**Abstract:** The background of this research relates to the performance of teachers in engineering and technology vocational schools. About the main tasks carried out by a teacher, it is certainly not an exaggeration to say that the level of competence of a teacher determines the barometer of the quality of Indonesian vocational education. This study identifies and analyses the factors influencing vocational education, especially in engineering and technology. This study examines the factors that influence the management of learning by vocational schoolteachers in technology and engineering. The evaluation includes five key variables, namely work innovation, work ethic, teacher performance, management innovation, and learning management. The following section examines the methodology used to assess the variables and describes the sampling and data collection approach. The sampling technique used simple random sampling, at the research respondents were 30 teachers in 3 vocational schools in Semarang, Indonesia. A combination of factor analysis and regression analysis was used to analyse the data using second order PLS-SEM analysis. The measurement model entails assessing two key aspects: convergent validity and discriminant validity. The results show that work motivation is 63.9%, and work ethics is 28.2% positively affecting teacher performance. So, all  $H_a$  hypotheses are accepted, which shows a positive and significant influence of work motivation and work ethic on teacher performance. The subsequent predictive relevance (Q<sup>2</sup>) assessment revealed that the research model attained a Q<sup>2</sup> score of 0.446, surpassing zero. This outcome underscores the model's high predictive relevance. aggregate, our exogenous variables collectively account for 69.8% of the variance observed in the context of learning management found in Vocational Higher Schools in the field of technology and engineering, and this portion of variance is indeed considerable. Schools are expected to encourage work motivation and review the learning process from planning to implementation to improve teacher performance readiness.

## 1 Introduction

2 The current era of modernization and  
3 globalization demands a response to the growing  
4 competitiveness of various competitions (Taranov  
5 & Taranov, 2021). It is essential to equip each  
6 field with top-notch human resources. Among the  
7 crucial sectors requiring the utmost focus and  
8 priority is formal education provided by schools  
9 (Morris & Rohs, 2023). These institutions play a  
10 vital role in cultivating high-calibre human  
11 resources and achieving educational objectives for  
12 the betterment of the nation's well-being (Drigas,  
13 Mitsea, & Skianis, 2023; Gimbert, Miller,  
14 Herman, Breedlove, & Molina, 2023; Zebua &  
15 Chakim, 2023).

16 The role of the teaching profession is  
17 pivotal within the education process, serving as a  
18 crucial endeavour to nurture the nation's  
19 development and cultivate exceptional human  
20 resources (Zimmerman, Greenberg, & Weinstein,  
21 2023). Effective communication and interaction  
22 between teachers and students undoubtedly yield  
23 high-calibre educational outcomes. This success  
24 not only contributes to eliminating ignorance and  
25 underdevelopment but also serves as a yardstick  
26 for measuring the nation's advancement (Darling-  
27 Hammond, 2021).

28 This significant responsibility necessitates a  
29 teacher to exhibit professionalism. Furthermore,  
30 teachers must possess the adaptability to confront  
31 the diverse array of challenges that will arise in  
32 the future due to the impact of advancements in  
33 science and information technology (Alam, 2022).  
34 Teachers who comprehend their roles and  
35 responsibilities as teachers and mentors remain  
36 driven to continually evolve and progress as  
37 experts in their field (Kusumaningrum et al.,  
38 2018). Nevertheless, the capacity to  
39 independently advance into professionals isn't

40 universal among all teachers. As a result, teachers  
41 require assistance and guidance, which  
42 underscores the necessity for initiatives aimed at  
43 enhancing teacher professionalism (Philipsen et  
44 al., 2019).

45 Hence, there arises a necessity for a  
46 dedicated governmental or related institutional  
47 effort to foster and advance the teaching  
48 profession, coupled with the individual teacher's  
49 commitment to attaining professional excellence  
50 (Lasmanawati et al., 2021). It is needed to  
51 enhance the capabilities deemed superior in  
52 teachers, encompassing creative thinking,  
53 productivity, sound decision-making, problem-  
54 solving, adaptability in learning, collaboration,  
55 and self-management (Cidral et al., 2018). In  
56 addition, teachers must possess the ability to  
57 facilitate independent learning among their  
58 students through the execution of effective  
59 learning processes. This implies that each teacher  
60 should be equipped with proficient learning  
61 management skills.

62 Online learning technologies, one product  
63 of management innovation to improve the quality  
64 of the learning aspect, designed for generating,  
65 overseeing, and dispensing course materials are  
66 termed Learning Management Systems (LMSs)  
67 (Sabharwal et al., 2018; Turnbull et al., 2020).  
68 Within the prevalent digital landscape of today,  
69 LMSs assume a crucial function in enriching and  
70 streamlining the teaching and learning process  
71 (Turnbull et al., 2021). These systems not only  
72 facilitate the distribution of instructions and  
73 digital resources to enhance collaborative student  
74 learning but also empower teachers to concentrate  
75 on crafting purposeful pedagogical engagements  
76 (Zimmerman et al., 2023).

77 Studies focusing on the utilization of the  
78 LMS have been massively adopted. Raza and  
79 colleagues conducted a study to examine how

80 social isolation impacts students' behavioural  
 81 intention toward the use of a learning  
 82 management system, considering the moderating  
 83 influence of fear related to the Coronavirus (Raza  
 84 et al., 2021). Aldiab and collaborators conducted a  
 85 comprehensive review of various features present  
 86 in commercially accessible and extensively  
 87 utilized modern LMS systems, accompanied by a  
 88 comparative assessment (Aldiab et al., 2019).  
 89 Juhanak et al delved into the exploration of  
 90 students' interactions and behaviours in diverse  
 91 forms of online quiz-based activities conducted  
 92 within an LMS (Juhaňák et al., 2019). 136

93 Functioning as a pivotal instrument that  
 94 facilitates the implementation of learning  
 95 management strategies, the LMS stands out as an  
 96 innovative notably advantageous resource for  
 97 teachers. It serves as a robust means through  
 98 which teachers can seamlessly guide the learning  
 99 process and cultivate interactive engagement with  
 100 their students. However, amidst these benefits, it  
 101 is crucial to underscore that successful attainment  
 102 outcomes rely on the commitment of teachers as  
 103 an internal factor in observing fundamental  
 104 requisites. This commitment is paramount in  
 105 ensuring that the utilization of learning  
 106 management tools is executed in a manner that  
 107 harmonizes with the projected objectives and  
 108 expected results. 152

109 In general, the challenges faced by  
 110 vocational higher education: 1. Link and Match  
 111 with industry has not occurred as a whole: a.  
 112 Industry involvement in vocational  
 113 implementation is still very limited. Accreditation  
 114 of vocational institutions does not involve  
 115 industry; b. Unemployment of Vocational  
 116 graduates is 16.41% of total unemployment; c.  
 117 Industrial interest in collaboration with vocations  
 118 is limited. Tax incentives (PP. 45/2019) need to  
 119 be supplemented with meaningful engagement  
 120 incentives. 2. Facilities and Infrastructure a.  
 121 Practice support facilities are not optimal; b.  
 122 There is a need for additional industrial practice  
 123 places for students in several areas. 3. There are  
 167

not enough lecturers in vocational institutions:  
 Many Polytechnic lecturers have academic  
 backgrounds (70%) 4. The demographic bonus is  
 characterized by the number of people of  
 productive age being greater than the number of  
 people of non-productive age. These conditions  
 need to be utilized optimally to improve the  
 quality of human resources, competitiveness and  
 people's welfare. 5. Industrial revolution 4.0  
 which resulted in changes in the economy, jobs  
 and even society. Trends in automation and data  
 exchange in manufacturing technologies,  
 including cyber-physical systems, Internet of  
 Things (IoT), cloud computing and cognitive  
 computing. The government needs to respond to  
 this through courses and training programs that  
 can touch every corner of people's lives.

The contribution of this research is to  
 strengthen the revitalization of vocational  
 education. All educational institutions are  
 required to have cooperation and partnerships  
 with the industrial world, initially by building  
 industry trust in vocational education; 2.  
 Improving the quality and quality of human  
 resources in vocational education, including  
 lecturers/instructors based on industry needs; 3.  
 Develop curriculum, facilities and infrastructure,  
 learning patterns based on industry needs; 4.  
 Developing content for competency tests as well  
 as apprenticeships and placement of graduates in  
 collaboration with industry; 5. Changing people's  
 mindset that vocational education is more  
 interesting because it is applicable, one of which  
 is by implementing polytechnics as applied  
 universities.

## Conceptual Development

### Work Motivation

Organizational leaders always hope that their  
 employees can carry out the tasks given  
 efficiently and by expectations. When these tasks  
 do not go smoothly, it is necessary to understand  
 why. Is this problem caused by limited individual  
 abilities in completing tasks or a lack of support

168 or encouragement from superiors to their  
 169 subordinates? Etymologically, "motivation"  
 170 comes from the word "motive." Gerungan (2012:140)  
 171 explains that "motive" is a concept that  
 172 includes all factors, reasons, or impulses in  
 173 humans that encourage them to act. Kartono  
 174 (2010: 135) defines work motivation as "not only  
 175 related to financial needs, but also involves  
 176 rewards from the environment, personal  
 177 achievement, and social status which are abstract  
 178 social rewards." Mangkunegara (2013:94)  
 179 describes work motivation as "a condition that  
 180 influences, directs, and maintains behaviour  
 181 related to the work environment." In other words,  
 182 work motivation is a factor that motivates  
 183 individuals to perform specific actions in the  
 184 context of work. In this context, it is essential to  
 185 remember that a lack of work motivation can  
 186 result in individuals only giving minimal effort at  
 187 work. Work motivation is a crucial element in  
 188 understanding individual performance in  
 189 organizations because work motivation includes  
 190 providing encouragement, creating motives, and  
 191 influences that trigger specific actions. According  
 192 to Sri (2009), the term "motivation" has various  
 193 meanings, such as desire, hope, goals, objectives,  
 194 needs, encouragement, motivation, and incentives.  
 195 The origin of the word "motivation" comes from  
 196 the Latin "movere," which means "to move." In a  
 197 comprehensive definition, motivation is a process  
 198 involving physical and psychological deficiencies  
 199 that encourage individuals to perform behaviour  
 200 or drives aimed at achieving goals or incentives.  
 201 According to ARUM (2022), several indicators of  
 202 work motivation can be recognized: Physiological  
 203 Needs include basic needs such as food, drink,  
 204 shelter and other aspects that support one's  
 205 physical survival. Safety Need: Individuals need  
 206 to feel safe in their work environment. This  
 207 includes aspects of physical security as well as job  
 208 stability. Socialization Need: Good social  
 209 relations and the quality of interaction with  
 210 colleagues and superiors are also essential factors  
 211 in work motivation. Need for Reward: Rewards in

recognition, financial rewards, or other rewards  
 can increase individual work motivation. Self-  
 Actualization Need: Developing personal  
 potential, achieving personal goals, and being  
 successful in a career is also an important  
 motivating factor. By understanding and meeting  
 these needs, organizations can create a more  
 motivating and productive work environment for  
 employees.

### **Work Ethic**

Work ethic has a vital role in improving teacher  
 performance. A positive work ethic is the key to  
 carrying out tasks effectively and producing  
 satisfying results. McShane and Von Glinow  
 (2008) say that ethics is related to moral  
 principles or values determining whether an  
 action is right or wrong. Lawton (2013) defines  
 ethics as principles that provide a framework for  
 making morally based decisions and guide  
 individuals in their actions. In other words, ethics  
 provides guidelines for directing one's behaviour  
 according to a set of moral principles. Individuals  
 with a high or positive work ethic, as described by  
 Porter (2004), usually exhibit the following  
 characteristics: punctuality, pride in their work,  
 ability to work independently, responsibility,  
 willingness to take initiative, and ability to  
 complete tasks. Task carefully. Meanwhile,  
 according to Miller, Woehr, and Hudspeth (in  
 Meriac, Poling, and Woehr, 2009), individuals  
 with a strong work ethic will show traits such as a  
 focus on work, self-confidence, hard work,  
 efficient time management, integrity, morale, the  
 ability to delay self-gratification and avoid  
 wasting time. Previous research, such as by  
 Wahyudi et al. (2013), has shown that work ethic  
 significantly affects performance. This  
 underscores the importance of establishing and  
 encouraging a positive work ethic among  
 teachers, as this can improve their performance  
 and, overall, increase the effectiveness of  
 education in the school setting.

## 254 **Teacher Performances**

255 Performance, or in English known as  
 256 "performance," is the leading indicator of success  
 257 for an organization and the individuals who work  
 258 in it. Performance is one of the essential keys that  
 259 must run effectively so that the organization as a  
 260 whole can achieve its goals. Performance is a  
 261 result that can be measured by achieving specific  
 262 goals. Good performance results are usually a  
 263 consequence of good behaviour. This includes  
 264 prudent and effective conduct appropriate to the  
 265 required skills and competencies. Pratama  
 266 Harapan, and Arafat (2018) have emphasized the  
 267 importance of the link between good behaviour  
 268 and good performance results. Walang and  
 269 Ahmad (2019) describe that performance systems  
 270 usually cover two main aspects, namely behaviour  
 271 (what employees do) and results (results of that  
 272 behaviour). However, it is essential to remember  
 273 that the performance dimension includes the  
 274 results of the behaviour and the behaviour itself.  
 275 In other words, how a person acts, works, and  
 276 behaves in a work context is very important in  
 277 determining the final performance results.  
 278 Therefore, promoting appropriate and effective  
 279 behaviour is essential to achieve optimal  
 280 organisational performance. Performance is a  
 281 critical element that must function effectively to  
 282 achieve overall organizational success. In  
 283 Armstrong's view, performance results from  
 284 achieving various goals and the processes that  
 285 enable the achievement of these goals. It covers  
 286 various performance dimensions, including  
 287 performance related to work processes and  
 288 outcomes. Armstrong (2006) states that  
 289 performance involves behaviour and results.  
 290 Performance reflects the behaviour of individuals  
 291 involved in work and changes the concept of  
 292 performance from something abstract to real  
 293 action. Apart from being an instrument for  
 294 measuring results, behaviour in performance is  
 295 also an actual result, which is the product of  
 296 mental and physical effort applied to tasks and  
 297 can be assessed separately from the final result.

298 Colquitt views performance as a set of  
 299 behavioural values generated by employees, both  
 300 positive and negative, that contribute to the  
 301 achievement of organizational goals. Colquitt's  
 302 view emphasizes that performance includes  
 303 behaviour within the employee's control but only  
 304 in the context of behaviour relevant to job  
 305 achievement. In this definition, the performance  
 306 focuses on employee behaviour in the context of  
 307 the core job duties and responsibilities. Overall,  
 308 performance results from the interaction between  
 309 employee behaviour and organizational goals.  
 310 This includes how individuals work, whether in  
 311 terms of the tasks performed or the behaviours  
 312 that affect the productivity and effectiveness of  
 313 the organization. The definition of performance,  
 314 according to Colquitt, indeed focuses on  
 315 performance behavior related to the core duties  
 316 and responsibilities of the job. This includes  
 317 behaviour that can be positive or negative, and all  
 318 impact achieving organizational goals. The  
 319 definition of performance proposed by Colquitt  
 320 emphasizes that performance primarily includes  
 321 behaviour relevant to work performance that is  
 322 within the employee's control. In other words, in  
 323 Colquitt's view, performance is how healthy  
 324 individuals carry out their core job duties and  
 325 responsibilities and how their behaviour  
 326 contributes to achieving organizational goals. This  
 327 definition allows organizations to assess and  
 328 measure the extent to which employees fulfil their  
 329 duties and the extent to which their behaviour  
 330 supports organizational success. Teacher  
 331 performance results from the teacher's work in  
 332 carrying out their duties based on abilities, skills,  
 333 and experience and in accordance with  
 334 predetermined competencies and work criteria.  
 335 Classroom observation is often used as a general  
 336 way to assess teacher performance (Moradi,  
 337 Sepehrifar, & Khadiv, 2014). In the evaluation  
 338 process, students are often the primary assessors  
 339 of teacher performance (Ardiana, 2017). Some  
 340 indicators used to measure teacher performance  
 341 include: Ability to Develop Lesson Plans (RPP):

342 This includes the extent to which teachers can  
 343 plan and organize learning materials according to  
 344 the curriculum and student needs. Ability to  
 345 Implement Learning: The teacher can convey  
 346 subject matter, facilitate discussion, and  
 347 implement appropriate learning strategies. Skill  
 348 in Interpersonal Relations: Teachers must interact  
 349 well with students, colleagues, and parents. This  
 350 ability includes effective communication and the  
 351 ability to build positive relationships. Ability to  
 352 Assess Learning Outcomes: Teachers must  
 353 objectively assess students' understanding and  
 354 progress. This includes skills in designing tests  
 355 and evaluation assignments. Ability to Implement  
 356 Enrichment Programs: Teachers must also  
 357 identify the needs of more capable students and  
 358 implement enrichment programs for them. These  
 359 indicators are an integral part of teacher  
 360 performance assessment, and the results are used  
 361 to understand the extent to which teachers are  
 362 successful in teaching and supporting student  
 363 growth and development.

#### 364 **Management Innovation**

365 Management innovation's essence lies not in  
 366 creating innovative solutions per se but in  
 367 establishing an environment that nurtures  
 368 creativity—a space wherein solutions can be  
 369 envisioned, nurtured, and implemented. As  
 370 pointed out by Goyal and Pitt in 2007, the  
 371 emphasis is not solely on generating novel  
 372 answers but on cultivating an atmosphere that  
 373 encourages the birth and evolution of solutions  
 374 from inception to execution. This perspective  
 375 highlights the significance of fostering an  
 376 organizational culture that supports and empowers  
 377 the entire innovation lifecycle, from idea  
 378 generation to practical implementation. According  
 379 to Scarbrough and Swan (2001), the emergence  
 380 and expansion of knowledge management  
 381 constitute a managerial reaction to the tangible  
 382 patterns linked with globalization and the era  
 383 following industrialization. These patterns  
 384 encompass the proliferation of knowledge-based  
 385 job roles and the technological progress of

information and communication technology  
(ICT).

The strategic implementation of learning  
technology has a dual impact, influencing the  
organizational milieu and production technology.  
This, in turn, shapes the creative procedures and  
the accumulation of organizational knowledge,  
thus impacting the competitive edge of the entity  
(Ahmad and Schroeder, 2011). A pivotal driver  
fuelling the swift evolution of organizations,  
including educational establishments, is the  
effective implementation of collaborative  
teamwork methodologies (Anderson and West,  
1998). In contemporary settings, the strategic  
integration of learning technology holds the  
power to transform the very fabric of an  
organization. It has a twofold effect – not only  
does it reshape the immediate organizational  
context, but it also exerts influence on the  
technology employed for production. This  
interplay extends its reach to impact the intricate  
creative processes that underlie the generation of  
novel ideas and the accumulation of essential  
organizational knowledge. Ultimately, this  
synthesis of technology and strategy becomes a  
determinative factor in shaping the organization's  
competitiveness within the broader landscape.

Within educational institutions and businesses  
alike, the impetus for rapid advancement is  
inherently tied to the efficient orchestration of  
collaborative efforts. In a landmark study,  
Anderson and West (1998) underscored the  
pivotal role of cohesive teamwork in propelling  
organizations forward. This bears testimony that  
the real catalyst for growth is not merely the  
application of advanced technologies or  
sophisticated strategies in isolation but rather the  
harmonious convergence of both elements to  
foster an environment conducive to innovation  
and development.

#### 42 **Learning Management**

The use of technology in learning, primarily  
through the Learning Management System (LMS)  
and E-learning, is essential in this digital era.

LMS is a system that facilitates online learning management, while E-learning is a learning approach that utilizes computer technology and other devices. This includes using information technology to create learning experiences in virtual environments. In this context, E-learning can be defined as using internet and web technologies to support the learning process. The main principle of E-learning is its ability to be connected to a network, making it easier to update, store, distribute, and share instruction and information instantly. This makes learning flexibly accessible to students, regardless of location and time. The use of LMS and E-learning has brought significant changes in the way education and learning are carried out. They provide students and students with broader access to educational resources, interact with learning materials, and communicate with instructors and fellow students online. It also provides moments in study time, allowing individuals to study according to their schedule.

This study assesses factors influencing learning management by teachers in Vocational Higher Schools in the field of technology and engineering. The evaluation encompasses five key variables: work motivation, work ethic, teacher performances, management innovation, and learning management. The subsequent section elucidates the methodology employed for assessing the variables and outlines the sampling and data collection approaches utilized. Following that, this study delves into the techniques used for data analysis and the resulting findings. In last, the conclusion by highlighting the implications derived from the findings and proposes future research directions.

## 2 Material and Method

This section outlines the approach undertaken to execute the present study. The chosen methodology involved the utilization of survey research design, aimed at comprehensively exploring the research objectives. The segment

provides a comprehensive breakdown of the questionnaire design and the data collection process conducted. Furthermore, it delves into the finer details of how the constructs under scrutiny were meticulously measured to ensure a robust evaluation of the research variables.

### *Questionnaire Design*

A set of questionnaires was meticulously devised to serve as a robust tool for gauging both the understanding of conceptual definitions and their practical application. Survey data collection was carried out through questionnaires. Respondents filled out questionnaires with 10 statement items for work motivation (Andrianto, Komardi, & Priyono, 2023; Febriani, Ahyani, & Fitriani, 2023; Nugroho, Tannady, Fuadi, Aina, & Anggreni, 2023), 10 statement items work ethic (Kamaruddin, Tannady, Al Haddar, Sembiring, & Qurtubi, 2023; Risadiana, Agung, & Yudana, 2023), 10 statement items for teacher performances (Kamaruddin et al., 2023), 10 statement items for management innovation (Karatepe, Dahleez, Jaffal, & Aboramadan, 2023), 10 statement items for learning management (Riza, Piantari, Junaeti, & Permana, 2023).

These questionnaires incorporated a 5-point measurement scale, encompassing a range from "Strongly Disagree" (1) to "Strongly Agree" (5), following the methodology outlined by Likert in 1972. The variables were measured using a scale of 1 to 5, which explains whether the respondent agrees or not with certain statements. Score 1, the respondent strongly disagrees with a certain statement; score 2, the respondent does not agree with a certain statement; score 3, the respondent is neutral with certain statements; score 4, the respondent agrees with a certain statement; and a score of 5, the respondent strongly agrees with a certain statement. A five-point Likert scale was used because this questionnaire was able to accommodate respondents' answers that were neutral or unsure.

### 518 *Reability and Validity*

519 To ensure the calibre and relevance of the  
520 content, various tools inherent to the research  
521 process were judiciously utilized. The assurance  
522 of both content validity and reliability rested on  
523 the evaluation of five experts, each a specialist in  
524 their respective fields. This panel of experts  
525 meticulously reviewed the content to ascertain its  
526 alignment with the research's objectives and  
527 scope. Reliability refers to the consistency or  
528 stability of a measurement over time or between  
529 different raters. A measurement instrument is  
530 considered reliable if it consistently provides the  
531 same results when used repeatedly to measure the  
532 same thing. In other words, a reliable instrument  
533 is an instrument that provides consistent results  
534 regardless of who gives it, when it is given, and  
535 under what conditions it is given. Validity refers  
536 to the extent to which a measurement instrument  
537 measures what it is supposed to measure. A  
538 measurement instrument is considered valid if it  
539 accurately measures the concept or construct it  
540 wants to measure. In other words, a valid  
541 instrument is one that measures what it claims to  
542 measure and produces results that are meaningful  
543 and relevant to the research question. Reliability  
544 refers to the consistency of measurement, while  
545 validity refers to the accuracy or correctness of  
546 the measurement. Although reliability is  
547 important to ensure the consistency and stability  
548 of results, validity is essential to ensure that the  
549 results obtained from a measurement instrument  
550 are meaningful and relevant to the research  
551 question.

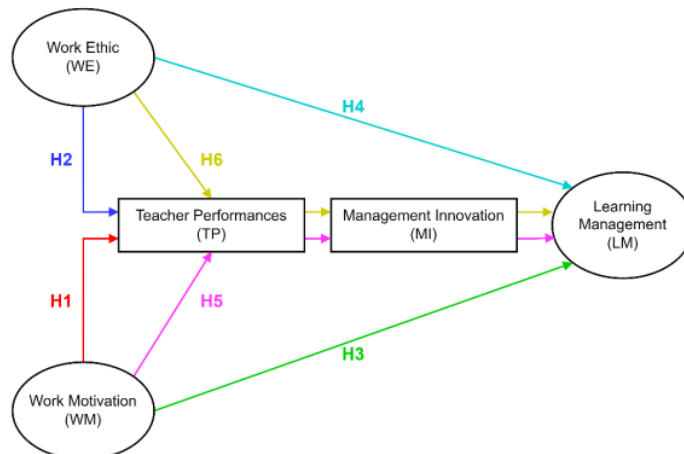

### 553 *The Data Collection Procedure*

554 Research data collection was carried out  
555 through questionnaires which were distributed via  
556 Google Form to respondents. The respondents  
557 were teachers at vocational schools that had

558 building engineering education programs. The  
559 purpose of this study centred on discerning the  
560 factors influencing learning management by  
561 teachers in Vocational Higher Schools for the  
562 technology and engineering field. To ascertain an  
563 appropriate sample size for this study, the  
564 G\*power analysis method, a well-regarded  
565 approach in the structural equation modelling  
566 realm, was applied (Kaya, Düzgün, & Boz, 2023).  
567 Since the model featured two predictors, this  
568 study aimed for a medium effect size and a power  
569 level of 0.8. As a result, a minimum sample of 32  
570 was deemed necessary. However, the sample size  
571 was increased to 385 due to the diversity inherent  
572 in the population, as suggested by (Hair et al.,  
573 2019). By expanding the sample size, this study  
574 aimed to better accommodate the heterogeneous  
575 nature of teachers as participants. This larger  
576 sample would consequently enhance the statistical  
577 robustness of the findings. Specifically, with a  
578 sample size of 385, it would achieve a power  
579 exceeding 0.9. This strategic decision ensures that  
580 this study is equipped with ample statistical  
581 strength and confidently generates substantial and  
582 reliable insights from the data analysis carried out.

### 584 *Construct Measurement*

585 This study has constructs comprising two  
586 independent variables, work motivation and work  
587 ethic. Teacher performances variable will have  
588 double functions as dependent variables for  
589 testing H1 and H2. Then, it will serially mediate  
590 together with management innovation to prove H5  
591 and H6 with learning management as a dependent  
592 variable. In addition, learning management has  
593 the same role to check H3 and H4. Figure 1 shows  
594 the hypothesis paths of this study.

**Figure 1. The hypothesis paths of the factors influencing learning management.**

All the indicators used in the analysis were of a reflective nature. Additionally, it's noteworthy that every single item incorporated in the analysis was drawn and adapted from established and previously conducted research studies.

- Work motivation were adapted from the work of the study of (Andrianto, Komardi, & Priyono, 2023; Febriani, Ahyani, & Fitriani, 2023; Nugroho, Tannady, Fuadi, Aina, & Anggreni, 2023)
- Work ethic were adapted from the work of the study of (Kamaruddin, Tannady, Al Haddar, Sembiring, & Qurtubi, 2023; Risadiana, Agung, & Yudana, 2023)
- Teacher performances were adapted from the work of the study of (Kamaruddin et al., 2023)
- Management innovation were adapted from the work of the study of (Karatepe, Dahleez, Jaffal, & Aboramadan, 2023)
- Learning management were adapted from the work of the study of (Riza, Piantari, Junaeti, & Armana, 2023)

The type of research used was quantitative research with sampling using random sampling techniques and a sample of 30 teachers from 3 vocational education institutions in Semarang was obtained. The list of schools and the number of respondents are Vocational Higher School (SMK

7 Semarang, (10), SMK 4 Semarang (10) and SMK 1 Semarang (10). In order to ensure that the items were devoid of ambiguity and accurately captured the intended constructs, a preliminary pilot study involving 30 participants was carried out prior to the primary data collection phase. This step was taken to refine the measurement instruments and to align them more precisely with the research objectives. Also, the expertise of specialists in the field was enlisted to validate the items for their relevance and suitability. Drawing from the insights gained from both the pilot study findings and the input provided by these experts, certain items underwent revisions to improve their clarity and overall effectiveness in capturing the intended nuances of the constructs under investigation.

### 3 Result and Discussion

Partial Least Squares (PLS) which allows latent variable modeling in SEM analysis. Using PLS provides higher flexibility compared to other SEM methods. One of the advantages of PLS is its ability to moderate. Moderation is an important concept in this research because it refers to the influence of an independent variable on the relationship between the explanatory variable (independent) and the dependent variable (dependent). PLS can explore moderation

relationships more effectively. PLS also has advantages in processing data that does not have a normal distribution. This allows data analysis that is more accurate and relevant to real conditions in research. PLS analyzes data realistically and is closer to the actual situation.

To conduct an analysis of the research model, this study employed structural equation modeling (SEM) techniques (Hair Jr & Sarstedt, 2019). Specifically, the analysis was executed utilizing the Partial Least Squares (PLS) method via SmartPLS 3.2.9 software. To scrutinize the pathways within the model, a bootstrap resampling technique was implemented, involving 5000 resampled instances. There are three distinct rationales driving the utilization of PLS in this study. Firstly, the distribution of the samples deviated from the normal distribution, a

characteristic that can be effectively accommodated by PLS as previously highlighted (Lubis, Zarlis, & Aulia, 2023). Secondly, PLS is renowned for its ability to handle smaller sample sizes, a particularly advantageous trait as emphasized by (Hair Jr & Sarstedt, 2019). Lastly, the nature of PLS makes it particularly well-suited for exploratory investigations such as the present study, aligning with the insights presented by (Chatterjee, Bhattacharjee, Tsai, & Agrawal, 2021). The research adhered to the recommended two-stage approach suggested by (Hair et al., 2019). This involved a sequential estimation of both the measurement model and the structural model, ensuring a comprehensive examination of the variables and their interrelations. The structural model of this study is shown in Figure 2.

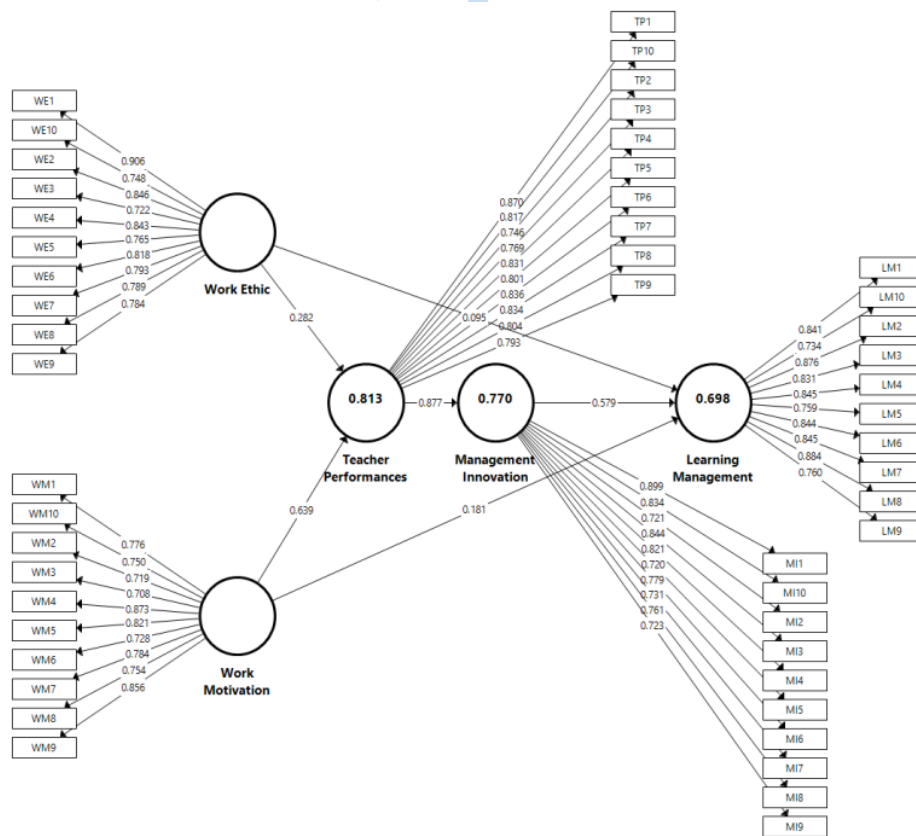

Figure 2. The structural model for the factors influencing learning management.

**The Measurement Model**

The measurement model entails the assessment of two key aspects: convergent validity and discriminant validity. To ascertain convergent validity, the initial assessment considers indicator loadings and all these loadings are observed to exceed the stipulated threshold of 0.7 as recommended by (Hair et al., 2019). Furthermore, this study examined the Average Variance Extracted (AVE) and observed that all AVE values exceeded 0.5. Convergent validity means that a set of indicators represents one latent variable and is the basis for that latent variable. This representation can be demonstrated through unidimensionality which can be expressed using the average value of the extracted variance (AVE). The AVE value is at least 0.5. This value illustrates adequate convergent validity, which means that one latent variable is able to explain more than half of the variance of its indicators on average. Additionally, the Construct Reliability

(CR) values were scrutinized, ensuring that each of them surpassed 0.7, in line with the criteria presented by (Supriyanto et al., 2022). Moreover, the evaluation of Cronbach's alpha values revealed that all values exceeded the recommended threshold of 0.7 (Zebua & Chakim, 2023). The result of the convergent validity is shown in Table 1. Given these findings, convergent validity was substantiated, and a concurrent assessment of discriminant validity was also carried out (Hair Jr & Sarstedt, 2019). Meanwhile, the data presented in Table 2 establishes that the square roots of each construct's AVE surpassed their respective correlations with other constructs, a principle advocated by (Habibi, Sofyan, & Mukminin, 2023). This thorough evaluation confirms the absence of issues with discriminant validity, allowing for the conclusion that all measures within the model exhibited exceptional psychometric properties.

**Table 1. The result of the convergent validity**

| Construct  | Code       | Outer Loading | Cronbach $\alpha$ | CR    | AVE   |       |
|------------|------------|---------------|-------------------|-------|-------|-------|
| Work       | WM1        | 0.776         | 0.927             | 0.939 | 0.606 |       |
|            | Motivation | WM2           |                   |       |       | 0.719 |

**The Structural Model**

In the structural model analysis, the investigation encompassed the evaluation of the path coefficient ( $\beta$ ), the t-test value, predictive relevance (Q2), and the coefficient of determination (R2), as advocated by Hair et al. in 2017. To scrutinize the hypotheses and establish

their significance, a bootstrapping technique involving 5000 resamples was employed. This technique adhered to a significance level ( $p$ ) of 5%, adopting a one-tailed test option. First, the testing results showed support for three structural hypotheses and three vice versa listed in Table 4.

**Table 4. The summary of the hypothesis test**

| Hypothesis Path   | $\beta$ | t-test | P-value | Result |
|---|---------|--------|---------|--------|
| <b>H1:</b> Work Motivation $\rightarrow$ Teacher Performances   | 0.639   | 4.446  | 0.000   | S      |
| <b>H2:</b> Work Ethic $\rightarrow$ Teacher Performances  | 0.282   | 1.893  | 0.029   | S      |
| <b>H3:</b> Work Motivation $\rightarrow$ Learning Management  | 0.181   | 0.707  | 0.240   | NS     |
| <b>H4:</b> Work Ethic $\rightarrow$ Learning Management   | 0.095   | 0.367  | 0.357   | S      |
| <b>H5:</b> Work Motivation $\rightarrow$ Teacher Performances $\rightarrow$ Management Innovation $\rightarrow$ Learning Management | 0.325   | 2.043  | 0.021   | NS     |
| <b>H6:</b> Work Ethic $\rightarrow$ Teacher Performances $\rightarrow$ Management Innovation $\rightarrow$ Learning Management      | 0.143   | 0.157  | 0.061   | NS     |

S : Supported, and NS : Not Supported

Table 4 shows the results of the hypotheses testing were as follows:

- **H1:** The work motivation possessed by teachers in Vocational Higher Schools in the field of technology and engineering has a direct and positive influence on teacher performances. Hypothesis testing found that the work motivation of the teachers has a direct and positive influence on teacher performances as witnessed by the coefficient = 0.639, the fact that the hypothesis significance is  $p < 0.05$ .
- **H2:** The work ethic possessed by teachers in Vocational Higher Schools in the field of technology and engineering has a direct and positive influence on teacher performances. Hypothesis testing found that the ethic motivation of the teachers has a direct and positive influence on teacher performances as witnessed by the coefficient = 0.282, the fact that the hypothesis significance is  $p < 0.05$ .
- **H3:** The work motivation possessed by teachers in Vocational Higher Schools in the field of technology and engineering has a

direct and positive influence on learning management. Hypothesis testing found that the work motivation of the teachers has an indirect and positive influence on learning management as witnessed by the coefficient = 0.181, the fact that the hypothesis significance is  $p < 0.05$ .

- **H4:** The work ethic possessed by teachers in Vocational Higher Schools in the field of technology and engineering has a direct and positive influence on learning management. Hypothesis testing found that the work ethic of the teachers has an indirect and positive influence on learning management as witnessed by the coefficient = 0.095, the fact that the hypothesis significance is  $p < 0.05$ .
- **H5:** The work motivation possessed by teachers in Vocational Higher Schools in the field of technology and engineering with serially mediated teacher performance and management innovation acted has a direct and positive influence on learning management. Hypothesis testing found that it has a direct and positive influence on learning

management as witnessed by the coefficient = 0.325, the fact that the hypothesis significance is  $p < 0.05$ .

- **H6:** The work ethic possessed by teachers in Vocational Higher Schools in the field of technology and engineering with serially mediated teacher performance and management innovation acted has a direct and positive influence on learning management. Hypothesis testing found that it has an indirect and positive influence on learning management as witnessed by the coefficient = 0.143, the fact that the hypothesis significance is  $p < 0.05$ .

Upon calculating the path coefficients, the subsequent Q2 assessment revealed that the research model attained a Q2 score of 0.446, surpassing zero. This outcome underscores the model's high predictive relevance. In aggregate, our exogenous variables collectively account for 69.8% of the variance observed in the context of learning management found in Vocational Higher Schools in the field of technology and engineering, and this portion of variance is indeed considerable.

### Discussion

#### The Affecting of Work Motivation on Teacher Performances

Motivation is the drive that pushes someone to achieve organizational goals by trying hard when their needs are met. The better a person's performance, the greater the rewards they receive and the higher their job satisfaction. Positive attitudes toward work can create high work motivation in the work environment, while negative attitudes can reduce motivation. Motivated teachers make a better contribution to achieving organizational goals. According to (Andrianto et al., 2023) and (Kamaruddin et al., 2023), improving teachers' work motivation levels can result in increased work motivation, which in turn contributes to improving individual, group,

and organizational performance. Findings from research conducted by (Febriani et al., 2023), also show that three aspects of psychological needs can predict work motivation and job performance. In addition, in research conducted by (Chatterjee et al., 2021), there is a significant correlation between work motivation and work performance. Meanwhile, research conducted by Imam and his colleagues in 2015 stated that three variables significantly influenced teacher performance, namely leadership style, corporate culture, and teacher motivation. Results also confirm a positive relationship between work motivation and teacher performance. These views confirm that teacher work motivation has a vital role in shaping the level of work motivation and successful teacher performance in an organizational context.

**H1:** Work motivation has a positive and significant effect on teacher performance (accepted)

#### The Affecting of Work Ethic on Teacher Performance

Work ethic is important in providing enthusiasm and stamina for a teacher to carry out his duties. It also influences the teacher's charisma and authority and shapes the teacher's personality and work behaviour. In this context, work ethics refers to viewing work as desirable rather than a burden. Individuals with strong work ethic are highly committed to their work and often feel satisfied in the teacher's work environment (Abbasi and Ghulam, 2012). Work ethics is not just about understanding moral values but also applying them in daily practice, and this can provide significant benefits in a teacher's professional development. The results of the various studies you mentioned, all show that work ethic has a significant positive impact on improving performance (Kaya et al., 2023). These findings underscore the importance of a strong work ethic in influencing performance and contributing positively to various aspects of work.

A good work ethic creates a productive work environment and can improve overall individual and organizational performance results.

**H2:** Work ethics has a positive and significant effect on teacher performance (accepted)

### **The Affecting of Work Motivation on Learning Management**

Teachers must consider work motivation factors relevant to the school when developing scientific development programs that support school needs. Funding for the provision of e-learning and financing related to other facilities, responsibilities and achievements are the main factors considered necessary by schools when considering work motivation factors that influence teachers' decisions to adopt a course learning management system (LMS) into their teaching practice. The school development program should provide financing to teachers, strengthen teachers' responsibilities for teaching, and help schools achieve their goals and advance their knowledge of teaching using the LMS. Another vital area that motivates teachers' work is the influence of policies both from schools and the state, which in particular, the use of the LMS is mandatory for teachers to use or not. This is what motivated the teacher's decision to adopt the LMS. Because LMS requires bureaucracy and interference from other parties, it does not significantly affect teacher's work motivation. Work motivation also does not have a significant effect on LMS.

**H3:** Work motivation has not a significant effect on learning management (rejected)

### **The Affecting of Work Ethics on Learning Management**

There are several problems surrounding the implementation of the learning management system, including strengthening work ethics that cannot be carried out continuously and continuously. Strengthening work ethics certainly requires good learning management. Management

of continuous supervision work ethics. This phenomenon provides extra duties and responsibilities for teachers to maximize their personal work ethics and the need for proper management of a learning management system.

**H4:** Work ethics has a positive and significant effect on learning management (accepted)

### **The Affecting of Work Motivation, Teacher Performances, and Management Innovation on Learning Management**

This study has limitations, namely only conducting an analysis using the principal's managerial ability and work motivation variables to determine the effect on teacher performance. Some suggestions that can be followed up by other researchers based on the results of this study are efforts by relevant agencies to increase the competency of school principals in management innovation through holding workshops and training and optimizing supervision of school principal performance. In addition, it is necessary to identify more learning management factors. This is because many factors influence and contribute to teacher performance in their duties and obligations. Other researchers can follow up by conducting further training and research activities by adding or replacing broader variables.

**H5:** Work Motivation, Teacher Performances, and Management Innovation has not significant affecting on Learning Management (rejected)

### **The Affecting of Work Ethic, Teacher Performances, and Management Innovation on Learning Management**

This study has several limitations, namely the focus on analysing principals' managerial abilities and work ethic variables in relation to teacher performance. For further research, it is suggested that relevant agencies make efforts to improve the competency of school principals in management innovation through organizing workshops and training, as well as maximizing

the supervision of school principals' performance. In addition, it is essential to identify more learning management factors that might influence teacher performance. Because many factors can contribute to teacher performance, future research may consider adding or replacing variables to make them more comprehensive. This underscores the need for more in-depth and broad research to understand the factors influencing teacher performance and how to improve it in the educational context.

**H6:** Work Ethic, Teacher Performances, and Management Innovation haven't significant affecting on Learning Management (rejected)

#### 4 Conclusion

This study provides information that work motivation and work ethics affect teacher performance in vocational education. Work motivation, from the results of this study is quite good and has a significant effect on teacher performance. This confirms that teachers' work motivation and work ethic level can directly influence their performance. Hypothesis testing found that the work motivation of the teachers has a direct and positive influence on teacher performances as witnessed by the coefficient = 0.639, the fact that the hypothesis significance is  $p < 0.05$ . Therefore, to improve teacher performance, school supervisor needs to provide high management innovation to teachers. Schools can create a more productive environment and help teachers reach their full potential by providing innovative management that encourages and maintains teacher motivation. This can include developing training programs, organizing workshops, and providing support and constructive feedback to teachers. Innovative management can also help teachers feel valued and encouraged to work better, which will strengthen the quality of education they provide to students. Therefore, it is suggested to the school to design management innovation, provide encouragement and evaluate the learning

management system process. The school can review the learning process from planning to the implementation process in the field and whether there are still deficiencies in the learning management system. It is hoped that this review will continue to improve teacher performance. The learning system in innovative management emphasizes on effective, open communication, discussion and public examination of problems encountered in learning, consider each other's views and put forward strategies. System collaborative work where conscious effort has been made to create strategies, policies and structures and institutionalize values, behavior and practices enables individuals and groups to work together effectively to achieve organizational goals.

#### Conflict of Interest Statement
