & Kim, 2023; Dai et al., 2019; Hao et al., 2018; Servaes & Tamayo, 2013). This study uses a sample of IBs in developing countries where developed and developing countries have different cultures. Different cultures may also occur in the response of stakeholders in companies that have social and environmental concerns. This different setting from the culture and operations of the research sample allows different results from previous researchers.

Third, we use the observation period of the year the covid-19 pandemic occurred. This pandemic can increase company social and environmental concerns. However, the covid-19 pandemic has also caused a decline in sales due to limitations on the government taking policies to limit community activities. Accordingly, this research expands on previous references by providing evidence of the impact of the covid-19 pandemic on the economic consequences of social and environmental concerns.

The next section of this paper is the theoretical background and hypothesis development. In this section, the paper discusses the legitimacy theory and logical background of the relationship between social and environmental concerns and the corporate's financial performance. The third section presents the methods concerning samples, methods of measuring variables, and data analysis. The fourth section is the results of the research, and the fifth section is the discussion. The end of the paper explains the conclusions, theoretical and practical recommendations, and research limitations.

Commented [A5]: The authors must think about this matters: **What is the definition of legitimacy theory**
How is the relationship between social and environmental concerns and corporate financial performance explained by legitimacy theory?
What are the variables measured in the study?

Theory and Hypothesis Development

1.1. Social and Environmental Concern Theory

Despite the growth of literature on social responsibility in the context of IBs, few researchers have addressed the issue of the economic consequence of social and environmental concerns in the context of IBs. While several papers have explored CSR in Islamic institutions and banks, they have generally used CSR disclosure and lack empirical analysis of the CSR expense of Islamic organizations.

While there is a broad, commonly accepted definition of CSR, it generally refers to business decisions making linked to ethical values, compliance with legal requirements, respect for people, and involvement in social activities, communities, and the environment (Hassan & Harahap, 2010). Naylor (1998) defines CSR as the obligation of managers to choose and act in ways that benefit both the interests of the organization and those of society as a whole. By CSR, businesses can manage the economic, social, and environmental impacts of their operations. Based on this definition, CSR performance can be measured based on disclosure or CSR performance based on expense.

In the CSR literature, the former influence is related to systems-oriented theories such as political economy, legitimacy, and stakeholder theories (Farook et al., 2011; Deegan, 2002). Systems-oriented theories such as political economy, stakeholder, and legitimacy propose that individuals, institutions, and organizations seeking to preserve their own self-interest will attempt to operate and interact within the system through various relationships with other parties (Farook et al., 2011). The systems-oriented theories also emphasize that the actors (individuals, institutions, and organizations) in this system have the right to pursue their own goals and self-interests, and these rights to self-interest are moderated by the social and political environment in which the actors interact (Farook et al., 2011). The concept of unity (*Tawhid*) prevails in the Islamic paradigm. According to the *tauhid* concept, God is the creator, owner, and source of all things, and God has entrusted mankind to the use of resources. The trusteeship requires a total commitment to the will of God and therefore involves both submission and a mission to follow the Shariah in all aspects of life, including economic aspects (Farook et al., 2011). In Islam, the enjoyment of self-interest is only conditioned by the permanent needs of a greater society (*umma*). As such, individual freedom is sacred only as long as it does not conflict with the larger societal interest or as long as the individual does not transgress the rights of others and God's rules.

Similarly, the proponents of political economy, stakeholder, and legitimacy theories define the relationship between individuals, organizations, and society as a "social contract" (Farook et al., 2011; Deegan, 2002). Organizations themselves play a significant role in society and have responsibilities assigned to them based on their status in society. The implications of this concept, both managers and providers of capital, are accountable for their policies both inside and outside their firms; accountability in this context means accountability to the community to establish socio-economic justice within their own capacity. Some examples of this concept are the payment of religious taxes (*zakah*), philanthropic trusts (*waqf*), alms, charity (*infaq* or *sadaqa*), interest-free loans (*qardul-hassan*) (Hassan & Harahap, 2010).

In Islamic banking in Indonesia, the setters of accounting standards in Indonesia (Indonesian financial accounting standards board) issue additional annual reports that specifically apply to Islamic entities, namely statements of sources and distribution of zakat funds and statements of sources and distribution of *qardul hasan* funds. The statement of sources and distribution of zakat funds provides

Commented [A6]: what are some examples of CSR activities undertaken by Islamic banks
how do Islamic banks balance social and environmental concerns with financial performance
what are the challenges faced by Islamic banks in implementing CSR initiatives

information on the number of zakat funds received and distributed by IB. Zakat receipts can come from zakat on the bank's net profit, or professional zakat for employees and customers. The statement of sources and distribution of *qardul hasan* funds provides information on the *qardul hasan* funds received and distributed by IBs. *Qardul hasan* fund receipts come from loan penalty income, non-halalincome, *infaq* or *sadaqa* funds, etc. The *qardul hasan* fund is channeled in the form of bank social activities, and IBs can have a bank's flagship social program to channel this fund. Based on political economy, stakeholder, and legitimacy theories, IBs determine an effective program in realizing the social contract, improving bank reputation, increasing stakeholder trust, and further improving bank financial performance. This policy allows banks to be chosen because regulators do not have specific provisions that IBs must comply with in channeling *qardul hasan* funds, including when and the amount of *qardul hasan* funds distributed by banks.

1.2. Hypothesis

Based on a system-oriented view, the entity is assumed to be influenced by, and in turn, to have an influence upon, the society in which it operates (Deegan, 2002). Stakeholder theory basically operates on the assumption that banks need to manage their relationships with their stakeholders in order to exist in bank operations. Deegan & Blomquist (2006) recognize that, according to stakeholder theory, reporting on specific types of information can be used to attract or maintain particular groups of stakeholders. For example, suppose a powerful individual or group is interested in a firm's social or environmental activities. In that case, the firm's social and environmental concerns are essential to attract or maintain them.

Cragg (2002) shows that the disclosure of CSR values and objectives in corporate statements and goals enhances the appeal of the firm's shares to socially responsible investors. Moreover, Fombrun & Foss (2004) stated that CSR is a valuable tool for creating reputational capital in the form of a good corporate image and enhanced reputation, which affords the firm a competitive advantage. Literature has provided a lot of evidence of the economic consequences of CSR disclosure. Xue et al. (2023) state that CSR disclosure reduces information asymmetry between firm and stakeholders. CSR disclosure is a tool to facilitate the monitoring of managers by stakeholders outside the company, such as investors, creditors, consumers, debtors, etc., on the company's concern for economic, environmental, and social issues. Thus, CSR disclosure will increase investor interest in investing in the company and further reduce the cost of debt (Magnanelli & Izzo, 2017; El Ghoul et al., 2011; Goss & Roberts, 2011).

Legitimate view, the company's concern for social and environmental issues is a manifestation that banks have established their social contract with society. This is the main tool to improve the bank's reputation and will further increase customer loyalty. Thus, CSR spending can improve the bank's financial performance. This study links social and environmental concerns with financial performance on the grounds that the financial performance of a firm is driven by the company's fundamental performance, such as return on assets (ROA) and return on equity (ROE) (Horta et al., 2012).

H1: Social and environmental concerns have a positive effect on financial performance.

One of the big challenges for IBs to improve their performance is the factor of business competition, both with fellow IBs and conventional banks. Even though IBs have different types of products from conventional banks. However, Ismal (2011) and Aysan et al. (2018) reported that IBs customers tend to be rational and do not pay attention to the characteristics of IBs who provide shariah-compliant bank product services. This causes IB to be required to be able to compete with conventional

Commented [A7]: what is the social contract in the context of Islamic banking?
how do stakeholder theories apply to Islamic banking?
what is the role of *qardul hasan* funds in Islamic banking?

banks in providing banking services. Thus, market competition factors can affect bank performance (Yuanita, 2019).

Recent literature develops two opposite effects of market competition: fragile market competition and stable market competition (Louhichi et al., 2020). The competition-stability view implies that high competition promotes the financial performance of banks. High market power enjoys lower competition in the loan market which encourages them to set high-interest rates for borrowers (Noman et al., 2017). In contrast, the competition-fragility view assumes causing reduced bank performance because competition leads banks to become more fragile and erodes market power (Noman et al., 2017). Based on the Lerner index, Alshubiri (2022) note that LR has a significant negative impact on financial performance. Trinugroho et al. (2018) have provided evidence that bank margins are affected mainly by competition. In a less competitive market, IBs banks are able to set high margins which leads to increased financial performance.

H2: Market competition has a negative effect on financial performance.

The covid-19 pandemic that hit all countries caused a decline in economic performance fundamentally. The covid 19 pandemic caused increases and uncertainties, security prices, and reduced trust, causing financial markets to fall to their lowest point since the 2008–2009 global financial crisis (Makki & Alqahtani, 2023). This condition makes it difficult for the company to maintain sales and reduces the company's fundamental performance (Alsamhi et al., 2022). The covid 19 pandemic has caused a decrease in disbursed credit, a decrease in receipt of income from financing, and an increase in credit risk. Thus, the covid-19 pandemic causes a decrease in corporate performance (Makki & Alqahtani, 2023; Alsamhi et al., 2022).

Political economy theory, like a number of other theories such as legitimacy theory and stakeholder theory, is considered to be a system-oriented theory. According to Deegan (2002), political economy theory explicitly recognizes the power conflict that exists within society and the various struggles that occur among groups within society. Based on political economy theory, the reduced corporate performance due to the covid-19 pandemic has caused banks to adopt normative policies by increasing their social and environmental concern to improve bank image and customer loyalty. In difficult conditions, a good bank image causes banks to remain in demand by customers using banking transactions.

H3: The Covid 19 pandemic has caused social and environmental concerns to have a positive effect on financial performance.

H4: The Covid 19 pandemic has caused market competition to have a positive effect on financial performance.

2. Methods

The object of this research is 14 full-fledged IBs in Indonesia. This research used hand- collected data from annual reports over 14 years from 2009 to 2021 and produced 145 bank-year (unbalanced data). The unbalanced data method was chosen because there were several IBs spin-offs (separate from the parent bank) during the study period.

Commented [A8]: To mitigate the economic impact of COVID-19, countries may have room to cut policy rates, provide liquidity to solvent banks, and support financial, industrial, and monetary policies
how has the covid-19 pandemic affected the banking industry
what are normative policies adopted by banks to increase social and environmental concern
how does a good bank image affect customer loyalty

Table 1. The operational variables.

Variables	Abbreviations	Retained measure	References
Dependent variables			
a. Return on assets	ROA	$ROA_{i,t} = \text{net income}_{i,t} / \text{Total assets}_{i,t}$	(Louhichi et al., 2020)
b. Return on equity	ROE	$ROE_{i,t} = \text{net income}_{i,t} / \text{Total equity}_{i,t}$	(Louhichi et al., 2019)
Independent variables			
a. Social and environmental concerns	SEC	$SEC_{i,t} = (\text{distribution of zakat fund}_{i,t} + \text{distribution of } qardul\ hasan\ fund_{i,t}) / \text{Total assets}_{i,t}$	developed from literature
b. Market competition	LERNER	$Lerner_{i,t} = \frac{Price_{i,t} - MC_{i,t}}{Price_{i,t}}$ <p>Price $_{i,t}$ is the price of banking outputs for bank i at time t,</p> <p>MC $_{i,t}$ is the marginal cost for bank i at time t.</p> <p>Lerner index is averaged over time under the study for each bank i.</p> <p>Lerner takes values between 0 and 1. Scores tend toward 0, meaning a purely competitive market and no pricing power otherwise.</p> <p>Scores tend toward 1 means low competitive market, reflecting a high markup of price above marginal cost, a high markup of price above marginal cost, the banks have monopoly power, and the market power is increased.</p>	(Alam et al., 2019)
c. Pandemic covid-19 crisis	COVID	A dummy variable that takes the value of zero for the 2020 and 2021 years and one otherwise.	(Mukhibad et al., 2022)
Control variables			
a. Financing ratio	FINAN	$FINAN_{i,t} = \text{Total Financing}_{i,t} / \text{Total assets}_{i,t}$	(Majid et al., 2014)
b. Capital ratio	CAPITAL	$ROA_{i,t} = \text{Total Equity}_{i,t} / \text{Total assets}_{i,t}$	(Louhichi et al., 2019)

c. Non-performing financing	NPF	Impaired financing _{i,t} /Gross financing _{i,t}	(Louhichi et al., 2019)
d. Total assets	SIZE	Natural logarithm of total assets _{i,t}	(Louhichi et al., 2019)

Research data were analyzed using panel data analysis. The Langrang test and Hausman test will be carried out in this test to determine the recommended analysis method between random and fixed effects. The classic assumption test includes multicollinearity, heteroscedasticity, and autocorrelation tests. The multicollinearity test is carried out by testing the correlation between the independent variables and the variance inflation factor (VIF). The Wooldridge test is used to detect the presence of autocorrelation in the model, and the Wald test is used to detect the existence of heteroscedasticity problems in the model.

The following research equations were formed:
 $ROA_{i,t}$ or $ROE_{i,t} = \beta_0 + \beta_1 SEC_{i,t} + \beta_2 LERNER_{i,t} + \text{control}_{i,t,c} + \varepsilon$

$ROA_{i,t}$ or $ROE_{i,t} = \beta_0 + \beta_1 SEC_{i,t} + \beta_2 SEC * COVID_{i,t} + \beta_3 LERNER_{i,t} + \beta_4 LERNER * COVID_{i,t} + \text{control}_{i,t} + \varepsilon$

3. Results

3.1. Descriptive statistic

Table 2 describes that the average ROA score is 1.477%, the minimum score is -20.13, and the maximum score is 13.60%. The research sample has an average ROE of 10.215%, a minimum score of -32.040, and a maximum score of 94.010%. Table 2 also presents that IBs channel social funds on average 0.393% of total assets. However, there are IBs that do not distribute social funds.

Table 2. Descriptive Statistics

Variable	Mean	Std. Dev.	Min	Max
ROA	1.477	3.514	-20.130	13.600
ROE	10.215	16.019	-32.040	94.010
SEC	0.393	1.875	0.000	14.806
LERNER	0.093	0.178	0.003	0.983
FINAN	0.920	4.330	0.015	38.822
CAPITAL	0.279	0.739	0.019	6.013
NPF	3.736	5.171	0.000	43.990
SIZE	29.741	1.434	24.240	32.474
COVID	0.154	0.362	0.000	1.000

LERNER's average score is 0.093. LERNER's cores tend toward 0, meaning a purely competitive market and no pricing power otherwise. These results indicate that IBs in Indonesia face a competitive market. IBs in Indonesia face competition from fellow IBs and conventional banks.

Commented [A9]: What is the significance of the variance inflation factor (VIF) in the multicollinearity test
 How does the Wooldridge test detect autocorrelation in a model
 Can you explain the Wald test and how it detects heteroscedasticity in a model

Indonesia as a country with the largest Muslim population in the world, does not cause them to choose IB in using banking transactions. Mukhibad et al. (2020) reported that IBs in Indonesia have a large annual growth but have a low market share compared to other countries.

3.2. Regression analysis test

Table 3 presents the correlation scores between variables. The largest correlation score is 0.443 (SIZE and CAPITAL). Table 3 shows that the correlation between variables is lower than 0.8 and indicates no serious correlation in the model. The VIF test strengthens this conclusion because all models produce a mean VIF of less than 5.

Table 3. Matrix Correlation

	1	2	3	4	5	6	7	8	
ROA	1								
SEC	2	-0.051	1						
LERNER	3	-0.026	-0.034	1					
FINAN	4	-0.084	0.146	-0.419	1				
CAPITAL	5	0.027	0.322	0.079	0.276	1			
NPF	6	-0.423	0.045	-0.100	0.112	-0.047	1		
SIZE	7	0.016	-0.104	-0.234	0.109	-0.443	-0.021	1	
COVID	8	-0.025	-0.092	-0.096	-0.012	-0.051	-0.063	0.151	1

The results of the autocorrelation test using the Wooldridge test on all models yield a probability <0.05 and indicate autocorrelation problems in the model. The Modified Wald test is used to test the heteroscedasticity problem and produces a probability of all models less than 0.05 (Table 3) and indicates that there is a heteroscedasticity problem in all models.

The Hausman test is to determine whether the coefficients for the two estimates (fixed effect and random effect model) are statistically different. In this case, the random effects model is better for our case because the probability of this test ($\text{prob} > \chi^2$) is 0.99 for models 1 and 2, 0.77 for model 3, 0.96 for model 4) is greater than the threshold of 0.05.

Table 4 presents the results of the model test using random effects. Model 1 test results show that SEC has a coefficient of 0.020 and a p-value score of more than 0.10. The test results indicate that SEC has no influence on ROA. The test results show that LERNER has a coefficient of -0.108, p-value score is more than 0.10, and indicates that LERNER has no effect on ROA.

The impact of COVID on ROA produces a coefficient of -1.229 and a p-value of less than 0.05 (model 1). These results indicate that COVID has reduced bank profitability. This result is consistent with the model 2 result score coefficient of -1.690 and a p-value score of less than 0.05.

Model 2 is a regression test of the role of COVID on the relationship between SEC and LERNER on ROA. Table 4 shows that SEC has a coefficient score of 5,593 (p-value score less than 0.1), while SEC*COVID has a coefficient score of 13,070 (p-value score less than 0.1). These results indicate that COVID causing SEC has an influence on ROA.

Meanwhile, the results of model 2 shows that LERNER has a coefficient score of -0.845 (p-value score more than 0.1), while LERNER*COVID has a coefficient score of -0.267 (p-value score more than 0.1). These results indicate that COVID does not cause LERNER to influence ROA.

Model 3 is a regression test that use ROE as an indicator of a bank's financial performance. Model 3 results show that SEC has a coefficient of -0.189 (p-value score is more than 0.10), and LERNER has a coefficient score of -3.008 (p-value score is more than 0.10). The results of regression model 3 show that SEC and LERNER have no effect on ROE. However, the results of regression model 4 show that SEC has a coefficient of 3,509 (p-value score is below 0.05) and SEC*COVID has a coefficient of 8,495 (p-value score is below 0.01). The results of regression model 4 show that LERNER has a coefficient of 0.495 (p-value score is more than 0.1) and LERNER*COVID has a coefficient of -0.417 (p-value score is more than 0.1). The results of regression model 4 show that COVID causes SEC to have a positive effect on ROE. However, COVID did not cause LERNER to have any influence on ROE.

We present scores of coefficients and robust standard error. ***, **, * denote 1%, 5%, and 10% significance levels, respectively. Following (Hoechle, 2007), we use random-effect GLS regressions with robust standard errors to solve the problems of autocorrelation and heteroscedasticity. Hausman test result in p-value score of more than 0.05 recommend using random-effect GLS regressions.

4. Discussion and robustness test

4.1. Discussion

The results of this study (Table 4) provide empirical evidence that social and environmental concerns have no effect on ROA and ROE. These results indicate that bank spending for social and environmental activities of the bank, originating from zakat and *qardul hasan* funds does not affect bank profitability. This result is in accordance with the findings of Kesto (2017) and Schröder (2007) that CSR spending is not able to improve bank performance. This is also in line with the opinion of Friedman (2007) that CSR is served only for the personal benefit of managers to raise their reputation in society. In the systems-oriented theories approach, the bank's concern for social and environmental issues as seeking to preserve their bank interest, bank directors will attempt to operate and interact within the system through various good relationships with other parties (Farook et al., 2011). The bank's concern for social and environmental issues indicates that the bank has fulfilled the social contract. However, because society is not concerned about social and environmental issues, it causes society not to use social and environmental concerns as a basis for selecting banks. Following Joshi & Rahman (2015), consumers' social and environmental concerns emerged as the major determinants of consumer behavior to use bank products that care for social and environmental issues. Al Mubarak et al. (2018) report that customers perceive CSR activities as a major element when dealing with banks, and the corporate image is strengthened when banks adopt CSR activities.

The results of the regression test show that market competition has no effect on financial performance. IBs face tremendous pressure to maintain their performance. Regulators and stakeholders demand that IBs provide bank products in accordance with shariah, while providing competitive returns like their competitors. However, the investment instruments available on the market are not suitable for IBs because most investment instruments are not in accordance with shariah (Mukhibad et al., 2023). Based on a competition-stability view, high competition causes IBs to try to improve bank services and develop new products to increase customer satisfaction. This policy is to win the market competition and further promote the financial performance of the bank.

IBs in Indonesia have a number of assets that tend to be homogeneous and have a low percentage compared to conventional banks. Low total assets reduce bank economies of scale and affect the market structure as well as bank performance (Alshubiri, 2022; Yuanita, 2019). The homogeneity of the number of IB assets in Indonesia causes them to compete with each other. However, due to their low number of assets, their competition is not able to compete with conventional banks. Keep in mind that IB customers are mostly rational and emphasize economic motivation (see Ismal, 2011; Aysan et al., 2018). This condition causes market competition does not affect IB's financial performance.

The covid-19 pandemic moderation test (Table 4) on the effect of social and environmental concerns on financial performance shows that the covid-19 pandemic causes social and environmental concerns to have a positive effect on ROA (model 2) and ROE (model 4). The covid-19 pandemic has increased social and economic issues and, furthermore, reduced in purchasing power of society. This condition causes a reducing bank lending (Boubakri et al., 2023), it is difficult for banks to maintain performance income and reduces fundamental bank performance (Alsamhi et al., 2022) and profitability (Makki & Alqahtani, 2023; Alsamhi et al., 2022). The covid-19 pandemic caused an increased economic recession, social imbalance, and inequity, creating even more difficulties for society (Javier et al., 2021). The worsening social and economic problems of the community due to the covid-19 pandemic have increased the social and economic concerns of society. Society also demands corporate have a social and economic concern. The consumer's social and environmental concerns are the major determinants of consumer behavior in using bank products (Joshi & Rahman, 2015). Thus, the covid-19 pandemic causes social and environmental concerns to positively influence financial performance.

Commented [A10]: Overall, these studies suggest that CSR activities can positively influence customer behavior in the banking sector. Banks that prioritize social and environmental concerns may attract more customers who value these issues, which can ultimately strengthen their corporate image and reputation.
what are some examples of CSR activities adopted by banks
how do banks communicate their CSR activities to customers
how does CSR impact customer loyalty in the banking sector

The results of this study provide an alternative explanation of recent literature that appears to be rather inclusive of the effects of social and environmental concerns or CSR performance on financial performance (Nollet et al., 2016). According to Maqbool & Zameer (2018), community groups, consumers, investors, civil society, and other actors have deposited tremendous pressure on corporate people to adhere to social and environmental. Moreover, consumers' social and environmental concerns emerged as the major determinants of consumer behavior to use bank products that care for social and environmental issues (Joshi & Rahman, 2015). In the legitimacy theory and stakeholder theory social and environmental concern approach of banks in increasing bank compliance with social contracts (Deegan, 2002) where consumers' encouragement to comply with social contracts increased during the covid-19 pandemic. Thus, the influence of CSR performance on financial performance depends on consumer behavior concerned social and environmental issues.

Table 4 also reports that the covid-19 pandemic did not cause social and environmental concerns to ROA (2) and ROE (model 4). The covid-19 pandemic caused reduced bank lending (Boubakri et al., 2023) and the performance of IBs and conventional banks (Alsamhi et al., 2022). The crisis due to the covid-19 pandemic has not caused a change in market competition among banks. This is the reason the covid-19 pandemic has not caused a social and environmental concern to bank financial performance.

We present scores of coefficients and robust standard error. ***, **, * denote 1%, 5%, and 10% significance levels, respectively. Following (Hoechle, 2007), we use random-effect GLS regressions with robust standard errors to solve the problems of autocorrelation and heteroscedasticity. Hausman test result in p-value score of more than 0.05 recommend using random-effect GLS regressions.

4.2. Robustness Test

following Mukhibad & Setiawan (2022), we add income diversity variables in the model to the robustness test. We developed models 1a, 2a, 3a, and 4a as robustness tests, and the model test results are presented in Table 5. The results of the regression test in Table 5 show that social and environmental concerns and market competition do not affect ROA and ROE. However, the covid-19 pandemic moderated the impact of social and environmental concerns on ROA and ROE. The covid-19 pandemic has caused social and environmental concerns to have a positive effect on ROA and ROE. The research results in Table 5 corroborate the results of the main regression test of this study.

5. Conclusion

This study aims to prove the influence of social and environmental concerns and market competition on financial performance. We also examine the impact of the covid-19 pandemic on relations between social and environmental concerns on profitability as well as the relationship between market competition and financial performance. The results of the research show that in the context of IBs in Indonesia, social and environmental concerns have no effect on ROA and ROE. The research results also prove that market competition has no effect on ROA and ROE. The results of the moderation test show that the covid-19 pandemic has caused social and environmental concerns to increase ROA and ROE. However, the covid-19 pandemic did not cause market competition to have an impact on ROA and ROE.

The research results prove that the economic consequence of social and environmental concerns depends on society's social and environmental concerns. The covid-19 pandemic increases consumer's social and environmental concerns, encourages banks to care about social issues, and will further improve bank performance. Following the legitimacy theory and stakeholder theory view, society's social and environmental concerns will encourage banks to comply with social contracts and increase consumer behavior to use bank products.

This research contributes to this in two ways. First, we give evidence of the influence of the economic consequences of social and environmental concerns on financial performance that is still needs to be improved evidenced by previous studies. In a broader scope, studies on the economic consequence of social and environmental concerns on financial performance have mixed results. Second, previous research that proves the economic consequences of social and environmental concerns has focused on corporate in developing countries, especially Indonesia. The cultural differences may cause differences in the responses of stakeholders in corporate that care about social and environmental issues. Third, this study expands the literature on the economic consequences of social and environmental concerns during the covid-19 pandemic.

This research is used as a consideration in determining CSR performance for banks because, in the context of IBs in Indonesia, this performance does not positively impact financial performance. CSR performance can improve financial performance if consumer behavior uses bank products that care about social and environmental issues.

This research only uses the scope of IBs in Indonesia because only IBs in Indonesia are required by regulators to publish the statements of sources and distribution of zakat funds and statements of sources and distribution of *qardul hasan* funds as social activities reports. This

Commented [A11]: The COVID-19 pandemic has created an economic crisis ranging from weak industrial output to severe market competition across the globe
The pandemic has also affected environmental sustainability adversely and disrupted economic activities worldwide
The author must put the implication:
what are the implications of the study's findings for IBs in Indonesia?

research bases the social and environmental concerns of IBs based on these reports. Future researchers can adopt this research in another country by adjusting the rules set by the regulator.

PANDEMIC MATTER?

Cogent Business & Management

Dear Asrori Asrori,

I am pleased to tell you that your work was accepted for publication in Cogent Business & Management on Jun 11, 2023.

Please note: only minor, or typographical changes can be introduced during typesetting and proofing of your manuscript. Major changes to your manuscript will not be permitted.

For your information, comments from the Editor and Reviewers can be found below if available, and you will have an opportunity to make minor changes at proof stage.

Your article will be published under the Creative Commons Attribution license (CC-BY 4.0), ensuring that your work will be freely accessible by all. Your article will also be shareable and adaptable by anyone as long as the user gives appropriate credit, provides a link to the license, and indicates if changes were made.

Once the version of record (VoR) of your article has been published in Cogent Business & Management, please feel free to deposit a copy in your institutional repository.

Thank you for submitting your work to this journal, and we hope that you will consider us for your future submissions.

Best wishes

Collins G. Ntim, PhD

Economic consequence of social and environmental concern in Islamic bank – Do COVID-19 pandemic matter?

Asrori^{1*}, Hasan Mukhibad¹ and Ahmad Nurkhin¹

Abstract: Islamic banks should care about social and environmental issues. However, the economic consequence of social and environmental concerns is still being debated. This study aims to prove the role of economic consequences of social and environmental concerns and market competition on financial performance. Based on the system-oriented view, the entity is assumed to be influenced by, and in turn, to have an influence upon, the society in which it operates, including the crisis due to the COVID-19 pandemic, which had an impact on bank operations. Based on this argument, this research aims to examine the role of the COVID-19 pandemic in the relationship between social and environmental concerns and market competition on financial performance. This study uses hand-collected data on the annual reports of 14 full-flagged Islamic banks (IBs) in Indonesia between 2009 and 2021. Data were analyzed using GLS regressions with robust standard

ABOUT THE AUTHORS

Asrori is an associate Professor at the Department of Accounting, Faculty of Economics and Business, Universitas Negeri Semarang, Indonesia. His current research interests include Islamic Accounting, and Islamic philanthropy. He received his Ph.D. in Islamic economics from Walisongo State Islamic University, Indonesia, in 2022. Hasan Mukhibad is an associate Professor at the Department of Accounting, Faculty of Economics and Business, Universitas Negeri Semarang, Indonesia. His current research interests include Islamic Accounting, Islamic Finance, and corporate governance. Currently, he is editor and reviewer in many international journals. Ahmad Nurkhin is an associate Professor at the Department of Economics Education, Faculty of Economics and Business, Universitas Negeri Semarang, Indonesia. He is also a reviewer in some international and national academic journals. He is active in the organization profession of accounting and economic educator. His field of research is ICT and education, learning methods, information system, and accounting.

PUBLIC INTEREST STATEMENT

Islamic bank (IB) is a bank that operates using Islamic law (shariah), which is based on the Qur'an and Sunnah. IBs should care about social and environmental issues. However, prior literature on social performance in IB emphasized disclosure performance and was limited to social fund distribution. This study expands the existing literature. First, this research proves the economic consequences of social and environmental concerns for IBs. Second, we use the distribution of zakat fund and *qardul hasan* fund as social and environmental concerns of IB. This is because the standard-setting body in Indonesia stipulates that IBs issue reports on the statement of sources and distribution of *zakah* fund and statement of sources and uses of *qardul hasan*. Third, this research expands on previous references by providing evidence of the impact of the COVID-19 pandemic on the economic consequences of social and environmental concerns.

errors. This study showed that social and environmental concerns and market competition did not affect financial performance. Therefore, the COVID-19 pandemic plays a major role in the extent to which social and environmental concerns affect financial performance. The findings suggest that directors should increase the effectiveness of the distribution of social funds to improve financial performance.

Subjects: Environmental Economics; Finance; Business, Management and Accounting

Keywords: System-oriented view; environmental concern; economic consequence; Covid-19 pandemic; *qardul hasan funds*

1. Introduction

Islamic bank (IB) is a bank that operates using Islamic law (shariah), which is based on the Qur'an and Sunnah. Al-Qur'an has revealed 675 verses in 84 chapters throughout all 30 parts of the Qur'an, with environmental content relating to the core components of the natural world, including human beings, water, land, plants, animals, and other natural resources (Helfaya et al., 2016). In addition (Mukhibad et al., 2019), added that in Islamic teaching, there are the concepts of *Hablum Minallah* and *Hablum Minannas* which posit that humans must have good vertical relations (humans with God) and good horizontal relations (humans with other humans and nature). Rizk (2014) appointed the concept of *khalifa*, or guardian of the planet Earth that every man and woman inherit the power and responsibility in relation to the planet and all its life forms. From this argument, a good Islamic should care for social and environmental concerns.

Meanwhile, a review of the general literature emphasizes that corporations do not only focus on profit. The company's operations have a negative impact on the environment and, in the long run, will further affect business continuity. From the perspective of legitimacy, companies must conduct business according to firm gain legitimacy by conforming to societal norms and values, such as ethical standards, legal requirements, and environmental responsibilities. They also gain legitimacy by engaging in social and environmental initiatives that benefit the community and the environment. This is the reason that corporate social responsibility (CSR) is a major concern of all three researchers, the business people, and the government.

Regulators from various countries set regulations to increase corporate awareness of CSR. Regulations from the Indonesian government (OJK Regulation No. 51/POJK.03/2017) concerning the Implementation of Sustainable Finance for Financial Services Institutions, Issuers, and Public Companies oblige the company to issue a business continuity report where this report contains the company's contribution to creating sustainable economic growth by aligning economic, social and environmental issues. In IBs in Indonesia, the regulator has adopted a policy that IBs care about CSR. Our identification, the fatwa of the National Shariah Council of the Indonesian Ulama Council (DSN-MUI) number 17/DSN-MUI/IX/2000 and 123/DSN-MUI/XI/2018 explain that loan penalty income and non-halal income obtained by Islamic entities must be issued as bank operating income and recognized as social funds. Then the standard-setting body in Indonesia (the Indonesian financial accounting standards board) stipulates those Islamic commercial entities issue reports on the statement of sources and distribution of *zakah* fund and statement of sources and uses of *qardul hasan* fund. These two financial reports describe the receipt and distribution of social funds, including *zakah* (Islamic tax), loan penalty income, non-halal income, etc.

Prior literature on CSR performance evaluation can be summed up in two approaches: disclosure of CSR activities and CSR expense. However, previous studies on social performance in IB put more emphasis on disclosure performance and were limited to social fund distribution performance (see Ahmed & El-Belhy, 2017; Amran et al., 2017; Bukair & Abdul-Rahman, 2013; Farook & Roman, 2007; Farook et al., 2011; Harun et al., 2020; Hassan & Harahap, 2010; Jusoh & Ibrahim, 2018). CSR performance studies on IBs in Indonesia also focus on disclosure-based CSR performance (see

(separate from the parent bank) during the study period. Table 1 illustrates variables used for measuring dependent variables, independent variables, and control variables.

Data were analyzed using panel data analysis. The Langrang test and Hausman test will be carried out in this test to determine the recommended analysis method between random and fixed effects. The classic assumption test includes multicollinearity, heteroscedasticity, and autocorrelation tests. The multicollinearity test is carried out by testing the correlation between the independent variables and the variance inflation factor (VIF). The Wooldridge test is used to detect the presence of autocorrelation in the model, and the Wald test is used to detect the existence of heteroscedasticity problems in the model.

The following research equations were formed:

$$ROA_{it} \text{ or } ROE_{it} = \beta_0 + \beta_1 SEC_{it} + \beta_2 LERNER_{it} + control_{it,c} + \varepsilon$$

$$ROA_{it} \text{ or } ROE_{it} = \beta_0 + \beta_1 SEC_{it} + \beta_2 SEC * COVID_{it} + \beta_3 LERNER_{it} + \beta_4 LERNER * COVID_{it} + control_{it,c} + \varepsilon$$

6. Empirical results and discussion

6.1. Descriptive statistic

Table 2 describes that the average ROA score is 1.477%, the minimum score is -20.13, and the maximum score is 13.60%. The research sample has an average ROE of 10.215%, a minimum score of -32.040, and a maximum score of 94.010%. Table 2 also presents that IBs channel social funds on average 0.393% of total assets. However, there are IBs that do not distribute social funds.

LERNER's average score is 0.093. LERNER's cores tend toward 0, meaning a purely competitive market and no pricing power otherwise. These results indicate that IBs in Indonesia face a competitive market. IBs in Indonesia face competition from fellow IBs and CBs. Indonesia, as the country with the largest Muslim population country in the world, does not cause them to choose IB in using banking transactions. Mukhibad et al. (2020) reported that IBs in Indonesia have a large annual growth but have a low market share compared to other countries.

6.2. Regression analysis test

Table 3 presents the correlation scores between variables. The largest correlation score is 0.443 (SIZE and CAPITAL). Table 3 shows that the correlation between variables is lower than 0.8 and indicates no serious correlation in the model. The VIF test strengthens this conclusion because all models produce a mean VIF of less than 5.

The results of the autocorrelation test using the Wooldridge test on all models yield a probability < 0.05 and indicate autocorrelation problems in the model. The Modified Wald test is used to test the heteroscedasticity problem and produces a probability of all models less than 0.05 (Table 3) and indicates that there is a heteroscedasticity problem in all models.

The Hausman test is to determine whether the coefficients for the two estimates (fixed effect and random effect model) are statistically different. In this case, the random effects model is better for our case because the probability of this test (prob>chi2 0.99 for models 1 and 2, 0.77 for model 3, 0.96 for model 4) is greater than the threshold of 0.05.

Table 4 presents the results of the model test using random effects. Model 1 test results show that SEC has a coefficient of 0.020 and a p-value score of more than 0.10. The test results indicate that SEC has no influence on ROA. The test results show that LERNER has a coefficient of -0.108, a p-value score is more than 0.10, and indicates that LERNER has no effect on ROA.

Table 1. The operational variables

Variables	Abbreviations	Retained measure	References
Dependent variables			
a. Return on assets	ROA	$ROA_{i,t} = \text{net income}_{i,t} / \text{Total assets}_{i,t}$	Louhichi et al. (2020)
b. Return on equity	ROE	$ROE_{i,t} = \text{net income}_{i,t} / \text{Total equity}_{i,t}$	Louhichi et al. (2019)
Independent variables			
a. Social and environmental concerns	SEC	$SEC_{i,t} = (\text{distribution of zakat fund}_{i,t} + \text{distribution of qardul hasan fund}_{i,t}) / \text{Total assets}_{i,t}$	developed from literature
b. Market competition	LERNER	$Lerner_{i,t} = \frac{Price_{i,t} - MC_{i,t}}{Price_{i,t}}$ Price _{i,t} is the price of banking outputs for bank i at time t. MC _{i,t} is the marginal cost for bank i at time t. Lerner index is averaged over time under the study for each bank i. Lerner takes values between 0 and 1. Scores tend toward 0, meaning a purely competitive market and no pricing power otherwise. Scores tend toward 1 means low competitive market, reflecting a high markup of price above marginal cost, a high markup of price above marginal cost, the banks have monopoly power, and the market power is increased.	Alam et al. (2019)
c. Pandemic COVID-19 crisis	COVID	This classifies the year of observation during the COVID-19 pandemic era and others. The COVID-19 pandemic crisis is measured by a dummy variable that takes the value of one for the 2020 and 2021 years and zero otherwise.	Mukhibad, Yudo Jayanto, et al. (2022)
Control variables			
a. Financing ratio	FINAN	$FINAN_{i,t} = \text{Total Financing}_{i,t} / \text{Total assets}_{i,t}$	Majid et al. (2014)
b. Capital ratio	CAPITAL	$ROA_{i,t} = \text{Total Equity}_{i,t} / \text{Total assets}_{i,t}$	Louhichi et al. (2019)
c. Non-performing financing	NPF	$\text{Impaired financing}_{i,t} / \text{Gross financing}_{i,t}$	Louhichi et al. (2019)
d. Total assets	SIZE	Natural logarithm of total assets _{i,t}	Louhichi et al. (2019)

6.3. Discussion

The results of this study (Table 4) provide empirical evidence that social and environmental concerns have no effect on ROA and ROE. These results indicate that bank spending for social and environmental activities of the bank, originating from zakat and *qardul hasan* funds does not affect bank profitability. This result is in accordance with the findings of Kesto (2017) and Schröder (2007) that CSR spending is not able to improve bank performance. This is also in line with the opinion of Friedman (2007) that CSR is served for the personal benefit of managers to raise their reputation in society. In the systems-oriented theories approach, the bank's concern for social and environmental issues as seeking to preserve their bank interest, bank directors will attempt to operate and interact within the system through various good relationships with other parties (Farook et al., 2011). The bank's concern for social and environmental issues indicates that the bank has fulfilled the social contract. However, because society is not concerned about social and environmental issues, it causes society not to use social and environmental concerns as a basis for selecting banks. Following Joshi and Rahman (2015), consumers' social and environmental concerns emerged as the major determinants of consumer behavior to use bank products that care for social and environmental issues. Al Mubarak et al. (2018) report that customers perceive CSR activities as a major element when dealing with banks, and the corporate image is strengthened when banks adopt CSR activities.

The results of the regression test show that market competition has no effect on financial performance. IBs face tremendous pressure to maintain their performance. Regulators and stakeholders demand that IBs provide bank products in accordance with shariah while providing competitive returns like their competitors. However, the investment instruments available on the market are not suitable for IBs because most investment instruments are not in accordance with shariah (Mukhibad et al., 2023). Based on a competition-stability view, high competition causes IBs to try to improve bank services and develop new products to increase customer satisfaction. This policy is to win the market competition and further promote the financial performance of the bank.

IBs in Indonesia have a number of assets that tend to be homogeneous and have a low percentage compared to conventional banks. Low total assets reduce bank economies of scale and affect the market structure as well as bank performance (Alshubiri, 2022; Yuanita, 2019). The homogeneity of the number of IB assets in Indonesia causes them to compete with each other. However, due to their low number of assets, their competition is not able to compete with conventional banks. Keep in mind that IB customers are mostly rational and emphasize economic motivation (see Aysan et al., 2018; Ismal, 2011). This condition causes market competition to not affect IB's financial performance.

The COVID-19 pandemic moderation test (Table 4) on the effect of social and environmental concerns on financial performance shows that the COVID-19 pandemic causes social and environmental concerns to have a positive effect on ROA (model 2) and ROE (model 4). The COVID-19 pandemic has increased social and economic issues and reduced the purchasing power of society. This condition causes a reducing bank lending (Boubakri et al., 2023), it is difficult for banks to maintain performance income and reduces fundamental bank performance (Alsamhi et al., 2022) and profitability (Alsamhi et al., 2022; Makki & Alqahtani, 2023). The COVID-19 pandemic caused an increased economic recession, social imbalance, and inequity, creating even more difficulties for society (Clemente-Suárez et al., 2021). The worsening social and economic problems of the community due to the COVID-19 pandemic have increased the social and economic concerns of society. Society also demands that corporate have social and economic concerns. The consumer's social and environmental concerns are the major determinants of consumer behavior in using bank products (Joshi & Rahman, 2015). Thus, the COVID-19 pandemic causes social and environmental concerns to positively influence financial performance.

The results of this study provide an alternative explanation of recent literature that appears to be rather inclusive of the effects of social and environmental concerns or CSR performance on

financial performance (Nollet et al., 2016). According to Maqbool and Zameer (2018), community groups, consumers, investors, civil society, and other actors have deposited tremendous pressure on corporate people to adhere to social and environmental. Moreover, consumers' social and environmental concerns emerged as the major determinants of consumer behavior to use bank products that care for social and environmental issues (Joshi & Rahman, 2015). In the legitimacy theory and stakeholder theory social and environmental concern approach of banks in increasing bank compliance with social contracts (Deegan, 2002) where consumers' encouragement to comply with social contracts increased during the COVID-19 pandemic. Thus, the influence of CSR performance on financial performance depends on consumer behavior concerning social and environmental issues.

Table 4 also reports that the COVID-19 pandemic did not cause social and environmental concerns to ROA (2) and ROE (model 4). The COVID-19 pandemic caused reduced bank lending (Boubakri et al., 2023) and the performance of IBs and CBs (Alsamhi et al., 2022). The crisis due to the COVID-19 pandemic has not caused a change in market competition among banks. This is the reason the COVID-19 pandemic has not caused a social and environmental concern to bank financial performance.

6.4. Robustness test

Following Mukhibad and Setiawan (2022), we add income diversity variables in the model to the robustness test. We developed models 1a, 2a, 3a, and 4a as robustness tests, and the model test results are presented in Table 5. The results of the regression test in Table 5 show that social and environmental concerns and market competition do not affect ROA and ROE. However, the COVID-19 pandemic moderated the impact of social and environmental concerns on ROA and ROE. The COVID-19 pandemic has caused social and environmental concerns to have a positive effect on ROA and ROE. The research results in Table 5 corroborate the results of the main regression test of this study.

7. Summary and conclusion

This study aims to prove the influence of social and environmental concerns and market competition on financial performance. We also examine the impact of the COVID-19 pandemic on relations social and environmental concerns on profitability as well as the relationship between market competition and financial performance. The results of the research show that in the context of IBs in Indonesia, social and environmental concerns have no effect on ROA and ROE. The research results also prove that market competition has no effect on ROA and ROE. The results of the moderation test show that the COVID-19 pandemic has caused social and environmental concerns to increase ROA and ROE. However, the COVID-19 pandemic did not cause market competition to have an impact on ROA and ROE.

The research results prove that the economic consequence of social and environmental concerns depends on society's social and environmental concerns. The COVID-19 pandemic increases consumers' social and environmental concerns, encourages banks to care about social issues, and will further improve bank performance. Following the legitimacy theory and stakeholder theory view, society's social and environmental concerns will encourage banks to comply with social contracts and increase consumer behavior to use bank products.

These findings could help regulators IBs in Indonesia should give the necessary training, workshop, or expand socialization to improve society's social and environmental concerns. Consumers' social and environmental concerns emerged consumer behavior to use bank products that care for social and environmental issues. This behavior encourages the IBs' social and environmental concerns. Thus, mutually beneficial behavior occurs between the bank and society. For IBs, this result can be used as a basis for increasing the effectiveness of bank policies in channeling social bank funds (*zakah* and *qardul hasan funds*) and regardless of the rules. This policy is important so that the social and environmental concerns of Islamic banks have an impact on improving financial performance.

This research contributes to expanding prior literature in two ways. First, we give evidence of the influence of the economic consequences of social and environmental concerns on financial performance that still needs to be improved, evidenced by previous studies. In a broader scope, studies on the economic consequence of social and environmental concerns on financial performance have mixed results. Second, previous research that proves the economic consequences of social and environmental concerns has focused on corporate in developing countries, especially Indonesia. The cultural differences may cause differences in the responses of stakeholders in corporate that care about social and environmental issues. Third, this study expands the literature on the economic consequences of social and environmental concerns during the COVID-19 pandemic.

This research is used as a consideration in determining CSR performance for banks because, in the context of IBs in Indonesia, this performance does not positively impact financial performance. CSR performance can improve financial performance if consumer behavior uses bank products that care about social and environmental issues.

This research only uses the scope of IBs in Indonesia because only IBs in Indonesia are required by regulators to publish the statements of sources and distribution of zakat funds and statements of sources and distribution of *qardul hasan* funds as social activities reports. This research bases the social and environmental concerns of IBs based on these reports. Future researchers can adopt this research in another country by adjusting the rules set by the regulator.
